ENCYCLOPÆDIA BRITANNICA;  
OR, A  
DICTIONARY  
OF  
ARTS, SCIENCES, &c.  
On a PLAN entirely NEW:

BY WHICH,  
THE DIFFERENT SCIENCES AND ARTS  
Are digested into the FORM of Distinct  
TREATISES OR SYSTEMS,  
COMPREHENDING  
The HISTORY, THEORY, and PRACTICE, of each,  
according to the Latest Discoveries and Improvements;  
AND FULL EXPLANATIONS ARE GIVEN OF THE  
VARIOUS DETACHED PARTS OF KNOWLEDGE,  
WHETHER RELATING TO  
NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,  
CIVIL, MILITARY, COMMERCIAL, &c.  
TOGETHER WITH  
A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, &c.  
throughout the WORLD;  
A General HISTORY, *Ancient and Modern*, of the different Empires, Kingdoms, and States;  
AND  
An Account of the LIVES of the most Eminent Persons in every Nation,  
from the earliest ages down to the present times.

THE WHOLE COMPILED FROM  
THE WRITINGS OF THE BEST AUTHORS, IN SEVERAL LANGUAGES; THE MOST APPROVED DICTIONARIES,  
AS WELL OF GENERAL SCIENCE AS OF PARTICULAR BRANCHES; THE TRANSACTIONS, JOURNALS, AND MEMOIRS, OF LEARNED  
SOCIETIES, BOTH AT HOME AND ABROAD; THE MS. LECTURES OF EMINENT PROFESSORS ON DIFFERENT SCIENCES;  
AND A VARIETY OF ORIGINAL MATERIALS, FURNISHED BY AN EXTENSIVE CORRESPONDENCE.

---

*The SECOND EDITION; greatly Improved and Enlarged.*

---

ILLUSTRATED WITH NEAR THREE HUNDRED COPPERPLATES.

## Dictionary of Arts, Sciences, &amp;c.

P O I

Poggius.

**POGGIUS BRACCIOLINUS**, a man of great parts and learning, who contributed much to the revival of knowledge in Europe, was born at Terranuova, in the territories of Florence, in 1380. His first public employment was that of writer of the apostolic letters, which he held 10 years; and was then made apostolic secretary, in which capacity he officiated 40 years, under seven popes. In 1453, when he was 72 years of age, he accepted the employment of secretary to the republic of Florence, to which place he removed, and died in 1459. He visited several countries, and searched many monasteries, to recover ancient authors, numbers of which he brought to light: his own works consist of moral pieces, orations, letters, and *A history of Florence* from 1350 to 1455, which is the most considerable of them.

**POICTIERS**, an ancient, large, and considerable town of France, capital of Poitou; with a bishop's see, four abbeys, a mint, and an university famous for law. It contains 22 parishes, nine convents for men, and 12 nunneries. There are several Roman antiquities; and particularly an amphitheatre, but partly demolished, and hid by the houses. There is also a triumphal arch, which serves as a gate to the great street. It is not peopled in proportion to its extent.

Near this place Edward the Black Prince obtained a decisive victory over the French in 1336. The army commanded by the former did not exceed 12,000 men, and of these not a third part were English. The French army, commanded by king John, consisted of 60,000 men, who unexpectedly came up with the English army, surrounded them, and by intercepting their provisions might have reduced the whole army without striking a blow. But such was the ardour of the French nobility, and so much had their thoughts been bent on overtaking the English as their sole object, that this idea never struck any of the commanders; and they immediately took measures for the assault, as for a certain victory. While the French army was drawn up in order of battle, they were stopped by the appearance of the cardinal of Perigord; who, having learned the approach of the two armies to each other, had hastened, by interposing his good offices, to prevent any farther effusion of Christian blood. By John's permission, he carried proposals to the prince of Wales; and found him so sensible of the bad posture of his affairs, that an accommodation seemed not impracticable. Edward told him, that he would agree to any terms consistent with his own honour and that of England; and he offered to purchase

P O I

Poitiers.

a retreat by resigning all the conquests which he had made during this and the former campaign, and by stipulating not to serve against France during the course of seven years. But John, imagining that he had now got into his hands a sufficient pledge for the restitution of Calais, required that Edward should surrender himself prisoner with 100 of his attendants; and offered on these terms a safe retreat to the English army. The prince rejected the proposal with disdain; and declared, that whatever fortune should attend him, England should never be obliged to pay the price of his ransom. This resolute answer cut off all hopes of accommodation; but as the day was already spent in negotiating, the battle was delayed till the next morning.

The cardinal of Perigord, as all the prelates of the court of Rome, was extremely attached to the French cause; but the most determined enemy could not have contrived a greater prejudice to John's affairs, than he did them by this delay. The prince of Wales had leisure, during the night, to strengthen, by new intrenchments, the post which he had before so judiciously chosen; and he contrived an ambush of 300 men at arms, and as many archers, whom he put under the command of the Captal de Buche, and ordered to make a circuit, that they might fall on the flank or rear of the French army during the engagement. The van of his army was commanded by the earl of Warwick, the rear by the earls of Salisbury and Suffolk, the main body by the prince himself. The lords Chandos, Audeley, and many other brave and experienced commanders, were at the head of different corps of his army.

John also arranged his forces in three divisions, nearly equal: the first was commanded by the duke of Orleans, the king's brother; the second by the dauphin attended with his two younger brothers; the third by the king himself, who had by his side Philip, his fourth son and favourite, then about 14 years of age. There was no reaching the English army but through a narrow lane, covered on each side by hedges; and in order to open this passage, the marshals Andrewen and Clermont were ordered to advance with a separate detachment of men at arms. While they marched along the lane, a body of English archers, who lined the hedges, plied them on each side with their arrows; and being very near them, yet placed in perfect safety, they coolly took their aim against the enemy, and massacred them with impunity. The French detachment, much discouraged with the unequal

Poitiers,  
Poictou.

qual fight, and diminished in their number, arrived at the end of the lane, where they met on the open grounds the prince of Wales himself, at the head of a chosen body, for their reception. They were difcomited and overthrown: one of the marshals was slain; the other was taken prisoner; and the remainder of the detachment, who were kill in the lane, exposed to the shot of the enemy, without being able to make resistance, recoiled upon their own army, and put every thing into disorder. In that critical moment, the Capital de Buche unexpectedly appeared, and attacked in flank the dauphin's line, which fell into some confusion. Landas, Bodenai, and St Venant, to whom the care of that young prince and his brothers had been committed, too anxious for their charge or for their own safety, carried them off the field of battle, and set the example of flight, which was followed by that whole division. The duke of Orleans, seized with a like panic, and imagining all was lost, thought no longer of fighting, but carried off his division by a retreat, which soon turned into a flight. The lord Chandos called out to the prince, that the day was won; and encouraged him to attack the division under king John, which, though more numerous than the whole English army, were somewhat dismayed by the precipitate flight of their companions. John here made the utmost efforts to retrieve by his valour, what his imprudence had betrayed; and the only resistance made that day was by his line of battle. The prince of Wales fell with impetuosity on some German cavalry placed in the front, and commanded by the counts of Sallebruche, Nydo, and Nolto. A fierce battle ensued. The one side was encouraged by the near prospect of so great a victory; the other was retained by the shame of quitting the field to an enemy so much inferior: but the three German generals, together with the duke of Athens, constable of France, falling in battle, that body of cavalry gave way, and left the king himself exposed to the whole fury of the enemy. The ranks were every moment thinned around him: the nobles fell by his side, one after another: his son, scarce 14 years of age, received a wound, while he was fighting valiantly in defence of his father: the king himself, spent with fatigue, and overwhelmed by numbers, might easily have been dispatched; but every English gentleman, ambitious of taking alive the royal prisoner, spared him in the action, called to him to surrender himself, and offered him quarter: several who attempted to seize him, suffered for their temerity. He still cried out, *Where is my cousin the prince of Wales?* and seemed unwilling to become prisoner to any person of inferior rank. But being told, that the prince was at a great distance on the field, he threw down his gauntlet, and yielded himself to Dennis de Morbec, a knight of Arras, who had been obliged to fly his country for murder. His son was taken with him.

POICTOU, a province of France, bounded on the north by Bretagne, Anjou, and part of Touraine; on the east by Touraine, Berry, and Manche; on the south by Angoumois, Saintonge, and the territory of Aunis; and on the west by the sea of Gascony. It is divided into the Upper and Lower; and is fertile in corn and wine, and feeds a great number of cattle, particularly mules. It was in the possession of the

kings of England for a considerable time, till it was lost by the unfortunate Henry VI. Poitiers is the capital town.

POINCIANA, BARBADOES FLOWER-FENCE; a genus of the monogynia order, belonging to the decandria of plants. There is only one species, viz. the pulcherrima, a native of both Indies. It rises with a straight stalk 10 or 12 feet high, which is covered with a grey bark, and is sometimes as thick as the small of a man's leg, dividing into several spreading branches at the top, which are armed at each joint with two short, crooked, strong spines, and garnished with decompound winged leaves, each leaf consisting of six or eight pair of simple winged leaves. They are of a light green colour, and, when bruised, emit a strong odour. The branches are terminated by loose spikes of flowers, which are sometimes formed into a kind of pyramid, and at others disposed more in the form of an umbel. The foot-stalk of each flower is near three inches long; the flower is composed of five petals which are roundish at the top, but are contracted to narrow tails at the base. They spread open, and are beautifully variegated with a deep red or orange colour, yellow, and some spots of green; and emit a very agreeable odour. After the flower is past, the germen becomes a broad flat pod three inches long, divided into three or four cells by transverse partitions, each including one flatish irregular seed. The plant is propagated by seeds; but, being tender, is to be constantly kept in the bark-stove. It is very impatient of moisture in winter; and if the least damp seizes its top, it either kills the plant, or destroys its head. With proper management it will grow taller here than in the places where it is native; but its stems will not be thicker than a man's finger. In Barbadoes it is planted in hedges to divide the lands, whence it has the name of *flower-fence*. In the West Indies, its leaves are made use of as a purge instead of senna; and in Jamaica, it is called *sena*.

POINT, a term used in various arts.

POINT, in grammar, a character used to mark the divisions of discourse. See COMMA, COLON, &c. A point proper is what we otherwise call a *full stop* or *period*. See PUNCTUATION.

The points, or vowel points, in the Hebrew grammar, are certain characters, which in the writings of that language, serve to mark the vowels. The antiquity of these points make the subject of a celebrated controversy, some maintaining their origin to be the same with that of the Hebrew language; and others asserting them to have been first introduced by Eldras, after the Babylonish captivity, when he compiled the canon, transcribed the books into the present Chaldee character, and restored the purity of the Hebrew text. Some will have them invented by the doctors of the school of Tiberias, usually called the *massoretes*, 500 or 600 years after Christ.

POINT, in music, a mark or note anciently used to distinguish the tones or sounds: hence we still call it *simple counter-point*, when a note of the lower part answers exactly to that of an upper; and *figurative counter-point*, when any note is syncopated, and one of the parts makes several notes or inflexions of the voice, while the other holds on one.

We still use a point, to raise the value of a note, and

Point  
Poison.

and prolong its time by one half, *e. g.* a point added to a semibreve instead of two minims, make it equal to three; and so of the other notes. See the article **TIME**.

**POINT**, in astronomy, a term applied to certain points or places, marked in the heavens, and distinguished by proper epithets.

The four grand points or divisions of the horizon, *viz.* the east, west, north, and south, are called the *cardinal points*.

The *zenith* and *nadir* are the vertical points; the points wherein the orbits of the planets cut the plane of the ecliptic, are called the *nodes*: the points wherein the equator and ecliptic intersect, are called the *equinoctial points*; particularly, that whence the sun ascends towards the north pole, is called the *vernal point*; and that by which he descends to the south pole, the *autumnal point*. The points of the ecliptic, where the sun's ascent above the equator, and descent below it, terminate, are called the *solstitial point*; particularly the former of them, the *spring or summer-point*; the latter, the *brumal or winter-point*.

**POINT**, is also used for a cape or headland, jetting out into the sea: thus seamen say, two points of land are in one another, when they are so in a right line against each other, as that the innermost is hindered from being seen by the outermost.

**POINT**, in perspective, is used for various poles or places, with regard to the perspective plane. See **PERSPECTIVE**.

**POINTS**, in heraldry, are the several different parts of an escutcheon, denoting the local positions of any figure. See **HERALDRY**, p. 3583, col. 2.

**POINT** is also an iron or steel instrument, used with some variety in several arts. Engravers, etchers, cutters in wood, &c. use points to trace their designs on the copper, wood, stone, &c. See the articles **ENGRAVING**, &c.

**POINT**, in the manufactorys, is a general term, used for all kinds of laces wrought with the needle; such are the point de Venice, point de France, point de Genoa, &c. which are distinguished by the particular economy and arrangement of their points. *Point* is sometimes used for lace woven with bobbins; as English point, point de Malines, point d'Havre, &c.

**POINT**, in poetry, denotes a lively brisk turn, or conceit, usually found or expected at the close of an epigram. See **POETRY**, n° 47.

**POINTING**, in grammar, the art of dividing a discourse, by points, into periods and members of periods, in order to show the proper pauses to be made in reading, and to facilitate the pronunciation and understanding thereof. See the article **PUNCTUATION**.

**POISON**, any substance which proves destructive to the life of animals in a small quantity, either taken by the mouth, mixed with the blood, or applied to the nerves.

Of poisons there are many different kinds, and these are as various in their operations. The mineral poisons, as arsenic and corrosive mercury, seem to attack the solid parts of the stomach, and to produce death by eroding its substance: the antimonials seem rather to attack the nerves, and to kill by throwing the whole system into convulsions: and in this manner also most of the vegetable poisons seem to operate. All of

Poison.

these, however, seem to be inferior in strength to the poisons of some of the more deadly kinds of serpents, which operate so suddenly that the animal bit by them will be dead before another that had swallowed arsenic would be affected.

Much has been written concerning a poison made use of by the African negroes, by the Americans, and by the East Indians. To this very strange effects have been ascribed. It has been said that by this poison a man might be killed at any certain time; as, for instance, after the interval of a day, a week, a month, a year, or even several years. These wonderful effects, however, do not seem worthy of credit; as the Abbe Fontana has given a particular account of an American poison called *ticonas*, which in all probability is the same with that used in Africa and the East Indies; and from this account it is extremely improbable that any such effects could be produced with certainty.

With this poison the Abbe was furnished by Dr Heberden. It was closed and sealed up in an earthen pot inclosed in a tin case. Within the tin case was a point containing the following words: "Indian poison, brought from the banks of the river of the Amazons by Don Pedro Maldonado. It is one of the sorts mentioned in the Philosophical Transactions, vol. xvii. number 12." In the volume of the Philosophical Transactions here quoted, mention is made of two poisons little different in their activity; the one called the *poison of Lamas*, and the other of *Ticonas*. The poison in the earthen vessel used by the Abbe Fontana was that of the *Ticonas*; but he was also furnished with a number of American arrows dipped in poison, but whether that of the *Lamas* or *Ticonas* he could not tell.

Our author begins his account of the nature of this poison with detecting some of the mistakes which had been propagated concerning it.—It had been asserted, that the *Ticonas* poison proves noxious by the mere effluvia, but much more by the steam which exhales from it in boiling or burning; that, among the Indians, it is prepared only by women condemned to die; and that the mark of its being sufficiently prepared is when the attendant is killed by its steam. All these assertions are by the Abbe refuted in the clearest manner. He exposed a young pigeon to the smell of the poison when the vessel was opened, to the steam of it when boiling, and to the vapour of it when burning to the sides of the vessel, without the animal's being the least injured; on which, concluding that the vapours of this poison were not to be dreaded, he exposed himself to them without any fear.

This poison dissolves very readily even in cold water, and likewise in the vegetable and mineral acids. With oil of vitriol it becomes as black as ink, but not with the rest of the acids. Its oil of vitriol it also dissolves more slowly than in any of the rest. It does not effervesce with acids or alkalis; neither does it alter milk, nor tinge it, except with the natural colour of the poison; nor does it tinge the vegetable juices either red or green. When examined by the microscope, there is no appearance of regularity or crystallization; but it for the most part appears made up of very small, irregular, roundish bodies, like vegetable juices. It dries without making any noise, and

*Poison.* and has an extremely bitter taste when put upon the tongue.

The ticusas poison is harmless when put into the eyes; nor is it fatal when taken by the mouth, unless the quantity is considerable. Six grains of the solid poison, dissolved in water, killed a young pigeon, which drank it, in less than 20 minutes. Five grains killed a small Guinea-pig in 25 minutes. Eight grains killed a rabbit in an hour and eight minutes, &c. In those experiments it was observed that much less poison was required to kill an animal whose stomach was empty than one that had a full stomach. Three rabbits and two pigeons were killed in less than 35 minutes by taking a dose of three grains each on an empty stomach; but when the experiment was repeated on five animals with full stomachs, only one of them died.

The most fatal operation of this poison is when mixed with the blood. The smallest quantity, injected into the jugular vein, killed the animal as if by a stroke of lightning. When applied to wounds in such a manner that the flowing of the blood could not wash it away, the animal fell into convulsions and a train of fatal nervous symptoms, which put an end to its life in a few minutes. Yet, notwithstanding these seeming affections of the nerves, the poison proved harmless when applied to the naked nerves themselves, or even to the medullary substance of them fit open.

The strength of this poison seems to be diminished and even destroyed by mineral acids, but not at all by alkalies or ardent spirits; but if the fresh poison was applied to a wound, the application of mineral acids immediately after could not remove the pernicious effects. So far, indeed, was this from being the case, that the application of nitrous acid to the wounded muscle of a pigeon killed the animal in a short time without any poison at all.—The effects of the arrows were equally fatal with those of the poison itself.

The poison of the viper is analogous in its effects to that of ticusas, but inferior in strength; the latter killing more instantaneously when injected into a vein, than even the poison of the most venomous rattlesnake.

The Abbe has, however, observed a difference in the action of the two poisons upon blood taken out of the body. He cut off the head of a pigeon, and received its blood into two warm conical glasses, to the amount of about 80 drops into each. Into the blood contained in one porringer, he put four drops of water; and into the other, four drops of the poison dissolved in water as usual. The event of this experiment was, that the blood, with which the water only was mixed, coagulated in a short time; but that in which the poison was mixed, did not coagulate at all. The poison of the viper also hinders the blood from coagulating, but gives it a much blacker tinge than the poison of the ticusas. The poison of the viper also proves certainly fatal when injected into the veins, even in very small quantity; but it produces a kind of grumous coagulation and blackness in the blood when drawn from a vein, though it prevents the proper coagulation of that fluid, and its separation into crassamentum and serum as usual.

In the Philosophical Transactions, n° 335. we have

*Poison.* a number of experiments which show the effects of many different poisons upon animals; from whence it appears, that many substances which are not at all accounted poisonous, yet prove as certainly fatal when mixed with the blood as even the poison of rattlesnakes, or the ticusas itself.—An ounce of emetic wine, being injected into the jugular vein of a large dog, produced no effect for a quarter of an hour. At the expiration of that space he became sick, had a continual vomiting, and evacuation of some hard excrements by stool. By these evacuations he seemed to be somewhat relieved; but soon grew uneasy, moved from place to place, and vomited again. After this he laid himself down on the ground pretty quietly; but his rest was disturbed by a return of his vomiting, and his strength greatly decreased. An hour and an half after the operation he appeared half dead, but was greatly revived by having some warm broth poured down his throat with a funnel. This, however, proved only a temporary relief; for in a short time the vomiting returned, he made urine in great quantity, howled miserably, and died in convulsions.—A dram and a half of sal ammoniac dissolved in an ounce and an half of water, and injected into the jugular vein of a dog, killed him with convulsions almost instantly.—The same effect followed from injecting a dram of salt of Tartar dissolved in an ounce of warm water; but a dram and an half of common salt injected into the jugular produced little other bad consequence than a temporary thirst.—A dram of purified white vitriol, injected into the crural vein of a dog, killed him immediately.—Fifteen grains of salt of urine dissolved in an ounce of water, and injected into the crural vein of a dog, threw him into such violent convulsions that he seemed to be dying; nevertheless he recovered from a second dose, though not without a great deal of difficulty: but an ounce of urine made by a man fasting, produced no bad effect. Diluted aqua fortis injected into the jugular and crural vein of a dog killed him immediately by coagulating the blood. Oil of sulphur, (containing some quantity of the volatile vitriolic acid) did not kill a dog, after repeated trials. On the contrary, as soon as he was let go, he ran into all the corners of the room searching for meat; and having found some bones, he fell a gnawing them with strange avidity, as if the acid, by injection into his veins, had given him a better appetite.—Another dog who had oil of tartar injected into his veins, swelled and died, after suffering great torment. His blood was found florid, and not coagulated.—A dram and a half of spirit of salt diluted with water, and injected into the jugular vein of a dog, killed him immediately. In the right ventricle of the heart the blood was found partly grumous and concreted into harder clots than ordinary, and partly frothy. Warm vinegar was injected without doing any manifest harm.—Two drams of fugar dissolved into an ounce of water were injected into the jugular vein of a dog without any hurt.

These are the results of the experiments where saline substances were injected into the veins. Many acids proved equally fatal. A decoction of two drams of white hellebore, injected into the jugular vein of a dog, killed him like a stroke of lightning. Another dog was killed in a moment by an injection of an ounce of

Poison.

rectified spirit of wine in which a dram of camphor was dissolved.—Ten drams of highly rectified spirit of wine, injected into the crural vein of a dog, killed him in a very short time: he died quietly, and licking his jaws with his tongue, as if with pleasure. In the vena cava and right ventricle of the heart the blood was coagulated into a great many little clots.—Three drams of rectified spirit of wine injected into the crural vein of a small dog made him apoplectic, and, as it were, half dead. In a little time he recovered from the apoplexy, and became giddy; and, when he endeavoured to go, reeled and fell down. Though his strength increased by degrees, yet his drunkenness continued. His eyes were red and fiery; and his sight so dull, that he scarce seemed to take notice of any thing; and when he was beat, he would scarce move. However, in four hours he began to recover, and would eat bread when offered him; the next day he was out of danger.—Five ounces of strong white-wine injected into the crural vein of a dog made him very drunk for a few hours, but did not produce any other consequences. An ounce of strong decoction of tobacco injected into a vein, killed a dog in a very short time in terrible convulsions. Ten drops of oil of sage rubbed with half a dram of sugar, and thus dissolved in water, did no harm by being injected into the blood.

Mercury, though seemingly void of all acrimony, proves also fatal when injected into the blood. Soon after the injection of half an ounce of this mineral into the jugular vein of a dog, he was seized with a dry short cough which came by intervals. About two days after, he was troubled with a great difficulty of breathing, and made a noise like that of a broken-winded horse. There was no tumour about the root of the tongue or the parotid glands, nor any appearance of a salivation. In four days he died; having been for two days before so much troubled with an orthopnea, that he could sleep only when he leaned his head against something. When opened, about a pint of bloody serum was found in the thorax, and the outside of the lungs in most places was blistered. Some of the blisters were larger and others smaller than a pea, but most of them contained mercurial globules. Several of them were broken; and upon being pressed a little, the mercury ran out with a mixture of a little sanies; but upon stronger pressure, a considerable quantity of sanies issued out. In the right ventricle of the heart some particles of quicksilver were found in the very middle of the coagulated blood lodged there, and the same thing also was observed in the pulmonary artery. Some blood also was found coagulated in a very strange and unusual manner between the columns of the right ventricle of the heart, and in this a greater quantity of quicksilver than any where else. In the left ventricle was found a very tenacious blood, coagulated, and sticking to the great valve, including the tendons of it, and a little resembling a polypus. No mercury could be found in this ventricle by the most diligent search; whence it appears, that the mercury had passed no farther than the extremities of the pulmonary artery, where it had stuck, and occasioned fatal obstructions. In another dog, which had mercury injected into the jugular, it appears to have passed the pulmonary artery, as part of it was found in the cavity of the abdomen, and part also in some other cavities of

Poison.

the body. All the glandules were very turgid and full of liquor, especially in the ventricles of the brain, and all round there was a great quantity of serum.

In like manner, oil of olives proves certainly fatal when injected into the blood. Half an ounce of this, injected into the crural vein of a dog, produced no effect in half a quarter of an hour: but after that, the animal barked, cried, looked dejected, and fell into a deep apoplexy; so that his limbs were deprived of all sense and motion, and were flexible any way at pleasure. His respiration continued very strong, with a snorting and wheezing, and a thick humour sometimes mixed with blood flowing out of his mouth. He lost all external sense: the eyes, though they continued open, were not sensible of any objects that were put to them; and even the cornea could be touched and rubbed, without his being in the least sensible of it: his eye-lids, however, had a convulsive motion. The hearing was quite lost; and in a short time the feeling became so dull, that his claws and ears could be bored with red hot-pincers without his expressing the least pain. Sometimes he was seized with a convulsive motion of the diaphragm and muscles subservient to respiration; upon which he would bark strongly, as if he had been awake: but this waking was only in appearance; for all the time of this barking, he continued as insensible as ever. In three hours he died; and on opening his body, the bronchiae were filled with a thick froth.—An ounce of oil of olives injected into the jugular of another dog, killed him in a moment; but a third lived an hour after it. He was seized with great sleepiness, snorting, and wheezing, but did not bark like the first. In all of them a great quantity of thick froth was found in the lungs.

We come now to speak of those poisons which prove mortal when taken by the mouth. The principal of these are, arsenic, corrosive mercury, glass of antimony, and lead, which have been already treated of\*. What the effects of these substances are when injected into the blood, cannot be related, as no experiments seem to have been made with them in that way, excepting antimony, whose effects have been already noticed. The effects of opium, when injected into the veins, seem to be similar to its effects when taken by the mouth. Fifty grains of opium, dissolved in an ounce of water, were injected into the crural vein of a cat. Immediately after the operation she seemed much dejected, but did not cry; only made a low, interrupted, and complaining noise. This was succeeded by trembling of the limbs, convulsive motions of the eyes, ears, lips, and almost all parts of the body, with violent convulsions of the breast. Sometimes she would raise up her head, and seem to look about her; but her eyes were very dull, and looked dead. Tho' she was let loose, and had nothing tied about her neck, yet her mouth was so filled with froth, that she was almost strangled. At last, her convulsive motions continuing, and being seized with stretching of her limbs, she died in a quarter of an hour. Upon opening the body, the blood was found not to be much altered from its natural state.—A dram and an half of opium was dissolved in an ounce and an half of water, and then injected into the crural vein of a lusty strong dog. He struggled violently; made a loud noise, though his jaws were tied; had a great difficulty of breathing,

and

and  
Medicine,  
no 373-494-

and palpitation of the heart; with convulsive motions of almost all parts of his body. These symptoms were succeeded by a profound and apoplectic sleep. Having untied him, he lay upon the ground without moving or making any noise, though feverently beaten. About half an hour after he began to recover some sense, and would move a little when beaten. The sleepiness still decreased; so that in an hour and a half he would make a noise and walk a little when beat. However, he died in four days, after having voided a quantity of fetid excrements, in colour resembling the diluted opium he had swallowed.

The oil of tobacco has generally been reckoned a very violent poison when introduced into the blood; but from the Abbe Fontana's experiments, it appears to be far inferior in strength to the poison of *Tiennas*, or to the bite of a viper. A drop of oil of tobacco was put into a small incision in the right thigh of a pigeon, and in two minutes the animal could not stand on its right foot. The same experiment was repeated on another pigeon with exactly the same success. In another case, the oil was applied to a slight wound in the breast; three minutes after which, the animal could not stand on the left foot. This experiment also was repeated a second time, with the same success. A tooth-pick, steeped in oil of tobacco, and introduced into the muscles of the breast, made the animal fall down in a few seconds as if dead. Applied to two others, they threw up several times all the food they had eaten. Two others treated in the same manner, but with empty stomachs, made many efforts to vomit.—In general, the vomiting was found to be a constant effect of this poison: but the loss of motion in the part to which the poison is applied, was found to be only accidental. None of the animals died by the application of the oil of tobacco.

The pernicious effects of laurel water are taken notice of under the article *MEDICINE*, n° 373. The account is confirmed by the late experiments of the Abbe Fontana; who tells us, that it not only kills in a short time when taken by the mouth, but that, when given in small doses, the animal writhes so that the head joins the tail, and the vertebræ arch out in such a manner as to strike with horror every one who sees it. In order to ascertain the effects of this water when taken into the blood, our author opened the skin of the lower belly of a pretty large rabbit, and made a wound in it about an inch long; and having slightly wounded the muscles under it in many parts, applied two or three tea-spoonfuls of laurel water. The animal fell down convulsed in less than three minutes, and died soon after. The experiment was repeated with similar success in other animals; but was always found to act most powerfully, and in the shortest time, when taken by the mouth, or injected by way of clyster. From these experiments, however, he concluded, that laurel-water would kill by being injected into the blood: but in this he was deceived; for two rabbits had each of them a large tea-spoonful injected into the jugular vein, without any inconvenience either at the time of injection or afterwards. It proved innocent also when applied to the bare nerves, and even when introduced into their medullary substance.

We ought now to give some account of the proper antidotes for each kind of poison; but from what has

been related concerning the extreme activity of some of them, it is evident that in many cases there can be but very little hope. People are most apt to be bit by serpents in the legs or hands; and as the poison, from the Abbé Fontana's experiments, appears to act only in consequence of being absorbed into the blood, it is plain that to prevent this absorption is the chief indication of cure. Various methods have been recommended for this purpose under the article *MEDICINE*, n° 394; but the Abbé Fontana proposes a method which is not mentioned there, namely, ligature. This, if properly applied between the wounded part and the heart, must certainly prevent the bad effects of the poison: but then it tends to produce a disease almost equally fatal; namely, a gangrene of the part; and our author gives instances of animals being thus destroyed, after the effects of the poison were prevented; for which reason he prefers amputation. But the good effects of either of these methods, it is evident, must depend greatly on the nature of the part wounded, and the time when the ligature is applied or the amputation performed. If the teeth of the serpent, or the poisoned arrow, happens to strike a large vein, the only possibility of escaping instant death is to compress the trunk of the vein above the wounded place, and to enlarge the wound, that the blood may flow freely and in large quantity, in order to wash away the poison, and discharge the infected parts of the blood itself. If this is neglected, and the person falls into the agonies of death, perhaps strongly stimulating medicines given in large doses, and continued for a length of time, may enable nature to counteract the virulence of the poison. For this purpose volatile alkalies seem most proper, as acting soonest; and perhaps a combination of them with ether might be advantageous, as by the volatility of that medicine the activity of the alkali would probably be increased. In the Philosophical Transactions, we have an account of the recovery of a dog seemingly by means of the volatile alkali when probably he was in a dying condition. This dog indeed seems to have had a remarkable strength of constitution. The poor creature had first got two ounces of the juice of nightshade, which he bore without any inconvenience. An equal quantity of the juice of hemlock was then given him without effect. He then got a large dose of the root of wolsban: with the same success. Two drachms of white hellebore root were next given. These caused violent vomitings and purgings, but still he outlived the operation. He was then made to swallow five roots of the colchicum, or meadow-saffron, dug fresh out of the earth. The effect of these was similar to that of the white hellebore, but still he did not die. Lastly, he got two drachms of opium; and he even outlived this dose. He was first cast into a deep sleep by it; but soon awaked, and was seized with violent vomitings and purgings, which carried off the effect of the opium. Seeing then that the animal had resisted the most violent poisons, it was resolved to try the effects of the bite of a viper; and he was accordingly bit three or four times on the belly a little below the navel by an enraged viper. The immediate consequence of this was an incipient gangrene in the parts adjoining to the wound, as appeared by the rising of little black bladders filled with a sanious matter, and a livid colour which propagated itself all

around. The motion of the heart became very faint and irregular, and the animal lay without strength or sensation, as if he had been seized with a lethargy or apoplexy. In this condition his wound was cupped and scarified, and Venice treacle (a famous antidote) applied to it. In two hours after this all the symptoms were increased, and he seemed to be near death; upon which half a drachm of volatile salt of hartshorn mixed with a little broth was poured down his throat; and the consequence was, that in a short time he was able to stand on his feet and walk. Another dose entirely dispelled his lethargy, and the heart began to recover its strength. However, he continued very weak; and though he eat no solid meat for three days, yet at the end of that time his strength was evidently increased. The first day he drank water plentifully and greedily, and on the second day he drank some broth. On the third day he began to eat solid meat, and seemed out of danger; only some large and foul ulcers remained on that part of the belly which was bit, and before these were healed he was killed by another dog.

From comparing this with some other observations, indeed, it would seem that volatile alkali is the best antidote against all poisons which suddenly kill by a mixture with the blood, and even of some others. Thus, on the testimony of Dr Mead, it counteracts the deadly effects of the laurel water. Here we see that it cured the bite of a viper; and from Dr Wolfe's experiments on hydrophobous patients, it may even claim some merit there. Still, however, there is another method of attempting a cure in such deplorable cases; and that is, by injecting into the veins any thing which will not destroy life, but will destroy the effects of the poison. It is much to be regretted, that in those cruel experiments which we have already related, the intention seems almost always to have been to kill the animal at all events; whereas, it ought to have been to preserve him alive, and to ascertain what medicines could be safely injected into the blood, and what could not, with the effects which followed the injection of different quantities, none of which were sufficient to destroy life. But in the way they were managed, scarce any conclusion can be drawn from them. Thus, when it was found that half an ounce of olive oil, injected into the jugular vein, killed a dog in a short time, to what purpose, except to gratify mere wanton cruelty, was it to inject a whole ounce into the jugular of another dog? Certainly, instead of this quantity, only a few drops ought to have been tried, which might have acted mechanically, or at worst brought on a disorder that would have been curable. A quantity of diluted aquafortis, we are told, coagulated all the blood in the vessels; but this effect might easily have been guessed *a priori*, from its effect on the blood taken out of the body. Ought it not then to have been tried in such small quantity, and so much diluted, that its coagulating power would not have destroyed life? However, even as they stand, the experiments are useful; because they show that some medicinal liquors may be injected into the veins of animals without destroying life; that thus they produce powerful effects, and therefore may remove diseases. They deserve therefore to be well considered, and often repeated, but in a more merciful manner. As to the performance of such operations on the human body, it is by no means to be encouraged,

VOL. IX.

without greater certainty than what can arise from the testimonies mentioned under INJECTION in the APPENDIX. These are equivocal, because the names of the medicines are concealed. Some of the patients, it is owned, sunk under either the disease or the remedy; and if the rest had recovered, it is difficult to account for the ceasing of such a successful mode of practice; as we are very certain that it is not at present followed.—What we have said, therefore, concerning a possibility of curing poisons by this method, is to be looked upon as merely speculative, and thrown out as a hint for further experiments.

Besides all this, there remains another method of cure in desperate cases, when there is a certainty that the whole mass of blood is infected; and that is, by the bold attempt of changing the whole diseased fluid for the blood of a found animal. Experiments of this kind have also been tried; and the method of making them, together with the consequences of such as are recorded in the Philosophical Transactions, are related under the article TRANSFUSION.

*Poison of Copper.* This metal, though when in an undissolved state it produces no sensible effects, becomes exceedingly active when dissolved; and such is the facility with which the solution is effected, that it becomes a matter of some consequence to prevent the metal from being taken into the human body even in its proper form.—It doth not, however, appear that the poison of copper is equally pernicious with those of arsenic or lead; much less with some others treated of in the last article. The reason of this is, that it excites vomiting so speedily as to be expelled, even tho' taken in considerable quantity, before it has time to corrode the stomach. Roman vitriol, which is a solution of copper in the vitriolic acid, has been used as a medicine in some diseases with great success. Verdigrise also, which is another very active preparation of the metal, has been by some physicians prescribed as an emetic, especially in cases where other poisons had been swallowed, in order to procure the most speedy evacuation of them by vomit. Where copper is not used with this view, it has been employed as a tonic and antispasmodic, with which it has been admitted into the last edition of the Edinburgh Dispensatory under the title of *Cuprum Annuniciale*. The effects of the metal, however, when taken in a pretty large quantity, and in a dissolved state, or when the stomach abounds with acid juices sufficient to dissolve it, are very disagreeable and even dangerous; as it occasions violent vomitings, pains in the stomach, faintings, and sometimes convulsions and death. The only cure for these symptoms is to expel the poison by vomiting as soon as possible, and to obtund its acrimony; for which purpose drinking warm milk will probably be found the most efficacious remedy. In order to prevent the entrance of the poison into the body, no copper vessels should be used in preparing food but such as are either well tinned or kept exceedingly clean. The practice of giving a fine blue or green colour to pickles, by preparing them in copper vessels, ought not to be tolerated; for Dr Falconer, in a treatise on this subject, assures us, that these are sometimes so strongly impregnated by this method of preparing them, that a small quantity of them will produce a slight nausea.—Mortars of brass or bell-

Poison  
Poland.

metal ought for the same reason to be avoided, as by this means a considerable quantity of the pernicious metal may be mixed with our food, or with medicines. In other cases, an equal caution ought to be used. The customs of keeping pins in the mouth, of giving copper halfpence to children to play with, &c. ought to be avoided; as thus a quantity of the metal may be insensibly taken into the body, after which its effects must be uncertain.—It is proper to observe, however, that copper is much more easily dissolved when cold than when hot; and therefore the greatest care should be taken never to let any thing designed for food, even common water, remain long in copper vessels when cold: for it is observed, that though the confectioners can safely prepare the most acid syrups in clean copper vessels without their receiving any detriment whilst hot, yet if the same syrups are allowed to remain in the vessels till quite cold, they become impregnated with the pernicious qualities of the metal. See CHEMISTRY, n° 373.

POLACRE, a ship with three masts, usually navigated in the Levant and other parts of the Mediterranean. These vessels are generally furnished with square sails upon the main-mast, and lateen sails upon the fore-mast and mizen-mast. Some of them, however, carry square sails upon all the three masts, particularly those of Provence in France. Each of their masts is commonly formed of one piece, so that they have neither top-mast nor top-gallant-mast; neither have they any *borjes* to their yards, because the men stand upon the top-sail-yard to loose or furl the top-gallant-sail, and on the lower-yard to reef, to loose, or furl, the top-sail, whose yard is lowered sufficiently down for that purpose.

POLAND, a kingdom of Europe, in its largest extent bounded by Pomerania, Brandenburg, Silesia, and Moravia, to the west; and, towards the east, by part of Russia and the Lesser Tartary; on the north, it has the Baltic, Russia, the grand province of Livonia, and Samogitia; and on the south, it is bounded by Bessarabia, Transylvania, Moldavia, and Hungary. Geographers generally divide it into the provinces of Poland Proper, Lithuania, Samogitia, Courland, Prussia, Maffovia, Polachia, Polchia, Little Russia, called likewise *Russia Rubra* or *Red Russia*, Podolia, and the Ukrain. Now, however, it is very considerably reduced in extent, as will appear in the course of its history.

With regard to the history of Poland, we are not to gather the earlier part of it from any accounts transmitted to us by the natives. The early histories of all nations indeed are involved in fable; but the Poles never had even a fabulous history of their own nation. The reason of this is, that it was not the custom with that nation to entertain itinerant poets for the amusement of the great; for to the songs of these poets entertained among other nations we are obliged for the early part of their history; but this assistance being deficient in Poland, we must have recourse to what is recorded concerning it by the historians of other nations.

The sovereigns of Poland at first had the title of *duces*, dukes or generals, as if their office had been

only to lead the armies into the field. The first of these is universally allowed to have been Lechus or Lecht; and to render him more illustrious, he is said to have been a lineal descendant from Japhet the son of Noah. According to some writers, he migrated at the head of a numerous body of the descendants of the ancient Slavi from some of the neighbouring nations; and, to this day, Poland is called by the Tartars, the kingdom of *Lechus*. Buching, however, gives a different account of the origin of the Poles. Sarmatia, he observes, was an extensive country, inhabited by a variety of nations of different names. He supposes the Poles to be the descendants of the ancient Lazi, a people who lived in Colchis near the Pontus Euxinus; whence the Poles are sometimes called *Polazii*. Crossing several rivers they entered Pofnania, and settled on the borders of the Warta, while their neighbours the Zechi settled on the Elbe, in the 550th year of Christ. As to the name of *Poland*, or *Poflka*, as it is called by the natives, it comes from the Slavonic word *Pole*, or *Poln*, which signifies a country adapted to hunting, because the whole country was formerly covered with vast forests, exceedingly proper for that employment.

Of the transactions of Lychus during the time that he enjoyed the sovereignty, we have no certain account. His successor was named *Vificimer*, who is generally supposed to have been the nephew of Lechus. He was a warlike and successful prince, subduing many provinces of Denmark, and building the city of Wismar, so called from the name of the sovereign. But the Danish historians take no notice of his wars with their country; nor do they even mention a prince of this name. However, he is said to have reigned for a long time with great glory; but to have left the people in great distress, on account of the disputes which arose about a successor.

After the death of Vificimer, the nobility were on the point of electing a sovereign, when the people, harassed by the grievous burdens occasioned by the wars of Vificimer, unanimously demanded another form of government, that they might no longer be made sacrifices to ambition and tyranny. At first the nobility pretended to yield to this humour of the people with great reluctance: however, they afterwards determined on such a form of government as threw all the power into their own hands. Twelve palatines, or vaivodes, were chosen; and the Polish dominions divided into as many provinces. These palatines exercised a despotic authority within their several jurisdictions, and aggravated the misery of the people by perpetual wars among themselves; upon which the Poles, worn out with oppression, resolved to return to their old form of government. Many assemblies were held for this purpose; but, by reason of the opposition of the vaivodes, they came to nothing. At last, however, they cast their eyes upon Cracus, or Cracus, whose wealth and popularity had raised him to the highest honours among his countrymen. The Poles say, that he was a native of Poland, and one of the 12 vaivodes; but the Bohemians affirm that he was a native of their country; however, both agree in maintaining, that he was descended from the ancient family of the Gracchi in Rome; who, they say, were banished to this country. He is said to have signa-  
lized

The dukedom restored.

7  
Polish sovereigns at first only titled dukes.

Poland. lized himself against the Franks, whom he overthrew in some desperate engagements, and afterwards built the city of Cracow with their spoils. He did not enlarge his dominions, but made his subjects happy by many excellent regulations. At last, after a long and glorious reign, he expired, or, according to some, was assassinated by a nobleman who aspired to the crown.

Cracus left three children, Cracus, Lechus, and a daughter named *Vanda*. The first succeeded to the dukedom in virtue of his birthright; but was soon after murdered by his brother Lechus. However, it seems the thoughts of the crime which he had committed do not disturb his conscience, that the secret could not be kept: when it was known that he had been the murderer of his late sovereign, he was deposed with all possible marks of ignominy and contempt, and his sister *Vanda* declared duchess. She was a most beautiful and accomplished lady; and soon after she had been raised to the sovereignty, one *Rithogar*, a Teutonic prince, sent an ambassador demanding her in marriage, and threatening war if his proposals were refused. *Vanda* marched in person against him at the head of a numerous army, and the event proved fatal both to *Rithogar* and herself. The troops of *Rithogar* abandoned him without striking a blow, upon which he killed himself in despair; and *Vanda*, having become enamoured of him, was so much concerned for his death, that she drowned herself in the river *Vitula* or *Wesel*. From this unfortunate lady the country of *Vandalia* takes its name.

7  
Again abo-  
lished.

The family of Cracus having become extinct by the death of *Vanda*, the Poles were again left at liberty to choose a new sovereign, or a new form of government. Through a natural levity, they changed the form of government, and restored the *vaivodes* notwithstanding all that they had formerly suffered from them. The consequences were the same as before: the *vaivodes* abused their power; the people were oppressed, and the state was distracted between foreign wars and civil contentions. At that time the Hungarians and Moravians had invaded Poland with a numerous army, and were opposed only by a handful of men almost ready to surrender at discretion. However, one *Premislaus*, a private soldier, contrived a stratagem by which the numerous forces of the enemy were overthrown; and, for his valour, was rewarded with the dukedom. We are ignorant of the other transactions of his reign; but all historians inform us, that he died deeply regretted, and without issue; so that the Poles had once more to choose a sovereign.

8  
Restored a  
second  
time.

On the death of *Premislaus*, several candidates appeared for the throne, and the Poles determined to prefer him who could overcome all his competitors in a horse-race. A stone pillar was erected near the capital, on which were laid all the ensigns of the ducal authority, and an herald proclaimed, that he who first arrived at that pillar from a river at some distance named *Pouderic*, was to enjoy them. A Polish lord named *Lechus* was resolved to secure the victory to himself by a stratagem; for which purpose he caused iron spikes to be driven all over the course, reserving only a path for his own horse. The fraudulent design took effect in part, all the rest of the competitors being dismounted, and some severely hurt by their fall. *Lechus*, in consequence of

Poland. this victory, was about to be proclaimed duke; when, unluckily for him, a peasant who had found out the artifice, opposed the ceremony; and upon an examination of the fact, *Lechus* was torn in pieces, and the ducal authority conferred upon the peasant.

The name of the new monarch was also *Lechus*. He attained the sovereignty in the year 774, and behaved with great wisdom and moderation. Though he possessed the qualities of a great warrior, and extended his dominions on the side of Moravia and Bohemia, yet his chief delight was to make his subjects happy by peace. In the decline of life he was obliged to engage in a war with *Charlemagne*, and is said by some to have fallen in battle with that powerful monarch; tho' others assert that he died a natural death, having lived so long that the springs of life were quite worn out.

*Lechus* III. was succeeded by his son *Lechus* IV. who inherited all his father's virtues. He suppressed an insurrection in the Polish provinces, by which he acquired great reputation; after which he led his army against the Greek and Italian legions who had overrun *Pannonia*. He gained a complete victory over his enemies. Nor was his valour more conspicuous in the battle than his clemency to the vanquished: for he dismissed all his prisoners without ransom; demanding no other conditions than that they should never again disturb the peace of Poland, or the allies of that kingdom. This duke is said to have been endowed with many virtues, and is charged only with the vice of incontinence. He left 20 natural children, and only one legitimate son, named *Popiel*, to whom he left the sovereignty. *Popiel* was also a virtuous and pacific prince, who never had recourse to arms but through necessity. He removed the seat of government from Cracow to *Gnesna*, and was succeeded by his nephew *Popiel* II. a minor.

The young king behaved with propriety as long as he was under the tuition of others; but as soon as he had got the reins of government into his own hands, the face of affairs was altered. *Lechus* III. who, as hath been already mentioned, had 20 illegitimate children, had promoted them to the government of different provinces; and they had discharged the duties of their offices in such a manner as shewed that they were worthy of the confidence reposed in them. However, as soon as *Popiel* came of age, being seduced by the advice of his wife, an artful and ambitious woman, he removed them from their posts, treated them with the utmost contempt, and at last found means to poison them all at once at an entertainment. A dreadful punishment, however, according to the historians of those times, attended his treachery and cruelty. The bodies of the unhappy governors were left unburied; and from them issued a swarm of rats, who pursued *Popiel*, his wife and children, wherever they went, and at last devoured them. The nation became a prey to civil discord, at the same time that it was harassed by a foreign enemy; and, in short, the state seemed to be on the verge of dissolution, when *Platus* was proclaimed duke in 830.

The election of the new duke is said to have been directed by a miracle. He was a man of very low extraction, having been formerly a wheelwright: however, he shewed himself to be in every respect worthy of the high authority to which he was raised, being a

Poland.

2  
Why the  
sovereigns  
of Poland  
are called  
*Piaſtes*.

man of the moſt benevolent and humane diſpoſition; nay, ſo much was he eſteemed by his ſubjects, that all the natives of Poland who have ſince been promoted to the ducal or royal authority, have from him been called *Piaſtes*.

Piaſtus died in 861, and was ſucceeded by his ſon Ziemowit. He was of a more warlike diſpoſition than his father, and was the firſt who introduced a regular diſcipline among the Polish troops. He maintained a reſpectable army, and took great pains to acquire a perfect knowledge in the art of war. The conſequence of this was that he was victorious in all his battles; and retook from the Germans and Hungarians not only all that they had gained, but enlarged his dominions beyond what they had been. After his death, nothing remarkable happened in Poland till the time of Miecziſlaus I. who attained the ducal authority in 964. He was born blind, and continued ſo for ſeven years: after which he recovered his ſight without uſing any medicine; a circumſtance ſo extraordinary, that, in thoſe times of ignorance and ſuperſtition, it was accounted a miracle. In his reign the Chriſtian religion was introduced into Poland. The moſt probable account of the manner in which Chriſtianity was introduced is, that Miecziſlaus having by ambaffadors made his addreſſes to Daborwka daughter to the duke of Bohemia, the lady rejected his offer, unleſs he would ſuffer himſelf to be baptized. To this the duke conſented, and was baptized, after having been inſtructed in the principles of Chriſtianity. He founded the archbiſhoprics of Gneſna and Cracow; and appointed St Adalbert, ſent by the pontiff to propagate Chriſtianity in Poland, primate of the whole kingdom. On the birth of his ſon Boleſlaus, he redoubled his zeal; founding ſeveral biſhoprics and monaſteries; ordering likewiſe, that, when any part of the Goſpel was read, the hearers ſhould half-draw their ſwords, in teſtimony of their readineſs to defend the faith. He was, however, too ſuperſtitious to attend to the duties of a ſovereign; and ſuffered his dominions to be ravaged by his barbarous neighbour the duke of Ruſſia. Yet, with all his devotion, he could not obtain the title of king from the pope, though he had warmly ſolicited it; but it was afterwards conferred on his ſon, who ſucceeded to all his dominions.

Chriſtianity  
introduced  
by Miecziſ-  
laus I.

22  
Boleſlaus  
the firſt  
king of Po-  
land.

Boleſlaus I. the firſt king of Poland, ſurnamed *Chrobry*, ſucceeded to the ſovereignty in 999. He alſo profeſſed and cheriſhed Chriſtianity, but was a man of great valour and prudence. However, the firſt tranſaction of his reign favoured very much of the ridiculous piety of thoſe times. He removed from Prague to Gneſna the remains of a ſaint which he had purchaſed at conſiderable price. The emperor Otho III. made a pilgrimage, on account of a vow, to the tomb of this ſaint. He was hoſpitably received by Boleſlaus, whom, in return, he inveſted with the regal dignity; an act which was confirmed by the pope. This new dignity added nothing to the power of Boleſlaus; though it increaſed his conſequence with his own ſubjects. He now affected more ſtate than before: his body-guards were conſiderably augmented; and he was conſtantly attended by a numerous and ſplendid retinue whenever he ſtirred out of his palace. Thus he inſpired his people with an idea of his great-

Poland.†

neſs, and conſequently of their own importance; which no doubt was neceſſary for the accompliſhment of a deſign he had formed, namely, an offensive war with Ruſſia: but, when he was upon the point of ſetting out on this expedition, he was prevented by the breaking out of a war with the Bohemians. The elevation of Boleſlaus to the regal dignity had excited the envy of the duke of Bohemia, who had ſolicited the ſame honour for himſelf, and had been reſuſed. His jealouſy was further excited by the connection between Boleſlaus and the emperor, the former having married Rixa the emperor's niece. Without any provocation, therefore, or without giving the leaſt intimation of his deſign, the duke of Bohemia entered Poland at the head of a numerous army, committing every where dreadful ravages. Boleſlaus immediately marched againſt him, and the Bohemians retired with precipitation. Scarcity of proviſions, and the inclemency of the ſeaſon, prevented Boleſlaus at that time from purſuing; but as ſoon as theſe obſtacles were removed, he entered Bohemia at the head of a formidable army, with a full reſolution of taking an ample revenge. The Bohemians were altogether unable to reſiſt; neither indeed had they courage to venture a battle, though Boleſlaus did all in his power to force them to it. So great indeed was the cowardice of the duke or his army, that they ſuffered Prague, the capital of the duchy, to be taken after a ſiege of two years; having never, during all that time, ventured to relieve it by fighting the Polish army. The taking of this city was quickly followed by the reduction of all the places of inferior note: but though Boleſlaus was in poſſeſſion of almoſt all the fortified places in Bohemia, he could not believe his conqueſts to be complete, until he became maſter of the duke's perſon. This unfortunate prince had ſtuff himſelf up with his ſon in his only remaining ſtrength of Wiſogrod, where he imagined that he ſhould be able to foil all the attempts of the Polish monarch. In this, however, he found himſelf diſappointed. Boleſlaus inveſted the place, and made his approaches with ſuch rapidity, that the garrifon, dreading a general aſſault, reſolved to capitulate, and perſiſted in their reſolution notwithstanding all the intreaties and promiſes of the duke. The conſequence was, that the unhappy prince fell into the hands of his enemies, and had his eyes put out by Boleſlaus; after which, his ſon Jaremiſ was put into perpetual and cloſe confinement.

32  
He con-  
quers Boh-  
mia.

From Bohemia Boleſlaus marched towards Mora-  
via; but no ſooner did he arrive on the frontier, than the whole province ſubmitted without a blow. He then reſumed his intention of invading Ruſſia; for which he had now a very fair opportunity, by reaſon of a civil war which raged with violence among the children of duke Volodomir. The chief competitors were Jaruiſlaus and Suantepolk. The latter, having been defeated by his brother, was obliged to take refuge in Poland, where he uſed all the arguments in his power with king Boleſlaus in order to induce him to revenge his cauſe. Boleſlaus having already an intention of invading that country, needed but little intreaty; and therefore moved towards Ruſſia at the head of a very numerous army; giving out, that he had no other deſign than to revenge the injuſtice done to Suantepolk. He was met, on the banks of the  
river

33  
And Mora-  
via.

Poland. river Bog, by Jarislaus, at the lead of an army much superior in number to his own; and for some days the Polish army was kept at bay by the Russians. At last Bolcslaus, growing impatient, resolved to pass the river at all events; and therefore forming his cavalry in the best manner for breaking the torrent, he exposed his own person to the utmost of his force. Encouraged by his example, the Poles advanced breath-high in the water to the opposite shore; from whence the enemy gave them all the annoyance in their power. In spite of all opposition, however, the Poles reached the bank, and soon gained a complete victory; Jarislaus being obliged to fly to Kiowia. This city was immediately invested; but Jarislaus retired farther into the country in order to recruit his army, leaving the city to its fate. The garrison made a brave defence, but were at last compelled to surrender at discretion. A vast treasure was found in the place; great part of which was distributed by Bolcslaus among the soldiers.

14 Gains a great victory over the Russians.

15 Places Suantepolk on the throne of Russia.

Though the king of Poland had now become master of the greatest part of Russia, he knew that the only possible means of keeping the country in subjection, was by placing a natural sovereign over the inhabitants. For this reason he reinstated Suantepolk, tho' his pretensions were still disputed by Jarislaus. The latter had formed a flying camp, and meditated a scheme of surprizing and carrying off his rival brother; but having failed in this attempt, he retired to Novogrod, where the attachment of the inhabitants enabled him to make some resistance, till at last he was attacked and defeated by Bolcslaus, which seemed to give the finishing stroke to his affairs. The king of Poland, however, now met with a more dangerous enemy in the perfidious and ungrateful Suantepolk, than he had experienced in Jarislaus. The Russian prince, imagining himself a dependent on Bolcslaus, formed a conspiracy against him; by which he projected nothing less than the destruction of him and his whole army. The massacre was already begun, when Bolcslaus received intelligence. The urgency of the case admitted of no delay: the king therefore mounted his horse; and having with the utmost haste assembled part of his army, fell upon the traitors with such fury, that they were obliged to betake themselves to flight, and Bolcslaus got safe into Poland. But in the mean time Jarislaus having assembled fresh forces, pursued the Polish army; and having come up, with them just as one half had crossed the river Borithenes, attacked them with the utmost fury. Bolcslaus defended himself with the greatest resolution; but by reason of his forces being divided, victory was dubious for a long time. At last, when the army had wholly crossed, the Russians were entirely put to the rout, and a terrible carnage ensued. The victory, however, though complete, was not decisive: for which reason Bolcslaus thought proper to continue his retreat, without attempting to conquer a country too extensive for him ever to keep in subjection. Still, however, his martial inclination continued, and he led his army into Saxony. The inhabitants of this country had hitherto resisted all attempts that had been made on their freedom, and still made a violent struggle for liberty; though, in spite of their utmost efforts, they were obliged at last to

16 Who attempts to cut him off with his whole army but is defeated.

17 A dreadful battle between the Russians and Poles.

submit to the yoke. On his withdrawing the troops from Saxony, however, the king thought proper to leave the people to their liberty, contenting himself with a rich booty. The boundaries of his empire he now fixed at the river Elbe; where he erected two iron columns, in order to transmit the memory of his conquest to posterity.

18 Saxony conquered by Bolcslaus.

19 Gains another great victory over the Russians, on which the whole country submits.

21 Bolcslaus dies.

22 Rixa, a tyrannical regent drives out with her son Casimir.

23 Poland distressed by foreign and domestic wars.

Bolcslaus, still unfast with victory, now meditated the conquest of Prussia and Pomerania; the latter of which provinces had, in the former civil wars, been dismembered from Poland. His arms were attended with equal success against both: indeed the very terror of his name seemed to answer all the purposes of a formidable army. These, however, he seems to have designed to be the last of his warlike enterprises; for he now applied himself wholly to the enacting of wholesome laws for the benefit of his people. But in the midst of this tranquillity, Jarislaus assembled the most numerous army that had ever been heard of in Russia, with which he appeared on the frontiers of Poland. Bolcslaus, though now advanced in years, marched out against his adversaries, and met them on the banks of the Borithenes, rendered famous by the victory he had lately gained there. The Poles crossed the river by swimming; and attacked the enemy before they had time to draw up in order of battle, with such impetuosity, that a total rout soon ensued. The Russians were seized with a panic, and Jarislaus was hurried away, and almost trampled to death by the fugitives. Many thousand prisoners were taken, but Bolcslaus released them upon very easy conditions; contenting himself with an inconsiderable tribute, and endeavouring to engage the affection of the people by his kindness. This well-timed clemency produced such a happy effect, that the Russians voluntarily submitted to his jurisdiction, and again became his subjects. Soon after this he died in the year 1025, after having vastly extended his dominions, and rendered his subjects happy.

Poland. submit to the yoke. On his withdrawing the troops from Saxony, however, the king thought proper to leave the people to their liberty, contenting himself with a rich booty. 23 Poland distressed by foreign and domestic wars.

By Bolcslaus was succeeded by his son Miecslaus II. but he possessed none of the great qualities of his father; being indolent and debauched in his behaviour. In the very beginning of his reign, the Russians, Bohemians, and Moravians, revolted. However, as the spirit and discipline introduced by Bolcslaus still remained in the Polish army, Miecslaus found no great difficulty in reducing them again to obedience: after which, devoting himself entirely to voluptuousness, he was seized with a frenzy, which put an end to his life in the year 1034. The bad qualities of this prince proved very detrimental to the interest of his son Casimir; though the latter had received an excellent education, and was possessed of many virtues. Instead of electing him king, they chose Rixa his mother queen-regent. She proved tyrannical, and so partial to her countrymen the Germans, that a rebellion ensued, and she was forced to fly to Germany; where she obtained the protection of the emperor by means of the immense treasures of Bolcslaus, which she had caused to be transported thither before her. Her bad behaviour and expulsion proved still more fatal to the affairs of Casimir than even that of his father. He was immediately driven out of the kingdom; and a civil war taking place, a great many of pretenders to the crown appeared at once. To the miseries occasioned

Poland.

by this were added those of a foreign war; for the Bohemians and Russians invaded the kingdom in different places, committing the most dreadful ravages. The consequence of these accumulated distresses was, that the nobility came at last to the resolution of recalling Casimir, and electing him sovereign. However, before they took this measure, it was thought proper to send to Rome, to complain of the behaviour of the duke of Bohemia. The deputies were at first received favourably: but the influence of the duke's gold prevailing, no redress was obtained; so that at last it was resolved, without more ado, to send for Casimir.

<sup>24</sup> Casimir recalled and elected king.

The only difficulty was where to find the fugitive prince; for he had been gone five years from the kingdom, and nobody knew the place of his retreat. At last, by sending an embassy to his mother, it was found out that he had retired into France, where he applied closely to study at the university of Paris. Afterwards he went to Italy; where, for the sake of subsistence, he took upon him the monastic habit. At that time he had returned to France, and obtained some preferment in the abbey of Clugni. Nothing now obstructed the prince's return but the sacred function with which he was invested. However, a dispensation was obtained from the Pope, by which he was released from his ecclesiastical engagements, on condition that he and all the kingdom should become subject to the capitation tax called *Peter-pence*. Some other conditions of less consequence were added; such as, that the Poles should shave their heads and beards, and wear a white linen robe at festivals, like other professors of the Catholic religion. Great preparations were made for the reception of the young prince: and he was met on the frontier by the nobility, clergy, and forces of the nation; by whom he was conducted to Gnesna, and crowned by the primate with more than usual solemnity. He proved a virtuous and pacific prince, as indeed the distracted situation of the kingdom would not admit of the carrying on of wars. However, Casimir proved his courage in subduing the banditti by which the country was over-run; and by marrying the princess Mary, sister to the Duke of Russia, all quarrels with that nation were for the present extinguished. Upon the whole, the kingdom flourished during his reign; and became more respectable from the wisdom and stability of the administration, than it could have been by many victories. After a happy reign of 16 years he died, beloved and regretted by all his subjects.

<sup>25</sup> Poland subjected to the tax called Peter-pence.

By the happy administration of Casimir, the kingdom recovered sufficient strength to carry on successful wars against its foreign enemies. Boleslaus II. the son of Casimir, an enterprising and valiant prince, succeeded to the throne; and soon made himself so famous, that three unfortunate princes all took refuge at his court at once, having been expelled from their own dominions by their rebellious subjects. These were, Jacomir, son of Briteslaus duke of Bohemia; Bela, brother to the king of Hungary; and Zaslava duke of Kiovia, eldest son to Jarislaus duke of Russia, and cousin to the king of Poland. Boleslaus determined to redress all their grievances; but while he deliberated upon the most proper means for so doing, the duke of Bohemia, dreading the consequence of Jaco-

<sup>26</sup> Boleslaus II. a valiant and successful prince.

<sup>27</sup> Enterprizes three unfortunate princes.

mir's escape, assembled an army, and, without any declaration of war, marched through the Hercynian forest, desolated Silesia, and laid waste the frontiers of Poland with fire and sword. Boleslaus marched against him with a force greatly inferior; and, by mere dint of superior capacity, cooped up his adversary in a wood, where he reduced him to the greatest distress. In this extremity the duke sent proposals for accommodation; but they were rejected with disdain by Boleslaus: upon which the former, ordering fires to be kindled in his camp, as if he designed to continue there, removed with the utmost silence in the night-time; and marching through narrow defiles, was advanced several leagues before Boleslaus received advice of his retreat. The king pursued him, but in vain; for which reason he returned, after having ravaged the frontiers of Moravia. The next year he entered Bohemia with a numerous army; but the duke, being unwilling to encounter such a formidable adversary, submitted to such terms as Boleslaus thought proper to impose. In these the king of Poland stipulated for certain conditions in favour of Jacomir, which he took care to see punctually executed; after which he determined to march towards Hungary, to assist the fugitive prince Bela.

Poland.  
<sup>28</sup> Affords succour to Jacomir prince of Bohemia.

This prince had been for some time solicited by a party of dissipated nobility to return, as his brother, the reigning king, had alienated the hearts of his subjects by his tyrannical behaviour: as soon therefore as Boleslaus had finished the war in Bohemia, he was solicited by Bela to embrace so favourable an opportunity, and put him in possession of the kingdom of Hungary. This the king readily complied with, as being agreeable to his own inclinations; and both princes entered Hungary by different routes, each at the head of a numerous body. The king of that country, however, was not disconcerted by such a formidable invasion; and being largely assisted by the emperor, advanced against his antagonists with a vast army; among whom was a numerous body of Bohemians, who had come to his assistance, though in direct violation of the treaty subsisting between the duke and the king of Poland. At last a decisive battle was fought, in which the Germans behaved with the greatest valour, but were entirely defeated through the treachery of the Hungarians, who in the heat of the battle deserted and went over to Bela. Almost all the foreign auxiliaries were killed on the spot; the king himself was seized, and treated with such insolence by his perfidious subjects, that he died in a short time of a broken heart; so that Bela was placed on the throne without further opposition, except from a revolt of the peasants, which was soon quelled by the Polish army.

<sup>29</sup> And to Bela prince of Hungary.

Boleslaus, having succeeded so happily in these two enterprizes, began to look upon himself as invincible; and, instead of designing only to assist Zaslava, as he had first intended, now projected no less than the subjection of the whole country. He had indeed a claim to the sovereignty by virtue of his descent from Mary, queen of Poland, sister to Jarislaus; and this he endeavoured to strengthen by marrying a Russian princess himself. Having therefore assembled a very numerous and well-disciplined army, he entered the duchy of Kiovia, where he was opposed by Wislisslaus, who

<sup>30</sup> He projects the conquest of Russia.

had

Poland. had usurped the sovereignty, with a vast multitude of forces. Boleslaus, however, continued to advance; and the Russian prince being intimidated by the number and good order of his enemies, deserted his own troops; and fled away privately with a slender retinue; upon which, his force dispersed themselves for want of a leader. The inhabitants of the city of Kiowia now called to their assistance Suantoffaus and Wizevold two brothers of Wisselaus; but these princes acting the part of mediators, procured pardon for the inhabitants from Zaslaua their natural sovereign. With the same facility the two princes recovered all the other dominions belonging to Zaslaua; only one city venturing to stand a siege, and that was soon reduced. But in the mean time the king of Hungary dying, a revolt ensued, and the two sons of Bela were on the point of being deprived of their paternal dominions. This Boleslaus no sooner heard, than he marched directly into Hungary; where by the bare terror of his name, he re-established tranquillity, and confirmed the princes in the enjoyment of their kingdom. In the time that this was doing, Zaslaua was again driven from his territories, all the conquests that had been formerly made were lost, and Suantoffaus and Wizevold more powerful than ever. The king's vigour, however, soon discontinued all their measures. He ravaged all those territories which composed the palatinates of Lufac and Chelm, reduced the strong city of Wolya, and transported the booty to Poland. The campaign was finished by a battle with Wizevold; which proved so bloody, that though Boleslaus was victorious, his army was weakened in such a manner that he could not pursue his conquests. In the winter he made numerous levies; and returning in the spring to Kiowia, reduced it, after several desperate attacks, by famine. On this occasion, instead of treating the inhabitants with cruelty, he commended their valour, and strictly prohibited his troops from pillaging or insulting them; distributing provisions among them with the utmost liberality.

This clemency procured the highest honour to the king of Poland, but his stay here produced a most terrible disaster. Kiowia was the most dissolute, as well as the richest city, in the north; the king, and all his soldiers gave themselves up to the pleasures of the place. Boleslaus himself affected all the imperious state of an eastern monarch, and contracted an inclination for the grossest debaucheries. The consequence had almost proved fatal to Poland. The Hungarian and Russian wars had continued for seven years, during all which time the king had never been at home excepting once for the short space of three months. In the mean time the Polish women, exasperated at hearing that their husbands had neglected them and connected themselves with the women of Kiowia, raised their slaves to the beds of their masters; and in short the whole sex conspired in one general scheme of prostitution, in order to be revenged of the infidelity of their husbands, excepting one single woman, namely, *Margaret*, the wife of count Nicholas of Dembohin, who preserved her fidelity in spite of all sollicitation. Advice of this strange revolution was soon received at Kiowia, where it excited terrible commotions. The soldiers blamed the king for his dishonour; forgetting how much they had to accuse their own conduct

in giving their wives such extreme provocation. The effect of these discontents was a general desertion, and Boleslaus saw himself suddenly left almost alone in the heart of Russia; the soldiers having unanimously resolved to return home to take vengeance of their wives and their gallants.

A dreadful kind of war now ensued. The women knew that they were to expect no mercy from their civil war enraged husbands, and therefore persuaded their lovers to take arms in their defence. They themselves fought by the side of their gallants with the utmost fury, and fought out their husbands in the heat of battle, in order to secure themselves from all danger of punishment by their death. They were, however, on the point of being subdued, when Boleslaus arrived with the few remaining Poles, but assisted by a vast army of Russians, with whom he intended to take equal vengeance on the women, their gallants, and his own soldiers who had deserted him. This produced a carnage more dreadful than ever. The soldiers united with their former wives and their gallants against the common enemy, and fought against Boleslaus and his Russians with the fury of lions. At last, however, the fortune of the king prevailed; the rebels were totally subdued, and the few who escaped the sword were tortured to death, or died in prison.

To add to the calamities of this unhappy kingdom, the schisms which for some time had prevailed in the church of Rome found their way into Poland also; and the animosity of parties became aggravated in proportion to the frivolousness of their differences. By perverse accident the matter came at last to be a contention for wealth and power between the king and clergy. This soon gave occasion to bloodshed; and the bishop of Cracow was massacred in the cathedral, while he was performing the duties of his office. This and some other enormous crimes in a short time brought on the most signal vengeance of the clergy, and Gregory VII. the pope at that time, thundered out the most dreadful anathemas against the king, released his subjects from their allegiance, deprived him of the titles of sovereignty, and laid the kingdom under a general interdict, which the archbishop of Gnesna saw punctually enforced. To this terrible sentence Boleslaus in vain opposed his authority, and recalled the spirit which had formerly rendered him so formidable to the neighbouring states. The minds of the people were blinded by superstition, so that they deemed it a less heinous crime to rise in rebellion against their sovereign than to oppose the tyranny of the holy see. Conspiracies were daily formed against the person and government of Boleslaus. The whole kingdom became a scene of confusion, so that the king could no longer continue with safety in his own dominions. He fled therefore with his son Mieczslaus, and took refuge in Hungary; but here also the holy vengeance of the clergy pursued him, nor did they cease persecuting him till he was brought to a miserable end. Authors differ widely with respect to the manner of his death. Some say that he was murdered by the clergy as he was hunting; others, that he killed himself in a fit of despair; and one author tells us, that he wandered about in the woods of Hungary, lived like a savage upon wild beasts, and was at last killed and devoured by dogs. The greatest number

however, tell us, that being driven from place to place by the persecutions of the clergy, he was at last obliged to become a cook in a monastery at Carinthia, in which mean occupation he ended his days.

38  
The interdiction removed at the expense of grievous impositions.

The destruction of Boleslaus was not sufficient to allay the papal resentment. It extended to the whole kingdom of Poland. Mieczslaus, the son of Boleslaus, was not suffered to ascend the throne; and the kingdom continued under the most severe interdiction, which could be removed only by the force of gold, and the most abject concessions. Besides the tax called *Peterpence*, new impositions were added of the most oppressive nature; till at length the pontiff, having fatiated his avarice, and impoverished the country, consented that the brother of the deceased monarch should be raised to the sovereignty, but only with the title of duke. This prince, named *Uladiслаus*, being of a meek disposition, with little ambition, thought it his duty to acquiesce implicitly in the will of the pope; and therefore accepted the terms offered, sending at the same time an embassy to Rome, earnestly intreating the removal of the interdiction. The request was granted; but all his endeavours to recover the regal dignity proved fruitless, the pope having, in conjunction with the emperor of Germany, conferred that honour on the duke of Bohemia. This was extremely mortifying to Uladiслаus, but it was absorbed in considerations of the utmost consequence to himself and his dominions. Russia took the opportunity of the late civil disturbances to throw off the yoke; and this revolt drew after it the revolt of Prussia, Pomerania, and other provinces. The smaller provinces, however, were soon reduced; but the duke had no sooner returned to Poland, than they again rebelled, and hid their families in impenetrable forests. Uladiслаus marched against them with a considerable army; but was entirely defeated, and obliged to return back with disgrace. Next year, however, he had better fortune; and, having led against them a more numerous army than before, they were content to submit and deliver up the ringleaders of the revolt to be punished as the duke thought proper.

39  
Uladiслаus becomes sovereign, but is allowed only the title of duke.

No sooner were the Pomeranians reduced, than civil dissensions took place. Sbgneus, the son of Uladiслаus by a concubine, was placed at the head of an army by the discontented nobility, in order to subvert his father's government, and dispute the title of Boleslaus, the legitimate son of Uladiслаus, to the succession. The war was terminated by the defeat and captivity of Sbgneus; who was at first confined, but afterwards released on condition that he should join his father in punishing the palatine of Cracow. But before this could be done, the palatine found means to effect a reconciliation with the duke; with which the young princes being displeas'd, a war took place between them and their father. The end of all was, that the palatine of Cracow was banished, and the princes submitted; after which, Uladiслаus, having chastised the Prussians and Pomeranians who had again revolted, died in the year 1103, the 59th of his age.

40  
Boleslaus III divided his dominions betwixt Sbgneus his illegitimate brother and his share, raised cabals against his brother; but a civil war was for some time prevented by the good offices of

Uladiслаus was succeeded by his son Boleslaus III. who divided the dominions equally betwixt his brother Sbgneus and himself. The former being dissatisfied with his share, raised cabals against his brother; but a civil war was for some time prevented by the good offices of

the primate: but at last Sbgneus, having privately stirred up the Bohemians, Saxons, and Moravians, against his brother, made such formidable preparations as threatened the conquest of all Poland. Boleslaus, being unprovided with forces to oppose such a formidable power, had recourse to the Russians and Hungarians; who readily embraced his cause, in expectation of turning it to their own advantage. The event was, that Sbgneus was entirely defeated; and might easily have been obliged to surrender himself at discretion, had Boleslaus generously left him in quiet possession of the duchy of Mazovia, in order to maintain himself suitably to the dignity of his birth. This kindness the ungrateful Sbgneus repaid by entering into another conspiracy; but the plot being discovered, he was seized, banished, and declared a traitor if ever he set foot again in Poland. Even this severity did not produce the desired effect: Sbgneus persuaded the Pomeranians to arm in his behalf; but he was defeated, taken prisoner, and again banished. Almost all the nobility solicited the king to put such an ungrateful traitor to death; however, that generous prince could not think of polluting his hands with the death of his brother, notwithstanding all he had yet done. Nay, he even took him back to Poland, and appointed him a maintenance suitable to his rank: but he soon had reason to repent his kindness; for his unnatural brother in a short time began to raise fresh disturbances, in consequence of which he soon met with the death which he deserved.

Poland.  
41  
A civil war.

42  
Generosity of Boleslaus and ingratitude of Sbgneus.

Boleslaus was scarce freed from the intrigues of his brother, when he found himself in greater danger than ever from the ambition of the emperor Henry IV. The emperor had attacked the king of Hungary, with whom Boleslaus was in close alliance, and from whom he had received assistance when in great distress himself. The king of Poland determined to assist his friend; and therefore made a powerful diversion in Bohemia, where he repeatedly defeated the Imperialists: upon which, the emperor collecting all his forces, ravaged Silesia, and even entered Poland, where he laid siege to the strong town of Lubusz; but was at last obliged to abandon the enterprise, after having sustained much loss. However, Henry was not discouraged, but penetrated still farther into Poland, and was laying waste all before him, when the superior skill of Boleslaus compelled him to retire, after having almost destroyed his army with fatigue and famine, without once coming to action. Enraged at this disappointment, Henry laid siege to Glogow, in hopes of drawing the Poles to an engagement before he should be obliged to evacuate the country. The fortifications of the place were weak; but the spirit of the inhabitants supplied their deficiencies, and they gave the Imperialists a most unexpected and vigorous reception. At last, however, they were on the point of surrendering to superior force; and actually agreed to give up the place, provided they did not receive any succours during that time. Boleslaus determined, however, not to let such a brave garrison fall a sacrifice to their loyalty; and therefore prevailed on the besieged to break the capitulation rather than surrender when they were on the point of being delivered. All this was transacted with the utmost secrecy; so that the emperor advanced, without thoughts of meeting with any resistance, to take possession

43  
Who is at last put to death.

44  
War with the emperor Henry IV.

Poland.

session of the city; but, being received by a furious discharge of arrows and javelins, he was incensed, that he resolved to storm the place, and give no quarter. On the approach of the army, the Imperialists were astonished to see not only the breaches filled up, but new walls, secured by a wet ditch, reared behind the old, and erected during the suspension of hostilities by the industry of the besieged. The attack, however, went on; but the inhabitants, animated by despair, defended themselves with incredible valour, and at last obliged the Imperialists to break up the siege with precipitation. Next day Boleflaus arrived, and pursued the emperor with such vigour, that he obliged him to fly with disgrace into his own country. This soon brought on a peace, which was confirmed by a marriage between Boleflaus and the emperor's sister.

45

46  
Boleflaus  
brought in-  
to difficul-  
ties by his  
own credu-  
lity and ge-  
nerosity.

Hitherto the glory of Boleflaus had equalled, or even eclipsed, that of his namesake and predecessor Boleflaus the Great; but about the year 1135 he was brought into difficulties and disgraces by his own credulity. He was imposed upon by a wretched story patched up by a certain Hungarian; who insinuated himself so far into his affections, that he gave him the government of Wislica, a strong town on the river Nida. But the traitor gave up the place to the Russians, who pillaged and burnt it; carrying the inhabitants at the same time into slavery. Boleflaus was incensed, and entered immediately upon a war with Russia, by which means he only heaped one calamity upon another. He received a deputation from the inhabitants of Halitz, to implore his assistance in favour of a young prince, who had been banished into Poland. Boleflaus marched to their relief with a choice body of troops; but as he was preparing to enter the town, he was attacked by the whole Russian army, and, after a most violent conflict, entirely defeated. By this disgrace the duke was so much afflicted, that he died in a short time, after having reigned 36 years.

47  
Poland di-  
vided a-  
mong the  
children of  
Boleflaus.

Boleflaus, by his will, left his dominions equally divided among his four sons. Uladislaus, the eldest, had the provinces of Cracow, Sirad, Lencici, Silesia, and Pomerania. Boleflaus, the second son, had for his share the palatinates of Culm and Cujava, with the duchy of Mazovia. The palatinates of Kalesch and Posenia, fell to Mieczslaus, the third son; and to Henry, the fourth son, were assigned those of Lublin and Sandomir. Casimir the youngest child, then an infant in the cradle, was entirely forgot, and no provision made for him. There have been but very few instances where dominions were thus divided, that the princes remained satisfied with their respective shares; neither did the sons of Boleflaus long continue at peace with one another. By the will of the late duke, all the brothers were obliged to own the supremacy of Uladislaus, who was declared duke of all Poland: they were refrained from forming alliances, declaring war, or concluding peace, without his approbation: they were obliged to take the field with certain number of troops, whenever the duke required it; and they were forbid to meddle with the guardianship of the infant prince Casimir, his education being left entirely to the sovereign. The harmony of the princes was first disturbed by the ambition of Christina, the wife of Uladislaus, who formed a scheme to get possession of all Poland, and deprive the younger children of the benefit of their father's

48  
A civil war.

VOL. IX.

2

will. Having obtained her husband's concurrence, she assembled the States of Poland, and made a long speech, showing the dangers which might arise from a partition of the ducal dominions among so many; and concluded with attempting to show the necessity of revoking the ratification of the late duke's will in order to ensure the obedience of the princes and the tranquillity of the republic. Many of the nobility expressed their resentment against this speech, and fully refuted every article in it; but they were all afterwards gained over, or intimidated by Uladislaus; so that none appeared to take the part of the young princes except a noble Dane, who lost his life for so doing.

Poland.

Uladislaus now having got the nobility on his side, first drove Boleflaus out of his territories; next, he marched against Henry, and dispossessed him also, forcing both to take refuge with Mieczslaus in Posenia, where all the three brothers were besieged. Several of the nobility interposed, and used all their influence to effect a reconciliation; but in vain; for Uladislaus was as inexorable as if he had received an injury, and therefore insisted that the besieged princes should surrender at discretion, and submit to the will of the conqueror. Thus, driven to despair, the brothers sallied out, and attacked the duke's army with such impetuosity, that they obtained a complete victory, and took all his baggage and valuable effects. The brothers improved their victory, and laid siege to Cracow. The Russians, who had assisted Uladislaus at first, now entirely abandoned him, and evacuated Poland, which obliged him to shut himself up in Cracow; but, finding the inhabitants little disposed to stand a siege, he retired into Germany in order to solicit assistance from his wife's friends. But here he found himself mistaken, and that these friends were attached to him only in his prosperity; while in the mean time the city of Cracow surrendered, the unfortunate Uladislaus was formally deposed, and his brother Boleflaus raised to the supreme authority.

49  
Uladislaus  
drives out  
all the rest.

50  
And is de-  
posed.

The new duke began his administration with an act of generosity to his brother, Uladislaus, to whom he gave the duchy of Silesia, which thus was separated from Poland, and has never since been re-annexed to it. This had no other effect upon Uladislaus than the putting him in a condition to raise fresh disturbances; for he now found means to persuade the emperor Conrad to invade Poland: but Boleflaus so harassed and fatigued his army by perpetual marches, ambuscades, and skirmishes, that he was obliged in a short time to return to his own country; and for some years Poland enjoyed a profound tranquillity.

During this interval Henry entered on a crusade; and, though he lost almost all his army in that enthusiastic undertaking, is celebrated by the superstitious writers of that age, as the bulwark of the church, and one of the greatest Christian heroes: however, in all probability, the reason of this extraordinary fame is, that he made large donations to the knights of St John of Jerusalem. Soon after the return of Henry, Poland was invaded by the emperor Frederic Barbarossa, who was persuaded to this by the solicitations of Uladislaus and his wife Christina. The number of the Imperialists was so great, that Boleflaus and his brothers did not think proper to oppose him in the field; they contented themselves with cutting off the convoys, placing ambuscades, harassing them on their march, and

keeping them in perpetual alarms by false attacks and skirmishes. With this view the three brothers divided their forces, desolated the country before the enemy, and burnt all the towns and cities which were in no condition to stand a siege. Thus the emperor, advancing into the heart of a desolated country where he could not submit, was at last reduced to such a situation that he could neither go forward nor retreat, and was obliged to solicit a conference with Boleslaus. The latter was too proud to irritate him by an unseasonable haughtiness, and therefore went to the German camp attended only by his brothers and a slight guard. This instance of confidence was so agreeable to the emperor, that a treaty was soon agreed upon, which was confirmed by a marriage between Adelaide, niece to the emperor, and Mieczslaus duke of Pofnania.

Boleslaus having thus happily escaped from so great a danger, took it into his head to attempt the conquest of Prussia, for no other reason but because the inhabitants were heathens. Having unexpectedly invaded the country with a very numerous army, he succeeded in his enterprise; great numbers of infidels were converted, and many churches set up: but no sooner was Boleslaus gone, than the inhabitants returned to their old religion. Upon this Boleslaus again came against them with a formidable power; but, being betrayed by some Prussians whom he had taken into his service and raised to posts of honour, his army was led into desiles and almost entirely cut off, duke Henry was killed, and Boleslaus and Mieczslaus escaped with great difficulty.

53  
A civil war.

This misfortune was quickly followed by another; for now the children of Uladiflaus laid claim to all the Polish dominions which had been possessed by their father, most of which had been bestowed upon young Casimir. They were supported in their pretensions by a great number of discontented Poles, and a considerable body of German auxiliaries. Boleslaus, finding himself unable to withstand his enemies by force, had recourse to negotiation, by which means he gained time to recruit his army and repair his losses. An assembly of the states was held, before which the duke so fully refuted the claims of the children of Uladiflaus, that it was almost unanimously voted that they had kindled an unjust war; and to take away every pretence for renewing the civil discords of Poland, they were a second time invested with the duchy of Silesia, which for the present put an end to all disputes. After this, Boleslaus applied himself to promote, by all means, the happiness of his subjects, till his death, which happened in the year 1174.

On the death of Boleslaus, the states raised his brother Mieczslaus to the ducal throne, on account of the great opinion they had of him. But the moment that Mieczslaus ceased to be a subject, he became a tyrant, and a slave to almost every kind of vice; the consequence of which was, that in a very short time he was deposed, and his brother Casimir elected in his stead.

54  
Casimir, an  
excellent  
prince.

Casimir was a prince of the greatest justice and benevolence, inasmuch that he scrupled to accept of the honour which the states had conferred upon him, lest it should be a trespass against the laws of equity. However, this scruple being soon got over, he set himself about the securing peace and tranquillity in all

parts of his dominions. He redressed all grievances, suppressed exorbitant imposts, and assembled a general diet, in which it was proposed to rescue the peasants from the tyranny of the nobility; an affair of such consequence, that the duke could not enter upon it by his own authority, even though supported by the clergy. Yet it proved less difficult than had been imagined, to persuade the nobility to relinquish certain privileges extremely detrimental to natural right. They were influenced by the example of their virtuous sovereign, and immediately granted all that he required; and, to secure this declaration in favour of the peasants, the archbishop of Gnesna thundered out anathemas against those who should endeavour to regain the unjust privileges which they had now renounced; and to give a still greater weight to this decision, the acts of the diet were transmitted to Rome, where they were confirmed by the pope.

But, though the nobility in general consented to have their power somewhat retrenched, it proved matter of discontent to some, who, for this reason, immediately became the partisans of the deposed Mieczslaus. This unfortunate prince was now reduced to such indigence, that he wrote an account of his situation to his brother Casimir; which so much affected him, that in an assembly of the diet he proposed to resign the sovereignty in favour of his brother. To this the states replied in the most peremptory manner: they desired him never more to mention the subject to them, lest they should be under the necessity of deposing him and excluding his brother, who, they were determined, should never more have the dominion of Poland. Casimir, however, was so much concerned at the account of his brother's misfortunes, that he tried every method to relieve him, and even connived at the arts practised by some discontented noblemen to restore him. By a very singular generosity, he facilitated the reduction of Gnesna and Lower Poland, where Mieczslaus might have lived in peace and splendor, had not his heart been so corrupted that it could not be subdued by kindness. The consequence was, that he used all his art to wrest from his brother the whole of his dominions, and actually conquered the provinces of Mazovia and Cujava; but of these he was soon dispossessed, and only some places in Lower Poland were left him. After this he made another attempt, on occasion of a report that Casimir had been poisoned in an expedition into Russia. He surprised the city of Cracow; but the citadel refused to surrender, and his hopes were entirely blated by the return of Casimir himself; who, with an unparalleled generosity and magnanimity, asked peace of his brother whom he had vanquished and had in a manner at his mercy.—The last action of this amiable prince was the conquest of Russia, which he effected rather by the reputation of his wisdom and generosity than by the force of his arms. Those barbarians voluntarily submitted to a prince so famed for his benevolence, justice, and humanity. Soon after his return he died at Cracow, lamented as the best prince in every respect who had ever filled the throne of Poland.

55  
Conquers  
Russia.

Casimir left one son, named *Lechus*, an infant; and the states, dreading the consequences of a long minority, hesitated at appointing him sovereign, considering how many competitors he must necessarily have,

and

Poland.

56  
Civil war  
between  
Lechus and  
the deposed  
Miecziſlaus.

and how dubious it muſt be whether he might be fit for the ſovereignty after he had obtained it. At laſt, however, Lechus was nominated, chiefly through the intereſt he had obtained on account of the reputation of his father's virtues. The conſequence of his nomination was precifely what might have been expected. Miecziſlaus formed an alliance againſt him with the dukes of Oppelen, Pomerania, and Breſlau; and having raiſed all the men in Lower Poland fit to bear arms, took the road to Cracow with a very numerous army. A bloody battle was fought on the banks of the river Mozgarva; in which both ſides were ſo much weakened, that they were unable to keep the field, and conſequently were forced to retire for ſome time in order to repair their forces. Miecziſlaus was firſt ready for action, and therefore had the advantage; however, he thought proper to employ artifice rather than open force; and therefore having attempted in vain to corrupt the guardians of Lechus, he entered into a treaty with the ducheſs dowager his mother. To her he repreſented in the ſtrongeſt manner the miſeries which would enſue from her refusal of the conditions he propoſed. He ſtipulated to adopt Lechus and Conrade, her ſons, for his own; to ſurrender the province of Cujavia for their preſent ſupport; and to declare them heirs to all his dominions. The principal nobility oppoſed this accommodation, but it was accepted by the ducheſs in ſpite of all their remonſtrances; and Miecziſlaus was once more put in poſſeſſion of the capital, after having taken a ſolemn oath to execute punctually every article of the treaty.

57  
Miecziſlaus  
reſtored.

It is not to be ſuppoſed, that a prince of ſuch a perfidious diſpoſition as Miecziſlaus would pay much regard to the obligations of a ſimple contract. It was a maxim with him, that a ſovereign is no longer obliged to keep his oath than while it is neither ſafe nor beneficial to break it. Having therefore got all the power into his hands, he behaved in the very ſame manner as if no treaty with the ducheſs had ſubſiſted. The ducheſs, perceiving herſelf duped, formed a ſtrong party, and excited a general inſurrection. The rebellion could not be withſtood: Miecziſlaus was driven out of Cracow, and on the point of being reduced to his former circumſtances, when he found means to produce a variance between the ducheſs and palatine of Cracow; and thus once more turned the ſcale in his favour. The forces of Miecziſlaus now became ſuperior, and he, in conſequence, regained poſſeſſion of Cracow, but did not long enjoy his proſperity, falling a victim to his intemperance; ſo that Lechus was reſtored to the ſovereignty in the year 1206.

58  
Poland ravaged by the Tartars.

The government of Lechus was the moſt unfortunate of any of the ſovereigns of Poland. In his time the Tartars made an irruption, and committed every where the moſt cruel ravages. At laſt they came to an engagement with the Poles, aſſiſted by the Ruſſians; and, after an obſtinate and dreadful conflict, obtained a complete victory. This incurſion, however, terminated as precipitately as it commenced; for, without any apparent reaſon, they retired, juſt as the whole kingdom was ready to ſubmit; but the deſolations they had committed, produced a famine, which was ſoon followed by a plague that depopulated one of the moſt populous countries of the north. In this unhappy ſituation of affairs, death ended the miſfortunes of

Poland.

Lechus, who was murdered by his own ſubjects as he was bathing. A civil war took place after his death; and the hiſtory for ſome time is ſo confuſed, that it is difficult to ſay with certainty who was his ſucceſſor. During this unfortunate ſtate of the country, the Tartars made a ſecond irruption, laid all deſolate before them, and were advancing to the capital, when they were attacked and defeated with great laughter by the palatine of Cracow with only a handful of men. The power of the enemy, however, was not broken by this victory; for, next year, the Tartars returned, and committed ſuch barbarities as can ſcarce be imagined. Whole provinces were defeated, and every one of the inhabitants maſſacred. They were returning, laden with ſpoil, when the palatine fell upon them a ſecond time, but not with the ſame ſucceſs as before: for, after an obſtinate engagement, he was defeated, and thus all Poland was laid open to the ravages of the barbarians; the nobility fled into Hungary, and the peaſants fought an aſylum among rocks and impene- trable foreſts. Cracow, being left entirely defenceleſs, was ſoon taken, pillaged, and burnt; after which the barbarians, penetrating into Sileſia and Moravia, deſolated theſe countries, deſtroying Breſlau and other cities. Nor did Hungary eſcape the fury of their barbarity: the king gave battle to the Tartars, but was defeated with vaſt ſlaughter, and had the mortification to ſee his capital laid in aſhes, and above 100,000 of his ſubjects periſh by fire and ſword. The arms of the Tartars were invincible; nothing could withſtand the prodigious number of forces which they brought into the field, and the fury with which they fought. They fixed their head-quarters on the frontiers of Hungary; and ſpread their deſolations on every ſide with a celerity and ſucceſs that threatened the deſtruction of the whole empire, as well as of the neighbouring kingdoms.

In this dreadful ſituation was Poland, when Boleslaus, furnamed the *Chaſte*, was raiſed to the ſovereignty; but this, ſo far from putting an end to the troubles, only ſuperadded a civil war to the reſt of the calamities. Boleslaus was oppoſed by his uncle Conrade the brother of Lechus, who was provoked at becoming the ſubject of his own nephew. Having aſſembled a powerful army, he gained poſſeſſion of Cracow; aſſumed the title of *duke of Poland*; and might poſſibly have kept poſſeſſion of the ſovereignty, had not his avarice and pride equally offended the nobility and peaſants. In conſequence of their diſcontents, they unanimouſly invited Boleslaus, who had fled into Hungary, to come and head the inſurrection which now took place in every quarter. On his arrival, he was joyfully received into the capital: but Conrade ſtill headed a powerful party; and it is reported, that on this occaſion the knights of the Teutonic order were firſt called into Poland, to diſpute the pretenſions of Boleslaus. All the endeavours of Conrade, however, proved unſucceſſful: he was defeated in two pitched battles, and forced to live in a private ſituation; tho' he never ceaſed to haraſs his nephew, and make freſh attempts to recover the crown. However, of the reign of Boleslaus we have little account, except that he made a vow of perpetual continency, and impoſed the ſame on his wife; that he founded near 40 monaſteries; and that he died, after a long reign, in

Poland. 1279, after having adopted Lechus duke of Cujavia, and procured a confirmation of his choice by the free election of the people.

60  
Poland  
over-run by  
the Rus-  
sians, Tar-  
tars, and  
Lithuanians.

The reign of this last prince was one continued scene of foreign and domestic trouble. On his first accession he was attacked by the united forces of Russia and Lithuania assisted by the Tartars; whom, however, he had the good fortune to defeat in a pitched battle. By this victory the enemy were obliged to quit the kingdom; but Lechus was so much weakened, that civil dissensions took place immediately after. These increased to such a degree, that Lechus was obliged to fly to Hungary, the common resource of distressed Polish princes. The inhabitants of Cracow alone remained firm in their duty; and these brave citizens stood all the fatigue and danger of a tedious siege, till they were at last relieved by Lechus at the head of an Hungarian army, who defeated the rebels, and restored the legitimate sovereign. He had scarce reascended the throne, when the united forces of the Russians, Tartars, and Lithuanians, made a second irruption into Poland, and desolated the country with the most savage barbarity. Their forces were now rendered more terrible than ever by their having along with them a vast number of large dogs trained to the art of war. Lechus, however, with an army much inferior, obtained a complete victory; the Poles being animated by despair, as perceiving, that, if they were conquered, they must also be devoured. Soon after this, Lechus died with the reputation of a warlike, wife, but unfortunate prince. As he died without issue, his crown was contended, a civil war again ensued; and the affairs of the state continued in a very declining way till the year 1296, when Premislaus, the duke at that time, resumed the title of king. However, they did not revive in any considerable degree till the year 1305, when Uladislaus Locticus, who had seized the throne in 1300, and afterwards been driven out, was again restored to it. The first transaction of his reign was a war with the Teutonic knights, who had usurped the greater part of Pomerania during the late disturbances. They had been settled in the territory of Culm by Conrade, duke of Mazovia; but soon extended their dominion over the neighbouring provinces, and had even got possession of the city of Dantzic, where they massacred a number of Pomeranian gentlemen in cold blood; which so much terrified the neighbouring towns, that they submitted without a stroke. The knights were commanded by the Pope himself to renounce their conquests; but they set at nought all his thunders, and even suffered themselves to be excommunicated rather than part with them. As soon as this happened, the king marched into the territories of the marquis of Brandenburg, because he had pretended to sell a right to the Teutonic knights to those countries, when he had none to them to himself. Uladislaus next entered the territory of Culm, where he laid every thing waste with fire and sword; and, being opposed by the joint forces of the marquis, the knights, and the duke of Mazovia, he obtained a complete victory after a desperate and bloody engagement. Without pursuing the blow, he returned to Poland, recruited his army, and being reinforced by a body of auxiliaries from Hungary and Lithuania, he dispersed the enemy's forces, and ravaged a second time all the

61  
War with  
the Teuto-  
nic knights.

dominions of the Teutonic order. Had he improved this advantage, he might easily have exterminated the whole order, or at least reduced them so low, that they could never have occasioned any more disturbances in the state; but he suffered himself to befoothed and cajoled by the promises which they made without any design of keeping them, and concluded a treaty under the mediation of the kings of Hungary and Bohemia. In a few months he was convinced of the perfidy of the knights; for they not only refused to evacuate Pomerania as had been stipulated in the treaty, but endeavoured to extend their usurpations, for which purpose they had assembled a very considerable army. Uladislaus enraged at their treachery, took the field a third time, and gave them battle with such success, that 4000 knights were left dead on the spot, and 30,000 auxiliaries killed or taken prisoners. Yet, though the king had it once more in his power to destroy the whole Teutonic order, he satisfied himself with obtaining the territories which had occasioned the war; after which he spent the remainder of his life in peace and tranquillity.

Uladislaus was succeeded by his son Casimir III. surnamed the Great. He subdued the province called *Russia Nigra* in a single campaign. Next he turned his arms against Mazovia; and with the utmost rapidity over-ran the duchy, and annexed it as a province to the crown; after which, he applied himself to domestic affairs, and was the first who introduced a written code of laws into Poland. He was the most impartial judge, the most rigid observer of justice, and the most submissive to the laws, of any potentate mentioned in the history of Europe. The only vice with which he is charged is that of incontinency; but even this the clergy declared to be a venial sin, and amply compensated by his other virtues, particularly the great liberality which he shewed to the clerical order.

Casimir was succeeded in 1370 by his nephew Lewis king of Hungary; but, as the Poles looked upon him to be a foreign prince, they were not happy under his administration. Indeed a coldness between this monarch and his people took place even before he ascended the throne; for in the *pacta conventa*, to which the Polish monarchs were obliged to swear, a great number of unusual articles were inserted. This probably was the reason why he left Poland almost as soon as his coronation was over, carrying with him the crown, sceptre, globe, and sword of state, to prevent the Poles from electing another prince during his absence. He left the government in the hands of his mother Elizabeth; and she would have been agreeable to the people, had her capacity for government been equal to the task. At that time, however, the state of Poland was too much distracted to be governed by a woman. The country was over-run with bold robbers and gangs of villains, who committed the most horrid disorders; the kingdom was likewise invaded by the Lithuanians; the whole province of *Russia Nigra* revolted; and the kingdom was universally filled with dissension. The Poles could not bear to see their towns filled with Hungarian garrisons; and therefore sent a message to the king, telling him that they thought he had been sufficiently honoured in being elected king of Poland himself, without suffering the kingdom to be governed by a woman and his Hun-  
garian

63

Unhappy  
reign of  
Lewis.

Poland. garian subjects. On this Lewis immediately raised a numerous army, with a design fully to conquer the spirit of his subjects. His first operations were directed against the Russians; whom he defeated, and again reduced to subjection. Then he turned his arms against the Lithuanians, drove them out of the kingdom, and re-established public tranquillity. However, instead of being satisfied with this, and removing the Hungarian garrisons, he introduced many more, and raised Hungarians to all the chief posts of government. His credit and authority even went so far as to get a successor nominated who was disagreeable to the whole nation, namely *Stejnund* marquis of Brandenburg. After the death of Lewis, however, this election was set aside; and Hedwiga, daughter of Casimir the Great, was proclaimed queen.

<sup>64</sup> Hedwiga marries the duke of Lithuania, thereby uniting that duchy, together with Samogitia and Russia Nigra, to Poland.

This prince's married Jagello duke of Lithuania, who was now converted to Christianity, and baptized by the name of *Uladislaus*. In consequence of this marriage, the duchy of Lithuania, as well as the vast provinces of Samogitia and Russia Nigra, became annexed to the crown of Poland. Such a formidable accession of power excited the jealousy of the Teutonic knights, who were sensible that *Uladislaus* was now bound to undertake the reduction of Pomerania, and revenge all the injuries which Poland had sustained from them for a great number of years. From his first accession therefore they considered this monarch as their greatest enemy, and endeavoured to prevent his designs against them by effecting a revolution in Lithuania in favour of his brother Andrew. The prospect of success was the greater here, as most of the nobility were discontented with the late alliance, and *Uladislaus* had proposed to effect a revolution in religion, which was highly disagreeable. On a sudden, therefore, two armies marched towards the frontiers of the duchy, which they as suddenly penetrated, laying waste the whole country, and seizing upon some important fortresses before the king of Poland had any notice of the matter. As soon as he received advice of these ravages, *Uladislaus* raised some forces with the utmost celerity, which he committed to the care of his brother *Skirgello*, who defeated the Teutonic knights, and soon obliged them to abandon all their conquests. In the mean time *Uladislaus* marched in person into the Higher Poland, which was subjected to a variety of petty tyrants, who oppressed the people, and governed with intolerable despotism. The palatine of Posenia in particular had distinguished himself by his rebellious practices; but he was completely defeated by *Uladislaus*, and the whole country reduced to obedience.

<sup>65</sup> Troubles in Lithuania.

Having secured the tranquillity of Poland, *Uladislaus* visited Lithuania, attended by a great number of the clergy, in order to convert his subjects. This he effected without great difficulty; but left the care of the duchy to his brother *Skirgello*, a man of a cruel, haughty, and debauched turn, and who immediately began to abuse his power. With him the king sent his cousin *Vitowda*, a prince of a generous, brave, and amiable disposition, to be a check upon his conduct; but the barbarity of *Skirgello* soon obliged this prince to take refuge among the Teutonic knights, who were now become the asylum of the oppressed and discontented. For some time, however, he did not assist the knights in their designs against

his country; but having applied for protection to the king, and finding him remiss in affording the necessary assistance, he at last joined in the schemes formed by the knights for the destruction of Poland. Entering Lithuania at the head of a numerous army, he took the capital, burnt part of it, and destroyed 14,000 persons in the flames, besides a great number who were massacred in attempting to make their escape. The upper part of the city, however, was vigorously defended, so that the besiegers were at last obliged to abandon all thoughts of making themselves masters of it, and to content themselves with desolating the adjacent country. The next year *Vitowda* renewed his attempts upon this city, but with the same ill success; though he got possession of some places of less note. As soon, however, as an opportunity offered, he came to an accommodation with the king, who bestowed on him the government of Lithuania. During the first years of his government, he bestowed the most diligent attention upon domestic affairs, endeavouring to repair the calamities which the late wars had occasioned; but his impetuous valour prompted him at last to engage in a war with *Tamerlane* the Great, after his victory over *Bajazet* the Turkish emperor. For some time before, *Vitowda* had been at war with the neighbouring Tartars, and had been constantly victorious, transporting whole hords of that barbarous people into Poland and Lithuania, where to this day they form a colony distinct in manners and dress from the other inhabitants. *Uladislaus*, however, dissuaded him from attacking the whole strength of the nation under such a celebrated commander as *Tamerlane*; but *Vitowda* was obstinate: he encountered an army of 400,000 Tartars under *Ediga*, *Tamerlane's* lieutenant, with only a tenth part of their number. The battle continued for a whole day; but at last *Vitowda* was surrounded by the numbers of his enemy, and in the utmost danger of being cut in pieces. However, he broke his way through, with prodigious slaughter on both sides; and came off at last without a total defeat, having killed a number of the enemy equal to the whole of his own army.

<sup>66</sup> Terrible battle with the Tartars.

<sup>67</sup> Wars with the Teutonic knights.

During the absence of *Vitowda*, the Teutonic knights had penetrated into Lithuania, committing every where the most dreadful ravages. On his return he attacked and defeated them, making an irruption into Livonia, to punish the inhabitants of that country for the assistance they had given to the Teutonic order. This was succeeded by a long series of wars between Poland and Prussia, in which it became necessary for *Uladislaus* himself to take the field. The knights had now, one way or other, got possession of Samogitia, Mazovia, Culm, Silesia, and Pomerania; so that *Uladislaus* resolved to punish them before they became too powerful. With this view he assembled an army composed of several different nations, with which he penetrated into Prussia, took several towns, and was advancing to *Marienburgh* the capital of Pomerania, when he was met by the army of the Prussian knights, who determined to hazard a battle. When the engagement began, the Poles were deserted by all their auxiliaries, and obliged to stand the brunt of the battle by themselves. The courage and conduct of their king, however, so animated them, that after a most desperate battle they obtained a complete victory; near

Poland.

near 40,000 of the enemy being killed in the field, and 30,000 taken prisoners. This terrible overthrow, however, was left fatal to the affairs of the Prussian knights than might have been expected; as Uladislaus did not improve his victory, and a peace was concluded upon easier terms than his adversaries had any reason to expect.—Some infraction of the treaty occasioned a renewal of hostilities; and Uladislaus was so much elated with victory that he would hearken to no terms, by which means the enemy were driven to the desperate resolution of burying themselves in the ruins of their capital. The siege was accordingly commenced, and both sides behaved with the greatest vigour; but at last, through the good conduct and valour of the grand master of the knights name *Plawen*, the Polish monarch found himself obliged to grant them an advantageous peace, at a time when it was universally expected that the whole order would have been exterminated.

Uladislaus V. died in 1435, and was succeeded by his son Uladislaus VI. at that time only nine years of age. He had scarce ascended the throne when the kingdom was invaded by the Tartars, who defeated Buccarius the general of the Polish forces; and committing every where dreadful ravages, returned to their own country laden with booty. A few years after, the nation was involved in a war with Amurath the emperor of the Turks, who threatened to break into Hungary; and it was thought by the diet to be good policy to assist the Hungarians at this juncture, because it was impossible to know where the storm might fall after Hungary was conquered. But before all things were prepared for the young king to take the field, a strong body of auxiliaries were dispatched under the celebrated John Hunniades vaivode of Transylvania, to oppose the Turks, and likewise to support the election of Uladislaus to the crown of Hungary. This detachment surprised the Turkish army near the river Morava, and defeated Amurath with the loss of 40,000 men; after which Hunniades retook all the places which had been conquered by Amurath, the proud Sultan was forced to sue for peace, and Uladislaus was raised without opposition to the crown of Hungary. A treaty was concluded, by which the Turks promised to relinquish their designs upon Hungary, to acknowledge the king's right to that crown, and to give up all their conquests in Rascia and Servia. This treaty was sealed by mutual oaths: but Uladislaus broke it at the persuasion of the Pope's legate; who insisted, that now was the time for humbling the power of the infidels; and produced a special commission from the pope, absolving him from the oath he had taken at the late treaty. The consequence of this perfidy was, that Uladislaus was entirely defeated and killed at Varna, and the greatest part of his army cut in pieces.

Uladislaus VI. was succeeded by Casimir III. in whose reign the Teutonic knights were subdued, and obliged to yield up the territories of Culm, Mielow, and the whole duchy of Pomerania, together with the towns of Elbing, Marienburg, Talkmith, Schut, and Christburgh, to the crown of Poland. On the other hand, the king reformed to them all the other conquests he had made in Prussia, granted a seat in the Polish senate to the grand-master, and endowed him with other privileges, on condition that, six months after

his accession, he should do homage for Prussia, and take an oath of fidelity to the king and republic.

This success raised the spirits of the Polish nation, which had drooped ever since the battle of Varna. The diet did not, however, think proper to renew the war against the Turks, but took under their protection the hospodar of Moldavia; as thinking that this province would make a convenient barrier to the Polish dominions on one side. The request of the prince who asked this protection was therefore readily granted, an oath of fidelity exacted from him and the inhabitants, and a tribute required; regular payment of which was made for a great number of years afterwards.

About this time also the crown of Bohemia becoming vacant, the people were extremely desirous of being governed by one of the princes of Poland; upon which, the barons were induced to bestow the crown upon Uladislaus, eldest son to Casimir, in opposition to the intrigues of the king of Hungary. Not satisfied with this acquisition, Uladislaus took advantage of the dissensions in Hungary, in order to unite that crown to his own: and this he also effected; by which means his power was greatly augmented, though not the felicity of his people. So many foreign expeditions had exhausted the treasury, and oppressed the peasants with taxes; the gentry were greatly diminished by a number of bloody engagements; agriculture was neglected, and the country almost depopulated. Before a proper remedy could be applied for these evils, Casimir died in 1492; much more admired, than beloved or regretted, by his subjects. It is related by the historians of this period, that in the reign of Casimir III. the deputies of the provinces first appeared at the diet, and assumed to themselves the legislative power; all laws before this time having been framed by the king in conjunction with the senate. It is observed also, that before Casimir's time, the Latin language was understood only by the clergy of Poland; in proof of which, it is alleged, that at an interview between this prince and the king of Sweden at Dantzick, his Polish majesty was forced to make use of the assistance of a monk to interpret between him and the Swedish monarch. Casimir, ashamed of the ignorance shown by himself and court, published an edict, enjoining the diligent study of the Latin, which in our days is spoken as vernacular by every Polish gentleman, though very unclassically.

During the succeeding reigns of John, Albert, and Alexander, the Polish affairs fell into decline; the kingdom being harassed by continual wars with the Turks and Tartars. However, they were retrieved by Sigismund I. who ascended the throne in 1507. This monarch, having reformed some internal abuses, next set about rendering the kingdom as formidable as it had formerly been. He first quelled a rebellion which broke out in Lithuania; after which, he drove the Walachians and Moldavians out of Russia Nigra, and defeated the Russians in a pitched battle, with the loss of 30,000 men. In this engagement he was obliged to cause his cavalry swim across the Borithens to begin the attack, while a bridge was preparing for the infantry. These orders were executed with astonishing celerity, notwithstanding the rapidity of the stream, the steepness of the banks, and the enemy's opposition. The onset was led by the Lithuanians, who were directed

rected to retreat gradually, with a view of drawing the enemy within reach of the cannon. This the Russians mistook for a real flight; and as they were pursuing with eagerness, Sigismund opened his line to the right and left, pouring in grape-shot from the artillery with dreadful success. The Russian general, and several noblemen of the first distinction, were taken prisoners, while the whole loss of the royal army did not amount to 300 men.

After this complete victory, the king turned his arms against the Teutonic knights, who had elected the marquis of Brandenburg their grand-master; and this prince not only refused to acknowledge the sovereignty of the crown of Poland, but even invaded the Polish territories. Sigismund marched against him, and gained possession of several important places in Brandenburg; but as he was pursuing his conquests, the marquis was reinforced by 14,000 Germans, led by the duke of Schonenburg, who ventured to lay siege to Dantzic, after having ravaged all the neighbouring country. The Dantzickers, however, defended themselves with so much spirit, that the besiegers were soon obliged to relinquish their enterprise. In their retreat they were attacked by a strong detachment of Polish cavalry, who made prodigious havoc, and compelled the wretched remains to take shelter in Pomerania, where they were inhumanely butchered by the peasants. Soon after this the marquis was obliged to submit to the clemency of the conqueror; from whom, however, he obtained better conditions than could have been expected, or indeed than he would have got, had he not abandoned the interest of the Teutonic order, and resigned the dignity of grand-master. In order to secure him in his interest, therefore, Sigismund granted him half the province of Prussia as a secular duke, and dependent on the crown of Poland; by which means he entirely deprived that order of the best part of their dominions, and put it quite out of their power to disturb the tranquillity of Poland any more.

The power of Sigismund had now excited the jealousy of the House of Austria; for which reason they took every method in their power to stir up enemies against him. By their means, the Russians, Moldavians, and Tartars, were all excited to fall upon the Polish territories at once. The vaivode of Walachia, with 50,000 men, made an irruption into the small province of Pokation, but was entirely defeated by count Taro at the head of no more than 6000. This victory is wholly ascribed to the good conduct of the commander, who possessed himself of some eminences on the flanks of the enemy. On these he erected batteries; which played with such fury, as soon put their ranks in disorder: upon which the Poles attacked them sword in hand, and entirely dispersed them with the loss of 10,000 killed or taken. The count having then augmented his army with a strong body of Lithuanians, attacked the Muscovites and Tartars, drove them entirely out of the duchy, pursued them into Russia, reduced several towns, and at last laid siege to the strong fortress of Staradub; in which the regent, together with some of the best troops of Russia, were inclosed. The garrison made a gallant defence; and the fortifications were composed of beams joined together, and supported by a bulwark of earth, upon

Poland.

which the cannon-shot made no impression: but the count contrived a method of setting the wood on fire; by which means the regent and nobility were obliged to surrender at discretion, and Taro carried off upwards of 60,000 prisoners, with an immense booty.

In the reign of Sigismund, we may look upon the kingdom of Poland to have been at its greatest pitch of glory. This monarch possessed, in his own person, the republic of Poland, the great duchies of Lithuania, Smolensko, and Saveria, besides vast territories lying beyond the Euxine and Baltic; while his nephew Lewis possessed the kingdoms of Bohemia, Hungary, and Silesia. But this glory received a sudden check in 1548, by the defeat and death of Lewis, who perished in a battle fought with Solyman the Great, emperor of the Turks. The daughter of this prince married Ferdinand of Austria; whereby the dominions of Hungary, Bohemia, and Silesia, became inseparably connected with the hereditary dominions of the Austrian family. This misfortune is thought to have hastened the death of Sigismund; tho' being then in his 84th year, he could not have lived long by the ordinary course of nature. He did not, however, survive the news many months, but died of a lingering disorder, leaving behind him the character of the completest general, the ablest politician, the best prince, and the strongest man, in the north; of which last, indeed, some instances are related by historians, that are almost incredible.

Sigismund Augustus, who succeeded his father Si-<sup>73</sup>gismund I. proved also a very great and happy prince. At that time the most violent and bloody wars were carrying on in Germany, and indeed through other parts of Europe, on account of religion; but Sigismund wisely avoided interfering in these disputes. He would not admit into his dominions any of those divines who were taxed with holding heterodox opinions, nor even allow his people the liberty of corresponding with them; yet he never persecuted, or employed any other means for the preservation of the state than those of a well-conducted and regular policy. Instead of disputing with his subjects about speculative opinions, Sigismund applied himself diligently to the reforming of abuses, enforcing the laws, enriching the treasury, promoting industry, and redeeming the crown-lands where the titles of the possessors appeared illegal. Out of the revenue recovered in this manner he maintained a formidable standing army, without laying any additional tax upon the subjects; and though he preferred peace to war, he was always able to punish those that offered indignities to his crown or person. His knowledge<sup>73</sup> in the art of war was soon tried in a contest with the Russians, who had made an irruption into Livonia, encouraged by the disputes which had subsisted between the Teutonic knights and the archbishop of Riga, confin to Sigismund. The province was at that time divided between the knights and the prelate; and the Russians, under pretence of assisting the former, had seized great part of the dominions of latter. The archbishop had recourse to his kinsman the king of Poland; who, after fruitless efforts to accommodate matters, marched towards the frontiers of Livonia with an army of 100,000 men. The knights were by no means able to resist such a formidable power; and therefore, deserting their late allies, put themselves under the protection<sup>73</sup> of the Russian.

tion of the king of Poland. The czar, John Basildes, though defeated by the knights, did not lose his courage; he, even insolently refused to return any answer to the proposals of peace made by Sigismund. His army consisted of 300,000 men, with whom he imagined himself able to reduce all Livonia, in spite of the utmost efforts of the king of Poland; however, having met with some checks on that quarter, he directly invaded Poland with his whole army. At first he carried every thing before him; but the Poles soon made a vigorous opposition. Yet the Russians, though every where defeated, still continued their incursions, which Sigismund at last revenged by invading Russia in his turn. These mutual desolations and ravages at last made both parties desirous of peace, and a truce for three years was agreed on; during the continuance of which the king of Poland died, and with him was extinguished the house of Jagello, which had governed Poland for near 200 years.

74  
Extinction of the house of Jagello.

On the death of Sigismund, Poland became a prey to intestine divisions; and a vast number of intrigues were set on foot at the courts of Vienna, France, Saxony, Sweden, and Brandenburg; each endeavouring to establish a prince of their own nation on the throne of Poland. The consequence of all this was, that the kingdom became one universal scene of corruption, faction, and confusion; the members of the diet consulted only their own interest, and were ready on every occasion to sell themselves to the best bidder. The Protestants had by this time got a considerable footing in the kingdom, and thus religious disputes were intermingled with political ones. One good effect, however, flowed from this confusion: for a law was passed, by which it was enacted, that no difference in religious opinions should make any contention among the subjects of the kingdom; and that all the Poles, without discrimination, should be capable of holding public offices and trusts under the government; and it was also resolved, that the future king should swear expressly to cultivate the internal tranquillity of the realm, and cherish, without distinction, their subjects of all persuasions.

75  
Distracted state of Poland.

While the candidates for the throne were severally attempting to support their own interest in the best manner they could, John Crafolski, a Polish gentleman of great merit, but diminutive stature, had just returned from France, whither he had travelled for improvement. His humour, wit, and diverting size, had rendered him universally agreeable at the court of France, and in a particular manner engaged the esteem of Catherine de Medicis, which the little Pole had the address to make use of for his own advantage. He owed many obligations to the duke of Anjou; whom, out of gratitude, he represented in such favourable terms, that the Poles began to entertain thoughts of making him their king. These sentiments were confirmed and encouraged by Crafolski, who returned into France by order of several leading men in Poland, and acquainted the king and queen Catharine, that nothing was wanting besides the formality of an embassy to procure the crown for the duke of Anjou, almost without opposition. Charles IX. king of France at that time, also promoted the scheme, being jealous of the duke of Anjou's popularity, and willing to have him removed to as great a distance as possible. Accordingly the par-

ties came to an agreement; and it was stipulated that the duke of Anjou should maintain the laws, liberties, and customs of the kingdom of Poland, and of the grand duchy of Lithuania; that he should transport all his effects and annual revenues in France into Poland; that the French monarch should pay the late king Sigismund's debts; that he should maintain 100 young Polish gentlemen at his court, and 50 in other places; that he should send a fleet to the Baltic, to assist Poland against the Russians; and lastly, that Henry should marry the princess Anne, sister to the late king Sigismund; but this article Henry would not ratify till his return to Poland.

Poland.  
76  
Duke of Anjou chosen king of Poland.

Every thing being thus settled, the young king quitted France, attended by a splendid retinue, and was accompanied by the queen-mother as far as Lorrain. He was received by his subjects on the frontiers of Poland, and conducted to Cracow, where he was soon after crowned. The affections of the Poles were soon engaged by the youth and accomplishments of Henry; but scarce was he seated on the throne, when, by the death of Charles IX. he became heir to the crown of France. Of this he was informed by repeated messages from queen Catharine; he repented his having accepted the crown of Poland, and resolved to leave it for that of France. But being sensible that the Poles would oppose his departure, he kept his intentions secret, and watched an opportunity of stealing out of the palace in disguise in the night-time. The Poles, as might well have been expected, were irritated at being thus abandoned, from the mere motive of interest, by a prince whom they had loved and honoured so much. Parties were dispatched after him by different roads; and Zamolski, a nobleman who headed one of these parties, overtook him some leagues distant from Cracow. All the prayers and tears of that nobleman, however, could not prevail on Henry to return; he rode post to Vienna, and then passed into France by the way of Italy.

77  
Runs away from his kingdom.

In the mean time the Poles were so much exasperated against Henry and his whole nation, that all the French in Cracow would have been massacred if the magistrates had not placed guards in the streets. Henry, however, had foreseen the consequences of his flight, and therefore endeavoured to apologise for his behaviour. One Danzai undertook his cause in full senate; and with great eloquence explained the king's motives for his abrupt departure. Henry also wrote to the chief nobility and clergy with his own hand. But nothing could satisfy the Poles; who now acquainted their king, that if he did not immediately return, they would be obliged to divest him of the royal dignity, and to choose another sovereign. Henry began to excuse himself on account of the wars in which he was engaged, and promised to send men of unexceptionable integrity to govern Poland till he should return: but no excuses could be accepted; and, on the 15th of July 1575, he was solemnly divested of the regal dignity in full diet, and the throne declared vacant.

78  
And is deposed.

After the deposition of Henry, the commotions and factions again took place. However, the contending parties were now reduced to two; one who supported the interest of Maximilian emperor of Germany; the other, who were for electing the princess Anne, and marrying her to Stephen Batori prince of Transylvania,

Poland.

79

tori chosen  
king.

nia. The latter prevailed through the courage of one gentleman, who, in imitation of the power assumed by the Roman tribunes, flood up in the full senate, and opposed the proclamation of Maximilian, declaring that his election was violent and illegal. In this situation of affairs, it was obvious that strength and celebrity must determine which election was legitimate: both parties wrote to the princes whose cause they had espoused, intreating them to come with all possible expedition to take possession of the throne. Batori proved the more alert; for while Maximilian was disputing about certain conditions which the Poles required for the security of their privileges, he entered Poland, married the princess, and was crowned on the 1st of May 1576.

80  
Dantzic re-  
volts.

No opposition was made to the authority of Batori except by the inhabitants of Dantzick. These adhered to the interest of Maximilian even after he was dead, and had the presumption to demand from the king an oath acknowledging their absolute freedom and independence. Batori referred them to the senate, declaring that he had no right to give up the privileges of the republic; but admonished the citizens to avoid all occasion of a civil war, which must necessarily terminate in their disadvantage. But the obstinate citizens, construing the king's lenity into fear, shut the gates against the ambassador, seized upon the fortrefs of Grebin, and published a manifesto resembling a libel upon the king and the republic. The king, incensed at these proceedings, marched against Grebin, retook the castle, and ravaged certain territories belonging to the Dantzickers; who retaliated by burning to the ground a monastery named *Oliva*, to prevent the Poles from taking possession of so important a situation.

Notwithstanding these outrages, Batori renewed his overtures for an accommodation; but the Dantzickers were deaf to these salutary proposals; so that he was obliged to declare them rebels, and send against them a body of troops under one Zborowki. As the number of the Polish army, however, was not considerable, the Dantzickers marched out to give him battle. They were assisted by a corps of Germans, and a resolution was formed of attacking the Poles in their camp by surprize; but the project was disconcerted by a sudden storm accompanied with dreadful thunder and lightning, which spread a panic through the army, as if it had been a judgment from heaven, and obliged the commander, John de Collen, to retire into the city.—In a short time, however, they recovered their spirits, and came to an action with the Poles; but were defeated with the loss of 8000 men killed on the spot, a great many taken prisoners, and the loss of several pieces cannon. But this check, instead of abating the courage of the Dantzickers, only animated them the more, and they resolved to hold out to the last extremity. In the mean time the Czar of Muscovy, thinking the present opportunity favourable for extending his dominions, laid siege to Revel; but, not being able to make himself master of that place, he was obliged to content himself with ravaging Livonia, which he did in a dreadful manner. This did not, however, hinder Batori from laying siege to Dantzick in person, and pursuing the operations with the utmost vigour. Collen made many vigorous sallies

81  
Poland in-  
vaded by  
the Rus-  
sians.

in several of which he defeated the Poles: but happening at last to be killed, nobody was found capable of supplying his place, and the citizens were at last obliged to surrender at discretion; though not till they had obtained a promise from the elector of Saxony and landgrave of Hesse of interposing as mediators in their behalf. The only terms which the king demanded of them were, that they should ask his pardon, dismiss their troops, and rebuild the monastery of *Oliva* which they had destroyed; while his majesty, on the other hand, confirmed all their privileges, and granted them full liberty of adhering to the confession of Augsburg, for which they had for some time been strenuous advocates.

Poland.

82  
Dantzick sub-  
mits.

The war with Dantzick was no sooner ended, than the king directed his whole strength against the czar of Muscovy, who had made himself master of several important cities in Livonia. The czar behaved every where with the greatest cruelty, slaughtering all without distinction who were able to bear arms, and abandoning the women and children to the shocking brutality of the Tartars who served in his army. Such was the horror inspired by the perfidy and cruelty of the czar's conduct, that the inhabitants of Wender chose rather to bury themselves in the ruins of their town, than to submit to such an inhuman enemy. For a considerable time the Russians were allowed to proceed in this manner, till the whole province of Livonia, excepting Riga and Revel, had suffered the barbarities of this insulting conqueror; but at last, in 1578, a body of forces was dispatched into the province, the towns of Wender and Dunnenburg were supplied, and an army sent by the czar to surprize the former was defeated.

83  
Cruelty of  
the Rus-  
sians.

At this time the Muscovites were not the only enemies who opposed the king of Poland, and oppressed Livonia. That unhappy province was also invaded by the Swedes, who professed themselves to be enemies equally to both parties, and who were scarce inferior in cruelty to the Russians themselves. The king, however, was not daunted by the number of his adversaries; but having made great preparations, and called to his assistance Christopher prince of Transylvania, with all the standing forces of that country, he took the field in person against the Muscovites, and laid siege to Polozce, a town of great importance situated on the river Dwina. The Russians no sooner heard

84  
Siege of Po-  
lozz.

of the approach of the Polish army, than they resolved to put all the citizens to death, thinking by this means to strike terror into the enemy. When Batori came near the town, the most shocking spectacle presented itself; the river appeared dyed with blood, and a vast number of human bodies fastened to planks, and terribly mangled, were carried down its stream. This barbarity, instead of intimidating the Poles, irritated them to such a degree, that nothing could resist them. Finding that their cannon made little impression upon the walls of the city, which were constructed of wood, they advanced to the assault with burning torches in their hands; and would soon have reduced the fortifications to ashes, had not a violent storm of rain prevented them. The design, however, was put in execution as soon as the rain slackened; and the barbarous Russians were obliged to surrender at discretion. It reflects the highest honour on Batori, that, notwithstanding the dreadful instances of

Poland.

cruelty which he had before his eyes, he would not suffer his soldiers to retaliate. Indeed the cruelties committed by the Russians on this occasion, seem almost to have authorized any revenge that could possibly have been taken. A number of Germans were found in the city, some expiring under the most dreadful tortures, and others dead of pains which nature could no longer support. Several of the officers had been dipped in cauldrons of boiling oil, with a cord drawn under the skin of the umbilical region, which fastened their hands behind; in which situation their eyes had been torn out from their sockets, or burnt with red-hot irons, and their faces otherwise terribly mangled. The disfigured carcases, indeed, plainly shewed the barbarous treatment they had met with; and the dreadful tale was confirmed by the testimony of the few who survived. The Polish soldiers were exasperated almost to madness; so that scarce all the authority of Batori could restrain them from cutting in pieces the wretches who had been the authors of such a dreadful tragedy.

85  
Monstrous  
barbarities  
committed  
by the Rus-  
sians in that  
city.

After the reduction of Polocz, Batori continued the war with great success. Two detachments from the army penetrated the enemy's country by different roads, waited all before them to the gates of Smolensko, and returned with the spoils of 2000 villages which they had pillaged and destroyed. In the mean time the Swedes and Poles thought proper to come to an accommodation: and though John king of Sweden was at that time prevented from bearing his share of the war, yet Batori reduced such a number of cities, and committed such devastations in the Russian territories, that the Czar was obliged to sue for peace; which he obtained, on condition of relinquishing Livonia, after having thrown away the lives of more than 400,000 of his subjects in attempting to conquer it.

87  
The Czar  
sues for  
peace.

Batori, being thus freed from a most destructive and cruel war, applied himself to the internal government of his kingdom. He regulated the Polish cavalry in such a manner, as made them become formidable to the Turks and other neighbouring nations: and this is the military establishment to which the Poles have given the name of *quartienne*; because a fourth part of the revenue is employed in supporting them. Batori sent this body of cavalry towards the frontiers of Tartary, to check the incursions of those barbarians; by which means the Ukraine, a vast tract of desert country, was filled with flourishing towns and villages, and became a strong barrier against the Turks, Tartars, and Russians. The last memorable action of Batori was his attacking the Cossacks \* to Poland, civilizing and instructing them in the arts of war and peace. His first endeavour was to gain their affections by his liberality; for which purpose, he presented them with the city of Tscheteravia, situated on the Boristhenes, which they formed into a magazine and made the residence of their chieftains. He gave them officers of all degrees, established discipline among them, altered their arms, and formed them into a regular militia, which afterwards performed eminent services to the state. All kinds of manufactures, at that time known in Poland, were likewise established among the Cossacks; the women were employed in spinning and weaving woollen cloths, while the men

89  
Batori civi-  
lizes the  
Cossacks.

were taught agriculture, and other arts proper for their sex.

Poland.

While Batori was employed in this manner, the Swedes broke the convention into which they had entered with Poland, and were on the point of getting possession of Riga. To this, indeed, Batori himself had given occasion, by attempting to impose the Romish religion upon the inhabitants, after having promised them entire liberty of conscience. This so irritated them, that they revolted, and were on the point of admitting a Swedish garrison into the city, when the king was informed of what was going forward. Upon this he resolved to take a most exemplary vengeance on the inhabitants of Riga; but before he could execute his intention, he died in the year 1586, the 54th of his age, and 10th of his reign.

89  
His death.

The death of Batori involved Poland in fresh troubles. Four candidates appeared for the crown, viz. the princes Ernest and Maximilian of the house of Austria; Sigismund, prince of Sweden; and Theodore czar of Muscovy. Each of these had a separate party; but Sigismund and Maximilian managed matters so well, that in 1587 both of them were elected. The consequence of this was a civil war; in which Maximilian was defeated and taken prisoner: and thus Sigismund III. surnamed *De Vasa*, became master of the throne of Poland without opposition. He waged a successful war with the Tartars, and was otherwise prosperous; but though he succeeded to the crown of Sweden, he found it impossible for him to retain both kingdoms, and he was formally deposed from the Swedish throne. In 1610 he conquered Russia, and placed his son on the throne; but the Polish conquests of that country have always been but for a short time. Accordingly the young prince was soon after deposed; and the Russians not only regained their liberty, but began to make encroachments on Poland itself. A very unfortunate war also took place with Sweden, which was now governed by the Great Gustavus Adolphus; the particulars of which, with the other exploits of that renowned warrior, are related under the article SWEDEN. At last Sigismund, worn out with cares and misfortunes, died in 1629.

90  
War with  
Gustavus  
Adolphus.

After Sigismund's death, the affairs of Poland seemed to revive a little under Uladislav VII.; for he obliged the Russians to sue for peace, and Sweden to restore some of her conquests; but having attempted to abridge the liberty of the Cossacks, they revolted, and gave the Poles several terrible defeats. Nor was the war terminated in the lifetime of Uladislav, who died in 1648. His successor, John Casimir, concluded a peace with these dangerous enemies: but the war was soon after renewed; and while the kingdom was distracted between these enemies and the discontents of its own inhabitants, the Russians took the opportunity of invading and pillaging Lithuania. In a little after, the whole kingdom was subdued by Charles Gustavus, successor to Christina queen of Sweden.

91  
Poland sub-  
dued by  
Charles  
Gustavus.

Happily for Poland, however, a rupture took place between the courts of Sweden and Copenhagen; by which means the Poles were enabled to drive out the Swedes in 1657. This was succeeded by civil wars and contests with Russia; which so much vexed the king, that he resigned the crown in 1668.

For.

Poland. For two years after the resignation of Casimir, the kingdom was filled with confusion; but on the 17th of September 1670, one Michael Coribut Wiefnowiski, collaterally descended from the house of Jagello, but in a very mean situation at that time, was chosen king. His reign continued but for three years; during which time, John Sobieski, a celebrated Polish general, gave the Turks a dreadful overthrow, tho' their army consisted of more than 300,000 men; and had this blow been pursued, the Cossacks would have been entirely subdued, and very advantageous terms might have been obtained from the Sultan. Of that vast multitude of Turks, no more than 15,000 made their escape, the rest being all either killed or taken; however, the Polish soldiers, being bound by the laws of their country only to stay a certain time in the field, they refused to pursue this signal victory, and suffered the king to make peace on any terms he could procure.

92  
John Sobieski retrieves the Polish affairs.

Wiefnowiski died before the news of this transaction reached Cracow; and after his death, a new scene of confusion ensued, till at last the fortune of John Sobieski prevailed, and he was elected king of Poland in 1674. He was a most magnanimous and heroic prince; who, by his valour and good conduct, retrieved the affairs of Poland, and entirely checked the progress of the Turks westward. These Barbarians were every where defeated, as is particularly related under the article TURKY; but notwithstanding his great qualities, Poland was now so thoroughly corrupted, and pervaded by a spirit of disaffection, that the latter part of this monarch's reign was involved in troubles, through the ambition and contention of some powerful noblemen.

Sobieski died in 1696; and with him fell the glory of Poland. Most violent contests took place about the succession; and the recital of which would far exceed our limits. At last Frederic Augustus, elector of Saxony, prevailed; but yet, as some of the most essential ceremonies were wanting in his coronation, because the primate, who was in an opposite interest, would not perform them, he found it extremely difficult to keep his subjects in proper obedience. To add to his misfortunes, having engaged in a league with Denmark and Russia against Sweden, he was attacked with irresistible fury by Charles XII. Though Augustus had not been betrayed, as indeed he almost always was, he was by no means a match for the ferocious Swede. The particulars of this war, however, as they make great part of the exploits of that northern hero, more properly fall to be related under the article SWEDEN. Here, therefore, we shall only observe, that Augustus was reduced to the humiliating necessity of renouncing the crown of Poland on oath, and even of congratulating his rival Stanislaus upon his accession to the throne; but when the power of Charles was broken by his defeat at Pultowa, the fortune of Augustus again prevailed; Stanislaus was driven out; and the former being absolved from his oath by the Pope, resumed the throne of Poland.

93  
Poland conquered by Charles XII.

Since that time the Polish nation hath never made any figure. Surrounded by great and ambitious powers, it hath sunk under the degeneracy of its inhabitants; so that it now scarce exists as a nation. This catastrophe took place in the following manner:

94  
History taken.

On the 5th of October 1763, died Augustus III. elector of Saxony, and king of Poland. He was succeeded by count Poniatowski, a Polish grandee, who was proclaimed September 7th 1764, by the name of *Stanislaus Augustus*, and crowned on the 25th of November the same year.—During the interregnum which took place between the death of Augustus III. and the election of Stanislaus, a decree had been made by the convocation-diet of Poland, with regard to the *diffidants*, as they were called, or dissenters from the Popish religion. By this decree they were prohibited from the free exercise of their religion, much more than they had formerly been, and totally excluded from all posts and places under the government. On this several of the European powers interposed, at the application of the dissenters, for their good offices. The courts of Russia, Prussia, Great Britain, and Denmark, made remonstrances to the diet; but, notwithstanding these remonstrances, the decree was confirmed by the coronation-diet held after the king's election.

October 6. 1766, an ordinary diet was assembled. Here declarations from the courts above mentioned were presented to his Polish majesty, requiring the re-establishment of the dissenters in their civil rights and privileges, and the peaceable enjoyment of their modes of worship secured to them by the laws of the kingdom which had been observed for two centuries. These privileges, it was alleged, had been confirmed by the treaty of Oliva, concluded by all the Northern powers, which could not be altered but by the consent of all the contracting parties. The Popish party contended strongly for a confirmation of some decrees made against the dissenters in 1717, 1723, and 1736. The deputies from the foreign powers replied, that those decrees had passed in the midst of intestine troubles, and were contradicted by the formal protestations and express declarations of foreign powers. At last, after violent contests, the matter was referred to the bishops and senators for their opinion. Upon a report from them, the diet came to a resolution, That they would fully maintain the dissenters in all the rights and prerogatives to which they were intitled by the laws of their country, particularly by the constitutions of the year 1717, &c. and by treaties; and that as to their complaints with regard to the exercise of their religion, the college of archbishops and bishops, under the direction of the prince primate, would endeavour to remove those difficulties in a manner conformable to justice and neighbourly love.—By this time, however, the court of Russia seemed determined to make her remonstrances more effectual, and a small body of Russian troops marched to within two miles of the capital of Poland.

These resolutions of the diet were by no means agreeable to the dissenters. They dated the beginning of their sufferings from the year 1717. The referring their grievances to the archbishops and bishops was looked upon as a measure the most unreasonable that could be imagined, as that body of men had always been their opposers, and in fact the authors of all the evils which had befallen them.—Shortly after matters were considered in this view, an additional body of Russians, to the number of about 15,000, entered Poland.

The dissenters, being now pretty sure of the protection of foreign powers, entered, on the 20th of March

Poland.

Poland.

1767, into two confederacies, at Thorn and Sluck. One of them was signed by the dissidents of Great and Little Poland, and the other by those of the Great Duchy of Lithuania. The purport of these confederacies was, an engagement to exert themselves in the defence of their ancient privileges, and the free exercise of their religion; professing, at the same time, however, the utmost loyalty to the king, and resolving to send a deputation to him to implore his protection. They even invited those of the Catholic communion, and all true patriots, to unite with them in maintaining the fundamental laws of the kingdom, the peace of religion, and the right of each one jointly with themselves. They claimed, by virtue of public treaties, the protection of the powers who were guaranties of their rights and liberties; namely, the empress of Russia, and the kings of Sweden, Great Britain, Denmark, and Prussia. Lastly, they protested, that they had no intention of acting to the detriment of the Roman Catholic religion, which they duly respected; and only asked the liberty of their own, and the re-establishment of their ancient rights. The three cities of Thorn, Elbing, and Dantzick, acceded to the confederacy of Thorn on the 10th of April; as did the duke and nobles of Courland to that of Sluck on the 15th of May.

The empress of Russia, and king of Prussia, in the mean time, continued to issue forth new declarations in favour of the dissidents, and the Russian troops in Poland were gradually augmented to 30,000 men. Great numbers of other confederacies were also formed in different parts of the kingdom. These at first took little part in the affairs of the dissidents; they complained only of the administration of public affairs, into which they alleged that innovations had been introduced, and were therefore for some time called *confederations of malcontents*. All these confederacies published manifestoes, in which they recommended to the inhabitants to quarter and treat the Russian troops as the defenders of the Polish liberties.

The different confederacies of malcontents formed in the twenty-four districts of Lithuania, united at Wilna on the 22d of June; and that general confederacy re-established prince Radzivil, who had married the king's sister, in his liberty, estates, and honour, of which he had been deprived in 1764 by the states of that duchy. On the 23d of June, prince Radzivil was chosen grand marshal of the general confederacy of all Poland, which then began to be called the *national confederacy*, and was said to be composed of 72,000 noblemen and gentlemen.

The general confederacy took such measures as appeared most proper for strengthening their party. They sent to the several waywodies of the kingdom, requiring their compliance with the following articles: 1. That all the gentlemen who had not signed the confederacy should do it immediately; 2. That all the courts of justice should subsist as formerly, but not judge any of the confederates; 3. That the marshals of the crown should not pass any sentence without the participation of at least four of the confederates; and, 4. That the marshals of the crown and the treasurers should be immediately restored to the possession of their respective rights. The Catholic party in the mean time were not idle. The bishop of Cracow sent a very pathetic and zealous letter to the dietines assembled at Warsaw on the

Poland.

15th of August, in which he exhorted them to arm their nuncios with courage, by giving them orthodox and patriotic instructions, that they might not grant the dissidents new advantages beyond those which were secured to them by the constitutions of the country, and treaties with foreign powers, &c. The pope also sent briefs to the king, the great chancellor, the noblesse, bishops of the kingdom, and to the prince primate, with such arguments and exhortations as were thought most proper to ward off the impending danger. Councils in the mean time were frequently held at the bishop of Cracow's palace, where all the prelates at Warsaw assembled.

On the 26th of September 1767 the confederacy of dissidents was united with the general confederacy of malcontents in the palace of prince Radzivil, who, on that occasion, expressed great friendship for the dissidents. In a few days after, the Russian troops in the capital were reinforced, and a considerable body of them was posted at about five miles distance.

On the 5th of October an extraordinary diet was held: but the affair of the dissidents met with such opposition, that it was thought necessary to adjourn the meeting till the 12th; during which interval, every expedient was used to gain over those who opposed prince Radzivil's plan. This was, to appoint a commission, furnished with full power to enter into conference with prince Reppin, the Russian ambassador, concerning the affairs of the dissidents. Notwithstanding all the pains taken, however, the meeting of the 12th proved exceedingly tumultuous. The bishops of Cracow and Kiow, with some other prelates, and several magnats, declared, that they would never consent to the establishment of such a commission; and at the same time spoke with more vehemence than ever against the pretensions of the dissidents. Some of the deputies answered with great warmth; which occasioned such animosities, that the meeting was again adjourned till the 16th.

On the 13th the bishops of Cracow and Kiow, the palatine of Cracow, and the staroste of Dolniski, were carried off by Russian detachments. The crime alleged against them, in a declaration published next day by prince Reppin, was, that they had been wanting in respect to the dignity of the empress of Russia, by attacking the purity of her intentions towards the republic; though she was resolved to continue her protection and assistance to the general confederacy united for preserving the liberties of Poland, and correcting all the abuses which had been introduced into government, &c.

It was probably owing to this violent proceeding of the Russians, that prince Radzivil's plan was at last adopted, and several new regulations were made in favour of the dissidents. These innovations, however, soon produced a civil war, which at last ended in the ruin of the kingdom. In the beginning of the year 1768, a new confederacy was formed in Podolia, a province bordering on Turkey, which was afterwards called the *confederacy of Bar*. The intention of it was, to abolish, by force of arms, the new constitutions, particularly those in favour of the dissidents. The members of the new confederacy likewise expressed great resentment against the carrying away of the bishop of Cracow, &c. and still detaining them in custody.

Podolia

Podolia was reckoned the fittest place for the purpose of the confederates, as they imagined the Russians could not attack them there without giving umbrage to the Ottoman court. Similar confederacies, however, were quickly entered into throughout the kingdom: the clergy excited all ranks of men to exert themselves in defence of their religion; and so much were their exhortations regarded, that even the king's troops could not be trusted to act against these confederates. The empress of Russia threatened the new confederates as disturbers of the public tranquillity, and declared that her troops would act against them if they persisted. It was, however, some time before the Russian troops were considerably reinforced; nor did they at first seem inclined to act with the vigour which they might have exerted. A good many skirmishes soon happened between these two contending parties, in which the confederates were generally defeated. In one of these the latter being worsted, and hardly pressed, a number of them passed the Niester, and took refuge in Moldavia. This province had formerly belonged to Poland, but was now subject to the Grand Signior: the Russians, however, pursued their enemies into Moldavia; but in order to prevent any offence being taken by the Porte, prince Repnin wrote to the Russian resident at Constantinople, to intimate there, that the conduct of the Russian colonel who commanded the party was quite contrary to the orders of his court, and that therefore he would be turned out of his post.

Great cruelty in the mean time was exercised against the dissidents where there were no Russian troops to protect them. Towards the end of October 1769, prince Martin Lubomirski, one of the southern confederates, who had been driven out of Poland, and had taken shelter with some of his adherents among the mountains of Hungary, got a manifesto posted up on several of the churches of Cracow, in which he invited the nation to a general revolt, and assuring them of the assistance of the Ottoman Porte, with whom he pretended to have concluded a treaty. This was the beginning of hostilities between the Turks and Russians, which were not terminated but by a vast effusion of blood on both sides.

The unhappy kingdom of Poland was the first scene of this war, and in a short time was reduced to the most deplorable situation. In the end of the year 1768, the peasants of the Greek religion in the Polish Ukraine, and province of Kiow, took up arms, and committed the greatest ravages, having, as they pretended, been threatened with death by the confederates unless they would turn Roman Catholics. Against these insurgents the Russians employed their arms, and made great numbers of them prisoners. The rest took refuge among the Haidamacks; by whom they were soon joined, and in the beginning of 1769 entered the Ukraine in conjunction with them, committing every where the most horrid massacres. Here, however, they were at last defeated by the Polish troops, at the same time that several of the confederacies in Poland were severally chastised. Soon after, the Chan of the Crim Tartars, having been repulsed with loss in an attempt on New Servia, entered the Polish territories, where he left frightful marks of his inhumanity upon some innocent and defenceless persons. This latter piece of conduct, with the cruelties exercised by the confederates,

induced the Polish coffacks of Braclau and Kiovia, amounting to near 30,000 effective men, to join the Russians, in order to defend their country against these destroyers. Matters continued much in the same way during the rest of the year 1769; and in 1770, skirmishes frequently happened between the Russians and confederates, in which the latter were almost always worsted; but they took care to revenge themselves by the most barbarous cruelties on the Dissidents, wherever they could find them. In 1770, a considerable number of the confederates of Bar, who had joined the Turks, and been excessively ill used by them, came to an accommodation with the Russians, who took them under their protection on very moderate terms.—Agriculture in the mean time had been so much neglected, that the crop of 1770 was very deficient. This encouraged a number of desperadoes to associate under the denomination of *confederates*, who were guilty of still greater excesses than those who had been under some kind of regulation. Thus a great part of the country was at last reduced to a mere desert, the inhabitants being either exterminated, or carried off to stock the remote Russian plantations, from whence they never could return.

In the year 1771, the confederacies, which seemed to have been extinguished, sprung up afresh, and increased to a prodigious degree. This was occasioned by their having been secretly encouraged and supplied with money by France. A great number of French officers engaged as volunteers in their service; who, having introduced discipline among their troops, they acted with much greater vigour than formerly, and sometimes proved too hard for their enemies. These gleams of success proved at last their total ruin. The Russians were reinforced, and properly supported. The Austrian and Prussian troops entered the country, and advanced on different other sides; and the confederates found themselves in a short time entirely surrounded by their enemies, who seemed to have nothing less in view than an absolute conquest of the country, and sharing it among themselves.

Before matters came to this crisis, however, the <sup>95</sup>confederates formed a design of assassinating the king, on account of his supposed attachment to the Dissidents. As he was returning to his palace at Warsaw, November 3, 1771, about nine in the evening, it being then very dark, and he not attended by his usual guards, the coach was suddenly attacked, at the corner of the street, by six men on horseback, the principal of whom was Koczinski, an officer among the confederates. They fired their carbines and pistols into the carriage; after which they dragged out the king, and carried him off. Soon after they were joined by 25 of their associates; and not only got clear of the city, but reached a place called *Willanow*, six or seven English miles distant from the capital. Mean time, however, the country was alarmed; cannon were repeatedly fired as signals; and parties of Russians, sent out in quest of the king, continually alarmed the conspirators with their shouts. At last Koczinski advised them to a separation, as the only probable means of escaping the Russians; and, his advice being complied with, he by this means got the king into his own power, and that of four others only. These companions he found means to get rid of, by sending them away

<sup>95</sup> Attempt to assassinate the king in 1771.

Poland.

away one by one to observe the motions of the pursuers. He then quitted the road, and dismounted; and, throwing himself at the king's feet, implored his pardon, and offered to save his life. After this they marched an hour and a half on foot through dismal woods and morasses, till they arrived at a hut; whence the king sent to the Russian general, and was conveyed to Warlaw early in the morning. He had received two wounds in his head, one from a ball, and the other from a sabre; and his escaping with life may be considered as a very extraordinary event.

The affairs of this unhappy country continued for some time in the same miserable way. Almost the whole of it was reduced to a mere desert; at the same time that a treaty was talked of between the three powers, for dividing the whole kingdom among them. By this treaty, it was said, that the Austrians were to have a great part of South Poland; the Russians, the Polish Ukraines, and a part of the duchy of Lithuania; and the Prussians, that part called *Po-<sup>96</sup>lish Prussia*.

<sup>96</sup>  
The kingdom divided between the Russians, Austrians, and Prussians.

A partition of this kind actually did take place. The king of Prussia, partly by treaty, and partly by encroachments, founded on antiquated claims and vague pretences, possessed himself of so much of the kingdom, that the court of Petersburg thought proper to check his progress; and the Austrians proceeded in the same manner; and at last the constitution of the kingdom was totally altered, by the appointing of a new assembly called a *permanent council*. This revolution took place on the 8th of August 1774. The council was composed of 40 members; and included three estates, the king, the senate, and the equestrian order. The members were to be chosen at the diets, by ballot, and their power to continue only from one diet to another. The king is always to be chief of the council; the senate to comprehend the great officers or ministry, and the members chosen from that body; and the equestrian order to be as nearly equal as the odd number 39 would permit. This council composes four particular departments: the first is to take cognizance of all those concerns which usually came before the marshals of the crown, or of Lithuania; the second is charged with whatever relates to the police, and all the inferior departments are to bring in their reports to it; the third comprehends the military, the whole immediate power of which is vested in the grand general, under the obligation of bringing in all his reports and accounts at stated times to be examined; the fourth have the care of correspondence with foreign powers. At this time also the revenues of the king, which before did not exceed L. 100,000, were now increased to three times that sum. The republic likewise agreed to pay his debts, amounting to upwards of L. 400,000. It bestowed on him also, in hereditary possession, four floridies, or governments of castles, with the districts belonging to them; and reimbursed him of the money he had laid out for the state. It was also agreed, that the revenues of the republic should be enhanced to 35 millions of florins (near two millions Sterling), and the army should consist of 30,000 men. Soon after the conclusion of the peace with Turkey, the empress of Russia also made the king a present of 250,000 rubles, as a compensation for that part of his

Poland.

dominions which fell into her hands. The air of this kingdom is cold in the north, but temperate in the other parts both in summer and winter, and the weather in both more settled than in many other countries. The face of the country is for the most part level, and the hills are but few. The Crapack or Carpathian mountains, separate it from Hungary on the south. The soil is very fruitful both in corn and pasturage, hemp and flax. Such is the luxuriance of the pastures in Podolia, that it is said one can hardly see the cattle that are grazing in the meadows. Vast quantities of corn are yearly sent down the Vitula to Dantzic, from all parts of Poland, and bought up chiefly by the Dutch. The eastern part of the country is full of woods, forests, lakes, marshes, and rivers; of the last of which, the most considerable in Poland are, the Vitula, Nieper, Niester, Duna, Bog, Warta, and Memel. The metals found in this country are iron and lead, with some tin, gold, and silver; but there are no mines of the two last wrought at present. The other products of Poland are most sorts of precious stones, oker of all kinds, fine rock-crystal; Muscovy glass, talc, alum, saltpetre, amber, pitch, quicksilver, spar, sal-gem, lapis calaminaris, and vitriol. In Lesser Poland are salt-mines, which are the chief riches of the country, and bring most money into the exchequer. In the woods, which consist mostly of oak, beech, pine, and fir trees, besides the more common wild beasts, are elks, wild asses, wild oxen or uris, lynxes, wild horses, wild sheep with one horn, bisons, hyænas, wild goats, and buffaloes. In the meadows and fenny ground is gathered a kind of manna; and the kermes-berries produced in this country are used both in dyeing and medicine.

The inhabitants consist of nobles, citizens, and peasants. The first possess great privileges, which they enjoy partly by the indulgence of their kings, and partly by ancient custom and prescription. Some of them have the title of *prince, count, or baron*; but no superiority or pre-eminence on that account over the rest, which is only to be obtained by some public post or dignity. They have the power of life and death over their vassals; pay no taxes; are subject to none but the king; have a right to all mines and salt-works on their estates; to all offices and employments, civil, military, and ecclesiastic; cannot be cited or tried out of the kingdom; may choose whom they will for their king, and lay him under what restraints they please by the *Pacta Conventa*; and none but they and the burghers of some particular towns can purchase lands. In short, they are almost entirely independent, enjoying many other privileges and prerogatives besides those we have specified; but if they engage in trade, they forfeit their nobility.

The Polish tongue is a dialect of the Slavonic: it is neither copious nor harmonious. Many of the words have not a single vowel in them; but the High Dutch and Latin are understood and spoken pretty commonly, though incorrectly. The language in Lithuania differs much from that of the other provinces. True learning and the study of the arts and sciences have been little attended to in Poland, till of late they began to be regarded with a more favourable eye, and to be not only patronized, but cultivated by several

<sup>97</sup>

Language.

ral

Poland. ral of the nobles and others, both laymen and ecclesiastics.

100 Archbishops, &c. There are two archbishops in the kingdom, viz. those of Gnesna and Laopol, and about a dozen bishops. The archbishop of Gnesna is always a cardinal, and primate of the kingdom; of which, during an interregnum, and in the king's absence, he is also regent. The prevailing religion is Popery; but there are great numbers of Lutherans, Calvinists, Greeks, who are called *Dissidents*, and by the laws of the kingdom were intitled to toleration; but were much oppressed till very lately. The Jews are indulged with great privileges, and are very numerous in Poland; and in Lithuania, it is said, there are a multitude of Mahometan Tartars. We may judge of the numbers of Jews in this country by the produce of their annual poll-tax, which amounts to near 57,000 rix-dollars.

101 Manufactures. There are few or no manufactures in the kingdom, if we except some linen and woollen clothes and hardwares; and the whole trade is confined to the city of Dantzic, and other towns on the Vistula or Baltic.

102 Constitution. The kings of Poland were anciently hereditary and absolute; but afterwards became elective and limited, as we find them at this day. In the reign of Lewis, towards the end of the 14th century, several limitations were laid on the royal prerogative. In that of Casimir IV. who ascended the throne in 1446, representatives from the several palatinates were first called to the diet; the legislative power, till then, having been lodged in the states, and the executive in the king and senate. On the decease of Sigismund Augustus, it was enacted by law, "That the choice of a king for the future should perpetually remain free and open to all the nobles of the kingdom;" which law has accordingly been hitherto observed. The king, in consequence, is elected by the clergy and gentry in the plains of Warfaw; and after his election is obliged to sign an instrument, by which his power is circumscribed within very narrow bounds; so that he is only a sort of president of the senate, which, in his absence, can meet and consult without him. The diets are either ordinary or extraordinary. The former meet every second year; the latter upon extraordinary occasions, when summoned by the king. They fit but six weeks; and one dissenting voice prevents their passing any laws, or coming to any resolution on what is proposed to them from the throne. The senate is composed of the primate, the archbishop of Lemberg, 15 bishops, 15 palatinates and castellans, and 130 laymen, consisting of the great officers of state, the palatinates, and castellans. Besides these officers, who are members of the senate, there are the starostas, who are a sort of governors and judges of their respective starosties or districts; but some of them have no jurisdiction. The palatinates and castellans, besides being senators, are also a sort of lord-lieutenants and deputy-lieutenants in their respective palatinates. There are not only general diets, but also provincial diets, or dietines, held previous to the general diets. When the nobility enter into an association, either during an interregnum, or while the king is living, it is called a *confederacy*. Every third diet is held at Grodno, in

Lithuania. Among the king's royal prerogatives the chief is, that he has the disposal of most of the dignities, offices, and the royal demesnes; but none of the officers are accountable to him, nor can they be displaced by him.

103 Revenue. The king's revenue is all clear to himself, for he pays no troops, nor even his own guards; but all the forces are paid by the republic, as well as the officers of state. The public revenues arise chiefly from the crown-lands, the salt-mines in the palatinate of Cracow, ancient tolls and customs, particularly those of Elbing and Dantzic, the rents of Marienburg, Dirhau, and Rogenhus, and of the government of Cracow and district of Niepolomicz.

104 Order of knighthood. The order of the White Eagle was instituted by Augustus II. in the year 1705. Its ensign is a cross of gold enamelled with red, and appendant to a blue ribbon. The motto, *Pro fide, rege, et lege*.

105 Forces. The standing forces of Poland are divided into the crown-army, and that of Lithuania, consisting of horse and foot, and amounting to between 20,000 and 30,000 men. These troops are mostly cantoned on the crown-lands, and in Poland are paid by a capitation or poll-tax; but in Lithuania other taxes are levied for this purpose. Most of the foot are Germans. On any sudden and imminent danger, the whole body of the nobility, with their vassals, are obliged to appear in the field on horseback; and the cities and towns furnish a certain number of foot-soldiers, with carriages, and military stores; but for want of proper arms, provisions, subordination, and discipline, and by being at liberty after a few weeks to return home, this body has proved but of little advantage to the republic. Dantzic is the only place in the Polish dominions that deserves the name of a fortress. Foreign auxiliaries are not to be brought into the kingdom, nor the national troops to march out of it, without the consent of the states.

With regard to many of these particulars, however, it is to be observed, that we can speak only as they were before the partition-treaty between the powers abovementioned. Since that time a very considerable alteration must have taken place in many parts of the constitution; but the particulars have not yet been properly authenticated.

106 Character of the people. The Poles are personable men, and have good complexions. They are esteemed a brave, honest people, without dissimulation, and exceeding hospitable. They clothe themselves in furs in winter, and over all they throw a short cloak. No people keep grander equipages than the gentry. They look upon themselves as so many sovereign princes; and have their guards, bands of music, and keep open houses: but the lower sort of people are poor abject wretches, in the lowest state of slavery. The exercises of the gentry are hunting, riding, dancing, vaulting, &c. They reside mostly upon their estates in the country; and maintain themselves and families by agriculture, breeding of bees, and grazing.

POLAR, in general, something relating to the poles of the world, or poles of the artificial globes.

POLAR Regions, those parts of the world which lie near the north and south poles. See the article POLE.

Polarity,  
Pole.

**POLARITY**, the quality of a thing considered as having poles, or a tendency to turn itself into one certain posture; but chiefly used in speaking of the magnet.

**POLE** (Reginald), cardinal, and archbishop of Canterbury, a younger son of Sir Rich. Pole, Lord Montague, was born at Stoverton castle, in Staffordshire, in the year 1500. At seven years of age, he was sent to a Carthusian monastery at Shene, near Richmond in Surry; and thence, when he was about 12 years old, removed to Magdalen college in Oxford, where, by the instructions of the celebrated Lineacre and Latimer, he made considerable progress in learning. In 1515 he took the degree of bachelor of arts, and entered into deacon's orders some time after: in 1517, he was made prebendary of Salisbury, and in 1519 dean of Wimborne and dean of Exeter. We are not surpris'd at this young nobleman's early preferences, when we consider him as the kinsman of Henry VIII. and that he was bred to the church by the king's special command.

Being now about the age of 19, he was sent, according to the fashion of the times, to finish his studies at Padua in Italy, where he resided some time in great splendor, having a handsome pension from the king. He returned to England in 1525, where he was most graciously received at court, and universally admired for his talents and address; but preferring study and sequestration to the pleasures of a court, he retired to the Carthusian convent at Shene, where he had continued about two years, when the pious king began to divulge his scruples of conscience concerning his marriage with Catharine of Spain. Pole foresaw that this affair would necessarily involve him in difficulties; he therefore determined to quit the kingdom, and accordingly obtained leave to visit Paris. Having thus avoided the storm for the present, he returned once more to his convent at Shene; but his tranquillity was again interrupted by the king's resolution to shake off the pope's supremacy, of which Pole's approbation was thought indispensably necessary. How he managed in this affair, is not very clear. However, he obtained leave to revisit Italy, and his pension was continued for some time.

The king, having now divorced queen Catharine, married Anne Boleyn, and being resolv'd to throw off the papal yoke, order'd Dr Richard Sampson to write a book in justification of his proceedings, which he sent to Pole for his opinion. To this Pole, secure in the pope's protection, wrote a scurrilous answer, entitled *Pro Unitate Ecclesiastica*, and sent it to the king; who was so offended with the contents, that he withdrew his pension, stripp'd him of all his preferments, and procur'd an act of attainder to be pass'd against him. In the mean time, Pole was created a cardinal, and sent nuncio to different parts of Europe. King Henry made several attempts to have him secur'd and brought to England, but without effect. At length the pope fix'd him as legate at Viterbo, where he continued till the year 1543, when he was appointed legate at the council of Trent, and was afterwards employ'd by the pope as his chief counsellor.

Pope Paul III. dying in 1549, Pole was twice elected his successor, and, we are told, twice refus'd the papal dignity: first, because the election was made in too great haste; and the second time, because it was

done in the night. This delicacy in a cardinal is truly wonderful: but the intrigues of the French party seem to have been the real cause of his miscarriage; they flar'd many objections to Pole, and by that means gain'd time to procure a majority against him. Cardinal Maria de Monte obtained the triple crown; and Pole, having kiss'd his slipper, retired to the convent of Magazone near Verona, where he continued till the death of Edward VI. in the year 1553. On the accession of queen Mary, Pole was sent legate to England, where he was received by her majesty with great veneration, and conducted to the archbishop's palace at Lambeth, poor Cranmer being at that time prisoner in the Tower. He immediately appear'd in the house of lords, where he made a long speech; which being reported to the commons by their speaker, both these obsequious houses concurr'd in an humble supplication to be reconcil'd to the see of Rome. They presented it on their knees to her majesty, who interceded with the cardinal, and he graciously condescended to give them absolution. This business being over, the legate made his public entry into London, and immediately set about the extirpation of heresy. The day after the execution of Cranmer, which he is said to have advis'd, he was consecrated archbishop of Canterbury. In the same year, 1556, he was elected chancellor of the university of Oxford, and soon after of Cambridge; both which he visit'd, by his commissioners, with great inhumanity. He died of a double quartan ague in the year 1558, about 16 hours after the death of the queen; and was buried in the cathedral of Canterbury.

As to his character, the Romish writers ascribe to him every virtue under heaven: even bishop Burnet is extremely lavish in his praise, and attributes the cruelties of Mary's reign to the advice of Gardiner. But, notwithstanding the apparent mildness in Pole's disposition, when we consider him as an abject slave to the see of Rome, and the chief counsellor and confidant of queen Mary, it is irrational to acquit him of the diabolical cruelties which so eminently stigmatise the reign of that princess.—He wrote, *Pro unitate ecclesiastica, De ejusdem potestate*, A treatise on justification, and various other tracts.

**POLE**, in astronomy, that point in the heavens round which the whole sphere seems to turn. It is also used for a point directly perpendicular to the centre of any circle's plane, and distant from it by the length of a radius.

**POLE**, in geography, one of the points on which the terraqueous globe turns; each of them being 90 degrees distant from the equator, and, in consequence of their situation, the inclination of the earth's axis, and its parallelism during the annual motion of our globe round the sun, having only one day and one night throughout the year.

By reason of the obliquity with which the rays of the sun fall upon the polar regions, and the great length of the night in the winter time, the cold is so intense, that those parts of the globe which lie near the poles have never been fully explor'd, though the attempt has been repeatedly made by the most celebrated navigators. Indeed their attempts have chiefly been confin'd to the northern regions; for with regard to the south pole, there is not the same incitement to attempt it. The great object for which navigators

Pole.

Pole. have ventured themselves in these frozen seas, was to find out a more quick and ready passage to the East Indies; and this hath been attempted three several ways: one by coasting along the northern parts of Europe and Asia, called the *north-east passage*; another, by sailing round the northern part of the American continent, called the *north-west passages*; and the third, by sailing directly over the pole itself.

Attempts to find out the north-east passage.

Why it is impossible to sail eastward along the northern coast of Asia.

1. The possibility of succeeding in the north-east passage was for a long time believed; and in the last century many navigators, Dutchmen particularly, attempted it with great fortitude and perseverance. It was always found impossible, however, to surmount the obstacles which nature had thrown in the way, and subsequent attempts have in a manner demonstrated the impossibility of ever sailing eastward along the northern coast of Asia. The reason of this impossibility has been assigned under the article AMERICA; where, speaking of the difference between the climates of continents and islands, it has been shown, that in proportion to the extent of land, the cold is always greater in winter, and *vice versa*. This is the case even in temperate climates; but much more so in those frozen regions where the influence of the sun, even in summer, is but small. Hence, as the continent of Asia extends a vast way from west to east, and has besides the continent of Europe joined to it on the west, it follows, that about the middle part of that tract of land the cold should be greater than any where else. Experience has determined this to be fact; and it now appears, that about the middle part of the northern coast of Asia, the ice never thaws; neither have even the hardy Russians and Siberians themselves been able to overcome the difficulties they met with in that part of their voyage. In order to make this the more plain, and the following accounts more intelligible, we shall observe, that from the north-western extremity of Europe, called the *North Cape*, to the north-eastern extremity of Asia, called the *promontory of the Tchibutski*, is a space including about 160 degrees of longitude, *viz.* from 40 to 200 east from Ferro; the port of Archangel lies in about 57 degrees east longitude, Nova Zembla between 70 and 95; which last is also the situation of the mouth of the great river Oby. Still farther eastward are the mouths of the rivers Jenisey in 100°; Pisida in 105°; Chatanga in 124°; Lena, which has many mouths, between 134° and 142°; Indigirka in 162°; and the Kovyma in 175. The coldest place in all this tract, therefore, ought to be that between the mouths of the Jenisey and the Chatanga; and indeed here the unsurmountable difficulty has always been, as will appear from the following accounts of the voyages made by the Russians with a view to discover the north-east passage.

Voyage of Morzovieff, &c.

In 1734, lieutenant Morzovieff sailed from Archangel towards the river Oby, but could scarce advance 20 degrees of longitude during that season. The next summer he passed through the straits of Weygatz into the sea of Kara; but did not double the promontory which separates the sea of Kara from the bay or mouth of Oby. In 1738, the lieutenants Malgyn and Shurakoff doubled that promontory with great difficulty, and entered the bay of Oby. Several unsuccessful attempts were made to pass from the bay of Oby to the Jenisey; which was at last effected, in 1738, by two ves-

sels commanded by lieutenants Ofizin and Koskeleff. The same year the pilot Feodor Menin sailed eastwards from the Jenisey to the mouth of the Pisida; but here he was stopped by the ice; and finding it impossible to force a passage, he returned to the Jenisey.

Pole.

In July 1735, lieutenant Pronthitcheff failed down the river Lena, in order to pass by sea to the mouth of the Jenisey. The western mouths of the Lena were so choaked up with ice, that he was obliged to pass through the most easterly one; and was prevented by contrary winds from getting out till the 13th of August. Having steered north-west along the islands which lie scattered before the mouths of the Lena, he found himself in Lat. 70. 4.; yet even here he saw pieces of ice from 24 to 60 feet in height, and in no place was there a free channel left of greater breadth than 100 or 200 yards. His vessel being much damaged, he entered the mouth of the Olenek, a small river near the western mouth of the Lena; and here he continued till the ensuing season, when he got out in the beginning of August. But before he could reach the mouth of the Chatanga, he was so entirely surrounded and hemmed in with ice, that it was with the utmost difficulty he could get loose. Observing then a large field of ice stretching into the sea, he was obliged to sail up the Chatanga. Getting free once more, he proceeded northward, doubled the cape called *Taimura*, and reached the bay of that name lying in about 115° east from Ferro; from thence he attempted to proceed westward along the coast. Near the shore were several small islands, between which and the shore the ice was immoveably fixed. He then directed his course towards the sea, in order to pass round the chain of islands. At first he found the sea more free to the north of these islands, but observed much ice lying between them. At last he arrived at what he took to be the last of the islands, lying in lat. 77. 25. Between this island and the shore, as well as on the other side of the island which lay most to the north, the ice was firm and immoveable. He attempted, however, to steer still more to the north; and having advanced about six miles, he was prevented by a thick fog from proceeding; this fog being dispersed, he saw nothing every where but ice, which at last drove him eastward, and with much danger and difficulty he got to the mouth of the Olenek on the 29th of August.

OF Font-thitcheff.

Another attempt to pass by sea from the Lena to the Jenisey was made in 1739 by Chariton Laptieff, but with no better success than that just mentioned. This voyager relates, that between the rivers Pisida and Taimura, a promontory stretches into the sea, which he could not double, the sea being entirely frozen up before he could pass round.

OF Chariton Laptieff.

Besides the Russians, it is certain that some English and Dutch vessels have passed the island of Nova Zembla into the sea of Kara: "But (says Mr Cox's observations) no Russian vessel has ever got from the Pisida to the Chatanga, or from the Chatanga to the Pisida; and yet some authors have positively asserted that this promontory has been sailed round. In order therefore to elude the Russian accounts, which clearly assert the

Mr Cox's observations.

<sup>Pole.</sup> contrary, it is pretended that Gmelin and Muller have purposely concealed some parts of the Russian journals, and have imposed on the world by a misrepresentation of facts. But without entering into any dispute upon this head, I can venture to affirm, that no sufficient proof has been as yet advanced in support of this assertion; and therefore, until some positive information shall be produced, we cannot deny plain facts, or give the preference to hearsay evidence over circumstantial and well attested accounts.<sup>9</sup>

<sup>7</sup>  
Of the navigation from the Lena to Kamtschatka.

The other part of this north-east passage, viz. from the Lena to Kamtschatka, though sufficiently difficult and dangerous, is yet practicable; as having been once performed, if we may believe the accounts of the Russians. According to some authors indeed, says Mr Coxe, this navigation has been open a century and an half; and several vessels at different times have passed round the north-eastern extremity of Asia. But if we consult the Russian accounts, we shall find that frequent expeditions have been unquestionably made from the Lena to the Koyvma, but that the voyage from the Koyvma round Tschutskoi Nofs into the Eastern Ocean has been performed but once. According to Mr Muller, this formidable cape was doubled in the year 1648. The material incidents of this remarkable voyage are as follow.

<sup>8</sup>  
Voyage of Deshneff, Ankudinoff &c.

“ In 1648 seven ketches, or vessels, sailed from the mouth of the river Koyvma, in order to penetrate into the Eastern Ocean. Of these, four were never more heard of: the remaining three were commanded by Simon Deshneff, Gerasim Ankudinoff, and Fedot Alexeeff. Deshneff and Ankudinoff quarrelled before their departure concerning the division of profits and honours to be acquired by their voyage; which, however, was not so easily accomplished as they had imagined. Yet Deshneff in his memorials makes no mention of obstructions from the ice, nor probably did he meet with any; for he takes notice that the sea is not every year so free from ice as it was at that time. The vessels sailed from the Koyvma on the 20th of June, and in September they reached the promontory of the Tschutski, where Ankudinoff's vessel was wrecked, and the crew distributed among the other two. Soon after this the two vessels lost sight of each other, and never joined again. Deshneff was driven about by tempestuous winds till October, when he was shipwrecked considerably to the south of the Anadyr. Having at last reached that river, he formed a scheme of returning by the same way that he had come, but never made the attempt. As for Alexeeff, after being also shipwrecked, he had died of the scurvy, together with Ankudinoff; part of the crew were killed by the savages; and a few escaped to Kamtschatka, where they settled.

From the voyage lately undertaken by Captain Cook towards the north-eastern parts of Asia, it appears, that it is possible to double the Promontory of Tschutsehki without any great difficulty; and it now appears, that the continents of Asia and America are separated from one another but by a narrow strait, which is free from ice; but, to the northwards, that experienced navigator was every where stopped by ice in the month of August, so that he could neither trace the American continent farther than to the latitude of 70°, nor reach the mouth of the river Koyvma on the Asiatic continent; though it is probable that this might have

been done at another time when the situation of the ice was altered either by winds or currents.

On the whole, therefore, it appears, that the unmountable obstacle in the north-east passage lies between the rivers Pisafda and Chatanga; and unless there be in that space a connection between the Asiatic and American continents, there is not in any other part. Ice, however, is as effectual an obstruction as land; and though the voyage were to be made by accident for once, it never could be esteemed a passage calculated for the purposes of trade, or any other beneficial purpose whatever.

2. With regard to the north-west passage, the difficulties occur as in the other. Captain Cook's voyage has now assured us, that if there is any strait which divides the continent of America into two, it must lie in a higher latitude than 70°, and consequently be perpetually frozen up. If a north-west passage can be found then, it must be by sailing round the whole American continent, instead of seeking a passage through it, which some have supposed to exist in the bottom of Baffin's Bay. But the extent of the American continent to the northward is yet unknown; and there is a possibility of its being joined to that part of Asia between the Pisafda and Chatanga, which has never yet been circumnavigated. It remains therefore to consider whether there is any possibility of attaining the wished for passage by sailing directly north, between the eastern and western continents.

3. The practicability of this method, which would lead directly to the pole itself, has been very ingeniously supported by the Hon. Daines Barrington, in some tracts published in the years 1775 and 1776, in consequence of the unsuccessful attempts made by captain Phipps, now lord Mulgrave, to reach a higher northern latitude than 81, as was the case in 1773, in the voyage undertaken by his majesty's command.—He instances a great number of navigators who have reached very high northern latitudes; nay, some who have been at the pole itself, or gone beyond it.—These instances are, 1. One captain Thomas Roberfon assured our author that he had been in latitude 82½, that the sea was open, and he was certain that he could have reached the latitude of 83°.—2. From the testimony of captain Cheyne, who gave answers to certain queries drawn up by Mr Dalrymple concerning the polar seas, it appears that he had been in the latitude of 82°.—3. One Mr Watt informed our author, that when he was 17 years of age, at that time making his first voyage with captain McCallam, a bold and skilful navigator, who commanded a Scots whale-fishing ship, as during the time that the whales are supposed to copulate no fishing can be carried on, the captain resolved to employ that interval in attempting to reach the north pole. He accordingly proceeded without the least obstruction to 83½, when the sea was not only open to the northward, but they had seen no ice for the last three degrees; but while he still advanced, the mate complained that the compass was not steady, and the captain was obliged with reluctance to give over his attempt. 4. Dr Campbell, the continuator of Harris's voyages, informed Mr Barrington, that Dr Dallie, a native of Holland, being in his youth aboard a Dutch ship of war, which at that time was usually sent to superintend the Greenland fishery, the

<sup>11</sup>  
Barrington's arguments in favour of a possibility of reaching the pole.

captain

captain determined, like the Scotfman above-mentioned, to make an attempt to reach the pole during the interval between the first and fecond fisheries. He penetrated, according to the belt of Dr Campbell's collection, as far as 88°; when the weather was warm, the fea free from ice, and rolling like the bay of Biscay. Dallie now preffed the captain to proceed: but he answered, that he had already gone too far, and fould be blamed in Holland for neglecting his ftation; upon which account he would fuffer no journal to be kept, but returned as foon as poffible to Spitzbergen. 5. In the year 1662-3, Mr Oldenburg, then fecretary of the royal fociety, was ordered to regifter a paper intitled "Several inquiries concerning Greenland, answered by Mr Gray, who had vifited thofe parts." The 19th of thefe queries is the following: How near hath any one been known to approach the pole?—The answer is, "I once met, upon the coaft of Greenland, a Hollander that fware he had been half a degree from the pole, fhewing me his journal which was alfo attested by his mate; where they had feen no ice or land, but all water." 6. In captain Wood's account of a voyage in quell of the north-eaft paffage, we have the following account of a Dutch fhip which reached the latitude of 89. "Captain Goulden, who had made above 30 voyages to Greenland, did relate to his majefty, that being at Greenland fome 20 years before, he was in company with two Hollanders to the eaftward of Edge's ifland; and that the whales not appearing on the fhore, the Hollanders were determined to go further northward; and in a fortnight's time returned, and gave it out that they had failed into the latitude 89, and that they did not meet with any ice, but a free and open fea, and that there run a very hollow *grown* fea like that of the Bay of Biscay. Mr Goulden being not fatisfied with the bare relation, they produced him four journals out of the two fhips, which testified the fame, and that they all agreed within four minutes." 7. In the Philofophical Tranfactions for 1675 we have the following paffage: "For it is well known to all that fail northward, that moft of the northern coafts are frozen up for many leagues, though in the open fea it is not fo, *no nor under the pole itfelf, unless by accident.*" In which paffage the having reached the pole is alluded to as a known fact, and as fuch ftated to the royal fociety. 8. Mr Miller, in his Gardener's Dictionary, mentions the voyage of one captain Johnson who reached 88 degrees of latitude. Mr Barrington was at pains to find a full account of this voyage; but met only with the following paffage in Buffon's Natural Hiftory, which he takes to be a confirmation of it. "I have been affured by perfons of credit, that an Englifh captain, whose name was *Monfon*, inftead of feeking a paffage to China between the northern countries, had directed his courfe to the pole, and had approached it within two degrees, where there was an open fea, without any ice." Here he thinks that Mr Buffon has miftaken Johnson for Monfon. 9. A map of the northern hemisphere, published at Berlin (under the direktion of the Academy of Sciences and Belles Letters) places a fhip at the pole, as having arrived there according to the Duch accounts. 10. Moxon, hydrographer to Charles II. gives an account of a Duch fhip having been two degrees beyond the pole, which

was much relied on by Wood.

Befides thefe, there are a great number of other teftimonies of fhips which have reached the latitude of 82, 83, 84, &c.; from all which our author concludes, that if the voyage is attempted at a proper time of the year, there would not be any great difficulty of reaching the pole. Thofe vaft pieces of ice which commonly obftrict the navigators, he thinks, proceed from the mouths of the great Afatic rivers which run northward into the frozen ocean, and are driven eaftward and weftward by the currents. But, though we fhould fuppofe them to come direftly from the pole, ftill our author thinks that this affords an undeniable proof that the pole itfelf is free from ice; becaufe, when the pieces leaves it, and come to the fouthward, it is impoffible that they can at the fame accumulate at the pole.

The extreme cold of the winter air on the continents of Asia and America has afforded room for fufpicion, that at the pole itfelf, and for feveral degrees to the fouthward of it, the fea muft be frozen to a vaft depth in one folid cake of ice; but this Mr Barrington refutes, from feveral confiderations. In the first place, he fays, that on fuch a fuppofition, by the continual intensity of the cold, and the accumulation of fnow and frozen vapour, this cake of ice muft have been increafing in thicknefs fince the creation, or at leaft fince the deluge; fo that now it muft be equal in height to the higheft mountains in the world, and be vifible at a great diftance. Befides, the pieces broken off from the fides of fuch an immense mountain muft be much thicker than any ice that is met with in the northern ocean; none of which is above two yards in height above the furface of the water, thofe immense pieces called *ice-mountains* being always formed on land.

Again, the fyftem of nature is fo formed, that all parts of the earth are expofed for the fame length of time, or nearly fo, throughout the year to the rays of the fun. But, by reafon of the fpheroidal figure of the terraqueous globe, the poles and polar regions enjoy the fun fomething longer than others; and hence the Dutch who wintered in Nova Zembla in 1672 faw the fun a fortnight fooner than they ought to have done by aſtronomical calculations. By reafon of this flatnefs about the poles too, the fun not only fhines for a greater fpace of time on thefe inhofpitable regions, but with lefs obliquity in the fummer-time, and hence the effect of his rays muft be the greater. Now Mr Barrington confiders it as an abfurd fuppofition, that this glorious luminary fhould fhine for fix months on a cake of barren ice where there is neither animal nor vegetable. He fays that the polar fea are affigned by nature as the habitation of the whales, the largeft animals in the creation; but if the greateft part of the polar fea are forever covered with an impenetrable cake of ice, thefe huge animals will be confined within very narrow bounds; and they cannot fubfift without frequently coming to the top of the water to breathe.

Laſtly, the quantity of water frozen by different degrees of cold, is by no means direftly in proportion to the intensity of the cold, but likewise to the duration of it. Thus, large bodies of water are never frozen in any temperature of fhort duration, though the fhallow bodies often are. Our author obferves, that as

cold.

Pole. much of a given mass of water was frozen in five hours of a temperature 12° below the freezing point, as was frozen in one hour of the temperature 50° below it; and that long duration of the temperature between 20 and 32 is, with regard to the congelation of water, equivalent to intensity of cold such as is marked 0 and below 0 in Fahrenheit, but of short duration.

14  
Mr Forster's arguments against the possibility of reaching the pole.

On the other hand, Mr Forster, in his Observations, takes the contrary side of the question with no little vehemence. "I know (says he) that Mr de Buffon, Lomonosof, and Crantz, were of opinion that the ice found in the ocean, is formed near the lands, only from the fresh water and ice carried down into the sea by the many rivers in Siberia, Hudson's Bay, &c.; and therefore, when we fell in with such quantities of ice in December 1772, I expected we should soon meet with the land from whence these ice masses had been detached. But being disappointed in the discovery of this land, though we penetrated beyond the 67° twice, and once beyond 71, south latitude, and having besides some other doubts concerning the existence of the pretended southern continent, I thought it necessary to inquire, what reasons chiefly induced the above authors to form the opinion that the ice floating in the ocean must be formed near land, or that an Austral land is absolutely requisite for that purpose; and having looked for their arguments, I find they amount chiefly to this: 'That the ice floating in the ocean is all fresh: that salt water does not freeze at all; or if it does, it contains briny particles. They infer from thence, that the ice in the ocean cannot be formed in the sea, far from any land; there must therefore exist Austral lands; because, in order to form an idea of the original of the great ice-masses agreeably to what is observed in the northern hemisphere, they find that the first point for fixing the high ice-islands is the land, and secondly that the great quantity of flat ice is brought down the rivers.' I have impartially and carefully considered and examined these arguments, and compared every circumstance with what we saw in the high southern latitude, and with other known facts, and will here insert the result of all my inquiries on this subject.

"First, they observe the ice floating in the ocean to yield, by melting, fresh water: which I believe to be true. However, hitherto it has by no means been generally allowed to be fresh; for Crantz says expressly, that 'the flat pieces (forming what they call the ice-fields) are salt, because they were congealed from seawater.' The ice taken up by us for watering the ship was of all kinds, and nevertheless we found it constantly fresh: Which proves, either that the principle of analogy cannot be applied indiscriminately in both hemispheres; and that one thing may be true in the northern hemisphere, which is quite otherwise in the southern, from reasons not yet known or discovered by us: or we must think that Crantz and others are mistaken, who suppose the ice floating in the ocean to be salt.

"The next remark is, That salt water does not freeze at all; or if it does, it contains briny particles.

Pole. Mr de Buffon tells us, 'that the sea between Nova Zembla and Spitzbergen under the 79° north latitude does not freeze, as it is there considerably broad: and that it is not to be apprehended to find the sea frozen not even under the pole itself; for indeed there is no example of having ever found a sea wholly frozen over, and at a considerable distance from the shores: that the only instance of a sea entirely frozen is that of the Black Sea, which is narrow and not very salt, and receives a great many rivers coming from northern regions, and bringing down ice: that this sea therefore sometimes freezes to such a degree, that its whole surface is congealed to a considerable thickness; and, if the historians are to be credited, was frozen, in the reign of the emperor Constantine Copronymus, thirty ells thick, not including twenty ells of snow which was lying on the ice. This fact, continues M. de Buffon, seems to be exaggerated: but it is true however, that it freezes almost every winter; whilst the high seas which are 1000 leagues nearer, towards the pole, do not freeze; which can have no other cause than the difference in saltness and the little quantity of ice carried out by rivers, if compared to the enormous quantity of ice which the rivers convey into the Black Sea.' Mr de Buffon is not mistaken when he mentions that the Black Sea frequently freezes. Strabo informs us, that the people near the Bosphorus Cimmerius pass this sea in carts from Panticapæum to Phanagorea; and that Neoptolemus, a general of Mithridates Eupator, won a battle with his cavalry on the ice, on the very spot where he gained a naval victory in the summer. Marcellinus Comes relates, that in the XIV Indiction, under the consulship of Vincentius and Fravia, in the year 401 after Christ, the whole surface of the Pontus was covered with ice, and that the ice in spring was carried through the Propontis, during thirty days, like mountains. Zonaras mentions the sea between Constantinople and Scutari frozen to such a degree in the reign of Constantine Copronymus, that even loaded carts passed over it. The prince Demetrius Cantemir observes, that in the year 1620-1, there happened so intense a frost, that the people walked over the ice from Constantinople to Iskodar. All these instances confirm Mr de Buffon's assertion. But as this great natural historian says that the Black Sea is the only instance of a sea being entirely frozen (A), I must beg leave to dissent from him; for it is equally well attested, that the Baltic is sometimes entirely frozen, according to Caspar Schütz's account. In the year 1426, the winter was so severe, that people travelled over the ice across the Baltic from Dantzick to Lubeck; and the sea was likewise passable from Denmark to Mecklenburgh: and in the year 1459, the whole Baltic was entirely frozen, so that persons travelled, both on foot and on horseback, over ice from Denmark to the Venedick Hanse-towns, called Lubeck, Wijnar, Roslock, and Stralsund, which had never happened before; people likewise travelled across the Baltic over ice from Revel in Estland to Denmark and to Sweden, and back

(A) In the year 860, the mediterranean was covered with ice, so that people travelled in carts and horses across the Ionian Sea to Venice; (*Hermannus Contractus ap. Pistor. Script. t. II. p. 236.*) And in 1236, the Mediterranean was again thus frozen, that the Venetian merchants travelled over the ice with their merchandise to what place they chose; *Matth. Paris. p. 78.*

Pole.

back again, without the least danger (B). But, according to Sæmund Frode, even the great German Ocean between Denmark and Norway was frozen in the year 1048, so that the wolves frequently ran over the ice from one country to the other. The great northern ocean is likewise most certainly sometimes frozen to a great distance from any land. For Muller relates, that in the year 1715, a Coffack called *Markoff*, with some other persons, was sent by the Russian government to explore the north sea; but finding it next to impossible to make any progress during summer, on account of the vast quantities of ice commonly filling this ocean, he at last determined to try the experiment during winter: he therefore took several sledges drawn according to the custom of the country by dogs, which commonly go about 80 or 100 wersts per day, 105 of which make a degree. And on March the 15th, Old Style, with this caravan of nine persons, he left the shores of Siberia at the mouth of the river Yana, under the 71° of north latitude, and proceeded for seven days together northward, so that he had reached at least the 77° or 78° north latitude, when he was stopped by the ice, which there began to appear in the shape of prodigious mountains. He climbed up to the top of some of these ice mountains: but seeing from thence no land, nor any thing except ice, as far as the eye could reach, and having besides no more food for his dogs left, he thought it very necessary to return; which he with great difficulty performed, on April the 3d, as several of the dogs, which had perished for want, were employed to support those that remained alive. These facts, I believe, will convince the unprejudiced reader, that there are other seas besides the Black Sea, which really do freeze in winter, and that the ice carried down the rivers could not at least freeze the German Ocean between Norway and Denmark, because the rivers there are so small, and bear a very inconsiderable proportion to the immense ocean, which according to experiments made by Mr Wilke is very salt, though near the land, in the Swedish harbour of Landferona.

“ Now, if six or seven degrees of latitude, containing from 360 to 420 sea miles, are not to be reckoned a great distance from the land, I do not know in what manner to argue, because no distance whatsoever will be reckoned far from any land. Nay, if the Coffack *Markoff*, being mounted on one of the highest ice-

mountains, may be allowed to see at least to the distance of 20 leagues, the extent alluded to above must then be increased to 480 English sea-miles; which certainly is very considerable, and makes it more than probable, that the ocean is frozen in winter, in high northern latitudes, even as far as the pole. Besides, it invalidates the argument which these gentlemen wish to infer from thence, that the ocean does not freeze in high latitudes, especially where there is a considerably broad sea; for we have shown instances to the contrary.

“ But M. de Buffon speaks of ice carried down the rivers into the northern ocean, and forming there these immense quantities of ice. ‘ And in case, says he, we would suppose, against all probability, that at the pole it could be so cold as to congeal the surface of the sea, it would remain equally incomprehensible, how these enormous floating ice-masses could be formed, if they had not land for a point to fix on, and from whence they are severed by the heat of the sun. The two ships, which the India Company sent in 1739 upon the discovery of the Aufral lands, found ice in 47° or 48° south latitude, but at no great distance from land; which they discovered, without being able to approach it. This ice, therefore, must have come from the interior parts of the lands near the south pole; and we must conjecture, that it follows the course of several large rivers, washing these unknown lands, in the same manner as the rivers Oby, the Yenisea, and the other great rivers which fall into the northern sea, carry the ice-masses, which stop up the freights of Waigats for the greater part of the year, and render the Tartarian sea inaccessible upon this course.’ Before we can allow the analogy between the rivers Oby, Yenisea, and the rest which fall into the northern ocean, and those coming from the interior parts of the Aufral lands, let us compare the situation of both countries, supposing the Aufral lands really to exist. The Oby, Yenisea, and the rest of the Siberian rivers, falling down into the northern ocean, have their sources in 48° and 50° north latitude, where the climate is mild and capable of producing corn of all kinds. All the rivers of this great continent increasing these great rivers, have likewise their sources in mild and temperate climates, and the main direction of their course is from south to north; and the coast of the northern ocean, not reckoning its sinuities, runs in general west and east. The small rivers, which

In 1423, the ice bore riding from Prussia to Lubeck. (*Crantzii Vandal. l. X. c. 40.*) The whole sea was covered with ice from Mecklenburg to Denmark. (*Incert auct. ap. Ludw. t. IX. p. 125.*)

In 1461, (says *Nicol. Marschallus in annual. Herul. ap. Westphal. t. 1. p. 261.*) Tanta erat hyems, ut concreto gela oceano plaustris millia passuum supra CCC merces ad ultimam Thylem (*Jealand*) et Orcaes verenterunt e Germania tota pene bruma.

In 1545, the sea between Rostock and Denmark, and likewise between Fionia and Sealand, was thus frozen, that the people travelled over the ice on foot, with sledges to which horses and oxen were put. (*Anonym. ap. Ludw. t. IX. p. 176.*)

In 1594, the Cattegat or sea between Norway and Denmark was frozen; that from Oxilo in Norway, they could travel on it to Jutland. (*Strelow Chron. Futhiland, p. 148.*)

Pole. which are formed in high latitudes, have, properly speaking, no sources, no springs, but carry off only the waters generated by the melting of snow in spring, and by the fall of rain in the short summer, and are for the greatest part dry in autumn. And the reason of this phenomenon is obvious, after considering the constitution of the earth in those high northern climates. At Yakutsk, in about 62° north latitude, the soil is eternally frozen, even in the height of summer, at the depth of three feet from the surface. In the years 1685 and 1686, an attempt was made to dig a well; and a man, by great and indefatigable labour, continued during two summer-seasons, and succeeded so far in this laborious task, that he at last reached the depth of 91 feet; but the whole earth at this depth was frozen, and he met with no water, which forced him to desist from so fruitless an attempt. And it is easy to infer from hence, how impossible it is that springs should be formed in the womb of an eternally frozen soil.

15  
Of the freezing of salt-water.

“The argument, therefore, is now reduced to this, *That salt water does not freeze at all; or, if it does, the ice contains briny particles.* But we have already before produced numberless instances, that the sea does freeze; nay, Crantz allows, *that the flat pieces of ice are salt, because they were congealed from sea-water.* We beg leave to add a few decisive facts relative to the freezing of the sea. Barentz observes in the year 1596, September the 16th, the sea froze two fingers thick, and next night the ice was as thick again. This happened in the middle of September; what effect then must the intense frost of a night in January not produce? When Captain James wintered in Charleton’s Isle, the sea froze in the middle of December 1631. It remains, therefore, only to examine, whether the ice formed in the sea must necessarily contain briny particles. And here I find myself in a very disagreeable dilemma; for during the intense frost of the winter in 1776, two sets of experiments were made on the freezing of sea-water, and published, contradicting one another almost in every material point. The one by Mr Edward Nairne F. R. S. an ingenious and accurate observer; the other by Dr Higgins, who reads lectures on chemistry and natural philosophy, and consequently must be supposed to be well acquainted with the subject. I will therefore still venture to consider the question as undecided by these experiments, and content myself with making a few observations on them: but previously I beg leave to make this general remark, that those who are well acquainted with mechanics, chemistry, natural philosophy, and the various arts which require a nice observation of minute circumstances, need not be informed, that an experiment or machine succeeds often very well when made upon a smaller scale, but will not answer if undertaken at large; and, *vice versa*, machines and experiments executed upon a small scale will not produce the effect, which they certainly have when made in a more enlarged manner. A few years ago an experiment made on the dyeing of scarlet, did not succeed when undertaken on a small scale, whereas it produced the desired effect when tried at a dyer’s house with the large apparatus; and it evidently confirms the above assertion, which I think I have a right to apply to the freezing

of salt-water. It is therefore probable, that the ice formed in the ocean at large, in a higher latitude, and in a more intense degree of cold, whereof we have no idea here, may become solid, and free from any briny particles, though a few experiments made by Dr Higgins, in his house, on the freezing of salt-water, produced only a loose spongy ice filled with briny particles.

Pole.

“The ice formed of sea-water by Mr Nairne was <sup>16</sup>very hard, 3½ inches long, and 2 inches in diameter; <sup>Result of experiments on this subject.</sup> it follows from thence, that the washing the outside of this ice in fresh water, could not affect the inside of a hard piece of ice. This ice when melted yielded fresh water, which was specifically lighter than water, which was a mixture of rain and snow water, and next in lightness to distilled water. Had the ice thus obtained not been fresh, the residuum of the sea water, after this ice had been taken out, could not have been specifically heavier than sea water, which, however, was the case in Mr Nairne’s experiment. It seems, therefore, in my opinion, evident from hence, that salt water does freeze, and has no other briny particles than what adhere to its outside. All this perfectly agrees with the curious fact related by Mr Adanson (c), who had brought to France two bottles of sea water, taken up in different parts of the ocean, in order to examine it and to compare its saltness, when more at leisure; but both the bottles containing the salt water were burst by being frozen, and the water produced from melting the ice proved perfectly fresh. This fact is so fairly stated, and so very natural, that I cannot conceive it is necessary to suppose, without the least foundation for it, *that the bottles were changed, or that Mr Adanson does not mention the circumstance by which the sea water was thus altered upon its being dissolved:* for as he expressly observes the bottles to have been burst, it is obvious that the concentrated briny parts ran out and were entirely drained from the ice, which was formed of the fresh water only.

“The ice formed by Dr Higgins from sea water, *consisted of thin laminae, adhering to each other weakly.* Dr Higgins took out the frozen ice from the vessels wherein he exposed the sea water, and continued to do so till the remaining concentrated sea water began to form crystals of sea salt. Both these experiments, therefore, by no means prove what the doctor intended to infer from thence; for it was wrong to take out such ice, which only *consisted of thin laminae, adhering to each other weakly.* Had he waited with patience, he would have obtained a hard ice as well as Mr Nairne, which, by a more perfect congelation, would have excluded the briny particles intercepted between the *thin laminae, adhering to each other weakly;* and would have connected the laminae, by others formed by fresh water. The doctor found afterwards, it is true, thicker and somewhat more solid ice, in the vessel B: but the sea water had already been, so much concentrated by repeated congelations, that it is no wonder the ice formed in it became at last brackish: it should seem then, that no conclusive arguments can be drawn from these experiments.

“There are two other objections against the formation of the ice in the great ocean. The *first* is taken from

(c) Second Supplement to the Probability of reaching the north pole, p. 129.

Pole.

from the immense bulk and size of the ice masses formed in the ocean, which is *the deepest mass of water we know of*. But the reader is referred to the table communicated above, where it appears, that in the midst of summer, in the latitudes of  $55^{\circ}$ ,  $55^{\circ} 26'$ , and  $64^{\circ}$  south, at 100 fathoms depth, the thermometer was at  $34^{\circ}$ ,  $34^{\circ} \frac{1}{2}$  and  $32^{\circ}$ ; and that in all instances, the difference between the temperature at top and 100 fathoms depth never exceeded four degrees of Fahrenheit's thermometer, or that the temperature of the air did not differ five degrees from that of the ocean at 100 fathom deep. If we now add to this, that beyond the  $71^{\circ}$  south the temperature of the air and ocean must be still colder, and that the rigours of an antarctic winter are certainly more than sufficient to cool the ocean to  $28^{\circ} \frac{1}{2}$ , which is requisite for congealing the aqueous particles in it; if we moreover consider, that these severe frosts are continued during six or eight months of the year, we may easily conceive that there is time enough to congeal large and extensive masses of ice. But it is likewise certain, that there is more than one way by which these immense ice masses are formed. We suppose very justly, that the ocean does freeze, having produced for many influences of it; we allow likewise, that the ice thus formed in a calm, perhaps does not exceed three or four yards in thickness; a storm probably often breaks such an ice-field, which Crantz allows to be 200 leagues one way, and 80 the other; the pressure of the broken fragments against one another frequently sets one upon the other piece, and they freeze in that manner together; several such double pieces, thrown by another pressure upon one another, form at last large masses of miles extent, and of 20, 40, 60, and more fathoms thickness, or of a great bulk or height. Martens, in his description of Spitzbergen, remarks, that the pieces of ice cause to great a noise by their shock, that the navigators in those regions can only with difficulty hear the words of those that speak; and as the ice-pieces are thrown one upon another, ice-mountains are formed by it. And I observed very frequently, in the years 1772 and 1773, when we were among the ice, masses which had the most evident marks of such a formation, being composed of strata of some feet in thickness. This is in some measure confirmed by the state in which the Cossack Markoff found the ice at the distance of 420 miles from the Siberian coasts. The high masses which were not found formed, as is suspected in the *Second Supplement to the probability of reaching the north pole*, p. 143-145, near the land, under the high cliffs, but far out at sea; and when these ice mountains were climbed by Markoff, nothing but ice, and no vestiges of land, appeared as far as the eye could reach. The high climates near the poles, are likewise subject to heavy falls of snow, of several yards in thickness, which grow more and more compact, and by thaws and rain are formed into solid ice, which increase the stupendous size of the floating ice mountains.

"The second objection against the freezing of the ocean into such ice as is found floating in it, is taken from the *opacity* of ice formed in salt water; because the largest masses are commonly transparent like crystal, with a fine blue tinct, caused by the reflection of the sea. This argument is very specious, and might

Pole.

be deemed unanswerable to those who are not used to cold winters and their effects. But whoever has spent several winters in countries which are subject to intense frosts, will find nothing extraordinary or difficult in this argument: for it is a well-known fact in cold countries, that the ice which covers their lakes and rivers, is often opaque, especially when the frosts sets in, accompanied by a fall of snow; for, in those instances, the ice looks, before it hardens, like a dough or paste, and when congealed it is opaque and white; however, in spring, a rain and the thaw, followed by frosty nights, change the opacity and colour of the ice, and make it quite transparent and colourless like a crystal; but, in case the thaw continues, and it ceases entirely to freeze, the same transparent ice becomes soft and porous, and turns again entirely opaque. This, I believe, may be applicable to the ice seen by us in the ocean. The field-ice was commonly opaque; some of the large masses, probably drenched by rain, and frozen again, were transparent and pellucid; but the small fragments of loose ice, formed by the decay of the large masses, and soaked by long-continued rains, we found to be porous, soft, and opaque.

"It is likewise urged as an argument against the formation of ice in the ocean, that it always requires land, in order to have a point upon which it may be fixed. First, I observe, that in Mr Nairne's experiments, the ice was generated on the surface, and was seen shooting crystals downwards: which evidently evinces, in my opinion, that ice is there formed or generated where the intensest cold is; as the air sooner cools the surface than the depth of the ocean, the ice floats naturally downwards, and cools the ocean more and more, by which it is prepared for further congelation. I suppose, however, that this happens always during calms, which are not uncommon in high latitudes, as we experienced in the late expedition. Nor does land seem absolutely necessary in order to fix the ice; for this may be done with as much ease and propriety to the large ice-mountains which remain undissolved floating in the ocean in high latitudes; or it may perhaps, not be improper to suppose, that the whole polar region, from 80 and upwards, in the southern hemisphere, remains a solid ice for several years together, to which yearly a new circle of ice is added, and of which, however, part is broken off by the winds and the return of the mild season. Wherever the ice floats in large masses, and sometimes in compact bodies formed of an infinite number of small pieces, there it is by no means difficult to freeze the whole into one piece, for amongst the ice the wind has not a power of raising high and great waves. This circumstance was not entirely unknown to the ancients; and it is probable they acquired this information from the natives of ancient Gaul, and from the Britons, and other northern nations, who sometimes undertook long voyages. The northern ocean was called by the ancients the *frozen, the dead, the lazy, and immovable sea*: sometimes they gave it the name *mare cronium*, the concrete sea, and *morimarusa*, the dead sea. And, what is very remarkable, in all the northern cold countries the frost sometimes is so intense, that all the waters become suddenly coagulated into a kind of paste or dough, and thus at once congeal."

On this reasoning of Mr Foster's, however, we must

Pole.  
17  
Observations on Mr. Forster's sea-faring.

must observe, that it cannot possibly invalidate any fact which Mr Barrington has advanced. The best concerted and most plausible theory in the world must yield to experience; for this is in fact what must judge all theories. Now, from what we have already related, it is demonstrated, that in the space between the mouths of the rivers Pisafida and Chatanga, more ice must be formed, and more intense colds generated, than in any other part of the world. Consequently, for a considerable space both on the east and west side of that, the sea must be more full of ice than any where else. Now, between these two rivers there is the promontory of Taimura, which runs out to the latitude of 78°, or near it, and which of necessity must obstruct the dispersion of the ice; and that it actually does so is in some degree probable, because in one of the Russian voyages abovementioned, the eastern mouth of the Lena was quite free, when the western ones were entirely choked up with ice. Now the mouth of the Yana lies several degrees to the eastward of the Lena: consequently, when the ice comes eastward from the Cape of Taimura, it must necessarily fill all that sea to the latitude of 78° and upwards; but the Cocklack Markoff, if he proceeded directly north, could not be farther than the promontory of Taimura, and consequently still enveloped among the ice. Besides, we are certain, that the sea in 78° is not at all frozen into a solid cake in some places, since Captain Phipps, in 1773, reached 81°. Mr Forster's argument therefore either proves nothing, or it proves too much. If it proves, that about the middle of the eastern continent the cold is so intense that a sufficient quantity of ice is formed to obstruct the navigation for several hundred miles round, this proves nothing; because we knew before, that this must be the case. But if it proves, that the sea must be unnavigable by reason of ice all round the globe at 78° N. L. this is too much; because we certainly know, that, in 1773, Captain Phipps reached the latitude of 81°. However, tho' it should be allowed that the sea is quite clear all the way to the pole, it must be a very great uncertainty whether any ship could by that way reach the East Indies; because we know that it must fall down between the continents of Asia and America, thro' that strait whose mouth must often be blocked up with ice driving eastward along the continent of Asia.

The four poles still more inaccessible than the north pole; for the ice is found in much lower southern than northern latitudes. This superior degree of cold has by many been supposed to proceed from a greater quantity of land about the south than the north pole; and the notion of a vast continent in these regions prevailed almost universally, inasmuch, that many have sought for it in vain. But for a particular discussion of this matter, see the articles SOUTH-Sea, and TERRA AUSTRALIS.

POLE Ase, a sort of hatchet nearly resembling a battle-axe, having an handle about 15 inches in length, and being furnished with a sharp point or claw, bending downwards from the back of its head; the blade whereof is formed like that of any other hatchet. It is principally employed to cut away and destroy the rigging of any adversary who endeavours to board.

Pole-axes are also said to have been successfully used

on some occasions in boarding an enemy, whose sides were above those of the boarder. This is executed by detaching several gangs to enter at different parts of the ship's length, at which time the pole-axes are forcibly driven into her side, one above another, so as to form a sort of scaling-ladders.

POLE-Cat. See MUSTELA.

POLEMICAL, in matters of literature, an appellation given to books of controversy, especially those in divinity.

POLEMONIUM, GREEK VALERIAN, or *Jacob's ladder*; a genus of the monogynia order, belonging to the pentandria class of plants. There are two species, of which the most remarkable is the ceruleum, with an empaleum longer than the flower. It grows naturally in some places of England; however, its beauty has obtained it a place in the gardens. There are three varieties, one with a white, another with a blue, and another with a variegated flower, also a kind with variegated leaves. They are easily propagated by seeds; but that kind with variegated leaves is preferred by parting its roots, because the plants raised from seeds would be apt to degenerate and become plain.

POLEMOSCOPE, in optics, the same with OPERA-GLASS. See OPTIC, p. 5584. col. 1. par. ult.

POLENBURG (Cornelius), a sweet painter of little landscapes and figures, was born at Utrecht in 1586, and educated under Blomaert, whom he soon quitted to travel into Italy; and studied for a long time in Rome and Florence, where he formed a style entirely new, which, though preferable to the Flemish, is unlike any Italian, except in his having adorned his landscapes with ruins. There is a varnished smoothness and finishing in his pictures, that render them always pleasing, though simple and too nearly resembling one another. The Roman cardinals were charmed with the neatness of his works, as was also the great duke; but could not retain him. He returned to Utrecht, and pleased Rubens, who had several of his performances. King Charles I. invited him to London, where he generally painted the figures in Steenwyck's perspectives: but the king could not prevail on him to fix here; for, after staying only four years, and being handsomely rewarded by his Majesty for several pieces which he performed for him, he returned to Utrecht, and died there at the age of 74. His works are very scarce and valuable.

POLERON, one of the Banda or nutmeg islands in the East Indies. This was one of those spice islands which put themselves under the protection of the English, and voluntarily acknowledged James I. king of England for their sovereign; for which reason the natives of this and the rest of the islands were murdered, or driven thence by the Dutch, together with the English.

POLESIA, a province of Poland, bounded by Polachio and Proper Lithuania on the north, and by Volinia on the south. It is one of the palatinates of Lithuania, and is commonly called *Bregia*, and its capital is of this name. It is full of forests and lakes.

POLESINO DE BOVIGO, a province of Italy in the republic of Venice, lying to the north of the river Po, and bounded on that side by the Paduan, on the south by the Ferrarese, on the east by Degado, and on the west

Pole  
&  
Poleimo.

*Polygonum*. west by the Veronese. It is 45 miles in length, and 17 in breadth, and is a fertile country. Rovigo is the capital.

**POLIANTHES**, the **TUBEROSE**; a genus of the monogynia order, belonging to the hexandria class of plants. There is but one species, consisting of some varieties; all of which being exotics of tender quality, require aid of artificial heat, under shelter of frames and glasses, &c. to bring them to flower in perfection in this country. The polianthes, or tuberose, hath an oblong, bulb-like, tuberous, white root; crowned with a few long very narrow leaves; amidst them an upright, straight, firm stem, three or four feet high, terminated by a long spike of large white flowers, arranged alternately. The varieties are the common tuberose, with single-flowers,—double flowered,—dwarf-stalked,—variegated leaved. They all flower here in June, July, and August: the flowers are funnel or bell shaped; garnish the upper part of the stem, in a long spike, consisting of from ten to twenty or more separate in alternate arrangements, the lower flowers opening first, which are succeeded by those above, in regular order, making in the whole a most beautiful appearance, highly enriched with a most fragrant odour. The common single-flowered tuberose, is the sort the most commonly cultivated, as it generally blows the most freely, and possesses the finest fragrance. The double-flowered kind also highly merits culture as when it blows fair it makes a singularly fine appearance. The dwarf and the variegated kinds are inferior to the other two, but may be cultivated for variety.

All the varieties being exotics from warm countries, although they are made to flower in great perfection in our gardens by assistance of hot-beds, they will not prosper in the open ground, and do not increase freely in England; so that a supply of the roots is imported hither annually from Genoa, and other parts of Italy, by most of the eminent nursery and seedsmen, and the Italian warehouse-keepers; generally arriving in February or March, time enough for the ensuing summer's bloom; and are sold commonly at the rate of twelve or fifteen shillings per hundred, being careful always to procure as large roots as possible, for on this depends the success of having a complete blow. They requiring artificial heat to blow them in this country, are planted in pots, and plunged in a hot-bed, under a deep frame furnished with glass lights; or placed in a hot-house, where they may be blown to great perfection, with little trouble. The principal season for planting them is March and April; observing, however, that in order to continue a long succession of the bloom, it is proper to make two or three different plantings, at about a month interval; one in March, another in April, and a third the beginning of May, whereby the blow may be continued from June until September; observing, as above-mentioned, they may be flowered either by aid of a common dung or bark hot-bed, or in a hot-house.

With respect to the propagation of these plants, it is principally by off-sets of the roots. The blowing roots that are brought annually from abroad, for sale, are often furnished with off-sets, which ought to be separated, previous to planting; those also that are planted here in our gardens frequently furnish off-sets

fit for separation in autumn when the leaves decay; Polican. &c. they must then be preserved in sand all winter in a dry sheltered place; and in the beginning of March, plant them either in a bed of light dry earth in the full ground; or, to forward them as much as possible, allow them a moderate hot-bed; and in either method indulge them with a shelter in cold weather, either of a frame and lights, or arched with hoops and occasionally matted; but let them enjoy the full air in all mild weather, giving also plenty of water in dry weather, during the season of their growth in spring and summer. Thus let them grow till their leaves decay in autumn; then take them up, clean them from earth, and lay them in a box of dry sand to preserve them till spring; at which time, such roots as are large enough to blow may be planted and managed as already directed, and the smaller roots planted again in a nursery-bed, to have another year's growth; afterwards plant them for flowering. The Egyptians put the flowers of tuberose into sweet oil; and by this means give it a most excellent flavour, scarce inferior to oil of jasmine.

**POLICANDRO**, a small island in the Archipelago, seated between Milo and Morgo. It has no harbour, but has a town about three miles from the shore near a huge rock. It is a ragged stony island, but yields as much corn as is sufficient for the inhabitants, who consist of about 120 Greek families, all Christians. The only commodity is cotton; of which they make napkins, a dozen of which are sold for a crown. E. Long. 35. 25. N. Lat. 36. 36.

**POLICASTRO**, an episcopal town of Italy in the kingdom of Naples, and in the Hither Principato; but now almost in ruins, for which reason the bishop resides in another town. E. Long. 15. 46. N. Lat. 40. 26.

**POLICY**, or **POLITY**, in matters of government. See **POLITY**.

**POLICY of Insurance**, or **Affurance**, of ships, is a contract or convention, whereby a person takes upon himself the risks of a sea-voyage; obliging himself to make good the losses and damages that may befall the vessel, its equipage, tackle, victualing, lading, &c. either from tempests, shipwrecks, pirates, fire, war, reprisals, in part or in whole; in consideration of a certain sum of seven, eight, or ten *per cent.* more or less according to the risk run; which sum is paid down to the assurer by the assured, upon his signing the policy. See **INSURANCE**.

**POLIDORO DA CARAVAGGIO**, an eminent painter, born at Caravaggio in the Milanese in 1492. He went young to Rome, where he worked as a labourer in preparing stucco for the painters; and was so animated by seeing them at work in the Vatican, that he solicited some of them to teach him the rules of designing. He attached himself particularly to Maturino a young Florentine; and a similarity in talents and taste, producing a disinterested affection, they associated like brothers, laboured together, and lived on one common purse, until the death of Maturino. He understood and practised the *chiaro scuro* in a degree superior to any in the Roman school; and finished an incredible number of pictures both in fresco and in oil, few of the public buildings at Rome being without some of his paintings. Being obliged

Pelignac  
Politian.

to fly from Rome when it was stormed and pillaged, he retired to Messina, where he obtained a large sum of money with great reputation, by painting the triumphal arches for the reception of Charles V. after his victory at Tunis: and when he was preparing to return to Rome, he was murdered, for the sake of his riches, by his Sicilian valet with other assassins, in the year 1543.

**POLIGNAC** (Melchior de), an excellent French genius and a cardinal, born of an ancient and noble family at Puy, the capital of Velay, in 1662. He was sent by Lewis XIV. ambassador extraordinary to Poland, where, on the death of Sobieski, he formed a project of procuring the election of the prince of Conti. But failing, he returned home under some disgrace; but when restored to favour, he was sent to Rome as auditor of the Rota. He was plenipotentiary during the congress at Utrecht, at which time Clement I. created him a cardinal; and upon the accession of Lewis XV. he was appointed to reside at Rome as minister of France. He remained there till the year 1722, and died in the 1741. He left behind him a MS. poem intitled *Anti-Lucretius, seu De Deo et Natura*; the plan of which he is said to have formed in Holland, in a conversation with Mr Bayle: this celebrated poem was first published in the year 1749, and has since been several times printed in other countries besides France.

**POLISHER**, or **BURNISHER**, among mechanics, an instrument for polishing and burnishing things proper to take a polish. The gilders use an iron-polisher to prepare their metals before gilding, and the bloodstone to give them the bright polish after gilding.

The polishers, among cutlers, are a kind of wooden wheels made of walnut-tree, about an inch thick, and of a diameter at pleasure, which are turned round by a great wheel; upon these they smooth and polish their work with emery and putty.

The polishers for glass consist of two pieces of wood; the one flat, covered with old hat; the other long and half-round, fastened on the former, whose edge it exceeds on both sides by some inches, which serves the workmen to take hold of, and to work backwards and forwards by.

The polishers used by spectacle-makers are pieces of wood a foot long, seven or eight inches broad, and an inch and a half thick, covered with old beaver hat, whereon they polish the shell and horn frames their spectacle-glasses are to be set in.

**POLISHING**, in general, the operation of giving a gloss or lustre to certain substances, as metals, glass, marble, &c.

The operation of polishing optic-glasses, after being properly ground, is one of the most difficult points of the whole process. See **OPTICS**, n<sup>o</sup> 181, &c. 194, &c.

**POLITIAN** (Angelo), was born at Monte Pulciano in Tuscany in 1454. He was one of the most learned and polite writers of his time. The first work which gained him a reputation was a poem on the tournament of Julian de Medicis. The account he wrote some time after of the conspiracy of the Pazzi's was very much esteemed. He wrote many other pieces, which have merited approbation; and had he lived longer, he would have enriched the republic of letters with many excellent works; but he died at the age

of 40 years. His morals answered the homeliness of his face rather than the beauty of his genius.

**POLITICS**, the first part of œconomy, consisting in the well governing and regulating the affairs of a state for the maintenance of the public safety, order, tranquillity, and morals.

**POLITY**, or **POLICY**, denotes the peculiar form and constitution of the government of any state or nation; or the laws, orders, and regulations relating thereto\*.—Polity differs only from politics, as the theory from the practice of any art.

**POLL**, a word used in ancient writings for the head: hence to poll is, either to vote, or to enter down the names of those persons who give their votes, at an election.

**POLL-Evil**. See **FARRIERY**, § xxx.

**POLL-Money**, or **Capitation**, a tax imposed by authority of parliament on the person or head; either on all indifferently, or according to some known mark or distinction, as quality, calling, &c.

Thus, by the statute 18 Car. II. every subject in the kingdom was assessed by the head, or poll, according to his degree; every duke 100 l. marquis 80 l. baronet 30 l. knight 20 l. esquire 10 l. &c. and every single private person 12 d.

This was no new tax, as appears by former acts of parliament.

**POLLEN**, the fecundating or fertilizing dust contained within the antheræ or tops of the stamina, and dispersed upon the female organ when ripe, for the purposes of impregnation. See **BOTANY**.

This dust, corresponding to the seminal fluid in animals, is commonly of a yellow colour; and is very conspicuous in the summits of some flowers, as the tulip and lily. Its particles are very minute, and of extreme hardness. Examined by the microscope, they are generally found to assume some determinate form, which often predominates, not only through all the species of a particular genus, but also through the genera of a natural family or order. The powder in question being triturated, and otherwise prepared in the stomach of bees, by whom great quantities are collected in the hairy brushes with which their legs are covered, is supposed by some authors to produce the substance known by the name of wax; a species of vegetable oil, rendered concrete by the presence of an acid, which must be removed before the substance can be rendered fluid.

**POLLEX**, in anatomy, denotes either the thumb or great toe, according as *manus* or *pedis* is added to it.

**POLLIO** (Caius Asinius), a celebrated Latin poet and orator, was of consular dignity, and composed some tragedies which were esteemed, but are now lost. He was the first who opened at Rome a library for the use of the public. He was the friend of Mark Antony; which prevented his complying with the solicitations of Augustus, who pressed him to embrace his party. At length Augustus having wrote some verses against Pollio, he was urged to answer them; on which he said, "I shall take care of writing against a man who has the power of proscribing us." He is praised by Virgil and Horæce.

**POLLUTION**, in general, signifies defilement, or the rendering a person or place unclean or unholly.

For

Politics  
Pollution.

\* See Government.

Pollution For the Jewish pollutions, see the article IMPURITY.

**Polyandria.** The Romanists hold a church to be polluted by the effusion of blood or of seed therein; and requires its being consecrated anew. And the Indians are so superstitious on this head, that they break all the vessels which those of another religion have drank out of, or even only touched; and drain all the water out of a pond in which a stranger has bathed.

**POLLUTION**, in medicine, a disease which consists in an involuntary emission of the seed in time of sleep. This, in different persons, is very different in degree; some being affected with it only once in a week, a fortnight, three weeks, or a month, and others being subject to it almost every night. The persons most subject to it, are young men of a sanguineous temperament, who feed high and lead a sedentary life. When this happens to a person but once in a fortnight or a month, it is of no great consequence; but when it happens almost every night, it greatly injures the health; the patient looks pale and sickly; in some the eyes become weak and inflamed, are sometimes affected with violent discharges, and are usually at last incircled with a livid appearance of the skin. This distemper is to be cured rather by a change of life than by medicines. When it has taken its rise from a high diet, and a sedentary life, a coarser food and the use of exercise will generally cure it. Persons subject to this disease should never take any stimulating purges, and must avoid as much as possible all violent passions of the mind; and though exercise is recommended in moderation, yet if this be too violent, it will rather increase the disorder than contribute to its cure.

*Self-POLLUTION.* See ONANISM.

**POLLUX.** See CASTOR.

**POLLUX**, in astronomy, a fixed star of the second magnitude in the constellation Gemini, or the Twins.

**POLTROON**, or **POLTRON**, a coward, or dastard, wanting courage to perform any thing great or noble. The word is borrowed from the French, who, according to Salmassius, derive it a *pollice truncato*; because anciently those who would avoid going to the wars, cut off their thumb. But Menage, with more probability, derives it from the Italian *poltrone*, and that from *poltro* a "bed;" because timorous, pusillanimous people, take pleasure in lying a-bed. Others choose to derive the word from the Italian, *poltro*, a "colt;" because of that creature's readiness to run away.

**POLOCSKI**, a palatinate in the duchy of Lithuania, bounded on the north by the palatinate of Weytepski, on the south by the Dwina, on the north by Mucovy, and on the west by Livonia. It is a desert country full of wood, and had formerly its own dukes.

**POLOCSKI**, a town of Lithuania, and capital of a palatinate of the same name, with two castles to defend it. It was taken by the Muscovites in 1563, and retaken the same year. It is seated on the river Dwina, 50 miles south-west of Weytepski, and 80 east of Braslaw. E. Long. 29. o. N. Lat. 56. 4.

**POLYADELPHIA**, (from *πολυ*, "many," and *αδελφια*, "brotherhood,") many brotherhoods. The name of the 18th class of Linnæus's sexual system, consisting of plants with hermaphrodite flowers, in which several stamina or male organs are united by their filaments into three or more distinct bundles.

**POLYANDRIA**, (*πολυ*, "many;" and *ανδρ*, a

"man, or husband,") many husbands; the name of the 13th class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, which are furnished with several stamina, that are inserted into the common receptacle of the flower.

**POLYANTHUS**, in botany. See PRIMULA.

**POLYXENUS**, the name of many ancient personages, and principally of one who appears to have been a Macedonian, and the writer of eight books of *Stratagemata*, Stratagems of illustrious commanders in war. The best edition is that of Leyden 1690, 8vo. Numbers of these stratagems appear ridiculous or impracticable; but the book is of use to those who study the Greek language or antiquity. We have citations from other works of the same author.

**POLYBIUS**, a famous Greek historian, was born at Megalopolis, a city of Arcadia; and was the son of Lycortas, chief of the republic of the Achæans. He was sent ambassador to Rome, where he contracted a strict friendship with Scipio and Lælius; and in that city composed his excellent history, after he had made several voyages to the places of which he was to treat. This history was divided into 40 books; but there only remains the five first, with extracts of some parts of the others. It has had several editions in Greek and Latin; and there is an English translation by Mr Hampton. Polybius lived about 120 years before the Christian æra, and died at the age of 82.

**POLYCARP**, one of the most ancient fathers of the Christian church, was born towards the end of the reign of Nero, probably at Smyrna; where he was educated at the expence of Calista, a noble matron distinguished by her piety and charity. He was unquestionably a disciple of St John the Evangelist, and conversed familiarly with other of the apostles. When of a proper age, Baculus ordained him a deacon and catechist of his church; and upon his death he succeeded him in the bishopric, to which he is said to have been consecrated by St John, who also directed his Apocalypse, among others, to him, under the title of the *angel of the church of Smyrna*. At length the controversy about the observation of Easter beginning to grow high between the eastern and western churches, he went to Rome to discourse with those who were of the opposite party. The see was then possessed by Anicetus, with whom he had many conferences, that were carried on in the most peaceable and amicable manner; and though neither of them could bring the other to embrace his opinion, they both retained their own sentiments without violating that charity which is the great law of their religion. Polycarp governed the church of Smyrna till he suffered martyrdom in 167. There is still extant an epistle written by St Polycarp to the Philippians.

**POLYCHREST**, in pharmacy, signifies a medicine that serves for many uses, or that cures many diseases.

*Sal* **POLYCHREST**, a compound salt made of equal parts of salt-petre and sulphur, deflagrated in a red-hot crucible.

**POLYDORE VIRGIL.** See VIRGIL.

**POLYGALA**, MILKWORT; a genus of the oSandra, belonging to the diadelphia class of plants. There are 24 species, of which the most remarkable are,

1. The vulgaris, or common milkwort, is a native of the British heaths and dry pastures. The stalks are

Polyanthus  
||  
Polygala.

Polygala  
Polygamy.

about five or six inches long, several arising from the same root: the leaves are firm, smooth, entire, and grow alternate upon the stalks, which are terminated with spikes of flowers, most commonly blue, but often red or white: the calix consists of five leaves, three of which are small and green, two below, and one above the corolla; the other two intermediate ones are large, oval, flat, coloured, veined, and resemble petals, which at length turn greenish, and remain a defence to the seed-vessel; the corolla consists of three petals folded together, and forming a tube: the carina is terminated by a kind of heart-shaped, concave appendage, fringed at the extremity. The root of this plant has a bitter taste, and has been found to possess the virtues of the American rattlesnake-root. It purges without danger, and is also emetic and diuretic; sometimes operating all the three ways at once. A spoonful of the decoction made by boiling an ounce of the herb in a pint of water till one half has exhales, has been found serviceable in pleuritis and fevers, by promoting a diaphoresis and expectoration; and three spoonfuls of the same, taken once an hour, has proved beneficial in the dropsy and anasarca. It has also been found serviceable in consumptive complaints.

2. The fenega, or feneka, rattlesnake-wort, grows naturally in most parts of North America. This hath a perennial root composed of several fleshy fibres, from which arise three or four branching stalks which grow erect, garnished with spear-shaped leaves placed alternately. The flowers are produced in loose spikes at the end of the branches: they are small, white, and shaped like those of the common foot. It flowers here in July, but the plants do not produce seeds. The root of this species operates more powerfully than the last; but besides the virtues of a purgative, emetic, and diuretic, it has been recommended as an antidote against the poison of a rattlesnake; tho' how precarious every remedy in that case must be, will appear from what is said under the article POISON.

As the seeds of the rattlesnake-wort seldom succeed even in the countries where the plant is a native, the best method of propagating it is to procure the roots from America, and plant them in a bed of light earth in a sheltered situation, where they will thrive without any other culture than keeping them free from weeds. But though the plant will stand our ordinary winters, it will be proper to cover it during that season with old tanner's bark, or other mulch, to keep out the frost.

**POLYGAMIA**, (ΠΟΛΥΓΑΜΙΑ, "many;" and γΑΜΟΣ, "marriage.") This term, expressing an intercommunication of sexes, is applied, by Linnæus, both to plants and flowers. A polygamous plant is that which bears both hermaphrodite flowers and male or female, or both.

**POLYGAMY**, a plurality of wives or husbands, in the possession of one man or woman, at the same time.

Many arguments have been offered to prove the unlawfulness of polygamy; one of the principal of which is, that the males and females brought into the world are nearly on a balance; only abating for a small excess on the side of the males, to make up for the extraordinary expence thereof in war and at sea: whence it evidently follows, that nature only intends one wife, or one husband, for the same person; since if they have more, some must go without any at all. Hence it is justly

Polygloft  
Polygamm.

concluded, that the Christian law, which prohibits polygamy, is more agreeable to the law of nature than the Mahometan, and, we may add, than the Jewish law, by which polygamy was tolerated. See BIGAMY.

**POLYGLOTT**, among divines and critics, chiefly denotes a bible printed in several languages. See BIBLE, and PRINTING.

**POLYGON**, in geometry, a figure with many sides, or whose perimeter consists of more than four sides at least; such are the pentagon, hexagon, heptagon, &c.

**POLYGONUM**, KNOT-GRASS; a genus of the trigynia order, belonging to the octandria class of plants. There are 27 species; but the most remarkable are, 1. The bistorta, bistort, or greater snakeweed, hath a thick oblique intorted root, blackish without and red within; a simple round slender stem near two feet high; oval leaves, having decurrent foot-stalks, and the stalk terminated by thick short spikes of whitish-red flowers. 2. The viviparum, or smaller bistort, hath a thickist root, a simple slender stem half a foot high, spear-shaped leaves, and the stalks and branches terminated by long spikes of whitish-red flowers. Both these perennials flower in May and June, succeeded by ripe seeds in August. They grow wild in England, &c. the first in moist places, the other in mountainous situations. 3. Oriental polygonum, commonly called *perficaria*, hath fibrous roots; an upright, robust, strong, jointed stem, rising eight or ten feet high, dividing at top into several branches; very large oval-lanceolate alternate leaves, on broad foot-stalks half surrounding the stem; and all the branches terminated by long, slender, hanging spikes of reddish-purple heptandrous and digynous flowers, from July till October. 4. Fagopyrum, buck-wheat, or brank, rises with an upright smooth branchy stem, from about a foot and a half to a yard high, heart-shaped sagittate leaves, and the branches terminated by clusters of whitish flowers, succeeded by large angular seeds; excellent for feeding pigeons, and most sorts of poultry.

All these plants are hardy, and succeed in almost any soil and situation; the two first are perennial in root; and the third and fourth are annual, wholly decay at the end of summer, or early in winter. The first two sorts are retained in some curious gardens for variety; but their chief merit is for medical purposes: they are powerful astringents, and are used both internally and externally; esteemed very efficacious in hæmorrhages, and other fluxes; and good to heal sore mouths. Third sort, Oriental polygonum, or *perficaria*, is a most elegant annual for the embellishment of the pleasure-ground; assuming a majestic tree-like growth by its erect luxuriant stem, and branchy head; which being garnished with noble large foliage, and numerous pendulous spikes of flowers, in constant succession three or four months, exhibits a very ornamental appearance from June or July until October, and is so easy of culture, that from its scattered seeds in autumn, young plants rise spontaneously in abundance the ensuing spring, and shoot up so rapidly as to attain six or eight feet stature by July, when they generally begin flowering, and continue till attacked by the frost, then totally perish; so that a fresh supply must be raised from seed annually. The fourth sort (buck-wheat) is a sort of corn, and is frequently cultivated both by way of fodder, cutting its stalks while young and green to feed

Polygonum feed cattle; and for its grain to feed pigeons, poultry, hogs, &c. It flourishes in any soil and situation, but generally thrives best in a light dry earth; and the driest seasons seldom retard its growth. The first and second sort are easily propagated in plenty, by parting the roots in autumn. The third sort, Oriental polygonum, being annual, is always propagated from seed annually, either in the full ground, or by aid of hot-beds.

*Ufer.* The root of a kind of bistort, according to Gmelin, is used in Siberia for ordinary food. This species is by Haller called *bistorta foliis ad oram nervosis*, and by some other botanists *bistorta montana minor*. The natives call it *mouka*; and so indolent are they, that, to save themselves the trouble of digging it out of the earth, they go in spring and pillage the holes of the mountain rats, which they find filled with these roots. In our country, bistort is used in medicine. All the parts of bistort have a rough auster taste, particularly the root, which is one of the strongest of the vegetable astringents. It is employed in all kinds of immoderate hæmorrhages and other fluxes, both internally and externally, where astringency is the only indication. It is certainly a very powerful styptic, and is to be looked on simply as such; the sudorific, antipeptic, and other like virtues ascribed to it, it has no other claim to, than in consequence of its astringency, and of the antipeptic power which it has in common with other vegetable styptics. The largest dose of the root in powder is one dram.

**POLYGRAPHY, POLYGRAPHIA, or Polygraphice**, the art of writing in various unusual manners or cyphers; as also of decyphering the same. The word is formed from the Greek, *πολυ*, *multum*, and *γραφω*, *scriptura*, "writing."

The ancients seem to have been very little acquainted with this art; nor is there any mark of their having gone beyond the Lacedæmonian fycuala. Trithemius, Porta, Vigenere, and father Niceron, have written on the subject of polygraphy or cyphers. See **CIPHER**.

**POLYHYMNIA**, in the pagan mythology, one of the nine muses, thus named from the Greek words *πολυ*, "much;" and *μνησις*, "memory." She presided over history, or rather rhetoric; and is represented with a crown of pearls and a white robe; her right hand in action as if haranguing, and holding in her left a caduceus or sceptre to shew her power.

**POLYHEDRON**, in geometry, denotes a body or solid comprehended under many sides or planes.

**POLYHEDRON**, in optics, is a multiplying glass or lens, consisting of several plane surfaces disposed into a convex form. See **OPTICS**, p. 5575.

**POLYMATHY**, denotes the knowledge of many arts and sciences. The word is derived from the Greek, *πολυ*, *multum*, and *μαθησις*, *disco*.

**POLYPETALOUS**, among botanists, an epithet applied to such flowers as consist of several petals or flower-leaves.

**POLYPODIUM, POLYPODY**; a genus of the order of filices, belonging to the cryptogamia class of plants. There are 65 species, of which the most remarkable is the filix mas, or common male fern. This grows in great plenty throughout Britain in woods and stony soils. The leaves are a cubit high, and grow in circular tufts. They are at first alternately pinnate,

the pinnae increasing in size from the base towards the middle, and afterwards gradually decreasing upwards to the summit of the leaf. These pinnae are again pinnatifid, or subdivided almost to the nerve into obtuse parallel lobes, crenated on the edges. The stalks are covered with brown filmy scales. The fructifications are kidney-shaped, and covered with a permanent fleshy shield or involucrem. The capsules are of a pale brown, surrounded with a saffron-coloured elastic ring.

This fern has nearly the same qualities, and is used for most of the same intentions as the *pteris aquilina*. They are both burnt together for the sake of their ashes, which are purchased by the soap and glass-makers. In the island of Jura are exported annually 150l. worth of these ashes.

Gunner relates, in his *Flor. Neveg.* that the young curled leaves, at their first appearance out of the ground, are by some boiled and eaten like asparagus; and that the poorer Norwegians cut off those succulent laminae, like the nails of the finger at the crown of the root, which are the bases of the future stalks, and brew them into beer, adding thereto a third portion of malt, and in times of great scarcity mix the same in their bread. The same author adds, that this fern cut green and dried in the open air, affords not only an excellent litter for cattle, but, if infused in hot water, becomes no contemptible fodder to goats, sheep, and other cattle, which will readily eat, and sometimes grow fat upon it: a circumstance well worth the attention of the inhabitants of the Highlands and Hebrides, as great numbers of their cattle, in hard winters, frequently perish for want of food.

But the antehelmintic quality of the root of the male fern is that for which it is chiefly to be valued, and of which an account is given under the article **MEDICINE**, n° 493.

**POLYPUS**, in zoology, a species of the **HYDRA**; which, though cut in a thousand pieces, and in every direction, still exists, and each section becomes a complete animal.

**POLYPUS of the Heart.** See **MEDICINE**, n° 209, 383.

**POLYSARCIA, or CORPULENCY.** See **MEDICINE**, n° 433.

**POLYSYLLABLE**, in grammar, a word consisting of more than three syllables; for when a word consists of one, two, or three syllables, it is called a *monosyllable*, a *disyllable*, and *trisyllable*.

**POLYSYNDETON.** See **ORATORY**, n° 65.

**POLYTHEISM**, in matters of religion, the doctrine or belief of a plurality of gods.

**POLYTRICHUM**, in botany, a genus of the order of musci, belonging to the cryptogamia class of plants. There are three species; the most remarkable of which is the commune, or great golden maiden-hair, frequently to be met with on the bogs and wet places of this country. It grows in patches, the stalks erect, generally single and unbranched, from three inches to a foot, or even a yard high. The leaves are numerous, stiff, lanceolate, acute, growing round the stalk without order, and, if viewed with a microscope, appear to have their edges finely serrated. They are of a bright green when young and fresh, but reddish when dried or in decay; the filaments, or peduncles, are of a shining red, or orange colour, from two to four inches long, arising singly from the top of the stalks, and surrounded

Polypodium  
||  
Polytrichum.

Polytrichum,  
Pomaceæ.

rounded at their base with a cylindrical tubular vagina, or perichæium. The anthera, or capsule, is quadrangular, green at first, afterwards yellow, and red when ripe, having an annular pedicel, or apophysis, at its base. The operculum is flat, with a projecting point in the centre; and underneath is a whitish circular membrane, placed in the middle of the capsule's orifice, and sustained there by numerous arched threads, or cilia, connected by one end to the circumference of this membrane, and by the other fastened to the ring of the anthera. The pollen, or, as others term it, the seed, is freed from the anthera or capsule through the space between the cilia. The calyptra is twofold, an internal and external one; both which at first entirely cover and hang over the anthera. The internal one is conical, membranaceous, and smooth; the external one is composed only of tawny hairs, connected into a sort of mat, lacerated at the base, and serving like a roof of thatch to defend the other. Besides the stalks before described, there are commonly some others near at hand, which are destitute both of filaments and capsules, but are terminated with a kind of rofaceous cup, either of a bright red or yellowish colour, composed of leaves of different sizes, the outermost broad, the innermost lanceolate, growing gradually more and more fine and slender to the centre. This cup is looked upon by Linnæus as the female flower of this moss; but Haller is opinion that it is only the gem or origin of a new stalk, which frequently rises from its centre, and this again becomes sometimes proliferosus. There are two varieties of this moss: the first has much shorter stalks than the preceding, and often branched; the leaves stiffer, erect, and more crowded; in other respects the same. The other has a stalk scarcely more than half an inch high, terminated with a cluster of linear, erect, rigid leaves, for the most part entire on the edges, and tipped each with a white hair. The filament is about an inch high, and the capsule quadrangular. The female flower, or gem, is of a bright red colour.

The first kind, when it grows long enough for the purpose, is sometimes used in England and Holland to make brooms or brushes. Of the female sort the Laplanders, when obliged to sleep in desert places, frequently make a speedy and convenient bed. Their manner of doing it is curious: Where this moss grows thick together, they mark out, with a knife, a piece of ground, about two yards square, or of the size of a common blanket; then beginning at one corner, they gently sever the turf from the ground, and so the roots of the moss are closely interwoven and matted together, they by degrees strip off the whole circumscribed turf in one entire piece; afterwards they mark and draw up another piece, exactly corresponding with the first; then, shaking them both with their hands, they lay one upon the ground, with the moss uppermost, instead of a mattress, and the other over it, with the moss downwards, instead of a rug; and between them both take a comfortable nap, free from fleas and bugs, and without fear of contagious distempers. It is probable they might take the hint of making such a bed from the bear, a cohabitant of their country, which prepares his winter-quarters with a large collection of this same moss.

POMACLE, (*pyrus*, an "apple,") the name of

the 36th order in Linnæus's Fragments of a Natural Method, the genera of which have a pulpy efulcent fruit of the apple, berry, and cherry kind. See BOTANY, Sect. vi. 36.

POMEGRANATE. See PUNICA.

POMERANIA, a province of Germany, in the circle of Upper Saxony, with the title of a duchy. It is bounded on the north by the Baltic Sea, on the east by Prussia and Poland, on the south by the marquise of Brandenburg, and on the west by the duchy of Mecklenburg; and is about 250 miles in length, and in some places 75 miles and in others 50 in breadth. It is watered by several rivers, the most considerable of which are the Oder, the Pene, the Rega, the Perant, the Wipper, the Stolz, the Lupo, and the Lobo. The air is cold; but the soil abounds in pastures, and produces corn, of which a great deal is exported. It is a flat country; containing many lakes, woods, and forests, and has several good harbours. It is divided into the Hither and Farther Pomerania, and the territories of the kings of Sweden and Prussia in this duchy are divided by the river Pene.

POMET (Peter), an able druggist at Paris, was born in 1658. He collected at a great expence from all countries drugs of every kind, and rendered himself celebrated by his book intitled *Histoire Generale des Drogues*, which is the most complete book on the subject that has yet been printed. He gave demonstrations with respect to his drugs in the king's garden, and a catalogue of all the drugs contained in his work, with a list of all the rarities of his cabinet, which he proposed to publish by subscription; but was prevented by his death, which happened in 1699, upon the very day when the patent for a pension granted him by Lewis XIV. was made out.

POMFRET (John), an English poet, son of the rector of Luton in Bedfordshire, was born in 1667, and educated at Cambridge. He entered into orders, and obtained a living in Bedfordshire, but died of the small-pox at the age of 35. He published a small volume of tolerable poems; which if they are not to be extolled for their sublimity, have a moral and pious turn, which recommended them to common readers; so that Pomfret's poems still continue to be a very popular book among those whose reading is not very extensive either in poetry or prose.

POMME, or POMMETTE, in heraldry, is a cross with one or more balls or knobs at each of the ends.

POMMEL, or PUMMEL, in the manege, a piece of brass or other matter at the top and in the middle of the saddle-bow.

POMONA, in fabulous history, the tutelar deity of orchards and fruit-trees. See VERTUMNUS.

POMPEII, (anc. geog.), a town of Campania near Herculaneum, and destroyed along with it by the great eruption of Vesuvius in the time of Titus.

POMPEY the GREAT, (Cneius Pompeius Magnus), the renowned rival of Julius Cæsar. Being defeated by him at the battle of Pharsalia, owing to the defection of his cavalry, he fled to Egypt by sea, where he was basely assassinated by order of Theodotus, prime minister to Ptolemy the Younger, then a minor, 48 B. C.\*

POMPEYS (Cneius and Sextus), his sons, commanded a powerful army when they lost their illustrious father. Julius Cæsar pursued them into Spain, and defeated

Pomegrate  
Pompeys.

\* See Rome.

Pomponius <sup>||</sup> Pontefract. feated them at the battle of Munda, in which Cneius was slain, 45 B. C. Sextus made himself master of Sicily; but being defeated in the celebrated naval engagement at Actium, by Augustus and Lepidus, he fled to Asia, with only 7 ships, the remains of his fleet, which consisted of more than 350; and from thence, unable to continue the war, he was obliged to retire to Lesbos, where renewing the war by raising an army, and seizing on some considerable cities, Marcus Titius, in the interest of Marc Anthony, gave him battle, defeated him, took him prisoner, and basely put him to death, 35 B. C. See ROME.

POMPONIUS MELA. See MELA.

POMUM, an APPLE; a species of seed-vessel, composed of a succulent fleshy pulp; in the middle of which is generally found a membranous capsule, with a number of cells, or cavities, for containing the seeds. Seed-vessels of this kind have no external opening, or valve. At the end opposite to the foot-stalk is frequently a small cavity, called by the gardeners the *eye of the fruit*, and by botanists *umbilicus*, the "navel," from its fancied resemblance to the navel in animals. Gourd, cucumber, melon, pomegranate, pear, and apple, furnish instances of the fruit or seed-vessel in question.

POND, or FISH-POND. See FISH-POND.

POND-Weed, in botany. See POTAMOGETON.

PONDICHERRY, a town of the East Indies, on the coast of Coromandel on this side the Ganges; the best French settlement in these parts. It was taken by the Dutch in 1693; but rendered back by the treaty of Ryfwick. It was taken by the British in the last war; and the fortifications were demolished. The country on which it stands is low, and the vessels are obliged to come to an anchor a mile and a half from it; not even boats or canoes could come within musket-shot of it, so that the black Indians were obliged to carry their merchandizes and other things to the factory in flat-bottomed boats. The factory stood on a barren spot, inasmuch that there is hardly a worse on the whole coast; but it was chosen because it is difficult to be attacked on the side of the sea. E. Long. 80. 14. N. Lat. 12. 26.

PONIARD, a little pointed dagger, very sharp edged; borne in the hand, or at the girdle, or hid in the pocket. The word is formed from the French *poignard*, and that from *poignée*, "handful."—The poniard was anciently in very great use; but it is now in good measure set aside, except among assassins.—Sword and poniard were the ancient arms of duellists; and are said to continue still so among the Spaniards. The practice of sword and poniard still make a part of the exercise taught by the masters of defence.

PONTEFRACT, or POMFRET, a town of the West Riding of Yorkshire in England, situated on the river Aire. It is said to take its name from a broken bridge, which is supposed to have been laid anciently over that marshy spot called the *Wash*. Here are the ruins of a noble old castle, where Richard II. was barbarously murdered, and two of Edward V.'s uncles. The collegiate chapel of St Clement, which had a dean, three prebendaries, &c. is still distinguishable in it. This town has a good market, and fairs for horses, sheep, and other cattle. It is a corporation, governed by a mayor, recorder, aldermen, and bur-

ges, and gives title of earl to the family of Ferror. In the reign of queen Elizabeth, 200 l. was left by George Talbot, earl of Shrewsbury, to be lent for ever, at 5 l. a time, on proper security, for three years, to the poor artificers of the town; and Thomas Wentworth, esquire, ancestor to the marquis of Rockingham, left 200 l. to the charity-school. A branch of the great Roman military way, called *Erminstreet*, which passed from Lincoln to York, may be traced betwixt this town and Doncaster. The adjacent country yields plenty of limestone, together with liquorice and skirrets. W. Long. 1. 5. N. Lat. 53. 42.

PONTIFEX, PONTIF, or *High priest*, a person who has the superintendance and direction of divine worship, as the offering of sacrifices and other religious solemnities. The Romans had a college of pontiffs; and over these a sovereign pontif, or pontifex maximus, instituted by Numa, whose function it was to prescribe the ceremonies each god was to be worshipped withal, compose the rituals, direct the vestals, and for a good while to perform the business of angury, till, on some superstitious occasion, he was prohibited intermeddling therewith. The office of the college of pontiffs was to assist the high-priest in giving judgment in all causes relating to religion, inquiring into the lives and manners of the inferior priests, and punishing them if they saw occasion, &c. The Jews too had their pontiffs; and among the Romaniits, the pope is still styled the *sovereign pontif*.

PONTIFICATE, is used for the state or dignity of a pontif or high priest; but more particularly in modern writers, for the reign of a pope.

PONTON, or PONTOON, in war, a kind of flat-bottomed boat, whose carcass of wood is laid within and without with tin; they serve to lay bridges over rivers for the artillery and army to march over. The French pontoons, and those of most other powers, are made of copper on the outside: though these cost more at first, yet they last much longer than those of tin; and when worn out, the copper sells nearly for as much as it cost at first; but when ours are rendered useless, they sell for nothing. Our pontoons are 21 feet long, 5 feet broad broad, and depth within 2 feet 1.5 inches.

PONTOON-Carriage, is made with two wheels only, and two long side-pieces, whose fore ends are supported by a limber; and serves to carry the pontoon, boards, cross timbers, anchors, and every other thing necessary for making a bridge.

PONTOON-Bridge, is made of pontoons slipped into the water, and placed about five or six feet asunder; each fastened with an anchor, when the river has a strong current; or to a strong rope that goes across the river, running through the rings of the pontoons. Each boat has an anchor, cable, baulks, and cheits. The baulks are about five or six inches square, and 21 feet long. The cheits are boards joined together by wooden bars, about three feet broad, and 12 feet long. The baulks are laid across the pontoons at some distance from one another, and the cheits upon them joined close; which makes a bridge in a very short time, capable of supporting any weight.

PONTUS, the name of an ancient kingdom of Asia, bounded on the east by Colchis, on the west by the river Halys, on the north by the Euxine Sea, and

Pontifex  
||  
Pontus.

<sup>1</sup> **Pontus.** on the south by Armenia Minor. Some derive the name of *Pontus* from the neighbouring sea, commonly called by the Latins *Pontus Euxinus*; others from an ancient king named *Pontus*, who imparted his name both to the country and the sea; but Bochart deduces it from the Phœnician word *botno*, signifying a silberd, as if that nut abounded remarkably in this place. But this derivation seems to be very far fetched; and the common opinion that the country derived its name from the sea, seems by far the most probable. The kingdom was divided into three parts; the first, named *Pontus Galaticus*, extending from the river Halys to the Thermodon; the second, named *Pontus Polemoniacus*, extended from the Thermodon to the borders of *Pontus Cappadocius*; and this last extended from Pontus Polemoniacus to Colchis, having Armenia Minor and the upper stream of the Euphrates for its southern boundary.

It is commonly believed, that the first inhabitants of Pontus were descended from Tubal; but in process of time mixed with Cappadocians, Paphlagonians, and other foreign nations, besides many Greek colonies which settled in those parts, and maintained their liberty till the time of Mithridates the Great and Pharnaces. The first king of this country whom we find mentioned in history is Artabazes, who had the crown bestowed on him by Darius Hystaspes. The next was Rhodobates, who reigned in the time of Darius Nottus. After him came Mithridates, who, refusing to pay the usual tribute to the Persians, was defeated by Artaxerxes Maemon; but a peace was soon after concluded by the mediation of Tissaphernes. Besides this, we hear nothing of him farther than that he was treacherously taken prisoner by Clearchus afterwards tyrant of Heraclea, and obliged to pay a large sum for his ransom.

<sup>2</sup> **Artabazes** the first king.  
<sup>3</sup> **Mithridates I.**  
Mithridates I. was succeeded by Ariobarzanes, who being appointed by Artaxerxes governor of Lydia, Ionia, and Phrygia, employed the forces that were under his care in the extending of his own dominions, and subduing those of his natural prince. The king of Persia sent one Autophradates against him; but Ariobarzanes, having with great promises prevailed on Agelilaus and Timotheus the Athenian to come to his assistance, obliged Autophradates to retire. He then rewarded Agelilaus with a great sum of money, and bestowed on Timotheus the cities of Sestos and Abydos, which he had lately taken from the Persians. He used his utmost endeavours to reconcile the Lacedæmonians and Thebans; but, not being able to bring the latter to any reasonable terms, he assisted the Lacedæmonians with vast sums of money. The Athenians shewed so much respect for this prince, that they not only made him free of their city, but granted both him and his children whatever they asked of them. He was murdered in the 28th year of his reign by one Mithridates, whom authors suppose to have been his son. This happened at the time that Alexander the Great invaded Asia, so that Pontus for a time fell under the power of the Macedonians.

<sup>4</sup> **Ariobarzanes** shakes off the Macedonian yoke.  
In the reign of Antigonus, Mithridates the son of Ariobarzanes shook off the Macedonian yoke, the particulars of which event are related as follow: Antigonus having dreamed that he had a field in which gold grew after the manner of corn, and that Mithridates

cut it down and carried it into Pontus, began to be very jealous of him, and ordered him to be put to death privately. But Mithridates, having got notice of the king's intention, withdrew into Paphlagonia, attended only by six horsemen. Here, being joined by many others, he possessed himself of Ciniatum; a strong hold situated near mount Olgafys; from whence, as his army continually increased, he made an irruption into Cappadocia; and, having driven the commanders of Antigonus from that part which borders upon Pontus, he entered his paternal kingdom, which, in spite of the utmost efforts of Antigonus, he held for the space of 26 years, and transmitted to his posterity.

Under the reigns of Mithridates III. Ariobarzanes II. and Mithridates IV. the immediate successors of Mithridates II. nothing remarkable happened. But Mithridates V. made war on the inhabitants of Sinope, a city on the coast of Paphlagonia. He made himself master of all the adjacent places; but finding the whole peninsula on which Sinope itself stood well fortified and garrisoned, not only by the inhabitants, but by their allies the Rhodians, he abandoned the enterprise. He afterwards proved a great friend to the Rhodians, and assisted them with money to repair the losses they had sustained by an earthquake. He entered also into a strict alliance with Antiochus the Great, who married one of his daughters named *Laodice*.

<sup>5</sup> **Pharnaces I** differs with the Romans.  
After the death of Mithridates V. his son Pharnaces I. attacking the city of Sinope, unexpectedly took it by storm. On this the Rhodians sent ambassadors to Rome, complaining of the behaviour of the king of Pontus; but Pharnaces was so far from being intimidated by their threats, that he invaded the territories of Eumenes their great ally. The latter sent ambassadors to Rome, and entered into an alliance with Ariarathes king of Cappodocia. Pharnaces in his turn sent ambassadors to Rome, complaining of Eumenes and Ariarathes; upon which some Romans were sent into Asia to inquire into the state of matters. These found Eumenes and his associates willing to accommodate the difference, but Pharnaces in a quite opposite disposition, which they accordingly reported at Rome.

In the mean time a war was commenced between Eumenes and Pharnaces; but the latter, being disappointed of assistance from Seleucus king of Syria, whom the Romans would not allow to join him, was at last forced to sue for peace, which was granted him upon the following conditions: That he should forthwith withdraw his forces from Galatia, and disannul all engagements and alliances with the inhabitants of that country; that he should in like manner evacuate Paphlagonia, and send back such as he had from thence carried into slavery; that he should restore to Ariarathes all the places which he had taken during the war, the hostages of both kings, all their prisoners without ransom, and moreover should deliver up to them such of their subjects as from the first breaking out of the war had fled to him; that he should return to Morzias, a petty king in these parts, and to Ariarathes, 900 talents which he had seized in the war, and pay down 300 more to Eumenes as a fine for invading his dominions without provocation. Mithridates

<sup>5</sup> **Pharnaces I** differs with the Romans.

<sup>7</sup> **Concludes** a most disadvantageous peace.

<sup>4</sup> Pontus. dates, king of Armenia, having in this war joined Pharnaces, was, by the articles of the treaty, obliged to pay 300 talents to Ariarathes for having assisted his enemy contrary to an alliance at that time subsisting between them. Soon after, Pharnaces died, and left the kingdom to his son Mithridates VI. more weakened by this peace than by the most destructive war.

<sup>8</sup> Mithridates the Great, a cruel prince. The new king entered into an alliance with the Romans, and proved such a faithful friend, that he was rewarded by the senate with Phrygia Major, and honoured with the title of the friend and ally of the people of Rome. After a long and prosperous reign, he was murdered by some of his intimate acquaintance, and was succeeded by his son Mithridates VII. furnished the *Great*.

The new prince, though not exceeding 13 years of age, began his reign with most inhuman acts of cruelty to his mother and nearest relations. His father, by his last will, had appointed him and his mother joint-heirs to the kingdom; but he, claiming the whole, threw her into prison, where the soon died thro' the hard usage she met with. Those to whom the care of his education was committed, observing him to be of a cruel and unruly temper, made various attempts on his life, but could never effect their design, as the king was always on his guard, and armed, in that tender age, against all kind of treachery, without showing the least diffidence.

<sup>9</sup> Mis extraordinary qualities. In his youth Mithridates took care to inure himself to hardships, passing whole months in the open air, employed in the exercise of hunting, and often taking his rest amidst the frozen snow. When he came of age he married his sister named *Laodice*, by whom he had a son named *Pharnaces*. After this he took a journey through many different kingdoms of Asia, having nothing less in view than the whole continent. He learned their different languages, of which he is said to have spoken <sup>22</sup>; took an estimate of their strength; and above all viewed narrowly their strong holds and fortified towns. In this journey he spent three years; during which time, a report being spread abroad that he was dead, his wife *Laodice* had a criminal conversation with one of the lords of her court, and had a son by him. When her husband returned, she presented him with a poisoned bowl; but Mithridates had accustomed himself to take poison from his infancy, so that it had now no other effect than to hasten the destruction of his wife, which very soon took place, together with all those who had been any way accessory to her disloyalty and incontinence.

The king now began to put in execution his schemes of conquest. However, he certainly took the wrong method by attacking first those nations which were immediately under the protection of Rome, and thus at once provoking that powerful people to fall upon him. He began with Paphlagonia, which the Romans had declared a free state. This country he easily reduced, and divided between himself and Nicomedes king of Bithynia, at that time his ally. The Romans remonstrated; but Mithridates, instead of paying any regard to their remonstrances, invaded Galatia, which was immediately under their protection. This he also reduced, and then turned his eyes on Cappadocia. But as the kingdom of Cappadocia

was at that time held by Ariarathes, who was a great favourite of the Romans, and married to the sister of Mithridates, the latter hired an assassin to dispatch Ariarathes, after which he thought he might succeed better in his designs. After the death of Ariarathes, king of Cappadocia was invaded by Nicomedes king of Bithynia, who drove out the son, and married the widow of Ariarathes. This gave Mithridates a plausible pretence for invading Cappadocia; which he instantly did, and drove Nicomedes quite out of the country. Thus Mithridates gained considerable reputation, not only as a warrior, but as a just and good-natured prince; for as it was not known that he had any hand in the murder of Ariarathes, every one imagined that he had undertaken the war against Nicomedes, merely to revenge the quarrel of his nephew, and to restore him to his right. To keep up the farce a little longer, Mithridates actually withdrew his troops out of the country, and left the young prince master of the kingdom. In a short time, however, he began to press the young king of Cappadocia to recal the assassin Gordius, who had murdered his father: but this the king of Cappadocia refused with indignation; and Mithridates, being determined on a quarrel at all events, took the field with an army of 80,000 foot, 10,000 horse, and 600 chariots armed with scythes. With this force he imagined he should carry all before him: but, finding the king of Cappadocia ready to oppose him with a force no way inferior to his own, he had recourse to treachery; and inviting his nephew to a conference, stabbed him, in the sight of both armies, with a dagger which he had concealed in the plaits of his garment. This barbarous and unexpected piece of treachery had such an effect<sup>10</sup> on the Cappadocians that they threw down their arms, and suffered Mithridates, without opposition, to seize upon all their strong holds. He reigned the kingdom, however, to his son, a child of eight years of age. The care of the young prince, and of the whole kingdom, he committed to Gordius; but the Cappadocians, disdaining to be ruled by such a scandalous assassin, placed on the throne the brother of Ariarathes, who had kept himself concealed in some part of Asia. His reign, however, was of short duration; he being soon after driven out by Mithridates, and the Cappadocians again reduced. The unhappy prince died of grief; and in him ended the family of Pharnaces, who had ruled Cappadocia from the time of Cyrus the Great.

Nicomedes, king of Bithynia, being now greatly afraid of Mithridates, and supposing that his own dominions would next fall a prey to the ambitious conqueror, suborned a youth of a comely and majestic aspect to pretend that he was a third son of Ariarathes, to go to Rome, and demand the kingdom of Cappadocia as his just right. He was received by the senate with the greatest kindness, and *Laodice* the wife of Nicomedes even confirmed the deceit by her oath. But in the mean time Mithridates having got intelligence of the plot, sent notice of it by Gordius to the Romans, so that the imposture was soon known at Rome also. The consequence of this was, that the senate commanded Mithridates to relinquish Cappadocia, and Nicomedes that part of Paphlagonia which he possessed; declaring both these countries free. The Cappadocians protested that they could not live with-

Pontus. out a king; upon which they were allowed to choose one of their own nation. Mithridates used all his interest in favour of Gordius; but he being excluded by the Romans, one Ariobarzanes was chosen by the majority of votes.

35  
Ariobarzanes settled on the throne of Cappadocia by the Romans, but driven out by Mithridates.

To enforce this election, Sylla was sent into Cappadocia. He had the character of an ambassador, but the real intent of his coming was to disappoint the ambitious designs of Mithridates. With an handful of forces he defeated a numerous army of Cappadocians and Armenians commanded by Gordius, and settled Ariobarzanes on the throne. But no sooner was Sylla gone, than Mithridates stirred up Tigranes king of Armenia against Ariobarzanes, who without making any resistance fled to Rome, and Tigranes restored the kingdom to Ariarathes the son of Mithridates. At the same time died the king of Bithynia; upon which Mithridates immediately invaded that country, and drove out Nicomedes the natural son of the late king. But the expelled prince, having fled to Rome, and being assisted by that powerful republic, the king of Pontus was soon obliged to abandon Bithynia and Cappadocia.

16  
Who engages in a war with the Romans.

The Romans now being exceedingly jealous of the power and ambition of Mithridates, resolved to humble him at all events. For this purpose they sent ambassadors to the kings of Bithynia and Cappadocia, desiring them to make frequent inroads into the neighbouring territories of Mithridates, and behave there as they pleased; assuring them of powerful assistance in case they should have occasion. Ariobarzanes could not by any means be induced to provoke so powerful a neighbour; but Nicomedes being induced, partly by promises, and partly by menaces, to comply, entered Pontus, where he laid waste whole provinces with fire and sword. Mithridates complained to the Roman legates: but they replied, that he himself had been the first aggressor; that Nicomedes had only paid him in his own coin, and that they would not allow him to hurt their friend and ally. Upon this, Mithridates, entering Cappadocia with a numerous army, put to flight the united forces of Ariobarzanes and Altinius the Roman legate; thus making himself once more master of this kingdom. In the mean time he sent ambassadors to Rome, complaining of the proceedings of Nicomedes: but his ambassadors met with a very indifferent reception; being enjoined to tell their master, that he must either restore the kingdom of Cappadocia to Ariobarzanes, and make peace with Nicomedes, or be accounted an enemy of the Roman people. With this answer they were commanded to depart the city that very day, and told that no more ambassadors could be admitted till such time as their commands were obeyed.

17  
Defeats Ariobarzanes and Altinius.

In the mean time both parties prepared for war. The Roman legates in Asia drew together all the forces they could muster in Bithynia, Cappadocia, Paphlagonia, and Galatia; and, being joined by Cassius governor of Asia, took the field against Mithridates in the year 89 B. C. They divided their army into several small bodies: Cassius encamped on the confines of Bithynia and Galatia; Manius Aquilius with his body possessed himself of the avenues leading from Pontus into Bithynia; Quintus Oppius secured the entrance into Cappadocia; and the admirals Minucius

Rufus and C. Popilius lay with a fleet of 300 sail at Byzantium, to prevent the enemy from entering the Euxine sea. Each of the generals had under his command an army of 40,000 men; besides a body of 50,000 foot and 6000 horse brought to their assistance by Nicomedes.

Pontus.

On the other hand, Mithridates having collected several of the neighbouring nations to join him, invited an army of 250,000 foot, 50,000 horse, 130 chariots armed with scythes; besides 300 ships and 100 galleys. Part of this force he detached against Nicomedes; and utterly defeated him, though much superior in number, as he was taking possession of an advantageous post by order of Cassius. Another part he detached against Manius Aquilius, whom he also defeated with the loss of 10,000 killed on the spot, and 3000 taken prisoners; on which the other Roman generals abandoned their posts, the fleet also dispersed, and most of the ships were either taken or sunk by the admirals of Mithridates.

18  
And Nicomedes and Manius Aquilius.

The king of Pontus now resolving to improve the opportunity, and drive the Romans entirely out of Asia, over-ran all Phrygia, Myfia, Asia Proper, Caria, Lycia, Pamphylia, Paphlagonia, and Bithynia, with all the rest of the countries which had either belonged to or sided with the Romans, as far as Ionia. He was received every where with the greatest demonstrations of joy; the inhabitants flocking to him in white garments, and calling him their father, deliverer, their god, and the great and sole lord of all Asia. What gained him the affections of the people was his kind usage to the prisoners he had taken in the two engagements above-mentioned; for he not only sent them all home without ransom, but furnished them with plenty of provisions, and money sufficient to defray their expences by the way. Ambassadors flocked to him from all parts; and among others, from Laodicea on the Lycus, to whom the king promised his protection, provided they delivered up to him Q. Oppius governor of Pamphylia, who had fled thither for protection. This request was readily complied with; Oppius was sent to him in chains, with licensors walking before him in derision of the Roman pride and ostentation. Mithridates was overjoyed to see a Roman general and proconsul in his power; and his joy was soon after increased by the arrival of Manius Aquilius, whom the Lesbians, revolting from the Romans, sent to him in fetters, together with many other Romans of distinction who had taken shelter among them. As he had been the chief author of the war, Mithridates led him about with him wherever he went, either bound on an ass, or on foot coupled with one Baltharnes a public malefactor, compelling him to proclaim to the crowds who came to see him, that he was Manius Aquilius the Roman legate. When he came to Pergamus, he caused him first to be publicly whipped, then to be put on the rack, and lastly melted gold death to be poured down his throat.

19  
Overruns Asia Minor.

Mithridates being now looked upon as invincible, all the free cities of Asia received him as their sovereign, contributing large sums towards the defraying the expences of the war; by which means he became possessed of such treasures as enabled him to keep several numerous armies in the field for five years without levying any taxes on his subjects. As many Roman

20  
Puts Aquilius to death.

man citizens were dispersed in the provinces which Mithridates had subdued, he considered these as so many spies who would not fail to send an account of his proceedings to Rome: for which reason he resolved to cut them all off at once by a general massacre; which barbarous policy, it is said, had never been heard of till his time, but has been since practised by other nations. He dispatched private letters to all the governors and magistrates of the cities where the Romans resided, enjoining them on pain of death, and the entire destruction of their country, to cause all the Italian race, women and children not excepted, to be murdered on the 30th day from the date of his letters, and to let their bodies lie unburied in the open fields. One moiety of their goods was to be forfeited to the king, and the other bestowed as a reward on the assassins. Whatever slave murdered his master was to receive his liberty, and one half of the debt was to be remitted to the debtor that should kill his creditor. Whoever concealed an Italian, under any pretence whatever, was to be punished with immediate death. On the fatal day, all the gates of the cities being shut, and the avenues kept with soldiers, the king's orders were proclaimed, which caused an universal horror, not only among the unhappy victims themselves, but among those who had any feelings of humanity, at seeing themselves obliged either to betray and murder their innocent guests, friends, and relations, or to become liable to a cruel death. However, as most of the Asiatics bore a mortal hatred to the Romans, and were moreover animated by the promise of an ample reward, the orders were without delay put in execution. The inhabitants of Ephesus, where Mithridates then resided, dragged such as had taken sanctuary in the temple of Diana from the very statue of the goddess, and put them to the sword. The Pergamenians discharged showers of darts upon them as they embraced the statues in the temple of Esculapius. At Adramyttium in Mysia many were murdered in the water, while they were attempting, with their children on their backs, to swim over to the island of Lesbos. The Caunians, who not long before had been delivered from the yoke of the Rhodians, and restored to their ancient privileges, excelled all the rest in cruelty: for, as if they had apostatized from human nature, they took pleasure in tormenting and butchering the innocent children before their mothers eyes; some of them running distracted, and others dying with grief at a sight which nature could not bear. The Tralians were the only people on the continent who could not have the cruelty to imbrue their hands in the blood of the innocent Italians. However, as the king's orders were peremptory, they hired one Theophilus a Paphlagonian to dispatch the few Romans that lived among them. He, having shut them all up together in the temple of Concord, first cut off their hands as they embraced the statues of the gods, and then hacked them in pieces. Many Romans were saved on the floating islands of Lydia called *Calamine*, where they concealed themselves till such time as they found an opportunity of escaping out of Asia. Nevertheless, according to Plutarch and Dion, 150,000 Roman citizens were massacred on that day; but, according to others, only 80,000.

Mithridates having now got rid of those whom he

was in dread of on the continent, embarked great part of his forces in order to reduce the islands of the Archipelago. At Cos he was gladly received, and had delivered up to him the young Alexander, son of Alexander king of Egypt, who, being driven out of that country, was killed by Chares a sea-captain as he was retiring in a small vessel to Cyprus. With the young prince, they put into the king's hands vast sums of money, with all the golden vessels and jewels, to an immense value, which his grandmother Cleopatra had been amassing for many years. To the young prince Mithridates gave an education suitable for a king's son, but kept the treasures for himself. Here likewise he found 800 talents in ready money, which, at the first breaking out of the war, had been deposited by the Jews of Asia, and were designed for the temple of Jerusalem.

From Cos Mithridates steered his course for Rhodes, where at that time all the Romans, who had escaped the massacre above-mentioned, found a sanctuary, and amongst others, L. Cassius the proconsul. The Rhodians, however, being very expert in maritime affairs, Mithridates did not think proper to venture an engagement. As the enemy's fleet advanced, therefore, he retired; but six of the Rhodian ships coming up with 25 of his, a sharp action ensued, in which the Rhodians sunk two of the king's ships, and put the rest to flight. In this encounter, though Mithridates had never seen a sea-fight before, he behaved with great intrepidity; but one of the ships of his own squadron falling foul of that which carried him, he was very near being taken prisoner. From this time forth he abhorred the sea, and took an aversion to all the Chians, because the pilot of that ship was a Chian. However, he again appeared before the island; but was forced anew to leave it with disgrace, and to give over all thoughts of reducing it.

Mithridates now retired into Asia, with a design to settle the civil government of the countries which he had conquered, committing the care of the war to his generals. Archelaus, his generalissimo, was sent into Greece with an army of 120,000 men; where, by treachery, he made himself master of Athens, and either put to the sword or sent to Mithridates all those who favoured or were suspected to favour the Romans. From Athens he dispatched parties to reduce the neighbouring castles and the island of Delos, which they did accordingly; but Orobius, a Roman general, hearing that the enemy kept no guards, but passed their time in carousing and debauchery, fell upon them unexpectedly, and cut off the whole party, except Appelicon the commander.

In the mean time, Metrophanes, another of the king's generals, entering Euboea, laid waste the whole country, exerting his rage chiefly against the cities of Demetrias and Magnesia, which refused to open their gates to him. But as he was falling off with a great booty, Brytius, the prætor or governor of Macedonia, coming up with him, sunk some of his ships, and took others, putting all the prisoners to the sword. Mithridates, upon the news of this loss, sent his son Ariarathes with a powerful army to invade Macedonia; which he soon reduced, together with the kingdom of Thrace, driving the Romans every where before him. The generals whom he sent into other

Pontus. quarters were no less successful; so that Mithridates had, according to Aulus Gellius, 25 different nations who paid him homage. The same author adds, that he was skilled in every one of their various languages, so that he could converse with the natives without an interpreter. Among these nations we find the Rhoxani, now the Russians or Muscovites, whom Deiphontus, one of the king's generals, brought under subjection, after having slain in an engagement 50,000 of the barbarians.

25  
Sylla sent against him.

All this time the Romans had been too much taken up with their own domestic quarrels to take such effectual measures as they otherwise would have done for checking the progress of Mithridates. But at last, having received certain advice that the king designed to invade Italy, and that he had even been solicited to do so by some of the revolted Italians, they sent against him Lucius Sylla, who had already given sufficient proofs of his courage, conduct, and experience in war. He had with him only five legions and a few cohorts. With this inconsiderable force he landed in Attica, and in a short time made himself master of the capital; Archelaus not daring, or, according to others, through treachery, not caring to engage him. As Sylla had but a few frigates, he sent Lucullus to the island of Rhodes, with orders to the Rhodians to join him with their fleet. The undertaking was very dangerous, as the king's fleet in a manner covered the sea. However, Lucullus, despising all danger, ventured out, and failed, without meeting with any perverse accident, to Syria, Egypt, Libya, and Cyprus; from whence he returned with such supplies of ships and experienced mariners, as enabled Sylla, after their conjunction with the Rhodians, to act offensively by sea also. Archelaus now dispatched messengers to Taxiles, who commanded in Thrace and Macedon, desiring him to join him with all his forces; which the other readily did, and between both mustered an army of 120,000 men. Sylla met them near Cheronæa, with only 15,000 foot and 1500 horse; but gave them a most dreadful overthrow, no fewer than 110,000 of the Asiatics being slaughtered, while the Romans lost only 12 men.

26  
Who totally defeats his generals in Greece.

This success having raised envy and jealousy against Sylla in Rome, the senate sent Lucius Valerius Flaccus, the consul of that year, with two legions into Asia, in appearance to attack Mithridates on that side, but with private instructions to fall upon Sylla himself, if they found him disaffected to the senate. As Flaccus was a man of no experience in war, C. Fimbria, a senator of great repute among the soldiery, was appointed to attend him with the character of legate and lieutenant-general. Sylla was at that time in Bœotia; but, hearing what had happened at Rome, he marched with all expedition into Thessaly, with a design to meet Flaccus, who, he expected, was to land in that province. But no sooner had he left Bœotia, than the country was overrun by an army of Asiatics, under the command of Dorylaus the king's chief favourite. On this advice Sylla returned into Bœotia, where he gained two signal victories, which put an end to the war in Greece. In the first of these Dorylaus lost 15,000 of his men according to some, or 200,000 according to others; and in the next all the rest. In

27  
Flaccus and Fimbria sent into Asia.

28  
Sylla gains two other victories in Greece.

this last engagement 20,000 were driven into a river, where they all perished; an equal number were pursued to a marsh, and entirely cut off; the rest were killed in the heat of battle, the Romans giving no quarter to men who had treated their fellow-citizens after such a barbarous manner in Asia. Plutarch tells us, that the marshes were dyed with blood; that the course of the river was stopped by the dead bodies; and that even in his time, that is, near 200 years after, a great number of bows, helmets, coats of mail, and swords, were found buried in the mud. Archelaus, who had joined Dorylaus with a body of 10,000 men a few days before the battle, lay three days stripped among the slain till he found a small vessel which carried him to Eubœa, where he gathered what forces he could, but was never again able to appear in the field. Indeed Livy tells us, that Archelaus betrayed the king's cause; and Aurelius Victor, that the king's fleet was intercepted by Sylla through the treachery of Archelaus; adding, that there was a good understanding between these two commanders, as was plain from Sylla's bestowing upon Archelaus 10,000 acres of land near the city of Chalcis in Eubœa. Strabo also informs us, that Archelaus was afterwards greatly esteemed and cared for by Sylla and the senate; but Sylla himself in his commentaries, and Dio, endeavour to clear Archelaus from all suspicion of treachery.

Pontus.

In the mean time, Sylla having given up Bœotia to be plundered by his soldiers, marched into Thessaly, where he took up his winter-quarters, caused his old ships to be refitted and several new ones built, in order to pass over into Asia in the beginning of the spring, that he might drive from thence not only Mithridates but his rival Flaccus also, whom the senate, out of opposition to him, had appointed governor of that province. But before he arrived, some differences having arisen between Flaccus and Fimbria, the latter was by the consul deprived of his command. Upon this Fimbria, having gained over the soldiery to his side, made war on the consul, took him prisoner, put him to death, and assumed the command of all the Roman forces in Asia. In this station he behaved with the greatest cruelty, inasmuch that his name became more odious than even that of Mithridates itself. This hated the king of Pontus endeavoured to improve to his own advantage; and therefore commanded his son, by name also *Mithridates*, to join Taxiles, Diophantes, and Menander, three of his most experienced commanders, to return at the head of a numerous army into Asia; not doubting, but the inhabitants, thus harassed by Fimbria, would shake off the Roman yoke when they saw such a powerful army in the field ready to protect them. But Fimbria, distrusting the Asiatics, marched out to meet the enemy, and offered them battle before they entered the province. As the king's army was greatly superior to the Romans in number, the forces of latter suffered greatly in the engagement, but held out till night parted them, when they withdrew to the opposite side of a river, which was at a small distance from the field of battle. Here they designed to intrench themselves; but in the mean time a violent storm arising, Fimbria laid hold of that opportunity to repass

Pontus. the river and surprize the enemy; of whom he made such havoc as they lay in their tents, that only the commanders and some few troops of horse escaped. Among these was the king's son; who, attended by a few horse, got safe to Pergamus, where his father resided. But Fimbria, pursuing him night and day without intermission, entered Pergamus sword in hand; and hearing that both Mithridates and his son had fled from thence a few hours before, he continued his pursuit, and would have taken the king himself, had he not entered Pitane with a considerable body of horse. The place was closely invested by Fimbria; but as he had no ships to block it up by sea also, he sent a messenger to Lucullus, who commanded the Roman navy in Asia, intreating him, as he tendered the welfare of the republic, to make what haste he could to Pitane, and assist him in taking the most inveterate enemy the Romans had. But Lucullus, preferring the gratification of a private pique to the good of his country, refused to come; and thus allowed the fleet of Mithridates to carry him in safety to Mitylene.

33  
Peace con-  
cluded.

Soon after the king's departure Fimbria took Pitane by storm, and reduced most of the cities of Asia, particularly Troy, which he took by storm in eleven days, and put most of the inhabitants to the sword, because they had sent an embassy to Sylla, offering to submit to him rather than to Fimbria.—To add to the misfortunes of Mithridates, his fleet was entirely defeated in two engagements by Lucullus; so that he began to be weary of the war, and therefore desired Archelaus to conclude a peace upon as honourable terms as he could. The king himself had afterwards also a conference with Sylla, and a peace was concluded in 85 B. C. on the following terms, viz. That Mithridates should relinquish all his conquests, and content himself with his paternal dominions which were confined within the limits of Pontus: that he should immediately resign Bithynia to Nicomedes, and Cappadocia to Ariobarzanes, and release without ransom all the prisoners he had taken during the war: that he should pay to the Romans 2000, or as others will have it 3000 talents, and deliver up to Sylla 80 ships with all their arms and ammunition, and 500 archers; and lastly, that he should not molest such cities or persons as had during the war revolted to him and sided with the Romans.

Sylla, having thus concluded the war with great glory to himself and advantage to the republic, turned his army against Fimbria; but the latter, finding himself in no condition to oppose his rival by force, had recourse to treachery, and attempted to get Sylla murdered. The plot miscarried, and Fimbria put an end to his own life; upon which Sylla, having now an uncontested power in Asia, declared the Chians, Rhodians, Lycians, Magnesians, and Trojans, free, and friends of the people of Rome, by way of reward for their having sided with the Romans: but on the other cities he laid heavy fines; condemning them in one year to pay 20,000 talents, and quartering his soldiers in the houses of those who had shewn disaffection to the Romans. Each private man was to receive of his landlord 16 drachmas a day, and each officer 50; and besides, both were to be supplied with provisions, not only for themselves, but for such of their friends

as they thought proper to invite. By these impositions most of the people of Asia were reduced to beggary; especially the inhabitants of Ephesus, who had above all others shown their hatred to the Romans. Sylla then, having collected immense treasures, set sail for Italy; leaving behind him Lucullus with the character of *questor*, and Muræna with that of *praetor*.

The two legions which Fimbria had commanded were given to Muræna, because Sylla suspected them of an inclination to the faction of Marius, whose party he was going to crush at Rome.

Mithridates in the mean time no sooner returned into Pontus, than he set about the reduction of those nations which had revolted from him during the war. He began with the Colchi; who immediately submitted, upon condition that Mithridates would give his son for a king over them. This was complied with; but the old king had thenceforward a jealousy of his son, and therefore first imprisoned and then put him to death. Soon after this, the king having made great preparations under pretence of reducing the Bosphori, a warlike nation who had revolted from him, the Romans began to be jealous. Their jealousy was further increased by Archelaus, who fled to them, and assured them that the preparations of Mithridates were not at all designed against the Bosphori. On hearing this, Muræna invaded Pontus without any further provocation.

The king put him in mind of the articles of peace concluded with Sylla; but Muræna replied that he knew of no such articles; for Sylla had set nothing down in writing, but contented himself with the execution of what had been agreed upon. Having given this answer, the Roman general began to lay waste and plunder the country, without sparing even the treasures or temples consecrated to the gods. Having put all to fire and sword on the frontiers of Pontus towards Cappadocia, he passed the river Halys, and on that side possessed himself of 400 villages without opposition; for Mithridates was unwilling to commit any hostilities before the return of an ambassador whom he had sent to Rome to complain of the conduct of Muræna. At last the ambassador returned, and with him one Callidius; who, in public assembly, commanded Muræna to forbear molesting a friend and ally of the Roman people; but afterwards, calling him aside, he had a private conference with him, in which it is supposed, as he brought no decree of the senate, that he encouraged him to pursue the war. Whatever might be in this, it is certain that Muræna still continued to practise the same hostilities, and even made an attempt on Sinope, where the king resided and the royal treasures were kept. But as the town was well fortified, he was forced to retire with some loss. In the mean time Mithridates himself taking the field, appeared at the head of a powerful army, drove the Romans out of their camp, and forced them, with great slaughter, to save themselves over the mountains into Phrygia; which sudden victory again induced many cities to join Mithridates, and gave him an opportunity once more of driving the Romans out of Cappadocia.

In the mean time Sylla, being created dictator at Rome, sent a messenger to Muræna, charging him in his name not to molest Mithridates, whom he had honoured with the title of a friend and ally of Rome.

Pontus. Muzena did not think proper to disregard this message; and therefore immediately abandoned all the places he had seized, and Mithridates again renounced Cappadocia, giving his own son as an hostage of his fidelity. Being then at leisure to pursue his other plans, Mithridates fell upon the Bosphori; and, having soon subdued them, appointed Machares one of his sons king of the country. But leading his army from thence against the Achæans, a people bordering on the Colchi, and originally descended from the Greeks, who returning from Troy had mistaken their way into Greece and settled there, he was defeated with the loss of three-fourths of his men. On his return to Pontus, however, he recruited his army, and made vast preparations to invade them anew; but in the mean time, hearing of Sylla's death, he came to the imprudent resolution of entering into a second war with the Romans. Having therefore induced his son-in-law Tigranes, king of Armenia, to invade Cappadocia, he himself entered Paphlagonia at the head of 120,000 foot disciplined after the Roman manner, 16,000 horse, and 100 chariots armed with scythes. This country readily submitted; after which the king marched into Bithynia, which also submitted without opposition; the province of Asia followed the example of the rest; for these countries being oppressed with exorbitant taxes, looked upon him as their deliverer. In entering the cities of Asia, he caused M. Marius or Varius, whom Sertorius had sent him out of Spain to discipline his troops, walk before him with the ensigns of consular dignity as if he was the chief magistrate; the king following as one of his attendants. He made several cities free; but at the same time acquainted the inhabitants that they were indebted to Sertorius for their liberty; and thus, by the connivance of that general, many cities revolted from the Romans without knowing that they had done so. But in the mean time Julius Cæsar, being at that time at Rhodes whither he had gone to study oratory, and hearing what havoc the king's officers made in the adjacent countries, he collected what troops he could, and falling unexpectedly upon them, drove them quite out of the province of Asia.

38  
Lucullus and Cotta  
sent against  
him.

The Roman senate, now finding a war unavoidable, appointed Lucullus to manage it. The other consul Cotta, having solicited an employment in this war, was sent with a fleet to guard the Propontis and defend Bithynia. Lucullus having raised one legion in Italy, passed over with it into Asia, where he was joined by four others, two of which, as they had served under Pimbræ, proved at first very mutinous and refractory; nor were the other two much better, having immersed in the Asiatic luxuries. The disciplining of these troops took up a considerable time, which was prejudicial to the Roman affairs; for almost all the Asiatics were ready to revolt, and Mithridates was making the greatest preparations. One of his armies was ordered to march into Cappadocia, under the command of Diophantus Matharus, in order to oppose Lucullus if he should attempt to enter Pontus on that side; another, commanded by Mithridates in person, consisted of 150,000 foot, 12,000 horse, and 100 chariots armed with scythes; a third army, commanded by Marius and Eumachus, two generals of great experience in war, was encamped in the neighbourhood of

Heraclea in Pontus.

The beginning of the war proved favourable to Mithridates. Cotta being desired by Lucullus to keep his fleet within the harbour, as being inferior to that of Mithridates, resolved to take the first opportunity of fighting the king by land, not doubting of an easy victory. Having for this purpose collected all the forces he could, Cotta dispatched his legate, P. Rutilius, with a considerable body to observe the motions of the enemy. This commander being met by Marius and Eumachus, an engagement ensued, in which the Romans were defeated, and the greatest part of them, together with their commander, cut in pieces. The same misfortune befel several other officers of distinction sent out to oppose Mithridates; who, being elated with success, ordered his admiral to sail into the very harbour, and fire the Roman fleet. This was accordingly performed without the least opposition from Cotta; and 60 ships were taken, sunk, or burnt, on that occasion.

Pontus.  
39  
Mithridates  
is at first  
successful.

These victories having increased the rebellious disposition of the Asiatics, made Lucullus hasten his march in order to stop the progress of the enemy. But finding the king's army much more numerous than he expected, he thought proper to decline an engagement. However, several skirmishes happened, in which the Romans had always so much the advantage, that they became impatient for a general engagement. But Lucullus did not at this time choose to run for great a risk; and therefore Mithridates, seeing he could not force the Romans to a battle, decamped in the night-time, and by day-break reached Cyzicum, a most important city, and greatly attached to the Romans. Lucullus pursued him; and, falling on his rear, killed 10,000, and took 13,000 prisoners. After this, the Roman general, by a manoeuvre, gained an important pass, which enabled him to cut off all communication between the army of Mithridates and the neighbouring country. The king, seeing himself thus in danger of famine, redoubled his efforts to gain the city; but finding that he could not batter down the walls, he resolved to undermine them. In this also he was unsuccessful; the besieged sunk countermines, and had very near taken the king himself in one of his own mines. In the mean time, winter coming on, the army of Mithridates was so distressed for want of provisions, that many died of hunger, while the survivors were forced to feed on the flesh of their dead companions. The famine was followed by a plague; which destroyed such numbers, that Mithridates was obliged to think of a retreat; and even this was become very dangerous. However, he laid hold of the opportunity when Lucullus went away to besiege a neighbouring castle, and sent off the greatest part of his cavalry in the night; ordering them not to halt till they were out of the reach of the enemy. But Lucullus having got intelligence of their march, suddenly returned, and pursued them so close, that he came up with them as they were passing a river, took 600 horse, all their beasts of burden, 15,000 men, and put the rest to the sword. On his return he fell in with Aristonicius the king's admiral, whom he took, just as he was ready to sail with a large sum of money designed to bribe the Roman army. In the mean time Mithridates, finding himself reduced to the last extremity, embarked in the night-time with

the greatest part of the forces, while Marius and Eumachus, with 30,000 men, made the best of their way to Lampfacus. But being closely pursued by the Romans, they were overtaken at the river *Æstopus*, which at that time was not fordable, by reason of its having been swelled by heavy rains. Twenty thousand were killed on the spot; nor could a single man have escaped, had not the Asiatics scattered great quantities of gold and silver in the way, that the march of the Romans might be retarded by their stopping to gather it up. Lucullus on his return entered Cyzicum amidst the acclamations of the citizens; who afterwards instituted public sports in honour of him, which they called *Lucullea*. The city was declared free, and all the privileges, exemptions, and immunities bestowed upon the citizens which were enjoyed by the inhabitants of Rome itself.

43  
Lucullus gains a great victory at sea.

From Cyzicum, Lucullus marched along the coast of the Hellespont till he came to Troas; where he equipped his fleet, and put to sea in quest of Marius, Alexander, and Dionysius, three of the king's generals, who had a fleet of 50 ships, with 10,000 land-forces on board. Lucullus came up with them near the island of Lemnos, took 32 of their ships, and put a great number of their land-forces to the sword. The day after the engagement the three generals were discovered in a cave where they had concealed themselves, and dragged from thence to Lucullus; who, after having severely upbraided Marius for fighting against his country, caused him to be put to death. Alexander and Dionysius were reserved for the triumph; but the latter poisoned himself to avoid that disgrace. Lucullus then steered his course for Bithynia, on receiving intelligence that Mithridates had appeared with his fleet on those coasts: but the king having notice of his approach, made what haste he could to gain Pontus, and arrived at Heraclea on board a pirate named *Selamus*; with whom he was obliged to trust himself, his fleet being dispersed by a violent storm, and the ship that carried him cast away.

43  
Further successes of Lucullus.

In the mean time Mithridates was no less unfortunate by land than by sea. Triarius, one of the officers of Lucullus, reduced the cities of Apamea, Prusa, Prusias, and Nicæa. From thence he marched with all expedition to Nicomedia, where the king himself was, and near which place Cotta lay encamped. But before the two armies could be joined, Mithridates escaped, first to Heraclea, which was betrayed to him, and from thence to Sinope. Nor was Lucullus himself all this time inactive. Having reduced all Paphlagonia and Bithynia, he marched through Cappadocia, and joined Cotta and Triarius at Nicomedia, with a design to invade Pontus; but hearing that Heraclea was in the hands of Mithridates, he dispatched Cotta to reduce that city. Triarius was ordered with the fleet to the Hellespont and Propontis, to intercept the king's fleet, which was daily expected from Spain with supplies from Sertorius. Lucullus himself, with the main strength of the army, pursued his march into Pontus. His army was greatly harassed, especially in the narrow passes between Cappadocia and Pontus, by sly parties of the enemy. But the greatest inconvenience was the want of provisions, as the king's troops had laid waste all the country round; inasmuch that Lucullus having lost almost all his beasts of burden, was

obliged to take along with the army 30,000 Galatians, each of them carrying a sack of corn on his back. At last, however, he gained the plains of Pontus; where provisions were so plentiful, that an ox was sold for a drachma, and every thing else in proportion.

The Roman general having now carried the war into the enemy's country, divided his forces, and at the same time invested a very strong town named *Amifus*; another called *Eupatoria*, built by Mithridates, and made the place of his residence; and another, named *Themiscyra*, situated on the banks of the Thermoodon. Eupatoria was soon taken, but Themiscyra made a vigorous resistance. The townsmen galled the Romans to such a degree, that, not daring to approach the walls openly, they contented themselves with undermining them: but in this, too, they met with no small difficulty; for the enemy countermined, and often engaged them under ground, letting into the mines bears and other wild beasts, with swarms of bees, which obliged them to abandon their works. However the town was at last obliged to surrender for want of provisions. As for Amifus, Lucullus himself sat down before it: but, finding it strongly fortified, and garrisoned with the flower of the king's troops, the Roman general thought proper to reduce it by famine; and on this occasion his countrymen first complained of him as protracting the war for his own advantage.

In the mean time Mithridates having recruited his shattered army, advanced to Cabiræ, a city not far distant from Amifus. Lucullus, leaving part of the army to continue the siege, marched at the head of the rest to oppose Mithridates. But the king having drawn his cavalry into a general engagement, defeated them with considerable loss, and drove them back to the mountains, through the passes of which Lucullus had lately marched to attack him. This check obliged the Roman general to retire to a rising ground near the city of Cabiræ, where the enemy could not force him to an engagement. Here, provisions beginning to grow scarce, Lucullus sent out strong parties from his army into Cappadocia, the only place from whence he could have supplies. One of these parties entirely defeated Taxiles and Diophantes, two of the king's generals, who had been stationed there to prevent Lucullus from having any communication with the country. The king, upon the news of this defeat, resolved to break up his camp and retire, not questioning but that Lucullus would attack him as soon as his forces returned.

This resolution he no sooner imparted to his nobles, than they began privately to send away their most valuable goods; which being found out by the soldiers, they took it in such bad part that no intelligence had been given them, that they plundered their baggage, and put those who had the care of it to the sword. After this they betook themselves to flight, crowding out of the gates in the utmost confusion. The king halted to stop their flight; but nobody showing him the least respect, he was carried away by the crowd, and in great danger of being trampled to death. Having with difficulty made his escape, he retired with a small retinue, first to Cabiræ, and then to his son-in-law Tigranes king of Armenia. Lucullus dispatched the best part of his cavalry to pursue the fugitives; while he himself, with the rest, invested the camp of Mithridates, where those remained who could not fly

with

44  
The army of Mithridates multiplies, which obliges the king to fly into Armenia.

Pontus.

with the rest. The camp was easily taken; but most of the foldiers made their escape, while the Romans, contrary to their general's orders, were busied in plundering. Lucullus then pursued hard after the king; who, being overtaken by a company of Galatians, caused a mule loaded with part of his treasures to be driven in among them, by which means he made his escape while they quarrelled about the booty. Mithridates, remembering in his flight, that he had left his sisters, wives, and concubines at Pharnacia, dispatched an eunuch, named *Bacchus*, or *Bacchides*, with orders to put them all to death, lest they should fall into the hands of the enemy; which was accordingly done.

After the flight of Mithridates, the Romans no longer met with any opposition; the king's governors flocking from all parts to put themselves under the protection of the conqueror. Among these was the grandfather of Strabo the geographer, whom the king had dishonoured by putting to death his cousin-german Tobias, and his son Theophilus. He was a man of such credit, that it was no sooner heard that he had abandoned the king's party, than 15 other commanders delivered up to Lucullus the places with which they had been intrusted; and about the same time Triarius falling in with the king's fleet near the island of Tenedos, obtained a complete victory, having either taken or sunk 60 of the enemy's vessels.

All this time Cotta had been employed without success in besieging Heraclea, which he could never have reduced without the assistance of Triarius. That commander, having defeated the fleet, soon reduced the town to such distress, that a third part of the garrison died of hunger; upon which the governor, Co-nacorex, privately agreed with Triarius to deliver one of the gates to him. This was accordingly done; and the Romans, entering, made a terrible slaughter of the helpless inhabitants. But in the mean time Cotta, provoked at seeing himself deprived both of all share of the booty, and the honour of reducing a place before which he had sat so long, fell upon his countrymen as they were busied in plundering; which would have occasioned a great deal of bloodshed, had not Triarius promised to divide the booty equally. Co-nacorex, in order to conceal his treachery, after marching out of Heraclea, seized on two forts belonging to the Romans; and Triarius being sent to recover them, Cotta, in his absence, plundered the city anew, rifled the temples which the other had spared, put all the citizens he could meet with to the sword, and having carried off every thing valuable, at last set fire to the city in several places, by which means it was soon reduced to ashes. Cotta then, having no farther occasion for his troops, dismissed the auxiliaries, resigned his legions to Lucullus, and put to sea himself in order to return to Rome. But he had scarce got out of the harbour, when part of his ships, being overloaded with the spoils of the city, sunk; and the others were by a violent north wind dashed against the shore, which occasioned the loss of a great part of the booty. However, on his return to Rome, he was highly applauded by the senate, and honoured with the title of *Ponticus*.

Lucullus, having now reduced Pontus, marched against the Chaldeans, Tibereadians, and inhabitants of Armenia Minor; who voluntarily submitted to him,

and put him in possession of all their strong holds. From Armenia, he returned before Amisus, which still held out; Callimachus, governor of the place, having harassed the Romans to such a degree by engines of his own contriving, that they had given over their assaults, and contented themselves with blocking it up by land, though the garrison was at the same time plentifully supplied with provisions by sea. Lucullus, on his arrival, summoned the city to surrender, offering the inhabitants very honourable terms; but, being refused, he made a general assault at the time when he knew that Callimachus used to draw off great part of his troops to give them some respite. The Romans applying their scaling ladders, got over the wall before Callimachus could come to the assistance of those whom he had left to guard it; however, by setting the city on fire, he found means in that confusion to make his escape. Lucullus commanded his men to use their utmost endeavours to save the city; but they being intent only upon plundering, regarded nothing but the furniture. At last the fire was extinguished by a violent shower; and Lucullus, having with much ado restrained his soldiers from committing any farther excesses, repaired the city in some measure before he left it, and suffered the inhabitants to enjoy their possessions in peace.

Nothing was now wanting but the captivity of Mithridates himself to put a final period to the war; and therefore Lucullus demanded him from his son-in-law Tigranes. But though that prince could not be prevailed to see Mithridates on account of his misconduct, he could as little be induced to deliver him up to his enemies. After this refusal, however, he for the first time condescended to see his father-in-law, after he had resided a year and eight months in his dominions. In a private conference held by the two kings, it was agreed, that Tigranes should march against the Romans, and Mithridates with 10,000 horse return into Pontus, where he should make what levies he could, and rejoin Tigranes, before Lucullus, who was then employed in the siege of Sinope, could enter Armenia. But, in the mean time, Sinope having surrendered, Lucullus with all possible expedition marched against Tigranes, and, having drawn him into a general engagement, gave him an entire defeat, as is related under the article ARMENIA.

Mithridates was marching to his assistance, when he met his son in law flying with a small retinue to shelter himself in some remote corner of the kingdom. He encouraged him to raise new forces; not doubting but that another campaign would repair all former losses, provided he would commit to his management every thing relating to the war. To this Tigranes agreeing, as thinking him more fit to deal with the Romans than himself, orders were issued out for raising a new army, and all the Armenians able to bear arms summoned to meet at the place of the general rendezvous. Out of these Mithridates choose 70,000 foot, and 35,000 horse; and having trained them up during the winter, after the Roman discipline, in the beginning of the spring he left part of them with Tigranes, and marched himself with the rest into Pontus, where he recovered many important places, and overcame in a pitched battle M. Fabius, whom Lucullus had appointed

ed governor of that province. Being flushed with this success, as soon as the wounds he received in the engagement suffered him to move, he pursued Fabius, and besieged him in the city of Cabira, whither he had retired; but in the mean time Triarius, who was marching out of Asia to join Lucullus, hearing what distress the Romans were in, hastened to their relief, and appearing unexpectedly on the neighbouring hill, struck such terror into the enemy, that they raised the siege, and made the best of their way into Cappadocia. Triarius pursued them, and got so near them as to be parted only by a river. Here he halted, with a design to pass the river after he had allowed his men some rest; for they were tired out with long marches. But Mithridates was before-hand with him, and crossing the river on a bridge, where he had placed a strong guard, attacked the Romans with great resolution before they had time to refresh themselves. The battle was bloody, and the event doubtful, till the bridge breaking down with the weight of the multitude that passed, the king's troops who had engaged, relying chiefly on their numbers, began to lose courage, seeing they could receive no further assistance; and the Romans charging them with fresh vigour, they betook themselves to a precipitate flight. After this engagement, as winter came on, both armies were glad to retire to their winter-quarters.

47 Mithridates defeated.

During the winter Mithridates raised new forces; and having received considerable supplies from Tigranes, took the field early in the spring, in hopes of driving the Romans quite out of Pontus, before Lucullus, who had work enough on his hands in Armenia, could come to their assistance. With this view he marched straight against Triarius and Sornatus, to whom Lucullus had committed the care and defence of that province; and finding them encamped near the city of Gaziurfa, proffered them battle; which they declining, he sent a strong detachment to besiege a castle where the Romans had left all their baggage, hoping they would rather venture an engagement to relieve the place, than lose all they had got with so much toil and labour during the war: neither was he disappointed in his hopes; for though Triarius was for keeping close in his camp till the arrival of Lucullus, whom he daily expected, having acquainted him with the danger, the soldiers hearing that the castle was besieged, declared in a tumultuous manner, that if he did not lead them they would march to the relief of the place without his leave. Triarius being thus forced by his own men to fight, drew out his forces against the king, whose army was three times his number; but while they were upon the point of engaging, both armies were by a violent storm forced to retire to their respective camps; but Triarius receiving that very day intelligence of the approach of Lucullus, and fearing he would snatch the victory out of his hands, resolved to make a bold push, and next morning by break of day attack the king in his camp. If he conquered, the glory he thought would be entirely his own; if he were overcome, the enemy could reap no great advantage from his victory, Lucullus being at hand with a powerful army. The king, in that surpris, putting himself at the head of a few troops of his guards, sustained the brunt of the Romans, till the rest of his army drawing up came to his relief, and attacked the enemy with

48 Defeats Triarius.

such fury, that the Roman foot were forced to give way, and were driven into a morass, where they were surrounded and great numbers of them cut in pieces.

Pontus.

Their horse were likewise put to flight, and pursued with great slaughter, till a Roman centurion in the king's service, pitying his countrymen, attempted to kill him. The king's life was saved by his breast-plate; but as he received a deep wound in the thigh, he was obliged to give over the pursuit himself, and those that were about him caused the retreat to be sounded, which, as it was unexpected, occasioned a great confusion in the whole army. The centurion was immediately cut in pieces; but the Roman horse in the mean time getting the start of the enemy, found means to make their escape. Above 7000 of the Romans were killed in that battle; and among them 150 centurions and 24 tribunes, the greatest number of officers that had been lost in any engagement to that day. Mithridates being cured of his wound, that he might not for the future be exposed to such dangers, caused all the Romans that served in his army to be formed into one body, as if they were to be sent out on a party, and then ordered them to retire to their tents, where they were all to a man cut in pieces.

49 All the Romans in the service of Mithridates massacred.

The king, however elated with success, yet would not engage Lucullus; but with long marches hastened into Armenia Minor, and encamped upon a hill near the town of Talura, expecting Tigranes, who was advancing with a strong army to join him. Lucullus, in pursuit of Mithridates, marched over the field of battle, leaving those unburied who had fallen in the engagement, which alienated the minds of the soldiery from him, and they began to be very mutinous; being stirred up by Appius Claudius, whom Lucullus had turned out of his command for his vile behaviour, notwithstanding he was nearly related to him, Lucullus having married his sister. The discontent that prevailed in the army came to such a height, that Lucullus was obliged to lie still in his camp all that summer; the soldiers declaring in a mutinous manner, that they would not follow him any longer, nor serve under a general who refused to share the booty with them.

These complaints, and the general discontent that reigned in the army, obliged the senate to recall Lucullus, and appoint Manius Acilius Glabrio, consul of that year, in his room. Glabrio arriving in Bithynia, gave notice by public criers to all the cities, that the senate had discharged Lucullus and his army, and confiscated his goods for protracting the war and refusing to comply with their injunctions. Hereupon Lucullus was abandoned by the greater part of his army, and forced to retire into Galatia, not being in a condition to make head against the joint forces of the two kings; who, laying hold of that opportunity, recovered the best part of Pontus, Bithynia, Cappadocia, and Armenia Minor: for though Glabrio had hastened into Pontus, as if he had intended to engage the enemy and rob Lucullus of the victory, yet, upon the first news of the approach of the two kings, he thought fit to retire and leave the country open on all sides to the enemy.

50 Lucullus recalled, which retrieves the affairs of Mithridates.

When this was heard at Rome, a law was enacted there by C. Manilius, a tribune of the people, whereby the management of the war against Mithridates and Tigranes was committed to Pompey, and likewise the provinces of Cilicia, then under Quintus Marcius, and

51 Pompey sent against him.

Pontus.

of Bithynia under Glabrio. By the same law he was continued in that unlimited power by sea, with which he was invested when he first set out against the pirates of Cilicia. In virtue of this law, Pompey, who had just then ended the war with the Cilician pirates, took upon him the command of the army, and directed all the allies of the Roman people to join him with all possible expedition: but before he took the field, he renewed the alliance which Sylla and Lucullus had concluded with Ptolemy king of Parthia, and then sent friendly proposals to Mithridates; who at first seemed inclined to give ear to them, and accordingly dispatched an ambassador to the Roman army to treat of a peace. Pompey required of him to lay down his arms if he was in earnest, and deliver up to him all those who had revolted from the Romans during the war. This demand was no sooner reported abroad in the king's camp, but the deserters, who were very numerous in the king's army, betaking themselves to their arms, threatened to put Mithridates himself to death; and would have occasioned a great disturbance, had not the king appeased the growing tumult, by assuring them, that he had sent ambassadors, not to treat of a peace, but only to take, under pretence of suing for peace, a view of the enemy's strength. He moreover obliged himself, by a solemn oath in the presence of the whole army, never to enter into any treaty of friendship with the Romans, nor to deliver up to them such as had ever served under him.

52  
Mithridates  
rejects his  
proposals  
of peace.

Pompey, finding his proposals rejected, advanced against the king with an army of 30,000 foot and 20,000 horse, as Plutarch writes, or 30,000, as we read in Appian, all chosen troops; for he discharged most of those who had served under Glabrio and Lucullus. As he entered Galatia, he was met by Lucullus, who endeavoured to persuade him to march back, the war being near finished, and even deputies sent by the republic to settle the province of Pontus: but not being able to prevail with him, after mutual complaints against each other, they parted; and Pompey removing his camp, commanded the troops that were with Lucullus to join him, except 1600 whom he left to attend Lucullus in his triumph. From thence Lucullus set out for Rome, where he was received by the senate with great marks of esteem, most men thinking him highly injured by the authors of the Manilian law. Pompey pursued his march into Pontus; but finding that he could not by any means draw the king to a battle, he marched back into Armenia Minor, with a design either to reduce that province, or oblige Mithridates to venture a battle in order to relieve it. Mithridates followed him at some distance; and entering Armenia, encamped on a hill over-against the Romans, and, by intercepting their convoys, reduced them to such distress, that they were obliged to remove to a more convenient place, the king cutting off many in their rear, and harassing them with frequent attacks, till he fell into an ambuscade laid by Pompey, whose personal courage and prudent conduct on that occasion confirmed the king in his resolution not to hazard a general engagement. The two armies encamped over-against each other; Pompey on one hill and the king on another, near the city of Dastira, in the province of Acilene, at a small distance from the Euphrates, which divides Acilene from Armenia Minor.

Here Pompey, seeing he could neither draw the king

to a battle, nor force his camp, which was pitched on a steep and craggy mountain, began to block him up with a ditch which he carried round the bottom of the hill where the king was encamped; and meeting with no opposition, finished his work, and quite cut off the enemy's communication with the country. Pompey was amazed to see the king thus tamely suffer himself to be shut up; and could not help saying, That he was either a great fool or a great coward; a fool, if he did not apprehend the danger he was in; a coward, if, being apprised of it, he did not to the utmost of his power prevent it. By this ditch, which was 150 furlongs in circuit, and defended by many forts raised at small distances from each other, the king was so closely besieged, that he could neither send out parties to forage, nor receive the supplies that came to him from Pontus. He was thus besieged for the space of 45 or 50 days; and his army reduced to such straits, that, having consumed all their provisions, they were at last forced to live on their dead horses. Hereupon Mithridates resolved at all events to break through the Roman fortifications; and accordingly, having put to the sword all those that were sick or disabled, that they might not fall into the enemy's hands, he attacked in the dead of the night the Roman guards, and having overpowered them with his numbers, got safe into the open fields, and continued his march all night towards Armenia Major, where he was expected by Tigranes.

Pontus.

53  
Is besieged  
by Pom-  
pey,

Pompey next morning by break of day pursued the enemy with his whole army; and having with much ado overtaken them, found the king encamped on a hill, to which there was but one ascent, and that guarded by a strong body of foot. The Romans encamped over-against them; but Pompey fearing the king should make his escape in the night-time, privately decamped, and taking the same rout the enemies were to hold in order to gain Armenia, possessed himself of all the eminences and defiles thro' which the king was to pass. Mithridates thinking that Pompey was returned

54  
But breaks  
through the  
Roman  
lines.

to his former camp, pursued his march, and about the dusk of the evening entered a narrow valley, which was surrounded on all sides by steep hills. On these hills the Romans lay concealed, expecting the signal to fall upon the enemy and attack them on all sides at once, while they were tired with their march, and seemingly, as they had sent out no scouts, in great security. Pompey was at first for putting off the attack till the next morning, thinking it not safe to engage in the night-time among such steep and craggy mountains; but was at last prevailed upon, by the earnest prayers and intreaties of all the chief officers of the army, to fall upon the enemy that very night. It was therefore agreed, that in the dead of the night all the trumpets should at once sound the charge, that this signal should be followed by an universal shout of the whole army, and that the soldiers should make what noise they could, by striking their spears against the brass vessels that were used in the camp. The king's army at this sudden and unexpected noise, which was echoed again by the mountains, imagined at first that the gods themselves were come down from heaven to destroy them; and the Romans charging them on all sides with showers of stones and arrows from the tops of the hills, they betook themselves to a precipitate flight; but finding all the passes beset with strong bodies of horse and foot

were

Pontus. were forced to fly back into the valley, where, for many hours together, they were exposed to the enemy's shot, without being able, in that confusion, either to attack them or defend themselves. They attempted indeed to make some resistance when the moon rose; but the Romans running down upon them from the hills, did not give them time to draw up, and the place was so narrow that they had not room even to make use of their swords. The king lost on that occasion 10,000 men, according to Appian, but 40,000, according to Eutropius and others. On Pompey's side there fell between 20 and 30 private men, and two centurions.

<sup>56</sup>  
Dilectus of  
Mithridates

Mithridates, at the head of 800 horse, broke through the Roman army, and being after this effort abandoned by all the rest, because they were closely pursued by the enemy, he travelled all night attended by three persons only, viz. his wife, or, as Plutarch calls her, his concubine, by name *Hypferasia*, his daughter Dripetire, and an officer. At day-break he fell in with a body of mercenary horse, and 3000 foot, who were marching to join him. By these he was escorted to the castle of Sinoria, situated on the borders of the two Armenias. As great part of his treasures were lodged here, he rewarded very liberally those who accompanied him in his flight; and taking 6000 talents, withdrew into Armenia. As soon as he entered the borders, he dispatched ambassadors to Tigranes, acquainting him with his arrival; but that prince, who was then on the point of concluding a separate peace with the Romans, clapt his ambassadors in irons, pretending that his son Tigranes had, at the instigation of Mithridates, revolted first to the Parthians, and then to the Romans. Mithridates finding himself thus abandoned, even by his son-in-law, left Armenia; and directing his course towards Colchis, which was subject to him, and not as yet invaded by the Romans, passed the Euphrates the fourth day, and got safe into his own territories.

Pompey sent out several parties in pursuit of the king; but remained himself with the main body of the army in the field of battle, where he built a city, calling it from that remarkable victory, *Nicomopolis*. This city, with the adjoining territory, he bestowed upon such of his soldiers as were old or disabled; and many flocking to it from the neighbouring countries, it became in a short time a very considerable place. This battle was certainly attended with very fatal consequences for Mithridates; who was forced, his army being entirely either cut off or dispersed, to abandon his own dominions, and fly for shelter to the most remote parts of Scythia. Pompey having concluded a peace with Tigranes, as we have related in the history of Armenia, and settled the affairs of that kingdom, began his march in pursuit of Mithridates through those countries that lie about mount Caucasus. The barbarous nations through which he passed, chiefly the Albanians and Iberians, attempted to stop his march, but were put to flight. However, he was obliged, by the excessive cold and deep roads, to pass the winter near the river Cyrus. Early in the spring he pursued his march; but meeting with great opposition from the Iberians, a warlike nation, and entirely devoted to Mithridates, he was employed most part of the summer in reducing them. In the mean time Mithridates, who had wintered at Dioscurias, on the isthmus between the Euxine and

Caspian seas, and had been joined there by such of his troops as had made their escape from the late unfortunate battle, continued his flight through the countries of the Achæans, Zygians, Hemiocchians, Cercetans, Moschi, and Colchians. Of these nations some received him kindly, and even entered into alliance with him; thro' others he was forced to make himself a way with his sword.

Pontus.

Pompey took the same rout, directing his course by the stars, especially in the northern parts of Scythia, and carrying with him even provision of water to supply the army in the vast desarts through which he marched. He spent two years in warring with these nations, and was often in danger of losing both his life and his army: but at last he overcame them all; and believing Mithridates, of whom he could have no account, to be dead, he marched back into Armenia Minor, where he allowed some rest to his soldiers, who were quite worn out with the hardships they had endured in that expedition. Having refreshed his army, he marched into Pontus, to reduce some strongholds which were still garrisoned by the king's troops. While he was at Alpis in Pontus, many of the king's concubines were brought to him; but he sent them all home to their parents, without offering them the least injury, and thereby gained the affection of the chief lords of Pontus, whose daughters they were. The strong castle of Symphori was delivered up to him by Stratonix, one of the king's concubines, upon no other terms than that he would spare her son Xipharex, who was with the king, in case he should fall into his hands. She likewise discovered to him great treasures hid under ground, which he, with great generosity, bestowed upon her, reserving for himself only some vessels to set off his triumph. Having taken another fort called the *New Castle*, and to that time looked upon as impregnable, he found in it great store of gold, silver, and other valuable things, which he afterwards consecrated to Jupiter Capitolinus. Here, in looking over the king's manuscripts, he came to discover where the rest of his treasures were concealed, what troops he could raise and maintain, what sums were yearly paid him by his subjects and tributaries, &c. whereby he could make a true estimate of his whole power and wealth. Amongst other manuscripts he found some books of physic, wrote by Mithridates himself, which he commanded Lenæus, a learned grammarian, to translate into Latin.

Pompey, having thus reduced all Pontus, marched into Syria, with a design to recover that kingdom, and passing through Arabia to penetrate as far as the Red Sea. But while he was employed in this expedition, news was brought him, that Mithridates, whom he believed dead, had appeared unexpectedly in Pontus at the head of a considerable army, and surprized Panticapæum, a famous emporj at the mouth of the Euxine Sea. He had lain all this time concealed in the territories of a Scythian prince, adjoining to the Palus Mæotis; but hearing that Pompey had left Pontus, and was engaged in other wars, he ventured out of his hiding-place, resolved either to recover his paternal kingdom, or die in the attempt. He returned privately into Pontus, and managed matters there so dexterously, that the Roman garrisons knew nothing of his arrival till he appeared with a consider-

able army in the field. He advanced first to the castle of Sympiori; and understanding that Stratonix had delivered it up to Pompey, on condition he would save the life of her son in case he should take him prisoner, the king immediately caused the youth, who was in his army, to be put to death, and his body to be left unburied, Stratonix beholding from the walls the cruel and unnatural murder, for he was her son by Mithridates, and had served him with great fidelity. At the same time he sent ambassadors to Pompey to treat of a peace; offering to pay a yearly tribute to the republic, on condition he restored to him his kingdom. Pompey replied, that he would hearken to no proposals whatsoever, without the king came to treat with him in person, as Tigranes had done. This Mithridates looked upon as noways consistent with his dignity; and therefore laying aside all thoughts of an accommodation, began to make what preparations he could for renewing the war.

60  
Recovers  
several  
places.

He summoned all his subjects that were able to bear arms to meet at an appointed place; and having chosen out of the whole multitude 60 cohorts, each consisting of 100 men, he incorporated them with the regular troops that were already on foot. Being now in a condition to act offensively, for Pompey had left but a small number of troops in Pontus, he possessed himself of Phanagorium, Cherfoneus, Theodosia, Nymphæum, and several other important places. But in the mean time Caïtor, whom Mithridates had appointed governor of Phanagorium, falling out with Tripho, one of the king's favourite eunuchs, killed him, and dreading the king's resentment, stirred up the inhabitants to a revolt: by which means Phanagorium was again lost; but the castle, which was defended by four of the king's sons, Artaphernes, Darius, Xerxes, and Oxathres, held out for some time. The king hastened to their relief; but the castle being set on fire by the rebels, they were forced to surrender themselves to Caïtor before his arrival. These four sons, with one of the king's daughters, by name *Cleopatra*, Caïtor sent to the Romans; and fortifying himself in the town, persuaded most of the neighbouring cities, which were oppressed with heavy taxes, and strangely harassed by the king's collectors, to join in the rebellion.

61  
His subjects  
dissent-

ed. Mithridates finding that he could neither rely upon the soldiery, most of them being forced into the service, nor on his other subjects, who were dissatisfied by reason of the exorbitant taxes, sent ambassadors to invite the princes of Scythia to his relief, and with them his daughters, to be bestowed in marriage upon such as showed themselves most inclined to assist him. But as the ambassadors he employed on this occasion were eunuchs, a race of men no less abhorred by the army than favoured by the king, over whom they had a great ascendancy, especially in his old age, the soldiers who were sent to attend them on their journey, put them ill to the sword as soon as they were out of the king's reach, and delivered his daughters up to the Romans. Mithridates, finding himself thus deprived of his children, betrayed by his army, and forsaken even by those on whom he chiefly relied, could not yet be induced to submit to the Romans, tho' Pompey promised him honourable conditions, provided he came to treat with him in person. In this

desperate condition, he left no stone unturned to stir up the princes of Asia against the Romans, especially the Parthians: but finding them awed by the great opinion they all had of Pompey, he had recourse at last to the European Gauls, whom he understood to be at war with the Romans; and having sent before some of his trusty friends to engage them in his favour, taking leave of his own kingdom, he began his long march, designing to pass thro' Bosphorus, Cimmericus, Scythia, Pannonia, &c. and joining the Gauls, pass the Alps, and invade Italy.

Pontus.

62  
His extra-  
ordinary  
design of  
invading I-

This design was no sooner known in the army, but the soldiers began openly to complain and mutiny; exaggerating the boldness of the attempt, the length of the march, and the unsurmountable difficulties that must necessarily attend such a desperate enterprise. The chief commanders did all that lay in their power to divert him from it; representing to him, that if he was not able to cope with the Romans in his own kingdom, much less would he be a match for them in Italy or Gaul, where they could daily receive new supplies; whereas he would lose the best part of his army in so long and difficult a march, and the rest perhaps in the first engagement, without any possibility of repairing the loss. But all was to no purpose; for they found him so unalterably fixed in his resolution, that he caused those to be put to death who with most warmth remonstrated against it, not sparing even his own son Exiopodrus for dropping some unguarded expressions on that occasion. Thus they were forced to let him pursue his own measures, till they found a more proper opportunity to oppose them, which soon after offered as they were encamped at Bosphorus Cimmericus on their march into Scythia.

62

Here Pharnaces, the king's favourite son, whom he had appointed to succeed him, observing the general discontent that reigned in the army, began to entertain thoughts of placing the crown on his own head; and not doubting but the soldiery would stand by him if he declared against the intended expedition into Italy, openly protested among the Roman deserters, who were a considerable part of the army, that if they would follow him he would return into Pontus. The Romans, who were well apprised of the danger that attended such an undertaking, and had most of all exclaimed against it, promised to support him to the utmost of their power, and even encouraged him, upon some expressions which he purposely dropped, to assume the title of *king*, a title which his father seemed determined to hold till he had destroyed, by his rash and desperate attempts, himself, his friends, and his army. Pharnaces, finding he could depend on the Romans, engaged the same night most of the chief commanders in his party, and by their means the greater part of the soldiery. It was agreed, that next morning by break of day all those who had declared in his favour should appear in arms, and with a loud shout proclaim Pharnaces king; which was done accordingly, and the shout returned even by those whom Pharnaces had not thought fit to let into the secret. The king, who had taken up his quarters in the city, being awakened by the noise, sent out some of his domestics to know what had happened in the army. Neither did the officers or soldiers dissemble the matter, but boldly answered, that they had chosen a young king

in-

Pontus. instead of an old dotard governed by eunuchs.

Hereupon Mithridates mounting on horseback, and attended by his guards, went out to appease the tumult: but his guards forsaking him, and his horse being killed under him, he was obliged to fly back into the city; from whence he sent several of his attendants one after another to desire of his son a safe-conduct for himself and his friends. But as none of the messengers returned, some being slain, others siding with the new king, Mithridates endeavoured to move his son to compassion by signifying to him from the walls the distressed condition he was reduced to by a son whom he had favoured above the rest of his children; but finding him noways affected by his speech, turning to the gods, he beseeched them with many tears to make his son know one day by experience the grief and agony which a father must feel in seeing his love and tenderness requited with such ungrateful and monstrous returns. Having thus spoke, he thanked in a very obliging manner those who had stood by him to the last, and exhorted them to make their submission to the new king on the best terms they could procure; adding, that as for himself, he was determined not to outlive the rebellion of a son whom he had always distinguished with particular marks of paternal affection.

63  
Mithridates  
attempts to  
destroy  
himself.

After this, he withdrew into the apartment of his wives and concubines, where he first took poison himself, and then presented it to them, and to his favourite daughters Mithridatis and Nissa, who not long before had been betrothed to the kings of Egypt and Cyprus. To the women it proved immediate death; but on the king, who from his infancy had inured his constitution to poisonous potions, it had no slow operation, that he was forced, through fear of falling into the rebels hands, to recur to his sword. Neither did the wound, as he was greatly weakened by the poison, prove mortal: so that the rebels, having in the mean time stormed the town, and broke into the house, found the king wallowing in his blood, but still alive, and in his senses; which Pharnaces hearing, sent some of those that were about him to dress his wounds, with a design to deliver him up to the Romans, and thereby ingratiate himself with Pompey. But in the mean time a Gaul, who served in the army, by name *Bitatus*, or *Bitobus*, entering the king's room in quest of booty, and being touched with compassion in seeing him forsaken by all his friends, and struggling on the bare ground with the pangs of death, drawing his sword, put an end to his present agonies, and prevented the insults which he chiefly apprehended if he should fall alive into his son's hands. The barbarian is said, when he first saw the king, to have been so awed with the majesty of his countenance, that, forgetful of his booty, he fled out of the room: but being called back, and earnestly intreated by the dying prince to put an end to his misery, he summoned all his courage to perform, as he did, with a trembling hand, that office; and immediately retired without touching any thing that belonged to the king, tho' the hopes of a rich booty was the only motive that had led him thither.

64  
A Gaul  
puts an end  
to his life  
out of com-  
passion.

Pompey, who was at time engaged in a war with the Jews, received the first notice of the death of Mithridates as he was on his march to Jerusalem. The

messenger who brought the joyful tidings, was sent by Pharnaces, and appeared unexpectedly before Pompey with the branch of a laurel, as was customary on the like occasions, twined round the head of his javelin. When he heard what had happened at Panticapæum, he was so impatient to impart it to the soldiery, that he could not even wait till they had raised him a mount of turf to speak from thence to the army according to the custom of the camp; but ordered those who were by him to form a kind of mount with their saddles, and from thence acquainted the soldiery that Mithridates had laid violent hands on himself, and his son Pharnaces was ready to acknowledge the kingdom as a gift of the people of Rome, or resign it if they were unwilling he should reign. This news was received with joyful shouts of the whole army, and the day solemnized with feasts and sacrifices throughout the camp, as if in Mithridates alone all the enemies of the republic had died. Pompey dispatched without delay a messenger with letters to the senate, acquainting them with the death of Mithridates, and the submission of his son Pharnaces. When his letters were read, the senators were so joyrized, that they appointed, at the proposal of Cicero, then consul, 12 days for returning due thanks to the gods, who had delivered them from such an insulting and powerful enemy; and the tribunes of the people enacted a law, whereby Pompey, in consideration of his eminent service in the Mithridatic war, was to wear a crown of laurel, with the triumphal gown at the Circensian sports, and a purple gown at the scenical plays.

Pharnaces, when he heard of his father's death, caused his body to be preserved in brine, proposing to present it to Pompey, who had promised to return into Pontus after the reduction of Judæa, and there settle matters to his satisfaction. And accordingly having taken the city and temple of Jerusalem, he set out with two legions for Pontus; and being arrived at Sinope, he was there met by ambassadors from Pharnaces, acquainting him, that their master had forbore assuming the title of king till his will and pleasure were known: that he put both himself and the kingdom entirely into his hands, and that he was willing to attend him at what time or place he thought fit to appoint. The same ambassadors delivered up to Pompey those who had taken Manius Aquilius the Roman legate, whom Mithridates had put to a cruel death, all the prisoners, hostages, and deserters, whether Romans, Greeks, or Barbarians, and the body of Mithridates, with his rich apparel and arms, which were greatly admired by Pompey and the other Romans. Both soldiers and officers flocked to see the king's body; but Pompey declined that sight; and, saying that all enmity between that great prince and the people of Rome was ended with his life, he returned the body to the ambassadors, and caused it to be interred with the utmost pomp and magnificence among his ancestors in the burying-place of the kings of Pontus, Pompey defraying all the charges of that ceremony, which was the most costly and pompous that ever had been seen in those parts. With the body Pompey restored his wearing apparel and armour; but the scabbard of his sword, which cost 400 talents, was stolen by Rublius a Roman, and sold to Ariarathes king of Cappadocia; and his cap or turban, which was a very curious

67  
Who be-  
stows up-  
on him the  
kingdom of  
Bosphorus.

Pompey bestowed the kingdom of Bosphorus on Pharnaces, and honoured him with the title of a friend and ally of the people of Rome. Pharnaces being thus acknowledged king of Bosphorus, sent orders to all the garrisons of Pontus to submit themselves, with the castles and treasures which they were trusted with, to Pompey, who by that means amassed an immense booty. In the city of Talaura, which Mithridates used to call his wardrobe, he found 2000 cups of onyx set in gold, with such store of gold and silver vessels, of costly furniture, of saddles, bridles, and trappings, set with jewels and precious stones, that the Roman commissaries spent 30 days in taking the inventory of the whole. In another castle he found three large tables with nine salvers of massy gold, enriched with precious stones to an incalculable value; the statues of Minerva, Mars, and Apollo, of pure gold and most curious workmanship; and a pair of gaming tables of two precious stones, three foot broad, and four foot long, on which was a moon of gold weighing 30 pounds, with their men all of the same precious stone. In a fort situated among the mountains, were delivered up to him the king's statue of massy gold eight cubits high, his throne and sceptre, and the bed of Darius the son of Hytaspes. Most of these treasures had been transmitted to him from his ancestors, chiefly from Darius king of Persia; some belonged to the Ptolemies of Egypt, and had been deposited by Cleopatra, as we have hinted above, in the hands of the Coans, who delivered them to Mithridates; great part of them had been collected by the king himself, who was very fond of rich and state-ly furniture.

Pompey having thus got entire possession of Pontus, and reduced it to the form of a Roman province, marched into Asia properly so called; and having wintered at Ephesus, early in the spring set out for Italy with a fleet of 700 ships. As he brought over his army with him, the senate was under no small apprehension lest he should make himself absolute, and rule without control. But he no sooner landed at Brundisium than he disbanded the army, without waiting for any decree either of the senate or people; what neither his friends nor his enemies had believed. His triumph lasted two whole days; and though he was attended in his triumphal chariot by 324 captives of distinction, among whom were five sons and two daughters of Mithridates, yet he would not suffer any of them to be put to death, as it had been practised by others; but sent them all back, except such as were of royal extraction, to their respective countries, and even supplied them with money to defray the charges of their journey. After his triumph he delivered into the treasury 20,000 talents, though, at the dismissing of the army, he had divided 16,000 talents among the tribunes and centurions, 2000 sesterteriums among the quaestors, and had given to each soldier 50 sesterteriums.

68  
Pharnaces  
falls out  
with the  
Romans.

Pompey had no sooner left Asia, but Pharnaces fell unexpectedly upon the Phanagorenses, a people of Bosphorus; whom Pompey had declared free, because

they had revolted the first of all from Mithridates, and by their example induced others to abandon the king's party. Pharnaces besieged their chief city Phanagoria, and kept them blocked up, till, for want of provisions, they were forced to fall out, and put all to the issue of a battle; which proving unsuccessful, they delivered up themselves and their city to the conqueror. Some years after the civil war breaking out between Cæsar and Pompey, he laid hold of that opportunity to recover the provinces which his father had formerly possessed; and having raised a considerable army, over-ran Pontus, Colchis, Bithynia, Armenia, and the kingdom of Moschis, where he plundered, as Strabo observes, the temple of the goddess Leucothea. He took the strong and important city of Sinope, but could not reduce Amisus. But in the mean time Cæsar, having got the better of Pompey and his party, appointed Cn. Domitius Calvinus governor of Asia, enjoining him to make war upon Pharnaces with the legions that were quartered in that province. Domitius immediately dispatched ambassadors to Pharnaces, commanding him to withdraw his troops from Armenia and Cappadocia. The king returned answer, that he was willing to abandon Cappadocia, but as for the kingdom of Armenia Minor, it was part of his hereditary dominions; and therefore he would not resign it till he had an opportunity of laying his pretensions before Cæsar himself, whom he was ready to obey in all things. Hereupon Domitius drawing together what forces he could, marched into Cappadocia, which he recovered without opposition, Pharnaces having abandoned it to make a stand in Armenia, which lay nearer his own dominions. Thither Domitius pursued him; and having overtaken him near Nicopolis, found his army drawn up in battle-array, and the king ready to come to an engagement; which Domitius not declining, both armies advanced.

The king, at the head of a choice body of men, <sup>69</sup>And de-  
fell upon the Romans left wing, consisting mostly of <sup>68</sup>feats them.  
raw and undisciplined Asiatics; and having without much ado put them to flight, penetrated to the centre, where the thirty-fifth legion, the only one which Domitius had, after a faint resistance, gave ground, and, retiring to the neighbouring mountains, left their allies to shift for themselves, who were all cut off. Domitius with the remains of his scattered army marched back into Cappadocia; and from thence, winter drawing on, into the province of Asia. The king being puffed up with this victory, and hearing that Cæsar, with the flower of the Roman forces, was engaged at the siege of Alexandria, appointed one Afander governor of Bosphorus, and marched himself into Cappadocia in pursuit of Domitius, with a design to invade Asia, and recover all the provinces which had been once subdued by his father. Bithynia and Cappadocia readily submitted; but Armenia the Lesser, which was held by Dejotarus, made so vigorous a resistance, that he was forced to give over the enterprise, lest the Romans should in the mean time strengthen themselves in Asia, whither he was in haste to march, in hopes of meeting there with the same success as his father Mithridates had done. But before he reached that province, he was informed that Afander had revolted, in hopes of gaining thereby the good-will of the

Pontus.

the Romans, and obtaining of them the kingdom of Bosphorus for himself. At the same time he received intelligence, that Cæsar having at last reduced Alexandria, and settled the affairs of Egypt and Syria, was marching into Armenia.

70  
Attempts  
to outwit  
Julius Cæ-  
sar,

He was not a little dismayed at this news, and therefore without delay dispatched ambassadors to sue for peace; hoping that Cæsar, who was hastening into Italy with a design to pass over into Afric, would willingly give ear to any proposals of that nature. Cæsar courteously entertained the ambassadors; and though he did not propose to agree to their conditions, yet, that he might come upon Pharnaces unawares, he showed himself very desirous of entering into a treaty of peace. But in the mean time he pursued his march with all possible expedition; and arriving on the confines of Pontus, ordered all the troops that were quartered in the neighbouring provinces to join him; for he had brought from Alexandria but one legion, namely, the sixth, and that consisting of 1000 men only, the rest having been killed at the siege of Alexandria. Besides this veteran legion, he found at the place of general rendezvous three others, but all of them very indifferently armed, and worse disciplined. With these forces however, such as they were, he advanced against Pharnaces; who being greatly frightened at his approach by reason of the success that had attended him in all his expeditions, again dispatched ambassadors to him with a crown of gold, offering him his daughter in marriage, and promising to do whatever he should require. The ambassadors took care to let know that their master, though highly obliged to Pompey, yet had never been prevailed upon to send him any supplies during the civil war, which Dejotarus king of Armenia the Lesser, whom he had honoured with his friendship, had done. Cæsar returned for answer, that he was willing to conclude a peace with Pharnaces, provided he retired without delay from Pontus, returned all the captives and hostages whether Roman or their allies, and restored the goods of the Roman citizens and publicans which he had seized since he first took up arms. He added, that as to his not sending supplies to Pompey, they ought rather to have concealed such an ungrateful proceeding of their master, than alledged it as any merit, since the forsaking of one to whom he was indebted for his crown, bespoke him a man of mean, selfish, and unworthy principles.

Pharnaces, upon the return of his ambassadors, acquainted Cæsar, that he agreed to the conditions; but finding that Cæsar's affairs called him into Italy, he required a longer term of time for the performance of what was stipulated between them, starting daily new difficulties, in hopes that Cæsar would in the mean time be obliged to depart, and leave the affairs of Pontus in the same posture he had found them. Cæsar seeing himself disappointed, and put off from day to day, could no longer brook the king's deceitful behaviour. Wherefore he determined to put himself at the head of his small army, and attack the enemy in his camp when he least expected it. And accordingly, marching out in the night, he came by break of day in sight of the king's army, and uttering these words, *Shall this treacherous parricide go unpunished?* broke into the camp at the head of 1000 horse. The

king's chariots, which were armed with scythes, caused some small disorder among Cæsar's horse; but in the mean time the rest of his army coming up, he put the enemy to flight, and obtained a complete victory. This battle was fought near the place where Mithridates had routed with great slaughter the Roman army under the command of Triarius. Most of the king's army were either taken or cut in pieces; but Pharnaces himself had the good luck to make his escape, while the Romans were busy in plundering the camp. This victory was so quick, that Cæsar in a letter to his friend Amintius, or Anitius, at Rome, expressed it in three words, thus: "I came, I saw, I conquered." He ever afterwards used to call Pompey a fortunate rather than a great commander, since he had gained his chief glory in the Mithridatic war, fighting with so cowardly an enemy. He divided the rich booty and the spoils of the camp among his soldiers; and because Mithridates had erected a trophy near that place as a monument of his victory over Triarius, which Cæsar, as it was consecrated to the gods, did not think lawful to pull down, he set up another over-against it to transmit to posterity his victory over Pharnaces. After this victory he recovered and restored to the allies of the people of Rome all the places which Pharnaces had possessed himself of during the war, declared Amisus a free city, and appointed Mithridates Pergamens king of Bosphorus in the room of Pharnaces.

Having thus settled the affairs of Pontus, he set sail for Italy; leaving Domitius Calvinus to pursue the war against Pharnaces, if he should appear again in the field. Pharnaces had retired after the battle to Sinope with 1000 horse, where he was quickly besieged by Domitius, to whom he surrendered the town, upon no other conditions than that he should be suffered to retire into Bosphorus with the small body that attended him. This Domitius willingly granted; but caused all the king's horses to be killed, since he had asked a safe-conduct only for his horsemen. With these and a band of Scythians and Samaritans he attempted to recover the kingdom of Bosphorus; but being met between Theudocia and Panticapæum, both which cities he had reduced, by Asander, who was still in possession of the kingdom, a sharp engagement ensued, wherein the king's men, as not being used to fight on foot, were put to flight, and Pharnaces himself, who remained alone in the field, was surrounded by the enemy, and cut in pieces, after having reigned in Bosphorus Cimmerius, the kingdom which Pompey had bestowed upon him, according to Appian, fifteen years, according to others, seventeen.

Upon the death of Pharnaces the kingdom of Pontus was again reduced to the form of a province, and continued to the triumvirate of Marc Antony, who after Pontus the battle at Philippi conferred it upon Darius the son of Pharnaces for his services during the civil war, by Marc Antony.

Darius was succeeded in the kingdom by Polemon, preferred to that honour by Marc Antony. He was the son of Zeno, a famous orator of Laodicea, and greatly favoured by Antony. From him that part of Pontus which borders on Cappadocia, borrowed the name of *Polemoniacus*. He attended Marc Antony in his expedition against

against the Parthians; and being taken prisoner in that unsuccessfull battle fought by Statianus, he was sent by the king of the Medes, an ally of the Parthians, to conclude a peace with the Romans. In which embassy he acquitted himself so well, that Antony added the kingdom of Armenia to his own dominions. In the war between Antony and Augustus he sided with the former: but after the battle at Actium, he was received into favour by the latter; and being sent by Agrippa against Scribonius, who upon the death of Afander had usurped the kingdom of Bosphorus, he overcame him, and reduced the kingdom of Colchis, which was bestowed upon him by Agrippa, who likewise honoured him with the title of *friend and ally of the people of Rome*. He afterwards waged war with the neighbouring barbarians refusing to live in subjection to the Romans; but was overcome, taken, and put to death, by the Aspungitani, a people bordering, according to Strabo, on the Palus Mæotis.

Upon his death his son Polemon II. was by the emperor Caligula raised to the throne of Bosphorus and Pontus. But the emperor obliged him to exchange the kingdom of Bosphorus with part of Cilicia; and Nero with his consent reduced that part of Pontus which he enjoyed to the form of a province. He fell in love with Berenice, daughter to Agrippa king of Judæa; and in order to marry her, embraced the Jewish religion. But as the soon became tired of his riotous way of living, and returned to her father; so he renounced his new religion, and again embraced the superstitions of Paganism. Polemon dying without issue, the ancient kingdom of Pontus was parcelled out into several parts, and added to the provinces of Bithynia, Galatia, and Cappadocia, only that part of it which was called *Pontus Polemoniacus* retaining the dignity of a distinct and separate province. During the civil disorders between Vespasian and Vitellius, one Anicetus, first a slave, afterwards freedman to king Polemon, and lastly commander of the royal navy, took up arms with a design to rescue the kingdom from the Roman bondage; and being joined by great multitudes drawn together with the prospect of spoil, over-ran the country, and possessed himself of Trapezund, a city founded by the Grecians on the utmost confines of Pontus. Here he cut in pieces a cohort made up of the inhabitants, but which had been formerly presented with the privilege of Roman citizens. He likewise burnt the fleet, and with scorn and insults scoured the sea; Mucianus having called to Byzantium most of the Roman galleys. Hereupon Vespasian, who was at that time in Syria, sent Verduis Gemnius into Pontus with a choice body of vexillaries from the legions. He assailing the enemy while they were in disorder and roaming afunder in pursuit of prey, drove them into their vessels; then with some galleys chased Anicetus into the mouth of the river Chobus, where he thought himself safe under the protection of Sedochus king of the Lazians, whose alliance he had purchased with large sums and rich presents. Sedochus at first refused to deliver him up to the Romans; but was soon prevailed upon, partly by threats, partly by presents, to surrender both him and all the other fugitives who had taken sanctuary in his dominions. Thus ended that servile war; and the kingdom of Pontus continued to be a province of the empire till the time of David and

vinces.

Alexis Comneni, who being driven from Constantinople by the French and Venetians, under the command of Baldwin earl of Flanders, settled, the one at Haraclea, the other at Trebifond. The troubles that arose among the Latins gave Alexus Comneus an opportunity of erecting here a new empire, which comprehended great part of Pontus, and was known by the name of the *empire of Trebifond*. The Comneni held it about 250 years, till the time of Mohamed II. who carried David Comneus, the last emperor of Trebifond, prisoner to Constantinople, with all his family, and subjected his empire to that of Constantinople; in which abject slavery Trebifond and all Pontus have continued ever since.

PONTYPOOL, a town of Monmouthshire in England, seated between two hills. It is but a small place, though noted for its iron-mills, great manufacture of janned mugs, &c. W. Long. 3. 0. N. Lat. 51. 45.

PONZA, or PONTIA, a small island in the Tuscan sea, being the place to which many illustrious Romans were formerly banished. E. Long. 13. 50. N. Lat. 41. 15.

POOL, is properly a reservoir of water supplied with springs, and discharging the overplus by sluices, defenders, weirs, and other causeways.

POOL, a sea-port town of Dorsetshire in England. It is surrounded on all sides by the sea, except on the north, where there is an entrance through a gate. It was formerly nothing but a place where a few fishermen lived: but in the reign of Henry VI. it was greatly enlarged, and the inhabitants had the privilege to wall it round; it was also made a county of itself, and sent two members to parliament. It is governed by a mayor, a senior bailiff, four other justices, and an indeterminate number of burgesses. The town consists of a church and about 600 houses, with broad paved streets; and has a manufactory of knit hofe. It is 47 miles west south-west of Winchester, and 110 west by south of London. W. Long. 3. 6. N. Lat. 50. 45.

POOLE (Matthew), a very learned writer in the 17th century, was born at York in 1624. He was educated at Emanuel-college Cambridge, and afterwards incorporated in the university of Oxford. He succeeded Dr Anthony Tuckney in the rectory of St Michael de Quern, in London, about 1648. In 1678 he set on foot a project for maintaining youths of great parts at the universities, and had the approbation of the heads of houses in both of them. He solicited the affair with so much vigour, that in a short time 900l. per annum was procured for that purpose; but this design was laid aside at the Restoration. In 1662, he was ejected from his living for unconformity. Ten years was he employed in composing his *Synopsis Criticorum Bibliorum*. Besides this great work he published several other pieces. When Dr Oates's depositions concerning the Popish plot were printed, our author found his name in the list of those who were to be cut off, on the account (as was supposed) of what he had written against the Papists in his *Nullity of the Romish Faith*. So that he was obliged to retire into Holland, where he died in 1679, and left behind him the character of a very able critic and casuist.

POOL, the stern of a ship; or the highest, uppermost, and hinder part of a ship's hull. See *STERN*.

POOR, in law, an appellation given to all those who  
arc

Pontnypool

Poor.

Popayan, are in such a low and mean condition, that they either are, or may become, a burden to the parish.

POPAYAN, a province of South America, in the kingdom of New Granada, between the audience of Panama, that of Quito, and the South Sea; 400 miles in length, and 300 in breadth. A chain of barren mountains runs through the country from north to south; and near the sea the soil is so soaked with almost continual rains, that few care to reside there, except for the sake of the gold that is met with in great plenty in the sands of the rivulets. This bewitching metal brings many in search of it, though it is a great doubt whether they ever return back alive or not. For this reason the savage Americans are still masters of a great part of it, and continually annoy the Spaniards.

POPAYAN, the capital town of a province of that name in South America, with a bishop's see, a Spanish governor, and where the courts of justice are held. The inhabitants are almost all Creoles. W. Long. 73. 5. N. Lat. 2. 25.

POPE, the sovereign pontiff, or supreme head of the Romish church. The appellation of *pope* was anciently given to all the Christian bishops; but about the latter end of the 11th century, in the pontificate of Gregory VII. it was usurped by the bishop of Rome, whose peculiar title it has ever since continued.

POPE (Alexander), a late celebrated English poet, was descended from good families, and born the 8th of June 1688, at London, where his father was then a considerable merchant. He was taught to read very early by an aunt; and learned to write without any assistance, by copying printed books. The family being of the Romish religion, he was put, at eight years of age, under one Taverner, a priest, who taught him the rudiments of the Latin and Greek tongues together; and soon after was sent to a Popish seminary at Winchester, from whence he was removed to a school at Hyde-Park Corner. He discovered early an inclination to versifying; and the translations of Ogilby and Sandys from Virgil and Ovid first falling in his way, these were his favourite authors. At 12, he retired with his parents to Binfield, in Windsor Forest; and there became acquainted with the writings of Spenser, Waller, and Dryden. Dryden struck him most, probably because the cast of that poet was most congenial with his own; and therefore he not only studied his works intently, but ever after mentioned him with a kind of rapturous veneration. He once obtained a sight of him at a coffee-house, but never was known to him: a misfortune which he laments in these pathetic words, *Virgilium tantum vidi*. Though Pope had been under more tutors than one, yet it seems they were so insufficient for the purpose of teaching, that he had learned very little from them: so that, being obliged afterwards to begin all over again, he may justly be considered as one of the *autodidactoi*, or "self-taught." At 15 he had acquired a readiness in the two learned languages; to which he soon after added the French and Italian. He had already scribbled a great deal of poetry in various ways; and this year set about an epic poem, called *Alexander*. He long after communicated it to Atterbury, with a declared intention to burn it; and that friend concurred with him: "Though (adds he) I would have interceded for the first page, and put it, with your leave, among my cu-

riorities." What the poet himself observes upon these early pieces is agreeable enough; and shows, that tho' at first a little intoxicated with the waters of Helicon, he afterwards arrived to great sobriety of thinking. "I confess (says he) there was a time when I was in love with myself; and my first productions were the children of Self-love upon Innocence. I had made an epic poem, and panegyrics on all the princes, and I thought myself the greatest genius that ever was. I cannot but regret these delightful visions of my childhood, which, like the fine colours we see when our eyes are shut, are vanished for ever." His pastorals, begun in 1704, first introduced him to the wits of the times; among which were Wycherly and Walth. This last gentleman proved a sincere friend to him; and soon discerning that his talent lay, not so much in striking out new thoughts of his own, as in improving those of other men, and in an easy versification, told him, among other things, that there was one way left open for him to excel his predecessors in, which was correctness: observing, that though we had several great poets, yet none of them were correct. Pope took the hint, and turned it to good account; for no doubt the distinguishing harmony of his numbers was in a great measure owing to it. The same year, 1704, he wrote the first part of his *Windsor Forest*, though the whole was not published till 1710. In 1708, he wrote the *Essay on Criticism*: which production was justly esteemed a master-piece in its kind, and showed not only the peculiar turn of his talents, but that those talents, young as he was, were ripened into perfection. He was not yet 20 years old; and yet the maturity of judgment, the knowledge of the world, and the penetration into human nature, displayed in that piece, were such as would have done honour to the greatest abilities and experience. But whatever may be the merit of the *Essay on Criticism*, it was still surpassed, in a poetical view, by the *Rape of the Lock*, first completely published in 1712. The former excelled in the didactic way, for which he was peculiarly formed; a clear head, strong sense, and a sound judgment, being his characteristic qualities: but it is the creative power of the imagination that constitutes what is properly called a *poet*; and therefore it is in the *Rape of the Lock* that Pope principally appears one, there being more *vis imaginandi* displayed in this poem than perhaps in all his other works put together. In 1713, he gave out proposals for publishing a translation of Homer's *Iliad*, by subscription; in which all parties concurred so heartily, that he acquired a considerable fortune by it. The subscription amounted to 6000 l. besides 1200 l. which Lintot the bookseller gave him for the copy. Pope's finances being now in good condition, he purchased a house at Twickenham, whither he removed with his father and mother in 1715; where the former died about two years after. As he was a Papist, he could not purchase, nor put his money to interest on real security; and as he adhered to the cause of king James, he made it a point of conscience not to lend it to the new government: so that, though he was worth near 20,000 l. when he laid aside business, yet, living afterwards upon the quick stock, he left but a slender substance to his family. Our poet, however, did not fail to improve it to the utmost: he had already acquired much by his publications, and he was all attention

Pope

Pope.

to acquire more. In 1717, he published a collection of all he had printed separately; and proceeded to give a new edition of *Shakespeare*, which, being published in 1721, discovered that he had consulted his fortune more than his fame in that undertaking. The *Iliad* being finished, he engaged upon the like footing to undertake the *Odyssey*. Mr Broome and Mr Fenton did part of it, and received 500*l.* of Mr Pope for their labours. It was published in the same manner, and on the same conditions to Lintot; excepting that, instead of 1200*l.* he had but 600*l.* for the copy. This work being finished in 1725, he was afterwards employed with Swift and Arbuthnot in printing some volumes of *Miscellanies*. About this time he narrowly escaped losing his life, as he was returning home in a friend's chariot; which, on passing a bridge, happened to be overturned, and thrown with the horses into the river. The glasses were up, and he not able to break them: so that he had immediately been drowned, if the pollution had not broke them, and dragged him out to the bank. A fragment of the glass, however, cut him so deeply, that he ever after lost the use of two of his fingers. In 1727, his *Dunciad* appeared in Ireland; and the year after in England, with notes by Swift, under the name of *Scrivenerus*. This edition was presented to the king and queen by Sir Robert Walpole; who, probably about this time, offered to procure Pope a pension, which however he refused, as he had formerly done a proposal of the same kind made him by Lord Halifax. He greatly cultivated the spirit of independency; and "Unplac'd, unpenion'd, no man's heir or slave," was frequently his boast. He somewhere observes, that the life of an author is a state of warfare: he has shown himself a complete general in this way of warring. He bore the insults and injuries of his enemies long; but at length, in the *Dunciad*, made an absolutely universal slaughter of them: for even Cibber, who was afterwards advanced to be the hero of it, could not forbear owning, that nothing was ever more perfect and finished in its kind than this poem. In 1729, by the advice of Lord Bolingbroke, he turned his pen to subjects of morality; and accordingly we find him, with the assistance of that noble friend, who furnished him with the materials, at work this year upon the *Essay on Man*. The following extract of a letter to Swift discovers the reason of his Lordship's advice: "Bid him (says Bolingbroke) talk to you of the work he is about, I hope, in good earnest; it is a fine one, and will be, in his hands, an original. His sole complaint is, that he finds it too easy in the execution. This flatters his laziness: it flatters my judgement; who always thought, that, universal as his talents are, this is eminently and peculiarly his, above all the writers I know, living or dead; I do not except Horace. Pope tells the dean in the next letter, that 'the work, Lord Bolingbroke speaks of with such abundant partiality, is a system of ethics, in the Horatian way.'" In pursuing the same design, he wrote his *Ethick Epistles*: the fourth of which, Upon *Talke*, giving great offence, as he was supposed to ridicule the duke of Chandos under the character of *Timon*, is said to have put him upon writing satires, which he continued till 1730. He ventured to attack persons of the highest rank, and set no bounds to his satirical rage. A genuine collection of his letters was publish-

ed in 1737. In 1738, a French translation of the *Essay on Man*, by the Abbé *Reinel*, was printed at Paris; and Mr *Croufaz*, a German professor, animadverted upon this system of ethics, which he represented as nothing else but a system of naturalism. Mr *Warburton*, afterwards bishop of Gloucester, wrote a commentary upon the *Essay*; in which he defends it against *Croufaz*, whose objections he supposes owing to the faultiness of the Abbé *Reinel's* translation. The poem was republished in 1740, with the commentary. Our author now added a fourth book to the *Dunciad*, which was first printed separately in 1742; but the year after, the whole poem came out together, as a specimen of a more correct edition of his works. He had made some progress in that design, but did not live to complete it. He had all his life long been subject to the head-ach; and that complaint, which he derived from his mother, was now greatly increased by a dropy in his breast, under which he expired the 30th of May 1744, in the 56th year of his age. In his will, dated December 12, 1743, Miss *Blount*, a lady to whom he was always devoted, was made his heir during her life; and among other legacies, he bequeathed to Mr *Warburton* the property of all such of his works, already printed, as he had written or should write commentaries upon, and had not otherwise been disposed of or alienated; with this condition, that they were published without future alterations. In discharge of this trust, that gentleman gave a complete edition of all Mr Pope's works, 1751, in 9 vols, 8vo. A work, entitled, *An Essay on the Writings and Genius of Pope*, by Mr *Warton*, 2 vols 8vo, will be read with pleasure by those who desire to know more of the person, character, and writings of this excellent poet. In the mean time, the following account of him by Lord *Orrery* may suffice: "If we may judge of him by his works, (says this noble author) his chief aim was to be esteemed a man of virtue. His letters are written in that style; his last volumes are all of the moral kind; he has avoided trifles, and consequently has escaped a rock which has proved very injurious to Swift's reputation. He has given his imagination full scope, and yet has preserved a perpetual guard upon his conduct. The constitution of his body and mind might really incline him to the habits of caution and reserve. The treatment which he met with afterwards, from an innumerable tribe of adversaries, confirmed this habit; and made him slower than the dean, in pronouncing his judgment upon persons and things. His prose-writings are little less harmonious than his verse; and his voice, in common conversation, was so naturally musical, that I remember honest Tom Southern used to call him the *little nightingale*. His manners were delicate, easy, and engaging; and he treated his friends with a politeness that charmed, and a generosity that was much to his honour. Every guest was made happy within his doors; pleasure dwelt under his roof, and elegance presided at his table."

POPE'S *Dominions*, or *Ecclesiastical States*; a country of Italy, bounded on the north by the gulph of Venice and the Venetian dominions, on the south by the Mediterranean, on the east by the kingdom of Naples and the Adriatic, and on the west by Tuscany and Modena. Its length is about 240 miles, but its breadth varies from 20 to 120 miles.

The

Pope.

Pope.

The soil, in general, of the pope's dominions is very fertile, but ill cultivated; and there are many fens and marshy grounds, which are very prejudicial to the air. That the lands are badly cultivated and inhabited, the air bad, and the inhabitants poor, idle, lazy, and grossly superstitious, is owing to their being governed by priests, who may justly be said not only to fleece them, but flea them. This country, with respect to the accommodations of life, is but in a very indifferent condition; for, notwithstanding the fertility of its soil, its advantageous situation for traffic, the large sums spent in it by travellers, or remitted to it from foreign countries, and its having, for its ruler, the successor of St Peter, the prince of the apostles, and the vicar of Jesus Christ, yet it is poor and thin of inhabitants, ill cultivated, and without trade and manufactures. This is partly owing to the great number of holidays, of sturdy beggars called *pilgrims*, and of hospitals and convents, with the amazing but useless wealth of churches and convents, and the inquisition; but the chief cause is the severity of the government, and the grievous exactions and hardships to which the subjects are exposed. The legates, tho' mostly clergymen, whose thoughts should be chiefly employed about laying up treasures in heaven, and who ought to set an example to the laity of disinterestedness and a contempt of this world, yet, in fact, scruple no kind of rapaciousness: even the holy father himself, and the cardinals, make the enriching of their nephews and other relations, and the aggrandizing their families, the great business of their lives. The extravagant claims and pretensions of the pope are well known, and by all the rational part of Christendom now treated with contempt and mockery. The Reformation gave a great blow to his spiritual power: but as to his temporal dominions, he still possesses them entire; tho' it is not likely that will long be the case, considering how much he hath lost, and is daily losing, of his ghostly empire, and the veneration in which he was formerly held. The Papal dominions were originally procured, partly by the voluntary gift of bigotted princes, and partly by other methods. The Campagna of Rome is under the pope's immediate government; but the other provinces are governed by legates and vice-legates, and there is a commander in chief of the pope's forces in every province. The pope is chosen by the cardinals in the conclave, who are 70 in number when complete, and consist of three classes, namely, cardinal-bishops, priests, and deacons: they look upon themselves as on a footing with crowned heads, and have the title of *eminentissimi*. The pope holds a consistory of cardinals on ecclesiastical affairs; but the cardinals do not meddle with his civil government. The pope's chief minister is the cardinal-patron, usually his nephew, who amasses an immense estate, if the reign be of any long duration. The cardinal that is chosen pope must be an Italian, and at least 55 years of age. The spiritual power of the pope, though far short of what it was before the Reformation, is still considerable. It is computed that the monks and regular clergy, who are absolutely at his devotion, do not amount to less than 2,000,000 of people dispersed through all the Roman Catholic countries, to assert his supremacy over princes, and promote the interest of the church. The revenues of

these monks do not fall short of L. 20,000,000 Sterling, besides the casual profits arising from offerings, and the people's bounty to the church, who are taught that their salvation depends on this kind of benevolence.

The pope's revenues, as a temporal prince, may amount to about L. 1,000,000 Sterling per annum, arising chiefly from the monopoly of corn, the duties on wine and other provisions. Over and above these, vast sums are continually flowing into the papal treasury from all the Roman Catholic countries, for dispensations, indulgences, canonizations, annates, the pallia, and investitures of archbishops, bishops, &c.

The pope has a considerable body of regular forces, well clothed and paid; but his fleet consists only of a few galleys. His life-guards are 40 Swizers, 75 cuirassiers, and as many light horse.

POPHAM (Sir John), lord chief justice of the common pleas in the reign of queen Elizabeth, was the eldest son of Edward Popham, esq; of Huntworth in Somersetshire, and born in the year 1531. He was some time a student of Balliol college in Oxford; "being then," says Ant. Wood, "given at leisure hours to many sports and exercises." After quitting the university, he fixed in the Middle Temple; where, during his novitiate, he is said to have indulged in that kind of dissipation to which youth and a vigorous constitution more naturally incline than to the study of voluminous reports: but, fatiated at length with what are called the *pleasures of the town*, he applied sedulously to the study of his profession, was called to the bar, and in 1568 became summer or autumn reader. He was soon after made serjeant at law, and solicitor-general in 1579. In 1581, he was appointed attorney-general, and treasurer of the Middle Temple. In 1592, he was made lord chief justice of the king's bench, and the same year received the honour of knighthood. In the year 1601, his lordship was one of the council detained by the unfortunate earl of Essex, when he formed the ridiculous project of defending himself in his house; and, on the earl's trial, he gave evidence against him relative to their detention. He died in the year 1607, aged 76; and was buried in the south aisle of the church at Wellington in Somersetshire, where he generally resided as often as it was in his power to retire. He was thought somewhat severe in the execution of the law against capital offenders; but his severity had the happy effect of reducing the number of highway robbers. He wrote, 1. Reports and cases adjudged in the time of queen Elizabeth. 2. Resolutions and judgments upon cases and matters agitated in all the courts at Westminster in the latter end of queen Elizabeth.

POPLAR, in botany. See POPULUS.

POPLITEUS, in anatomy, a small muscle obliquely pyramidal, situated under the ham. See ANATOMY, *Table of the Muscles*.

POPPY, in botany. See PAPAVER.

POPULAR, something that relates to the common people.

POPULUS, the POPLAR; a genus of the octandria order, belonging to the diœcia class of plants.

*Species*. 1. The alba, or abele-tree, grows naturally in the temperate parts of Europe. Its leaves are

Popham  
#  
Populus.

Populus.

large, and divided into three, four, or five lobes, indented on their edges, of a very dark colour on their upper side, but very white and downy on their under side; standing upon footstalks an inch long. The young branches have a purple bark, and are covered with a white down; but the bark of the stem and older branches is grey. In the beginning of April, the male flowers or catkins appear, which are cylindrical, and about three inches long. About a week after come out the female flowers on catkins, which have no stamina like those of the male. Soon after these come out, the male catkins fall off; and in five or six weeks after, the female flowers will have ripe seeds inclosed in a hairy covering. The catkins will then drop, and the seeds be wafted by the winds to a great distance. 2. The major, or white poplar, has its leaves rounder than the first, and not much above half their size: they are indented on their edges, and are downy on their under side, but not so white as those of the former, nor are their upper surfaces of such a deep green colour. 3. The nigra, or black poplar, has oval heart-shaped leaves, slightly crenated on their edges; they are smooth on both sides, and of a light green colour. 4. The tremula, or aspen-tree, has roundish, angularly-indented leaves: they are smooth on both sides, and stand on long footstalks; so are shaken by the least wind; from whence it has the title of the *trembling poplar*, or *aspen-tree*. 5. The balsamifera, or Carolina poplar, is a native of Carolina, where it becomes a large tree. The shoots of this sort grow very strong in Britain, and are generally angular; with a light green bark like the willow. The leaves on young trees, and also those on the lower shoots, are very large, almost heart-shaped and crenated; but those upon the older trees are smaller: as the trees advance, their bark becomes lighter, approaching to a greyish colour. 7. The *tacamahaca* grows naturally in Canada and other parts of North America. This is a tree of a middling growth, sending out on every side many short thick shoots, which are covered with a light brown bark, garnished with leaves differing from one another in shape and size; most of them are almost heart-shaped; but some are oval, and others nearly spear-shaped; they are whitish on their under side, but green on their upper.

*Culture.* These trees may be propagated either by layers or cuttings, as also from suckers which the white poplars send up from their roots in great plenty. The best time for transplanting these suckers is in October, when their leaves begin to decay. These may be placed in a nursery for two or three years to get strength before they are planted out where they design to remain; but if they are propagated from cuttings, it is better to defer the doing of that until February, at which time truncheons of two or three feet long should be thrust about a foot and a half into the ground. These will readily take root; and if the soil in which they are planted be moist, they will arrive at a considerable bulk in a few years. The black poplar is less apt to take root from large truncheons; therefore it is a better method to plant cuttings of it about a foot and a half in length, thrusting them a foot deep in the ground. This sort will grow almost on any soil, but will thrive best in moist places. The Carolina poplar may also be propagated by cuttings

or layers; but the last is the method generally practised, and the plants raised by it are less moist than others. The shoots of this tree while young are frequently killed down to a considerable length by the frost in winter; but as the trees grow older, their shoots are not so vigorous, and become more ligneous, so are not liable to the same disaster. But the trees should be planted in a sheltered situation: for, as their leaves are very large, the wind has great power over them; and the branches being tender, they are frequently broken or split by the winds in summer, when they are much exposed. The *tacamahaca* sends up a great number of suckers from its roots, by which it multiplies in plenty, and every cutting which is planted will take root.

*Uses.* The wood of these trees, especially of the *abele*, is good for laying floors, where it will last for many years; and on account of its extreme whiteness is by many preferred to oak; yet, on account of its soft texture, being very subject to take the impression of nails, &c. it is less proper on this account than the harder woods. The inner bark of the black poplar is used by the inhabitants of Kamtschatka as a material for bread; and paper has sometimes been made of the cottony down of the seeds. The roots have been observed to dissolve into a kind of gelatinous substance, and to be coated over with a tubular crustaceous spar, called by naturalists *esthecolla*, formerly imagined to have some virtue in producing the callus of a fractured bone. The buds of the sixth species are covered with a glutinous resin which smells very strong, and is the gum *tacamahaca* of the shops. The best, called, from its being collected in a kind of gourd-shells, *tacamahaca in shellis*, is somewhat unctuous and stitish, of a pale yellowish or greenish colour, an aromatic taste, and a fragrant delightful smell, approaching to that of lavender or ambergris. This sort is very rare; that commonly found in the shops is in semitransparent globes or grains, of a whitish, yellowish, brownish, or greenish colour, of a less grateful smell than the foregoing. This resin is said to be employed externally by the Indians, for discharging and maturing tumours, and abating pains in the limbs. It is an ingredient in some anodyne, hyfteric, cephalic, and stomatick plasters; but the fragrance of the finer sort sufficiently points out its being applicable for other purposes.

PORCELAIN, a fine kind of earthen ware, chiefly manufactured in China, and thence called *China-ware*. All earthen wares which are white and semitransparent are generally called *porcelains*: but amongst these, so great differences may be observed, that, notwithstanding the similarity of their external appearance, they cannot be considered as matters of the same kind. These differences are so evident, that even persons who are not connoisseurs in this way prefer much the porcelain of some countries to that of others.

The art of making porcelain is one of those in which Europe has been excelled by oriental nations. The first porcelain that was seen in Europe was brought from Japan and China. The whiteness, transparency, fineness, neatness, elegance, and even the magnificence of this pottery, which soon became the ornament of sumptuous tables, did not fail to excite the admiration

Populus,  
Porcelain.

Porcelain. ration and industry of Europeans; and their attempts have succeeded so well, that in different parts of Europe, earthen wares have been made so like the oriental that they have acquired the name of *porcelain*. The first European porcelains were made in Saxony and in France; and afterwards in England, Germany, and Italy; but as all these were different from the Japanese, so each of them had its peculiar character.

1  
Porcelain first examined scientifically by Reaumur.

The illustrious Reaumur first attended to the manufacture of porcelain as a science, and communicated his researches in two memoirs before the Academy of Sciences in 1727 and 1729. He did not satisfy himself with considering the external appearance, the painting and gilding, which are only ornaments not essential to the porcelain, but he endeavoured to examine it internally: and having broken pieces of the Japanese, Saxon, and French porcelains, he examined the difference of their grains (which name is given to their internal structure). The grain of the Japanese porcelain appeared to him to be fine, close, compact, moderately inooth, and somewhat shining. The grain of the Saxon porcelain was found to be still more compact, not granulous, smooth, shining like enamel. Lastly, the porcelain of St Cloud had a grain much less close and fine than that of Japan; not, or but little, shining; and resembling the grain of sugar.

2  
Different kinds of porcelain.

From these first observations Mr Reaumur perceived that porcelains differed considerably. That he might examine them further, he exposed them to a violent heat. More essential differences than those of the grain appeared upon this trial; for the Japanese porcelain was unaltered by the fire, and all the European were melted.

This essential difference betwixt the Japanese and European porcelains suggested to Mr Reaumur a very ingenious thought, and in many respects true, concerning the nature of porcelain in general. As all porcelains somewhat resemble glass in consistence and transparency, though they are less compact and much less transparent, Mr Reaumur considered them as semivitrifications. But every substance may appear, and may actually be, in a semivitrified state in two ways: for, first, it may be entirely composed of vitrifiable or fusible matters; and in this case, by exposing it to the action of fire, it will be actually melted or vitrified, if the heat be sufficiently strong and long-continued. But as this change is not made instantly, especially when the heat is not very violent; and as it passes thro' different stages or degrees, which may be more easily observed as the heat is better managed; hence, by stopping in proper time the application of heat to porcelain made in this manner, we may obtain it in an intermediate state betwixt those of crude earths and of completely vitrified substances, and also possessed of the semitransparency and of the other sensible qualities of porcelain. We know also, that if such porcelain be exposed to a stronger degree of fire, it will then be completely fused and entirely vitrified. But the European porcelains tried by Mr Reaumur had this fusibility; from which he concluded, that their composition is founded upon the abovementioned principle.

3  
True composition of porcelain discovered by Reaumur.

In the second place, a paste of porcelain may be composed of fusible and vitrifiable matter, mixed with a certain proportion of another matter which is absolutely infusible in the fires of our furnaces. We may

easily perceive, that if such a mixture be exposed to a heat sufficient to melt entirely the vitrifiable ingredient, that this matter will actually melt: but as it is intermixed with another matter which does not melt, and which consequently preserves its consistency and opacity, the whole must form a compound partly opaque and partly transparent; or rather a semitransparent mass; that is, a semi-vitrified substance, or porcelain, but of a kind very different from the former; for as the fusible part of this latter has produced all its effect, and as it has been as much fused as it can be during the baking of the porcelain, the compound may be exposed a second time to a more violent fire, without approaching nearer to a complete vitrification, or without departing from its state of porcelain. But as oriental porcelain has precisely these appearances and properties, Mr Reaumur concludes with reason, that it is composed upon this principle; and he afterwards confirmed his opinion by undeniable facts.

Porcelain.

Father Entrecolles, missionary at China, had sent<sup>4</sup> from thence a summary description of the procefs by which the inhabitants of that country make their porcelain, and also a small quantity of the materials which they employ in its composition. He said that the Chinese composed their porcelain of two ingredients; one of which is a hard stone or rock, called by them *petuntse*, which they carefully grind to a very fine powder; and the other, called by them *kaolin*, is a white, earthy substance, which they mix intimately with the ground *petuntse*. Mr Reaumur examined both these matters, and having exposed them separately to a violent fire, he discovered that the *petuntse* had fused without addition, and that the *kaolin* had given no sign of fusibility. He afterwards mixed these matters, and formed cakes of them, which by baking were converted into porcelain similar to that of China. Mr Reaumur easily found, that the *petuntse* of the Chinese was a hard stone of the kind called *vitrifiable*, but much more fusible than any of those which were known in Europe; and that the *kaolin* was a talcaceous matter, reduced to a very fine powder. From that time he hoped to make a porcelain of the same kind as the Chinese with materials found in France. Whether he could not find any materials equal to those of China, particularly that material analogous to the *petuntse* of the Chinese, or because other occupations prevented the continuance of his researches, we do not know; but we find, from his second memoir upon porcelain, that he afterwards attempted to make an artificial *petuntse*, by mixing our vitrifiable stones with salts capable of rendering them fusible, or even by substituting for it glass ready formed, and by adding to these such substances as he thought might be substituted for *kaolin*. But he probably found he could not execute these intentions; for he did not resume this subject from the year 1729 to 1739, when he gave a<sup>5</sup> process for converting common glass to a singular kind of porcelain, to which he has given his name, and of which an account is given under the article CHEMISTRY, n° 92.

Confirmed by accounts from the East Indies.

Although Mr Reaumur has surmounted many difficulties, and has given just notions concerning this subject, yet he has been mistaken, or rather misled, in two important points. His first error concerns the

5  
Glass converted into a kind of porcelain.

6  
Mistaken in some particulars.

Porcelain. Saxon porcelain, which he confounds with the other fusible porcelains made in Europe. Formerly, indeed, a porcelain might be made in Saxony, composed entirely of fusible or vitrifiable materials, the vitrification of which was stop't in proper time, and which Mr Reaumur had examined. But now we are certainly informed, that all of that country is capable of resisting the most violent fires without fusion, as well, at least, as those of China and Japan. Mr Reaumur might have been misled by the appearance of the internal texture of this porcelain. For when a piece of it is broken, its internal surface does not appear granulous, but compact, uniform, smooth, shining, and much resembling white enamel. But this appearance, so far from showing that Saxon porcelain is a fused or vitrified substance, proves that it is not entirely composed of fusible matters. All who have considered attentively this subject know, that the internal surface of the most fusible porcelains is also the least dense and least compact: the reason of which is, that no vitreous matter can be smooth and dense internally, unless it has been completely fused. But if the density and shining appearance of the internal surface of the Saxon porcelain were only the effects of the fusion of a vitreous matter, how could we conceive that vessels formed of that matter should have sustained the necessary fusion for giving this density and shining appearance, without having entirely lost their shape? The impossibility of this is evident to any persons who have been conversant in these matters and in the fusion of glass.

7  
Difference between the Saxon and oriental porcelain.

This quality of the Saxon porcelain must therefore proceed from another cause. It does indeed contain, as every porcelain does, particularly those of China and Japan, a fusible substance, which has been even completely fused during the baking. Its density also and its internal lustre proceed chiefly from this fused matter: but we are also certain, that it contains a large quantity of a substance absolutely unfusible, from which it receives its admirable whiteness, its firmness and solidity, during the baking; in a word, which supplies the place of the oriental kaolin, and which has the property of contracting its dimensions considerably while it incorporates with the fusible substance. If it be subjected to the most decisive trial, namely, the action of a violent fire, capable of melting every porcelain composed of fusible matters alone,

Chem. Dis.

“ I affirm, (says Mr Macquer), after many experiments, that it cannot be fused, unless by a fire capable also of melting the best Japanese porcelain.” The Saxon porcelain is therefore not to be confounded with those which are vitreous and fusible; but is in its kind as excellent as that of Japan, and perhaps superior, as we shall see when we enumerate the qualities which constitute the excellence of porcelain. The subject of Mr Reaumur's second error, or at least that which he has not sufficiently explained, is the kaolin of China. According to him, this matter is a fine talcy powder, from the mixture of which with petuntse the oriental porcelain is formed. Possibly a very finely-ground talcy substance mixed with petuntse might form a porcelain similar to the oriental; but persons acquainted with the manufacture of any porcelain, must perceive the impossibility of forming vessels, unless the paste of which they are made be so ductile and tenacious, that it may be worked upon a potter's

lathe, or at least that it may be moulded. But talcs, or any kinds of stones, however finely-ground, cannot acquire the requisite tenacity, which clays only, of all known earthy substances, possess. The Chinese porcelain vessels evidently appear to be turned upon the lathe, since they retain the marks of it: hence they must have been formed of a very tenacious paste, and consequently the kaolin is not a purely talcy matter, but is mixed with clay; or else the petuntse and kaolin are not, as Mr Reaumur supposes, the only ingredients of the paste of which Chinese porcelain is formed, but a sufficient quantity of some binding matter, unknown to father d'Entrecolles and Mr Reaumur, must be also added.

Although, since Mr Reaumur, no scientific person has written concerning porcelain, many have attempted to make it. Manufactories have been established in almost all the states of Europe. Besides that of Saxony, which has been long established, porcelain is also made at Vienna, at Frankendal, and lately in the neighbourhood of Berlin. All these German porcelains are similar to the Saxon; and are made of materials of the same kind, although they differ somewhat from each other. England and Italy also have their porcelains, the chief of which are those of Chelsea and of Naples. Mr de la Condamine, in his last journey into Italy, visited a manufacture of porcelain established at Florence by the marquis de la Ginori, then governor of Leghorn. Mr de la Condamine observed particularly the large size of some pieces of this porcelain. He says he saw statues and groupes half as large as nature, modelled from some of the finest antiques. The furnaces in which the porcelain was baked were constructed with much art, and lined with bricks made of the porcelain materials. The paste of this porcelain is very beautiful; and from the grain of broken pieces it, it appears to have all the qualities of the best Chinese porcelain. A whiter glazing would be desirable, which they might probably attain, if the Marquis Ginori was not determined to use those materials only which were found in that country.

But in no state of Europe have such attempts been made to discover porcelain, or so many manufactories of it been established, as in France. Before even Mr Reaumur had published on this subject, porcelain was made at Saint Cloud, and in the suburb of St Antoine at Paris, which was of the vitreous and fusible kind, but considerably beautiful. Since that time, considerable manufactures of it have been established at Chantilly, at Villeroi, and at Orleans; the porcelains of which have a distinguished merit. But the porcelain produced in the king's manufacture at Sevres holds at present the first rank, from its shining white, its beautiful glazing, and coloured grounds, in which no porcelain has ever equalled it. The magnificence of the gilding, the regularity and elegance of its forms, surpass every thing of the kind.

Mr Guettard has published an account of his discoveries on this subject, in the Memoirs of the Academy of Sciences for the year 1765. The kaolin which he employed was a white argillaceous earth, filled with mica, which he found in, the neighbourhood of Aleson; and his petuntse is a hard, quartzose grit stone, found abundantly in the same country, with which the streets of Aleson are paved. We al-

8  
Manufactories of porcelain in different countries.

9  
M. Guettard's discoveries.

Porcelain. so know that Mr Guettard had begun to make his experiments on porcelain with these materials in the year 1751, together with the late Duke of Orleans, to whom he was attached. The Count de Lauraguais, of the Academy of Sciences, engaged in the pursuit of porcelain for several years with uncommon ardour and constancy. He spared no trouble nor expence to attain his purpose, which was to make porcelain equal in all respects to that of China and Japan. He shewed some pieces made by him, in the year 1766, to the members of the Academy of Sciences. The persons appointed by them to examine it gave their opinion, "that of all the porcelains made in the country, that of the Count de Lauraguais most resembles the porcelain of China and Japan in solidity, grain, and unfusibility." It were to be wished that it possessed equally the other qualities essential to the excellence of porcelain, namely, the whiteness and lustre observable in the ancient Japanese porcelain. See CHEMISTRY, n° 91.

10  
Qualities which constitute the perfection of porcelain

We shall now shew what those qualities are which constitute the perfection of porcelain. We must first carefully distinguish the qualities which only contribute to the beauty and external appearance, from the intrinsic and essential properties in which the goodness and solidity of porcelain consist. All persons who have made experiments in this way have soon discovered the possibility of making compounds very white, beautifully semi-transparent, and covered with a shining glazing; but which cannot be worked for want of tenacity, are not sufficiently compact, are essentially fusible, are subject to break by sudden application of heat and cold; and lastly, the glazing of which cracks, becomes rough, and consequently loses its lustre by use, because it is too soft.

On the other side, we shall also find it not difficult to compose very tenacious pastes, which shall be capable of being easily worked and well baked; which in the baking shall acquire the desirable hardness and density; which are unfusible, and capable of sustaining very well the sudden change of heat and cold; and, in a word, which shall have all the qualities of the most excellent porcelain, excepting whiteness and beauty. We shall soon see that the materials fit for the composition of such porcelains may be found abundantly in every country. The only difficulty, then, in this inquiry concerning porcelain, is, to unite beauty and goodness in one composition; and indeed nature seems to be very sparing of materials fit for this purpose, and therefore perfect porcelain will always be a dear and valuable commodity.

11  
Stone ware a kind of porcelain.

Those potteries which we call *stone-ware* are not of modern invention, and have all the essential qualities of the best Japanese. For if we except whiteness, on which alone the semi-transparency depends, and compare all the properties of Japanese porcelain with those of our stone-ware, no difference can be found betwixt them. The same grain appears internally in both; the same found is produced by striking them when properly suspended; the same density, the same hardness by which they strike fire with steel, the same faculty of sustaining the heat of boiling liquors without breaking, and the same unfusibility in fire, are observable. Lastly, if the earths of which stone-ware is made were free from heterogeneous colouring mat-

ters, which prevent their whiteness and semitransparency; if vessels were carefully formed; if all the proper attentions were given; and if these vessels were covered over with a fine glazing; they would be as perfect porcelain as that of Japan. The most perfect porcelain, therefore, is nothing else than a fine white stone-ware.

Earths of this kind are probably more rare in Europe than in Japan and China. And probably also the want of these earths was the cause that the first makers of porcelain in this country confined themselves to an external imitation, by employing nothing but vitrifiable matters with fusible salts and a small quantity of white earth, from which fusible and vitreous porcelains were composed, which might be called *false porcelains*. But things are much changed since these first attempts. Besides the discoveries of the count de Lauraguais and of Mr Guettard, genuine white porcelains have been made a long time ago in Germany, especially in Saxony and at Frankendal.

Porcelain.

12  
Genuine porcelain made in some countries of Europe.

These porcelains are not inferior in any respect to the oriental; they are even much superior in beauty and whiteness to the modern oriental porcelain, which has much degenerated in these respects; they seem even to excel the oriental in the most valuable quality of porcelain, namely, the property of sustaining the sudden change of heat and cold. We cannot judge of the quality of porcelain by a slight trial: for so many circumstances concur to make a piece of porcelain capable or incapable of sustaining the sudden application of heat and cold, that if at the same time boiling water be poured into the two vessels, one of which is good porcelain and the other bad, the former may possibly break and the latter remain entire. The only true method of discovering good porcelain in this respect is, to examine several pieces of it which are daily used; for instance, a set of coffee-cups. But it has been observed, that in many such pieces of oriental porcelain, which have been long and daily used, cracks in the direction of their height may be always perceived, which are never seen in the good European porcelains.

Every one talks of porcelain, and yet few are connoisseurs of it. None can be considered as such but those who have long made it an object of their inquiries. That the ancient Japanese porcelain is the most perfect is a general opinion. This porcelain is indeed very beautiful, and we must also acknowledge that its quality is excellent. It has been our model, and has long been the object of our admiration and emulation; but which we have been never able to equal, and which many persons believe never can be equalled. Some persons even deny the Saxon porcelain for a quality which really gives it a superiority to the Japanese, namely, the greater smoothness, lustre, and less granulous appearance of its internal surface than the oriental. The resemblance of this surface to that of glass has evidently suggested this notion: and it would be well founded, if the density and lustre of this porcelain proceeded only from a fusible and vitreous quality; but as they do not, and as this porcelain is as fixed and as unfusible as the Japanese, its density, so far from being a fault, is a valuable quality. For we must allow, that of porcelains equal in other respects, those are best which are most firm and compact. Hence the interior substance of the Japanese porcelain is esteemed for its great

13  
Excellency of the ancient Japanese porcelain.

Porcelain. er density, compactness, and lustre, than our vitreous sand or fritt porcelains, because these qualities indicate greater cohesion, and more intimate incorporation of its parts. For the same reason also the superior density of the Saxon porcelain ought to give it the preference to the Japanese. Besides, nothing would be easier than to give the Saxon porcelain the granulous texture of the Japanese, by mixing with the paste a certain quantity of sand. But the persons who perfected that manufacture were certainly sensible, that such a conformity to the Japanese porcelain would lessen the merit of theirs. For we know, that in general porcelains are better in proportion as they contain a larger proportion of clay or earth, and less of sand, flints, or other matters of that kind.

What we have said concerning porcelain in general, and the principal kinds of it, seems sufficient to give just notions of it, if not to persons who without considering the subject are determined to prefer the most ancient, to those, at least, who have made experiments on this subject, or who, having a sufficient knowledge of chemistry, are capable of studying and examining it thoroughly. We shall finish this article by giving a short description of the method of manufacturing porcelain.

74  
Of making  
scissible or  
vitreous  
porcelains.

The basis of the porcelains which we have called *scissible, vitreous, or false porcelains*, is called by artists a *fritt*; which is nothing else than a mixture of sand or of powdered flints, with salts capable of disposing them to fusion, and of giving them a great whiteness by means of a sufficient heat. This fritt is to be then mixed with as much, and no more, of a white tenacious earth of an argillaceous or marly nature, than is sufficient to make it capable of being worked upon the wheel. The whole mixture is to be well ground together in a mill, and made into a paste, which is to be formed, either upon the wheel or in moulds, into pieces of such forms as are required.

Each of these pieces, when dry, is to be put into a case made of earthen ware (A); which cases are to be ranged in piles one upon another, in a furnace or kiln, which is to be filled with these to the roof. The furnaces are chambers or cavities of various forms and sizes; and are so disposed, that their fire-place is placed on the outside opposite to one or more openings, which communicate within the furnace. The flame of the fuel is drawn within the furnace, the air of which rarifying, determines a current of air from without inwards, as in all furnaces. At first a very little fire is made, that the furnace may be heated gradually, and is to be increased more and more till the porcelain is baked, that is, till it has acquired its proper hardness and transparency; which is known by taking out of the furnace from time to time, and examining, small pieces of porcelain, placed for that purpose in cases which have lateral openings. When these pieces show that the porcelain is sufficiently baked, the fritt is no longer to be supplied with fuel, the furnace is to be cooled, and the porcelain taken out, which in this state resembles white marble not having a shining surface, which is afterwards to be given by covering them with a vitreous

composition called the *glazing*.

The porcelain when baked and not glazed is called *biscuit*, which is more or less beautiful according to the nature of the porcelain. The manufacture of Sévres excels all others in this respect, and it is therefore the only one which can produce very fine pieces of sculpture; that is, in which all the fineness of the workmanship is preserved, and which are preferable in smoothness and whiteness to the finest marble of Italy.

As no piece of sculpture of this kind can preserve all the delicacy of its workmanship when covered with a glazing; and as sculptors avoid polishing their marble figures, because the lustre of the polish is disadvantageous; therefore, in the manufactures at Sévres, all figures, or little statues, and even some ornamental vases, are left in the state of biscuit. The other pieces of porcelain are to be glazed in the following manner.

A glass is first to be composed suited to the nature of the porcelain to which it is to be applied; for every glass is not fit for this purpose. We frequently find that a glass which makes a fine glazing for one porcelain shall make a very bad glazing for another porcelain; shall crack in many places, shall have no lustre, or shall contain bubbles. The glazing then must be appropriated to each porcelain, that is, to the hardness and density of the ware, and to the ingredients of its composition, &c.

Porcelain.  
15  
Porcelain  
sculptures.

16  
Method of  
glazing and  
colouring  
Porcelain.

These glazings are prepared by previously fusing together all the substances of which they consist, so as to form vitreous masses. These masses are to be ground very finely in a mill. This vitreous powder is to be mixed with a sufficient quantity of water, or other proper liquor, so that the mixture shall have the consistence of cream of milk. The pieces of porcelain are to be covered with a thin stratum of this matter; and when very dry, they are to be again put into the furnace in the same manner as before for the forming of the biscuit, and to be continued there till the glazing be well fused. The necessary degree of fire for fusing the glazing is much less than that for baking the paste.

The pieces of porcelain which are intended to remain white are now finished; but those which are to be painted and gilded must undergo further operations. The colours to be applied are the same as those used for enamel painting. They all consist of metallic calxes bruised and incorporated with a very fusible glass. Crocus of iron furnishes a red colour: Gold precipitated by tin makes the purple and violet; copper calcined by acids and precipitated by an alkali gives a fine green; zaffre makes the blue; earths slightly ferruginous produce a yellow; and, lastly, brown and black colours are produced by calcined iron, together with a deep blue of zaffre. These colours being ground with gum-water, or with oil of spike, are to be employed for the painting of the porcelain with designs of flowers and other figures. For gilding, a powder or calx of gold is to be applied in the same manner as the coloured enamels. The painted and gilded porcelains are to be then exposed to a fire capable of fusing the glass, with which the metallic colours are mixed.

n<sup>o</sup> 354.

Thus

(A) The cases are called by English potters, *seggars*. They are generally formed of coarser clays, but which must be also capable of sustaining the heat required without fusion. By means of these cases, the contained porcelain is preserved from the smoke of the burning fuel. The whiteness of the porcelain depends much on their compactness of texture by which the smoke is excluded, and on the purity of the clay of which they are made.

Preparation  
of unfusible  
porcelain.

Thus the colours are made to adhere, and at the same time acquire a gloss equal to that of the glazing. The gold alone has not then a shining appearance, which must be afterwards given to it by burnishing with a blood stone.

The operations for the unfusible porcelains, and also for such as are of the nature of stone-ware, are somewhat more simple. The sands and flones which enter into their composition are to be ground in a mill: the earths or clays are to be washed: the materials are to be well mixed, and formed into a paste: the pieces are first rudely formed upon a potter's wheel; and when dry, or half dry, they are turned again upon the wheel, and their form is made more perfect: they are then placed in the furnace, not to bake them, but only to apply a sufficient heat to give them such a solidity that they may be handled without breaking, and may receive the glazing. As the pieces of porcelain after this first heat are very dry, they imbibe water readily. This disposition affords the application of the glazing. The vitrifiable or vitrified matter of this glazing, which has been previously ground in a mill, is to be mixed with such a quantity of water, that the liquor shall have the consistence of milk. The pieces of porcelain are hastily dipped in this liquor, the water of which they imbibe, and thus on their surface is left an uniform covering of the glazing materials. This covering, which ought to be very thin, will soon become so dry, that it cannot stick to the fingers when the pieces are handled.

The pieces of this porcelain are then put into the furnace to be perfectly baked. The heat is to be raised to such a height, that all within the furnace shall be white, and the cases shall be undistinguishable from the flame. When, by taking out small pieces, the porcelain is known to be sufficiently baked, the fire is discontinued, and the furnace cooled. If the baking has been well performed, the pieces of porcelain will be found by this single operation to be rendered compact, sonorous, close-grained, moderately glossy, and covered externally with a fine glazing. The painting and gilding of this porcelain are to be executed in a manner similar to that already described.

PORCELAIN *Shell*, a species of *CYPREA*.

PORCH, in architecture, a kind of vestibule supported by columns; much used at the entrance of the ancient temples, halls, churches, &c.

A porch, in the ancient architecture, was a vestibule, or a disposition of insulated columns usually crowned with a pediment, forming a covert place before the principal door of a temple or court of justice. Such is that before the door of St Paul's, Covent-Garden, the work of Inigo Jones. When a porch had four columns in front, it was called a *tetrapstyle*; when six, *hexastyle*; when eight, *octostyle*, &c.

PORCUPINE, in zoology. See *HISTRIX*.

PORE, in anatomy, a little interstice or space between the parts of the skin, serving for perspiration.

PORK, the flesh of swine killed for the purposes of food. See *Sus*.

The hog is the only domestic animal that we know of no use to man when alive, and therefore seems properly designed for food. Besides, as loathsome and ugly to every human eye, it is killed without reluctance. The Pythagoreans, whether to preserve health, or on account of compassion, generally forbade the use of

animal food; and yet it is alleged that Pythagoras reserved the use of hogs-flesh for himself. The Jews, the Egyptians, &c. and others in the warm countries, and all the Mahometans at present, reject the use pork. It is difficult to find out the reason of this, or of the precept given to some of them, though commonly such as are not given without a particular one. The Greeks gave great commendations to this food; and Galen, though indeed that is suspected to be from a particular fondness, is every where full of it. The Romans considered it as one of their delicacies; and if some of the inhabitants of the northern climates have taken an aversion to it, that probably arose from the uncultivated state of their country not being able to rear it. Pork is of a very tender structure; increased perhaps from a peculiarity in its economy, *viz.* taking on fat more readily than any other animal. Pork is a white meat even in its adult state, and then gives out a jelly in very great quantity. On account of its little perspirability and tenderness, it is very nutritious, and was given for that intention to the *athleta*. With regard to its alkaliescence, no proper experiments have yet been made; but as it is of a gelatinous and succulent nature, it is probably less so than many others. Upon the whole, it appears to be a very valuable nutriment, and the reason is not very obvious why it was in some countries forbid. It is said that this animal is apt to be diseased; but why were not inconveniences felt on that account in Greece? Again, it has been alleged, that as Palestine would not rear these animals, and as the Jews had learned the use of them in Egypt, it was necessary they should have a precept to avoid them. But the Egyptians themselves did not use this meat; and this religious precept, indeed, as well as many others, seems to have been borrowed from them. Possibly, as pork is not very perishable, it might increase the leprosy, which was said to be epidemic in Palestine; though this is far from being certain.

PORPESE, in ichthyology. See *DELPHINUS*.

PORPHYRIUS, a famous Platonic philosopher, born at Tyre in 233, in the reign of Alexander Severus. He was the disciple of Longinus, and became the ornament of his school at Athens; from thence he went to Rome, and attended Plotinus, with whom he lived six years. After Plotinus's death, he taught philosophy at Rome with great applause; and became well skilled in polite literature, geography, astronomy, and music. He lived till the end of the third century, and died in the reign of Dioclesian. There are still extant, his book on the Categories of Aristotle; a Treatise on Abstinence from Flesh; and several other pieces in Greek. He also composed a large treatise against the Christian Religion, which is lost. That work was answered by Methodius bishop of Tyre, and also by Eusebius, Apollinaris, St Augustin, St Jerome, St Cyril, and Theodoret. The emperor Theodosius the Great caused Porphyrius's book to be burned in 338. Those of his works that are still extant, were printed at Cambridge in 1655, 8vo, with a Latin version.

PORPHYRY, in natural history, a kind of stone of a plain uniform mass, spotted with separate concretions, of great hardness, giving fire with steel, not fermenting with acids, and very slowly and difficultly calcining in a strong fire.

Porphyry is of several sorts; as, 1. The porphyry

Pork  
||  
Porphyry.

Colles's  
Mat. Med.

**Porphyry** of the ancients, which is a most elegant mass of an extremely firm and compact structure, remarkably heavy, and of a fine strong purple, variegated more or less with pale red and white; its purple is of all degrees, from the claret-colour to that of the violet; and its variegations are rarely disposed in veins, but spots, sometimes very small, and at others running into large blotches. It is less fine than many of the ordinary marbles; but it excels them all in hardness, and is capable of a most elegant polish. It is still found in immense strata in Egypt. 2. The hard red-lead coloured porphyry, variegated with black, white, and green. This is a most beautiful and valuable substance. It has the hardness and all the other characters of the oriental porphyry; and even greatly excels it in brightness, and in the beauty and variegation of its colours. It is found in great plenty in the island of Minorca; and is extremely worth importing, for it is greatly superior to all the Italian marbles. 3. The hard, pale-red porphyry, variegated with black, white, and green. This is of a pale flesh-colour; often approaching to white. It is variegated in blotches from half an inch to an inch broad. It takes a high polish, and emulates all the qualities of the oriental porphyry. It is found in immense strata in Arabia Petraea, and in the Upper Egypt; and in separate nodules in Germany, England, and Ireland.

**PORPHYRY-Shell**, a species of MUREX.

**PORRUM**, the LEEK; a species of plants, belonging to the genus of ALLIUM. There are two species known in this country; the fativum, or London leek, and the ampeloprasum. The first is the kind commonly cultivated; and of it there have been supposed two varieties: but Mr Miller observes, that the difference has been occasioned by some persons sowing the seeds from old leeks, and not from the seedling leeks; whereby they have degenerated, and become smaller and narrower-leaved; but may be recovered again by proper care. The other species is a native of Siberia; its leaves are narrower than the common sort; the stalks are smaller, and do not rise near so high; the heads of the flowers are also smaller, and of a purplish colour; the stamina stand out beyond the flower. Leeks are cultivated in the same manner as onions, and commonly sown along with them; their qualities as food are also the same.

**PORT**, a harbour, river, or haven, formed either by nature or art, to receive and shelter shipping from the storms and waves of the open sea.

Artificial ports are those which are either formed by throwing a strong mound or rampire across the harbour's mouth to some island or rock, or erecting two long barriers, which stretch from the land on each side like arms or the horns of a crescent, and nearly inclose the haven; the former of these are called *mole-heads*, and the latter *piers*.

**PORT**, is also a name given on some occasions to the larboard or left side of the ship, as in the following instances. Thus it is said, "the ship heels to port," *i. e.* floops or inclines to the larboard side. "Top the yard to port!" the order to make the larboard extremity of a yard higher than the other. "Port the helm!" the order to put the helm over to the larboard-side of the vessel. In all these senses this phrase appears intended to prevent any mistakes happening from the similarity of

sounds in the words *starboard* and *larboard*, particularly when they relate to the helm, where a misapprehension might be attended with very dangerous consequences.

**PORTS**, the embrasures or openings in the side of a ship of war, wherein the artillery is ranged in battery upon the decks above and below.

The ports are formed of a sufficient extent to point and fire the cannon, without injuring the ship's side by the recoil; and as it serves no end to enlarge them beyond what is necessary for that purpose, the shipwrights have established certain dimensions, by which they are cut in proportion to the size of the cannon.

The ports are shut in at sea by a sort of hanging-doors, called the *port-lids*; which are fastened by hinges to their upper-edges, so as to let down when the cannon are drawn into the ship. By this means the water is prevented from entering the lower-decks in a turbulent sea. The lower and upper edges of the ports are always parallel to the deck, so that the guns, when levelled in their carriages, are all equally high above the lower extremity of the ports, which is called the *port-cells*.

**PORT**, is also a strong wine brought from Port-a-port, and also called *Porto* and *Oporto*.

**PORT of the Voice**, in music, the faculty or habit of making the shakes, passages, and diminutions, in which the beauty of a song or piece of music consists.

**PORT-Crayon**, a pencil-case, which is usually four or five inches long, and contrived so as that the pencil may slide up and down. Its inside is round, and its outside is sometimes filed into eight sides or faces, on which are drawn the sector-lines; sometimes it is made round both without-side and within, and has its length divided into inches and parts of inches.

**PORTCULLICE**, in fortification, is an assemblage of several large pieces of wood, joined across one another like a harrow, and each pointed with iron at the bottom. They are sometimes hung over the gate-way of old fortified towns, ready to let down in case of surprise, when the gates could not be shut.

**PORT-Fire**, a composition for setting fire to powder, &c. Port-fires are frequently used by artillery people in preference to matches; and they are distinguished into wet and dry port-fires. The composition of the former is salt-petre four, sulphur one, and mealed powder four. When these materials are thoroughly mixed and sifted, the whole is to be moistened with a little linseed oil, and rubbed between the hands till all the oil is imbibed by the composition. The preparation for dry port-fires is salt-petre four, sulphur one, mealed powder two, and antimony one. These compositions are driven into small paper cases, to be used whenever necessary.

**PORT-aux-Prunes**, so called by the French, is a country on the coast of Africa, to the north of the island of Madagascar. It is a rich country, and fertile in rice and paltures; it is inhabited only by the Negroes, who are an industrious, good sort of people, but very superstitious. There are no towns, but several villages, and they have some customs which seem to incline to Judaism.

**PORT-Royal**, a sea-port town of America, in the island of Jamaica. It was once one of the finest sea-port towns in America, abounding in riches and trade; but

but in 1692 it was destroyed by an earthquake, in 1702 by fire, in 1722 by an inundation of the sea, and in 1744 it suffered greatly by a hurricane. It is now but a small place; and yet it consists of three handsome streets, with several cross lanes, and a fine church. Not many years ago there was a yard built here for the king's naval stores, and for workmen employed about men of war. It is built on a small neck of land which jets out several miles into the sea, and is guarded by a very strong fort, which has a line of near 100 pieces of cannon, and a garrison of soldiers. The harbour is one of the best in the world, and 1000 ships may ride therein, secure from every wind that can blow. It is six miles east of Spanish-town, and as much by water south-east of Kingston. W. Long. 77. o. N. Lat. 17. 30.

**PORT-ROYAL**, an island in North America, on the coast of South Carolina, which, with the neighbouring continent, forms one of the most commodious harbours in the British plantations. It is 15 miles in length; and the town on the north shore is called *Beaufort*. W. Long. 80. 10. N. Lat. 31. 45.

**PORT-ROYAL**, the name of two monasteries of Cistercian nuns in the diocese of Paris; the one near Chevreuse, at the distance of five leagues from Paris, called *Port-Royal of the Fields*; and the other in Paris, in the suburbs of St James.

The nuns of the former of these monasteries proving refractory, were dispersed; when many ecclesiastics, and others, who were of the same sentiments as these religious, retired to Port-Royal, took apartments there, and printed many books. Hence the name of *Port-Royalists* was given to all of their party, and their books were called *books of Port-Royal*: from hence we say the writers of Port-Royal, *Messieurs de Port-Royal*, and the translations and grammars of Port-Royal.

**PORTA**, or *Vena PORTA*, in anatomy, a large vein distributed through the liver in the manner of an artery. See ANATOMY, a<sup>o</sup> 357, d.

**PORTAL**, in architecture, a little gate where there are two gates of a different bigness; also a little square corner of a room cut off from the rest by the waincoat, and forming a short passage into the room. The same name is also sometimes given to a kind of arch of joiners work before a door.

**PORTATE**, or a *Cross PORTATE*, in heraldry, a cross which does not stand upright, as crosses generally do; but lies across the escutcheon in bend, as if it were carried on a man's shoulder.

**PORTER**, a kind of malt-liquor which differs from ale and pale beer in its being made with high dried malt. See ALE, BEER, and BREWING.

**PORT-GREVE**, or **PORTGRAVE**, was anciently the principal magistrat in ports and other maritime towns. The word is formed from the Saxon *port*, "a port or other town;" add *geref*, a "governor."—It is sometimes also written *port-reve*.

Camden observes, that the chief magistrate of London was anciently called *port-greve*: instead of whom, Richard I. ordained two *bailiffs*; and soon afterwards king John granted them a mayor for their yearly magistrat.

**PORTICO**, in architecture, a kind of gallery on the ground; or a piazza encompassed with arches supported by columns, where people walk under covert.

The roof is usually vaulted, sometimes flat. The ancients called it *lacunar*. Though the word *portico* be derived from *porta*, "gate, door;" yet it is applied to any disposition of columns which form a gallery, without any immediate relation to doors or gates. The most celebrated porticos of antiquity were, those of Solomon's temple, which formed the atrium or court, and encompassed the sanctuary: that of Athens, built for the people to divert themselves in, and wherein the philosophers held their disputes and conversations; which occasioned the disciples of *Zeno* to be called *stoics*, from the Greek *στω*, *porticus*: and that of Pompey at Rome, raised merely for magnificence, consisting of several rows of columns supporting a platform of vast extent; a draught whereof, Serlio gives us in his antique buildings. Among the modern porticos, the most celebrated is the piazza of St Peter of the Vatican.—That of Covent-Garden, London, the work of Inigo Jones, is also much admired.

**PORTICI**, a palace of the king of Naples, four miles from that capital. It has a charming situation, on the sea-side, near mount Vesuvius. It is enriched with a vast number of fine statues, and other remains of antiquity, taken out of the ruins of *Herculeanum*, which is not far from thence, and was swallowed up by an earthquake which attended an eruption of mount Vesuvius in the reign of the emperor Titus.

**PORTLAND**, a peninsula in Dorsetshire, of great strength both by nature and art, being surrounded with inaccessible rocks, except at the landing-place, where there is a strong castle, called *Portland castle*, built by king Henry VIII. There is but one church in the island; and that stands fo near the sea, that it is often in danger from it. But this peninsula is chiefly noted for the free stone which is got here, and greatly employed in London for building the finest structures, and particularly St Paul's church was built therewith. W. Long. 2. 35. N. Lat. 50. 30.

**PORTO-BELLO**, a town of North America, situated in N. Lat. 9° 34' 35", close to the sea, on the declivity of a mountain, which surrounds the whole harbour. This harbour is so large, deep, and safe, that Columbus, who first discovered it, gave it the name of *Porto-Bello*, or the "Fine Harbour," which is now commonly used to denote the town. The number of the houses is about 130; most of them of wood, large and spacious, forming one long street along the strand, with other smaller ones crossing it. The governor of the town is always a gentleman of the army, subordinate to the president of Panama; but having under him the commandants of the forts that defend the harbour. At the east end of the town, on the road to Panama, is a place called *Guinea*, where all the negroes of both sexes, whether slaves or free, have their habitations. This place is very much crowded when the galleons are here: most of the inhabitants of the town quitting their houses entirely, for the sake of letting them; while others content themselves with a small part, in order to make money of the rest. The Mulattoes, and other poor families also, remove either to *Guinea*, or to cottages already erected near it, or built on the occasion. Great numbers of artificers likewise, who flock to *Porto-Bello* from Panama to work at their respective callings during the fair, lodge in *Guinea* for cheapness. Towards the sea, in a large tract be-

Porto-Bello

tween the town and Gloria castle, barracks are erected, in most of which the ships crews keep stalls of sweetmeats, and other kinds of eatables, brought from Spain; but at the conclusion of the fair, when the ships put to sea, all these buildings are taken down, and the town returns to its former tranquillity and emptiness. In 1739, the harbour was defended by a castle and two forts; which were all demolished by admiral Vernon, who, with six ships only, made himself master of this port. The country about Porto-Bello is over-run with mountains and impenetrable forests, except a few valleys, in which are some scattered farms. Among the mountains that surround the harbour, one distinguished by the name of *Capiro* and by its superior loftiness, is a fort of barometer to the country, by foretelling every change of weather. Its top is always covered with clouds, of a density and darkness seldom seen in those of the atmosphere. When these clouds thicken, increase their blackness, and sink below their usual station, it is a sure sign of a tempest; while, on the other hand, their clearness and ascent as certainly indicate the approach of fair weather. These changes are very sudden and frequent here. The summit of the mountain is scarce ever clear from clouds; and when it happens, it is only, as it were, for an instant. Except in the time of the fair, all the inhabitants of Porto-Bello do not amount to 3000; half of whom are Indians, Mulattoes, or negroes; the Spaniards of any substance not choosing to reside in a place so extremely unhealthy, and fatal even to the lives of the natives. Ulloa tells us, that the cattle brought hither from Panama or Carthagena, lose their flesh so fast in the best pastures, as to become scarce eatable: he assures us also, that neither horses nor asses are bred here. The heat, indeed, is excessive; and the torrents of rain are so dreadful, sudden, and impetuous, that one not accustomed to them would imagine a second deluge was coming. These torrents are also accompanied with frightful tempests of thunder and lightning, the awfulness of the scene being heightened by the repercussions from the mountains, and the shrieks and howlings of multitudes of monkeys of all kinds which inhabit the surrounding woods.

Fresh water pours down in streams from the mountains, some running without the town, and others crossing it. These waters are very light and digestive; qualities, which in other countries would be very valuable, but are here pernicious, producing dysenteries, which the patient seldom survives. However, these rivulets, formed into reservoirs, serve the purposes of bathing, which is here found to be very conducive to health.

As the forests almost border on the houses of the streets, tygers often make incursions into the streets during the night, carrying off fowls, dogs, and other domestic animals, and sometimes even children have fallen a prey to them. Besides the snares usually laid for them, the negroes and mulattoes, who fell wood in the forests of the mountains, are very dextrous in encountering them; and some, for a slender reward, even seek them in their retreats.

The town of Porto-Bello, which is thinly inhabited by reason of its noxious air, the scarcity of provisions, and the barrenness of the soil, becomes, after the arrival of the galleons, one of the most populous towns in

the world. He who had seen it quite empty, and every place wearing a melancholy aspect, would be filled with astonishment, to see the bustling multitudes in the time of the fair, when every house is crowded, the squares and streets encumbered with bales of merchandize and chests of gold and silver, the harbour full of ships and vessels, some loaded with provisions from Carthagena, and others with the goods of Peru, as cocoa, Jesuits bark, Vicuna wool, and bezoar stones; and this town, at all other times detested for its deleterious qualities, becomes the staple of the riches of the Old and New World, and the scene of one of the most considerable branches of trade in the universe. Formerly the fair was limited to no particular time; but as a long stay in such a sickly place extremely affected the health of the traders, his Catholic majesty transmitted an order that the fair should not last above 40 days; and that, if in that time the merchants could not agree on their rates, those of Spain should be allowed to carry their goods up the country to Peru; and accordingly, the commodore of the galleons has orders to re-embark them, and return to Carthagena; but otherwise, by virtue of a compact between the merchants of both kingdoms, and ratified by the king, no Spanish trader is to send his goods, on his own account, beyond Porto-Bello. The English were formerly allowed to send a ship annually to this fair, which turned to great account; and, whilst the assiento contract subsisted, either with the English or the French, one of their principal factories was at Porto-Bello.

*Porto-Farralo*, a handsome town of Italy, in the isle of Elba, with a good citadel. It is very strong, and seated on a long, high, steep point of land, to the west of the bay of the same name, which has two forts. It belongs to the great duke of Tuscany, who always keeps a good garrison there. E. Long. 10. 37. N. Lat. 48. 55.

*Porto-Longone*, a small but very strong town of Italy, and in the isle of Elba, with a good harbour, and a fortress upon a rock almost inaccessible. The king of Naples has a right to put a garrison therein, though the place belongs to the prince of Piombino. It is seated on the east end of the island, eight miles south-west of Piombino. E. Long. 10. 40. N. Lat. 42. 45.

*Porto-Santo*, an island of the Atlantic Ocean, on the coast of Africa, and the least of those called the *Madeiras*. It is about 15 miles in circumference, and produces but little corn; however, there are oxen and wild hogs, and a vast number of rabbits. There are trees which produce the gum or resin called *dragon's blood*; and there is likewise a little honey and wax, which are extremely good. It has no harbour, but good mooring in the road. It belongs to the Portuguese, and is 300 miles west of the coast of Africa. W. Long. 15. 5. N. Lat. 32. 30.

*Porto-Seguro*, a government of South America, on the eastern coast of Brazil; bounded on the north by the government of Rio-dos-Hilios, on the east by the North Sea, on the south by the government of Spiritu-Santo, and on the west by the Tupicks. It is a very fertile country, and the capital town is of the same name. It is built on the top of a rock, at the mouth of a river, on the coast of the North Sea, and is inhabited by Portuguese. W. Long. 35. 50. S. Lat. 17. 0.

PORTRAIT, in painting, the representation of a person,

Porto-Bello

Portrait.

**Portsmouth** person, and especially of a face, done from the life. In this sense we use the term *portrait-painting*, in contradistinction to *history-painting*, where a resemblance of person is usually disregarded. Portraits, when as large as the life, are usually painted in oil-colours; sometimes they are painted in miniature with water-colours, crayons, pastels, &c. See PAINTING, n<sup>o</sup> 39.

**PORTSMOUTH**, a sea-port town in Hampshire, with one of the most secure and capacious harbours in England, being defended by a numerous artillery, both on the sea and land-side, and very good fortifications. A great part of the royal navy is built here; and here are some of the finest docks, yards, and magazines of naval stores, in Europe. It is seated in the isle of Portsey, being surrounded by the sea except on the north side, where there is a river which runs from one arm of it to the other. It is much resorted to on account of the royal navy, whose usual rendezvous is at Spit-head, which is at the east end of the isle of Wight, and opposite to Portsmouth. There is a draw-bridge over the river, and it has always a good garrison. It is governed by a mayor, 12 aldermen and burgesses, and sends two members to parliament. It has one church, and two chapels, one in the garrison, and one in the Common, for the use of the dock, and others, besides several meeting-houses of the dissenters. The houses of Portsmouth amount to about 2000, and the inhabitants to about 12,000. W. Long. 1. 6. N. Lat. 50. 48.

The town is supposed to receive its name from Port, a famous Saxon chieftain, who, A. D. 501, landed here with his two sons. It made a considerable figure in the time of the Saxons; and from the utility of its situation, was highly favoured by all our monarchs of the Norman line. It was incorporated, and became also a parliamentary borough. In the reign of Edward III. it was in a very flourishing state; but, A. D. 1338, in the very same reign, was burned by the French, when that monarch, which was afterwards ratified by king Richard II. forgave the inhabitants a debt, and remitted their fee-farm for 10 years; within which space they so recovered themselves, as to equip a squadron, which sailed into the mouth of the Sein, sunk two ships, and brought away a great booty. The singular excellence of its port, and the convenience of sitting out fleets from thence in the time of a French war, induced Edward IV. to think of fortifying it, as he actually, in some measure, did; which fortifications were farther carried on by Richard III. But king Henry VII. was the first who settled a garrison therein; which was increased, and the place made still stronger, in the reign of Henry VIII. who had a great dock there, wherein was built the Henry Grace de Dieu, which was the largest ship in the navy of his time. The same monarch, remarkably attentive to the security of all maritime places, built what is now called *South-Sea Castle*, for the protection of this. The improvements made here in the reign of queen Elizabeth, were much superior to all these. King Charles II. after his restoration, directed great alterations, established new docks and yards, raised several forts, and fortified them after the modern manner; which works were augmented under his brother's reign. Notwithstanding this, king William directed likewise fresh alterations and additions; and succeed-

ing princes, following his example, have, at a large expence, extended these fortifications, and taken in a vast deal of ground: so that it is at present, as the importance of the place deserves, the most regular fortress in Britain; and, as it cannot be effectually attacked by sea, may be justly esteemed impregnable.

**PORTUGAL**, the most westerly kingdom of Europe, bounded on the west and south by the Atlantic Ocean, and on the east and north by Spain; extending about 310 miles in length, and 150 in breadth.

By modern writers, we find this country constantly styled in Latin, *Lusitania*; and it is certain, that anciently a country of Spain went by that name; but it does not by any means appear that the country called by the ancients *Lusitania*, had the same boundaries with the modern kingdom of Portugal. Before Augustus Cæsar, *Lusitania* seems to have been bounded on the north by the ocean, and on the south by the river Tagus; by which means it comprehended all Galicia, and excluded two of the six provinces of Portugal. But in the more strict and restrained sense of the word, it was bounded on the north by the Durus, now the Douro, and on the south by the river Anas, now the Guadiana; in which sense it was not quite so long as modern Portugal, but considerably broader.

The commonly received opinion with regard to the etymology of the word *Portugal* is, that a great number of Gauls landed at Porto, or Oporto, whence it received the name of *Portus Gallorum*, or the *Port of the Gauls*; and in process of time that name gradually extended over the whole country, being softened, or rather shortened, into *Portugal*. But the time when this event happened, the reason why these Gauls came thither, and what became of them afterwards, are all particulars which lie buried in oblivion. It is alleged, however, that upon an eminence which overlooks the mouth of the river Douro, there stood an ancient town called *Cale*, strong and well peopled, but ill seated for trade; and this occasioned the construction of a lower town or hamlet, which was called *Portus Cale*, that is, *the haven of Cale*; and, in process of time, *Portucalia*. At length becoming so considerable as to merit an episcopal chair, these bishops subscribed themselves, as the records of ancient councils testify, *Portucalenses*, and the name of the city was transferred to the diocese. It is true, that these bishops afterwards changed their title, and subscribed themselves *Portuenses*, that is, *bishops of Porto*. But the facts just mentioned are actually recorded in authentic histories, and as the diocese of Portucalia contained in a great measure that little country in which the sovereignty originally began, the name extended itself, together with the acquisitions of the sovereigns, and has remained to the kingdom, tho' the diocese itself has changed its name, and possibly on that very account.

Portugal, though even yet but a small kingdom, was originally much smaller. The Spanish and Portuguese historians agree, that Don Alonso, king of Leon and Castile, and son to Don Ferdinand the Great, bestowed his daughter Donna Theresa in marriage upon an illustrious stranger, Don Henry, and gave him with her the frontier province which he had conquered from the Moors, small indeed in extent, but

but excellently situated, and so pleasant and fertile, that it has sometimes been stiled *Medalla Hispanica*, or the marrow of Spain. To this territory was added the title of *Count*; but authors are much divided about the time that this stranger came into Spain, and who he was. However, the authors of the Universal History make it pretty evident, that he was a grandson of Robert the first duke of Burgundy. The manner in which he obtained the principality abovementioned is related as follows.

The king, Don Alonso, apprehensive that his success in taking the city of Toledo would bring upon him the whole force of the Moors, sent to demand assistance from Philip I. of France, and the duke of Burgundy, whose daughter he had married. His request was granted by both princes; and a numerous body of troops was speedily collected for his service, at whose head went Raymond count of Burgundy, Henry younger brother of Hugh duke of Burgundy, Raymond count of Thoulouse, and many others. They arrived at the court of Don Alonso in the year 1087, where they were received and treated with all possible marks of esteem; and having in the course of two or three years given great proofs of their courage and conduct, the king resolved to bestow his only daughter named *Urraca*, then a mere child, being at most in her ninth year, upon Raymond count of Burgundy, and assigned them the province of Galicia for the support of their dignity. About four years after, Don Alonso being very desirous to express his gratitude to Henry of Burgundy, gave him in marriage a natural daughter of his, born while he remained in exile at Toledo, whose name was *Donna Therefa*; and upon this marriage, he gave up in full property the country which has been already mentioned.

The new sovereign, with his consort, fixed their residence in the town of Guimaraez, pleasantly situated on the banks of the river Ave. The remains of an ancient palace belonging to their successors are still to be seen; and on account of its having been anciently the capital, the king Don Denis granted the inhabitants an immunity from taxes, which they still enjoy.

The Portuguese, now finding themselves independent, immediately began, like other nations, to attempt the subjection of their neighbours. Henry is said to have performed great exploits against the Moors; but the accounts of them are so indistinct, that they cannot be taken notice of here. He died in 1112; and was succeeded by his son Don Alonso, then an infant in the third year of his age. In his minority, the kingdom was governed by his mother Donna Therefa, assisted by two able ministers. During the first nine years of their administration nothing remarkable happened; but after that period, some differences took place between the queen regent (for she had assumed the title of queen after her father's death, and Urraca queen of Castile.) Therefa insisted, that some part of Galicia belonged to her in virtue of her father's will; and therefore seized on Tuy an episcopal town, and a place of some consequence. Urraca, having assembled a numerous army, went in person into Galicia; upon which Therefa was obliged to abandon Tuy, and take shelter in one of her own fortresses. The consequences, in all probability, would have been

fatal to the new kingdom, had not the archbishop of Compostella, without whose assistance Urraca could do nothing, demanded leave to retire with his vassals. This offended the queen to such a degree, that she threw him into prison; which act of violence excited such a commotion among her own subjects, that the Portuguese were soon delivered from their apprehensions. Queen Therefa fell immediately after into a similar error, by throwing into prison the archbishop of Braga, who had not espoused her cause so warmly as she had expected. The bishop, however, was quickly delivered by a bull from the pope, who also threatened the kingdom with an interdict; and this was the first remarkable offence which Therefa gave her subjects.

Soon after this, queen Urraca died, and all differences were amicably settled at an interview between Therefa and Don Alonso Raymond, who succeeded to the kingdom of Castile. But, in 1126, the king of Castile being obliged to march with the whole strength of his dominions against his father-in-law the king of Navarre and Arragon, Therefa took the opportunity of again seizing upon Tuy; but the king soon returning with a superior army, she was again obliged to abandon her conquest. But the greatest misfortune which befel this princess, was a quarrel with her own son Don Alonso Enriquez. It does not appear indeed that Therefa had given him any just cause of offence; but it is certain that a civil war ensued, in which the queen's forces were totally defeated, and she herself made prisoner, in which situation she continued during the remainder of her life.

Enriquez having thus attained to the free and Don Alonso's full possession of his dominions, made several attempts upon some places in Galicia, but without success; for that he was at last constrained to make peace with Don Alonso king of Castile and Leon, who had assumed the title of *Emperor of the Spains*; the more especially as his dominions happened to be at that time invaded by the Moors. The number of infidels was so great, that the count of Portugal had little hopes of subduing them: but a plague breaking out in the Moorish army, they were obliged to retreat; after which he reduced several places belonging to that nation. But in the mean time the emperor Don Alonso, breaking into the Portuguese territories, destroyed every thing with fire and sword. The king of Portugal surpris'd and cut off a considerable part of his army; which, however, did not hinder the emperor from marching directly towards him. But, at the intercession of the pope's legate, all differences were accommodated, and a peace concluded; all places and prisoners taken on both sides being delivered up.

In the mean time, the progress of the Christian arms in Spain being reported to Abu-Ali Teseben the miramamoln or chief monarch of the Moors in Barbary, he directed Ismar, or Ishmael, his lieutenant in Spain, to assemble all the forces in the southern provinces, and drive the Christians beyond the Douro. Ishmael immediately began to prepare for putting these orders in execution; and having added a considerable body of troops brought from Barbary to those whom he had raised in Spain, the whole army was very numerous. He was met by Don Alonso of Portugal in the plains of Ourique on the banks of the river Tayo; and

Victory of Ourique.

Henry of Burgundy the first count of Portugal.

Differences with Castile.

Portugal.

Portugal. Ishmael took all possible means to prevent the Christians from passing that river, because his own cavalry, in which the strength of his army chiefly consisted, had thus more room to act. The Portuguese forces were very inconsiderable in number in comparison of the Moors; but Ishmael, being too confident of victory, divided his army into 12 bodies, and disposed them in such a manner as might best prevent the flight, not sustain the attack, of the Christians. The consequence was, that his army was overthrown with incredible slaughter, and a vast number of prisoners taken, among whom were 1000 Christians, of the sect styled *Mozarabians*, whom, at the request of Theotonus, prior of the Holy Cross, Don Alonso set at liberty with their wives and children, and procured them settlements in his own dominions.

8 Don Alonso assumes the title of king. After this signal victory, gained in the year 1139, Don Alonso was proclaimed king by his soldiers, and ever after retained that title, renouncing all kind of subjection to the crown of Spain. Being very desirous, however, of bringing down the power of the emperor, he entered into a league with Raymond count of Barcelona and regent of the kingdom of Arragon, against that prince. In consequence of this treaty, he entered Galicia with a considerable force on one side, while Don Raymond did the same on the other. Neither of these enterprises, however, succeeded. The Portuguese monarch met with a severe check in his expedition into Galicia, where he received a dangerous wound, and had some of the nobility who attended him taken prisoners. At the same time he received intelligence that the Moors had invaded his dominions, so that he was obliged to retire; which, however, was not done in time sufficient to prevent the strong fortresses of Leyria from falling into their hands. This fortress they demolished, and put all the garrison to the sword; but the king caused it to be rebuilt stronger than before, and put a more numerous garrison into it; however, he undertook nothing farther this campaign. The war continued with various success till the year 1145, when the king projected an enterprise against Santarem, a strong city about 12 miles from Lisbon. In this he luckily succeeded; and by that means gained a considerable track of country, and a strong barrier to his dominions.

9 Reduces Lisbon and twelve other cities. After this success Don Alonso caused himself with much ceremony to be chosen and crowned king of Portugal before an assembly of the states, where he also solemnly renounced all dependence on the crown of Spain, declaring, that if any of his successors should condescend to pay tribute or to do homage to that crown, he was unworthy of enjoying the kingdom of Portugal. The next year the king undertook the recovery of Lisbon out of the hands of the Moors; and concerning this expedition there are such numbers of fables, that it is almost impossible to come at the truth. What can be gathered from these accounts is, that he undertook the siege with a small army, and was able to make but little progress in it, partly from the strength of the place, and partly from the numerous garrison by which it was defended. At length, fortunately for Don Alonso, a fleet of adventurers, French, English, Germans, and Flemings, that were going to the Holy Land, anchored at the mouth of the river Tagus, whose assistance he demanded, as not altogether fo-

reign to their design of making war on the infidels. His request was readily granted; and, with their assistance, Lisbon was speedily reduced; which conquest so much raised the reputation of this monarch, and brought such numbers to recruit his army, that before the end of the year 1147 he had reduced 12 other considerable cities.

For many years after this, Don Alonso was successful in all his undertakings. He settled the internal government of his kingdom, procured a bull from pope Alexander III. confirming his regal dignity, undertook many successful expeditions against the Moors, and became master of four of the six provinces which compose the present kingdom of Portugal. In all his undertakings, he was assisted by the counsels of his queen Matilda, who was a woman of great capacity, and sufficient for the government of the kingdom in her husband's absence. By her he had a numerous offspring, particularly three daughters; the eldest of whom, Donna Mafalda, or Mathilda, was married to the king of Arragon; the second, Urraca, to Don Ferdinand king of Leon; and the third, Theresa, to Philip earl of Flanders. In 1166, however, the king thought proper, from what provocation we know not, to invade the dominions of his son-in-law Don Ferdinand; and possessed himself of Limmia and Turon, two cities of Galicia, in which he put strong garrisons. The next year, elated with his success, he marched with a numerous army towards Badajos, which he invested; on the news of which, Don Ferdinand, who had assembled a large army at Ciudad Rodrigo, marched to its relief. Yet before he could come within sight of it, it had surrendered to the king of Portugal: upon which Don Ferdinand came to a resolution of besieging his antagonist in his newly conquered city; which Don Alonso perceiving, endeavoured to draw out his forces into the field. Though he was at that time upwards of 70 years of age, he was himself on horseback, and pushing forwards at the head of his horse to get out at the gate, he struck his leg against one of the bolts with such violence that the bone was shattered to pieces. This accident occasioned such confusion, that the Portuguese troops were easily beaten, and Don Alonso was taken prisoner. He was exceedingly mortified by this disgrace, especially as he had no great reason to expect very kind treatment from his son-in-law. However, the king of Leon behaved towards him with the greatest respect and affection. He desired him to lay aside all thoughts of business, and attend to his cure; but finding him restless and impatient, he assured him that he expected nothing more than to have things put into the same condition as before the war, and that they might live in peace and friendship for the future: to which the king of Portugal most readily assented; but returned to his dominions before his cure was perfected, which was the cause of his being lame all the rest of his life. However, this did not abate his military ardour; for, notwithstanding this inconvenience, his courage transported him into the field wherever he was called by the interest of his subjects. Towards the end of his reign, an opportunity seemed to present itself of obtaining once for all an entire release from the disagreeable pretensions of the king of Leon, who, it seems, had insisted on the king of Portugal's doing homage for his king-

Portugal.

Portugal.

dom. The opportunity which now presented itself was a quarrel between the king of Leon and his nephew Don Alonso king of Castile. The latter asked assistance from the king of Portugal, which was readily granted. But Don Ferdinand, having received intelligence that the infant Don Sancho (the king's eldest son) was advancing towards Ciudad Rodrigo, assembled his troops on that frontier with such diligence, that he was enabled to attack him unexpectedly, and entirely defeated him. Understanding, however, that Don Sancho was recruiting his forces with great diligence, he let him know that they might be much better employed against the infidels, who remained careles and unprepared, expecting the issue of the war. Don Sancho made a proper use of this advice; and, after making some motions to amuse the enemy, made a sudden irruption into Andalusia, penetrating as far as Triana, one of the suburbs of Seville. The Moors assembled their forces in order to attack him on his retreat; but Don Sancho having first fatigued them by the celerity of his march, at length chose a strong camp, and, having given his troops time to repose, drew them out and offered the enemy battle. The Moors accepted the challenge, but were entirely defeated; and Don Sancho returned into Portugal with spoils to an immense value. For some years after, the war was continued without any remarkable event; but, in 1184, Joseph king of Morocco, having already transported multitudes of men from Barbary, at length followed in person with a prodigious army, and carried all before him as far as the Tajo. He appeared before the city of Santaren; but having wearied and reduced his army by unsuccessful assaults on that place, he was attacked by the Portuguese forces assisted by Ferdinand of Leon, entirely defeated, and himself killed. By this victory, the Portuguese were left at liberty to improve the interior part of their country, and fortify their frontiers; and during this interval, the king died in the 76th year of his age, in the year 1185.

73  
Don Sancho's success against the Moors.

13  
His wife administration over the king.

Don Alonso was succeeded by his son Don Sancho I. Of this prince it is remarkable, that, before he ascended the throne, he was of a restless and warlike disposition; but no sooner did he come to the possession of the kingdom, than he became a lover of peace, and began with great assiduity to repair the cities that had suffered most by the war, and to re-people the country around them. By his steady attention to this, he in a very short time quite altered the appearance of his territories, and procured to himself the glorious title of *The restorer of cities, and father of his country*. In the year 1189, a fleet composed for the most part of English vessels, but having on board a great number of adventurers of other nations, bound to the Holy Land, entered the river of Lisbon. They were very kindly received, and supplied with all kinds of refreshments by Don Sancho, who took this opportunity of soliciting them to assist him in a design he had formed of attacking the city of Silves in Algarve, to which they readily yielded. Having joined a squadron of his own galleys, and marched a body of troops by land, the place was reduced, and the English, according to agreement, rewarded with the plunder. But, in a short time, the Moors from Africa having again invaded Portugal, the town was se-

veral times taken and retaken, till at last, Don Sancho, being sensible of the difficulties that would attend the keeping of it, caused it to be demolished. His last enterprize was the reduction of Elvas; soon after which he died with the reputation of the best administrator that ever sat on the throne of Portugal. With the character of being rather liberal than avaritious, he had amassed a treasure of more than 700,000 crowns in ready money, besides 1400 merks of silver, and 100 of gold plate, which he disposed of some time before his death. He was interred by his own command with much less pomp than his father, in the cathedral of Coimbra; and when his body was taken up 400 years after by order of the king Don Emanuel that it might be laid in a new tomb, it was found uncorrupted.

Portugal.

The history of Portugal affords scarce any event of importance till the year 1289; when, in the reign of Don Denis, a difference commenced with Castile, which subsisted for a long time. Frequent reconciliation took place; but these were either of very short duration, or never sincere. At length, in the reign of John I. Don Juan of Castile, who had also pretensions to the crown of Portugal, invaded that kingdom at the head of the whole force of his dominions, and with the flower of the Castilian nobility entered the province of Alentejo. According to the Portuguese historians, he besieged the city of Elvas without effect; which disappointment enraged him to such a degree, that he determined next year to invade Portugal a second time, and ruin all the country before him. Accordingly, having collected an army of 30,000 men, he invaded Portugal, took and ruined several places, while king John lay inactive, with a small army, waiting for some English succours, which he expected. At last he ventured an engagement with the forces which he had; and, notwithstanding the great superiority of the enemy, obtained a complete victory; after which he made an irruption into Castile, and had the good fortune to gain another battle, which fixed him firmly on the throne of Portugal. The Castilians were obliged to consent to a truce of three years, which was soon after improved into a lasting peace.

14  
Difference with Castile.

15  
The Castilians entirely defeated.

In 1214, king John undertook an expedition against the Moors in Barbary, where he commanded in person; but before he set out, his queen (Philippa the daughter of John duke of Lancaster) died of grief at the thoughts of his absence. The expedition, however, proved successful, and the city of Ceuta was taken from the Moors almost at the first assault; but scarce had the king left that country, when the princes of Barbary formed a league for the recovery of it; and though they were defeated by the young princes of Portugal, whom John again sent into Barbary, yet the trouble of keeping it was so great, that some of the king's council were of opinion that the town should be demolished. But John, having considered the arguments on both sides, determined to keep the city; and therefore enlarged and strengthened the fortifications, augmenting his forces there to 6000 foot and 2500 horse, which he hoped would be sufficient for keeping off the attacks of the Moors.

16  
The city of Ceuta taken from the Moors.

King John died in 1278, and was succeeded by his eldest son Edward. He undertook an expedition against Tangier in Barbary; but the event proved very unfor-

unfor-

Portugal. unfortunate; the Portuguese being so shut up by the Moors, that they were obliged to offer Ceuta back again, in order to obtain leave to return to Portugal. The king's son, Don Ferdinand, was left as a hostage for the delivery of Ceuta; but was, with the utmost cruelty and injustice, left in the hands of the infidels, by the king and council of Portugal, who constantly refused to deliver up the place. Many preparations indeed were made for recovering the prince by force; but before any thing could be accomplished the king died in 1430, which put an end to all these designs.

17 Passage to the East Indies discovered.  
The war with Barbary continued at intervals, but with little success on the part of the Portuguese; and till the year 1497, there is no event of any consequence recorded in the history of Portugal. This year was remarkable for the discovery of the passage to the East Indies by the Cape of Good Hope. The enterprising spirit of the Portuguese had prompted them to undertake voyages along the coast of Africa for a considerable time before; but none of the voyagers had the good fortune to double the Cape of Good Hope, before Vasco de Gama, in the year abovementioned. He performed his voyage in two years, but with a great loss of men; for out of 148 persons whom he took out with him, only 55 returned. The king received him with all possible testimonies of respect and kindness; created him count of Vidigueira; and not only declared him admiral of the Indies, but made that office hereditary in his family. This discovery tended greatly to enrich the kingdom; but at the same time it proved detrimental, by inducing the most bold and enterprising adventurers to leave their country for the Indies, whence very few of them returned. The introduction of foreign luxuries also proved detrimental by corrupting the manners of the people, and producing an effeminacy unknown before. The settlements on the western coasts of Africa, of which there were now a great number, contributed also to produce the same effect. However, the king had the honour of beginning a correspondence with the emperor of Abyssinia, and of gaining some advantages over the Moors in Barbary: but neither of these turned out to be of any service to the kingdom; for jealousy, envy, rapine, and every kind of vice, had diffused itself thro' the whole nation, inasmuch that the Portuguese could neither be unanimous among themselves, nor behave with propriety to any other nation.

18 Proves detrimental to the kingdom.  
In September 1522, king Emanuel died of an epidemical fever, and was succeeded by his son John III. The most remarkable transaction of this prince's reign was the introduction of the inquisition into his dominions. This happened in the year 1525, or, as some say, in 1535. A famine happening to cease in a short time after it was introduced, the priests persuaded the ignorant multitude that it was a blessing from heaven on account of the erecting such an holy tribunal. However, it was not long before the bulk of the nation perceived what kind of a blessing the inquisition was: but their discernment came too late; for by that time the inquisitors had acquired such power, that it became equally dangerous and ineffectual to attempt disclosing any of their mysteries.

19 Inquisition introduced into Portugal.  
In the mean time the Mohammedans, provoked at the continual depredations and arbitrary behaviour of

the Portuguese in the East Indies, resolved to drive them all out at once. This scheme had been propoed by Camphon sultan of the Mamalukes in Egypt, but his affairs not allowing him to put it in execution, Solyman II. emperor of the Turks resolved to take up the quarrel against the Portuguese; and accordingly sent orders to the bashaw of Egypt to employ his whole strength against the Christians in the East Indies. The bashaw, on obedience to these orders, failed out from the Red Sea with a greater naval force than ever the Mohammedans had employed before; having 4000 Janissaries, and 16,000 other land troops on board. Yet, by the courage and conduct of the Portuguese officers and soldiers, all this mighty armament was defeated, and their East India possessions saved from the danger which threatened them. In Africa likewise the king of Fez was baffled before the town of Safi, and fresh quarrels breaking out among the princes gave great relief to the Christians, who had long been obliged to carry on a defensive war, and had more than once been on the very brink of ruin. For a long time indeed their safety had been derived only from the quarrels of the Moors among themselves; for such was the envy and jealousy which reigned among the Portuguese, that they could never unite heartily in opposing the common enemy, and therefore had their enemies united against them, they must certainly have been cut off. But whenever the christis quarrelled with each other, one party was sure to have recourse to the Portuguese; who, by sending them a small supply, secured quiet to themselves, and had the pleasure of seeing their enemies destroy one another. Yet in the end even this had bad consequences; for, on one hand, it kept up a martial spirit among the Moors, and on the other it made them acquainted with the Portuguese discipline; so that after every short interval of repose they not only found them as such enemies as before, but much more formidable than ever. The consequence of all was, that king John began to apprehend that the conquest of Barbary was impossible, and therefore began to limit his desires to the keeping of those few fortresses which he had already; which, though a necessary and prudent measure, displeas'd the generality of his subjects.

King John exerted himself much in the settlement of Brazil in South America, which he brought into a very good state, caused several strong towns to be erected there, and took all possible methods to encourage the conversion of the natives to Christianity. He also made many regulations for the welfare and happiness of his subjects. The disputes of the nobility about precedence were frequently attended with very disagreeable consequences, which made the king resolve once for all to settle them by established rules, and the rules established by him on this occasion have subsisted ever since, and in a great measure prevent these altercations. He had other great designs in his mind, particularly with regard to the reformation, which he had pushed very far with respect to religious persons of both sexes; but, on a close examination of his affairs, he found his subjects in general to have been so much injured by his leaving their concerns to the inspection of his council, that he was thrown by the grief of it into a kind of apoplexy, from which he

21 Bad state of affairs in Barbary.

Portugal.

never recovered. His death happened in June 1557; and he was succeeded by his son Don Sebastian III. an infant of three years of age.

After the death of King John, the administration remained in the hands of the queen, grandmother to Sebastian, who behaved with great prudence and circumspection. The Moors, however, supposing that under a minority they might be able to dispossess the Christians of such places as they held in Barbary, laid close siege to Masagan. But the queen-regent sent such speedy succours, and promised such rewards to those who distinguished themselves, that the Moors, though they brought 80,000 men into the field, were obliged to abandon the enterprise. This was at first magnified as a high instance of the queen's capacity and wisdom; but in a short time the natural aversion which the Portuguese had to the government of women, together with the prejudice they had against her country, as being a Castilian, appeared so plainly, and gave her so much uneasiness, that of her own accord she resigned her authority into the hands of cardinal Don Henry the king's brother. By him Don Alexius de Meneses was appointed the king's governor, and Gonfales de Gomera with two other priests his preceptors. By means of those instructors the king's education was totally marred. His governor assiduously inculcated upon him that the chief virtue of a king was courage; that danger was never to be avoided, but always surmounted, let the occasion be what it would. His other tutors, instead of instructing him in the true religion, only inspired him with an abhorrence of professed infidels: the consequence of all which was, that he became rash, inconsiderate, and obstinate; all which qualities conspired to draw upon him the catastrophe which ruined both him and the kingdom.

After the king was grown up to man's estate, his desire was to distinguish himself against the infidels. He himself chose an expedition to the East Indies; but the prime minister Alcegoa, who did not choose to attend his monarch to such a distance, substituted Africa in its stead. This expedition the king entered into in the most inconsiderate and absurd manner. He first sent over Don Antonio prior of Crato, with some hundreds of soldiers; carried his principal courtes over with him from a hunting match, and without equipages; he then sent for the duke of Aveyro, with such troops as he could collect on the short warning he had got; and when all these were assembled, the king spent his time in hunting, and slight excursions against the enemy, without doing any thing of consequence, except exposing his person upon all occasions. At length he returned to Portugal in such tempestuous weather, that his subjects had given him up for lost; when they were agreeably surpris'd by his unexpected arrival in the river of Lisbon, which they celebrated with the greatest rejoicings.

The little success which attended the king in this expedition served only to inflame him more with desire for another; so that from the time he returned, he seemed to think on nothing else. He was highly delighted also with an accident which at this time furnished him with a pretence for war, though that he stood in no great need. Muley Hamet, king of Fez and Morocco, had been dispossessed of his domi-

nions by his uncle Muley Moloch. At the beginning of this war Don Sebastian had offered him his troops in Africa, which offer was rejected with contempt; but now being a fugitive, and having in vain applied for assistance to Philip of Spain, Muley Hamet applied to the king of Portugal; and, that he might the more easily succeed, caused the fortresses of Arzila, which his father had recovered, to be restored to the Portuguese. The king was in a rapture at this event, and fancied that his glory would exceed that of all his predecessors. He was advised against this expedition, however, by all his friends. King Philip of Spain having done every thing to dissuade him from it in a personal conference, sent Francisco Aldana, an old and experienced officer, to Morocco; and at his return ordered him to attend Don Sebastian, in order to give him an account of the state of affairs in that country. This he performed with the greatest fidelity, but without any effect. The queen dowager and cardinal united in their endeavours to divert him from this unfortunate enterprise; but he treated them both with so little respect, that his grandmother broke her heart, and the cardinal, to shew his distaste to the measure, retired to Evora without coming either to court or council; which example was followed by many of the nobles. Many of these, however, sent very free remonstrances to the king on the impropriety of his conduct; and king Philip sent to him the duke de Medina Celi, once more to lay before him the reasons why he thought his scheme impracticable, and to put him in mind that he had no hand in pushing him upon his destruction, or of concealing from him the dangers into which he seemed determined to plunge himself and his subjects. Lastly, he received a letter on the subject from Muley Moloch himself, wherein that prince explained to him his own right to the crown of Fez, and shewed that he had only dispossessed a tyrant and a murderer, who had therefore no right to his friendship or assistance. He next assured him that he had no reason to fear either the power or neighbourhood of the Portuguese; as a proof of which, and as a mark of his esteem, he was content to make him a present of ten miles of arable ground round each of the fortresses he possessed in Africa, and which indeed were no more than four, viz. Tangier, Ceuta, Masagan, and Arzila. At the same time he addressed himself to king Philip of Spain, with whom he was on good terms, desiring him to interpose with his nephew Sebastian, that things might be yet adjusted without the effusion of human blood. But the king of Portugal was deaf to all salutary advice; and therefore paid no regard to this letter, nor to the remonstrances of his uncle. On the 24th of June 1577, therefore, he set sail from the bar of Lisbon with a fleet of 50 ships and five galleys, twelve pieces of cannon, and transports and tenders, making up near 1000 sail. His troops consisted of 9000 Portuguese foot; 3000 Germans; 700 Italians commanded by Sir Thomas Stukeley, an English exile, but remarkably brave; 2000 Castilians and 300 volunteers, commanded by Don Christopher de Tuvara master of the horse, a man of courage, but without either conduct or experience. He touched first at Lagos bay in the kingdom of Algarve, where he remained for four days: thence he proceeded to Cadiz; where he was magnificently

Portugal. feasted for a week by the duke de Medina Sidonia, who took the opportunity once more, by order of Philip, of dissuading him from proceeding further in person. But this exhortation proved as fruitless as the rest; and the king having failed with a strong detachment for Tangier, ordered Don Diego de Souza, his commander in chief, to follow with the remaining part of the army.

The troops landed on the coast of Africa without any bad accident, and joined at Arzila. Here the king was met by the cheriff Muley Hamet, on whose account he had undertaken the war, who delivered him his son Muley, a boy of 12 years of age, as a hostage, and brought a reinforcement of 300 Moors. The boy was sent to Masagan under a strong guard; but the father remained in the Portuguese camp. Here it was resolved in a council of war to reduce the town of Larache, but it was disputed whether the troops should proceed thither by land or sea. Don Sebastian, who espoused the former opinion, finding himself opposed by Muley Hamet, gave him such a rude answer, that he left his presence in discontent; after which the king's opinion prevailed, and the army began its march on the 29th of July. As they proceeded, the king received a letter from the duke of Alba, requesting him to attempt nothing beyond the taking of the town of Larache. Along with this letter was sent an helmet which had been worn by Charles V.

26 On the other hand Muley Moloch, having intelligence of this formidable invasion, took the field, tho' at that time so ill of a fever that he could not sit on horseback, with 40,000 foot and 60,000 horse. He conducted every thing, notwithstanding his distressed situation, with the greatest prudence. Finding some reason to suspect that part of his army were desirous of going over to his rival, he proclaimed that such as inclined to join their old master were at liberty to do it. This at once put a stop to the defection, and only a very few made use of the liberty which was granted them. Standing in doubt likewise of the fidelity of a body of 3000 horse, he sent them to reconnoitre the enemy, by which act of confidence he secured them. Still, however, he feared that his officers might be corrupted by the Portuguese gold; for which reason he changed the disposition of his army entirely, so that none of his officers commanded the corps to which they had been accustomed; and therefore, having new men to deal with, had none whom they could trust.

Having taken these precautions, he advanced against the Portuguese army with such celerity, that he came in sight of them on the 3d of August. On this Don Sebastian called a council of war; in which many who out of complaisance had given their opinions for this march, were now for returning. They were separated from the enemy by a river, and the Moors were masters of the ford, so that it was impossible to force them immediately in their posts; neither was it practicable for them to wait for a more favourable opportunity, because they had no provisions. The foreign officers, on the contrary, were of opinion that fighting was now become necessary, and a retreat dangerous. This, however, was violently opposed by the cheriff, who saw plainly that they ran a great risk of being defeated and of losing all, while at the same time they were not

Portugal. certain of gaining any thing of consequence though they should be victorious: whereas, if they drew down towards the sea, they might entrench themselves till they were relieved by their fleet; during which interval if Muley Moloch should die, he looked upon it as certain that a great part of the army would desert to him, which would render him master not only of the kingdom, but of the fate of the Christians also. When he found that the king was bent on fighting, he only requested that the engagement might be delayed till 4 o'clock in the afternoon, that, in case of a defeat, they might have some chance of escaping; but even in this he could not prevail; for the king having disposed of every thing for a battle the next day, was impatient to begin the onset as soon as it was light.

In the mean time Muley Moloch was so sensible of the advantages of his situation, that he was inclined to take the whole Portuguese army prisoners; but finding his disease increase, so that he had no hopes of recovery, he came to a resolution to fight, that his antagonist might not avail himself of his death. The disposition of the Christian army was very regular and correct, through the care of some old officers in Don Sebastian's service: the infantry were disposed in three lines; the battalion of volunteers made the vanguard; the Germans commanded by colonel Amberg, and the Italians by Sir Thomas Stukeley, were on the right; the Castilian battalions on the left; the Portuguese in the centre and rear; the cavalry, consisting of about 1500 men, partly on the right under the command of the duke d'Avogro, to whom the cheriff joined himself with his horse: on the left was the royal standard, with the rest of the cavalry, under the command of the duke of Barcelos eldest son to the duke of Braganza, Don Antonio prior of Crato, and several other persons of great rank. The king took post at first with the volunteers. Muley Moloch disposed all his troops in three lines: the first consisted of the Andalusian Moors, commanded by three officers who had distinguished themselves in the wars of Granada; the second of renegades; and the third of the natives of Africa. They moved in a half moon, with 10,000 horse on each wing, and the rest in the rear, with orders to extend themselves in such a manner as to encompass the Christian army. Muley Moloch, though extremely weak, was taken out of his litter, and set on horseback, that he might see how his commands had been obeyed; and being perfectly satisfied with the situation of his troops, he directed the signal of battle to be given. The Christians advanced with the greatest resolution; broke the first line of the Moorish infantry, and disordered the second. On this Muley Moloch drew his sword, and would have advanced to encourage his troops, but that his guards prevented him; on which his emotion of mind was so great, that he fell from his horse. One of his guards caught him in his arms, and conveyed him to his litter; where he immediately expired, having only time to lay his finger on his lips by way of enjoining them to conceal his death. But by this time the Moorish cavalry had wheeled quite round, and attacked the Christian army in the rear: upon which the cavalry in the left wing made such a vigorous effort that they broke the Portuguese on the right; and at this time the cheriff, in passing a rivulet

Portugal. rivulet was drowned. In this emergency, the Germans, Italians, and Castilians, did wonders; but the Portuguese, according to their own historians, behaved indifferently. Attacked on all sides, however, they were unable to resist; and the whole army, except about 50 men, were killed or taken prisoners. The fate of the king is variously related. According to some, he had two horses killed under him, and then mounted a third. His bravest officers were killed in his defence; after which the Moors surrounding him, seized his person, stripped him of his sword and arms, and secured him. They immediately began to quarrel about whole prisoner he was; upon which one of the generals rode in among them, crying, "What, you dogs, when God has given you so glorious a victory, would you cut one another's throats about a prisoner?" at the same discharging a blow at Sebastian, he brought him to the ground, when the rest of the Moors soon dispatched him. Others affirm, that one Lewis de Brito meeting the king with his standard wrapped round him, Sebastian cried out, "Hold it fast, let us die upon it!" upon which charging the Moors, he was seized, rescued by Brito, who was himself taken with the standard, and carried to Fez. He affirmed, that after he was taken, he saw the king at a distance, and unpurged. Don Lewis de Lima met him afterwards making towards the river, and this is the last account we have of his being seen alive.

Muley Hamet, the brother of Muley Moloch, was proclaimed king by the Moors immediately after the battle. Next day, having ordered all the prisoners to be brought before him, the new sovereign gave orders to search for the body of Don Sebastian. The king's valet-de-chambre brought back a body, which he said was that of his master, but so disfigured with wounds, that it could not well be known; so that notwithstanding the most diligent search, this monarch's death could never be properly authenticated. This body, however, was preserved by Muley Hamet, who delivered it up as the body of Don Sebastian, to king Philip of Spain. By him it was sent to Ceuta, from whence it was transported to Portugal, and buried among his ancestors in the monastery at Belem, with all possible solemnity.

By this terrible disaster, the kingdom of Portugal, from being the most eminent, sunk at once into the lowest rank of the European states. All the young nobility were cut off, or carried into slavery: the kingdom was exhausted of men, money, and reputation; so that Don Henry, who assumed the government after the death of his brother Don Sebastian, found himself in a very disagreeable situation. The transactions of his reign were quite trifling and unimportant; but after his death a great revolution took place. The crown of Portugal was claimed by three different competitors; viz. the prince of Parma, the dukes of Braganza, and king Philip of Spain. Whatever might have been the merits of their respective claims, the power of Philip quickly decided the contest in his favour. He found his schemes facilitated by the treachery of the regents, who took the most scandalous methods of putting the kingdom into his hands. Under pretence of inspecting the magazines, they took out some of the powder, and mixed the rest with

Portugal. sand: they appointed an agent to go to France for succours, from whence they knew that they could not arrive in time; they dissolved the states as soon as they discovered that they were bent on maintaining the freedom of the nation; and, under a show of confidence, sent off to distant places such of the nobility as they suspected.

King Philip, finding every thing in his favour, commanded the duke of Alva to invade Portugal, at the head of 20,000 men. The people, perceiving that they were betrayed, exclaimed against the governors, and placed on the throne Don Antonio prior of Crato. But his forces being inexperienced, and he himself behaving in a very improper manner, he was quickly defeated by the duke of Alva, and forced to fly out of the kingdom, which he effected with great difficulty. On his flight the whole kingdom submitted; together with the garrisons in Barbary, the settlements on the western coast of Africa, of Brazil, and in the East Indies. All the Madeiras, however, except the isle of St Michael, held out for Don Antonio until they were reduced, and the French navy, who came to their assistance, entirely defeated and destroyed.

Philip made his entry into Lisbon as soon as the kingdom was totally reduced, and endeavoured to conciliate the affections of the people by confirming the terms which he had before offered to the states. These terms were, that he would take a solemn oath to maintain the privileges and liberties of the people: that the states should be assembled within the realm, and nothing proposed in any other states that related to Portugal: that the viceroy or chief governor should be a native, unless the king should give that charge to one of the royal family: that the household should be kept on the same footing: that the post of first president, and of all offices, civil, military, and judicial, should be filled with Portuguese; all dignities in the church, and in the orders of knighthood confined to the same; the commerce of Ethiopia, Africa, and the Indies, reserved also to them, and to be carried on only by their merchants and vessels: that he would remit all imposts on ecclesiastical revenues: that he would make no grant of any city, town, or jurisdiction royal, to any but Portuguese: that estates resulting from forfeitures should not be united to the domain, but go to the relations of the last possessor, or be given to other Portuguese for recompense of services: that when the king came to Portugal, where he should reside as much as possible, he should not take the houses of private persons for his officers lodging, but keep to the custom of Portugal: that wherever his majesty resided, he should have an ecclesiastic, a treasurer, a chancellor, two masters of requests, with under officers, all of them Portuguese, who should dispatch every thing relating to the kingdom: that Portugal should ever continue a distinct kingdom, and its revenue be consumed within itself: that all matters of justice should be decided within the realm: that the Portuguese should be admitted to charges in the households of the king and queen of Spain: that all duties on the frontiers should be taken away: and lastly, that Philip should give 300,000 ducats to redeem prisoners, repair cities, and relieve the miseries which the plague and other calamities had brought upon the people.

Portugal.

Portugal.

people. All these conditions, formerly offered and rejected by the Portuguese, the king now confirmed: but whereas the duke of Olfuna, by way of security for these conditions, had promised them a law, that if the king did not adhere to them, the states should be freed from their obedience, and might defend their right by the sword, without incurring the reproach of perjury, or the guilt of treason; this he absolutely refused to ratify.

All these concessions, however, did not answer the purpose; nay, though Philip was to the last degree lavish of honours and employments, the Portuguese were still dissatisfied. This had also an effect which was not foreseen: it weakened the power, and absorbed the revenues, of the crown; and, by putting it out of the power of any of his successors to be liberal in the same proportion, it raised only a short-lived gratitude in a few, and left a number of malcontents, to which time was continually adding.

Thus Philip, with all his policy, and endeavours to please, found his new subjects still more and more disgusted with his government, especially when they found their king treating with the utmost severity all those who had supported Don Antonio. The exiled prince, however, still styled himself *king of Portugal*. At first he retired to France, and there demanded succours for the recovery of his dominions. Here he found so much countenance, that with a fleet of near 60 sail, and a good body of troops on board, he made an attempt upon the Terceiras, where his fleet was beat by the Spaniards; and a great number of prisoners being taken, all the officers and gentlemen were beheaded, and a great number of meaner people hanged. Don Antonio, notwithstanding, kept possession of some places, coined money, and did many other acts of regal power; but was at length constrained to retire, and it was with some difficulty that he did this, and returned into France. He passed from thence into England, where he was well received; and many fitted out privateers to cruise against the Spaniards under his commission. But after king Philip had ruined the naval power of Portugal as well as Spain, by equipping the armada, Queen Elizabeth made no difficulty of owning and assisting Don Antonio, and even of sending Sir John Norris and Sir Francis Drake with a strong fleet and a great army to restore him. Upon this occasion Don Antonio sent his son Don Christopher a hostage to Muley Hamet king of Fez and Morocco, who was to lend him 200,000 ducats. But king Philip prevented this by surrendering Arzila: and this disappointment, the unreasonable enterprise upon Corunna, and the disputes that arose between Norris and Drake, rendered that expedition abortive; so that, except carrying the plague into England, it was attended with no consequences worthy of notice. He remained some time after in England; but finding himself little regarded, he withdrew once more into France, where he fell into great poverty and distress; and at length dying in the 64th year of his age, his body was buried in the church of the nuns of Ave Maria, with an inscription on his tomb, in which he is styled *king*. He left several children behind him, who, on account of his being a knight of Malta, and having made a vow of virginity at his entrance into the order, were looked upon as illegitimate. He pre-

served, even to the day of his death, a great interest in Portugal; and had drawn from thence, in the course of his life, immense sums of money; which had been squandered in many fruitless negotiations, and attempts to disturb the possessions of king Philip in almost all parts of his dominions, and particularly in the Indies, where the Portuguese were rather more averse to the Castilian yoke, or at least testified their aversion more openly, than in Europe.

But Don Antonio was not the only pretender to the crown of Portugal: for the people, partly thro' the love of their prince, and partly from their hatred to the Castilians, were continually feeding themselves with the hopes that Don Sebastian would appear and deliver them; and in this respect such a spirit of credulity reigned, that it was said proverbially, they would have taken a negro for Don Sebastian. This humour put the son of a tyler at Alcobaza, who had led a profligate life, and at length turned hermit, to give himself out for that prince; and having with him two companions, one of them styled himself *Don Christopher de Tavora*, and the other the *bishop of Guarda*, they began to collect money, and were in a fair way of creating much disturbance, if the cardinal arch-duke had not caused him to be apprehended; and after leading him ignominiously through the streets of Lisbon, he who took the name of *Sebastian* was sent to the galleys for life, and the pretended bishop was hanged. Not long after, Gonfalo Alvarez, the son of a mason, gave himself out for the same king, and having promised marriage to the daughter of Pedro Alonso, a rich yeoman, whom he created earl of Torres Novas, he assembled a body of about 800 men, and some blood was spilt before he was apprehended: at length, being clearly proved to be an impostor, himself and his intended father-in-law were publicly hanged and quartered at Lisbon; which, instead of extinguishing this humour, farther increased it.

There was, however, a person who appeared, about 20 years after the fatal defeat of Sebastian, at Venice, who created much more trouble. He assumed the name of *Don Sebastian*, and gave a very distinct account of the manner in which he had passed his time from that defeat. He affirmed, that he had preserved his life and liberty by hiding himself amongst the slain: that, after wandering in disguise for some time in Africa, he returned with two of his friends into the kingdom of Algarve: that he gave notice of this to the king Don Henry: that finding his life sought, and being unwilling to disturb the peace of the kingdom, he returned again among the Moors, and passed freely from one place to another in Barbary, in the habit of a penitent: that after this he became a hermit in Sicily; but at length resolved to go to Rome, and discover himself to the pope. On the road he was robbed by his domestics, and came almost naked to Venice, where he was known, and acknowledged by some Portuguese. Complaint being made to the senate, he was obliged to retire to Padua. But the governor of that city ordering him also to depart, he, not knowing what to do, returned again to Venice; where, at the request of the Spanish ambassador, who charged him not only with being an impostor, but also with many black and atrocious crimes, he was seized, and thrown into prison. He underwent 28 examinations before a committee of noble

Portugal. and impartial persons; in which he not only acquitted himself clearly of all the crimes that had been laid to his charge, but entered also into so minute a detail of the transactions that had passed between himself and the republic, that the commissioners were perfectly astonished, and shewed no disposition to declare him an impostor; moved more especially by the firmness of his behaviour, his singular modesty, the sobriety of his life, his exemplary piety, and his admirable patience under his afflictions. The noise of this was diffused throughout Europe, and the enemies of Spain endeavoured every where to give it credit.

The state, however, refused to discuss the great point, whether he was or was not an impostor, unless they were requested to do by some prince or state in alliance with them. Upon this the prince of Orange sent Don Christopher, the son of the late Don Antonio, to make that demand; and at his request an examination was made with great solemnity: but no decision followed; only the senate set him at liberty, and ordered him to depart their dominions in three days. He went therefore, by the advice of his friends, to Padua, but in the disguise of a monk, and from thence to Florence; where he was arrested by the command of the grand duke, who delivered him to the viceroy of Naples. The count de Lemos, then in possession of that dignity, died soon after, before whom he was first brought; this man asserted, he must know him to be Don Sebastian, since he had been twice sent to him from the king of Spain. He remained prisoner several years in the castle del Ovo, where he endured incredible hardships. At length he was brought out, led with infamy thro' the streets of the city, and declared to be an impostor, who assumed the name of *Sebastian*: at which words, when proclaimed before him, he said gravely, *And so I am*. In the same proclamation it was affirmed, that he was in truth a Calabrian; which as soon as he heard, he said, *It is false*. He was next shipped on board a galley as a slave; then carried to St Lucar, where he was some time confined; from thence he was transferred to a castle in the heart of Castile, and never heard of more. Some persons were executed at Lisbon for their endeavours to raise an insurrection on his behalf: but it was thought strange policy, or rather a strange want of policy, in the Spaniards, to make this affair so public without proofs; and the attempt to silence this objection, by affirming him to be a magician, was justly looked upon as ridiculous.

34  
Bad consequences of the Spanish administration.

The administration of affairs in Portugal, during the reign of Philip, was certainly detrimental to the nation; and yet it does not appear that this flowed so much from any ill intention in that monarch, as from errors in judgment. His prodigious preparations for the invasion of England impoverished all his European dominions; but it absolutely exhausted Portugal. The pretensions of Don Antonio, and the hopes of despoiling their Indian fleets, exposed the Portuguese to the resentment of the English; from which the king having granted away all his domains, wanted power to defend them. Their clamours were not at all the less loud for their being in some measure without cause. The king, to pacify them, borrowed money from the nobility upon the customs, which were the only sure remedy he had still left; and this was attended with fatal consequences. The branches, thus mortgaged, be-

came, and continue to this hour, fixed and hereditary; so that the merchant was oppressed, and the king received nothing. This expedient failing, a tax of three per cent. was imposed, in the nature of ship-money, for the defence of the coasts and the commerce, which for some years was properly applied; but then made a part of the ordinary revenue, and went into the king's exchequer without account. This made way for diverting other appropriated branches; as for instance, that for the repair of fortifications, the money being strictly levied, and the works suffered to decay and tumble down; and for the maintenance of the conquests in Africa, by which the garrisons mouldered away, and the places were lost. Upon the whole, in the space of 18 years, the nation was visibly impoverished: and yet the government of Philip was incomparably better than that of his successors; so that his death was justly regretted; and the Portuguese were taught by experience to confess, that of bad masters he was the best.

His son Philip, the second of Portugal and the third of Spain, sat 20 years upon the throne before he made a visit to Portugal, where the people put themselves to a most enormous expence to receive him; for which they received little more than the compliment, that, before his entry into Lisbon, he knew not how great a king he was. He held an assembly of the states, in which his son was sworn successor. Having done all that he wanted for himself, he acquired a false idea of the riches of the nation from an immoderate and foolish display of them during his short stay at Lisbon; and having shown himself little, and done less, he returned into Spain; where he acted the part of a good king upon his death-bed, in deploring bitterly that he never thought of acting it before. The reign of Philip III. and IV. was a series of worse measures, and worse fortune: all his dominions suffered greatly; Portugal most of all. The loss of Ormus in the East, of Brazil in the West Indies, together with the shipwreck of a fleet sent to escort that from Goa, brought the nation incredibly low, and encouraged the conde duke to hope they might be entirely crushed. These are the heads only of the transactions for 40 years: to enter in any degree into the particulars, is, in other words, to point out the breaches made by the Spanish ministers on the conditions granted by king Philip; which, with respect to them, was the original contract, and unalterable constitution of Portugal while subject to the monarchs of Castile; and which, notwithstanding, they so often and so flagrantly violated, that one would have imagined they had studied to provoke the wrath of heaven, and insult the patience of men, instead of availing themselves, as they might have done, of the riches, power, and martial spirit of the Portuguese people.

25  
Great losses in Asia and America.

It was the very basis and foundation of their privileges, that the kingdom should remain separate and independent, and consequently that Lisbon should continue as much its capital as ever, the several supreme councils and courts residing; so that the natives of this realm might not be obliged to travel in search of justice. So little, or at least so short a time was this observed, that neither promotion nor justice was to be obtained without journeys, and Madrid was not more the capital of Castile than of Portugal. The general assembly of estates was to be held frequently, and they were held thrice in the space of 60 years; and of these

36  
The Portuguese oppressed by the Spaniards.

Portugal. twice within the first three. The king was to reside in this realm, as often and as long as possible; in compliance with which, Philip I. was there but once, Philip II. but four months, and Philip III. was never there at all. The household establishment was suppressed through all their reigns. The viceroys was to be a native of Portugal, or a prince or princefs of the blood; yet when any of the royal family bore the title, the power was in reality in the hands of a Spaniard. Thus, when the princefs of Mantua was vice-queen, the marquis de la Puebla was to assist in council, and in all dispatches; and she was to do nothing without his advice. The council of Portugal, which was to be composed entirely of natives, was filled with Castilians, as the garrisons also were, though the contrary had been promised. The presidents of provinces, or corregidores, were to be natives; but by keeping those offices in his own hands, the king eluded this article. No city, town, or district, were to be given but to Portuguese; yet the duke of Lerma had Beja, Serpa, and other parts of the demefnes of the crown, which were formerly appenages of the princes of the blood. None but natives were capable of offices of justice, in the revenue, in the fleet, or of any post civil or military; yet these were given promiscuously to foreigners, or sold to the highest bidder; not excepting the governments of castles, cities, and provinces. The natives were so far from having an equal chance in such cases, that no posts in the presidials were ever given to them, and scarce any in garrisons; and whenever it happened, in the case of a person of extraordinary merit, whose pretensions could not be rejected, he was either removed, or not allowed to exercise his charge; as fell out to the marquis of Marialva and others. The forms of proceeding, the jurisdiction, the ministers, the secretaries, were all changed, in the council of Portugal; being reduced from five to three, then two, and at last to a single person.

By reason of these and many other grievances too tedious to be mentioned here, the detestation of the Spanish government became universal; and in 1640 a revolution took place, in which John duke of Braganza was declared king, by the title of John IV. This revolution, as being determined by the almost unanimous voice of the nation, was attended with very little effusion of blood; neither were all the efforts of the king of Spain able to regain his authority. Several attempts indeed were made for this purpose. The first battle was fought in the year 1644, between a Portuguese army of 6000 foot and 1100 horse, and a Spanish army of nearly the same number. The latter were entirely defeated; which contributed greatly to establish the affairs of Portugal on a firm basis. The king carried on a defensive war during the remainder of his life; but after his death, which happened in 1655, the war was renewed with great vigour. The marquis of Marialva gained another battle at Elvas; and in 1665 the fortune of the war was finally decided in favour of the Portuguese by the victory of Montefclaros, which entirely broke the power of the Spaniards, and since that time they have never been able to undertake any thing of moment against Portugal. But though the Portuguese had recovered their liberty, they have entirely lost their consequence in the political scale of Europe; and had not Britain, for

commercial reasons, constantly kept their powerful neighbours in awe, it is more than probably that the country would long since have again become a province of Spain; of which the last invasion of Portugal by the Spaniards affords a convincing proof. See BRITAIN, n<sup>o</sup> 449.

The air of Portugal, in the southern provinces, would be excessive hot, if it were not refreshed by the breezes; but in the northern, it is much cooler, and the weather more subject to rains. The spring is extremely delightful here; and the air, in general, more temperate than in Spain. Lisbon has been much reformed to of late by valetudinarians, and consumptive persons, from Great Britain, on account of its air. The soil is very fruitful in wine, oil, lemons, oranges, pomegranates, figs, raisins, almonds, chestnuts, and other fine fruits; but there is a want of corn, owing, it is said, in a great measure to the neglect of agriculture. There is plenty of excellent honey here; and also of sea and river-fish, and sea-salt. The horses in Portugal are brisk lively animals, as they are in Spain, but of a slight make: but mules being surer-footed, are more used for carriage and draught. By reason of the scarcity of pasture, there are not many herds of cattle or flocks of sheep; and what they have are small and lean, though the flesh is tolerably good: their best meat is said to be that of hogs and kids. The country in many parts is mountainous: but the mountains contain all kinds of ores; particularly of silver, copper, tin and iron, with a variety of gems, beautifully variegated marble, mill-stones, and many curious fossils. Not far from Lisbon is a mine of salt-petre; but none of the metal mines are here worked, the inhabitants being supplied with metals of all kinds from their foreign settlements. The principal rivers are the Minho, in Latin *Minius*; the Limia, anciently the famed Lethe; the Cavado; the Douro; the Guadiana, anciently Anas; and the Tajo, or Tagus, which is the largest river in the kingdom, carrying some gold in its sands, and falling into the sea a little below Lisbon. There are several mineral springs in the kingdom, both hot and cold, which are much frequented.

The only religion tolerated in Portugal is that of the church of Rome; yet there are many concealed Jews, and those too even among the nobility, bishops, prebends, monks, and nuns, and the very inquisitors themselves. If a Jew pretends to be a Christian and a Roman catholic, while he is really a Jew, by going to mass, confession, &c. or if after being converted, or pretending to be converted and pardoned, he relapses in Judaism and is discovered, the inquisition lays hold of him. In the first case, if they renounce Judaism, they are only condemned to some corporal punishment or public shame, and then ordered to be instructed in the Christian religion. In the second, they are condemned to the flames without mercy. Besides Jews and heretics, who broach or maintain any doctrines contrary to the religion of the country, the inquisition punishes all sodomites, pretenders to sorcery and the black art, apostates, blasphemers, perjured persons, impostors, and hypocrites. The burning of those condemned by the inquisition, is called an *auto da fe*, or "act of faith." There are several tribunals of the inquisition, one of which is at Goa in the East Indies; but there are none in Brasil. The number of convents

37  
A revolution in favour of the Duke of Braganza.

39  
Religion.

Portugal. in Portugal is said to be 900. The order of Jesuits hath been suppressed in this country, as they have been in others. Here is a patriarch, several archbishops and bishops: the patriarch is always a cardinal, and of the royal family. The archbishops rank with marquises, and the bishops with counts. The Portuguese have archbishops and bishops in the other quarters of the world, as well as in Europe. The fums raised by the popes here, by virtue of their prerogatives, are thought to exceed the revenues of the crown, and the nuncios never fail of acquiring vast fortunes in a short time. Though there are two universities and several academies, yet while the papal power, and that of the ecclesiastics, continues at such a height, true learning is like to make but a small progress. The language of the Portuguese does not differ much from that of Spain: Latin is the ground-work of both; but the former is more remote from it, and harsher to the ear, than the latter. The Portuguese tongue is spoken on all the coasts of Africa and Asia as far as China, but mixed with the languages of the several nations in those distant regions.

40 Manufactures. With regard to manufactures, there are very few in Portugal, and those chiefly coarse silks, woollen cloths, and some linen; but their foreign trade is very considerable, especially with England, which takes a great deal of their wine, salt, foreign commodities, and fruits, in return for its woollen manufactures, with which the Portuguese furnish their colonies and subjects in Asia, Africa, and America. Their plantations in Brazil are very valuable, yielding gold, diamonds, indigo, copper, tobacco, sugar, ginger, cotton, hides, gums, drugs, dying woods, &c. From their plantations in Africa, they bring gold and ivory, and slaves to cultivate their sugar and tobacco plantations in Brazil. They have still several settlements in the East Indies, but far less considerable than formerly. The Azores or Western Isles, Madeira and the Cape de Verde islands also belong to them; but a great part of the riches and merchandize brought from these distant countries becomes the property of foreigners, for the goods they furnish the Portuguese with to carry thither. The king's fifth of the gold brought from Brazil amounts commonly to about 300,000. Sterling; so that the whole annual produce of gold in Brazil may be estimated at near 2,000,000 Sterling. Lisbon is the greatest port in Europe next to London and Amsterdam.

41 Constitution and government. As to the constitution of Portugal, it is an absolute hereditary monarchy. Both here and in Spain, there were anciently cortes, states, or parliaments; but they have long since entirely lost their share in the legislature. For the administration of the civil government, there is a council of state, and several secretaries; for military affairs, a council of war; for the finances, a treasury-court; and, for the distribution of justice, several high tribunals, with others subordinate to them, in the several districts into which the kingdom is divided. The cities have their particular magistracy. The proceedings of the courts are regulated by the Roman law, the royal edicts, the canon law, and the pope's mandates. Like the Spaniards, they transact most of their business in the mornings and evenings, and sleep at noon. The nobility are very numerous, and many of them are descended from natural sons of

Portugal. the royal family. They are divided into high and low. The high consuls of the dukes, marquises, counts, viscounts, and barons, who are also grantees, but of different classes, being suffered to be covered in the king's presence, and having the title of *doms*, with a pension from the royal treasury, to enable them the better to support their dignity: the king styles them *illustrissimus* in his letters, and treats them as princes. A duke's sons are also grantees and his daughters rank as marchionesses. The inferior nobility or gentry are termed *Hidalgos*, i. e. gentlemen: they cannot assume the title of *dom*, without the king's licence.

42 Revenues of the king. The revenues of the crown, since the discovery of the Brazil mines are very considerable; but the real amount can only be guessed at. Some have said that it amounts, clear of all salaries and pensions, to upwards of 3,000,000 Sterling: others make it a great deal less. Thus much is certain, that the customs and other taxes run excessively high. Besides the royal demesnes, the hereditary estates of the house of Braganza, the monopoly of Brazil snuff, the coinage, the money arising from the sale of indulgences granted by the pope, the fifth of the gold brought from Brazil, the farm of the Brazil diamonds, the masterships of the orders of knighthood, and other sources, yield very large sums. The forces, notwithstanding, of this nation, both by sea and land, are very inconsiderable; their land-forces being the worst militia in Europe, and their navy of little importance. They would be an easy conquest to the Spaniards if they were not under the protection of Britain.

43 Orders of knighthood. There are several orders of knighthood here, viz. the order of Christ, the badge of which is a red cross within a white one, and the number of the commanderies 454. 2. The order of St James, the badge of which is a red sword in the shape of a cross. A great number of towns and commanderies belong to this order. 3. The order of Aviz, whose badge is a green cross in form of a lily, and the number of its commanderies 49. Though these three orders are religious, yet the knights are at liberty to marry. 4. The order of St John, which has also several commanderies.

44 King's titles. The king's titles are, *King of Portugal and the Algarves, on this side and the other side the sea of Africa; Lord of Guinea, and of the navigation, conquests, and commerce, in Ethiopia, Arabia, Persia, India, &c.* The king's eldest son is styled *Prince of Brazil*. In the year 1749, pope Benedict XIV. dignified the king with the title of *His most faithful majesty*.

45 Character of the people. The Portuguese are represented as inferior to the Spaniards both in person and genius; as extremely haughty, treacherous, and crafty in their dealings; much given to avarice and usury; and vindictive, malicious, and cruel. The meaner sort are said to be extremely addicted to thieving; notwithstanding, it must be owned, that they have shown themselves on many occasions a brave and warlike people. They are justly famed for their skill in navigation; and for the many discoveries they have made, both in the East and West Indies. The women here, and in other countries of the same degree of heat, are not so prolific as in the colder climates; but they are said to be very beautiful whilst young, though their complexion

Portugallia is somewhat upon the olive. Their eyes are very black and sparkling, and retain their brilliancy after all their other charms are gone. It is the fashion here, at present, as in most other countries, for the ladies to spoil and disfigure their skins and complexions with paints and washes: but, though lively and witty, they are said to have a nice sense of female honour. Both men and women make great use of spectacles; often not so much to aid their sight, as to denote their wisdom and gravity. Their dress, like that of the Spaniards, never used to vary till of late, especially among the men; but of late years, both men and women have given much into the French modes. The women, when they go abroad on foot, are wont to use long veils, which cover their heads, but leave their faces bare.

PORTUGALLICA TERRA, earth of Portugal; the name of a fine alstringent bole, dug in great plenty in the northern part of Portugal.

PORTULACA, PURSLANE; a genus of the monogynia order, belonging to the dodecandria class of plants. There are several species, but the two following are the most remarkable. 1. The oleracea, annual or common culinary purslane, rises with herbaceous, low, succulent, branchy stalks, six or eight inches high, garnished with wedge-shaped, thick, succulent-leaves, and small close-setting flowers. There are two varieties; one with deep green leaves, the other with yellow leaves; both of which rise from the same seed. 2. The anacampseros, perennial or shrubby cape purslane, rises with a shrubby branchy stalk, about six inches high, with oval, gibbous, succulent leaves, and the stalks terminated by small clusters of red flowers. Both these plants are of a succulent nature: the first is an herbaceous annual, for culinary uses; and the second a shrubby perennial, raised by the curious for variety. They are both exotics of a tender quality, of the temperature of green-house or stove-plants. The common culinary purslane is raised annually from seed for summer use, and is an excellent ingredient in summer salads, but improper for winter on account of its cold moist nature. The plant being tender, must be raised either on a hot-bed, or in a warm border; in which last it will not succeed before April or May. The shrubby sort must be kept in the hot-house, in pots of a dry soil.

POSE, in heraldry, denotes a lion, horse, or other beast, standing still, with all his four feet on the ground.

POSITIVE, a term of relation, opposed to negative. It is also used in opposition to relative or arbitrary: thus we say, Beauty is no positive thing, but depends on the different tastes of people.

Positive Degree, in grammar, is the adjective in its simple signification, without any comparison.

Positive Electricity. In the Franklinian system all bodies supposed to contain more than their natural quantity of electric matter, are said to be positively electrified; and those from whom some part of their electricity is supposed to be taken away, are said to be electrified negatively. These two electricities being first produced, one from glass, the other from amber or rosin, the former was called vitreous, the latter resinous electricity.

POSSE COMITATUS, in law, signifies the power of the county, or the aid and assistance of all the

knights, gentlemen, yeomen, labourers, servants, apprentices, &c. and all others within the county that are above the age of 15, except women, ecclesiastical persons, and such as are decrepit and infirm.

This posse comitatus is to be raised where a riot is committed, a possession kept upon a forcible entry, or any force of rescue used contrary to the king's writ, or in opposition to the execution of justice; and it is the duty of all sheriffs to assist justices of the peace in the suppression of riots, &c. and to raise the posse comitatus, or to charge any number of men for that purpose.

POSSESSION, in law, is either actual, where a person actually enters into lands or tenements descended or conveyed to him; or where lands are descended to a person, and he has not yet entered into them. A long possession is much favoured by the law, as an argument of right, even tho' no deed can be shown, and it is more regarded than an ancient deed without possession.

If he that is out of possession of land brings an action, he must prove an undeniable title to it; and when a person would recover any thing of another, it is not sufficient to destroy the title of the person in possession, without he can prove that his own right is better than his.

In order to make possession lawful upon an entry, the former possessor and his servants are to be removed from off the premises entered on: but a person by lease and release, is in possession without making any entry upon the lands.

POSSESSION, in Scots law. See LAW, Part III, N° clxii. II, &c.

DEMONIACAL POSSESSION. See DEMON, DEMONIACS, and DEMONIACAL, in the APPENDIX.

POSSESSIVE, in grammar, a term applied to pronouns, which denote the enjoyment or possession of any thing either in particular, or in common: as *meus*, "mine;" and *tuus*, "thine."

POSSESSORY ACTION, in Scots law. See LAW, N° clxxxiii. 18.

POSSIBILITY, in law, is defined to be any thing that is altogether uncertain, or what may or may not be.

POSSIBILITY, also denotes a non-repugnance to existing, in any thing that does not any way exist.

POSSIBLE, is sometimes opposed to real existence, and is understood of a thing, which, though it actually does not exist, yet may exist; as a new star.

POSSIDONIA, (anc. geog.) See POSTUM.

POST, a courier or letter-carrier; or one who frequently changes horses, posted or placed on the road, for quicker dispatch.

We find mention made of post-horses in the Theodosian Code, *De cursu publico*; but these were very different from the present establishment, and were only public horses first appointed by Trajan, till whose time the messengers seized any horses that came in their way.

Lewis Hornigk has an express treatise on posts, whereof he makes four kinds: viz. on horseback, in chariots, in boats, and on foot; which last kind is in use in Italy, Turkey, and Peru.

Herodotus ascribes the first origin of posts to Cyrus, or

Portugallia

Post.

**Post.** Xerxes; but the posts instituted by those princes were no more than couriers.

In effect, posts on the present footing are but a modern invention; though some go back as high as Charlemagne.—It is certain it was the policy, or rather the diffidence, of Louis XI. of France that they owed their rise to; that unceasingly prince first settling them by an ordinance of the 19th of June 1464, to be the sooner, and the more surely, advertised of what passed in his own kingdom, and in the neighbouring states. From France, the institution propagated itself, by degrees, through the several other parts of Europe. In Germany, Hornigk observes, posts were first settled by the count de Taxis at his own expence; in acknowledgment whereof, the emperor Matthias, in 1716, gave him, in fief, the charge of post-master under him and his successors.

The duty for the carriage of letters by post in Britain, forms a branch of the REVENUE.

This useful invention owes its first legislative establishment in England to the parliament 1643. It is true, there existed post-masters in much earlier times; but their business was confined to the furnishing of post-horses to persons who were desirous to travel expeditiously, and to the dispatching of extraordinary packets upon special occasions. King James I. originally erected a post-office under the controul of one Matthew de Quester or de l'Equeter for the conveyance of letters to and from foreign parts; which office was afterwards claimed by lord Stanhope, but was confirmed and continued to William Frizell and Thomas Witherings by king Charles I. A. D. 1632, for the better accommodation of the English merchants. In 1635, the same prince erected a letter-office for England and Scotland, under the direction of the same Thomas Witherings, and settled certain rates of postage. But this extended only to a few of the principal roads, the times of carriage were uncertain, and the post-masters on each road were required to furnish him with horses at the rate of 2½ d. a mile. Witherings was superfed, for abuses in the execution of both his offices, in 1640; and they were sequestrated into the hands of Philip Burlamachy, to be exercised under the care and oversight of the king's principal secretary of state. On the breaking out of the civil war, great confusions and interruptions were necessarily occasioned in the conduct of the letter-office. And, about that time, the outline of the present more extended and regular plan seems to have been conceived by Mr Edmund Prideaux, who was appointed attorney-general to the commonwealth after the murder of king Charles. He was chairman of a committee in 1642, for considering what should be set upon inland letters; and afterwards appointed post-master by an ordinance of both the houses, in the execution of which office he first established a weekly conveyance of letters into all parts of the nation; thereby saving to the public the charge of maintaining postmasters, to the amount of 7000 l. per annum. And, his own emoluments being probably very considerable, the common council of London endeavoured to erect another post-office in opposition to his; till checked by a resolution of the commons, declaring, that the office of post-master is, and ought to be, in the sole power and disposal of the

parliament. This office was afterwards farmed by one Manley in 1654. But, in 1657, a regular post-office was erected by the authority of the protector and his parliament, upon nearly the same model as has been ever since adopted, with the same rates of postage as were continued till the reign of queen Anne. After the restoration, a similar office, with some improvements, was established by statute 12 Car. II. c. 35. but the rates of letters were altered, and some farther regulations added, by the statutes 9 Ann. c. 10. 6 Geo. I. c. 21. 26 Geo. II. c. 12. 5 Geo. III. c. 25. & 7 Geo. III. c. 50. and penalties were enacted, in order to confine the carriage of letters to the public office only, except in some few cases: a provision, which is absolutely necessary; for nothing but an exclusive right can support an office of this sort: many rival independent offices would only serve to ruin one another.

Post, in war, any fort of ground, fortified or not, where a body of men can be in a condition of resisting the enemy.

**Advanced Post**, a spot of ground, seized by a party to secure their front and the posts behind them.

**Post of Honour**. The advanced guard is a post of honour: the right of the two lines is the post of honour, and is always given to the eldest regiment: the left is the next post, and is given to the next eldest, and so on. The centre of the lines is the post the least honourable, and is given to the youngest regiments. A centinel placed before the colours, and at the door of the commanding officer, is a post of honour.

**Penny-Post**, a post established for the benefit of London and the adjacent parts; by which any letter or parcel not exceeding 16 ounces weight, is speedily conveyed to and from all parts within ten miles of London.

**POSTDIAM**. See **POTSDAM**.

**POSTERIOR**, a term of relation, implying something behind, or that comes after another. In which sense it is used in opposition to *prior* and *anterior*.

The back and hips are the posterior parts of man. Aristotle has given prior and posterior analytics. A date is posterior to another, when it is later or fresher.

**POSTERN**, in fortification, a small gate, usually made in the angle of the flank of a bastion, or in that of the curtain, or near the orillon, descending into the ditch; whereby the garrison can march in and out, unperceived by the enemy, either to relieve the works, or to make private sallies, &c.

The word is also used in the general for any private or back-door.

**POSTHUMOUS**, a child born after the death of his father, or taken out of the body of a dead mother: from whence it is frequently applied to the works of an author not published till after his decease.

**POSTIL**, a name anciently given to a note in the margin of the bible, and afterwards to one in any other book posterior to the text.

**POSTING**, among merchants, the putting an account forward from one book to another, particularly from the journal or waste-book to the ledger. See **BOOK-KEEPING**.

**POSTLIMINIUM**, among the Romans, the return

Post  
Postlimi-  
nium.

Postponing turn of one who had gone to sojourn elsewhere, or had been banished, or taken by an enemy to his own country or state.

**POSTPONING**, putting any thing after or behind another with regard to time.

**POSTSCRIPT**, an article added to a letter or memoir, containing something learnt or recollected after the piece was written.

**POSTULATE**, in mathematics, &c. is described to be such an easy and self-evident supposition, as needs no explication or illustration to render it intelligible; as that a right line may be drawn from one point to another.

**POSTURE**, in painting and sculpture, the situation of a figure with regard to the eye, and of the several principal members thereof with regard to one another, whereby its action is expressed. A considerable part of the art of a painter, consists in adjusting the postures; in giving the most agreeable ones to his figures, in accommodating them to the characters of the respective figures and the part each has in the action, and in conducting and in pursuing them throughout.

Postures are either natural or artificial.

*Natural* postures are such as nature seems to have had a view to in the mechanism of the body, or rather such as the ordinary actions and occasions of life lead us to exhibit while young, and while the joints, muscles, ligaments, &c. are flexible.

*Artificial* postures, are those which some extraordinary views, or studies, occasion us to learn; as those of dancing, fencing, &c. Such also are those of our balance and posture-matters.

A painter would be strangely puzzled with the figure of Clark (a late famous posture-master in London) in a history-piece. This man, we are told in the Phil. Trans. had such an absolute command of his muscles, &c. that he could disjoin almost his whole body; so that he imposed on the great surgeon Mullens, who looked upon him as in such a miserable condition, he would not undertake his care. Though a well-made man, he would appear with all the deformities imaginable; hunch-backed, pot-bellied, sharp-breasted, &c. He disjoined his arms, shoulders, legs, and thighs; and rendered himself such an object of pity, that he has frequently extorted money, in quality of a cripple, from the same company in which he had the minute before been in quality of a comrade. He would make his hips stand a considerable way out from his loins, and so high as to invade the place of his back. Yet his face was the most changeable part about him, and showed more postures than all the rest. Of himself he could exhibit all the uncouth odd faces of a Quaker's meeting.

**POT-ASH**, the lixivious ashes of certain vegetables, used in making of glass, soap, &c. See **GLASS**, **SOAP**, &c.

The method of making pot-ash is directed by Dr Shaw, as follows. Burn a quantity of billet-wood to grey ashes; and taking several pounds of these ashes, boil them in water, so as to make a very strong lixivium, or ley. Let this ley be strained through a coarse linen cloth, to keep out any black parts of the half-burnt wood that might happen to remain in the ashes; then evaporate this strained ley in an iron-pan

over a quick fire almost to drincks: then taking out the matter remaining at the bottom, and putting it into an iron-crucible, set it in a strong fire till the matter is melted, and then immediately pour it out upon an iron-plate, where it soon cools, and appears in the form of a solid lump of pot-ash. Much after this manner is pot-ash made in the large way of business, for the service of the soap-boiler, glass-maker, fuller, &c. but according to the difference of the wood, or combustible matter employed, with the manner of turning it, and conducting the process, different kinds of pot-ash are prepared. There are certain saline-plants that yield this pot-ash to great advantage, as particularly the plant kali; there are others that afford it in less plenty, and of an inferior quality, as bean-stalks, &c. but in general, all vegetable subjects afford it of one kind or other, and may most of them be made to yield it tolerably perfect after the manner of the process already laid down, even the loppings, roots, and refuse parts of ordinary trees, vine clippings, &c. The fixed salts of all vegetables excepting the kali, and marie plants, when reduced to absolute purity, or entirely separated from the other principles, appear to be one and the same thing: when it should seem, says Dr Shaw, that by a suitable management, good saleable pot-ash might be made in all places where vegetable matters abound. For if by examining Russia pot-ash, for example, we find that its superior excellence depends upon its being clear of earth, or upon its containing a large proportion of oil, or fixed salt, these advantages may, by properly regulating the operation, be given to English pot-ashes, so as perhaps to render the latter as good as the former: but where the pot-ash of any remarkable saline vegetable is to be imitated, that of the kali, for example, the doctor recommends a prudent sprinkling of the subject with salt, or sea-water, in the burning; and by these ways, properly diversified, any principle that is naturally wanting, might be artificially introduced so as to perfect the art of pot-ash.

In the 70th volume of the Philosophical Transactions we have an account of a method of procuring this salt from the putrid water which runs from dung-hills. The process is very simple, consisting only in simple evaporation of the fluid, and calcining the impure salt till most of the foulness is burnt out. From 24 wine pipes full of this muck-water were obtained 9 Cwt. 1 q. 12 lb. of saleable pot-ash, valued at 42 s. per Cwt; the expence of manufacturing them being only valued at 4l. 9 s.

The pot-ash thus made is of a greyish white appearance; deliquesces a little in moist air; but if kept in a dry room, near the fire, acquires a powdery surface. It is hard and of a spongy texture when broken, with many small crystals in its substance. The colour of its internal parts is dusky and variegated. To the taste it is acrid, saline, and sulphureous. It emits no smell of volatile alkali, either in a solid form, dissolved, or when added to lime-water; neither does it communicate the sapphire colour to a solution of blue vitriol. Silver is quickly tinged black by it; a proof that it contains much phlogiston. Ten grains of this pot-ash required 11 drops of the weak spirit of vitriol to separate it. The like quantity of salt of tartar required 24 drops: a strong effervescence occurred in both

*Pot-ash.* mixtures; and a sulphureous vapour exhaled from the former. A tea spoonful of the syrup of violets diluted with an ounce of water, was changed into a bright green colour by five grains of the salt of tartar; but ten grains of this pot-ash were necessary to produce the same hue in a similar mixture. Half an ounce of the salt dissolved entirely in half a pint of hot-water; but when the liquor was cold, a large purple sediment subsided to the bottom; and it was found that this sediment amounted to about two-thirds of the whole quantity of ashes used.

These are the two processes most essentially different from one another which have appeared concerning the manufacture of this useful salt. Some indeed have attempted to compose it on the supposition that alkali consisted of an earth combined in a peculiar manner with a certain acid. But the little success of all these attempts show that they have been built on a false principle. The only method of producing alkaline salts originally is from the ashes of vegetables; and the vegetable substances which yield the largest quantity of them are tartar, and marine plants. From the former the purest and strongest vegetable alkali is obtained, and from the latter the mineral alkali. From other vegetables, as fern, broom, bean-stalks, &c. an alkaline salt is produced, but so impure, and in such small quantity, that no manufacture of it can be established in this country with any reasonable expectations of profit. The pot-ashes of different countries also vary much in quality; and the experiments of Dr Home, in his treatise on Bleaching, seem to set forth their different properties in the clearest point of view. The different kinds tried by him were,

1. *Blue pearl-ashes.* These appear to be a pure alkaline salt, mixed with a small quantity of vitriolated tartar, and earth. Half a pound of this, filtered and evaporated, yielded  $5\frac{1}{2}$  ounces of pure salt.—Here, however, we must observe, that though the quantity was so far diminished by this operation, yet we are not to imagine that the whole of this diminution was owing to impurities; for all salts are destroyed in some measure by solution in water and exsiccation. See CHEMISTRY, n<sup>o</sup> 21.

2. *White pearl-ashes* are nearly of the same quality with the former; half a pound of them giving five ounces and seven drams of pure salt, with some vitriolated Tartar and earth.

3. *Russia or Muscovy ashes* have very much the appearance of flaked lime, and are, like it, friable between the fingers. They adhere to the tongue, and their alkaline taste soon goes away, leaving in the mouth a strong taste of lime. Some small bits of charcoal are observable in their composition, and they never turn moist in the air. Half a pound of the salt lixiviated with water and evaporated, gave only 10 drams 15 grains of very caustic salt. These consist therefore of a small quantity of alkaline salt united with a large quantity of lime.

4. *Cashub ashes* are of the colour of iron stone, and extremely hard, with many shining particles of charcoal in them. They have a saline taste with a considerable degree of pungency; feel gritty in the mouth, when broke in pieces by the teeth; and will dissolve in water. To extract the pure salt, half a pound of the ashes were boiled in a pint of water; then that water poured off, and half a pint put on the ashes

*Pot-ash.* again; and so on, till the ashes taste no more salt. This boiling took 24 hours, and the last water that came off had a strong taste of sulphur and was blackish. A piece of silver put in the decoction was in a few minutes turned almost black; but though the decoction was evaporated considerably, it did not turn silver black more speedily than before. The whole, when totally evaporated, yielded only 10 drams of a brown salt having a strong caustic alkaline taste. Some Cashub ashes powdered, and often washed in water so that the salts were all carried off, were infused in water. After standing some time, there was a weak lime-water, with something of a saline taste, but no pellicle. Some of this residuum was put into a reverberatory furnace for two hours; after which it afforded good lime-water. Cashub ashes then appear to contain an earth half vitrified, some lime, alkaline salts, and a quantity of sulphur.

5. *Marcott's ashes* are of a paler colour than the former, with some small pieces of charcoal in their composition. They have a strong saline taste; and so great pungency, that they cannot be held long in the mouth. Half a pound dissolved in water, filtered and evaporated, yielded 11 drams one scruple and two grains of alkaline residuum. The decoction blackened silver, but not so strongly as the former, and by evaporation it quickly lost that quality.

Our author next proceeds to consider the probability of manufacturing these ashes in this country; on which subject he has the following observations.—

“The blue and white pearl-ashes we have discovered to be pure alkaline salts, without any considerable mixture of heterogeneous bodies. Their purity shows the lixive to have been strained through some close substance, such as linen or flannel. The blue ashes show, by their colour, that they have sustained the most fire. But both of them are so much alike, that the one may be substituted for the other; and therefore we shall consider them in one view.

“Every one knows, that alkaline salts, such as these, are got from all plants except the alkalefcent, and from all trees except the most resinous, which afford them in very small quantity. These plants, or trees, when found, are pulled or felled in the spring, dried, and burnt to ashes. By the assuasion of warm water the salts are dissolved, and, by straining, separated from the earth along with the water. This saline liquor, which is called a *lixive*, is evaporated over a fire; and what remains, is an alkaline salt of the same kind with the pearl ashes.

“I was informed by a skilful bleacher in Ireland, that he practised a more expeditious way of extracting the salts. He bought the ashes of different vegetables from the commonalty for 9s. a-bushel. From these a very strong ley was made, into which dry straw was dipped, until it sucked up all the ley. This straw was afterwards dried and burnt, and gave him salts which he showed me, almost as good and pure as the pearl-ashes. This method I have several times tried; but could never burn the straw to white ashes, the salts diminishing the inflammability of the straw. It is a very expeditious method, if it can be practised. But I can see no occasion for bringing the ley into a solid form, as the salts must again be dissolved in water before they can be used. The strength of the ley can easily be determined by the hydrostatical balance.

“Though

" Though I make no question, that the quantity of salt, in plants of the same species, will vary in different soils and climates; yet it would be of advantage to have the proportion ascertained in general. Some trials of this kind I have made.

" Two pounds of fern which had been pulled August 16. were dried, and burnt to white ashes. These weighed 7 dr. and tasted very flat. When lixiviated, strained, and evaporated, they gave me 49 gr. of salt, about the eighth part of the ashes. If the fern had been pulled in April, it would have afforded more salt. Why then should we not prepare salts from this vegetable? There is more of it growing on our hills than would serve all our bleachfields. The Irish make great use of it.

" From 11 oz. of tobacco-ashes I had 1 oz. of salt. Two oz. of peat-ashes afforded half a drachm of salt. Nettles, I am informed, afford much salt. Furz and broom, natives of this country, are very fit for this purpose.

" But the kelp, as it grows in such plenty along our shores, and contains more salt than any other vegetable I know, would be the most proper, were it not for a mixture of some substance that renders it unfit for bleaching, at least of fine cloths, after they have obtained a tolerable degree of whiteness. It is observed by bleachers, that, in these circumstances, it leaves a great yellowness in the linen. As these ashes are much used in Ireland, and as it is not uncommon to bleach coarse cloths with them in Scotland, a disquisition into their nature, and some attempts to purify them, may not be improper. There are no ashes sold so cheap as these; for the best gives but 2 l. the 2000 weight (A). They may, therefore, allow of more labour to be expended on them, and come cheaper at long-run than the foreign salts.

" I dried some sea-ware, and burnt it, though I found that last operation very difficult. When I had kept them fused in the fire for two hours, they weighed 3½ oz. I poured on the ashes an English pint and a half of cold water, that I might have as little of the sulphur as possible. This ley, after it had stood for some hours, was poured off clear, and had but a slight tendency to a green colour. I made a second infusion with milk-warm water, and poured it off from the sediment. This had a darker colour than the former; was kept separated from it, and evaporated by itself. There was a third infusion made; but having no salt taste, it was thrown away. The second infusion seemed to contain more sulphur than the first; and a piece of white linen kept in it half an hour, while it was boiling, was tinged yellow, and could not be washed white again. The earthy part remaining, weighed, when well dried, 1 oz. 2 dr. The saline decoction, evaporated by degrees, and set at different times in a cellar to crystallize, afforded me 5 dr. 46 gr. The liquor, when entirely evaporated, left 4½ dr. of a yellow salt, which appeared to be a strong alkaline. The salts which crystallized seemed to be mostly sea-salt, with a considerable quantity of sulphur, and some alkaline salt. There appeared no signs of the bitter in these salts, as their solution did not turn turbid with the oil of tartar. Nor was any of the bitter to be

expected in kelp ashes, although it probably is to be found in the recent vegetable; because the alkaline salts formed by the fire must have changed it into a neutral. The ley made warm with water, being evaporated, left 4 dr. of a black bitter salt, which, from its quantity of sulphur, appeared unfit for bleaching. These ashes, then, seem to be a composition of somewhat less than the fourth of sulphur, the same quantity of sea-salt, about a fourth of alkaline salt, and somewhat more than a fourth of earth. The alkaline salt contained in kelp ashes, amounts to one penny a pound. This cheapness makes it worth our pains to bestow some labour on them.

" If the bad effects in bleaching with kelp ashes arise from the sea-salt, as some of the most knowing bleachers think, they can be freed from it in an easy manner. Let a lixivie of kelp-ashes be made with cold water, for that does not extract so much of the sulphur; it must stand but for a short time, for these salts dissolve easily; decant it, and evaporate the ley. As the boiling continues, the sea-salt will crystallize. When that is all separated, the remaining ley will contain alkaline salt with some sulphur. This operation every master of a bleachfield may learn and oversee, without taking up much of his time. A similar process is carried on by common servants in the alum-works, who have by practice learned it from others.

" I had some hopes that the sulphur might be carried off by long roasting, such as these salts undergo before they are fused in order to be turned into glass; because I had observed, that the longer time they were kept in the fire, the freer were they from this sulphureous part.

" I ordered a quantity of kelp ashes to be kept in the furnace of a glass-house, where the heat was just below the vitrifying point, for 24 hours. During this time they had lost almost four-fifths of their weight. They were now much freer from their sulphur, and were of a light colour; but much of the alkaline salt had been driven off with the oils. If a ley is much impregnated with this sulphureous matter, it appears to be carried off, in a great measure, by long boiling.

" We come now to explain the method of manufacturing the white Muscovy ashes. We have shown, by undoubted experiments, that the greatest part of these ashes consists of lime; and yet we have several acts of parliament which forbid the use of that material under severe penalties. The parliament were in the right to discharge its use, upon the disadvantageous reports which were made to them. We shall immediately see how dangerous a material it is when used improperly, or without the mixture of alkaline salts, which render it safe, and more soluble in water. But I will venture to say, that experiment will not support the prejudice entertained with regard to it, if carried any further.

" Since bleaching, then, cannot be carried on without it; for those ashes which contain it, are quite necessary in that operation; and since we import them from foreign countries; let these prejudices against it, cease, and let us only consider how we may render our own lime as safe as the foreign. If we can do that, the wisdom of the legislature will be as ready to abrogate

(A) Since this treatise was written, however, the price of kelp has been advanced to 7 l. or upwards the 2000 weight; so that those who would now attempt any thing of this kind, must also manufacture the kelp themselves.

Pot-ash. gate these ashes, as they were to make them.

“ By my experiments on the white Muscovy ashes, I got about the eighth part of alkaline salts from them. This made me expect, that, by mixing in the same proportion quick-lime and alkaline salts, I should be able to produce Muscovy ashes.

“ To an ounce of quick-lime and a drachm of white pearl ashes, I added about a gill of water, and boiled them together till the water was all evaporated. The taste of this substance was little different from lime. To recover the salts again from the lime, I dissolved it in water, strained off the liquor, and evaporated it. Instead of the drachm of salts, I had but 2 gr. of a substance which was more earthy than saline.

“ To 3 dr. of quicklime, and as much potashes, I added a mitchkin of water, and kept it boiling for two hours till it was evaporated. I dissolved it again in water, which being filtered and evaporated, gave me  $1\frac{1}{2}$  dr. of a caustic salt, that liquefied in the air when it had been but four minutes from the fire. It appears, then, that the alkaline salts are destroyed by lime, and that a great part of them can never be again recovered. From the remaining lime, after the salts were extracted, I got strong lime-water, but without a pellicle. This shows, that a quantity of alkaline salts, equal to the lime, boiled with it for two hours, are not able to fix all the soluble part of the lime.

“ From these experiments we may draw some corollaries with regard to the present subject. *1st*, That evaporating the water from the lime and salts by boiling, is a most unfrugal way of preparing these white ashes. *2dly*, That these ashes ought to be kept close shut up in casks; for if exposed to the open air, though in a room, the alternate moisture and drought must fix their most useful parts. This I have found to be fact: for the salts that I made became less pungent by keeping; and I have observed, that the surface of the Muscovy ashes lost all pungency by being exposed to the air, while their internal parts still retained it. *3dly*, That all boiling is prejudicial to these Muscovy ashes, as it fixes, and that quickly, their most subtle, and probably their most serviceable parts.

“ Let us now proceed to another method of making these white ashes. I imagined, that if the salts were dissolved in water, and the quick-lime slaked with that, the mass would soon dry without the assistance of fire. In this way I added equal parts of both; but the composition was so strong, that it blistered my tongue if it but touched it. When the fourth part was alkaline salt, it blistered my tongue when kept to it a few seconds. I could taste the salts plainly in the composition, when they made but the thirty-second part of the whole.

“ I thought, when composed with the eighteenth part of salt, it had, when fresh made, just the taste and look of the Muscovy ashes; nor could any person have distinguished them. This I once imagined was the proportion; but when I found that the saline pungency soon turned weaker by keeping, and that this composition would not afford the same quantity of salts that the Muscovy ashes did, I saw that a much greater quantity of salts was necessary. The proportion appears to be one of salt to four of lime, prepared in this last way. Three drachms of ashes prepared in this way, and kept for a fortnight, gave me but 15 grains of

fast; which is but the half of what the Muscovy would have afforded. I find, if the quick-lime is first quenched, it does not fix the salts so much; and therefore is better and cheaper. One drachm of potashes dissolved in a little water, and added to 3 drachms of quenched lime, gave me 44 grains of a very caustic salt. I prefer this method as the best.

“ The manufacturers of this salt probably pour the lixive upon the lime, as they can know by its specific gravity what quantity of salts is in the water, and so save themselves the expence of procuring the salts in a dry form.

“ The manufacture of the Marcoft and Caslub ashes remains yet to be explained. We have discovered that both of them contain sulphur, earth, alkaline salts, and lime; and differ in nothing, but in the Caslub's having more sulphur than the Marcoft ashes. We shall therefore consider them together.

“ Whether these two species of ashes are of any use in bleaching, may be, and has already been, disputed. I find they contain no other principles, the sulphureous part excepted, than the former ashes combined together. Why then should we expect any other effects from the same ingredients in the Marcoft and Caslub ashes, than what we have from either of the pearl and Muscovy ashes mixed together? The sulphureous principle in the former must have very bad effects; as I find by experiment, that it leaves a yellowness on cloth that is very hard to be washed out. It is owing to this sulphureous principle, that linen, after it has been washed with soap, and is pretty well advanced in whiteness, is apt to be discoloured by ley which is brought to boil: for, by boiling, the sulphureous part is extracted from these ashes, and the ley becomes of a deep brown colour. Daily practice, then, shows the disadvantage of this sulphureous principle. Besides, as sulphur unites itself, quickly and firmly, with alkaline salts, it must weaken, or altogether destroy a great quantity of these in the Marcoft and Caslub ashes, and so render them of no effect in bleaching. These two reasons seem to me sufficient to exclude them from the bleachfield; especially as, by increasing the other materials, we can attain, perhaps more speedily, the same end.

“ However, as custom has introduced them into general practice, we shall consider how they are to be manufactured. Dr Mitchell has, in a very ingenious and useful paper, contained in the Philosophical Transactions for the year 1748, delivered an account transmitted to him by Dr Linnæus, of the method of making potashes in Sweden. This account was contained in an academical dissertation of one Lundmark upon this subject at Aboe in Sweden. The substance of this account is, “ That birch or alder is burnt by a slow fire to ashes, and made into a paste with water. “ This paste is plastered over a row of green pine or fir logs. Above that is laid, transversely, another row of the same; and that likewise is plastered over. “ In this way they continue building and plastering, till the pile be of a considerable height. This pile is set on fire; and whenever the ashes begin to run, it is overturned, and the melted ashes are beat with flexible sticks, so that the ashes incrust the logs of wood, and become as hard as stone.” This, in the Doctor's opinion, is the method of making the potashes that come from Sweden, Russia, and Dantzic: and

Pot-ash.

and that there is no other difference betwixt the ashes made in those different countries, but that the Russian, containing more salt, must be made into a paste with a strong ley.

" There would appear, by my experiments, a greater difference than this, betwixt the Swedish ashes, if that is the true process, and those I have examined. I had discovered the greatest part of the Muscovy ashes to be lime. I suspected it might enter into the composition of the Marcoft and Cashub; and have accordingly discovered it there. Without the same grounds, none would ever have searched for it. Whence then comes this lime? It must either enter into its composition, or arise from the materials managed according as the process directs.

" I have tried the birch ashes made into a paste with water. I have tried common charcoal, made into a paste with a third part of potashes, and kept them in a strong reverberatory heat for some hours, and yet no such caustic substance appeared. I have kept earth and salts of kelp-ashes fused together for 24 hours in the furnace of a glass-house, where the heat was just below the degree of vitrification; and yet no remarkable causticity appeared, afterwards, in the concreted masses. But supposing that there did, will ever this account for the generation of lime? These chemists do not assert that it is a calcareous causticity. The earth of vegetables kept in fusion with their salts, is so far from turning into a quick-lime, that the mass takes the opposite course, and becomes glass. Bodies that, by the laws of nature, are vitrescible, can never, so far as we know, become calcareous. In one or other of these two substances all bodies terminate, that are changeable by fire; and vegetables are of the former kind. Here it may be asked, Why then, since they endure such a fire, are they not vitrified? The objection would be just, did they contain nothing else but what was found in vegetables. But if we once allow, that lime is one of the materials, the difficulty is easily solved: for lime, we know, in proportion as it is mixed, hinders the vitrification of all bodies. In effect, the earthy part in these ashes is almost vitrified; and I think that I have carried the vitrification yet farther in that part; but I never was able, with the utmost heat of a reverberatory furnace, continued for six hours, to produce any thing like a thorough vitrification in these ashes. The heat of the fire used in the process would seem to be very great; and must, if it were not very difficult, reduce them to glass. The invitrifiable nature of these salts, so far from being an objection, becomes a strong proof of my opinion.

" These salts have a remarkable pungency. This we have already seen is the natural effect of quick-lime on salts.

" These salts are found to be the fittest for making soap, and to incorporate soonest and best with oils. Salts, we know, of themselves do not readily unite with oil; but when once mixed with quick-lime, they have a greater tendency to union.

" Again, I find that these ashes are more easily fluxed than charcoal made into a paste with the third part salt; which is much more than the ashes contain. Now, it is observed, that quicklime increases the fluxing power of alkaline salts; for the common caustic made of quicklime and alkaline salts, is sooner fused

than the latter alone.

" From these reasons, and the experiments that discover lime in these ashes, I am led to think, that it is not generated by the process, but mixed with the ashes when they are made into a paste. The following experiment is a convincing proof of what I have been endeavouring to make out.

" I boiled some pease-straw in a strong ley of pearl ashes burnt into a black coal, and made it into a paste with water. Another quantity of straw was boiled in a ley made of one part of quick-lime and four parts pearl salts, the ley being poured off turbid from the lime. This straw was likewise burnt when dry, and made into a paste. These two substances were put into separate crucibles, and fluxed in a reverberatory furnace. The latter appeared to resemble the Marcoft and Cashub ashes more than the former, which seemed to want their pungency."

Though the only method of preparing the alkaline salt originally is by the combustion of vegetables, yet there are some neutral salts from which if it were possible to expel the acid, we should have it in our power to procure the finest pearl-ashes in vast quantity. These are vitriolated tartar, nitre, but especially sea-salt, on account of the inexhaustible quantities of it to be met with in the waters of the ocean. Unhappily, however, there are some objections to every one of those. The vitriolated tartar, or any other salt in which the vitriolic acid enters, cannot be decomposed without converting the acid into sulphur by charcoal dust; in which case it is as difficult to get free of the sulphur as of the acid; and if we attempt it by frequent solutions in water, we destroy the phlogiston of the sulphur, and have only vitriolated tartar again instead of alkali. See CHEMISTRY, n° 225, 324.

With respect to nitre, though its acid may be expelled by fire, yet it is too high-priced, and too much used in other manufactures, to be thought of for this purpose. A potash manufacture from sea-salt has indeed been lately erected in England. The principle on which this was established is, that the acid of sea-salt may be extracted by means of lime; and accordingly we find that the saline efflorescence, which frequently appears on walls, consists chiefly of the marine alkali deprived of its acid. But this, tho' delivered on the credit of a very eminent chemist, we can affirm from our own observation to be a mistake. Of the many cases in which we have examined this efflorescence, only one was found to be alkaline; the others uniformly appeared to be true Glauber's salt composed of the vitriolic acid and fossil alkali. Neither did this appear to be formed by any decomposition of salt originally in the plaster, but to be a real generation of both acid and alkali where none of them existed before. See EFFLORESCENCE, in the APPENDIX.

**POTAMOGETON, FOND-WEED;** a genus of the tetragynia order, belonging to the tetrandria class of plants. There are 12 species, all of them, floating vegetables on the surfaces of stagnant waters, affording an agreeable shade to fish, and food to cattle.

**POTATOE,** in botany. See SOLANUM.

These roots came first from Ireland into Lancashire where they are still very much cultivated. It was, however, 40 years after their introduction before they were much cultivated about London; and then they were

Pot-ash

||

Potatoe.

Potatoc.

considered as rarities, without any conception of the utility that might arise from bringing them into common use. At this time they were distinguished from the Spanish by the name of *Virginia potatoes*, or *battatas*, which is the Indian name of the Spanish fort. At a meeting of the Royal Society, March 18th, 1662-3, a letter was read from Mr Buckland, a Somerset gentleman, recommending the planting of potatoes in all parts of the kingdom to prevent famine. This was referred to a committee; and, in consequence of their report, Mr Buckland had the thanks of the society, such members as had lands were intreated to plant them, and Mr Evelyn was desired to mention the proposals at the clove of his Sylva. Since that time the plant has been so universally cultivated, that it has become a considerable part of our food; and attempts have even been made to substitute the potatoe instead of bread, or to make bread from it. See the article BREAD.

For the method of cultivating potatoes, see AGRICULTURE, n<sup>o</sup> 127—129. Besides what is there delivered, there are many curious experiments concerning the culture of potatoes related in the Georgical Essays.

“ 1. *On the Howard or large Bedfordshire potatoe.* By all the experiments that have been made, the Howard potatoe is found to produce the largest crop. On that account they are chiefly used in feeding of cattle. In two beds, four feet wide and 200 feet long, I planted in a common field a sufficient number of sets of this kind of potatoe, and managed them by the horse-hoe. The produce was 64 bushels, each bushel up-heaped, weighing about 70 lb. My cattle eat them boiled with as much eagerness as the best forts, and came on as well with them. I have built a boiling-house, &c. on Mr Young's plan, and during this whole winter have boiled potatoes for my cattle. For the fattening ones, I mix ground oats with them; and for the milk-cows, malt-dust; and dare venture to affirm, that they are much more profitable than either turnips or cabbages. Once, when my potatoes grew low, I desisted giving them to the milking-cows. Immediately, though fed with the best hay, they fell off amazingly in their milk. I therefore began again, and in a week's time they gave better than one-third more butter. I own this accidental discovery gave me much satisfaction, as it confirmed my opinion, that potatoes boiled are an excellent winter food for cattle. Their culture is not so difficult, at least not so precarious, as either turnips or cabbages. Their value is superior, and there is no risk of their giving a disagreeable taste either to butter or milk. Add to this the vast increase of the Howard potatoe, and its equality with the best forts when used for cattle.

“ 2. *On the increase of potatoes.* My gardener cut a large potatoe into nine pieces, which he planted with dung, in a drill, in the garden. By earthing up and laying the shoots, he produced 575 sizeable potatoes, which weighed eight stone eight pound. Another of my servants produced, in the field, seven stone of good potatoes from the same number of sets. Tho' this experiment cannot always be executed in its full force in an extensive scale, it ought, notwithstanding, to be imitated as nearly as circumstances will allow. It

shows, in the most distinguishing manner, the use of clean and careful husbandry.

“ 3. *On the increase of potatoes.* On the 14th of April, I cut a large white potatoe into 17 sets, which were planted in as many hillocks, at the distance of four feet. In the course of growing, the plants were earthed up, and on the 14th of October the crop was taken up: The produce, 10 pecks of sizeable potatoe. At the time that this experiment was made, I had several hillocks, in which I put three and four sets of the same kind of potatoe. But, upon the most careful examination, I could not observe that these hillocks produced a greater crop than the others planted with a single set. Hence it is obvious, that the potatoe spreads its roots most kindly when least crowded.

“ 4. *On the method of raising seedling potatoes.* Take a bunch of the apples of any sort of potatoe. Hang it up in a warm room during the winter, and in February separate the seeds from the pulp, by washing the apples in water, and pressing them with the fingers. Then dry the seeds upon paper. In the month of April, sow these seeds, in drills, in a bed of earth well dug, and manured with rotten dung. When the plants are about an inch high, draw a little earth up to them with a hoe, in order to lengthen their main roots. When they are about three inches high, dig them up with a spade, and separate them carefully from each other, in order for planting out in the following manner.

“ Prepare a piece of fresh ground by trenching it well. Dig up the seedling plants as before directed; and plant them out in the ground, thus prepared, in such a manner, that there shall be 16 inches between each plant. As they advance in growth, let them receive one or two earthings up, in order to lengthen the main root, and encourage the shoots under ground.

“ By this management, the potatoes will, in the course of one season, arrive at the size of hen's eggs, and the haulm will be as vigorous as if sets had been planted. But what proves the luxuriance, in the most convincing manner, is, that flowers and apples are produced.

“ In Lancashire, where the gardeners raise potatoes from seed, they are always two, and sometimes three years in bringing them to full size. By the above method of transplanting, with wide distances, many of the potatoes nearly attain their full size in one season.

“ It is observable, that these seedlings produce potatoes of all the different kinds; and sometimes new sorts are procured. We do not find any difference whether the apple comes from one kind or another. It is not so when we use the set, which invariably produces the same kind.

“ Potatoes, when propagated from sets, after a number of years, are found to decrease in bearing; for which reason they should be brought back every 14 years to their original.

“ From a want of attention to this circumstance, I have known potatoes to run out, that they hardly returned treble feed. The farmer complains that his land is tired of them, but the true cause is the age of the sets.

“ The increase of potatoes raised from seed is  
afto-

Potatoc.

astonishing. They continue in vigour for about 14 years; after which, the produce gradually declines.

" 5. *On the best method of raising early potatoes.* As the culture of potatoes, and particularly of the early sorts for the table, has of late become an object of very general attention, I hope the following account of a new method of obtaining these (without the help of hot-beds) will be acceptable to the public.

" On the 2d of January 1772, I made a hot-bed for the forward sort of potatoes, and on the 7th put in the sets, placing a glass and frame over them, and taking every precaution to defend them from the frost. Of these small potatoes, or sets, there remained about 40 in a basket, which was accidentally hung up in a warm kitchen, and there remained unnoticed till about the 25th of April. I then accidentally observed the basket, and perceiving something green on the edge of it, took it down, and, to my great surprize, found that the potatoes had sprouted half a yard in length, and that there were a great number of very small potatoes formed on the fibrous roots which had grown out. I took them into my garden, and planted them in a rich sandy soil, without any manure. The roots I put into the ground three inches deep, and laid down the stems that had sprouted, horizontally, and covered them with two inches of soil, but left the tops uncovered. Without farther attention they grew surprizingly.

" On the 26th of May, I took up the roots planted in the hot-bed on the 7th of January. They by no means answered my expectations, or paid for the trouble of their culture: but, at the same time, I was astonished to find the others, which were put into the ground so late, to have produced larger potatoes than the roots in the hot-bed. I took up all the roots, and picked off the large potatoes from them, which amounted to from 4 to 12 on each root, and then set the roots again in the same ground. This, indeed, I have successfully practised for many years, sometimes even twice, and have had a third good crop at Michaelmas. When this method is tried, the roots must be watered on the evenings of hot days.

" In January 1773, in order to make a second trial of this experiment with a large quantity, I placed a great many potatoes of the early sorts on a thick layer of gravelly soil, close to each other, over an oven, flated over, but open to the south-west, and covered them two inches deep with the same earth.

" At the end of April I took them up, and found the stems about a foot long or more. For fear of injuring the fine and delicate fibres of the roots, I took great care in taking them up, and planting them in the soil. This I now manured, but in all other respects treated them in the manner above described, many of the fibrous roots having then potatoes formed upon them, nearly as large as walnuts. For a week, the plants came on surprizingly, when, by one sharp night's uncommon frost, they were nearly destroyed. However, notwithstanding this, fresh stems grew up in a few days, and I actually gathered from them, on the 3d of June following, finer potatoes than were fold at that time, at Manchester, for 1s. to 1s. 6d. per pound, being the produce of hot-beds.

" After taking off the larger potatoes, I again planted the roots for a second crop, and in September

obtained a very large produce. I weighed the increase of many separate roots, which amounted from four pound eight ounces to 14 pound 12 ounces, the potatoes being the largest of the forward kinds I ever saw.

" 6. *On a method of raising potatoes in winter.* Make a compost of earth, sand, and coal-ashes. With this mixture fill a tub about 16 inches deep. Plant this artificial soil with some sets of the early round potatoe, and place the tub in a stable opposite to a window, taking care to water the earth now and then. In all seasons the sets will sprout, and give a tolerable increase of potatoes. Last November I planted some sets in the above manner; and, in February following, I took up a considerable number of young potatoes, clean skinned and well flavoured.

" 7. *On transplanting potatoe tops.* On the 18th of May 1772, finding some beds I had sown very early with onions, to be a missing crop, I was induced to make the following experiment. The year before, I had set some potatoes in another part of my garden, in the common way; and as it is impossible but some will remain in the ground all winter, so I found a number of sprouts about three inches high, which I nipped off close to the ground, and transplanted them into the onion-beds, without any further preparation, about a foot and a half asunder, in the same manner that cabbages and cauliflowers are planted. As the season became immediately very dry, I was obliged to give my plants a little water for four or five successive nights; after which they began to flourish, and had the appearance of a promising crop during all the summer. At the usual time, in October, I ordered them to be taken up; and for size, quantity, and quality, they exceeded all I ever had in the common way. Had the ground been fresh, properly manured and prepared, and the plants put down at a proper distance from each other, I am of opinion that the success would have been still greater.

" 8. *On feeding hogs with potatoes.* From an accurate experiment made last year, I dare venture to recommend baked potatoes as an excellent food for hogs. The pork produced by this food, was equal to that from barley and beans: but at present I cannot exactly ascertain the comparative experiment with regard to expence; however, I am of opinion, that roasted potatoes, considering the improvement of the hogs, is as cheap a food, if not cheaper, than can be given them. I roasted my potatoes upon a kiln, similar to what is used by oat-meal shellers for drying their oats. The difference in expence between boiling and roasting the potatoes is prodigious, both with regard to the labour and fuel. A kiln that will cost 3l. will roast potatoes sufficient for the maintenance of more than 20 hogs; and one man will bestow all the necessary attendance upon them, and do other work besides. The action of the fire, by dissipating the crude juices that are contained in raw potatoes, reduces them into a state highly wholesome and nutritious. Boiling does this in part, but not so effectually. A potatoe roasted in the manner above described, partakes more of the nature of a chestnut, and perhaps is not greatly inferior to it."

There is one remarkable property of the potatoe, that when planted in water, it shoots out a great num-

Potatoc  
||  
Potentilla.

ber of fine white roots like threads into the water; but on none of them is there to be found the least appearance of a bulb; while on the other hand, the potatoes in that case always grow on the top.

POTATOE-Bread. See BREAD.  
Spanish POTATOE. See CONVULVULUS.

POTENT, or POTENCE, in heraldry, a term for a kind of cross, whose ends all terminate like the head of a crutch. It is otherwise called the *Jerusalem cross*, and is represented Plate CXLVI. fig. x. 12.

POTENTIA (POWER), that whereby a thing is capable either of acting, or being acted upon.

POTENTIAL, in the schools, is used to denote and distinguish a kind of qualities, which are supposed to exist in the body in *potentia* only; by which they are capable in some measure of affecting and impressing on us the ideas of such qualities, though not actually inherent in themselves; in which sense we say, potential heat, potential cold, &c.

POTENTIAL Caustery, in medicine, denotes the consuming, or reducing to an eschar, any part of the human body by a caustic alkaline or metallic salt, &c. instead of a red-hot iron, which last is called the *actual caustery*.

POTENTIAL, in grammar, an epithet applied to one of the moods of verbs. The potential is the fame in form with the subjunctive, and is, according to Ruddiman, implied in that mood, for which reason that grammarian rejects it; but others will have it to differ from the subjunctive in this, that it always implies in it either *possibile, vole, or dehee*. It is sometimes called the *permissive mood*, because it often implies a permission or concession to do a thing. See GRAMMAR, n<sup>o</sup> 43.

POTENTILLA, SILVER-WEED, *wild tansey*, or *cinquefoil*; a genus of the pentagynia order, belonging to the icofandria class of plants. The species are, 1. The fruticosa, or shrubby potentilla, commonly called *shrub cinquefoil*. This rises with a short shrubby stem, dividing into a branchy full head, three or four feet high; closely garnished with pinnate leaves of five oblong, narrow, acute-pointed, folioles, pale green above, and whitish underneath; and the branches terminated by clusters of large, spreading, yellow flowers. This is a beautiful deciduous flowering shrub, worthy a place in every curious collection. It grows wild in Yorkshire and other northern parts of England, &c. but has been long cultivated in gardens as an ornamental shrub. 2. The reptans, or creeping common five-leaved potentilla, or five-leaved grass, hath a thick fibry root, slender, trailing, repeat stalks, digitated, five-lobed, petiolated leaves, and yellow flowers singly. 3. The rupestris, or mountain upright cinquefoil, hath upright stalks, eight or nine inches high; pinnated five and three-lobed alternate leaves, having oval creuated lobes, and the stalks terminated by small white flowers. 4. The recta, or erect seven-lobed yellow cinquefoil, hath erect stalks, seven-lobed leaves; having three lobes spear-shaped and serrated, green and hairy on both sides, and the stalks terminated by corymbose clusters of yellow flowers. 5. The fragaroides, or strawberry-like trailing potentilla, hath a somewhat tuberous root, furnished with many long fibres, long trailing shoots, rooting at the joints; pinnated, mostly three-

lobed leaves, having oval lobes, with the extreme lobe the largest, and clusters of small white flowers. This species bears a great resemblance to the small sterile strawberry plants. 6. The argentea, silvery upright potentilla, hath upright stalks, branching a foot high; and five-lobed leaves, having the lobes wedge-shaped, cut on the edges, hoary and white underneath, and the branches terminated by small yellow flowers.

All these plants flower in June and July; the flowers are composed each of five roundish petals, and about 20 stamina. They are all very hardy, and may be employed in the different compartments of the pleasure ground. Their propagation is very easy. The shrubby potentilla may be propagated abundantly by suckers, layers, and cuttings; all of which will readily grow, and make plants in one year, which after having two or three years growth in the nursery will be fit for any of the shrubby compartments. All the herbaceous kinds may be propagated by parting the roots in autumn or spring, or by seed in any of those seasons.

POTERIUM, GARDEN BURNET; a genus of the polyandria order, belonging to the monœcia class of plants. The species are, 1. The sanguifera, or common garden burnet, hath fibry perennial roots, crowned by a large tuft of pinnate leaves, or six or seven pair of sawed lobes, terminated by an odd one; upright angular stalks, dividing, and branching a foot and a half high, terminated by oblong spikes of purplish red flowers. This species grows wild in England, in chalky soils; but has been long cultivated as a choice salad-herb for winter and spring use, it being of a warm nature; the young leaves are the useful parts. It is perennial in root, and retains its radical leaves all the year, but the stalks are annual. 2. The hybridum, hybrid agrimony-leaved Montpellier burnet, rises with upright, taper, closely gathered stalks two feet high; pinnated odoriferous leaves of three or four pair of sawed lobes, terminated by an odd one; and the stalks terminated by long foot-stalks dividing into smaller, each supporting a small roundish spike of flowers. This species often proves biennial; but by cutting down some of the stalks before they flower, it will cause it to multiply at bottom, and become abiding. 3. Poterium spinosum, shrubby spinous burnet of Crete, hath a shrubby stem and branches, rising a yard high, armed with spines; small pinnated evergreen leaves, of six or seven pair of lobes, terminated by an odd one, and the branches terminated by small heads of greenish flowers.

All these three species flower in June and July, succeeded by ripe seeds in Autumn. They are all naturally perennial; but the two herbaceous ones are abiding in root only; the other in root, stem, and branches: the two former are hardy, and the third requires shelter in winter. The first sort merits culture in every kitchen-garden for winter and spring salads. Some plants, both of the first and second sorts, may be introduced in the herbaceous collection in the pleasure-garden for variety. The third sort must be kept always in pots to have shelter in winter. They are all easily propagated, the first sort by seed, and by parting the roots. The second sort may also be increased by seeds and slips off the root, as for the

Potentilla  
||  
Poterium.

Potion former fort. And the propagation of the third is by slips or cuttings of the branches in spring and summer, planted in pots, and placed under glasses, giving shade and water; or might be forwarded more by plunging them in a hot-bed.

Burnet is of a heating drying nature, cordial, and alexipharmic; in summer, the leaves are used for cool tankards, to given the wine an agreeable flavour. The powder of the root of the first species is commended against spitting of blood, bleeding at the nose, dysenteries, and diseases attended with violent secretions. In winter and spring, the young tender leaves are used in salads. For its uses as food for cattle, see AGRICULTURE, n<sup>o</sup> 47—49.

POTION, an liquid medicine, consisting of as much as can be drunk at one draught.

POTOSI, a city of Peru in South America, situated at the bottom of a mountain of that name, in which is the richest silver mine ever discovered. Situated in W. Long. 67. S. Lat. 22. See the article PERU, p. 5996.

POTTER (Christopher), a learned English divine, was born in 1591, and bred at Oxford. In 1233, he published his "Answer to a late Popish plot," intitled *Charity mistaken*, which he wrote by special order of king Charles I. whose chaplain he was. In 1634, he was promoted to the deanry of Worcester; and, in 1640, was constituted vice-chancellor of the university of Oxford, in the execution of which office he met with some trouble from the members of the long parliament. Upon breaking out of the civil wars, he sent all his plate to the king, declaring, "that he would rather, like Diogenes, drink in the hollow of his hand, than that his majesty should want;" and he afterward suffered much for the royal cause. In consideration of this he was nominated to the deanry of Durham in 1646, but was prevented from being installed by his death, which happened about two months after. He was a person learned and religious, exemplary in his conversation, courteous in his carriage, of a sweet and obliging nature, and of a comely presence. He was remarkable in his charity to the poor.

POTTER (Dr John), archbishop of Canterbury, was the son of a linen-draper at Wakefield in Yorkshire, where he was born about the year 1674. He studied at University college, Oxford; and at 19 published *Variantes lectiones & notæ ad Plutarchi librum de audientis poetis; & ad Basilii magni orationem ad juvenes, quomodo cum fructu legere possint Græcorum libros*, 8vo. 1693. In 1697, came out his edition of *Lycophron*, in folio; which is reckoned the best of that obscure writer: soon after, he published his *Antiquities of Greece*, 2 vols, 8vo. These works established his literary reputation, and engaged him in a correspondence with Grævius and other learned foreigners. In 1706, he was made chaplain to the queen; in 1715, bishop of Oxford; and in 1737, he succeeded archbishop Wake in the see of Canterbury; which high station he supported with much dignity until his death in 1747. He was a learned and exemplary churchman; but not of an amiable disposition, being strongly tainted with that sort of pride which usually accompanies rigid orthodoxy; nor is it to his credit that he disinherited his eldest son for marrying below his rank in

life. His "Theological works, containing sermons, charges, discourses on church-government, and divinity lectures," were printed at Oxford, in 3 vols, 8vo. 1753.

POTTERY, the manufacture of earthen ware, or the art of making earthen vessels. See DELFT-Ware, STONE-Ware, and PORCELAIN.

The wheel and lathe are the chief and almost the only instruments in pottery: the first for large works, and the last for small. The potters-wheel consists principally in the nut, which is a beam or axis, whose foot or pivot plays perpendicularly on a free-stone sole or bottom. From the four corners of this beam, which does not exceed two feet in height, arise four iron bars, called the *spokes of the wheel*; which forming diagonal lines with the beam, descend, and are fastened at bottom to the edges of a strong wooden circle, four feet in diameter, perfectly like the felloes of a coach-wheel, except that it has neither axis nor radii, and is only joined to the beam, which serves it as an axis by the iron bars. The top of the nut is flat, of a circular figure, and a foot in diameter: and on this is laid the clay which is to be turned and fashioned. The wheel thus disposed, is encompassed with four sides of four different pieces of wood fastened on a wooden frame; the hind-piece, which is that on which the workman sits, is made a little inclining towards the wheel; on the fore-piece are placed the prepared earth; on the side-pieces he rests his feet, and these are made inclining to give him more or less room. Having prepared the earth, the potter lays a round piece of it on the circular head of the nut, and sitting down turns the wheel with his feet till it has got the proper velocity; then, wetting his hands with water, he presses his fist or his fingers-ends into the middle of the lump, and thus forms the cavity of the vessel, continuing to widen it from the middle; and thus turning the inside into form with one hand, while he proportions the outside with the other, the wheel constantly turning all the while, and he wetting his hands from time to time. When the vessel is too thick, he uses a flat piece of iron, somewhat sharp on the edge, to pare off what is redundant; and when it is finished, it is taken off from the circular head, by a wire passed under the vessel.

The potters-lathe is also a kind of wheel, but more simple and slight than the former; its three chief members are an iron beam or axis three feet and a half high, and two feet and a half diameter, placed horizontally at the top of the beam, and serving to form the vessel upon; and another larger wooden wheel, all of a piece, three inches thick, and two or three feet broad, fastened to the same beam at the bottom, and parallel to the horizon. The beam or axis turns by a pivot at the bottom in an iron stand. The workman gives the motion to the lathe with his feet, by pushing the great wheel alternately with each foot, still giving it a greater or lesser degree of motion as his work requires. They work with the lathe, with the same instruments, and after the same manner, as with the wheel. The mouldings are formed by holding a piece of wood or iron cut in the form of the moulding to the vessel, while the wheel is turning round; but the feet and handles are made by themselves and set on with the hand; and if there be any sculpture in the

Pottery.

Pottle work, it is usually done in wooden moulds, and stuck on piece by piece on the outside of the vessel. For the glazing of the work, see GLAZING.

POTTLE, an English measure containing two quarts.

POULTICE, a sort of medicine, called also a *cataplasim*. See CATAPLASM.

POULTRY, all kinds of domestic birds brought up in yards, as cocks, hens, capons, ducks, turkeys, &c.

Almost, if not all the domestic birds of the poultry kind that we maintain in our yards are of foreign extraction; but there are others to be ranked in this class that are as yet in a state of nature, and perhaps only wait till they become sufficiently scarce to be taken under the care of man to multiply their propagation. It will appear remarkable enough, if we consider how much the tame poultry which we have imported from distant climates has increased, and how much those wild birds of the poultry kind that have never yet been taken into keeping have been diminished and destroyed. They are all thinned; and many of the species, especially in the more cultivated and populous parts of the kingdom, are utterly unseen.

Under birds of the poultry kind may be ranked all those that have white flesh, and, comparatively to their head and limbs, have bulky bodies. They are furnished with short strong bills for picking up grain, which is their chief and often their only sustenance. Their wings are short and concave; for which reason they are not able to fly far. They lay a great many eggs; and as they lead their young abroad, the very day they are hatched, in quest of food, which they are shown by the mother, and which they pick up for themselves, they generally make their nests on the ground. The toes of all these are united by a membrane as far as the first articulation, and then are divided as in those of the former class.

Under this class we may therefore render the common cock, the peacock, the turkey, the pintada or Guinea hen, the pheasant, the bustard, the grouse, the partridge, and the quail. They all bear a strong similitude to each other, being equally granivorous, fleshy, and delicate to the palate. They are among birds what beasts of pasture are among quadrupeds, peaceable tenants of the field, and shunning the thicker parts of the forest, that abounds with numerous animals who carry on unceasing hostilities against them.

As nature has formed the rapacious class for war, so she seems equally to have fitted these for peace, rest, and society. Their wings are but short, so that they are ill formed for wandering from one region to another; their bills are also short, and incapable of annoying their opposers: their legs are strong indeed; but their toes are made for scratching up their food, and not for holding or tearing it. These are sufficient indications of their harmless nature; while their bodies, which are fat and fleshy, render them unwieldy travellers, and incapable of straying far from each other.

Accordingly, we find them chiefly in society: they live together: and though they may have their disputes, like all other animals, upon some occasions; yet, when kept in the same district, or fed in the same yard, they learn the arts of subordination; and,

in proportion as each knows his strength, he seldom tries a second time the combat where he has once been worsted.

In this manner, all of this kind seem to lead an indolent voluptuous life. As they are furnished internally with a very strong stomach, commonly called a gizzard, so their voraciousness scarce knows any bounds. If kept in close captivity, and separated from all their former companions, they have still the pleasure of eating left; and they soon grow fat and unwieldy in their prison. To say this more fully, many of the wilder species of birds, when cooped or caged, pine away, grow gloomy, and some refuse all sustenance whatever; none except those of the poultry kind grow fat, who seem to lose all remembrance of their former liberty, satisfied with indolence and plenty.

POUNCE, gum sandarach pounded and sifted very fine, to rub on paper, in order to preserve it from sinking, and to make it more fit to write upon.

POUNCE, is also a little heap of charcoal dust, inclosed in a piece of muslin or some other open stuff, to be passed over holes pricked in a work, in order to mark the lines or designs thereof on paper, silk, &c. placed underneath; which are to be afterwards finished with a pen and ink, a needle, or the like. This kind of pounce is much used by embroiderers, to transfer their patterns upon stuffs; by lace-makers, and sometimes also by engravers.

POUNCES, in falconry, the talons or claws of a bird of prey.

POUND, a standard-weight; for the proportion and subdivisions of which, see the article WEIGHT.

POUND also denotes a money of account; so called, because the ancient pound of silver weighed a pound troy.

POUND, among lawyers, denotes a place of strength, in which to keep cattle that are distrained, or put in for trespass, until they are replevied or redeemed.

POUNDSAGE, a subsidy of 12 d. in the pound, granted to the crown on all goods and merchandizes exported or imported; and if by aliens, one penny more.

POURPRESTURE, in law, is a wrongful inclosure, or encroachment upon another person's property.

POURSUIVANT, or PURSUIVANT, in heraldry, the lowest order of officers at arms.—They are properly attendants on the heralds when they marshal public ceremonies. Of these in England there were formerly many; but at present there are only four, viz. blue-mantle, rouge-crois, rouge dragon, and port-cullice. In Scotland, there is only one king at arms, who is styled *Yon*; and has under him no less than six heralds, as many pursuivants, and a great many messengers at arms. See LYON.

POURVEYANCE, or PURVEYANCE, in law, the providing corn, fuel, victuals, &c. for the king's household; and hence the officer who did so was termed *pourveyor*. As several offences were committed by these officers, it was enacted by stat. 12. Car. II. that no person, under colour of *pourveyance*, shall take any timber, cattle, corn, &c. from any subject without his free consent, or without a just appraisement and paying for the same.

POUSSIN (Nicholas), an eminent French painter, born

Poussin,  
Powder.

born in 1594 at Andel, a little city in Normandy, where his father was of noble extraction but born to a small estate. He was instructed for a few months by one Ferdinand Elle a portrait-painter, and afterward spent a month with L'Allemand; but finding these artists not likely to improve him suitably to his desires, he first studied the paintings of the best masters, and then hastened to finish a few pieces he was engaged in, and travelled to Italy. Here he devoted almost his whole attention to the study of antique statues and bas-reliefs; which was probably the cause of his want of knowledge in, and taste for, the art of colouring. Being invited back to Paris by Lewis XIII. who assigned him a pension with lodgings in the Tuilleries, he painted for prince Justiniani an historical picture representing Herod's cruelty; an admirable composition, in which he gave such expression to every character, as could not fail to strike the beholder with terror and pity: he then laboured for several years on the celebrated pictures of the seven sacraments of the Romish church. But none of Poussin's designs have been more generally admired than that of the death of Germanicus; which would have gained him immortal honour if he had never painted another picture. He began the labours of Hercules in the gallery of the Louvre; but the faction of Vouet's school railing at him and his performances, put him fo out of humour with his own country, that he returned to Rome, where he died in 1665. He never went beyond easel pieces, for which he had a perpetual demand; and his method was to fix the price he expected on the back of the canvas, which was readily paid.

POUSSIN (Gaspar), this painter, whose real name was *Dughet*, was born at Paris in 1600; and was induced to travel to Rome, not only from a love to the art of painting, but also to visit his sister who was married to Nicholas Poussin. Sandrart says that Gaspar was employed at first only to prepare the pallet, pencils, and colours, for Nicholas; but by the precepts and example of that excellent master, gradually rose to the highest reputation, and is undoubtedly one of the best landscape painters that ever appeared. It is generally thought that no painter ever studied nature to better purpose, or represented the effects of land-storms more happily, than Gaspar; all his trees shew a natural degree of agitation, every leaf being in motion; his scenes are all beautifully chosen, as are the sites of his buildings. He designed human figures but very indifferently; for which reason he frequently prevailed on Nicholas to paint them for him; and they were always introduced with the utmost propriety. While he continued at Rome, he dropped his own name, and assumed that of his brother-in-law and benefactor, by which only he is at present known. He died in 1662.

POWDER, in pharmacy, a dry medicine well broken, either in a mortar by grinding, or by some chemical operation.

*Gun-Powder.* See *GUN-POWDER*.

*Powder-Chests*, certain small boxes charged with powder and a quantity of old nails or splinters of iron, and fastened occasionally on the deck and sides of a ship, in order to be discharged on an enemy who attempts to seize her by boarding. These cases are usually from 12 to 18 inches in length, and about eight or ten in breadth, having their outer or upper part ter-

minating in an edge. They are nailed to several places of the quarter-deck and bulk-head of the waist, having a train of powder, which communicates with the inner apartments of the ship, so as to be fired at pleasure to annoy the enemy. They are particularly used in merchant-ships which are furnished with close-quarters to oppose the boarders.

*Powder for the Hair.* The best sort is starch well pounded and sifted, and generally prepared with some perfume.

POWER, the faculty of doing or suffering any thing. Power therefore is two-fold, *viz.* considered as able to make, or able to receive, any change; the former whereof may be called *active power*, and the latter *passive power*. See *METAPHYSICS*, n<sup>o</sup> 73—80.

POWER, in mechanics, denotes any force, whether of a man, a horse, a spring, the wind, water, &c. which, being applied to a machine, tends to produce motion.

POWER, in law, signifies in general, a particular authority granted by any person to another to represent him, or to act in his stead.

POWERS, in arithmetic and algebra, are nothing but the products arising from the continual multiplications of a number or quantity into itself. See *ALGEBRA* and *ARITHMETIC*.

POX, *French Pox*, or *Lues Venerea*. See *MEDICINE*, n<sup>o</sup> 447.

*Small-Pox.* See *MEDICINE*, n<sup>o</sup> 326—328.

POYNING'S LAW, an act of parliament made in Ireland under Henry VII. whereby all the statutes of force in England were made of force in Ireland; which before that time they were not.—Nor are any now in force there, made in England since that time.

The law took its name from Sir Edward Poyning, lord lieutenant of that kingdom at the time of its making.

PRACTICE, in arithmetic. See there, n<sup>o</sup> 16, &c.

*Gun-PRACTICE*, in military education. In the spring, as soon as the weather permits, the exercise of the great guns begins, with an intention to shew the gentlemen cadets at the royal military academy at Woolwich, and private men, the manner of laying, loading, pointing, and firing the guns. Sometimes instruments are used to find the centre line, or two points, one at the breech, the other at the muzzle, which are marked with chalk, and whereby the piece is directed to the target: then a quadrant is put into the mouth to give the gun the required elevation, which at first is guessed at, according to the distance the target is from the piece. When the piece has been fired, it is sponged to clear it from any dust or sparks of fire that might remain in the bore, and loaded: then the centre line is found, as before; and if the shot went too high or too low, to the right or to the left, the elevation and trail are altered accordingly. This practice continues morning and evening for about six weeks, more or less, according as there are a greater or less number of recruits. In the mean time others are shown the motions of quick firing with field-pieces.

*Mortar-PRACTICE*, generally thus. A line of 1500 or 2000 yards is measured in an open spot of ground from the place where the mortars stand, and a flag fixed at about 300 or 500 yards: this being done, the ground where the mortars are to be placed is prepared and

Powder  
Practice.

Pragmatic,  
Præmunire

and levelled with sand, so that they may lie at an elevation of 45 degrees; then they are loaded with a small quantity of powder at first, which is increased afterwards by an ounce every time, till they are loaded with a full charge: the times of the flights of the shell are observed, to determine the length of the fuzes. The intention of this practice is, when a mortar battery is raised in a siege, to know what quantity of powder is required to throw the shells into the works at a given distance, and to cut the fuzes of a just length that the shell may burst as soon as it touches the ground.

**PRAGMATIC SANCTION**, in the civil law, is defined by Hottoman to be a rescript or answer of the sovereign, delivered by advice of his council, to some college, order, or body of people, upon consulting him on some case of their community. The like answer given to any particular person is called simply *rescript*.

The term *pragmatic sanction*, is chiefly applied to a settlement of Charles VI. emperor of Germany, who, in the year 1722, having no sons, settled his hereditary dominions on his eldest daughter the arch-duchess Maria Theresia, which was confirmed by the diet of the empire, and guaranteed by Great Britain, France, the States General, and most of the powers in Europe. The word *pragmatic* is derived from the Greek *πραγμα*, *negotium*, "business."—It is sometimes also called absolutely *pragmatic*, *το πραγματικον*.

**PRÆMUNIRE**, in law, is taken either for a writ so called, or for the offence whereon the writ is granted; the one may be understood by the other.—The church of Rome, under pretence of her supremacy and the dignity of St Peter's chair, took on her to bestow most of the ecclesiastical livings of any worth in England by mandates, before they were void; pretending therein great care to see the church provided of a successor before it needed. Whence these mandates or bulls were called *gratie expectativa*, or *provisiones*; whereof see a learned discourse in *Duarenus de beneficiis*, lib. 3. cap. 1. These provisions were so common, that at last Edward III. not digesting so intolerable an encroachment, in the 35th year of his reign made a statute against papal provisions, which, according to Sir Edward Coke, is the foundation of all the subsequent statutes of præmunire: which is ranked as an offence immediately against the king, because every encouragement of the papal power is a diminution of the authority of the crown.

In the weak reign of Edward II. the pope again endeavoured to encroach, but the parliament manfully withstood him; and it was one of the articles charged against that unhappy prince, that he had given allowance to the bulls of the see of Rome. But Edw. III. was of a temper extremely different; and, to remedy these inconveniences first by gentle means, he and his nobility wrote an expostulation to the pope: but receiving a menacing and contemptuous answer, withal acquainting him, that the emperor (who a few years before at the diet of Nuremberg, A. D. 1233, had established a law against provisions) and also the king of France had lately submitted to the holy see; the king replied, that if both the emperor and the French king should take the pope's part, he was ready to give battle to them both, in defence of the liberties of the

Præmunire. crown. Hereupon more sharp and penal laws were devised against provisors, which enact severally, that the court of Rome shall present or collate to no bishopric or living in England; and that whoever disturbs any patron in the presentation to a living by virtue of a papal provision, such provisor shall pay fine and ransom to the king at his will, and be imprisoned till he renounces such provision: and the same punishment is inflicted on such as cite the king, or any of his subjects, to answer in the court of Rome. And when the holy see resented these proceedings, and pope Urban V. attempted to revive the vassalage and annualty to which king John had subjected his kingdom, it was unanimously agreed by all the estates of the realm in parliament assembled, 40 Edw. III. that king John's donation was null and void, being without the concurrence of parliament, and contrary to his coronation-oath; and all the temporal nobility and commons engaged, that if the pope should endeavour by process or otherwise to maintain these usurpations, they would resist and withstand him with all their power.

In the reign of Richard II. it was found necessary to sharpen and strengthen these laws, and therefore it was enacted by statutes 3 Ric. II. c. 3. and 7 Ric. II. c. 12. first, that no alien shall be capable of letting his benefice to farm; in order to compel such as had crept in, at least to reside on their preferments: and afterwards, that no alien should be capable to be presented to any ecclesiastical preferment, under the penalty of the statutes of provisors. By the statute 12 Rich. II. c. 15. all liegemen of the king accepting of a living by any foreign provision, are put out of the king's protection, and the benefice made void. To which the statute 13 Rich. II. st. 2. c. 2. adds banishment and forfeiture of lands and goods: and by c. 3. of the same statute, any person bringing over any citation or excommunication from beyond sea, on account of the execution of the foregoing statutes of provisors, shall be imprisoned, forfeit his goods and lands, and moreover suffer pain of life and member.

In the writ for the execution of all these statutes, the words *præmunire facias*, being used to command a citation of the party, have denominated in common speech, not only the writ, but the offence itself of maintaining the papal power, by the name of *præmunire*. And accordingly the next statute we shall mention, which is generally referred to by all subsequent statutes, is usually called the *statute of præmunire*. It is the statute 16 Rich. II. c. 5. which enacts, that whoever procures at Rome, or elsewhere, any translations, processes, excommunications, bulls, instruments, or other things which touch the king, against him, his crown, and realm, and all persons aiding and assisting therein, shall be put out of the king's protection, their lands and goods forfeited to the king's use, and they shall be attached by their bodies to answer to the king and his council; or process of *præmunire facias* shall be made out against them as in other cases of provisors.

By the statute 2 Henry IV. c. 3. all persons who accept any provision from the pope, to be exempt from canonical obedience to their proper ordinary, are also subjected to the penalties of præmunire. And this is the last of our ancient statutes touching this offence; the usurped civil power of the bishop of Rome being  
 pretty

Blackst.  
Comment.

*Præmunire*. pretty well broken down by these statutes, as his usurped religious power was in about a century afterwards: the spirit of the nation being so much raised against foreigners, that about this time, in the reign of Hen. V. the alien priories, or abbeys for foreign monks, were suppressed, and their lands given to the crown. And no farther attempts were afterwards made in support of these foreign jurisdictions.

This then is the original meaning of the offence which we call *præmunire*; viz. introducing a foreign power into this land, and creating *imperium in imperio*, by paying that obedience to papal process which constitutionally belonged to the king alone, long before the Reformation in the reign of Henry VIII. at which time the penalties of *præmunire* were indeed extended to more papal abuses than before; as the kingdom then entirely renounced the authority of the see of Rome, though not all the corrupted doctrines of the Roman church. And therefore by the several statutes of 24 Hen. VIII. c. 12. and 25 Hen. VIII. c. 19. & 21. to appeal to Rome from any of the king's courts, which (though illegal before) had at times been connived at; to sue to Rome for any licence or dispensation, or to obey any process from thence, are made liable to the pains of *præmunire*. And, in order to restore to the king in effect the nomination of vacant bishoprics, and yet keep up the established forms, it is enacted by statute 25 Hen. VIII. c. 20. that if the dean and chapter refuse to elect the person named by the king, or any archbishop or bishop to confirm or consecrate him, they shall fall within the penalties of the statutes of *præmunire*. Also by statute 5 Eliz. c. 1. to refuse the oath of supremacy will incur the pains of *præmunire*; and to defend the pope's jurisdiction in this realm, is a *præmunire* for the first offence, and high treason for the second. So too, by statute 13 Eliz. c. 2. to import any *agnus Dei*, crosses, beads, or other superstitious things pretended to be hallowed by the bishop of Rome, and tender the same to be used; or to receive the same with such intent, and not discover the offender; or if a justice of the peace, knowing thereof, shall not within 14 days declare it to a privy counsellor, they all incur a *præmunire*. But importing or selling mass-books, or other Popish books, is by stat. 3 Jac. I. c. 5. § 25. only liable to a penalty of 40s. Lastly, to contribute to the maintenance of a Jesuit's college, or any Popish seminary whatever beyond sea, or any person in the same, or to contribute to the maintenance of any Jesuit or Popish priest in England, is by statute 27 Eliz. c. 2. made liable to the penalties of *præmunire*.

Thus far the penalties of *præmunire* seem to have kept within the proper bounds of their original institution, the depressing the power of the pope: but, they being pains of no inconsiderable consequence, it has been thought fit to apply the same to other heinous offences; some of which bear more, and some less relation to this original offence, and some no relation at all.

Thus, 1. By the statute 1 & 2 Ph. and Mar. c. 8. to molest the possessors of abbey-lands granted by parliament to Henry VIII. and Edward VI. is a *præmunire*. 2. So likewise is the offence of acting as a broker or agent in any usurious contract where above 10 *per cent.* interest is taken, by statute 13 Eliz. c. 10.

3. To obtain any stay of proceedings, other than by arrest of judgment or writ of error, in any suit for a monopoly, is likewise a *præmunire*, by statute 21 Jac. I. c. 3. 4. To obtain an exclusive patent for the sole making or importation of gunpowder or arms, or to hinder others from importing them, is also a *præmunire* by two statutes; the one 16 Car. I. c. 21. the other 1 Jac. II. c. 8. 5. On the abolition, by stat. 12 Car. II. c. 24. of purveyance, and the prerogative of pre-emption, or taking any victual, beasts, or goods for the king's use, at a stated price, without consent of the proprietor, the exertion of any such power for the future was declared to incur the penalties of *præmunire*. 6. To assert, maliciously and advisedly, by speaking or writing, that both or either house of parliament have a legislative authority without the king, is declared a *præmunire* by statute 13 Car. II. c. 1. 7. By the *habeas corpus* act also, 31 Car. II. c. 2. it is a *præmunire*, and incapable of the king's pardon, besides other heavy penalties, to send any subject of this realm a prisoner into parts beyond the seas. 8. By the statute 1 W. & M. II. c. 8. persons of 18 years of age refusing to take the new oaths of allegiance, as well as supremacy, upon tender by the proper magistrate, are subject to the penalties of a *præmunire*; and by statute 7 & 8 W. III. c. 24. serjeants, counsellors, proctors, attorneys, and all officers of courts, practising without having taken the oaths of allegiance and supremacy, and subscribed the declaration against Popery, are guilty of a *præmunire*, whether the oaths be tendered or no. 9. By the statute 6 Ann. c. 7. to assert maliciously and directly, by preaching, teaching, or advised speaking, that the then pretended prince of Wales, or any person other than according to the acts of settlement and union, hath any right to the throne of these kingdoms, or that the king and parliament cannot make laws to limit the descent of the crown; such preaching, teaching, or advised speaking, is a *præmunire*: as writing, printing, or publishing the same doctrines amounted, we may remember, to high treason. 10. By statute 6 Ann. c. 23. if the assembly of peers of Scotland, convened to elect their 16 representatives in the British parliament, shall presume to treat of any other matter save only the election, they incur the penalties of a *præmunire*. 11. The stat. 6 Geo. I. c. 18. (enacted in the year after the infamous South Sea project had beggared half the nation) makes all unwarrantable undertakings by unlawful subscriptions, then commonly known by the name of *bubbles*, subject to the penalties of a *præmunire*. 12. The stat. 12 Geo. III. c. 11. subjects to the penalties of the statute of *præmunire* all such as knowingly and wilfully solemnize, assist, or are present at, any forbidden marriage of such of the descendants of the body of king George II. as are by that act prohibited to contract matrimony without the consent of the crown.

Having thus inquired into the nature and several species of *præmunire*, its punishment may be gathered from the foregoing statutes, which are thus shortly summed up by Sir Edward Coke: "That, from the conviction, the defendant shall be out of the king's protection, and his lands and tenements, goods and chattels, forfeited to the king; and that his body shall remain in prison at the king's pleasure, or (as other authorities have it) during life; both which amount to the

Præsentis the same thing, as the king by his prerogative may any time remit the whole, or any part of the punishment, except in the case of transgressing the statute of *hæreas corpus*. These forfeitures here inflicted do not (by the way) bring this offence within our former definition of *FELONY*; being inflicted by particular statutes, and not by the common law. But so odious, Sir Edward Coke adds, was this offence of præmunire, that a man that was attainted of the same, might have been slain by any other man without danger of law; because it was provided by law, that any man might do to him as to the king's enemy; and any man may lawfully kill an enemy. However, the position itself, that it is at any time lawful to kill an enemy, is by no means tenable: it is only lawful, by the law of nature and nations, to kill him in the heat of battle, or for necessary self-defence. And to obviate such savage and mistaken notions, the statute 5 Eliz. c. 1. provides, that it shall not be lawful to kill any person attainted in a præmunire, any law, statute, opinion, or exposition of law to the contrary notwithstanding. But still such delinquent, though protected as a part of the public from public wrongs, can bring no action for any private injury, how atrocious forever; being so far out of the protection of the law, that it will not guard his civil rights, nor remedy any grievance which he as an individual may suffer. And no man, knowing him to be guilty, can with safety give him comfort, aid, or relief.

PRÆNESTE, (anc. geog.) a town of Latium, to the south-east of Rome, towards the territory of the *Æqui*; a place of great strength. Famous for the temple and oracle of Fortune, called *Sortes Prænestinae*, (Strabo); which Tiberius wanted to destroy, but was deterred by the awful majesty of the place. From a colony it was raised to a municipium by Tiberius; (Inscriptions, Florus, A. Gellius), on the consideration of his recovery from a dangerous illness near this place. Thither the Roman emperors usually retired, on account of the agreeableness of the situation, (Suetonius). It was a very ancient city, with a territory of large extent, (Livy.) The temple of Fortune was built in the most sumptuous manner by Sylla, and the pavement was mosaic work, (Pliny). Concerning the *Sortes*, there is a remarkable passage in Cicero; who says, that it was all a mere contrivance, in order to deceive, either for the purposes of gain or superstition. The town that has succeeded it, stands low in a valley, and is called *Palastrina*, in the Campania of Rome. E. Long. 13. 30. Lat. 42. 0.

PRÆSIDIUM, (Notitia) a town of the Cornavii in Britain. Now thought to be Warwick, (Camden).—Another of Corfica (Antonine), 30 miles to the south of Aleria.—A third *Præsidium*URNAMED *Jalium*, in Bætica, (Pliny).

PRÆTORIA AUGUSTA (Ptolemy), a town of Dacia. Now called *Brassov* by the natives, and *Cronstat* by the Germans, (Baudrand): a town in Transylvania. E. Long. 25°. N. Lat. 47°.—Another of the Salassii, near the two gates or defiles of the Alps, the Graje and Penninae, (Pliny); a Roman colony, settled by Augustus after the defeat of the Salassii by Terentius Varro, on the spot where he encamped, (Strabo, Dio Cassius, Ptolemy), situated on the river Duria Major. The town is now called *Aosta*

or *Auß*, in Piedmont. E. Long. 7. 14. N. Lat. Prætorium, Prægue, 45. 19.  
PRÆTORIUM (Antonine, Notitia Imperii), a town of the Brigantes. New *Paterington* (Camden), near the mouth of the Humber in Yorkshire. *Coventry*, (Talbot.)

PRAGUE, a city of Bohemia, and capital of the whole kingdom, is situated 14° 40' of long. and 50° 5' of lat. It stands on both sides the Mulda, over which there is a stone bridge; but the river, though of great breadth here, is nevertheless shallow, and not navigable. On both sides the bridge are several statues, and, among others, that of St John of Nepomuck, whom king Wenzel caused to be thrown from the bridge into the river, for venturing to reprove him upon some occasion; but in 1720 he was canonized as a saint, and is at present held in such veneration in Bohemia, that all other saints seem, on his account, to be forgotten. The houses of this city are wholly built of stone, and consist for the most of three stories. Here are near 100 churches and chapels, and about 40 cloisters. The number of its Christian inhabitants is said to be 70,000, and of Jews about 12,000. The principal branch of its trade consists in brewing of beer. It is divided into the Old and the New Towns, and that called the *Small side*; the former lying on the east side of the Mulda, and the latter on the west. The whole is about 12 miles in circumference, and but thinly inhabited. The fortifications are not of great importance, as it may be flanked and raked on all sides. However, the king of Prussia was not able to make himself master of it in the late war, though he almost destroyed it with his bombs, &c. It stands in a pleasant and fruitful country, in the midst of gardens, fine fields, palaces, and pleasure-houses. It hath suffered greatly by sieges, and hath been often taken and plundered. The university was founded by Charles IV. in the year 1347. In 1409, when John Huss was rector of the university, there were no less than 44,000 students; and when the emperor Charles V. would have retrenched their privileges, 24,000 are said to have left it in one week, and 16,000 in a short time after. The Jews have the trade of this city almost entirely in their own hands. They deal in all sorts of commodities, especially the precious stones found in the Bohemian mines, and, by receiving all old-fashioned things in payment, quite ruin the Christian handicraftsmen. In 1744 they narrowly escaped being expelled the kingdom, having been suspected of corresponding with the Prussians, when they made themselves masters of the city. The grand prior of the order of Malta, for Bohemia, Moravia, and Silesia, resides here; and the church and hospital of the Holy Ghost is the seat of the general and grand-masters of the holy order of knights of the cross with the red star, residing in the above-mentioned countries, and in Poland and Hungary. The cathedral is dedicated to St Veit, and adorned with many magnificent tombs of great personages. On Ratschin-hill, in Upper-Prague, most of the nobility have houses, and the emperor a very magnificent palace, and a summer-house, commanding one of the finest prospects in the world. Here the tribunals of the regency meet; and the halls, galleries, and other apartments, are adorned with a multitude of noble pictures. The great hall, where

Prague  
Pratique.

Praxagoras  
Precedence.

where the coronation-feast is kept, is said to be the largest of the kind in Europe next to that of Westminster. The castle stands on the above-mentioned mountain, called *Ratschin* or the *White Mountain*, and is very strong. From a window of this castle the emperor's counsellors were thrown in 1618; but though they fell from a great height, yet they were not killed, nor indeed much hurt. On the same mountain stands also the archiepiscopal palace. In the New Town is an arsenal, and a religious foundation for ladies, called the *Free Temporal English foundation*, over which an abbess presides. In the Lesser Side or Town, the counts Colloredo and Wallenstein have very magnificent palaces and gardens. The stables of the latter are very grand; the racks being of steel, and the mangers of marble, and a marble pillar betwixt each horse; over each horse also is placed his picture, as big as life. Though the inhabitants of Prague in general are poor, and their shops but meanly furnished; yet, it is said, there are few cities where the nobility and gentry are more wealthy, and live in greater state. Here is much gaming, masquerading, feasting, and very splendid public balls, with an Italian opera, and assemblies in the houses of the quality every night. On the White Mountain, near the town, was fought the battle, in which the Protestants, with the elector Palatine Frederic their king, were defeated. The lustres and drinking glasses made here of Bohemian crystal are much esteemed, and vended all over Europe. These crystals are also polished by the Jews, and set in rings, ear-pendants, and shirts-buttons. The chief tribunal consists of twelve stadtholders, at the head of whom is the great burgrave, governor of the kingdom and city, immediately under the emperor, and the chancery of Bohemia.

PRAM, or PRAME, a kind of lighter used in Holland and the ports of the Baltic Sea, to carry the cargo of a merchant-ship *along-side* in order to lade, or to bring it to shore to be lodged in the storehouses after being discharged out of the vessel.

PRAME, in military affairs, a kind of floating battery, being a flat-bottomed vessel, which draws little water, mounts several guns, and is very useful in covering the disembarkation of troops. They are generally made use of in transplanting the troops over the lakes in America.

PRAMNION, in natural history, the name of a femipellucid gem.—This is a very singular stone, and of a very great concealed beauty. Our lapidaries, when they meet with it, call it by the name of the *black agate*. It is of an extremely close, compact, and firm texture, of a smooth and equal surface, and in shape very irregular, being sometimes round, sometimes oblong, and often flat; in size it seldom exceeds two inches. It appears, on a common inspection, to be of a fine deep black; but held up against the sun, or the light of a candle, it is an elegant red clouded by a quantity of subtle black earth. We have it from the East Indies.

PRATIQUE, or PRATTIC, in commerce, a negotiation or communication of commerce which a merchant vessel obtains in the port it arrives in and the countries it discovers; hence to obtain a pratique, is to obtain liberty to frequent a port, to go ashore, to buy and sell, &c.

PRAXAGORAS, a native of Athens, at 19 years of age composed the History of the Kings of Athens, in two books: and at 22 the Life of Constantine the Great, in which, though a pagan, he speaks very advantageously of that prince. He also wrote the History of Alexander the Great. He lived under Constantius, about the year 345.

PRAXITILES, a very famous Greek sculptor, who lived 330 years before Christ, at the time of the reign of Alexander the Great. All the ancient writers mention his statues with a high commendation, especially a Venus excubited by him for the city of Cnidus, which was so admirable a piece, that king Nicomedes offered to release the inhabitants from their tribute as the purchase of it; but they refused to part with it. He was one of the gallants of the celebrated courtesan Phryne.

PREACHING. See DECLAMATION, Art. I.—The word is derived from the Hebrew *parafsch, expofuit*, “he expounded.”

PREADAMITE, a denomination given to the inhabitants of the earth, conceived, by some people, to have lived before Adam.

Isaac de la Pereyra, in 1655, published a book to evince the reality of Preadamites, by which he gained a considerable number of proselytes to the opinion: but the answer of Demarets, professor of theology at Groningen, published the year following, put a stop to its progress; though Pereyra made a reply.

His system was this: The Jews he calls *Adamites*, and supposes them to have issued from Adam; and gives the title *Preadamites*, to the Gentiles, whom he supposes to have been a long time before Adam. But this being expressly contrary to the first words of Genesis, Pereyra had recourse to the fabulous antiquities of the Egyptians and Chaldeans, and to some idle rabbins, who imagined there had been another world before that described by Moses. He was apprehended by the inquisition in Flanders, and very roughly used, though in the service of the dauphin. But he appealed from their sentence to Rome; whither he went in the time of Alexander VII. and where he printed a retractation of his book of Preadamites.

PREAMBLE, in law, the beginning of an act of parliament, &c. which serves to open the intent of the act, and the mischiefs intended to be remedied by it.

PREBEND, the maintenance a prebendary receives out of the estate of a cathedral or collegiate church. Prebends are distinguished into simple and dignitary: a simple prebend has no more than the revenue for its support; but a prebend with dignity, has always a jurisdiction annexed to it.

PREBENDARY, an ecclesiastic who enjoys a prebend.

The difference between a prebendary and a canon is, that the former receives his prebend in consideration of his officiating in the church, but the latter merely by his being received into the cathedral or college.

PRECARIUM, in Scots law. See LAW, N° clxxxiii.

PRECEDENCE, a place of honour to which a person is entitled. This is either of courtly or of right. The former is that which is due to age, estate, &c. which is regulated by custom and civility: the latter

Precedent  
Predefinition.

latter is settled by authority; and, when broken in upon, gives an action at law. For the rules of precedence in Britain, see HERALDRY, p. 3612.

**PRECEDENT**, in law, a case which has been determined, and which serves as a rule for all of the same nature.

**PRECENTOR**, a dignity in cathedrals, popularly called the *chantor*, or *master of the choir*.

**PRECEPT**, in law, a command in writing sent by a chief justice or justice of the peace, for bringing a person, record, or other matter before him.

**PRECEPT of *Clare Constat***, in Scots law. See LAW, Part II. N° clxxx. 28.

**PRECEPT of *Sessin***, in Scots law. See LAW, Part III. N° clxiv. 16.

**PRECIÆ**, (*precious*, "early,") the name of the 21 order in Linnæus's fragments of a natural method; consisting of primrose, an early flowering plant, and a few genera which agree with it in habit and structure, tho' not always in the character or circumstance expressed in the title.

**PRECEPTIVE**, any thing which gives or contains precepts.

**PRECEPTIVE Poetry**. See POETRY, n° 69, &c.

**PRECIPITANT**, in chemistry, is applied to any liquor, which, when poured on a solution, separates what is dissolved, and makes it precipitate, or fall to the bottom of the vessel.

**PRECIPATE**, in chemistry, a substance which, having been dissolved in a proper menstruum, is again separated from its solvent, and throw down to the bottom of the vessel, by pouring some other liquor upon it.

**PRECIPITATION**. See CHEMISTRY, n° 71.

**PRECOGNITION**, in Scots law. See LAW, Part III. N° clxxvi. 43.

**PRECORDIA**, in anatomy, a general name for the parts situated about the heart, in the forepart of the thorax: as the diaphragm, pericardium, and even the heart itself, with the spleen, lungs, &c.

**PREDECESSOR**, properly signifies a person who has preceded or gone before another in the same office or employment, in which sense it is distinguished from ancestor.

**PREDESTINATION**, in general, signifies a decree of God, whereby, from all eternity, he ordained such a concatenation of causes as must produce every event by a kind of fatal necessity, and maugre all opposition.

In this sense, the Turks are great predestinarians; and on this account are much more daring in battle, and willingly encounter greater dangers that they would otherwise do.

Predestination, among Christians, is used, in a more limited sense, for a judgment or decree of God, whereby he has resolved, from all eternity, to save a certain number of persons, from thence called *elect*; so that the rest of mankind, being left in a state of impotence, are said to be reprobated.

Nothing has occasioned more disputes than this thorny subject of predestination; the Lutherans speak of it with horror, while the Calvinists contend for it with great zeal; the Molinists and Jesuits preach it down as a most dangerous doctrine, whilst the Jansenists assert it as an article of faith: the Arminians,

Remonstrants, and Pelagians, are all avowed enemies to predestination.

**PREDIAL TITHES**, are those that are paid of things arising and growing from the ground only; as corn, hay, fruit, &c.

**PREDICABLE**, among logicians, denotes a general quality which may be predicated, or asserted of several things: thus animal is predicabile of mankind, beasts, birds, fishes, &c.

**PREDICAMENT**, among logicians, the same with category. See CATEGORY.

**PREDICATE**, in logic, that part of a proposition which affirms or denies something of the subject: in these propositions, *snow is white, ink is not white, whiteness is the predicate which is affirmed of snow, and denied of ink.*

**PRE-EMPTION**, a privilege anciently allowed the King's purveyor, of having the choice and first buying of corn and other provisions for the King's house; but taken away by the statute 19, Car. II.

**PREENING**, in natural history, the action of birds cleaning, composing, and dressing their feathers, to enable them to glide more easily through the air. For this purpose, they have two peculiar glands on their rump, which secrete an unctuous matter into a bag that is perforated, out of which the bird occasionally draws it with its bill.

**PRE-EXISTENCE**, a priority of being, or the being of one thing before another. Thus a cause, if not in time, is yet in nature pre-existent to its effect. Thus God is pre-existent to the universe. Thus a human father is pre-existent to his son. The Peripatetics, though they maintained the eternity of the world, were likewise dogmatical in their opinion, that the world ever-universe was produced, actuated, and governed, by a sovereign intelligence\*. Embarrassed, however, with the difficulty, that causation seemed to imply previous existence, as no being could operate either production or change upon another till its own existence and powers of operation had first been realized, these profound and accurate philosophers exerted all their subtilty and learning to obviate an objection so formidable. Thus, in order to extricate their system, they had recourse to a distinction which equally showed the extent of their genius and the depth of their erudition. They distinguished between priority in nature and priority in time. It is impossible, say they, to conceive the existence of the sun, for one indivisible instant prior to his emission of rays.

When a seal is stamped upon wax, the impression must be strictly and absolutely coexistent with the impulse; thus the emanant act or exertion of Deity in producing, moving, and superintending the universe, must be one continued and unsuccessive energy. It is unnecessary to enter into the depth or minutæ of this controversy, since we are assured by the best of all authorities, that the world was created in time; from whence it follows, that even in the course of duration the existence of God must have been anterior to that of his works. The difficulty urged by them, and by other sceptical philosophers, that at whatever period of duration creative power began to be exerted, it must have passed an eternity prior to that point in supine indolence and inactivity; though not to be solved by human divine activity.

Predial  
Pre-existent.

The Peripatetics maintain the world eternal.  
\* See A-  
dverse on  
the Soul.

The world, though created in time, continued in a state of inactivity, until the divine activity.

Pre-existence.

Pre-existence.

man reason, is yet less formidable, because more easily conceivable, than the eternal coexistence of an effect with its cause. Previous to that distinguished era in endless duration, when nature at the Almighty *fiat* emerged from nothing, we are entirely ignorant of the motives (if it may be so expressed) which might predispose infinite wisdom, power, and goodness, then, and not till then, to exert themselves in creating. But since, from all that we see of the divine energy and administration, nothing appears to be done without a sufficient reason, we have the best grounds to conclude, that the same conduct prevails in those divine exertions, whose nature, manner, and adjuncts, are absolutely incomprehensible by our limited powers.

It is evident, that the Divine Nature, rich in its eternal and independent all-sufficiency, could never feel any necessity which might be redressed or gratified by the existence or homage of external nature. The universe therefore must be formed for itself alone; and could only be the glorious result of unconstrained wisdom and voluntary goodness. Besides, there is no series of deductions more natural and congenial to the human mind, than to conclude, that what is eternal must be unproduced: That if it was produced, there must have been a period when it did not exist: if it was not produced, it must be independent; if independent, it must be self-existent; and if self-existent, it must from eternity to eternity be invested with powers sufficient for the maintenance and regulation of its own existence; so that not only the necessity, but perhaps even the possibility of a supreme Agent and wife Superintendent, acting upon nature, and animating or controlling her operations, is upon this hypothesis entirely superfluous.

But from the beauty, symmetry, and order, of nature, and from the number of final causes pursued in her progress and accomplished in its results, Aristotle and his followers were too wise not to perceive, and too ingenuous not to acknowledge, the sacred vestiges, the conspicuous interpositions, of infinite wisdom, power, and goodness; hence his notion of an eternal world, though generally admitted among the sages of antiquity, was an incompatible or self-destructive opinion. The objections which have already been mentioned against a temporary creation, might perhaps be obviated, if not annihilated, were it our present business to enter deeply into the nature of space and time.

But this disquisition requires a boldness and abstraction of thought, in which we might probably be followed by few, and relished by fewer readers. Such, however, as have courage, sagacity, and perseverance, to penetrate and pursue these intricacies to their ultimate conclusions, will find their investigation cheered and enlightened by the philosophical essays of Dr Isaac Watts, and by the chevalier Ramfay's principles of natural and revealed religion. Veracity likewise obliges us to add, that the speculations of Mr Hume on this abstract and arduous subject, had a greater tendency to dissipate its gloom than that philosopher himself could imagine.

The pre-existence of the human soul to its corporeal vehicle had been from time immemorial a prevailing opinion among the Asiatic sages, and from them was perhaps transferred by Pythagoras to the philosophy of the Greeks; but his metempsychosis, or transmi-

gration of souls, is too trivial either to be seriously proposed or refuted. Nevertheless, from the sentiments of Socrates concerning the immortality of the soul, delivered in his last interview with his friends, it is obvious that the tenet of pre-existence was a doctrine of the Platonic school. If at any period of life, say these philosophers, you should examine a boy, of how many ideas, of what a number of principles, of what an extent of knowledge, will you find him possessed! these, without doubt, could neither be self-derived nor recently acquired. With what avidity and promptitude does he attain the knowledge of arts and sciences, which appear entirely new to him! these rapid and successful advances in knowledge can only be the effects of reminiscence, or of a fainter and more indistinct species of recollection. But in all the other operations of memory, we find retrospective impressions attending every object or idea which emerges to her view; nor does she ever suggest any thought, word, or action, without informing us, in a manner equally clear and evident, that those impressions have been made upon our senses, mind, or intellect, on some former occasion. Whoever contemplates her progress, will easily discover, that association is her most faithful and efficacious auxiliary; and that by joining impression with impression, idea with idea, circumstance with circumstance, in the order of time, of place, of similarity or dissimilarity, she is capacitated to accumulate her treasures and enlarge her province even to an indefinite extent. But when intuitive principles, or simple conclusions, are elicited from the puerile understanding, by a train of easy questions properly arranged; where is the retrospective act of memory, by which the boy recognises those truths as having formerly been perceived in his mind? Where are the crowds of concomitant, antecedent, or subsequent ideas, with which those recollections ought naturally to have been attended? In a word, where is the sense of personal identity, which seems absolutely inseparable from every act of memory? This hypothesis, therefore, will not support pre-existence. After the Christian religion had been considerably diffused, and warmly combated by its philosophical antagonists, the same doctrine was resumed and taught at Alexandria, by Platonic proselytes, not only as a topic constituent of their master's philosophy, but as an answer to those formidable objections which had been deduced from the doctrine of original sin, and from the vices which stain, and from the calamities which disturb, human life: hence they strenuously asserted, that all the human race were either introduced to being prior to Adam, or pre-existent in his person; that they were not therefore represented by our first parents, but actually concurred in their crime, and participated their ruin.

The followers of Origen, and such as entertained the notion of pre-Adamites, might argue from the doctrine of pre-existence with some degree of plausibility. For the human beings introduced by them to the theatre of probation had already attained the capacity or dignity of moral agents; as their crime therefore was voluntary, their punishment might be just. But those who believe the whole human race created in Adam to be only pre-existent in their germs or stamina, were even deprived of this miserable subterfuge; for in these homunculi we can neither suppose the moral nor rational constitution unfolded. Since, therefore, their degeneracy

Self-existence implied in eternal being.

The Socratic argument for pre-existence refuted.

Pre-existence revived by modern Platonists.

The pre-existence of the soul taught by Asiatic sages.

Pre-existence no solution of original sin.

Pre-exist-  
-encc.

racy was not spontaneous, neither could their sufferings be equitable. Should it be said that the evil of original sin was penal, as it extended to our first parents alone, and merely consequential as felt by their posterity, it will be admitted that the distinction between penal and consequential evil may be intelligible in human affairs, where other laws, allotments, and combinations than those which are simply and purely moral, take place. But that a moral government, at one of the most cardinal periods of its administration, should admit gratuitous or consequential evil, seems to us irreconcilable with the attributes and conduct of a wise and just legislator. Consequential evil taken as such, is misery sustained without demerit; and cannot result from the procedure of wisdom, benignity, and justice; but must flow from necessity, from ignorance, from cruelty, or from caprice, as its only possible sources. But even upon the supposition of those who pretend that man was mature in all his faculties before the commission of original sin, the objections against it will still remain in full force. For it is admitted by all except the Samian sage, that the consciousness of personal identity which was felt in pre-existence, is obliterated in a subsequent state of being.

Now it may be demanded, whether agents thus re-fuscitated for punishment, have not the same right to murmur and complain as if they had been perfectly innocent, and only created for that dreadful catastrophe? It is upon this principle alone that the effects of punishment can be either exemplary or disciplinary; for how is it possible, that the punishment of beings unconscious of a crime, should ever be reconciled either to the justice or beneficence of that intention with which their sufferings are inflicted? or how can others be supposed to become wise and virtuous by the example of those who are neither acquainted with the origin nor the tendency of their miseries, but have every reason to think themselves afflicted merely for the sake of afflicting. To us it seems clear, that the nature and rationale of original sin lie inferentially retired in the bosom of Providence; nor can we, without unpardonable presumption and arrogance, form the most simple conclusion, or attempt the minutest discovery, either different from or extraneous to the clear and obvious sense of revelation. This sense indeed may with propriety be extracted from the whole, or from one passage collated with another; but independent of it, as reason has no premises, she can form no deductions. The boldness and temerity of philosophy, not satisfied with contemplating pre-existence as merely relative to human nature, has dared to try how far it was compatible with the glorious Persons of the sacred Trinity. The Arians, who allowed the subordinate divinity of our Saviour, believed him pre-existent to all time, and before all worlds; but the Socinians, who esteemed his nature as well as his person merely human, insisted that before his incarnation he was only pre-existent in the divine idea, not in nature or person. But when it is considered, that children do not begin to deduce instructions from nature and experience, at a period so late as we are apt to imagine; when it is admitted, that their progress, tho' insensible, may be much more rapid than we apprehend; when the opportunities of sense, the ardour of curiosity, the avidity of memory, and the activity of understanding, are remarked; we need not have re-

course to a pre-existent state for our account of the knowledge which young minds discover. It may likewise be added, that moral agents can only be improved and cultivated by moral discipline. Such effects therefore of any state, whether happy or miserable, as are merely mechanical, may be noxious or salutary to the patient, but can never enter into any moral economy as parts of its own administration. Pre-existence, therefore, whether rewarded or punished, without the continued impression of personal identity, affords no solution of original sin.

**PREFACE**, something introductory to a book, to inform the reader of the design, method, &c. observed therein, and generally whatever is necessary to the understanding of a book.

**PREFECT**, in ancient Rome, one of the chief magistrates who governed in the absence of the kings, consuls, and emperors.

This power was greatest under the emperors. His chief care was the government of the city, taking cognizance of all crimes committed therein and within 100 miles. He judged capitally and finally, and even presided in the senate. He had the superintendance of the provisions, building, and navigation.

The prefect of modern Rome differs little from the ancient *prefectus*, his authority only extending to 40 miles round the city.

**PREFECT of the Prætorium**, the leader of the prætorian bands destined for the emperor's guards, consisting, according to Dion, of 10,000 men. This officer, according to Suetonius, was instituted by Augustus, and usually taken from among the knights.

By the favour of the emperors his power grew very considerable; to reduce which, Constantine divided the præfecture of the prætorium into four præfectures, and each of these again he subdivided into civil and military departments, though the name was only reserved to him who was invested with the civil authority, and that of *comes belli* given him who commanded the cohorts.

**PREGNANCY**, the state of a woman who has conceived, or is with child. See **MIDWIFERY**.

**PREJUDICE**, does not mean a judgment merely as prior to another in respect of time, but as being passed before the things were duly considered and fully understood. Hence prejudice is sometimes called *anticipation*, and a *preconceived opinion*.

**PRELATE**, an ecclesiastic raised to some eminent and superior dignity in the church; as bishops, archbishops, patriarchs, &c.

**PRELIMINARY**, in general, denotes something to be examined and determined before an affair can be treated of to the purpose.

**PRELUDE**, in music, is usually a flourish or irregular air, which a musician plays off-hand, to try if his instrument be in tune, and so lead him into the piece to be played.

**PREMISSES**, in logic, an appellation given to the two first propositions of a syllogism. See **LOGIC**.

**PREMISES**, in law, properly signifies the land, &c. mentioned in the beginning of a deed.

**PREMIUM**, or **PRÆMIUM**, properly signifies a reward or recompense; but it is chiefly used in a mercantile sense for the sum of money given to an insurer whether of ships, houses, lives, &c. See **INSURANCE**.

**PRENOMEN**,

Preface  
Premium.

Prenomen, Preparation PRENOMEN, PRENOMEN, among the ancient Romans, a name prefixed to their family name, and answering to our Christian name: such are Caius, Lucius, Marcus, &c.

PREPARATION, in a general sense, the act of disposing things in such a manner as to render any foreseen event more advantageous or less hurtful according to its nature.

PREPARATION of *Dissonances*, in music, is their disposition in harmony in such a manner, that, by something congenial in what precedes, they may be rendered less harsh to the ear than they would be without that precaution: according to this definition, every discord ought to be prepared. But when, in order to prepare a dissonance, it is exacted that the found which forms it should before have formed a consonance, then there is fundamentally but one single dissonance which is prepared, viz. the seventh. Nor is even this preparation necessary in the chord which contains the sensible note, because then the dissonance being characteristic, both in its chord and in its mode, the ear has sufficient reason to expect it: it accordingly does expect it, and recognise it; nor is either deceived with respect to its chord, nor its natural progress. But when the seventh is heard upon a fundamental found which is not essential to the mode, it ought then to be prepared, in order to prevent all ambiguity; to prevent the ear, whilst listening to this note, from losing its train: and as this chord of the seventh may be inverted and combined in several different manners, from this arise likewise a number of different ways by which it may seem to be prepared, which, in the main, always issue however in the same thing.

In making use of dissonances three things are to be considered; viz. the chord which precedes the dissonance, that in which it is found, and that which is immediately subsequent to it. Preparation only respects the two first; for the third, see RESOLUTION.

When we would regularly prepare a discord in order to arrive at its chord, we must choose such a career of the fundamental bass, that the found which forms the dissonance may be a protraction into the perfect time of the same note which formed a consonance formerly struck in the imperfect in the preceding chord; this is what we call *sincoption*. See SINCOPTION.

From this preparation two advantages result; viz. 1. That there is necessarily an harmonical connection between the two chords, since that connection is formed by the dissonance itself; and, 2. That this dissonance, as it is nothing else but the continuation of the same found which had formed a consonance, becomes much less harsh to the ear than it would have been with any found recently struck. Now this is all that we expect to gain by preparation. See CADENCE, DISCORD, and HARMONY.

By what has been just said, it will appear that there is no other part peculiarly destined for preparing the dissonance, except that in which it is heard: so that if the treble shall exhibit a dissonance, that must be sincopted; but if the dissonance is in the bass, the bass must be sincopted. Though there is nothing here but what is quite simple, yet have masters of music miserably embroiled the whole matter.

Some dissonances may be found which are never prepared; such is the sixth superadded: some which are

very infrequently prepared; such is the diminished seventh.

PREPARATIONS, in pharmacy, the medicines when mixed together in such a manner as to be fit for the use of the patient. See PHARMACY, Part II. chap. i.

PREPARATIONS, in anatomy, the parts of animals prepared and preserved for anatomical uses.

The manner of preserving anatomical preparations, is either by drying them thoroughly in the air, or putting them into a proper liquor.

In drying parts which are thick, when the weather is warm, care must be taken to prevent putrefaction, fly-blows, insects, &c. This is easily done by the use of a solution of corrosive sublimate in spirit of wine, in the proportion of two drams of sublimate to a pound of spirit: the part should be moistened with this liquor as it dries, and by this method the body of a child may be kept safe even in summer. Dried preparations are apt to crack and moulder away in keeping; to prevent this their surface should be covered with a thick varnish, repeated as often as occasion requires.

Though several parts prepared dry are useful, yet others must be so managed as to be always flexible, and nearer a natural state. The difficulty has been to find a proper liquor for this purpose. Dr Monro says, the best he knows is a well rectified colourless spirit of wine, to which is added a small quantity of the spirit of vitriol or nitre. When these are properly mixed, they neither change their colour nor the consistence of the parts, except where there are ferrous or mucous liquors contained in them. The brain, even of a young child, in this mixture grows so firm as to admit of gentle handling, as do also the vitreous and crystalline humours of the eye. The liquor of the sebaceous glands and the semen are coagulated by this spirituous mixture; and it heightens the red colour of the injection of the blood-vessels, so that after the part has been in it a little time, several vessels appear which were before invisible. If you will compare these effects with what Ruysch has said of his balsam, you will find the liquor above-mentioned to come very near to it.

The proportion of the two spirits must be changed according to the part prepared. For the brain and humours of the eye, you must put two drams of spirit of nitre to one pound of spirit of wine. In preserving other parts which are harder, 30 or 40 drops of the acid will be sufficient; a larger quantity will make bones flexible, and even dissolve them. The part thus preserved should be always kept covered with the liquor: therefore great care should be taken to stop the mouth of the glass with a waxed cork and a bladder tied over it, to prevent the evaporation of the spirit; some of which, notwithstanding all this care, will fly off; therefore fresh must be added as there is occasion. When the spirits change to a dark tincture, which will sometimes happen, they should be poured off, and fresh put in their room; but with somewhat less acid than at first.

The glasses which contain the preparations should be of the finest sort, and pretty thick; for through such the parts may be seen very distinctly, and of a true colour, and the object will be so magnified as to show vessels in the glass which out of it were not to be seen.

Preparation As the glass when filled with the liquor has a certain focus, it is necessary to keep the preparation at a proper distance from the sides of it, which is easily done by little sticks suitably placed, or by suspending it by a thread in a proper situation. The operator should be cautious of putting his fingers in this liquor oftener than is absolutely necessary; because it brings on a numbness on the skin, which makes the fingers unfit for any nice operation. The best remedy for this is to wash them in water mixed with a few drops of oil of tartar per deliquium.

Dr Christ. Jac. Trew prefers the rectified spirit of grain for preserving anatomical preparations to spirit of wine, or to compositions of alcohol, amber, camphor, &c. because these soon change into a brown colour, whereas the spirit from malt preserves its limpid appearance. When any part is to be preserved wet, wash it with water till it is no more tinged. The water is next to be washed away with spirits, and then the preparation is to be put among spirits in a glass, the mouth of which is to be closely covered with a glass head, over which a wet bladder and leaf-tin are to be tied. *Com. Lit. Norimb. 1731, fenesl. 1. specim. 9.*

PREPOSITION, in grammar, one of the parts of speech, being an indeclinable particle which yet serves to govern the nouns that follow it; such as *per, pro, propter*; and through, for, with, &c.

F. Buffer allows it to be only a modificative of a part of speech, serving to circumscribe a noun.

PREPUCE, in anatomy, the foreskin; being a prolongation of the cutis of the penis, covering the glans. See ANATOMY, n° 371, q.

PREROGATIVE, an exclusive or peculiar privilege.

Royal PREROGATIVE, that special pre-eminence which the king hath over and above all other persons, and out of the ordinary course of the common law, in right of his royal dignity. It signifies in its etymology (from *præ* and *rogatus*) something that is required or demanded before, or in preference to, all others. And hence it follows, that it must be in its nature singular and eccentric; that it can only be applied to those rights and capacities which the king enjoys alone in contradistinction to others, and not to those which he enjoys in common with any of his subjects: for if once any one prerogative of the crown could be held in common with the subject, it would cease to be prerogative any longer. And therefore Finch lays it down as a maxim, that the prerogative is that law in case of the king, which is law in no case of the subject.

Prerogatives are either *direct* or *incidental*. The *direct* are such positive substantial parts of the royal character and authority, as are rooted in, and spring from, the king's political person, considered merely by itself, without reference to any other extrinsic circumstance; as, the right of sending ambassadors, of creating peers, and of making war or peace. But such prerogatives as are *incidental* bear always a relation to something else, distinct from the king's person; and are indeed only exceptions, in favour of the crown, to those general rules that are established for the rest of the community: such as, that no costs shall be recovered against the king; that the king can never be a joint-tenant; and that his debt shall be pre-

ferred before a debt to any of his subjects.

These substantive or direct prerogatives may again be divided into three kinds: being such as regard, first, the king's royal *character*, or *dignity*; secondly, his royal *authority* or *power*; and, lastly, his royal *income*. These are necessary, to secure reverence to his person, obedience to his commands, and an affluent supply for the ordinary expences of government; without all of which it is impossible to maintain the executive power in due independence and vigour. Yet, in every branch of this large and extensive dominion, our free constitution has interposed such seasonable checks and restrictions, as may curb it from trampling on those liberties, which it was meant to secure and establish. The enormous weight of prerogative, if left to itself (as in arbitrary governments it is), spreads havoc and destruction among all the inferior movements: but, when balanced and bridled (as with us) by its proper counterpoise timely and judiciously applied, its operations are then equable and regular; it invigorates the whole machine, and enables every part to answer the end of its constitution.

I. Of the royal *dignity*. Under every monarchical establishment, it is necessary to distinguish the prince from his subjects, not only by the outward pomp and decorations of majesty, but also by ascribing to him certain qualities as inherent in his royal capacity, distinct from and superior to those of any other individual in the nation. For though a philosophical mind will (says Sir William Blackstone) consider the royal person merely as one man appointed by mutual consent to preside over many others, and will pay him that reverence and duty which the principles of society demand; yet the mass of mankind will be apt to grow insolent and refractory, if taught to consider their prince as a man of no greater perfection than themselves. The law therefore ascribes to the king, in his high political character, not only large powers and emoluments, which form his prerogative and revenue, but likewise certain attributes of a great and transcendent nature; by which the people are led to consider him in the light of a superior being, and to pay him that awful respect which may enable him with greater ease to carry on the business of government. This is what we understand by the royal dignity, the several branches of which we will now proceed to enumerate.

1. And, first, the law ascribes to the king the attribute of *sovereignty*, or pre-eminence. See SOVEREIGNTY.

2. The law also, (according to Sir William Blackstone) ascribes to the king, in his political capacity, absolute *perfection*. 'The king can do no wrong.' Which ancient and fundamental maxim (says he) is not to be understood as if every thing transacted by the government was of course just and lawful; but means only two things. First, that whatever is exceptionable in the conduct of public affairs is not to be imputed to the king, nor is he answerable for it personally to his people: for this doctrine would totally destroy that constitutional independence of the crown, which is necessary for the balance of power, in our free and active, and therefore compounded, constitution. And, secondly, it means that the prerogative of the crown extends not to do any injury; that it is created for the benefit of the people, and therefore can-

Prerogative cannot be exerted to their prejudice.—“The king, moreover, (he observes), is not only incapable of *doing* wrong, but even of *thinking* wrong: he can never mean to do an improper thing: in him is no folly or weakness. And, therefore, if the crown should be induced to grant any franchise or privilege to a subject contrary to reason, or in any wise prejudicial to the commonwealth or a private person, the law will not suppose the king to have meant either an unwise or an injurious action, but declares that the king was deceived in his grant; and thereupon such grant is rendered void, merely upon the foundation of fraud and deception, either by or upon those agents whom the crown has thought proper to employ. For the law will not cast an imputation on that magistrate whom it entrusts with the executive power, as if he was capable of intentionally disregarding his trust: but attributes to mere imposition (to which the most perfect of sub-lunary beings must still continue liable) those little inadvertencies, which, if charged on the will of the prince, might lessen him in the eyes of his subjects.”

But this doctrine has been exposed as ridiculous and absurd, by Lord Abingdon, in his late *Dedication to the collective body of the people of England*. “Let us see (says he) how these maxims and their comments agree with the constitution, with nature, with reason, with common sense, with experience, with fact, with precedent, and with Sir William Blackstone himself; and whether, by the application of these rules of evidence thereto, it will not be found, that (from the want of attention to that important line of distinction which the constitution has drawn between the *king* of England and the *crown* of England) what was attributed to the *monarchy* has not been given to the *monarch*, what meant for the *kingship* conveyed to the *king*, what designed for the *thing* transferred to the *person*, what intended for *theory* applied to *practice*; and so in consequence, that whilst the premises (of the perfection of the monarchy) be true, the conclusion (that the king can do no wrong) be not false.

“And first, in reference to the constitution: to which if this matter be applied (meaning what it expresses, and if it do not it is unworthy of notice), it is subversive of a principle in the constitution, upon which the preservation of the constitution depends; I mean the principle of *resistance*: a principle which, whilst no man will now venture to gain say, Sir William Blackstone himself admits, “*is justifiable to the person of the prince*, when the being of the state is endangered, and the public voice proclaims such resistance necessary;” and thus, by such admission, both disproves the maxim, and oversets his own comment thereupon: for to say that “the king can do no wrong,” and that “he is incapable even of thinking wrong,” and then to admit that “resistance to his person is justifiable,” are such jarring contradictions in themselves, that, until reconciled, the necessity of argument is suspended.

“With respect then, in the next place, to the agreement of this maxim, and its comment, with nature, with reason, and with common sense, I should have thought myself sufficiently justified in appealing to every man’s own reflection for decision, if I had not been made to understand that nature, reason, and common sense, had had nothing to do with either. Sir William Blackstone says, ‘That though a philosophical mind will

Prerogative consider the royal person merely as one man appointed by mutual consent to preside over others, and will pay him that reverence and duty which the principles of society demand, yet the maxims of mankind will be apt to grow insolent and refractory if taught to consider their prince as a man of no greater perfection than themselves; and therefore the law ascribes to the king, in his high political character, certain attributes of a great and transcendent nature, by which the people are led to consider him in the light of a superior being, and to pay him that awful respect which may enable him with greater ease to carry on the business of government.’ So that, in order to govern with greater ease, (which by the bye is mere assertion without any proof), it is necessary to deceive the maxims of mankind, by making them believe, not only what a philosophical mind cannot believe, but what it is impossible for any mind to believe; and therefore, in the investigation of this subject, according to Sir William, neither nature, reason, nor common sense, can have any concern.—

“It remains to examine in how much this maxim and its comment agree with experience, with fact, with precedent, and with Sir William Blackstone himself. And here it is matter of most curious speculation, to observe a maxim laid down, and which is intended for a rule of government, not only without a single case in support of it, but with a string of cases, that may be carried back to Egbert the first monarch of England, in direct opposition to the doctrine. Who is the man, that, reading the past history of this country, will show us any king that has done no wrong? Who is the reader that will not find, that all the wrongs and injuries which the free constitution of this country has hitherto suffered, have been solely derived from the arbitrary measures of our kings? And yet the maxims of mankind are to look upon the king as a superior being; and the maxim, that “the king can do no wrong,” is to remain as an article of belief. But, without pushing this inquiry any further, let us see what encouragement Sir William Blackstone himself has given us for our credulity. After stating the maxim, and presenting us with a most lively picture, ‘of our sovereign lord thus *all perfect and immortal*,’ what does he make this all-perfection and immortality in the end to come to? His words are these: “For when king Charles’s deluded brother attempted to *enslave* the nation,’ (*no wrong this, to be sure*), ‘he found it was beyond his power: the people both *could*, and *did* resist him; and in consequence of such resistance obliged him to quit his enterprize and his throne together \*.”

The sum of all is this: That the Crown of England and the King of England are distinguishable, and not synonymous terms: that allegiance is due to the *crown*, and through the crown to the *king*: that the attributes of the crown are sovereignty, perfection, and perpetuity; but that it does not therefore follow, that the king can do no wrong. It is indeed to be admitted, that in high respect for the crown, high respect is also due to the wearer of that crown; that is, to the king: but the crown is to be preferred to the king, for the first veneration is due to the constitution. It is likewise to be supposed, that the king will do no wrong: and as, to prevent this, a privy council is appointed.

Prerogative pointed by the constitution to assist the king in the execution of the government; so if any wrong be done, 'these men,' as Montefquieu expresses it, 'may be examined and punished (A).'

"But if any future king shall think to screen these evil counsellors, from the just vengeance of the people, by becoming *his own minister*; and, in so doing, shall take for his sanction the *attribute of perfection*, shall trust to the deception of his being a *superior being*, and cloak himself under the maxim that *the king can do no wrong*; I say, in such a case, let the appeal already made to the constitution, to nature, to reason, to common sense, to experience, to fact, to precedent, and to Sir William Blackstone himself, suffice; and preclude the necessity of any further remarks from me (B)."

To proceed now to other particulars: The law determines, that in the king can be no negligence, or LACHES; and therefore no delay will bar his right. *Nullum tempus occurrit regi*, is the standing maxim upon all occasions: for the law intends that the king is always buied for the public good, and therefore has not leisure to assert his right within the times limited to subjects. In the king also can be no stain or corruption of blood: for if the heir to the crown were attainted of treason or felony, and afterwards the crown should descend to him, this would purge the attainer *ipso facto*. And therefore, when Henry VII. who as earl of Richmond stood attainted, came to the crown, it was not thought necessary to pass an act of parliament to reverse this attainder; because, as lord Bacon in his history of that prince informs us, it was agreed that the assumption of the crown had at once purged all attainders. Neither can the king in judgment of law, as king, ever be a minor or under age; and therefore his royal grants and assents to acts of parliament are good, though he has not in his natural capacity attained the legal age of 21. By a statute indeed, 28 Hen. VIII. c. 17. power was given to future kings to rescind and revoke all acts of parliament that should be made while they were under the age of 24: but this was repealed by the statute 1 Edw. VI. c. 11. so far as related to that prince, and both statutes are declared to be determined by 24 Geo. II. c. 24. It hath also been usually thought prudent, when the heir apparent has been very young, to appoint a protector, guardian, or regent, for a limited time: but the very necessity of such extraordinary provision is sufficient to demonstrate the truth of that maxim of common law, that in the king is no minority; and therefore he hath no legal guardian. See REGENT.

Blackst.  
Comment.

3. A third attribute of the king's majesty is his *perpetuity*. The law ascribes to him, in his political capacity, an absolute immortality. The king never dies. Henry, Edward, or George, may die; but the king survives them all. For, immediately upon the decease of the reigning prince in his natural capacity, his kingship or imperial dignity, by act of law, without any interregnum or interval, is vested at once in his heir; who is, *eo instanti*, king to all intents and purposes. And so tender is the law of supposing even a possibility of his death, that his natural dissolution is generally called his *demise*; *dimissio regis vel coronæ*: an expression which signifies merely a transfer of property; for, as is observed in Plowden, when we say the demise of the crown, we mean only, that, in consequence of the disunion of the king's body-natural from his body-politic, the kingdom is transferred or demised to his successor, and so the royal dignity remains perpetual. Thus too, when Edward the fourth, in the tenth year of his reign, was driven from his throne for a few months by the house of Lancaster, this temporary transfer of his dignity was denominated his *demise*; and all process was held to be discontinued, as upon a natural death of the king.

II. We are next to consider those branches of the royal prerogative, which invest this our sovereign lord with a number of *authorities and powers*; in the exertion whereof consists the executive part of government. This is wisely placed in a single hand by the British constitution, for the sake of unanimity, strength, and dispatch. Were it placed in many hands, it would be subject to many wills: many wills, if dissipated and drawing different ways, create weakness in a government; and to unite those several wills, and reduce them to one, is a work of more time and delay than the exigencies of state will afford. The king of England is therefore not only the chief, but properly the sole, magistrate of the nation; all others acting by commission from, and in due subordination to, him: in like manner as, upon the great revolution in the Roman state, all the powers of the ancient magistracy of the commonwealth were concentrated in the new emperor; so that, as Grævia expresses it, *in ejus unius persona veteris rei publicæ vis atque majestas per cumulatam magistratuum potestates exprimebatur*.

In the exertion of lawful prerogative the king is held to be absolute; that is, so far absolute, that there is no legal authority that can either delay or resist him. He may reject what bills, may make what treaties, may coin what money, may create what peers, may pardon what offences, he pleases: unless where

(A) Except the parliament, which is the great council of the nation, the judges, and the peers, who, being the hereditary counsellors of the crown, have not only a right, but are bound *in foro conscientis*, to advise the king for the public good, the constitution knows of no other council than the privy council. Any other council, like Clifford, Arlington, Buckingham, Ashley, Lauderdale, and, as the initial letters of these names express, is a CABAL, and as such should be suppressed. Nat. Bacon, speaking of the loss of power in the grand council of lords, says, "The sense of state once contracted into a privy-council, is soon recontracted into a cabinet-council, and last of all into a favourite or two; which many times brings damage to the public, and both themselves and kings into extreme precipices; partly for want of maturity, but principally through the providence of God over-ruling irregular courses to the hurt of such as walk in them." Pol. Disc. part 2. pag. 201.

(B) For experience, fact, and precedent, see the reigns of king John, Henry III. Edward II. Richard II. Char. I. and James II. See also *Mirror of Justice*; where it is said, "that this grand assembly (meaning the now parliament, or then Wittena-gemotte) is to confer the government of God's people, how they may be kept from sin, live in quiet, and have right done them, according to the customs and laws; and more especially of wrong done by the king, queen, or their children" to which Nat. Bacon adds this note; "At this time the king might do wrong, &c. and to say Bracon and Fleta of the kings in their time." Disc. part 1. pag. 37. Lond. 1739.

Prerogative where the constitution hath expressly, or by evident consequence, laid down some exception or boundary; declaring, that thus far the prerogative shall go and no farther. For otherwise the power of the crown would indeed be but a name and a shadow, insufficient for the ends of government, if, where its jurisdiction is clearly established and allowed, any man or body of men were permitted to disobey it, in the ordinary course of law: we do not now speak of those extraordinary resources to the first principles, which are necessary when the contracts of society are in danger of dissolution, and the law proves too weak a defence against the violence of fraud or oppression. And yet the want of attending to this obvious distinction has occasioned these doctrines, of absolute power in the prince and of national resistance by the people, to be much misunderstood and perverted, by the advocates for slavery on the one hand, the demagogues of faction on the other.

Blackp.  
Comment.

The former, observing the absolute sovereignty and transcendent dominion of the crown laid down (as it certainly is) most strongly and emphatically in our law-books as well as our homilies, have denied that any case can be excepted from so general and positive a rule; forgetting how impossible it is, in any practical system of laws, to point out beforehand those eccentric remedies, which the sudden emergence of national distress may dictate, and which that alone can justify. On the other hand, over-zealous republicans, feeling the absurdity of unlimited passive obedience, have fancifully (or sometimes factiously) gone over to the other extreme: and, because resistance is justifiable to the person of the prince when the being of the state is endangered, and the public voice proclaims such resistance necessary, they have therefore allowed to every individual the right of determining this expedience, and of employing private force to resist even private oppression. A doctrine productive of anarchy, and (in consequence) equally fatal to civil liberty as tyranny itself. For civil liberty, rightly understood, consists in protecting the rights of individuals by the united force of society: society cannot be maintained, and of course can exert no protection, without obedience to some sovereign power; and obedience is an empty name, if every individual has a right to decide how far he himself shall obey.

In the exertion, therefore, of those prerogatives which the law has given him, the king is irresistible and absolute, according to the forms of the constitution. And yet, if the consequence of that exertion be manifestly to the grievance or dishonour of the kingdom, the parliament will call his advisers to a just and severe account. For prerogative consisting (as Mr Locke has well defined it) in the discretionary power of acting for the public good where the positive laws are silent, if that discretionary power be abused to the public detriment, such prerogative is exerted in an unconstitutional manner. Thus the king may make a treaty with a foreign state, which shall irrevocably bind the nation; and yet, when such treaties have been judged pernicious, impeachments have pursued those ministers by whose agency or advice they were concluded.

The prerogatives of the crown (in the sense under which we are now considering them) respect either this nation's intercourse with foreign nations, or its

own domestic government and civil polity.

Prerogative

With regard to *foreign concerns*, the king is the delegate or representative of his people. It is impossible that the individuals of a state, in their collective capacity, can transact the affairs of that state with another community equally numerous as themselves. Unanimity must be wanting to their measures, and strength to the execution of their counsels. In the king therefore, as in a centre, all the rays of his people are united, and form by that union a consistency, splendour, and power, that make him feared and respected by foreign potentates; who would scruple to enter into any engagement, that must afterwards be revised and ratified by a popular assembly. What is done by the royal authority, with regard to foreign powers, is the act of the whole nation: what is done without the king's concurrence, is the act only of private men. And so far is this point carried by our law, that it hath been held, that should all the subjects of England make war with a king in league with the king of England, without the royal assent, such war is no breach of the league. And, by the statute 2 Hen. V. c. 6. any subject committing acts of hostility upon any nation in league with the king was declared to be guilty of high treason: and, though that act was repealed by the statute 20 Hen. VI. c. 11. so far as relates to the making this offence high treason, yet still it remains a very great offence against the law of nations, and punishable by our laws, either capitally or otherwise, according to the circumstances of the case.

1. The king therefore, considered as the representative of his people, has the sole power of sending ambassadors to foreign states, and receiving ambassadors at home.

2. It is also the king's prerogative to make treaties, leagues, and alliances, with foreign states and princes. For it is, by the law of nations, essential to the goodness of a league, that it be made by the sovereign power; and then it is binding upon the whole community: and in Britain the sovereign power *quoad hoc*, is vested in the person of the king. Whatever contracts therefore he engages in, no other power in the kingdom can legally delay, resist, or annul. And yet, lest this plenitude of authority should be abused to the detriment of the public, the constitution (as was hinted before) hath here interposed a check, by the means of parliamentary impeachment, for the punishment of such ministers as from criminal motives advise or conclude any treaty, which shall afterwards be judged to derogate from the honour and interest of the nation.

3. Upon the same principle the king has also the sole prerogative of making war and peace. For it is held by all the writers on the law of nature and nations, that the right of making war, which by nature subsisted in every individual, is given up by all private persons that enter into society, and is vested in the sovereign power: and this right is given up, not only by individuals, but even by the entire body of people that are under the dominion of a sovereign. It would indeed be extremely improper, that any number of subjects should have the power of binding the supreme magistrate, and putting him against his will in a state of war. Whatever hostilities, therefore, may be com-

Prerogative mitted by private citizens, the state ought not to be affected thereby; unless that should justify their proceedings, and thereby become partner in the guilt. And the reason which is given by Grotius, why, according to the law of nations, a denunciation of war ought always to precede the actual commencement of hostilities, is not so much that the enemy may be put upon his guard (which is matter rather of magnanimity than right), but that it may be certainly clear that the war is not undertaken by private persons, but by the will of the whole community; whose right of willing is in this case transferred to the supreme magistrate by the fundamental laws of society. So that, in order to make a war completely effectual, it is necessary with us in England that it be publicly declared and duly proclaimed by the king's authority; and then, all parts of both the contending nations, from the highest to the lowest, are bound by it. And wherever the right resides of beginning a national war, there also must reside the right of ending it, or the power of making peace. And the same check of parliamentary impeachment, for improper or inglorious conduct, in beginning, conducting, or concluding a national war, is in general sufficient to restrain the ministers of the crown from a wanton or injurious exertion of this great prerogative.

4. But, as the delay of making war may sometimes be detrimental to individuals who have suffered by depredations from foreign potentates, our laws have in some respects armed the subject with powers to impel the prerogative; by directing the ministers of the crown to issue letters of marque and reprisal upon due demand: the prerogative of granting which is nearly related to, and plainly derived from, that other of making war; this being indeed only an incomplete state of hostilities, and generally ending in a formal denunciation of war. These letters are grantable, by the law of nations, whenever the subjects of one state are oppressed and injured by those of another, and justice is denied by that state to which the oppressor belongs. In this case, letters of marque and reprisal (words in themselves synonymous, and signifying a taking in return) may be obtained, in order to seize the bodies or goods of the subjects of the offending state, until satisfaction be made, wherever they happen to be found. And indeed this custom of reprisals seems dictated by nature herself; for which reason we find in the most ancient times very notable instances of it. But here the necessity is obvious of calling in the sovereign power, to determine when reprisals may be made; else every private sufferer would be a judge in his own cause. In pursuance of which principle, it is with us declared by the statute 4 Hen. V. c. 7. that, if any subjects of the realm are oppressed in time of truce by any foreigners, the king will grant marque in due form to all that feel themselves grieved. See MARQUE.

5. Upon exactly the same reason stands the prerogative of granting safe-conducts; without which, by the law of nations, no member of one society has a right to intrude into another. And therefore Puffendorf very justly resolves, that it is left in the power of all states, to take such measures about the admission of strangers as they think convenient; those being ever excepted who are driven on the coasts by necessity, or by any

Prerogative cause that deserves pity or compassion. Great tenderness is shown by our laws, not only to foreigners in distress, (see WARRER), but with regard also to the admission of strangers who come spontaneously: for so long as their nation continues at peace with ours, and they themselves behave peaceably, they are under the king's protection; though liable to be sent home whenever the king sees occasion. But no subject of a nation at war with us can, by the law of nations, come into the realm, nor can travel himself upon the high seas, or send his goods and merchandize from one place to another, without danger of being seized by our subjects, unless he has letters of safe-conduct; which, by divers ancient statutes, must be granted under the king's great seal and enrolled in chancery, or else are of no effect; the king being supposed the best judge of such emergencies, as may deserve exception from the general law of arms. But passports under the king's sign-manual, or licences from his ambassadors abroad, are now more usually obtained, and are allowed to be of equal validity.

These are the principal prerogatives of the king respecting this nation's intercourse with foreign nations; in all of which he is considered as the delegate or representative of his people. But in domestic affairs, he is considered in a great variety of characters, and from thence there arises an abundant number of other prerogatives.

1<sup>o</sup>. He is a constituent part of the supreme legislative power; and, as such, has the prerogative of rejecting such provisions in parliament, as he judges improper to be passed. The expediency of which constitution has before been evinced at large under the article PARLIAMENT. We shall only farther remark, that the king is not bound by any act of parliament, unless he be named therein by special and particular words. The most general words that can be devised ("any person or persons, bodies politic, or corporate, &c.") affect not him in the least, if they may tend to restrain or diminish any of his rights or interests. For it would be of most mischievous consequence to the public, if the strength of the executive power were liable to be curtailed, without its own express consent, by constructions and implications of the subject. Yet, where an act of parliament is expressly made for the preservation of public rights and the suppression of public wrongs, and does not interfere with the established rights of the crown, it is said to be binding as well upon the king as upon the subject: and, likewise, the king may take the benefit of any particular act, though he be not especially named.

2. The king is considered, in the next place, as the generalissimo, or the first in military command, within the kingdom. The great end of society is to protect the weakness of individuals by the united strength of the community; and the principal use of government is to direct that united strength in the best and most effectual manner, to answer the end proposed. Monarchical government is allowed to be the fittest of any for this purpose: it follows therefore, from the very end of its institution, that in a monarchy the military power must be trusted in the hands of the prince.

In this capacity, therefore, of general of the kingdom, the king has the sole power of raising and regulating

**Prerogative** governing fleets and armies. The manner in which they are raised and regulated, is explained under the article **MILITARY State**. We are now only to consider the prerogative of enlisting and of governing them: which indeed was disputed and claimed, contrary to all reason and precedent, by the long parliament of king Charles I.; but, upon the restoration of his son, was solemnly declared by the statute 13 Car. II. c. 6. to be in the king alone: for that the sole supreme government and command of the militia within all his majesty's realms and dominions, and of all forces by sea and land, and of all forts and places of strength, ever was and is the undoubted right of his majesty, and his royal predecessors, kings and queens of England; and that both or either house of parliament cannot, nor ought to, pretend to the same.

This statute, it is obvious to observe, extends not only to fleets and armies, but also to forts and other places of strength within the realm; the sole prerogative, as well of erecting, as manning and governing of which, belongs to the king in his capacity of general of the kingdom: and all lands were formerly subject to a tax, for building of castles wherever the king thought proper. This was one of the three things, from contributing to the performance of which no lands were exempted, and therefore called by the Anglo-Saxons the *trinoda necessitas*; *sc. pontis reparatio, arcis constructio, et expeditio contra hostem*. And this they were called upon to do so often, that, as Sir Edward Coke from M. Paris assures us, there were in the time of Henry II. 1115 castles subsisting in England. The inconveniencies of which, when granted out to private subjects, the lordly barons of those times, were severely felt by the whole kingdom; for, as William of Newburgh remarks in the reign of king Stephen, *erant in Anglia quodammodo tot reges, vel potius tyranni, quot domini castellorum*: but it was felt by none more sensibly than by two succeeding princes, king John and king Henry III. And therefore, the greatest part of them being demolished in the barons' wars, the kings of after times have been very cautious of suffering them to be rebuilt in a fortified manner: and Sir Edward Coke lays it down, that no subject can build a castle, or house of strength, imbattled, or other fortress defensible, without the licence of the king; for the danger which might ensue, if every man at his pleasure might do it.

It is partly upon the same, and partly upon a fiscal foundation, to secure his marine revenue, that the king has the prerogative of appointing *ports* and *havens*, or such places only, for persons and merchandise to pass into and out of the realm, as he in his wisdom sees proper. By the feudal law, all navigable rivers and havens were computed among the regalia, and were subject to the sovereign of the state. And in England it hath always been held, that the king is lord of the whole shore, and particularly is the guardian of the ports and havens, which are the inlets and gates of the realm: and therefore, so early as the reign of king John, we find ships seized by the king's officers for putting in at a place that was not a legal port. These legal ports were undoubtedly at first assigned by the crown; since to each of them a court of portmote is incident, the jurisdiction of which must flow from the royal authority: the *great ports* of the sea are also re-

**Prerogative**ferred to, as well known and established, by statute 4 Hen. IV. c. 20. which prohibits the landing elsewhere under pain of confiscation: and the statute 1 Eliz. c. 11. recites, that the franchise of lading and discharging had been frequently granted by the crown.

But though the king had a power of granting the franchise of havens and ports, yet he had not the power of resumption, or of narrowing and confining their limits when once established; but any person had a right to load or discharge his merchandize in any part of the haven: whereby the revenue of the custom, was much impaired and diminished, by fraudulent landings in obscure and private corners. This occasioned the statutes of 1 Eliz. c. 11. and 13 and 14 Car. II. c. 11. § 14. which enable the crown by commission, to ascertain the limits of all ports, and to assign proper wharfs and quays in each port, for the exclusive landing and loading of merchandize.

The erection of beacons, light-houses, and sea-marks, is also a branch of the royal prerogative: whereof the first was anciently used in order to alarm the country, in case of the approach of an enemy; and all of them are signally useful in guiding and preserving vessels at sea by night as well as by day. See **BEACON**.

3<sup>o</sup>. Another capacity in which the king is considered in domestic affairs, is as the fountain of justice and general conservator of the peace of the kingdom. See the article **JUSTICE**.

4<sup>o</sup>. The king is likewise the fountain of honour, of office, and of privilege: and this in a different sense from that wherein he is styled the *fountain of justice*; for here he is really the parent of them. See the articles **JUSTICE** and **HONOUR**.

5<sup>o</sup>. Another light, in which the laws of England consider the king with regard to domestic concerns, is as the arbiter of commerce. By commerce, we at present mean domestic commerce only; the king's prerogative with regard to which, will fall principally under the articles **MARTS**, **WEIGHTS** and **Measures**, and **MONEY**.

6<sup>o</sup>. The king is, lastly, considered by the laws of England as the head and supreme governor of the national church.

To enter into the reasons upon which this prerogative is founded is matter rather of divinity than of law. We shall therefore only observe, that by statute 26 Hen. VIII. c. 1. (reciting that the king's majesty justly and rightfully is and ought to be the supreme head of the church of England; and so had been recognized by the clergy of that kingdom in their convocation) it is enacted, that the king shall be reputed the only supreme head in earth of the church of England; and shall have, annexed to the imperial crown of this realm, as well the title and stile thereof, as all jurisdictions, authorities, and commodities, to the said dignity of supreme head of the church appertaining. And another statute to the same purport was made, 1 Eliz. c. 1.

In virtue of this authority the king convenes, regulates, restrains, regulates, and dissolves, all ecclesiastical synods or convocations. This was an inherent prerogative of the crown long before the time of H. VIII. as appears by the statute 8 Hen. VI. c. 1. and the

Prærogative  
 Prefburg.

many authors, both lawyers and historians, vouched by Sir Edward Coke. So that the stat. 25 Hen. VIII. c. 19. which restrains the convocation from making or putting in execution any canons repugnant to the king's prerogative, or the laws, customs, and statutes of the realm, was merely declaratory of the old common law: that part of it only being new, which makes the king's royal authority actually necessary to the validity of every canon. The convocation or ecclesiastical synod, in England, differs considerably in its constitution from the synods of other Christian kingdoms: those consisting wholly of bishops; whereas in England the convocation is the miniature of a parliament, wherein the archbishop presides with regal fate; the upper house of bishops represents the house of lords; and the lower house, composed of representatives of the several dioceses at large, and of each particular chapter therein, resembles the house of commons with its knights of the shire and burgesses. This constitution is said to be owing to the policy of Edward I. who thereby at one and the same time let in the inferior clergy to the privileges of forming ecclesiastical canons (which before they had not), and also introduced a method of taxing ecclesiastical benefices, by consent of convocation.

From this prerogative also, of being the head of the church, arises the king's right of nomination to vacant bishoprics, and certain other ecclesiastical preferments.

As head of the church, the king is likewise the *dernier ressort* in all ecclesiastical causes; an appeal lying ultimately to him in chancery from the sentence of every ecclesiastical judge: which right was restored to the crown by statute 25 Hen. VIII. c. 19.

III. The king's fiscal prerogatives, or such as regard his revenue. See the article REVENUE.

**PRÆROGATIVE-COURT**, an English court established for the trial of all testamentary causes, where the deceased hath left *bona notabilia* within two different dioceses. In which case the probate of wills belongs to the archbishop of the province, by way of special prerogative. And all causes relating to the wills, administrations, or legacies of such persons, are originally cognizable herein, before a judge appointed by the archbishop, called the *judge of the prerogative court*; from whom an appeal lies by statute 25 Hen. VIII. c. 19. to the king in chancery, instead of the pope as formerly.

**PRESAGE**, in antiquity, denotes an augury, or sign of some future event; which was chiefly taken from the flight of birds, the entrails of victims, &c. See AUGURY and ARUSPICES.

**PRESBURG**, the capital of the kingdom of Lower Hungary, called by the inhabitants *Pestum* and *Prefporen*, situated on the Danube, about 46 miles east from Vienna, and 75 from Buda. The cattle, in which the regalia are kept, stands on a hill above the town. Here the states assemble; and in the cathedral, dedicated to St Martin, the king is crowned. The town is not very large, nor well built; but is very ancient, pleasantly situated, and enjoys a good air. Its fortifications are only a double wall and ditch. In the lower suburbs is a hill, where the king, after his coronation, goes on horseback, and brandishes St Stephen's sword towards the four cardinal points, intimating, that he will defend his country against all its enemies. Besides the cathedral, there are several other

Popish and one Lutheran church, with a Jesuits college, three convents, and two hospitals. It gives name to a county; and is the residence of the archbishop of Gran, who is primate, chief secretary, and chancellor of the kingdom, *legatus natus* of the Papal see, and prince of the holy Roman empire. E. Long. 17. 30. N. Lat. 48. 20.

**PRESBYTÆ**, persons whose eyes are too flat to refract the rays sufficiently, so that unless the object is at some distance, the rays coming from it will pass through the retina before their union, consequently vision is confused; old people are usually the subjects of this disease. In order to remedy, or at least to palliate this defect, the person should first use glasses which do not magnify, and from them pass gradually to more convex spectacles, which shorten the focus.

**PRESBYTER**, in the primitive Christian church, an elder, one of the second order of ecclesiastics; the other two being bishops and deacons. See the articles BISHOP and DEACON.

Presbyter, or elder, is a word borrowed from the Greek translation of the Old Testament, where it commonly signifies ruler or governor; it being a note of office and dignity, not of age, and in this sense bishops are sometimes called *presbyters* in the New Testament. The presbyters might baptize, preach, consecrate, and administer the eucharist in the bishop's absence, or in his presence if he authorized and deputed them; and the bishops did scarce any thing in the government of the church without their advice, consent, and amicable concurrence.

The grand dispute between the followers of the Geneva and Roman discipline, is about the sameness and difference of presbyters and bishops at the time of the apostles.

**PRESBYTERIANS**, a sect of Protestants, so called from their maintaining that the government of the church appointed in the New Testament was by presbyteries; that is, by ministers and ruling-elders, associated for its government and discipline.

The presbyterians affirm, that there is no order in the church as established by Christ and his apostles, superior to that of presbyters; that all ministers being ambassadors of Christ, are equal by their commission; and that elder or presbyter, and bishop, are the same in name and office: for which they allege, Acts xx. 28, &c.

The only difference between them and the church of England, relates to discipline and church-government. Their highest assembly is a synod, which may be provincial, national, or oecumenical: and they allow of appeals from inferior to superior assemblies, according to Acts xv. 2, 6, 22, 23. The next assembly is composed of a number of ministers and elders, associated for governing the churches within certain bounds. This authority they found upon Acts xi. 30. Acts xv. 4, 6, &c. The lowest of their assemblies or presbyteries, consists of the minister and elders of a congregation, who have power to cite before them any member, and to admonish, instruct, rebuke, and suspend him from the eucharist. They have also a deacon, whose office is to take care of the poor.

The ordination of their ministers is by prayer, fasting, and imposition of the hands of the presbytery. This

Presbyta  
 Presbyteri-  
 ans.

Preſcience is now the diſcipline of the church of Scotland.

**PRESCIENCE**, in theology, previfion, or fore-knowledge; that knowledge which God has of things to come.—The doctrine of predeſtination is founded on the preſcience of God, and on the ſuppoſition of all futurity's being preſent to him.

**PRESCRIPTION**, in medicine, is the affigning a proper and adequate remedy to the diſeaſe, from an examination of its ſymptoms, and an acquaintance with the virtues and effects of the materia medica.

**PRESCRIPTION**, in law, is a title acquired by uſe and time, and allowed by law; as when a man claims any thing, becauſe he, his anceſtors, or they whoſe eſtate he hath, have had or uſed it all the time, whereof no memory is to the contrary: or it is where for continuance of time, *ultra memoriam hominis*, a particular perſon hath a particular right againſt another.

There is a difference between preſcription, cuſtom, and uſage.

*Preſcription* hath reſpect to a certain perſon, who by *intendment* may have continuance for ever; as for inſtance, he and all they whoſe eſtate he hath in ſuch a thing, this is a preſcription: but,

*Cuſtom* is local, and always applied to a certain place; as, *time out of mind there has been ſuch a cuſtom in ſuch a place*, &c. And *preſcription* belongeth to one or a few only; but *cuſtom* is common to all.

*Uſage* differs from both, for it may be either to perſons or places; as to *inhabitants of a town to have a way*, &c.

A cuſtom and preſcription are in the right; uſage is in the poſſeſſion; and a preſcription that is good for the matter and ſubſtance, may be bad by the manner of ſetting it forth; but where that which is claimed as a cuſtom, is or for many, will be good, that regularly will be ſo when claimed by preſcription for one.

*Preſcription* is to be time out of mind; though it is not the length of time that begets the right of preſcription, nothing being done by time, although every thing is done in time; but it is a *preſumption in law, that a thing cannot continue ſo long quiet, if it was againſt right, or injurious to another*.

**PRESENCE**, a term of relation, uſed in oppoſition to abſence, and ſignifying the exiſtence of a perſon in a certain place.

**PRESENT Tense**, in grammar, the firſt tenſe of a verb, expreſſing the preſent time, or that ſomething is now performing; as *ſcribo*, I write, or am writing.

**PRESENTATION**, in eccleſiaſtical law. See **PATRONAGE**.

**PRESENTMENT**, in law. See **PROSECUTION**.

A preſentment, generally taken, is a very comprehensive term; including not only *preſentments* properly ſo called, but alſo inquisitions of office, and indictments by a grand jury. A preſentment, properly ſpeaking, is the notice taken by a grand jury of any offence from their own knowledge or obſervation, without any bill of indictment laid before them at the ſuit of the king: As the preſentment of a nuſance, a libel, and the like; upon which the officer of the court muſt afterwards frame an indictment, before the party preſented can be put to answer it. An inquisition of office is the act of a jury, ſummoned by the proper officer to inquire of matters relating to the crown, upon evidence laid before them. Some of theſe are in theſelves convictions,

and cannot afterwards be traſverſed or denied; and therefore the inqueſt, or jury, ought to hear all that can be alleged on both ſides. Of this nature are all inquisitions of *ſelo de ſe*; of flight in perſons accuſed of felony; of deodands, and the like; and preſentments of petty offences in the ſheriff's tourn or court-leet, whereupon the preſiding officer may ſet a fine. Other inquisitions may be afterwards traſverſed and examined; as particularly the coroner's inquisition of the death of a man, when it finds any one guilty of homicide; for in ſuch caſes the offender ſo preſented muſt be arraigned upon this inquisition, and may diſpute the truth of it; which brings it to a kind of indictment, the moſt uſual and effectual means of proſecution. See **INDICTMENT**.

**PRESS**, in the mechanic arts, a machine of wood or iron, ſerving to ſqueeze any body very cloſe, generally by means of a ſcrew.

Preſſes uſually conſiſt of ſix pieces; two flat ſmooth planks, between which the things to be preſſed are laid; two ſcrews or worms faſtened to the lower plank, and paſſing through two holes in the upper; and two nuts in form of an S, that ſerve to drive the upper plank, which is moveable, againſt the lower which is fixed.

Preſſes uſed for expreſſing liquors are in moſt reſpects the ſame with the common preſſes, only the under plank is perforated with a great number of holes for the juice to run through. Others have only one ſcrew or arbor, paſſing through the middle of the moveable plank, which descends into a kind of ſquare box, full of holes, through which the juices flow as the arbor is turned.

*Printing-Preſs*. } See **PRINTING**.

*Rolling-Preſs*. } See **LIBERTY of the Preſſ**.

**PRESSING**, in the manufactures, is the violently ſqueezing a cloth, ſtuff, &c. to render it ſmooth and gloſſy.

There are two methods of preſſing, viz. cold or hot.

As to the former, or cold preſſing: After the ſtuff has been ſcour'd, full'd, and ſhorn, it is folded ſquare in equal plaits, and a ſkin of vellum or paſteboard put between each plait. Over the whole is laid a ſquare wooden plank, and ſo put into the preſſ; which is ſcrew'd down tight by means of a lever. After it has lain a ſufficient time in the preſſ, they take it out, removing the paſteboards, and lay it up to keep. Some only lay the ſtuff on a firm table after plaiting and paſteboarding, cover the whole with a wooden plank, and load it with a proper weight.

The method of preſſing hot is this: When the ſtuff has received the above preparations, it is ſprinkled a little with water, ſometimes gum-water; then plaited equally, and between each two plaits are put leaves of paſteboard; and between every ſixth and ſeventh plait, as well as over the whole, an iron or braſs plate well heated in a kind of furnace. This done, it is laid upon the preſſ, and forcibly ſcrew'd down. Under this preſſ are laid five, ſix, &c. pieces at the ſame time, all furniſhed with their paſteboards and iron-plates. When the plates are well cooled, the ſtuffs are taken out and ſtitched a little together to keep them in the plaits. This manner of preſſing was only invented to cover the defects of the ſtuffs; and, accordingly, it has been frequently

Preſ.  
Preſſing.

Pressing  
||  
Prevarication.

quently prohibited.

**PRESSING**, or *Impressing*. See **IMPRESSING**.  
**PREST**, is used for a duty in money, to be paid by the sheriff on his account, in the exchequer, or for money left or remaining in his hands: 2 & 3 Edw. VI. c. 4.

**PREST-Money**, is so called from the French word *prest*, that is, *promptus, expeditus*; for that it binds those who receive it, to be ready at all times appointed, being commonly meant of soldiers.

**PRESTER JOHN**, or *Jean*, an appellation formerly given to an emperor of the Tartars who was overcome and killed by Jenghiz Khan. Since that time it has been given to the emperor of Abyssinia or Ethiopia; however, in Ethiopia itself this name is utterly unknown, the emperor being there called the *grand negus*.

**PRESTO**, in the Italian music, intimates to perform quick; as *prestissimo* does extremely quick.

**PRESTON**, a town of Lancashire in England, seated on the river Ribble, over which there is a handsome stone bridge. Here is held a court of chancery, and other offices of justice for the county palatine of Lancaster. It is noted for the defeat of the rebels here in 1715, when they were all made prisoners, and sent up to London. W. Long. 2. 26. N. Lat. 53. 45.

**PRETERITE**, in grammar, a tense which expresses the time past, or an action completely finished; as, *scripsit*, "I have written."

**PRETEXT**, a colour or motive, whether real or feigned, for doing something.

**TOGA PRETEXTA**, among the ancient Romans, a long white gown, with a border of purple round the edges, and worn by children of quality till the age of puberty, viz. by the boys till 17, when they changed it for the *toga virilis*; and by the girls till marriage.

**PRETOR**, a magistrate among the ancient Romans, not unlike our lord chief justices, or lord chancellor, or both in one; as being vested with the power of distributing justice among the citizens. At first there was only one pretor; but afterwards, another being created, the first or chief one had the title of *pretor urbanus*, or the "city pretor;" the other was called *peregrinus*, as being judge in all matters relating to foreigners. But, besides these, there were afterwards created many provincial pretors; who were not only judges, but also assisted the consuls in the government of the provinces, and even were invested with the government of provinces themselves.

**PRETORIAN GUARDS**, in Roman antiquity, were the emperor's guards, who at length were increased to 10,000: they had this denomination, according to some, from their being stationed at a place called *pretorium*: their commander was styled *praefectus pretorii*.

**PRETORIUM**, among the Romans, denoted the hall or court wherein the pretor lived, and wherein he administered justice.

It likewise denoted the tent of the Roman general, wherein councils of war, &c. were held: also a place in Rome, where the Pretorian guards were lodged.

**PREVARICATION**, in the civil law, is where the informer colludes with the defendants, and so makes only a sham prosecution.

**PREVARICATION**, in our laws, is when a man falsely seems to undertake a thing, with intention that he may

destroy it; where a lawyer pleads booty, or acts by collusion, &c.

Prevaricator  
||  
Prideaux.

It also denotes a secret abuse committed in the exercise of a public office, or of a commission given by a private person.

**PREVARICATOR**, at Cambridge, is a master of arts, chosen at a commencement, to make an ingenious satirical speech reflecting on the misdemeanours of the principal members.

**PRIAM**, king of Troy, was the son of Laomedon. He was carried into Greece after the taking of that city by Hercules; but was afterwards ransomed, on which he obtained the name of *Priam*, a Greek word signifying "ransomed." At his return he rebuilt Ilium, and extended the bounds of the kingdom of Troy, which became very flourishing under his reign. He married Hecuba, the daughter of Cisseus king of Thrace, by whom he had 19 children; and among the rest Paris, who carried off Helen, and occasioned the ruin of Troy, which is supposed to have been sacked by the Greeks about 1184 B.C. when Priam was killed by Pyrrhus the son of Achilles at the foot of an altar where he had taken refuge, after a reign of 52 years.

**PRIAPISMUS**, a **PRIAPISM**, is an erection of the penis without any concomitant pain, or the consent of other parts. It is thus called, because the person in this state resembles the lewd god Priapus. Caelius Aurelianus says it is a palsy of the femoral vessels, and other nerves distributed to the parts about the penis, by the distension of which this disorder is produced. It is of the same nature as the **SATYRIASIS**, which see.

**PRIAPUS**, in pagan worship, the son of Bacchus and Venus, who presided over gardens and the most indecent actions. He was particularly adored at Lampascus, a city at mouth of the Hellespont, said to be the place of his birth; and his image was placed in gardens to defend them from thieves and birds destructive to fruit. He was usually represented naked, with a stern countenance, matted hair, and holding either a wooden sword or sickle in his hand, and with a monstrous privy; from whence downward his body ended in a shapeless trunk. The sacrifice offered to this obscene deity was the ass; either on account of the natural uncomeliness of this animal, and its propensity to venery, or from the disappointment which Priapus met with on his attempting the chastity of Vesta, while that goddess was asleep, when she escaped the injury designed her by her being awakened by the braying of old Silenus's ass.

**PRIDEAUX** (Humphrey), was born at Padstow in Cornwall in 1648, and was honourably defended by both parents. Three years he studied at Westminster under Dr Busby; and then was removed to Christchurch, Oxford. Here he published, in 1676, his *Marmora Oxoniensia ex Arundelianis, Seldenianis, alisque conflata, cum perpetuo Commentario*. This introduced him to the Lord chancellor Finch, afterward Earl of Nottingham, who in 1679 presented him to the rectory of St Clements near Oxford, and in 1681 bestowed on him a prebend of Norwich. Some years after he was engaged in a controversy with the Papists at Norwich, concerning the validity of the orders of the church of England, which produced his book upon that subject. In 1688 he was installed in the archdeaconry of Suffolk;

Priest  
||  
Prime.

folk; to which he was collated by Dr Lloyd, then bishop of Norwich. In 1691, upon the death of Dr Edward Pocock, the Hebrew professorship at Oxford, being vacant, was offered to Dr Prideaux, but he refused it. In 1697, he published his *Life of Mahomet*; and in 1702, was installed dean of Norwich. In 1710 he was cut for the stone, which interrupted his studies for more than a year. Some time after his return to London, he proceeded with his Connexion of the History of the Old and New Testament; which he had begun when he laid aside the design of writing the History of Appropriations. He died in 1724.

**PRIEST**, a person set apart for the performing of sacrifice and other offices of religion.

**PRIEST**, in the Christian church, is a person invested with holy orders; in virtue whereof he has a power to preach, pray, administer the sacraments, &c.

**PRIMÆ VIÆ**, among physicians, denote the whole alimentary duct; including the œsophagus, stomach, and intestines with their appendages.

**PRIMAGE**, in commerce, a small duty at the water-side, usually about 12 d. *per ton*, or 6 d. *per bale*, due to the master and mariners of a ship.

**PRIMARY**, first in dignity, chief, or principal.

**PRIMARY Qualities of Bodies**. See **METAPHYSICS**, n<sup>o</sup> 31, 33, 34.

**PRIMATE**, in church-polity, an archbishop, who is invested with a jurisdiction over other bishops.

**PRIMATICCIO** (Francesco), an excellent Italian painter, descended from a noble family in Bologna. His friends perceiving his fondness for drawing, allowed him to go to Mantua, where he was six years the disciple of Julio Romano; in which time he acquired such skill, that he formed battles in stucco and basso relievo better than any other of his master's pupils in that city. When Francis I. king of France, sending to Rome for a person that understood painting and stucco, Primaticcio was chosen for this service: and the king had such confidence in him, that in 1540 he sent him to Rome to buy antiques; on which he brought back 180 statues, with a great number of busts. Upon the death of Rosso, he succeeded him in the post of superintendent of the public buildings; and in a short time finished the gallery begun by his predecessor. He brought so many statues of marble and brass to Fontainebleau, that it seemed another Rome, as well from the number of the antiques as from his own works in painting and stucco; and he was so esteemed in France, that nothing of any consequence was done without him, that had any relation to painting or building. He likewise directed the preparations for all festivals, tournaments, and masquerades; and lived in such splendor, that he was respected as a courtier, as well as a painter. Rosso and he first taught the French a good gusto. Primaticcio died in an advanced age, after being favoured and caressed in four reigns.

**PRIME, PRIMUS**, an appellation given to whatever is first in order, degree, or dignity, among several things of the same or like kind; thus we say, the prime minister, prime cost, &c.

Prime is sometimes used to denote the same with decimal, or the tenth part of an unit.

**PRIME Figure**, in geometry, one which cannot be divided into any other figures more simple than itself,

as a triangle among planes, and the pyramid among solids.

For prime numbers, in arithmetic, see the article **NUMBER**.

**PRIME of the Moon**, is the new moon when she first appears, which is about three days after the change.

**PRIME Vertical**, is that vertical circle which passes through the poles of the meridian, or the east and west points of the horizon; whence dials projected on the plane of this circle, are called *prime vertical*, or *north-and-south dials*.

**PRIME**, in the Romish church, is the first of the canonical hours, succeeding to lauds.

**PRIME**, in fencing, is the first of the chief guards. See **GUARD**.

**PRIMER SEASIN**, in feudal law, was a feudal burden, only incident to the king's tenants *in capite*, and not to those who held of inferior or mesne lords. It was a right which the king had, when any of his tenants *in capite* died seized of a knight's fee, to receive of the heir (provided he were of full age) one whole year's profits of the lands if they were in immediate possession, and half a year's profits if the lands were in reversion expectant on an estate for life. This seems to be little more than an additional relief, (see **RELIEF**;) but grounded upon this feudal reason, That, by the ancient law of feuds, immediately upon the death of a vassal the superior was entitled to enter and take seisin or possession of the land, by way of protection against intruders, till the heir appeared to claim it, and receive investiture; and for the time the lord so held it, he was entitled to take the profits; and unless the heir claimed within a year and day, it was by the strict law a forfeiture. This practice however seems not to have long obtained in England, if ever, with regard to tenures under inferior lords; but, as to the king's tenures *in capite*, this *prima seisina* was expressly declared, under Hen. III. and Ed. II. to belong to the king by prerogative, in contradistinction to other lords. And the king was entitled to enter and receive the whole profits of the land, till livery was sued; which suit being commonly within a year and day next after the death of the tenant, therefore the king used to take at an average the *first-fruits*, that is to say, one year's profits of the land. And this afterwards gave a handle to the popes, who claimed to be feudal lords of the church, to claim in like manner from every clergyman in England the first year's profits of his benefice, by way of *primities*, or *first-fruits*.—All the charges arising by primer seisin were taken away by 12 Car. II. c. 24.

**PRIMING**, in gunnery, the train of powder that is laid, from the opening of the vent, along the gutter or channel on the upper part of the breech of the gun; which, when fired, conveys the flame to the vent, by which it is further communicated to the charge, in order to fire the piece. This operation is only used on shipboard at the proof, and sometimes in garrison; for, on all other occasions, tubes are used for that purpose.

**PRIMING-Wire**, in gunnery, a sort of iron needle employed to penetrate the vent or touch-hole of a piece of ordnance, when it is loaded; in order to discover whether the powder contained therein is thoroughly

Prime  
||  
Priming.

Priming  
||  
Primula

thoroughly dry and fit for immediate service; as likewise to search the vent and penetrate the cartridge, when the guns are not loaded with the loose powder.

PRIMING, among painters, signifies the laying on of the first colour.

PRIMOGENIURE, the right of the first-born. This right seems to be an unjust prerogative, and contrary to the natural right: for since it is birth alone that gives children a title to the paternal succession, the chance of primogeniture should not throw any inequality among them. It was not till the race of Hugh Capet, that the prerogative to the succession of the crown was appropriated to the first born. By the ancient custom of gavel-kind, still preserved in some parts of our island, primogeniture is of no account, the paternal estate being equally shared among the sons.

PRIMIPILUS, in antiquity, the centurion of the first cohort of a legion, who had the charge of the Roman eagle.

PRIMITIE, the first-fruits gathered of the earth, whereof the ancients made presents to the gods.

PRIMITIVE, in grammar, is a root or original word in a language, in contradistinction to *derivative*: thus, *God* is a primitive; *godly*, a derivative; and *god-like*, a compound.

PRIMULA, the PRIMROSE; a genus of the monogynia order, belonging to the pentandria class of plants. This genus, including also the polyanthus and auricula, furnishes an excellent collection of low, fibrous-rooted, herbaceous showery perennials.

1. The *primula veris*, or spring primrose, has thick, and very fibrous roots, crowned by a cluster of large oblong indented rough leaves, and numerous flower-stalks, from about three or four, to five or six inches high; each terminated commonly by one flower.—The varieties are, common yellow-flowered primrose of the woods—white primrose—paper-white—red—double red—double yellow, and double white.—All these flower abundantly in March and April, and continue for a month or six weeks.

The cowslip primrose, or cowslip, has very thick fibrous roots, crowned by a cluster of oblong, indented round leaves, and upright, firm, flower-stalks five or six inches high; terminated each by a cluster of small flowers. The varieties are, Common single yellow cowslip of the meadows—double yellow cowslip—scarlet cowslip—hose-and-hose cowslip; one flower growing out of the bosom of another, the lowermost serving as a calyx; all of which varieties have the flower-stalks crowned by many flowers in branches.—They flower in April and May, continuing in succession a month or six weeks.

2. The polyanthus has thick fibrous roots, increasing into large bunches, crowned with a cluster of large oblong indented rough leaves; amidst them upright flower-stalks six or eight inches high, terminated mostly by a cluster of several spreading flowers of many different colours in the varieties. The principal are, purple, red, gold, orange-coloured, &c. They all flower beautifully in April and May, and frequently again in autumn; and sometimes even in winter, if the season is mild. The polyanthus is one of the noted prize-flowers among the florists; many of whom are remarkably industrious in raising a considerable variety

of different sorts, as well as in ing every art to blow them with all requisite perfection; for, among the virtuous, a polyanthus must possess several peculiar properties in order to be admitted in their collections. The chief properties required in a florist's polyanthus are, 1. The stem or flower-stalk shall be upright, moderately tall, with strength in proportion, and crowned by a good regular bunch of flowers on short pedicles, strong enough to support them nearly in an upright position. 2. The florets of each branch should be equally large, spreading open flat, with the colours exquisite, and the stripes and variegations lively and regular. 3. The eye in the centre of each floret should be large, regular, and bright; and the antheræ, by the florists called the *thrum*, should rise high enough to cover the mouth of the tube or hollow part in the middle of the florets, and render them what they call *thrum-eyed*: but when the style elevates the stigma above the antheræ, the eye of the tube generally appears hollow, showing the stigma in the middle, like the head of a pin, and is rejected as an incomplete flower, though its other properties should be ever so perfect. This pin-eyed polyanthus, however, though rejected by the florists, is the flower in its most perfect state, and great numbers of them are of as beautiful forms and colours as the thrum-eyed varieties.

3. The auricula has a thick fibrous root, crowned by a cluster of oblong, fleshy, broad, serrated, smooth leaves, resembling the shape of a bear's ear; and amidst them upright flower-stalks from about three or four to six or eight inches high, terminated by an umbellate cluster of beautiful flowers, of many different colours in the varieties. All of these have a circular eye in the middle of each flower, and of which there are different colours, whence the auriculas are distinguished into yellow-eyed, white-eyed, &c. The petals of most of the kinds are powdered with an exceeding fine farina or mealy powder, which contributes greatly to the beauty of the flower. They all flower in April or May, continuing a month or six weeks in beauty, and ripening plenty of seeds in June.

*Culture.* All the varieties of the common spring primrose multiply so fast by the roots, that it is scarce worth while to raise them from seeds. However, tho' many single kinds may be raised from seed, yet parting the roots is the only method by which the double kind can be preserved; and the same thing is to be observed of all the rest,

PRIMUM MOBILE, in the Ptolemaic astronomy, the ninth or highest sphere of the heavens, whose centre is that of the world, and in comparison of which the earth is but a point. This they will have to contain all other spheres within it, and to give motion to them, turning itself, and all them, quite round in 24 hours.

PRINCE, PRINCES, in polity, a person invested with the supreme command of a state, independent of any superior.

PRINCE also denotes a person who is a sovereign in his own territories, yet holds of some other as his superior; such are the princes of Germany, who, tho' absolute in their respective principalities, are bound to the emperor in certain services.

PRINCE also denotes the issue of princes, or those of the royal family. In France, they are called *princes*

Primula  
||  
Prince.

of the blood. In England the king's children are called *sons and daughters of England*; the eldest son is created *prince of Wales*; the cadets are created *dukes or earls* as the king pleases; and the title of all the children is *royal highness*: all subjects are to kneel, when admitted to kiss their hand, and at table out of the king's presence they are served on the knee. See *ROYAL Family*.

*PRINCE of the Senate*, in old Rome, the person who was called over first in the roll of senators, whenever it was renewed by the censors: he was always of consular and censorian dignity. See the article *SENATE*.

*PRINCE's Metal*, a mixture of copper and zinc, in imitation of gold. See *CHEMISTRY*, n<sup>o</sup> 378.

*PRINCIPAL*, the chief and most necessary part of a thing.

In commerce, principal is the capital of a sum due or lent; so called in opposition to interest. See *INTEREST*.

It also denotes the first fund put by partners into a common stock, by which it is distinguished from the calls or accessions afterwards required.

*PRINCIPAL*, in music. See *FUNDAMENTAL* and *GENERATOR*.

*PRINCIPATO*, the name of a province of Italy, in the kingdom of Naples, which is divided into two parts, called by the Italians the *Principato Ultra* and the *Principato Citra*, that is, the Hither and Farther Principato. The Hither Principato is bounded on the north by the Farther Principato and part of the Terra-di-Lavoro, on the west and south by the Tufcan Sea, and on the east by the Basilicata. It is about 60 miles in length, and 30 in breadth; the soil is fertile in wine, corn, oil, and saffron; and they have a great deal of silk, besides several mineral springs. The capital town is Salerno. The Farther Principato is bounded on the north by the county of Molese and the Terra-di-Lavoro, on the west by the Tufcan Sea, on the south by the Hither Principato, and on the east by the Capitanata. It is about 37 miles in length, and 30 in breadth. The Appennine mountains render the air cold; and the soil is not very fertile either in corn or wine, but it produces chestnuts, and pastures in great plenty. Benevento is the capital town.

*PRINCIPLE*, *PRINCIPUM*, in general, is used for the cause, source, or origin of any thing.

*PRINCIPLE*, in human nature. See *DISPOSITION*.

*PRINCIPLES*, in physics, are often confounded with elements, or the first and simplest parts whereof natural bodies are compounded, and into which they are again resolvable by the force of fire.

*PRINT*, the impression taken from a copperplate. See *Rolling-press PRINTING*.

*PRINTER*, a person who composes and takes impressions from moveable characters ranged in order, by means of ink, and a press.

*PRINTING*, the art of taking impressions from characters or figures, moveable and immovable, on paper, linen, silk, &c. There are three kinds of  
VOL. IX. 2

printing: the one from moveable letters, for books; another from copper-plates, for pictures; and the last from blocks, in which the representation of birds, flowers, &c. are cut, for printing calicoes, linen, &c. The first is called *common* or *letter-press* printing; the second, *rolling-press* printing; and the last, *calico*, &c. printing. The principal difference between the three consists in this, that the first is cast in relief, in distinct pieces; the second engraven in creux; and the third cut in relief, and generally stamped, by placing the block upon the materials to be printed, and striking upon the back of it.

*LETTER-PRESS PRINTING*. Of the above branches, this is the most curious, and deserves the most particular notice: for to it are owing chiefly our deliverance from ignorance and error, the progress of learning, the revival of the sciences, and numberless improvements in arts, which, without this noble invention, would have been either lost to mankind, or confined to the knowledge of a few.

*History of PRINTING*. Some writers have ascribed the origin of this art to the East, and ascribed a very early period to its invention; particularly P. Jovius, (*Hist. lib. xiv. p. 226.* ed. Florent. 1550.) from whom Olorius and many others have embraced the same opinion. But these have evidently confounded the European mode of printing, with the *engraved tablets* which to this day are used in China. The invention of these tablets has been ascribed by many writers even to an earlier period than the commencement of the Christian æra; but is with more probability ascribed, by the very accurate Phil. Couplet, to the year 930. The *Historia Sinensis* of Abdalla, written in Persic in 1317, speaks of it as an art in very common use. MEERMAN, vol. i. p. 16. 218, 219. vol. ii. p. 186. N.

The honour of having given rise to the European method has been claimed by the cities of Hæreleim, Mentz, and Strasburg. And to each of these it may be ascribed in a qualified sense, as they made improvements upon one another.

I. The first testimony of the inventor is that recorded by Hadrian Junius, in his *Batavia*, p. 253, ed. Lugd. Bat. 1588; which, though it hath been rejected by many, is of undoubted authority. Junius had the relation from two reputable men; Nicolaus Galius (A), who was his schoolmaster; and Quirinius Talefius, his intimate and correspondent. He ascribes it to LAURENTIUS, the son of John (Ædituus, or Custos, of the cathedral at HARLEIM, at that time a respectable office), upon the testimony of Cornelius, some time a servant to Laurentius, and afterwards bookbinder to the cathedral, an office which had before been performed by Franciscan friars. His narrative was thus: "That, walking in a wood near the city (as the citizens of opulence use to do), he began at first to cut some letters upon the rind of a beach-tree; which, for fancy's sake, being impressed on paper, he printed one or two lines, as a specimen for his grand-children (the sons of his daughter) to follow. This having  
36 K hap-

(A) Galius seems to be the same who is called *Clæus Lottynsz. Gael*, Scabinius Harlemi, as it is in the Fasti of that city, in the years 1531, 1533, and 1535. Quirinius in the same Fasti is called *Mr Quiryn Dirkzoon*. He was many years amanuensis to the great Erasmus, as appears from his epistle, 23d July 1529. tom. iii. Oper. p. 1222. He was afterwards Scabinius in 1537 & seq. and Consul in 1552 & seq. But in the troubles of Holland he was cruelly killed by the Spanish soldiers, May 23, 1573. There are some letters of Hadrian Junius to this Talefius, in the *Epistola Juniana*, p. 198.

Printing. happily succeeded, he meditated greater things (as he was a man of ingenuity and judgment); and first of all, with his son-in-law Thomas Peter (who, by the way, left three sons, who all attained the consular dignity), invented a more glutinous writing-ink, because he found the common ink sunk and spread; and then formed whole pages of wood, with letters cut upon them; of which fort I have seen some essays, in an anonymous work, printed only on one side, intitled, *Speculum nefræ salutis*; in which it is remarkable, that in the infancy of printing (as nothing is complete at its first invention) the back sides of the pages were pasted together, that they might not by their nakedness betray their deformity. These beechen letters he afterwards changed for leaden ones, and these again for a mixture of tin and lead [*stannæus*] as a less flexible and more solid and durable substance. Of the remains of which types, when they were turned to waste metal, those old wine-pots were cast, that are still preserved in the family-house, which looks into the market-place, inhabited afterwards by his great grandson Gerard Thomas, a gentleman of reputation; whom I mention for the honour of the family, and who died old a few years since. A new invention never fails to engage curiosity. And when a commodity never before seen excited purchasers, to the advantage of the inventor; the admiration of the art increased, dependents were enlarged, and workmen multiplied, the first calamitous incident! Among these was one John, whether, as we suspect, he had ominously the name of *Faufus* (a), unfaithful and unlucky to his master, or whether it was really a person of that name, I shall not much inquire; being unwilling to molest the silent shades, who suffer from a consciousness of their past actions in this life. This man, bound by oath to keep the secret of printing, when he thought he had learned the art of joining the letters, the method of casting the types, and other things of that nature, taking the most convenient time that was possible, on Christmas-eve, when every one was customarily employed in lulstral sacrifices, seizes the collection of types, and all the implements his master had got together, and, with one accomplice, marches off to Amsterdam, thence to Cologne, and at last settled at Mentz, as at an asylum of security, where he might go to work with the tools he had stolen. It is certain, that in a year's time, viz. in 1442, the *Doctrinale* of Alexander Gallus, which was a grammar much used at that time, together with the *Tracts* of Peter of Spain, came forth there, from the same types as Laurentius had made use of at Harlem."

Thus far the narrative of Junius, which he had frequently heard from Nicolaus Galius; to whom it was related by Cornelius himself, who lived to a great age, and used to burst into tears upon reflecting on the less his master had sustained, not only in his substance, but in his honour, by the roguery of his servant, his former associate and bedfellow. Cornelius, as appears by the registers of Harlem cathedral, died either in 1515, or the beginning of the following year; so that he might very well give this information to Ni-

colaus Galius, who was school-master to Hadrian Junius.

Though this circumstance is probable as to the main fact, yet we must set aside the evidence of it in some particulars. 1. The first obvious difficulty is noticed by Scrivierius; "that the types are said to be made of the *rind* of beech, which could not be strong enough to bear the impression of the press." Though this is removed, if, instead of the *bark*, we substitute a *bough* of the beech. The idea of the *bark*, when Junius wrote this, was perhaps strong in his mind, from what Virgil tells us (Ecl. v. 13.) of its being usual to cut words on the *bark* of a beech; and thence he was easily led to make a wrong application of it here.

2. The letters were at first *wooden*, and are said to be afterwards exchanged for *metal* types; from which the wine-pots were formed, remaining in the time of Junius. According to tradition, printing was carried on in the same house long after the time of Laurentius; those pots might therefore be formed from the waste metal of the printing-house, after the use of *fusile* types became universal.—But Laurentius seems to have carried the art no farther than *separate wooden types*. What is a remarkable confirmation of this, Henry Spiechel, who wrote, in the 16th century, a Dutch poem intitled *Hertspiegel*, expresses himself thus: "Thou first, Laurentius, to supply the defect of wooden tablets, adaptedst *wooden types*, and afterwards didst connect them with a thread, to imitate writing. A treacherous servant surreptitiously obtained the honour of the discovery. But truth itself, though destitute of common and wide-spread fame; Truth, I say, still remains." No mention in the poem of *metal* types; a circumstance which, had he been robbed of such, as well as of *wooden* ones, would scarcely have been passed over in silence.

When Laurentius first devised his rough specimen of the art, can only be guessed at. He died in 1440, after having published the *Speculum Belgicum*, and two editions of *Donatus*, all with different *wooden types*; which it is probable (considering the difficulties he had to encounter, and the many artists whom he must necessarily have had occasion to consult) cost him some years to execute; so that the first essay might be about 1430, which nearly agrees with Petrus Scrivierius, who says the invention was about 10 or 12 years before 1440. See LAURENTIUS.

3. What was the specimen he first diverted himself in cutting, at the distance of three centuries, one would think impossible to be discovered. And yet Joh. Enschedius, a printer, thinks he was so happy as to find it, being an old parchment *Horarium*, printed on both sides, in eight pages, containing the Letters of the Alphabet, the Lord's Prayer, the Apollies Creed, and three short prayers. And Mr Meerman having shewn this to proper artists who were judges of these matters, they gave it as their opinion that it agreed exactly with the description of Junius. It is conformable to the first edition of the Dutch *Speculum Salvationis*, and the fragments of both *Donatus*'s of Holland, both which are the works of the same Laurentius

(a) *John Fauf*, or *Fuß*, is by many supposed to have derived his name from *faustus*, "happy;" and Dr Faustus seems to carry an air of grandeur in the appellation: but very erroneously. *John Fauf*, or *Fuß*, is no more than *John Hand*, whence our name *Fiß*,

Bowyer and  
Nichols's  
Origin of  
Printing.

rentius, and were preceded by this. In these types, which are certainly moveable, cut, and uneven, there is a rudeness which Mr Meerman has not observed in any other instances. There are no numbers to the pages, no signatures, no *direction-words*, no divisions at the end of the lines; on the contrary, a syllable divided in the middle is seen, thus, *Sp iritū*, in p. 8. l. 2, 3. There are neither distinctions nor points, which are seen in the other works of Laurentius; and the letter *i* is not marked with an accent, but with a dot at the top. The lines throughout are uneven. The shape of the pages not always the same; nor (as they should be) rectangular, but sometimes rhomb-like, sometimes an *isofele trapezium*; and the performance seems to be left as a specimen both of his piety, and of his ingenuity in this essay of a new invented art. Mr Meerman has given an exact engraving of this singular curiosity.

But, whatever else may appear doubtful in the narrative of Junius, it is very clear, that the first essays of the art are to be attributed to Laurentius, who used only *separate wooden types*. See the article LAURENTIUS.

(c) Authors differ as to the person who committed this robbery. It is clear from all accounts that his name was *John*; but what his surname was is the disputed point. Junius, after some hesitation, ascribes it to John Fust; but with injustice: for he was a wealthy man, who assisted the first printers at Mentz with money; and though he afterwards was proprietor of a printing-office, yet he never, as far as appears, performed any part of the business with his own hands, and consequently he could never have been a servant to Laurentius. Nor is the conjecture of Scriverius better founded, which fixes it upon John Gutenberg, who (as appears by authentic testimonies) resided at Strasburg from 1435 to 1444, and during all that period employed much fruitless labour and expense in endeavouring to attain this art. Mr Meerman once thought, "it might be either John Meidenbachius, (who, we are told by Seb. Munster and the author of *Chronographia Moguntinensis*, was an assistant to the first Mentz printers); or John Peterheimius (who was some time a servant to Fust and Schoeffer, and set up a printing-house at Francfort in 1459); or, lastly, some other person, who, being unable through poverty to carry on the business, discovered it to *Geinsfleisch* at Mentz." But more authentic intelligence afterwards convinced him there were two persons of this name; and that John Geinsfleisch senior\* was the dishonest servant, who was born at Mentz, and who, in the papers published by Kohlerus, we find there in the year 1441, and not before: for though he was of a good family, yet was he poor, and seems to have been obliged, as well as his brother, to seek his livelihood in a foreign country; and perhaps was content to be under Laurentius, that, when he had learned the art, he might follow it in his own. But, to leave conjecture, we may produce some certain testimonies.

1. It is what Junius himself says, that the person who stole the types did it with a view to set up elsewhere; nor is it likely that he would either make no use of an art he had seen so profitable to Laurentius, or that he would teach it to another and submit to be again a servant.

2. The Lambeth Record (which is printed below, from Mr Atkins) tells us, that "Mentz gained the art by the brother of one of the workmen of Harleim, who learned it at home of his brother, who after set up for himself at Mentz."—By the strictest examination of the best authorities, it is plain that by these two *brothers* the two Geinsfleischs must be meant. But as the younger (*Gutenberg*) was never a servant to Laurentius, it must be the senior who carried off the types, and instructed his brother in the art; who first applied himself to the business at Strasburg, and afterwards joined his elder brother, who had in the mean time settled at Mentz.

What is still stronger, two chronologers of Strasburg, the one named *Dan Speklinus*, the other anonymous (in Meerman's *Documenta*, no LXXXV, LXXXVI), tells us expressly, that John Geinsfleisch (*viz.* the senior, whom they distinguish from Gutenberg), having learned the art by being servant to his *first inventor*, carried it by theft into Mentz his native country. They are right in the fact, though mistaken in the application of it; for they make Strasburg the place of the invention, and Mentelius the inventor, from whom the types were stolen. But this is plainly an error: for Geinsfleisch lived at Mentz in 1441, as appears from undoubted testimonies; and could not be a servant to Mentelius, to whom the before-mentioned writers ascribe the invention in 1440, tho' more ancient ones do not attempt to prove that he began to print before 1444 or 1447. Nor will the narrative agree better with Gutenberg, who was an earlier printer than Mentelius; since, among the evidences produced by him in his law-suit, 1439, no Geinsfleisch senior appears, nor any other servant but Laurentius Beilack. The narration therefore of the theft of Geinsfleisch, being spread by various reports through the world, and subsisting in the time of these chronologers, was applied (them to serve the cause they wrote for) to Strasburg; but serves to confirm the truth, since no writer derives the printing spoils from any other country than Holland or Alsatia. The chronologers have likewise, instead of Fust, called Gutenberg the wealthy man; who, from all circumstances, appears to have been poor. They also call Schoeffer the son-in-law of Mentelius; when it is clear that he married the daughter of Fust.

II. Some of Laurentius's types were stolen from him by one of his servants (c), *JOHN GEINSFLEICH senior*; who fled therewith to MENTZ. Having introduced the art from Harleim into this his native city, he set with all diligence to carry it on; and published in 1442, ALEXANDRI GALLI *Doctrinale*, and PETRI HISPANI *Traclatus*; two works, which, being small, but futed his circumstances; and for which, being much used in the schools, he might reasonably expect a profitable sale. They were executed with *wooden types*, cut after the model of those he had stolen.

In 1443 he hired the house *Zum Jungen*; and was assisted with money by FUST, a wealthy person, who in return had a share of the business; and about the same time *John Meidenbachius* was admitted a partner, as were some others whose names are not transmitted to our times; and in 1444 they were joined by GUTENBERG, who for that purpose quitted Strasburg. *Wooden types* being found not sufficiently durable, and not answering expectation in other respects, the two brothers first invented *cut metal types*. But while these were preparing, which must have been a work of time, several works were printed, both on *wooden separate*

36 K 2 *rate*

\* He was called *Geinsfleisch* *xar'* *zoyev*; the other was distinguished by the name of *Gutenberg*. They were both poor, though of a family distinguished by knight-hood. They were both married men; and were most probably brothers, as it was not uncommon in that age for two brothers to have the same Christian name. Their both appearing in disreputable light. The eldest raised himself, with many appearing circumstances, into a contract of marriage with Anna, a noble girl of *The Iron Gate*, related to marry her, but was compelled by a judicial decree; and afterwards cared not what became of the lady, but after he had been at Strasburg when he removed to Mentz. He had not only frequent quarrels with all his wives; but with *Andreas Wiseman*, *Andreas Wiseman*, and *John Riff*, all of whom were associated with him at Strasburg in his different employments of making of looking glasses, polishing of precious stones, and endeavouring to attain the art of printing; and with these he involved himself in three law-suits. See Meerman, vol. i. p. 163, &c. N.

Printing.

rate types and on wooden blocks; which were well adapted to small books of frequent use, such as the *Tabula Alphabctica*, the *Catholicon*, *Donati Grammatica*, and the *Confessionalia*.

From the abovementioned printers in conjunction, after many smaller essays, the Bible was published in 1450, with large cut metal types (D). And it is no wonder, considering the immense labour this work cost, that it should be seven or eight years in completing. In this same year the partnership was dissolved, and a new one entered into, in August, between *Fust and Gutenberg*; the former supplying the money, the latter skill, for their common benefit. Various difficulties arising, occasioned a law-suit for the money which *Fust* had advanced; which was determined against *Gutenberg*. A dissolution of this partnership ensued in 1455; and in 1457 a magnificent edition of the *Pfalter* was published by *Fust and Schoeffer*, with a remarkable commendation, in which they assumed to themselves the merit of a new invention, (viz. of metal types), *ad inventionem artificiosam imprimendi ac characterizandi*. This book was uncommonly elegant, and in some measure the work of *Gutenberg*; as it was four years in the press, and came out but 18 months after the partnership was dissolved between him and *Fust*.

The latter continued in possession of the printing-office: and *Gutenberg*, by the pecuniary assistance of *Conrad Humery* syndic of *Mentz* (E), and others, opened another office in the same city; whence appeared, in 1460, without the printer's name, the *Catholicon Jo. de Janua*, with a pompous colophon in praise of its beauty, and ascribing the honour of the invention to the city of *Mentz*. It was a very handsome book, though inferior to the *Pfalter* which had been published in 1457 by *Fust and Schoeffer*. Both the *Pfalter* and *Catholicon* were printed on cut metal types (F). It may not be improper to observe here, that as the *Pfalter* is the earliest book which is known to have a genuine date, it became a common practice after that publication, for printers to claim their own performances, by adding their names to them.

III. The progress of the art has been thus traced thro' its second period, the invention of cut metal types.

(D) Many writers have supposed that this was the edition of which some copies were sold in France, by *Fust*, as manuscripts, for the great price of 500 or 600 crowns, which he afterwards lowered to 50, and at last to less than 40. But it was the second and more expensive edition of 1462, that was thus disposed of, when *Fust* went to Paris in 1466, and which had cost 4000 florins before the third *quaternion* (or quire of four sheets) was printed. MEERMAN, vol. I. p. 6. 151, 152.

(E) At death of *Gutenberg*, *Conrad Humery* took possession of all his printing materials; and engaged to the archbishop *Adolphus*, that he never would sell them to any one but a citizen of *Mentz*. They were, however, soon disposed of to *Nicholas Bechtermuntze* of *Altavilla*, who, in 1469, published *Vocabularium Latino-Teutonicum*, which was printed with the same types which had been used in the *Catholicon*. This very curious and scarce *Vocabularium* was shewn to Mr *Meerman*, by Mr *Bryant*, in the duke of *Marlborough's* valuable library at *Blenheim*. It is in quarto, 35 lines long, contains many extracts from the *Catholicon*, and is called *Ex quo*, from the preface beginning with those words. MEERMAN, vol. II. p. 96.

(F) *Gutenberg* never used any other than either wooden or cut metal types till the year 1462. In 1465 he was admitted *inter Sublicos* by the elector *Adolphus*, with an annual pension; and died in the year 1468. His elder brother *Geinsfleisch* died in 1462. Their epitaphs are printed by Mr *Meerman*, vol. II. p. 154, 295.

(G) In German, *Schoeffer*; in Latin, *Opilio*; in English, *Shepherd*.—He is supposed by Mr *Meerman* to have been the first engraver on copper-plates.

(H) *Annales Hirsaugienjes*, tom. ii. ad ann. 1450.—As this book was finished in 1514, and *Trithemius* tells us he had the narrative from *Schoeffer* himself about 30 years before; this will bring us back to 1484, when *Schoeffer* must have been advanced in years, and *Trithemius* about 22 years old, who died in 1516. See *Voss's* Hist. Lat. l. i. c. 10. *Fabr. Med. & Infim. Art. l. 9.*

(I) See *Meerman*, vol. I. p. 183; who copied this testimony from *Wolffius*, *Monument. Typograph.* vol. I. p. 462.

64.

Printing.

But the honour of completing the discovery is due to *PETER SCHOEFFER* (G) de *Gernsheim*.

A very clear account of this final completion of the types is preferred by *Trithemius* (H). *Post hæc inventis successerunt subtiliora, inveneruntque modum fundendi formas omnium Latini alphabeti litterarum, quas ipsi matricæ nominabant: ex quibus rursus aeneis sive stanneis characteres fundebant, ad omnem pressuram sufficientes, quos prius manibus sculpebant. Et revera fecit ante xxx ferme annos ex ore. Petri Opilionis de Gernsheim, civis Moguntini, qui gener erat primi artis inventoris, audivi, magnam a primo inventionis sue hæc ars impressoria habuit difficultatem.—Petrus autem memoratus Opilio, tunc sanulus postea gener, sicut diximus, inventoris primi, Johannis Fust, homo ingeniosus et prudens, faciliorem modum fundendi characteres excogitavit, et artem, ut nunc est, complevit.*

Another ample testimony in favour of *Schoeffer* is given by *Jo. Frid. Faustus* of *Alschaffenburg*, from papers preserved in his family: "Peter *Schoeffer* of *Gernsheim*, perceiving his master *Fust's* design, and being himself ardently desirous to improve the art, found out (by the good providence of God) the method of cutting (*incidendi*) the characters in a matrix, that the letters might easily be singly cast, instead of being cut. He privately cut matrices for the whole alphabet; and when he showed his master the letters cast from these matrices, *Fust* was so pleased with the contrivance, that he promised Peter to give him his only daughter, *Christina*, in marriage; a promise which he soon after performed. But there were as many difficulties at first with these letters, as there had been before with wooden ones; the metal being too soft to support the force of the impression: but this defect was soon remedied, by mixing the metal with a substance which sufficiently hardened it (I)."

*Fust and Schoeffer* concealed this new improvement, by administering an oath of secrecy to all whom they intrusted, till the year 1462; when, by the dispersion of their servants into different countries, at the sacking of *Mentz* by the archbishop *Adolphus*, the invention was publicly divulged.

The first book printed with these improved types was *Durandi Rationale*, in 1459; at which time, however, they

Printing. they seem to have had only *one size of cast letters*, all the larger characters which occur being *cut types*, as appears plainly by an inspection of the book. From this time to 1466, Fuft and Schoeffer continued to print a considerable number of books; particularly two famous editions of *Tully's Offices*. In their earliest books, they printed more copies on *vellum* than on *paper*, which was the case both of their *Bibles* and *Tully's Offices*. This, however, was soon inverted; and *paper* introduced for the greatest part of their impressions: a few only being printed on *vellum*, for curiosities, and for the purpose of being *illuminated*. How long Fuft lived, is uncertain; but in 1471 we find Schoeffer was in partnership with *Conrad Henlis* and a kinsman of his master Fuft. He published many books after the death of his father-in-law; the last of which that can be discovered is a third edition of the *Psalter* in 1490, in which the old *cut types* of the first edition were used.

IV. With regard to the claim of STRASBURG: It has been already mentioned, that Gutenberg was engaged in that city in different employments; and, among others, in endeavouring to attain the art of printing. That these endeavours were unsuccessful, is plain from an authentic judicial decree of the senate of Strasburg in 1439, after the death of Andrew Drizehen (K).

But there are many other proofs that Gutenberg and his partners were never able to bring the art to perfection.

1. Wimpelingius\*, the oldest writer in favour of Strasburg, tells us, that Gutenberg was the inventor of "a new art of writing," *ars impressoria*, which might also be called a *divine benefit*, and which he happily completed at Mentz; but does not mention one book of his printing; though he adds, that Mentelius printed many volumes correctly and beautifully, and acquired great wealth; whence we may conclude that he perfected what Gutenberg had in vain essayed.

2. Wimpelingius, in another book †, tells us, the art of printing was found out by Gutenberg *incomplete*; which implies, not that he practised the art in an imperfect manner (as Laurentius had done at Harleim), but rather that he had not been able to accomplish what he aimed at.

3. Gutenberg, when he left Strasburg in 1444 or the following year, and entered into partnership with Geinsfleisch senior and others, had occasion for his brother's assistance to enable him to complete the art; which shows that his former attempts at Strasburg had been unsuccessful †.

4. These particulars are remarkably confirmed by Trithemius, who tells us, in two different places †, that Gutenberg spent all his substance in quest of this art; and met with such insuperable difficulties, that, in despair, he had nearly given up all hopes of attaining it,

till he was assisted by the liberality of Fuft, and by his brother's skill, in the city of Mentz.

5. Ulric Zell says\* the art was completed at Mentz; but that some books had been published in Holland earlier than in that city. Is it likely that Zell, who was a German, would have omitted to mention Strasburg, if it had preceded Mentz in printing?

There is little doubt therefore that all Gutenberg's labours at Strasburg amounted to no more than a fruitless attempt, which he was at last under the necessity of relinquishing; and there is no certain proof of a single book having been printed in that city till after the dispersion of the printers in 1462, when Mentelius and Eggeletius successfully pursued the business.

In fine, the pretensions of Strasburg fall evidently to be set aside. And as to the other two cities, *Harleim* and *Mentz*, the disputes between them seem easily cleared up, from the twofold invention of printing abovementioned: the first with *separate wooden types* at Harleim, by Laurentius, about 1430, and after continued by his family; the other with *METAL types*, first *cuts*, and afterwards *cast*, which were invented at Mentz, but not used in Holland till brought thither Theodoric Martens at Aloft about 1472.

From this period printing made a rapid progress in most of the principal towns of Europe. In 1490, it reached Constantinople; and, according to Mr Palmer, p. 281, &c. it was extended, by the middle of the next century, to Africa and America. It was introduced into Russia about 1560: but, from motives either of policy or superstition, it was speedily suppressed by the ruling powers; and, even under the present enlightened emperors, has scarcely emerged from its obscurity.—That it was early practised in the inhospitable regions of Iceland, we have the respectable authority of Mr Bryant: "Arngrim Jonas was born amidst the snows of Iceland; yet as much prejudiced in favour of his country as those who are natives of a happier climate. This is visible in his *Crymogæa*; but more particularly in his *Anatome Blefchiniana*. I have in my possession this curious little treatise, written in Latin by him in his own country, and printed *Typis Holensibus in Islandiâ Boreali, anno 1612*. *Hela* is placed in some maps within the Arctic circle, and is certainly not far removed from it. I believe, it is the farthest north of any place, where arts and sciences have ever resided." *Observations and Inquiries relating to various parts of Ancient History, 1767, p. 277.*

INTRODUCTION OF PRINTING INTO BRITAIN. It was a constant opinion, delivered down by our historians, as hath been observed by Dr Middleton, that the Art of Printing was introduced and first practised in England by *William Caxton*, a mercer and citizen of London; who, by his travels abroad, and a residence of many years in Holland, Flanders, and Germany, in the affairs

Printing.

Meerman, at supra.  
Annal. Harleim. ut supra, & Chron. Spontano Soc. Meerman, vol. ii. p. 103. 137.

(x) Their first attempts were made about 1436, with *wooden types*. Mr Meerman is of opinion that Geinsfleisch junior (who was of an enterprising genius, and had already engaged in a variety of projects) gained some little insight into the business by visiting his brother who was employed by Laurentius at Harleim, but not sufficient to enable him to practise it. It is certain, that, at the time of the law-suit in 1439, much money had been expended, without any profit having arisen; and the unfortunate Drizehen, in 1438, on his death-bed, lamented to his confessor, that he had been at great expence, without having been reimbursed a single *obolus*. Nor did Gutenberg (who persisted in his fruitless endeavours) reap any advantage from them; for, when he quitted Strasburg, he was overwhelmed in debt, and under a necessity of selling every thing he was in possession of. [MEERMAN, vol. I. p. 198—202.] All the depositions in the law-suit abovementioned (with the judicial decree) are printed by Mr Meerman, vol. II. p. 58—58. N.

Printing. fairs of trade, had an opportunity of informing himself of the whole method and process of the art; and by the encouragement of the great, and particularly of the abbot of Westminster, first set up a press in that abbey, and began to print books soon after the year 1471.

This was the tradition of our writers; till a book, which had scarce been observed before the Reformation, was then taken notice of by the curious, with a date of its impression from Oxford, anno 1468 and was considered immediately as a clear proof and monument of the exercise of printing in that university several years before Caxton began to deal in it.

This book, which is in the public library at Cambridge, is a small volume of 41 leaves in 4to, with this title: *Expositio Sancti Ieronimi in Simbolum Apostolorum ad Papam Laurentium*; and at the end, *Explicit expositio, &c. Impressa Oxonie, & finita Anno Domini M.CCCC.LXVIII. XVII die Decembris.*

The appearance of this book has robbed Caxton of a glory that he had long possessed, of being the author of printing to this kingdom; and Oxford ever since carried the honour of the first press. The only difficulty was, to account for the silence of history in an event so memorable, and the want of any memorial in the university itself concerning the establishment of a new art amongst them of such use and benefit to learning. But this likewise has been cleared up, by the discovery of a record, which had lain obscure and unknown at Lambeth-house, in the Register of the See of Canterbury; and gives a narrative of the whole transaction, drawn up at the very time.

An account of this record was first published in a thin quarto volume, in English; with this title: "The Original and Growth of Printing, collected out of History and the Records of this Kingdom: wherein is also demonstrated, that Printing appertaineth to the Prerogative Royal, and is a Flower of the Crown of England. By Richard Atkins, esq.—Whitehall, April the 25, 1664. By order and appointment of the right honourable Mr Secretary Morrice, let this be printed. Tho. Rycout. London: Printed by John Streater, for the Author. 1664," 4to.

It sets forth in short, "That as soon as the art of printing made some noise in Europe, Thomas Bourchier, archbishop of Canterbury, moved the then king (Henry VI.) to use all possible means for procuring a printing-mold (for so it was then called) to be brought into this kingdom. The king (a good man, and much given to works of this nature) readily hearkened to the motion; and, taking private advice how to effect his design, concluded it could not be brought about without great secrecy, and a considerable sum of money given to such person or persons as would draw off some of the workmen of Harleim in Holland, where John Guttenberg had newly invented it, and was himself personally at work. It was resolved, that less than 1000 merks would not produce the desired effect; towards which sum the said archbishop presented the king 300 merks. The money being now prepared, the management of the design was committed to Mr Robert Turnour; who then was of the robes to the king, and a person most in favour with him of any of his condition. Mr Turnour took to his assistance Mr Caxton, a citizen of good abilities, who traded much into Hol-

land; which was a creditable pretence, as well for his going, as stay in the Low Countries. Mr Turnour was in disguise (his beard and hair shaven quite off); but Mr Caxton appeared known and public. They, having received the said sum of 1000 merks, went first to Amsterdam, then to Leyden, not daring to enter Harleim itself; for the town was very jealous, having imprisoned and apprehended divers persons who came from other parts for the same purpose. They staid till they had spent the whole thousand merks in gifts and expences: so as the king was fain to send 500 merks more, Mr Turnour having written to the king that he had almost done his work; a bargain (as he said) being struck betwixt him and two Hollanders, for bringing-off one of the under-workmen, whose name was Frederick Corfellis (or rather Corfellis), who late one night stole from his fellows in disguise into a vessel prepared before for that purpose; and so, the wind favouring the design, brought him safe to London. It was not thought for prudent to set him on work at London: but, by the archbishop's means (who had been vice-chancellor and afterwards chancellor of the university of Oxon) Corfellis was carried with a guard to Oxon; which guard constantly watched, to prevent Corfellis from any possible escape, till he had made good his promise in teaching them how to print. So that at Oxford printing was first set up in England, which was before there was any printing-press or printer in France, Spain, Italy, or Germany (except the city of Mentz), which claims seniority, as to printing, even of Harleim itself, calling her city, *Urbem Moguntinam artis typographicæ inventricem primam*, though it is known to be otherwise; that city gaining the art by the brother of one of the workmen of Harleim, who had learnt it at home of his brother, and after set up for himself at Mentz. This press at Oxon was at least ten years before there was any printing in Europe, except at Harleim and Mentz, where it was but newborn. This press at Oxford was afterwards found inconvenient to be the sole printing-place of England; as being too far from London and the sea. Wherefore the king set up a press at St Alban's, and another in the city of Westminster, where they printed several books of *divinity* and *physic*: for the king (for reasons best known to himself and council) permitted then no *law-books* to be printed; nor did any printer exercise that art, but only such as were the king's sworn servants; the king himself having the price and emolument for printing books.—By this means the art grew so famous, that anno primo Rich. III. c. 9. when an act of parliament was made for restraint of aliens for using any handicrafts here (except as servants to natives), a special proviso was inserted, that strangers might bring in printed or written books to sell at their pleasure, and exercise the art of printing here, notwithstanding that act: so that in that space of 40 or 50 years, by the indulgence of Edward IV. Edward V. Richard III. Henry VII. and Henry VIII. the English proved so good proficients in printing, and grew so numerous, as to furnish the kingdom with books; and so skilful, as to print them as well as any beyond the seas; as appears by the act 25 Hen. VIII. c. 15. which abrogates the said proviso for that reason. And as it was further enacted in the said statute, that if any person bought foreign books bound, he should pay 6s. 8d.

Printing. *per book.* And it was further provided and enacted, that in case the said printers or sellers of books were unreasonable in their prices, they should be moderated by the lord chancellor, lord treasurer, the two lords chief justices, or any two of them; who also had power to fine them 3s. 4d. for every book whose price should be enhanced.—But when they were by charter corporated with *bookbinders, booksellers, and founders of letters*, 3 & 4 Philip and Mary, and called *The Company of Stationers*—they kicked against the power that gave them life, &c.—Queen Elizabeth, the first year of her reign, grants by patent the *privilege of sole printing all books that touch or concern the common laws of England*, to Tottel a servant to her majesty, who kept it entire to his death; after him, to one Yest Weirt, another servant to her majesty; after him, to Weight and Norton; and after them, king James grants the same privilege to More, one of the signet; which grant continues to this day, &c.”

From the authority of this record, all our later writers declare Corfellis to be the first printer in England; Mr Anthony Wood, the learned Mr Maittaire, Palmer, and one John Bagford, an industrious man, who had published proposals for an History of Printing, (Phil. Transf. for April 1707). But Dr Middleton has called in question the authenticity of this account, and has urged several objections to it, with the view of supporting Caxton's title to the precedence with respect to the introduction of the art into this country; of which we shall quote one or two, with the answers that have been made to them.

Objection 1. “The silence of Caxton, concerning a fact in which he is said to be a principal actor, is a sufficient confutation of it: for it was a constant custom with him, in the prefaces or conclusions of his works, to give an historical account of all his labours and transactions, as far as they concerned the publishing and printing of books. And, what is still stronger, in the continuation of the *Polychronicon*, compiled by himself, and carried down to the end of Henry the sixth's reign, he makes no mention of the expedition in quest of a printer: which he could not have omitted, had it been true; whilst in the same book he takes notice of the invention and beginning of printing in the city of Mentz.”

Answer. As Caxton makes no mention in his *Polychronicon* of his expedition in quest of a printer; so neither does he of his bringing the art into England, which it is as much a wonder he should omit as the other. And as to his saying that the invention of printing was at Mentz, he means, of printing on *single* separate types. In this he copies, as many others have, from the *Fasciculus Temporum*; a work written in 1470, by Wernerus Rolewinch de Laer, a Carthusian monk, a MS. copy of which is in the library of Gerard Jo. Vossius (see lib. iii. de *Hist. Latin.* c. 6.); and afterwards continued to the year 1474, when it was first printed at Cologne *typis Arnoldi ter Huernem*. It was republished in 1481 by Henricus Wirzburg de Vach, a Cluniac monk, without mentioning the name either of the printer or of the place of publication. It is plain that Caxton had one at least, or more probably both, of these editions before him, when he wrote his continuation of *Polychronicon*, as he mentions this work in his preface, and adopts the

sentiments of its editor. (See MEERMAN, vol. ii. p. 37. *Printing.* and his *Documenta*, N<sup>o</sup> VII. XXIV. and XXV.)

Obj. 2. “There is a farther circumstance in Caxton's history, that it seems inconsistent with the record; for we find him still beyond sea, about twelve years after the supposed transactions, “learning with great charge and trouble the art of printing” (*Recule of the Histories of Troye*, in the end of the 2d and 3d books); which he might have done with ease at home, if he had got Corfellis into his hands, as the record imports, to many years before: but he probably learnt it at Cologne, where he resided in 1471, (*Recule*, &c. *ibid.*), and whence books had been first printed with date, the year before.”

Ans. Caxton tells us, in the preface to *The History of Troye*, that he began that translation March 1. 1468, at Bruges; that he proceeded on with it at Ghent; that he finished it at Cologne in 1471; and printed it, probably, in that city with its own types. He was 30 years abroad, chiefly in Holland; and lived in the court of Margaret dutchess of Burgundy, sister of our Edward IV. It was therefore much easier to print his book at Cologne, than to cross the sea to learn the art at Oxford. But further, there was a special occasion for his printing it abroad. Corfellis had brought over so far the art of printing as he had learnt it at Harleim, which was the method of printing on *wooden separate* types, having the face of the letter cut upon them. But the art of *casting* metal types being divulged in 1462 by the workmen of Mentz, Caxton thought proper to learn that advantageous branch before he returned to England. This method of casting the types was such an improvement, that they looked on it as the *original* of printing; and Caxton, as most others do, ascribes that to Mentz.—Caxton was an assiduous with Turner in getting off *Corfellis*; but it is nowhere supposed that he came with him into England. (See MEERMAN, vol. ii. p. 34. B.)

Obj. 3. “As the Lambeth record was never heard of before the publication of *Atkins*'s book, so it has never since been seen or produced by any man; though the registers of Canterbury have on many occasions been diligently and particularly searched for it. They were examined, without doubt, very carefully by archbishop Parker, for the compiling his *Antiquities of the British Church*; where, in the life of Thomas Bourchier, though he congratulates that age on the noble and useful invention of printing, yet he is silent as to the introduction of it into England by the endeavours of that archbishop: nay, his giving the honour of the invention to Strasburg clearly shows that he knew nothing of the story of Corfellis conveyed from Harleim, and that the record was not in being in his time. Palmer himself owns, “That it is not to be found there now; for that the late earl of Pembroke assured him, that he had employed a person for some time to search for it, but in vain.” (*Hist. of Printing*, p. 314.) On these grounds we may pronounce the record to be a forgery; though all the writers above-mentioned take pains to support its credit, and call it an *authentic piece*.”

Atkins, who by his manner of writing seems to have been a bold and vain man, might possibly be the inventor: for he had an interest in imposing it upon the world, in order to confirm the argument of his book, that printing was of the prerogative royal; in opposition

Printing. opposition to the *company of Stationers*, with whom he was engaged in an expensive suit of law, in defence of the *king's patents*, under which he claimed *some exclusive powers of printing*. For he tells us, p. 3. "That, upon considering the thing, he could not but think that a public person, more eminent than a mercer, and a public purse, must needs be concerned in so public a good : and the more he considered, the more inquisitive he was to find out the truth. So that he had formed his hypothesis before he had found his record ; which he published, he says, as a friend to truth ; not to suffer one man to be entitled to the worthy achievements of another ; and as a friend to himself, not to lose one of his best arguments of entitling the king to this art." But, if Atkins was not himself the contriver, he was imposed upon at least by some more crafty ; who imagined that his interest in the cause, and the warmth that he showed in prosecuting it, would induce him to swallow for genuine whatever was offered of the kind."

Anf. On the other hand, is it likely that Mr Atkins would dare to *forge* a record, to be laid before the king and council, and which his adversaries, with whom he was at law, could disprove?—(2.) He says he received this history from a person of honour, who was some time keeper of the Lambeth Library. It was easy to have confuted this evidence, if it was false, when he published it, April 25. 1664.—(3.) John Bagford (who was born in England 1651, and might know Mr Atkins, who died in 1677), in his History of Printing at Oxford, blames those who doubted of the authenticity of the Lambeth MS.; and tells us that he knew Sir John Birkenhead had an authentic copy of it, when in 1665 [which Bagford by some mistake calls 1664, and is followed in it by Meerman] he was appointed by the house of commons to draw up a bill relating to the exercise of that art. This is confirmed by the Journals of that house, Friday Oct. 27, 1665, Vol. VIII. p. 622. where it is ordered that this Sir John Birkenhead should carry the bill on that head to the house of lords, for their consent.—The act was agreed to in the upper house on Tuesday Oct. 31. and received the royal assent on the same day; immediately after which, the parliament was prorogued. See *Journals of the House of Lords*, Vol. XI. p. 700.—It is probable then, that, after Mr Atkins had published his book in April 1664, the parliament thought proper the next year, to inquire into the *right of the king's prerogative*; and that Sir John Birkenhead took care to inspect the original, then in the custody of archbishop Sheldon: and, finding it not sufficient to prove what Mr Atkins had cited it for, made no report of the MS. to the house; but only moved, that the former law should be renewed. The MS. was probably never returned to the proper keeper of it; but was afterwards burnt in the fire of London, Sept. 13, 1666.—(4.) That Printing was practised at Oxford, was a prevailing opinion long before Atkins. Bryan Twyne, in his *Apologia pro Antiquitate Academiae Oxoniensis*, published 1608, tells us, it is so delivered down in *ancient writings*; having heard, probably, of this Lambeth MS. And king Charles I. in his letters-patent to the University of Oxford, March 5, in the eleventh of his reign, 1635, mentions Printing as brought to Oxford from abroad. As to what is objected, "that it is not

likely that the press should undergo a ten or eleven years sleep, viz. from 1468 to 1479," it is probably urged without foundation. Corfelli's might print several books without date or name of the place, as Ulric Zell did at Cologn, from 1467 to 1473, and from that time to 1494. Corfelli's name, it may be said, appears not in any of his publications; but neither does that of Joannes Peterhemius. [See MEERMAN, Vol. I. p. 34; Vol. II. p. 21—27, &c.]

Further, the famous Shakespeare, who was born in 1564, and died 1616, in the Second Part of Henry VI. act. sc. 7. introduces the rebel John Cade, thus upbraiding Lord Treasurer Say: "Thou hast most traiterously corrupted the youth of the realm, in creating a grammar-school: and whereas, before, our forefathers had no other book but the score and the tally, thou hast caused *Printing* to be used; and contrary to the king, his crowns, and dignity, thou hast built a paper-mill."—Whence now had Shakespeare this accusation against Lord Say? We are told in the Poetical Register, vol. ii. p. 231. ed. Lond. 1724, that it was from Fabian, Pol. Vergel. Hall, Hollinghed, Grafton, Stow, Speed, &c. But not one of these scribes printing to the reign of Henry VI. On the contrary, Stow, in his Annals, printed at London 1560, p. 686, gives it expressly to William Caxton, 1471. "The noble science of Printing was about this time found in Germany at Magunce, by one John Guthumburgus a knight. One Conradus an Almaine brought it into Rome: William Caxton of London mercer, brought it into England about the year 1471, and first practised the same in the Abbie of St Peter at Westminster; after which time it was likewise practised in the Abbies of St Augustine at Canterburie, Saint Albons, and other monasteries of England." What then shall we say, that the above is an anachronism arbitrarily put into the mouth of an ignorant fellow out of Shakespeare's head? We might believe so, but that we have the record of Mr Atkins confirming the fame in king Char. II.'s time. Shall we say, that Mr Atkins borrowed the story from Shakespeare, and published it with some improvements of money laid out by Henry VI. from whence it might be received by Charles II. as a prerogative of the crown? But this is improbable, since Shakespeare makes Lord Treasurer Say the instrument of importing it, of whom Mr Atkins mentions not a word. Another difference there will still be between Shakespeare and the Lambeth MS.; the poct placing it before 1449, in which year Lord Say was beheaded; the MS. between 1454 and 1459, when Bourchier was archbishop. We must say then, that lord Say first laid the scheme, and sent one to Harleim, tho' without success; but after some years it was attempted happily by Bourchier. And we must conclude, that as the generality of writers have overlooked the invention of printing at Harleim with *wooden types*, and have ascribed it to Mentz where *metal types* were first made use of; so in England they have passed by *Corfelli*, (or the first *Oxford Printer*, whoever he was, who printed with *wooden types* at Oxford, and only mentioned Caxton as the original artist who printed with *metal types* at Westminster. [See MEERMAN, vol. ii. 7, 8.] It is strange, that the learned commentators on our great dramatic poet, who are so minutely

Printing. nutely particular upon less important occasions, should every one of them, Dr Johnson excepted, pass by this curious passage, leaving it entirely unnoticed. And how has Dr Johnson trifled, by slightly remarking, "that Shakespeare is a little *too early* with this accusation!"—The great critic had undertaken to decipher obsolete words, and investigate unintelligible phrases; but never, perhaps, bestowed a thought on Caxton or Corfellis, on Mr Atkins or the authenticity of the Lambeth Record.

But, independent of the record altogether, the book stands firm as a monument of the exercise of printing in Oxford six years older than any book of Caxton's with a date. In order to get clear of this strong fact, Dr Middleton,

1. Supposes the date in question to have been falsified originally by the printer either by design or mistake; and an X to have been dropped or omitted in the age of its impression. Examples of this kind, he says, are common in the history of printing. And, "whilst I am now writing, an unexpected instance is fallen into my hands, to the support of my opinion; in an *Inauguration Speech of the Woodwardian Professor, Mr Mason*, just fresh from the press, with its date given 10 years earlier than it should have been, by the omission of an x, viz. MDCXXXIV; and the very blunder exemplified in the last piece printed at Cambridge, which I suppose to have happened in the first from Oxford."—"To this it has been very properly answered, That we should not pretend to set aside the authority of a *plain date*, without very strong and cogent reasons; and what the Doctor has in this case advanced will not appear, on examination, to carry that weight with it that he seems to imagine. There may be, and have been, mistakes and forgeries in the date both of books and of records too; but this is never allowed as a reason for suspecting such as bear no mark of either. We cannot, from a blunder in the last book printed at Cambridge, infer a like blunder in the first book printed at Oxford. Besides, the *type used* in this our Oxford edition seems to be no small proof of its antiquity. It is the German letter, and very nearly the same with that used by Fust [who has been supposed to be] the first printer; whereas Caxton and Rood use a quite different letter, something between this German and our old English letter, which was soon after introduced by De Worde and Bynlon.

2. "For the probability of his opinion, (he says) the book itself affords sufficient proof: for, not to insist on what is less material, the *neatness of the letter*, and *regularity of the page*, &c. above those of Caxton, it has one mark, that seems to have carried the matter beyond probable, and to make it even certain, viz. *the use of signatures*, or letters of the alphabet placed at the bottom of the page to shew the sequel of the pages and leaves of each book; an improvement contrived for the direction of the bookbinders; VOL. IX.

Printing. which yet was not practised or invented at the time when this book is supposed to be printed; for we find no signatures in the books of Fault or Schoeffler at Mentz, nor in the improved or beautiful impressions of John de Spira and Jenfon at Venice, till several years later. We have a book in our library, that seems to fix the very time of their invention, at least in Venice; the place where the art itself received the greatest improvements: *Baldi lectura super Codic. &c.* printed by John de Colonia and Jo. Mantem de Gherretzen, anno MCCCCXXXIII. It is a large and fair volume in folio, *without signatures*, till about the middle of the book, in which they are first introduced, and so continued forward: which makes it probable, that the first thought of them was suggested during the impression; for we have likewise *Lectura Bartholi super Codic. &c.* in two noble and beautiful volumes in folio, printed the year before at the same place, by Vendelin de Spira, without them: yet from this time forward they are generally found in all the works of the Venetian printers, and from them propagated to the other printers of Europe. They were used at (L) Cologne, in 1475; at Paris, 1476; by Caxton, not before 1480: but if the discovery had been brought into England, and practised at Oxford 12 before, it is not probable that he would have printed so long at Westminster without them. Mr Palmer indeed tells us, p. 54, 180, that Anthony Zarot was esteemed the inventor of signatures; and that they are found in a Terence printed by him at Milan in the year 1470, in which he first printed. I have not seen that Terence; and can only say, that I have observed the want of them in some later works of this, as well as of other excellent printers of the same place. But, allowing them to be in the Terence, and Zarot the inventor, it confutes the date of our Oxford book as effectually as if they were of later origin at Venice; as I had reason to imagine, from the testimony of all the books that I have hitherto met with."—"As to these proofs, first, the neatness of the letter, and the regularity of the page, prove, if any thing, the very reverse of what the Doctor asserts. The art of printing was almost in its infancy brought to perfection; but afterwards debased by later printers, who consulted rather the cheapness than the neatness of their work. Our learned dissertator cannot be unacquainted with the labours of Fust and Jenfon. He must know, that though other printers may have printed more correctly, yet scarce any excel them, either in the neatness of the letter, or the regularity of the page. The same may be observed in our English printers. Caxton and Rood were indifferently good printers: De Worde and Pynfon were worse; and those that follow them most abominable. This our *anonymous Oxford printer* excels them all; and for this very reason we should judge him to be the most ancient of all. Our dissertator lays

(L) Dr Middleton is mistaken in the time and place of the invention of signatures.—They are to be found even in very ancient MSS. which the earliest printers very studiously imitated; and they were even used in some editions from the office of Laurence Coster (whence Corfellis came), which consisted of wooden cuts, as in *Figure typice antitypice Novi Testamenti*; and in some editions with metal types, as in *Gasp. Pergamenfis epistole*, published at Paris, without a date, but printed A. D. 1470, (Maittaire, *Annal.* vol. i. p. 25.); and in *Mammiretus*, printed by Helias de Louffon, at Born in Switzerland, 1470; and in *De Tondeli visione*, at Antwerp, 1472. Venice, therefore, was not the place where they were first introduced.—They began to be used in *Baldus*, it seems, when the book was half finished. The printer of that book might not know, or did not think, of the use of them before. See *Meerman*, vol. ii. p. 18; and *Phil. Transf.* vol. xxiii. n<sup>o</sup> 208. p. 1509.

Printing.

great fires on the use of signatures. But no certain conclusion can be drawn either from the use or non-use of these lesser improvements of printing. They have in different places come in use at different times, and have not been continued regularly even at the same places. If Anthony Zarot used them at Milan in 1470, it is certain later printers there did not follow his example; and the like might happen also in England. But, what is more full to our purpose, we have in the Bodleian library an *Æsop's Fables* printed by Caxton. This is, it is believed, the first book which has the leaves numbered. But yet this improvement, though more useful than that of the signatures, was diffused both by Caxton himself and other later printers in England. It is therefore not at all surprizing (if true) that the signatures, though invented by our Oxford printer, might not immediately come into general use. And consequently, this particular carries with it no such certain or effectual confutation as our dissertator boasts of.

3. What the doctor thinks farther confirms his opinion is, "That, from the time of the pretended date of this book, anno 1468, we have no other fruit or production from the presses at Oxford for 11 years next following; and it cannot be imagined that a press, established with so much pains and expence, could be suffered to be so long idle and useless."—To this it may be answered, in the words of Oxonides, 18, That his books may have been lost. Our first printers, in those days of ignorance, met with but small encouragement; they printed but few books, and but few copies of those books. In after-times, when the same books were re-printed more correctly, those first editions, which were not as yet become curiosities, were put to common uses. This is the reason that we have so few remains of our first printers. We have only four books of Theodoric Rood, who seems by his own verses to have been a very celebrated printer. Of John Lettoun-William de Machlinia, and the schoolmaster of St Alban's, we have scarce any remains. If this be considered, it will not appear impossible that our printer should have followed his business from 1468 to 1479, and yet Time have destroyed his intermediate works. But, 2dly, We may account still another way for this distance of time, without altering the date. The Civil Wars broke out in 1469: this might probably oblige our Oxford printer to shut up his press; and both himself and his readers be otherwise engaged. If this were the case, he might not return to his work again till 1479; and the next year, not meeting with that encouragement he deserved, he might remove to some other country with his types.

Dr Middleton concludes with apologizing for his "spending so much pains on an argument so inconceivable, to which he was led by his zeal to do a piece of justice to the memory of our worthy countryman William Caxton; nor suffer him to be robbed of the glory, so clearly due to him, of having first imported into this kingdom an art of great use and benefit to mankind: a kind of merit, that, in the sense of all nations, gives the best title to true praise, and the best claim to be commemorated with honour to posterity."

The fact, however, against which he contends, but which it seems impossible to overturn, does by no means derogate from the honour of Caxton, who, as

Printing.

has been shown, was the first person in England that practised the art of printing *fusile types*, and consequently the first who brought it to perfection; whereas Corfellis printed with *separate cut types in wood*, being the only method which he had learned at Harlem. Into this detail, therefore, we have been led, not so much by the importance of the question, as on account of several anecdotes connected with it, which seemed equally calculated to satisfy curiosity and afford entertainment.

Caxton had been bred very reputedly in the way of trade, and served an apprenticeship to one Robert Large, a mercer; who, after having been sheriff and lord mayor of London, died in the year 1441, and left by will, as may be seen in the prerogative-office, xxiiii merks to his apprentice William Caxton: a considerable legacy in those days, and an early testimonial of his good character and integrity.

From the time of his master's death, he spent the following thirty years beyond sea, in the business of merchandize: where, in the year 1464, we find him employed by Edward IV. in a public and honourable negotiation, jointly with one Richard Whitehill, esq; to transact and conclude a treaty of commerce between the king and his brother-in-law the duke of Burgundy, to whom Flanders belonged. The commission styles them, *ambassadors, procuratores, nuncios, & deputatos speciales*; and gives to both or either of them full powers to treat, &c.

Whoever turns over his printed works, must contract a respect for him, and be convinced that he preserved the same character through life, of an honest, modest, man; greatly industrious to do good to his country, to the best of his abilities, by spreading among the people such books as he thought useful to religion and good manners, which were chiefly translated from the French. The novelty and usefulness of his art recommended him to the special notice and favour of the great; under whose protection, and at whose expence, the greatest part of his works were published. Some of them are addressed to king Edward IV. his brother the duke of Clarence, and their sister the duchess of Burgundy; in whose service and pay he lived many years before he began to print, as he often acknowledges with great gratitude. He printed likewise for the use, and by the express order, of Henry VII. his son prince Arthur, and many of the principal nobility and gentry of that age.

It has been generally asserted and believed, that all his books were printed in the abbey of Westminster; yet we have no assurance of it from himself, nor any mention of the place before the year 1477: so that he had been printing several years, without telling us where.

There is no clear account left of Caxton's age: but he was certainly very old, and probably above fourscore, at the time of his death. In the year 1471 he complained of the infirmities of age creeping upon him, and feeling his body: yet he lived 23 years after, and pursued his business, with extraordinary diligence, in the abbey of Westminster, till the year 1494, in which he died; not in the year following, as all who write of him affirm. This appears from some verses at the end of a book, called, "Hilton's Scale of Perfection," printed in the same

Printing. same year :

" Infynite laud with thankynges many folde  
 I yield to God me focouryng with his grace  
 This boke to fynythe which that ye beholde  
 Scale of Perfection calde in every place  
 Whereof th'author Walter Hilton was  
 And Wynkyn de Worde this hath fett in print  
 In William Caxtons hows fo fylle the cafe,  
 God rest his foule. In joyr ther met it fhynt.

Impressus anno salutis mccccxxxiii."

Though he had printed for the use of Edward IV. and Henry VII. yet there appears no ground for the notion which Palmer takes up, that the first printers, and particularly Caxton, were sworn servants and printers to the crown; for Caxton, as far as can be observed, gives not the least hint of any such character or title: though it seems to have been instituted not long after his death: for of his two principal workmen, Richard Pynfon and Wynkin de Worde, the one was made printer to the king, the other to the king's mother the Lady Margaret. Pynfon gives himself the first title, in *The imitation of the Life of Christ*; printed by him at the commandment of the Lady Margaret, who had translated the fourth book of it from the French, in the year 1504: and Wynkin de Worde assumes the second, in *The seven Penitential Psalms*, expounded by bishop Fisher, and printed in the year 1509. But there is the title of a book given by Palmer, that seems to contradict what is here said of Pynfon: viz. *Psalterium ex mandato victoriosissimi Anglie Regis Henrici Septimi, per Gulielmum Fanque, impressorem regium*, anno mduiii; which, being the only work that has ever been found of this printer, makes it probable that he died in the very year of its impression, and was succeeded immediately by Richard Pynfon.

*Different CHARACTERS when first used in PRINTING.* Before 1465, the uniform character was the old Gothic, or German; whence our Black was afterwards formed. But in that year an edition of Lactantius was printed in a kind of Semi-Gothic, of great elegance, and approaching nearly to the present Roman type; which last was first used at Rome in 1467, and soon after brought to great perfection in Italy, particularly by Jenfon.

Towards the end of the 5th century, Aldus invented the *Italic* character which is now in use, called, from his name, *Aldine*, or *curfivus*. This sort of letter he contrived, to prevent the great number of abbreviations that were then in use.

*Of the first GREEK PRINTING.* The first essays in Greek that can be discovered are a few sentences which occur in the edition of *Tully's Offices*, 1465, at Mentz; but these were miserably incorrect and barbarous, if we may judge from the specimens Mr Maittaire has given us, of which the following is one:

Οτι σταυροειδης ακατα και ταπεινη.

In the same year, 1465, was published an edition of *Lactantius's Institutes*, printed in *monasterio Sublacensi*, in the kingdom of Naples, in which the quotations from the Greek authors are printed in a very neat Greek letter. They seem to have had but a very small quantity of Greek types in the monastery; for, in the first part of the work, whenever a long sentence occurred, a blank was left, that it might be writ-

ten in with a pen; after the middle of the work, however, all the Greek that occurs is printed.

The first printers who settled at Rome were Conrad Sweynheim and Arnold Pannartz, who introduced the present Roman type, in 1466, in Cicero's *Epistola Familiariæ*: in 1469 they printed a beautiful edition of *Aulus Gellius*, with the Greek quotations in a fair character, without accents or spirits, and with very few abbreviations.

The first whole book that is yet known is the Greek Grammar of Constantine Lascaris, in quarto, revised by Demetrius Cretenfis, and printed by Dionysius Palavinus, at Milan, 1476. In 1481, the Greek *Psalter* was printed here, with a Latin translation, in folio; as was *Alop's Fables* in quarto.

Venice soon followed the example of Milan; and in 1486 were published in that city the *Greek Psalter* and the *Batraebismomachia*, the former by Alexander, and latter by Laonicus, both natives of Crete. They were printed in a very uncommon character; the latter of them with accents and spirits, and also with *scholia*.

In 1488, however, all former publications in this language were eclipsed by a fine edition of *Homer's Works* at Florence, in folio, printed by Demetrius, a native of Crete. Thus Printing (says Mr Maittaire, p. 185.) seems to have attained its acme of perfection, after having exhibited most beautiful specimens of Latin, Greek, and Hebrew.

In 1493, a fine edition of *Isoocrates* was printed at Milan, in folio, by Henry German and Sebastian ex Pantremulo.

All the above works are prior in time to those of Aldus, who has been erroneously supposed to be the first Greek Printer: the beauty, however, correctness, and number of his editions, place him in a much higher rank than his predecessors; and his characters in general were more elegant than any before used. He was born in 1445, and died in 1515.

Though the noble Greek books of Aldus had raised an universal desire of reviving that tongue, the French were backward in introducing it. The only pieces printed by them were some quotations, so wretchedly performed, that they were rather to be guffed at than read; in a character very rude and uncouth, and without accents. But Francis Tissard introduced the study of this language at Paris, by his *Βιβλος η γραμμαρικη*, in 1507; and that branch of printing was afterwards successfully practised by Henry, Robert, and Henry Stephens. See the article STEPHENS.

The earliest edition of the *whole Bible* was, strictly speaking, the Complutensian Polyglott of cardinal Ximenes; but as that edition, though finished in 1517, was not published till 1522, the *Venetian Septuagint* of 1518 may properly be called the first edition of the *whole Greek Bible*; Erasmus having published the *New Testament only*, at Basil, in 1516.

*Of the first HEBREW PRINTING.* A very satisfactory account of this branch of printing is thus given by Dr Kennecott, in his *Annual Account of the Collation of Hebrew MSS.* p. 112. "The method which seems to have been originally observed, in printing the Hebrew Bible, was just what might have been expected: 1. The Pentateuch, in 1482. 2. The Prior Prophets, in 1484. 3. The Posterior Prophets, in 1486. 4. The Hagiographa,

Printing. in 1487. And, after the four great parts had been thus printed separately (each with a comment), the whole text (without a comment) was printed in one volume in 1488: and the text continued to be printed, as in these first editions, so in several others for 20 or 30 years, without marginal *Keri* or *Masora*, and with greater arguments to the more ancient Mss. till, about the year 1520, some of the Jews adopted *later* Mss. and the *Masora*; which absurd preference has obtained ever since."

Thus much for the ancient editions given by Jews.

In 1642, a Hebrew Bible was printed at Mantua, under the care of the most learned Jews in Italy. This Bible had not been heard of among the Christians in this country, nor perhaps in any other; tho' the nature of it is very extraordinary. The text indeed is nearly the same with that in other modern editions; but at the bottom of each page are various readings, amounting in the whole to above 2000, and many of them of great consequence, collected from manuscripts, printed editions, copies of the Talmud, and the works of the most renowned Rabbies. And in one of the notes is this remark:—"That in several passages of the Hebrew Bible the differences are so many and so great, that they know not which to fix upon as the true readings."

We cannot quit this subject without observing, on Dr Kennicott's authority, that as the first printed Bibles are more correct than the later ones; so the variations between the first edition, printed in 1488, and the edition of Vander Hooght, in 1705, at Amsterdam, in 2 vols 8vo. amount, upon the whole, to above 1200! See further *Bowyer* and *Nichols*, p. 112—117.

*Method of PRINTING.* The workmen employed in the art of printing are of two kinds: compositors, who range and dispose the letters into words, lines, pages, &c. according to the copy delivered them by the author; and pressmen, who apply ink upon the same, and take off the impression. The types being cast, the compositor distributes each kind by itself among the divisions of two wooden frames, an upper and an under one, called *cases*; each of which is divided into little cells or boxes. Those of the upper case are in number 98: these are all of the same size; and in them are disposed the capitals, small capitals, accented letters, figures, &c. the capitals being placed in alphabetical order. In the cells of the lower case, which are 54, are placed the small letters, with the points, spaces, &c. The boxes are here of different sizes, the largest being for the letters most used; and these boxes are not in alphabetical order, but the cells which contain the letter oftentimes wanted are nearest the compositor's hand. Each case is placed a little aslope, that the compositor may the more easily reach the upper boxes. The instrument in which the letters are set is called a *composing-stick* (fig. 3.) which consists of a long and narrow plate of brass, or iron, &c. on the right side of which arises a ledge, which runs the whole length of the plate, and serves to sustain the letters, the sides of which are set against it: along this ledge is a row of holes, which serve for introducing the screw *a*, in order to lengthen or shorten the extent of the line, by moving the sliders *b* & *c* farther from or nearer to the shorter ledge at the end *d*. Where marginal notes are required in a work,

the two sliding-pieces *b* & *c* are opened to a proper distance from each other in such a manner as that while the distance between *d* & *e* forms the length of the line in the text, the distance between the two sliding-pieces forms the length of the lines for the notes on the side of the page. Before the compositor proceeds to compose, he puts a rule, or thin slip of brass-plate, cut to the length of the line, and of the same height as the letter, in the composing-stick, against the ledge, for the letter to bear against. Things thus prepared, the compositor having the copy lying before him, and his stick in his left-hand, his thumb being over the slider *c*; with the right, he take up the letters, spaces, &c. one by one, and places them against the rule, while he supports them with his left thumb by pressing them to the end of the slider *c*, the other hand being constantly employed in setting in other letters: the whole being performed with a degree of expedition and address not easy to be imagined.

A little being thus composed, if it end with a word or syllable, and exactly fill the measure, there needs no further care; and otherwise, more spaces are to be put in, or else the distances lessened, between the several words, in order to make the measure quite full, so that every line may end even. The spaces here used are pieces of metal exactly shaped like the shanks of the letters: they are of various thicknesses, and serve to support the letters, and to preserve a proper distance between the words; but not reaching so high as the letters, they make no impression when the work is printed. The first line being thus finished, the compositor proceeds to the next; in order to which he moves the brass-rule from behind the former, and places it before it, and thus composes another line against it after the same manner as before; going on thus till his stick is full, when he empties all the lines contained in it into the galle.

The compositor then fills and empties his composing-stick as before, till a complete page be formed; when he ties it up with a cord or pack-thread; and setting it by, proceeds to the next, till the number of pages to be contained in a sheet is completed; which done, he carries them to the imposing-stone, there to be ranged in order, and fastened together in a frame called a *chase*; and this is termed *imposing*. The chase is a rectangular iron-frame, of different dimensions according to the size of the paper to be printed, having two cross-pieces of the same metal, called a *long* and *short* cross, mortised at each end so as to be taken out occasionally. By the different situations of these crosses the chase is fitted for different volumes: for quartos and octavos, one traverses the middle lengthwise, the other broadwise, so as to intersect each other in the centre: for twelves and twenty-fours, the short cross is shifted nearer to one end of the chase; for folios, the long cross is left entirely out, and the short one left in the middle; and for broad-sides, both crosses are set aside. To dress the chase, or range and fix the pages therein, the compositor makes use of a set of furniture, consisting of slips of wood of different dimensions, and about half an inch high, that they may be lower than the letters: some of these are placed at the top of the pages, and called *head sticks*; others between them, to form the inner margin; others on the sides of the crosses, to form the outer margin.

Printing. margin, where the paper is to be doubled; and others in the form of wedges to the sides and bottom of the pages. Thus all the pages being placed at their proper distances, and secured from being injured by the chafe and furniture placed about them, they are all untied, and fastened together by driving small pieces of wood called *quins*, cut in the wedge-form, up between the slanting side of the foot and the side sticks and the chafe, by means of a piece of hard wood and a mallet; and all being thus bound fast together, so that none of the letters will fall out, it is ready to be committed to the pressman. In this condition the work is called a *form*; and as there are two of these forms required for every sheet, when both sides are to be printed, it is necessary the distances between the pages in each form should be placed with such exactness, that the impression of the pages in one form shall fall exactly on the back of the pages of the other, which is called *register*.

As it is impossible but that there must be some mistakes in the work, either through the oversight of the compositor, or by the casual transposition of letters in the cases; a sheet is printed off, which is called a *proof*, and given to the corrector; who reading it over, and rectifying it by the copy, making the alterations in the margin, it is delivered back to the compositor to be corrected.

The compositor then unloading the form upon the correcting-stone, by loosening the quins or wedges which bound the letters together, rectifies the mistakes by picking out the faulty or wrong letters with a slender sharp-pointed steel-bodkin, and puts others into their places. After this another proof is made, sent to the author, and corrected as before; and lastly, there is another proof, called a *revise*, which is made in order to see whether all the mistakes marked in the last proof are corrected.

The pressman's business is to work off the forms thus prepared and corrected by the compositor; in doing which there are four things required, paper, ink, balls, and a press. To prepare the paper for use, it is to be first wetted by dipping several sheets together in water: these are afterwards laid in a heap over each other; and to make them take the water equally, they are all pressed close down with a weight at the top. The ink is made of oil and lamp-black; for the manner of preparing which, see *Printing-Ink*. The balls, by which the ink is applied on the forms are a kind of wooden funnels with handles, the cavities of which are filled with wool or hair, as is also a piece of alum-leather or felt nailed over the cavity, and made extremely soft by picking in urine and by being well rubbed. One of these the pressman takes in each hand; and applying one of them to the ink-block daubs and works them together to distribute the ink equally; and then blackens the form which is placed on the press, by beating with the balls upon the face of the latter.

The printing-press, represented fig. 2. is a very curious, though complex machine. The body consists of two strong cheeks, *aa*, placed perpendicularly, and joined together by four cross-pieces; the cap *b*; the head *c*, which is moveable, being partly sustained by two iron pins, or long bolts, that pass the cap; the till, or shelf, *dd*, by which the spindle and its apparatus are kept in their proper position; and the

winter *e*, which bears the carriage, and sustains the effort of the press beneath. The spindle *f* is an upright piece of iron pointed with steel, having a male-screw which goes into the female one in the head about four inches. Through the eye *g* of this spindle is fastened the bar *h*, by which the pressman makes the impression. The spindle passes through a hole in the middle of the till; and its point works into a brass pan or nut, supplied with oil, which is fixed to an iron plate let into the top of the platten. The body of the spindle is sustained in the centre of an open frame of polished iron, 1, 1, 2, 2, 3, 3, fixed to it in such a manner as, without obstructing its free play, to keep it in a steady direction; and at the same time to serve for suspending the platten. This frame consists of two parts; the upper called the *garter*, 1, 1; the under, called the *crane*, 2, 2. These are connected together by two short legs or bolts, 3, 3; which being fixed below in the two ends of the crane, pass upward, through two holes in the till, and are received at top into two eyes at the ends of the garter, where they are secured by screws. The carriage *l* is placed a foot below the platten, having its fore-part supported by a prop called the *fore-stay*, while the other rests on the winter. On this carriage, which sustains the plank, are nailed two long iron bars or ribs; and on the plank are nailed short pieces of iron or steel called *cramp-irons*, equally tempered with the ribs, and which slide upon them when the plank is turned in or out. Under the carriage is fixed a long piece of iron called the *spit*, with a double wheel in the middle, round which leather-girts are fastened, nailed to each end of the plank; and to the outside of the spit is fixed a rounce *m*, or handle to turn round the wheel. Upon the plank is a square frame or coffin, in which is inclosed a polished stone on which the form *n* is laid; at the end of the coffin are three frames, viz. the two tympan and frisket: the tympan *o* are square, and made of three slips of very thin wood, and at the top a piece of iron still thinner; that called the *outer tympan* is fastened with hinges to the coffin: they are both covered with parchment; and between the two are placed blankets, which are necessary to take off the impression of the letters upon the paper. The frisket *p* is a square frame of thin iron, fastened with hinges to the tympan: it is covered with paper cut in the necessary places, that the sheet, which is put between the frisket and the great or outward tympan, may receive the ink, and that nothing may hurt the margins. To regulate the margins, a sheet of paper is fastened upon this tympan, which is called the *tympan-sheet*; and on each side is fixed an iron point, which makes two holes in the sheet, which is to be placed on the same points when the impression is to be made on the other side. In preparing the press for working, the parchment which covers the outer tympan is wetted till it is very soft, in order to render the impression more equable; the blankets are then put in, and secured from slipping by the inner tympan: then while one pressman is beating the letter with the balls *q*, covered with ink taken from the ink-block, the other person places a sheet of white paper on the tympan-sheet; turns down the frisket upon it, to keep the paper clean and prevent its slipping; then bringing the tympan upon the form, and, turning the

Printing.

rounce, he brings the form with the stone, &c. weighing about 300 pounds weights, under the platten; pulls with the bar, by which means the platten presses the blankets and paper close upon the letter, whereby half the form is printed; then easing the bar, he draws the form still forward, gives a second pull; and letting go the bar, turns back the form, takes up the tympan and frisket, takes out the printed sheet, and lays on a fresh one; and this is repeated till he has taken off the impression upon the full number of sheets the edition is to consist of. One side of the sheet thus printed, the form for the other is laid upon the press, and worked off in the same manner.

*Chinese* PRINTING, is performed from wooden planks or blocks, cut like those used in printing of callico, paper, cards, &c.

*Rolling-press* PRINTING, is employed in taking off prints or impressions from copper-plates engraven, etched, or scraped as in mezzotintos. See ENGRAVING.

This art is said to have been as ancient as the year 1540, and to owe its origin to Finiguerra, a Florentine goldsmith, who pouring some melted brimstone on an engraven plate, found the exact impression of the engraving left in the cold brimstone, marked with black taken out of the strokes by the liquid sulphur: upon this he attempted to do the same on silver plates with wet paper, by rolling it smoothly with a roller; and this succeeded: but this art was not used in England till the reign of king James I. when it was brought from Antwerp by Speed. The form of the rolling-press, the composition of the ink used therein, and the manner of applying both in taking off prints, are as follow.

The rolling press AL, may be divided into two parts, the body and carriage: the body consists of two wooden cheeks PP placed perpendicularly on a stand or foot LM, which sustains the whole press. From the foot likewise are four other perpendicular pieces *e, e, e, e*, joined by other crosses or horizontal ones *d, d, d*, which serve to sustain a smooth even plank or table HIK, about four feet and a half long, two feet and a half broad, and an inch and a half thick. Into the cheeks go two wooden cylinders or rollers, DE, FG, about six inches in diameter, borne up at each end by the cheeks, whose ends, which are lessened to about two inches diameter, and called *trunnions*, turn in the cheeks about two pieces of wood in form of half-moons, lined with polished iron to facilitate the motion. Lastly, to one of the trunnions of the upper roller is fastened a cross, consisting of two levers AB, or pieces of wood, traversing each other, the arms of which crosses serve instead of the bar or handle of the letter-press, by turning the upper roller, and when the plank is between the two rollers, giving the same motion to the under one, by drawing the plank forward and backward.

The ink used for copper-plates, is a composition made of the stones of peaches and apricots, the bones of sheep and ivory, all well burnt, and called *Frankfurt black*, mixed with nut-oil that has been well boiled, and ground together on a marble, after the same manner as painters do their colours.

The method of printing from copper-plates is as

Prior.

follows: They take a small quantity of this ink on a rubber made of linnen-rags, strongly bound about each other, and therewith smear the whole face of the plate as it lies on a grate over a charcoal fire. The plate being sufficiently inked, they first wipe it over with a foul rag, then with the palm of their left hand, and then with that of the right; and to dry the hand and forward the wiping, they rub it from time to time in whitening. In wiping the plate perfectly clean, yet without taking the ink out of the engraving, the address of the workman consists. The plate thus prepared, is laid on the plank of the press; over the plate is laid the paper, first well moistened, to receive the impression; and over the paper two or three folds of flannel. Things thus disposed, the arms of the cross are pulled, and by that means the plate with its furniture passed thro' between the rollers, which pinching very strongly, yet equally, presses the moistened paper into the strokes of the engraving, whence it takes out the ink.

PRIOR, in general, something before or nearer the beginning than another, to which it is compared.

PRIOR, more particularly denotes the superior of a convent of monks, or the next under the abbot. See ABBOT.

Priors are either *claustral* or *conventual*. *Conventual* are the same as abbots. *Claustral* prior, is he who governs the religious of an abbey or priory in *commendam*, having his jurisdiction wholly from the abbot.

*Grand* PRIOR, is the superior of a large abbey, where several superiors are required.

PRIOR (Matthew), an eminent English poet, was born at London in 1664. His father dying when he was very young, an uncle a vintner, having given him some education at Westminster school, took him home in order to breed him up to his trade. However, at his leisure hours he prosecuted his study of the classics, and especially of his favourite Horace. This introduced him to some polite company, who frequented his uncle's house; among whom the earl of Dorset took particular notice of him, and procured him to be sent to St John's college in Cambridge, where, in 1686, he took the degree of A. B. and afterward became fellow of that college. Upon the revolution, Mr Prior was brought to court by the earl of Dorset; and in 1690 he was made secretary to the earl of Berkeley, plenipotentiary at the Hague; as he was afterward to the ambassador and plenipotentiaries at the treaty of Ryfwick in 1697; and the year following to the earl of Portland, ambassador to the court of France. He was in 1697 made secretary of state for Ireland; and in 1700 was appointed one of the lords commissioners of trade and plantations. In 1710, he was supposed to have had a share in writing *The Examiner*. In 1711, he was made one of the commissioners of the customs; and was sent minister plenipotentiary to France, for the negotiating a peace with that kingdom. Soon after the accession of George I. to the throne in 1714, he presented a memorial to the court of France, requiring the demolishing of the canal and new works at Mardyke. The year following he was recalled; and upon his arrival was taken up by a warrant from the house of commons, and strictly examined by a committee of the privy-council. Robert Wal-

Privateer.

Walpole, Esq; moved the house of commons for an impeachment against him; and Mr Prior was ordered into close custody. In 1717, he was excepted out of the act of grace; however, at the close of that year he was set at liberty. The remainder of his days he spent in tranquillity and retirement; and died in 1721. His poems are well known and justly admired.

**PRIORITY**, the relation of something considered as prior to another.

**PRIORITY**, in law, denotes an antiquity of tenure, in comparison of another less ancient.

**PRISCIANUS**, an eminent grammarian, born at Cæsarea, taught at Constantinople with great reputation about the year 525. Laurentius Valla calls Priscian, Donatus, and Servius, *triumviri in re grammatica*; and thinks none of the ancients who wrote after them, fit to be mentioned with them. He composed a work *De arte grammatica*, which was first printed by Aldus at Venice in 1476; and another *De naturalibus questionibus*, which he dedicated to Choroë king of Persia: beside which he translated Dionysius's description of the world into Latin verse. A person who writes false Latin is proverbially said to "break Priscian's head."

**PRISCILLIANISTS**, in church-history, Christian heretics, so called from their leader Priscillian, a Spaniard by birth, and bishop of Avila. He is said to have practised magic, and to have maintained the principal errors of the Manichees; but his peculiar tenet was, That it is lawful to make false oaths in order to support one's cause and interests.

**PRISM**, an oblong solid, contained under more than four planes, whose bases are equal, parallel, and alike situated. See **OPTICS**.

**PRISON**, a goal, or place of confinement.

Lord Coke observes, that a prison is only a place of safe custody, *salva custodia*, not a place of punishment. Any place where a person is confined may be said to be a prison; and when a process is issued against one, he must, when arrested thereon, either be committed to prison, or be bound in a recognizance with sureties, or else give bail, according to the nature of the case, to appear at a certain day in court, there to make answer to what is alleged against him. Where a person is taken and sent to prison, in a civil case, he may be released by the plaintiff in the suit; but if it be for treason or felony, he may not regularly be discharged, until he is indicted of the fact and acquitted. See **INDICTMENT**, and the next article.

**PRISONER**, a person restrained or kept in prison upon an action civil or criminal, or upon commendment: and one may be a prisoner on matter of record or matter of fact. A prisoner upon matter of record, is he who, being present in court, is by the court committed to prison; and the other is one carried to prison upon an arrest, whether it be by the sheriff, constable, or other officer.

**PRIVATEERS**, are a kind of private men of war, the persons concerned wherein administer at their own costs a part of a war, by fitting out these ships of force, and providing them with all military stores; and they have instead of pay, leave to keep what they take from the enemy, allowing the admiral his share, &c.

Privateers may not attempt any thing against the laws of nations; as to assault an enemy in a port or haven, under the protection of any prince or republic, whether he be friend, ally, or neuter; for the peace of such places must be inviolably kept: therefore, by a treaty made by king William and the States of Holland, before a commission shall be granted to any privateer, the commander is to give security, if the ship be not above 150 tons, in L. 1500, and if the ship exceeds that burden, in L. 3000, that they will make satisfaction for all damages which they shall commit in their courses at sea, contrary to the treaties with that state, on pain of forfeiting their commissions; and the ship is made liable.

Besides these private commissions, there are special commissions for privateers, granted to commanders of ships, &c. who take pay; who are under a marine discipline; and if they do not obey their orders, may be punished with death: and the wars in later ages have given occasion to princes to issue these commissions, to annoy the enemies in their commerce, and hinder such supplies as might strengthen them or lengthen out the war; and likewise to prevent the separation of ships of greater force from their fleets or squadrons.

Ships taken by privateers, were to be divided into five parts; four parts whereof to go to the persons interested in the privateer, and the fifth to his Majesty: and as a farther encouragement, privateers, &c. destroying any French man of war or privateer, shall receive, for every piece of ordnance in the ship so taken, L. 10 reward, &c.

By a particular statute lately made, the lord admiral, or commissioners of the admiralty, may grant commissions to commanders of privateers, for taking ships, &c. which being adjudged prize, and the tenth part paid to the admiral, &c. wholly belong to the owners of the privateers and the captors, in proportions agreed on between themselves.

**PRIVATION**, in a general sense, denotes the absence or want of something; in which sense darkness is only the privation of light.

**PRIVATE**, in grammar, a particle, which, prefixed to a word, changes it into a contrary sense. Thus, among the Greeks, the  $\alpha$  is used as a privative; as in *αθεος*, *αθηεις*, *αcephalus*, &c.—The Latins have their privative *in*; as, *incorrigibilis*, *indeclinabilis*, &c.—The English, French, &c. on occasion, borrow both the Latin and Greek privatives.

**PRIVERNUM**, (Livy, Virgil); a town of the Volsci, in Latium, to the east of Setia. *Privernates*, the people. Whose ambassadors being asked, What punishment they deserved for their revolt? answered, What those deserve who deem themselves worthy of liberty. And again, being asked by the Roman consul, should the punishment be remitted, What peace was to be expected with them? If you grant a good peace, you may hope to have it sincere and lasting; but if a bad one, you may well expect it of short continuance. At which answer, the Romans were so far from being displeas'd, that by a vote of the people they had the freedom of the city granted them. *Privernus*, *atis*, the epithet. The town is now called *Piperno Vecchio*, situate in the Campania of Rome. E. Long. 10. o. N. Lat. 41. 30.

Privateer  
||  
Privernum.Jacob's  
Law Dict.

**PRIVET**, in botany. See **LIGUSTRUM**.  
**PRIVILEGE**, in law, some peculiar benefit granted to certain persons or places, contrary to the usual course of the law.

Privileges are said to be *personal* or *real*.

*Personal* privileges are such as are extended to peers, ambassadors, members of parliament, and of the convocation, &c. See **LORDS**, **AMBASSADOR**, **PARLIAMENT**, **ARREST**.

A *real* privilege is that granted to some particular place; as the king's palace, the courts at Westminster, the universities, &c.

**PRIVY COUNCIL**. See **COUNCIL**.

**PRIVY SEAL**. See **SEAL**.

**PRIZE**, or **PRIZE**, in maritime affairs, a vessel taken at sea from the enemies of a state, or from pirates; and that either by a man of war, a privateer, &c. having a commission for that purpose.

Vessels are looked on as prize, if they fight under any other standard than that of the state from which they have their commission; if they have no charter-party, invoice, or bill of lading aboard; if loaded with effects belonging to the king's enemies, or with contraband goods.

In ships of war, the prizes are to be divided among the officers, seamen, &c. as his Majesty shall appoint by proclamation; but among privateers, the division is according to the agreement between the owners.

By stat. 13 Geo. II. c. 4. judges and officers, failing of their duty in respect to the condemnation of prizes, forfeit L. 500, with full costs of suit; one moiety to the king, and the other to the informer.

**PROBABILITY**, is nothing but the appearance of the agreement or disagreement of two ideas by the intervention of proofs, whose connection is not constant and immutable; or is not perceived to be so; but is, or appears for the most part to be so; and is enough to induce the mind to judge the proposition to be true or false, rather than the contrary. See **METAPHYSICS**, n<sup>o</sup> 246—265.

**PROBATE** of a will or testament, in law, is the exhibiting and proving of last wills and testaments before the ecclesiastical judge delegated by the bishop who is ordinary of the place where the party died.

**PROBATION**, in the universities, is the examination and trial of a student who is about to take his degrees.

**PROBATION**, in a monastic sense, signifies the year of a novice, which a religious must pass in a convent, to prove his virtue and vocation, and whether he can bear the severities of the rule.

**PROBATIONER**, in the church of Scotland, a student in divinity, who bringing a certificate from a professor in an university of his good morals, and his having performed his exercises to approbation, is admitted to undergo several trials; and, upon his acquitting himself properly in these, receives a licence to preach.

**PROBATUM EST**, (*It is proved*), a term frequently subjoined to a receipt for the cure of some disease.

**PROBE**, a surgeon's instrument for examining the circumstances of wounds, ulcers, and other cavities, searching for stones in the bladder, &c.

**PROBLEM**, in logic, a proposition that neither

appears absolutely true or false; and, consequently, may be asserted either in the affirmative or negative.

**PROBLEM**, in geometry, is a proposition, wherein some operation or construction is required; as to divide a line or angle, erect or let fall perpendiculars, &c. See **GEOMETRY**.

**PROBOSCIS**, in natural history, is the trunk or snout of an elephant, and some other animals and insects.

Flies, gnats, &c. are furnished with a proboscis or trunk; by means of which they suck the blood of animals, the juice of vegetables, &c. for their food.

**PROBUS** (Marcus Aurelius), from the son of a gardener, became, by his great valour as a soldier, and his eminent virtues, emperor of Rome, to which dignity he was raised by the army. After having subdued the barbarous nations that had made incurious into different parts of the empire where they committed horrid cruelties, and governed with great wisdom and clemency, he was massacred in the 7th year of his reign, by some soldiers who were weary of the public works at which he made them labour, in 282.

**PROCATARCTIC CAUSE**, in medicine, the pre-existing, or predisposing cause or occasion of a disease.

**PROCELEUSMATICUS**, in the ancient poetry, a foot consisting of four short syllables, or two pyrrhichiuses; as *hominibus*.

**PROCELLARIA**, in ornithology; a genus of birds, belonging to the order of anseres. The beak is somewhat compressed, and without teeth; the mandibles are equal, the superior one being crooked at the point; the feet are palmated, the hind claw being sessile, without any toe. There are six species, principally distinguished by their colour. The most remarkable are.

1. The cinerea, or fulmar. The size of this bird is rather superior to that of the common gull: the bill very strong, much hooked at the end, and of a yellow colour. The nostrils are composed of two large tubes, lodged in one sheath: the head, neck, whole under side of the body, and tail, are white; the back and coverts of the wings ash-coloured: the quill-feathers dusky: the legs yellowish. In lieu of a back toe, it has only a foot of spur, or sharp straight nail. These birds feed on the blubber or fat of whales, &c. which, being soon convertible into oil, supplies them constantly with means of defence, as well as provision for their young, which they eat up into their mouths. They are likewise said to feed on sorrel, which they use to qualify the unctuous diet they live on. This species inhabits the isle of St Kilda; makes its appearance there in November, and continues the whole year, except September and October; it lays a large, white, and very brittle egg; and the young are hatched the middle of June. No bird is of such use to the islanders as this: the fulmar supplies them with oil for their lamps, down for their beds, a delicacy for their tables, a balm for their wounds, and a medicine for their distempers. The fulmar is also a certain prognosticator of the change of the wind; if it comes to land, no west wind is expected for some time; and the contrary when it returns and keeps the sea. The whole genus of petrels have a peculiar faculty of spouting from their bills, to a considerable distance, a large quantity of pure

Procellaria.

pure oil; which they do, by way of defence, into the face of any that attempts to take them: so that they are, for the sake of this panacea, seized by surprize; as this oil is subservient to the abovementioned medical uses. Martin tells us, it has been used in London and Edinburgh with success in rheumatic cafes. Frederick Martens, who had opportunity of seeing vast numbers of these birds at Spitzbergen, observes, that they are very bold, and resort after the whale-fishers in great flocks; and that, when a whale is taken, they will, in spite of all endeavours, light on it and pick out large lumps of fat, even when the animal is alive: That the whales are often discovered at sea by the multitudes of malleuckles flying; and that when one of the former are wounded, prodigious multitudes immediately follow its bloody track. He adds, that it is a most glutinous bird, eating till it is forced to disgorge itself.

2. The puffins, or shear-water, is 15 inches in length; the breadth 31; the weight 17 ounces: the bill is an inch and three-quarters long; nostrils tubular, but not very prominent: the head, and whole upper side of the body, wings, tail, and thighs, are of a sooty blackness; the under side from chin to tail, and inner coverts of the wings, white: the legs weak, and compressed sidewise; dusky behind, whitish before. These birds are found in the Calf of Man; and, as Mr Ray supposes, in the Scilly-isles. They resort to the former in February; take a short possession of the rabbit burrows, and then disappear till April. They lay one egg, white and blunt at each end; and the young are fit to be taken the beginning of August; when great numbers are killed by the person who farms the isle: they are salted and barrelled; and when they are boiled, are eaten with potatoes. During the day they keep at sea, fishing; and towards evening return to their young; whom they feed, by discharging the contents of their stomachs into their mouths; which by that time is turned into oil: by reason of the backward situation of their legs, they fit quite erect. They quit the isle the latter end of August, or beginning of September; and, from accounts lately received from navigators, we have reason to imagine, that, like the storm-finch, they are dispersed over the whole Atlantic ocean. This species inhabits also the Orkney isles, where it makes its nest in holes on the earth near the shelves of the rocks and headlands: it is called there the *lyre*; and is much valued, both on account of its being a food, and for its feathers. The inhabitants take and salt them in August for winter provisions, when they boil them with cabbage. They also take the old ones in March; but they are then poor, and not so well tasted as the young: they appear first in those islands in February.

3. The pelagica, or stormy petrel, is about the bulk of the house-swallow: the length six inches; the extent of wings, 13. The whole bird is black, except the coverts of the tail and vent-feathers, which are white: the bill is hooked at the end: the nostrils tubular: the legs slender, and long. It has the same faculty of spouting oil from its bill as the other species: and Mr Brunnich tells us, that the inhabitants of the Ferroe isles make this bird serve the purposes of a candle, by drawing a wick through the mouth and rump, which being lighted, the flame is fed by the fat and oil of the body. Except in breeding-time, it is al-

ways at sea; and is seen all over the vast Atlantic ocean, at the greatest distance from land; often following the vessels in great flocks, to pick up any thing that falls from on board: for trial sake, chopped straw has been flung over, which they would stand on with expanded wings; but were never observed to settle on or swim in the water: it prefaces bad weather, and cautions the seamen of the approach of a tempest, by collecting under the stern of the ships: it braves the utmost fury of the storm, sometimes skimming with incredible velocity along the hollows of the waves, sometimes on the summits: Clusius makes it the Camilla of the sea.

Process.

*Vel mare per medium fluctu suspensa tument  
Feret iter, celeres nec rugerici aqueore plantas.*

VIRG.

She swept the seas; and as she skim'd along,  
Her flying feet unbatth'd on billows hung.

DRYDEN.

These birds are the *cyffelli* of Pliny, which he places among the *apodes* of Aristotle; not because they wanted feet, but were *Kaxovola*, or had bad or useless ones; an attribute he gives to these species, on a supposition that they were almost always on the wing. In August 1772, Mr Pennant found them on the rocks called *Macdonald's Table*, off the north end of the isle of Skie; so conjectures they breed there. They lurked under the loose stones, but betrayed themselves by their twittering noise.

PROCESS, in law, denotes the proceedings in any cause, real or personal, civil or criminal, from the original writ to the end thereof.

In a more limited sense, process denotes that by which a man is called first into any temporal court.

It is the next step for carrying on the suit, after suing out the original writ. See *SUIT* and *WRIT*.

It is the method taken by the law to compel a compliance with the original writ, of which the primary step is by giving the party notice to obey it. This notice is given upon all real *precipes*; and also upon all personal writs for injuries not against the peace, by *summons*; which is a warning to appear in court at the return of the original writ, given to the defendant by two of the sheriff's messengers called *summoners*, either in person, or left at his house or land: in like manner as in the civil law the first process is by personal citation, *in jus vocando*. This warning on the land is given, in real actions, by erecting a white flick or wand on the defendant's grounds, (which flick or wand among the northern nations is called the *baculus nunciatorius*), and by statute 31 Eliz. c. 3. the notice must also be proclaimed on some Sunday before the door of the parish-church.

Blackst.  
Comment.

If the defendant disobeyes this verbal monition, the next process is by writ of *attachment*, or *poine*; so called from the words of the writ, *poine per vadium et salvores plegios*, "put by gage and safe pledges A. B. the defendant, &c." This is a writ not issuing out of chancery, but out of the court of common-pleas, being grounded on the non-appearance of the defendant at the return of the original writ; and thereby the sheriff is commanded to attach him; by taking *gage*, that is, certain of his goods, which he shall forfeit if he doth not appear; or by making him find *safe pledges* or sureties, which shall be amerced in case of his non-appearance. This is also the first and immediate process, without any previous summons, upon actions of tres-

Process.

*pafs vi et armis*, or for other injuries, which, though not forcible, are yet trespasses against the peace, as *deceit* and *conspiracy*; where the violence of the wrong requires a more speedy remedy, and therefore the original writ commands the defendant to be at once attached, without any precedent warning.

If, after attachment, the defendant neglects to appear, he not only forfeits this security, but is moreover to be farther compelled by writ of *disfringas*, or distress infinite; which is a subsequent process issuing from the court of common-pleas, commanding the sheriff to distress the defendant from time to time, and continually afterwards, by taking his goods and the profits of his lands, which are called *issues*, and which he forfeits to the king if he doth not appear. But the issues may be sold, if the court shall so direct, in order to defray the reasonable costs of the plaintiff. In like manner by the civil law, if the defendant absconds, so that the citation is of no effect, *mittitur adversarius in possessionem bonorum ejus*.

And here, by the common as well as the civil law, the process ended in case of injuries without force: the defendant, if he had any substance, being gradually stripped of it all by repeated distresses, till he rendered obedience to the king's writ; and, if he had no substance, the law held him incapable of making satisfaction, and therefore looked upon all farther process as nugatory. And besides, upon feudal principles, the person of a feudatory was not liable to be attached for injuries merely civil, lest thereby his lord should be deprived of his personal services. But, in cases of injury accompanied with force, the law, to punish the breach of the peace and prevent its disturbance for the future, provided also a process against the defendant's person, in case he neglected to appear upon the former process of attachment, or had no substance whereby to be attached; subjecting his body to imprisonment by the writ of *capias ad respondendum*. But this immunity of the defendant's person, in case of peaceable though fraudulent injuries, producing great contempt of the law in indigent wrongdoers, a *capias* was also allowed, to arrest the person in actions of account, though no breach of the peace be suggested, by the statutes of Marlbridge, 52 Hen. III. c. 23. and Westm. 2. 13 Edw. I. c. 11. in actions of debt and detainue, by statute 25 Edw. III. c. 17. and in all actions on the case, by statute 19 Hen. VII. c. 9. Before which last statute a practice had been introduced of commencing the suit by bringing an original writ of trespass *quare clausum fregit*, by breaking the plaintiff's close, *vi et armis*; which by the old common law subjected the defendant's person to be arrested by writ of *capias*: and then afterwards, by connivance of the court, the plaintiff might proceed to prosecute for any other less forcible injury. This practice (through custom rather than necessity, and for saving some trouble and expence, in suing out a special original adapted to the particular injury) still continues in almost all cases, except in actions of debt; though now, by virtue of the statutes above cited and others, a *capias* might be had upon almost every species of complaint.

If therefore the defendant, being summoned or attached, makes default, and neglects to appear; or if the sheriff returns a *nihil*, or that the defendant hath nothing whereby he may be summoned, attached, or

disfranted, the *capias* now usually issues: being a writ commanding the sheriff to take the body of the defendant, if he may be found in his bailiwick or county, and him safely to keep, so that he may have him in court on the day of the return, to answer to the plaintiff of a plea of debt, or trespass, &c. as the case may be. This writ, and all others subsequent to the original writ, not issuing out of chancery, but from the court into which the original was returnable, and being grounded on what has passed in that court in consequence of the sheriff's return, are called *judicial*, not *original*, writs; they issue under the private seal of that court, and not under the great seal of England; and are *test'd*, not in the king's name, but in that of the chief justice only. And these several writs being grounded on the sheriff's return, must respectively bear date the same day on which the writ immediately preceding was returnable.

This is the regular and orderly method of process. But it is now usual in practice, to sue out the *capias* in the first instance, upon a supposed return of the sheriff; especially if it be suspected that the defendant, upon notice of the action, will abscond; and afterwards a fictitious original is drawn up, with a proper return thereupon, in order to give the proceedings a colour of regularity. When this *capias* is delivered to the sheriff, he by his under-sheriff grants a warrant to his inferior officers or bailiffs to execute it on the defendant. And, if the sheriff of Oxfordshire (in which county the injury is supposed to be committed and the action is laid) cannot find the defendant in his jurisdiction, he returns that he is not found, *non est inventus*, in his bailiwick: whereupon another writ issues, called a *testatum capias*, directed to the sheriff of the county where the defendant is supposed to reside; as of Berkshire, reciting the former writ, and that it is testified, *testatum est*, that the defendant lurks or wanders in his bailiwick, where he is commanded to take him, as in the former *capias*. But here also, when the action is brought in one county and the defendant lives in another, it is usual, for saving trouble, time, and expence, to make out a *testatum capias* at the first; supposing not only an original, but also a former *capias*, to have been granted; which in fact never was. And this fiction, being beneficial to all parties, is readily acquiesced in, and is now become the settled practice; being one among many instances to illustrate that maxim of law, that in *fictione juris consistit equitas*.

But where a defendant absconds, and the plaintiff would proceed to an outlawry against him, an original writ must then be sued out regularly, and after that a *capias*. And if the sheriff cannot find the defendant upon the first writ of *capias*, and returns a *non est inventus*, there issues out an *alias* writ, and after that a *pluries*, to the same effect as the former: only after these words "we command you," this clause is inserted, "as we have formerly," or, "as we have often, commanded you;"—"sicut alius," or, "sicut pluries, precepimus." And if a *non est inventus* is returned upon all of them, then a writ of *exigent* or *exigi facias* may be sued out, which requires the sheriff to cause the defendant to be proclaimed, required, or exacted, in five county-courts successively, to render himself; and if he does, then to take him, as in a *capias*: but if he does not appear, and is returned

Process.

Process.

turned *quinto exaltus*, he shall then be outlawed by the coroners of the county. Also by statute 6 Hen. VIII. c. 4. and 31 Eliz. c. 3. whether the defendant dwells within the same or another county than that wherein the *exigent* is sued out, a writ of proclamation shall issue out at the same time with the *exigent*, commanding the sheriff of the county, wherein the defendant dwells, to make three proclamations thereof in places the most notorious, and most likely to come to his knowledge, a month before the outlawry shall take place. Such outlawry is putting a man out of the protection of the law, so that he is incapable to bring an action for redress of injuries; and it is also attended with a forfeiture of all one's goods and chattels to the king. And therefore, till some time after the conquest, no man could be outlawed but for felony; but in Bracon's time, and somewhat earlier, process of outlawry was ordained to lie in all actions for trespasses *vi et armis*. And since, by a variety of statutes (the same which allow the writ of *capias* before-mentioned) process of outlawry doth lie in divers actions that are merely civil; providing they be commenced by original and not by bill. If after outlawry the defendant appears publicly, he may be arrested by a writ of *capias utlagatum*, and committed till the outlawry be reversed. Which reversal may be had by the defendant's appearing personally in court (and in the king's bench without any personal appearance, so that he appears by attorney, according to statute 4 & 5 W. & M. c. 18.) and any plausible cause, however slight, will in general be sufficient to reverse it, it being considered only as a process to compel an appearance. But then the defendant must pay full costs, and put the plaintiff in the same condition as if he had appeared before the writ of *exigi facias* was awarded.

Such is the first process in the court of common pleas. In the king's bench they may also (and frequently do) proceed in certain causes, particularly in actions of ejectment and trespass, by original writ, with attachment and *capias* thereon; returnable, not at Westminster, where the common pleas are now fixed in consequence of *magna carta*, but *ubicunque fuerimus in Anglia*, wheresoever the king shall then be in England; the king's bench being removable into any part of England at the pleasure and discretion of the crown. But the more usual method of proceeding therein is without any original, but by a peculiar species of process intitled a bill of Middlesex; and therefore so intitled, because the court now sits in that county; for if it sat in Kent, it would then be a bill of Kent. For though, as the justices of this court have, by its fundamental constitution, power to determine all offences and trespasses, by the common law and custom of the realm, it needed no original writ from the crown to give it cognizance of any misdemeanor in the county wherein it resides; yet as, by this court's coming into any county, it immediately superseded the ordinary administration of justice by the general commissions of *eyre* and of *oyer and terminer*, a process of its own became necessary, within the county where it sat, to bring in such persons as were accused of committing any forcible injury. The bill of Middlesex (which was formerly always founded on a plaint of trespass *quare clausum frogit*, entered on the records of the court) is a kind of *capias*, di-

Process.

rected to the sheriff of that county, and commanding him to take the defendant, and have him before our lord the king at Westminster on a day prefixed, to answer to the plaintiff of a plea of trespass. For this accusation of trespass it is that gives the court of king's bench jurisdiction in other civil causes, as was elsewhere observed; since, when once the defendant is taken into custody of the marshal, or prison keeper of this court, for the supposed trespass, he, being then a prisoner of this court, may here be prosecuted for any other species of injury. Yet, in order to found this jurisdiction, it is not necessary that the defendant be actually the marshal's prisoner; for, as soon as he appears, or puts in bail, to the process, he is deemed by so doing to be in such custody of the marshal, as will give the court a jurisdiction to proceed. And, upon these accounts, in the bill or process, a complaint of trespass is always suggested, whatever else may be the real cause of action. This bill of Middlesex must be served on the defendant by the sheriff, if he finds him in that county: but if he returns, *non est inventus*, then there issues out a writ of *latitat*, to the sheriff of another county, as Berks; which is similar to the *testatum capias* in the common pleas, and recites the bill of Middlesex and the proceedings thereon, and that it is testified that the defendant *latitat et discurrit*, lurks and wanders about in Berks; and therefore commands the sheriff to take him, and have his body in court on the day of the return. But as in the common pleas the *testatum capias* may be sued out upon only a supposed, and not an actual, preceding *capias*; so in the king's bench a *latitat* is usually sued out upon only a supposed, and not an actual, bill of Middlesex. So that, in fact, a *latitat* may be called the first process in the court of king's bench, as the *testatum capias* is in the common pleas. Yet, as in the common pleas, if the defendant lives in the county wherein the action is laid, a common *capias* suffices; so in the king's bench likewise, if he lives in Middlesex, the process must still be by bill of Middlesex only.

In the exchequer the first process is by writ of *quo minus*, in order to give the court a jurisdiction over pleas between party and party. In which writ the plaintiff is alleged to be the king's farmer or debtor, and that the defendant hath done him the injury complained of, *quo minus sufficiens existit*, by which he is the less able to pay the king's his rent or debt. And upon this the defendant may be arrested as upon a *capias* from the common pleas.

Thus differently do the three courts set out at first, in the commencement of a suit, in order to entitle the two courts of king's bench and exchequer to hold plea in subjects causes, which by the original constitution of Westminster-hall they were not empowered to do. Afterwards, when the cause is once drawn into the respective courts, the method of pursuing it is pretty much the same in all of them.

If the sheriff had found the defendant upon any of the former writs, the *capias latitat*, &c. he was anciently obliged to take him into custody, in order to produce him in court upon the return, however small and minute the cause of action might be. For, not having obeyed the original summons, he had shown a contempt of the court, and was no longer to be trusted

Process.

at large. But when the summons fell into disuse, and the *capias* became in fact the first process, it was thought hard to imprison a man for a contempt which was only supposed: and therefore, in common cases by the gradual indulgence of the courts (at length authorised by statute 12 Geo. I. c. 29. which was amended by statute 5 Geo. II. c. 27. and made perpetual by statute 21 Geo. II. c. 3.) the sheriff or his officer can now only personally serve the defendant with the copy of the writ or process, and with notice in writing to appear by his attorney in court to defend this action; which in effect reduces it to a mere summons. And if the defendant thinks proper to appear upon this notice, his appearance is recorded, and he puts in sureties for his future attendance and obedience; which sureties are called *common bail*, being the same two imaginary persons that were pledges for the plaintiff's prosecution, John Doe and Richard Roe. Or, if the defendant does not appear upon the return of the writ, or within four (or in some cases eight) days after, the plaintiff may enter an appearance for him, as if he had really appeared; and may file common bail in the defendant's name, and proceed thereupon as if the defendant had done it himself.

But if the plaintiff will make affidavit, or assert upon oath, that the cause of action amounts to ten pounds or upwards, then in order to arrest the defendant, and make him put in substantial sureties for his appearance, called *special bail*, it is required by statute 13 Car. II. stat. 2. c. 2. that the true cause of action should be expressed in the body of the writ or process: else no security can be taken in a greater sum than L. 40. This statute (without any such intention in the makers) had like to have ousted the king's bench of all its jurisdiction over civil injuries without force: for, as the bill of Middlesex was framed only for actions of trespass, a defendant could not be arrested and held to bail thereupon for breaches of civil contracts. But to remedy this inconvenience, the officers of the king's bench devised a method of adding what is called a clause of *ac etiam* to the usual complaint of trespass; the bill of Middlesex commanding the defendant to be brought in to answer the plaintiff of a plea of trespass, and also to a bill of debt: the complaint of trespass giving cognizance to the court, and that of debt authorising the arrest. In imitation of which, lord chief justice North, a few years afterwards, in order to save the suitors of his court the trouble and expence of suing out special originals, directed, that in the common pleas, besides the usual complaint of breaking the plaintiff's close, a clause of *ac etiam* might be also added to the writ of *capias*, containing the true cause of action; as, "that the said Charles the defendant may answer to the plaintiff of a plea of trespass in breaking his close: and also, *ac etiam*, may answer him, according to the custom of the court, in a certain plea of trespass upon the case, upon promises, to the value of twenty pounds, &c." The sum sworn to by the plaintiff is marked upon the back of the writ; and the sheriff, or his officer the bailiff, is then obliged actually to arrest or take into custody the body of the defendant, and, having so done, to return the writ with a *cepi corpus* endorsed thereon. See ARREST.

When the defendant is regularly arrested, he must

Process.

either go to prison, for safe custody; or put in *special bail* to the sheriff. For, the intent of the arrest being only to compel an appearance in court at the return of the writ, that purpose is equally answered, whether the sheriff detains his person, or takes sufficient security for his appearance, called *bail*, (from the French word *bailler*, to deliver), because the defendant is bailed, or delivered, to his sureties, upon their giving security for his appearance; and is supposed to continue in their friendly custody instead of going to gaol. See BAIL. The method of putting in bail to the sheriff is by entering into a bond or obligation, with one or more sureties, (not fictitious persons, as in the former case of common bail, but real, substantial, responsible bondsmen), to insure the defendant's appearance at the return of the writ; which obligation is called the *bail-bond*. The sheriff, if he pleases, may let the defendant go without any sureties; but that is at his own peril: for, after once taking him, the sheriff is bound to keep him safely, so as to be forthcoming in court; otherwise an action lies against him for an escape. But, on the other hand, he is obliged, by statute 23 Hen. VI. c. 10. to take (if it be tendered) a sufficient bail-bond: and, by statute 12 Geo. I. c. 29. the sheriff shall take bail for no other sum than such as is sworn to by the plaintiff, and endorsed on the back of the writ.

Upon the return of the writ, or within four days after, the defendant must appear according to the exigency of the writ. This appearance is effected by putting in and justifying bail to the action; which is commonly called *putting in bail above*. If this be not done, and the bail that were taken by the sheriff below are responsible persons, the plaintiff may take an assignment from the sheriff of the bail-bond (under the statute 4 & 5 Ann. c. 16.) and bring an action thereupon against the sheriff's bail. But if the bail so accepted by the sheriff, be insolvent persons, the plaintiff may proceed against the sheriff himself, by calling upon him, first to return the writ (if not already done), and afterwards to bring in the body of the defendant. And if the sheriff does not then cause sufficient bail to be put in above, he will himself be responsible to the plaintiff.

The bail above, or bail to the action, must be put in either in open court, or before one of the judges thereof; or else, in the country, before a commissioner appointed for that purpose by virtue of the statute 4 W. & M. c. 4. which must be transmitted to the court. These bail, who must at least be two in number, must enter into a recognizance in court, or before the judge or commissioner, whereby they do jointly and severally undertake, that if the defendant be condemned in the action, he shall pay the costs and condemnation, or render himself a prisoner, or that they will pay it for him: which recognizance is transmitted to the court in a slip of parchment, intitled a *bail-piece*. And, if required, the bail must justify themselves in court, or before the commissioner in the country, by swearing themselves housekeepers, and each of them to be worth double the sum for which they are bail, after payment of all their debts. This answers in some measure the *stipulatio* or *satisfactio* of the Roman laws, which is mutually given by each litigant party to the other: by the plaintiff, that he will pro-

pro-

Procefs.

prosecute his suit, and pay the costs if he loses his cause; in like manner as our law still requires nominal pledges of prosecution from the plaintiff: by the defendant, that he shall continue in court, and abide the sentence of the judge, much like our special bail; but with this difference, that the *fidejussores* were there absolutely bound *judicatum solvere*, to see the costs and condemnation paid at all events: whereas our special bail may be discharged, by surrendering the defendant into custody within the time allowed by law; for which purpose they are at all times entitled to a warrant to apprehend him.

Special bail is required (as of course) only upon actions of debt, or actions on the case in trover, or for money due, where the plaintiff can swear that the cause of action amounts to ten pounds: but in actions where the damages are precarious, being to be assessed *ad libitum* by a jury, as in actions for words, ejectment, or trespass, it is very seldom possible for a plaintiff to swear to the amount of his cause of action; and therefore no special bail is taken thereon, unless by a judge's order, or the particular directions of the court, in some peculiar species of injuries, as in cases of mayhem or atrocious battery; or upon such special circumstances as make it absolutely necessary that the defendant should be kept within the reach of justice. Also in actions against heirs, executors, and administrators, for debts of the deceased, special bail is not demandable; for the action is not so properly against them in person, as against the effects of the deceased in their possession. But special bail is required even of them, in actions for a *deceit*, or waiving the goods of the deceased; that wrong being of their own committing.

Thus much for *procefs*; which is only meant to bring the defendant into court, in order to contest the suit, and abide the determination of the law. When he appears either in person as a prisoner, or out upon bail, then follow the *pleadings* between the parties. See PLEADINGS.

PROCESS upon an Indictment. See PROSECUTION. The proper process on an indictment for any petty misdemeanour, or on a penal statute, is a writ of *venire facias*, which is in the nature of a summons to cause the party to appear. And if by the return to such *venire* it appears, that the party hath lands in the county whereby he may be distrained, then a *distress infinite* shall be issued from time to time till he appears. But if the sheriff returns, that he hath no lands in his bailiwick, then (upon his non-appearance) a writ of *capias* shall issue, which commands the sheriff to take his body, and have him at the next assizes; and if he cannot be taken upon the first *capias*, a second and a third shall issue, called an *alias*, and a *pluries capias*. But, on indictments for treason or felony, a *capias* is the first process: and, for treason or homicide, only one shall be allowed to issue, or two in the case of other felonies, by statute 25 Edw. III. c. 14. though the usage is to issue only one in any felony; the provisions of this statute being in most cases found impracticable. And so, in the case of misdemeanours, it is now the usual practice for any judge of the court of king's bench, upon certificate of an indictment found, to award a writ of *capias* immediately, in order to bring in the defendant. But if he absconds, and it is thought

Procefs.

proper to pursue him to an outlawry, then a greater exactness is necessary. For, in such case, after the several writs have issued in a regular number, according to the nature of the respective crimes, without any effect, the offender shall be put in the *exigent* in order to his outlawry: that is, he shall be exacted, proclaimed, or required, to surrender, at five county courts; and if he be returned *quinto exactus*, and does not appear at the fifth exaction or requisition, then he is adjudged to be *outlawed*, or put out of the protection of the law; so that he is incapable of taking the benefit of it in any respect, either by bringing actions or otherwise.

The punishment, for outlawries upon indictments for misdemeanours, is the same as for outlawries upon civil actions; viz. forfeiture of goods and chattels. But an outlawry in treason or felony, amounts to a conviction and attainder of the offence charged in the indictment, as much as if the offender had been found guilty by his country. His life is, however, still under the protection of the law, as hath elsewhere been observed; (see HOMICIDE:) that though anciently an outlawed felon was said to have *caput lupinum*, and might be knocked on the head like a wolf, by any one that should meet him; because, having renounced all law, he was to be dealt with as in a state of nature, when every one that should find him might slay him: yet now, to avoid such inhumanity, it is holden that no man is entitled to kill him wantonly or wilfully; but in so doing is guilty of murder, unless it happens in the endeavour to apprehend him. For any person may arrest an outlaw on a criminal prosecution, either of his own head, or by writ or warrant of *capias utlagatum*, in order to bring him to execution. But such outlawry may be frequently reversed by writ of error; the proceedings therein being (as it is fit they should be) exceedingly nice and circumstantial; and if any single minute point be omitted or misconducted, the whole outlawry is illegal, and may be reversed: upon which reversal the party accused is admitted to plead to, and defend himself against, the indictment.

Thus much for process to bring in the offender after indictment found; during which stage of the prosecution it is that writs of *certiorari facias* are usually had, though they may be had at any time before trial, to certify and remove the indictment, with all the proceedings thereon, from any inferior court of criminal jurisdiction into the court of king's bench; which is the sovereign ordinary court of justice in causes criminal. And this is frequently done for one of these four purposes; either, 1. To consider and determine the validity of appeals or indictments and the proceedings thereon; and to quash or confirm them as there is cause; or, 2. Where it is surmised that a partial or insufficient trial will probably be had in the court below, the indictment is removed, in order to have the prisoner or defendant tried at the bar of the court of king's bench, or before the justices of *nisi prius*: or, 3. It is so removed, in order to plead the king's pardon there: or, 4. To issue process of outlawry against the offender, in those counties or places where the process of the inferior judges will not reach him. Such writ of *certiorari*, when issued and delivered to the inferior court for removing any record or other proceed-

Procefs  
||  
Proclama-  
tions.

ceeding, as well upon indictment as otherwise, super-  
fedes the jurisdiction of fuch inferior court, and makes  
all fubfequent proceedings therein entirely erroneous  
and illegal; unlefs the court of king's bench remands  
the record to the court below, to be there tried and  
determined. A *Certiorari* may be granted at the in-  
ftance of either the profeutor or the defendant: the  
former as a matter of right, the latter as a matter of  
difcretion; and therefore it is feldom granted to re-  
move indictments from the juftices of goal-delivery, or  
after iffue joined, or confeffion of the fact in any of the  
courts below.

At this ftage of profeution alfo it is, that indict-  
ments found by the grand jury againft a peer, muft, in  
confequence of a writ of *certiorari*, be certified and  
transmitted into the court of parliament, or into that  
of the lord high fteward of Great Britain; and that,  
in places of exclusive jurisdiction, as the two univer-  
fities, indictments muft be delivered (upon challenge  
and claim of cognizance) to the courts therein e-  
ftablifhed by charter, and confirmed by act of parlia-  
ment, to be there refpectively tried and determined.  
See PLEA.

PROCESS, in chemiftry, the whole courfe of an ex-  
periment or ferief of operations, tending to produce  
fomething new.

PROCESS, in anatomy, denotes any protuberance or  
eminence in a bone.

PROCESSION, a ceremony in the Romifh church,  
confifting of a formal march of the clergy and people,  
putting up prayers, &c. and in this manner vifiting  
fome church, &c. They have alfo proceffions of the  
holy or facrament, &c. See HOSt.

PROCHEIN AMY, in law, the perfon next akin  
to a child in non-age, and who, in that refpect, is al-  
lowed to act for him, and be his guardian, &c. if he  
hold land in focage.

To fue, an infant is not allowed to make an attor-  
ney; but the court will admit his next friend as plain-  
tiff, or his guardian as defendant.

PROCLAMATION, a public notice given of any  
thing of which the king thinks proper to advertife his  
fubjects.

Proclamations are a branch of the king's preroga-  
tive\*; and have then a binding force, when (as Sir  
Edward Coke obferves) they are grounded upon and  
enforce the laws of the realm. For, though the mak-  
ing of laws is entirely the work of a diftinct part, the  
legiflative branch of the fovereign power, yet the man-  
ner, time, and circumftances, of putting thofe laws in  
execution, muft frequently be left to the difcretion of  
the executive magiftrate. And therefore his conftitu-  
tions or edicts, concerning thofe points which we call  
*proclamations*, are binding upon the fubject, where they  
do not either contradict the old laws, or tend to e-  
ftablifh new ones; but only enforce the execution of fuch  
laws as are already in being, in fuch manner as the  
king fhall judge neceffary. Thus the eftablifhed law  
is, that the king may prohibit any of his fubjects from  
leaving the realm: a proclamation therefore forbid-  
ding this in general for three weeks, by laying an em-  
bargo upon all fhipping in time of war, will be equal-  
ly binding as an act of parliament, becaufe founded  
upon a prior law. But a proclamation to lay an em-  
bargo in time of peace upon all veffels laden with wheat,

(though in the time of a public fcarcity), being con-  
trary to law, and particularly to ftatute 22 Car. II.  
c. 13. the advifers of fuch a proclamation, and all per-  
fons acting under it, found it neceffary to be indemnified  
by a fpecial act of parliament, 7 Geo. III. c. 7.  
A proclamation for difarming Papifts is alfo binding,  
being only in execution of what the legiflature has firft  
ordained: but a proclamation for allowing arms to Pa-  
pifts, or for difarming any Proteftant fubjects, will not  
bind; becaufe the firft would be to affume a difpenfing  
power, the latter a legiflative one; to the velting of  
either of which in any fingle perfon the laws of Eng-  
land are abfolutely ftangers. Indeed, by the ftatute  
31 Hen. VIII. c. 8. it was enacted, that the king's  
proclamations fhould have the force of acts of parlia-  
ment: a ftatute, which was calculated to introduce the  
moft defpotic tyranny; and which muft have proved  
fatal to the liberties of this kingdom, had it not been  
luckily repealed in the minority of his fucceffor, about  
five years after.

PROCLUS, firnamed DIADOCUS, a Greek philo-  
fopher and mathematician, was born in Lycia, and  
lived about the year 500. He was the difciple of Sy-  
rianus, and had a great fhare in the friendship of the  
emperor Anaftafius. It is faid, that when Vitalian laid  
fiege to Conftantinople, Proclus burnt his fhips with  
large brazen fpeculums. This philofopher was a pa-  
gan, and wrote againft the Chriftian religion. There  
are ftill extant his Commentaries on fome of Plato's  
books, and other of his works written in Greek.

PROCONSUL, a Roman magiftrate, fent to govern  
a province with confular authority.

The proconfuls were appointed out of the body of  
the fenate; and usually as the year of any one's con-  
fulate expired, he was fent proconful into fome province.

The proconfuls decided cafes of equity and juftice,  
either privately in their pretorium or palace, where  
they received petitions, heard complaints, granted  
writs under their feal, and the like; or elfe publicly,  
in the common hall, with the ufual formalities obfer-  
ved in the court of judicature at Rome. They had be-  
fides, by virtue of their edicts, the power of ordering  
all things relating to the tribunes, taxes, contributions,  
and provifions of corn and money, &c. Their office  
lafted only a year. See CONSUL.

PROCOPIUS, a famous Greek hiftorian, born in  
Cæfaria, acquired great reputation by his works in the  
reign of Juftinian, and was fecretary to Belifarius dur-  
ing all the wars carried on by that general in Perfia,  
Africa, and Italy. He at length became fenator, ob-  
tained the title of *illuftrious*, and was made pretor of  
Conftantinople.

PROCREATION, the begetting and bringing  
forth children. See GENERATION.

PROCTOR, a perfon commiffioned to manage an-  
other perfon's caufe in any court of the civil or eccle-  
fiaftical law.

PROCURATION, an act or inftrument by which  
a perfon is empowered to treat, tranfaft, receive, &c.  
in another perfon's name.

PROCURATOR, a perfon who has a charge com-  
mitted to him to act for another.

PRODUCT, in arithmetic and geometry, the fac-  
tum of two or more numbers, or lines, &c. into one  
another: thus  $5 \times 4 = 20$  the product required.

Proclus  
Product.

\* See Pre-  
rogative.

Profanation  
Projectiles.

**PROFANATION**, the acting disrespectfully to sacred things.

**PROFANE**, a term used in opposition to *holy*; and in general is applied to all persons who have not the sacred character, and to things which do not belong to the service of religion.

**PROFESSION**, among the Romanists, denotes the entering into a religious order, whereby a person offers himself to God by a vow of inviolably observing obedience, chastity, and poverty.

**PROFESSOR**, in the universities, a person who teaches or reads public lectures in some art or science from a chair for the purpose.

**PROFILE**, in architecture, the draught of a building, fortification, &c. wherein are expressed the several heights, widths, and thicknesses, such as they would appear were the building cut down perpendicularly from the roof to the foundation. Whence the profile is also called the *section*, sometimes *orthographical section*, and by Vitruvius also *sciagraphy*.

*Profile*, in this sense, amounts to the same with *elevation*; and stands opposed to a *plan* or *ischnography*.

**PROFILE** is also used for the contour or out-line of a figure, building, member of architecture, or the like; as a base, a cornice, &c. Hence *profiling* is sometimes used for designing, or describing the member with rule, compass, &c.

$$\begin{aligned} \text{thus } \left\{ \begin{array}{l} a, a+d, a+2d, a+3d, \text{ \&c. increasing} \\ a, a-d, a-2d, a-3d, \text{ \&c. decreasing} \end{array} \right\} & \text{ by the difference } d. \\ \text{In numbers } \left\{ \begin{array}{l} 2, 4, 6, 8, 10, \text{ \&c. increasing} \\ 10, 8, 6, 4, 2, \text{ \&c. decreasing} \end{array} \right\} & \text{ by the difference } 2. \end{aligned}$$

*Geometric Progression*, or *Continued Geometric Proportion*, is when the terms do increase or decrease by equal ratios: thus,

$$\begin{aligned} \left. \begin{array}{l} a, ar, ar^2, ar^3, \text{ \&c. increasing} \\ a, \frac{a}{r}, \frac{a}{r^2}, \frac{a}{r^3}, \text{ \&c. decreasing} \end{array} \right\} & \text{ from a continual } \left\{ \begin{array}{l} \text{multiplication} \\ \text{division} \end{array} \right\} \text{ by } r. \\ \left. \begin{array}{l} 2, 4, 8, 16, 32, 64, \text{ increasing} \\ 64, 32, 16, 8, 4, 2, \text{ decreasing} \end{array} \right\} & \text{ from a continual } \left\{ \begin{array}{l} \text{multiplication} \\ \text{division} \end{array} \right\} \text{ by } 2. \end{aligned}$$

See the articles **FLUXIONS**, **GEOMETRY**, and **SERIES**.

**PROJECTILES**, are such bodies as, being cast in a violent motion by any great force, are then cast off or let go from the place where they received their quantity of motion: as a stone thrown from a sling, an arrow from a bow, a bullet from a gun, &c.

It is usually taken for granted, by those who treat of the motion of projectiles, that the force of gravity near the earth's surface is every where the same, and acts in parallel directions; and that the effect of the air's resistance upon very heavy bodies, such as bombs and cannon-balls, is too small to be taken into consideration.

The famous Sir Isaac Newton has shown, that the gravity of bodies which are above the superficies of the earth, is reciprocally as the squares of their distances from its centre; but the theorems concerning the descent of heavy bodies, demonstrated by Galilæus, Huygens, and others, are built upon this foundation, that the action of gravity is the same at all distances: and the consequences of this hypothesis are found to be very nearly agreeable to experience. For it is obvious, that the error arising from the supposition of gravity's acting uniformly, and in parallel lines, must

Profile  
Progression

**PROFILE**, in sculpture and painting.—A head, a portrait, &c. are said to be in *profile*, when they are represented sidewise, or in a side-view; as, when in a portrait there is but one side of the face, one eye, one cheek, &c. shown, and nothing of the other.—On almost all medals, the faces are represented in *profile*.

**PROFLUVIUM**, in medicine, denotes a flux, or liquid evacuation of any thing.

**PROGNOSTIC**, among physicians, signifies a judgment concerning the event of a disease, as whether it shall end in life or death, be short or long, mild or malignant, &c.

**PROGRAMMA**, anciently signified a letter sealed with the king's seal.

Programma is also an university term for a billet or advertisement, posted up or given into the hand, by way of invitation to an oration, &c. containing the argument, or so much as is necessary for understanding thereof.

**PROGRESSION**, in general, denotes a regular advancing, or going forward, in the same course and manner.

**PROGRESSION**, in mathematics, is either arithmetical or geometrical. Continued arithmetical proportion is, where the terms do increase and decrease by equal differences and is called *arithmetical progression*:

be exceeding small; because even the greatest distance of a projectile above the surface of the earth, is inconsiderable in comparison of the distance from the centre to which the gravitation tends. But then, on the other hand, it is very certain, that the resistance of the air to very swift motions, is much greater than it has been commonly represented. Nevertheless, (in the application of this doctrine to gunnery), if the amplitude of the projection, answering to one given elevation, be first found by experiment, (which we suppose), the amplitudes in all other cases, where the elevations and velocities do not very much differ from the first, may be determined, to a sufficient degree of exactness, from the foregoing hypothesis: because, in all such cases, the effects of the resistance will be nearly as the amplitudes themselves; and were they accurately so, the proportions of the amplitudes, at different elevations, would then be the very same as in vacuo.

Now, in order to form a clear idea of the subject here proposed, the path of every projectile is to be considered as depending on two different forces: that is to say, on the impellent force, whereby the motion is first begun, (and would be continued in a right line); and

Projectiles. and on the force of gravity, by which the projectile, during the whole time of its flight, is continually urged downwards, and made to deviate more and more from its first direction. As whatever relates to the track and flight of a projectile or ball (neglecting the resistance of the air) is to be determined from the action of these two forces, it will be proper, before we proceed to consider their joint effect, to premise something concerning the nature of the motion produced by each, when supposed to act alone, independent of the other; to which end we have premised the two following lemmata.

*Lem. I.* Every body, after the impressed force whereby it is put in motion ceases to act, continues to move uniformly in a right line; unless it is interrupted by some other force or impediment.

This is a law of nature, and has its demonstration from experience and matter of fact.

*Corollary.* It follows from hence, that a ball, after leaving the mouth of the piece, would continue to move along the line of its first direction, and describe spaces therein proportional to the times of their description, were it not for the action of gravity, whereby the direction is changed, and the motion interrupted.

*Lem. II.* The motion or velocity acquired by a ball, in freely descending from rest, by the force of an uniform gravity, is as the time of the descent; and the space fallen through, as the square of that time.

The first part of this lemma is extremely obvious: for since every motion is proportional to the force whereby it is generated, that generated by the force of an uniform gravity will be as the time of the descent; because the whole effort of such a force is proportional to the time of its action; that is, as the time of the descent.

To demonstrate that the distances descended are proportional to the squares of the times, let the time of falling through any proposed distance AB, be represented by the right line PQ; which conceive to be divided into an indefinite number of very small, equal particles, represented each by the symbol  $m$ ; and let the distance descended in the first of them be  $Ac$ ; in the second  $cd$ ; in the third  $de$ ; and so on.

Then the velocity acquired being always as the time from the beginning of the descent, it will at the middle of the first of the said particles be represented by  $\frac{1}{2}m$ ; at the middle of the second, by  $1\frac{1}{2}m$ ; at the middle of the third, by  $2\frac{1}{2}m$ , &c. which values constitute the series  $\frac{m}{2}, \frac{3m}{2}, \frac{5m}{2}, \frac{7m}{2}, \frac{9m}{2},$  &c.

But since the velocity, at the middle of any one of the said particles of time, is an exact mean between the velocities of the two extremes thereof, the corresponding particle of the distance AB may be therefore considered as described with that mean velocity: and fo the spaces  $Ac, cd, de, ef,$  &c. being respectively equal to the abovementioned quantities  $\frac{m}{2}, \frac{3m}{2},$

Projectiles.  $\frac{5m}{2}, \frac{7m}{2},$  &c. it follows, by the continual addition of these, that the spaces  $Ac, Ad, Ae, Af,$  &c. fallen thro' from the beginning, will be expressed by  $\frac{m}{2}, \frac{4m}{2}, \frac{9m}{2}, \frac{16m}{2}, \frac{25m}{2},$  &c. which are evidently to one another in

proportion, as 1, 4, 9, 16, 25, &c. that is, as the squares of the times. Q. E. D.

*Corol.* Seeing the velocity acquired in any number ( $n$ ) of the aforesaid equal particles of time (measured in the space that would be described in one single particle) is represented by ( $n$ ) times  $m$ , or  $nm$ ; it will therefore be as one particle of time is to  $n$  such particles, so is  $nm$ , the said distance answering to the former time, to the distance,  $n^2m$ , corresponding to the latter, with the same celerity acquired at the end of the said  $n$  particles. Whence it appears, that the space  $\frac{n^2m}{2}$

(found above) through which the ball falls in any given time  $n$ , is just the half of that time ( $n^2m$ ) which might be uniformly described with the last, or greatest celerity in the same time.

*Schol.* It is found by experiment, that any heavy body near the earth's surface (where the force of gravity may be considered as uniform) descends about 16 feet from rest, in the first second of time. Therefore, as the distances fallen through are proved above to be in proportion as the squares of the time, it follows, that as the square of one second is to the square of any given number of seconds, so is 16 feet to the number of feet a heavy body will freely descend in the said number of seconds. Whence the number of feet descended in any given time will be found, by multiplying the square of the number of seconds by 16. Thus the distance descended in 2, 3, 4, 5, &c. seconds, will appear to be 64, 144, 256, 400 feet, &c. respectively. Moreover, from hence, the time of the descent through any given distance will be obtained, by dividing the said distance in feet by 16, and extracting the square root of the quotient; or, which comes to the same thing, by extracting the square root of the whole distance, and then taking  $\frac{1}{4}$  of that root for the number of seconds required. Thus, if the distance be supposed 2640 feet; then, by either of the two ways, the time of the descent will come out 12.84, or 12.50 seconds.

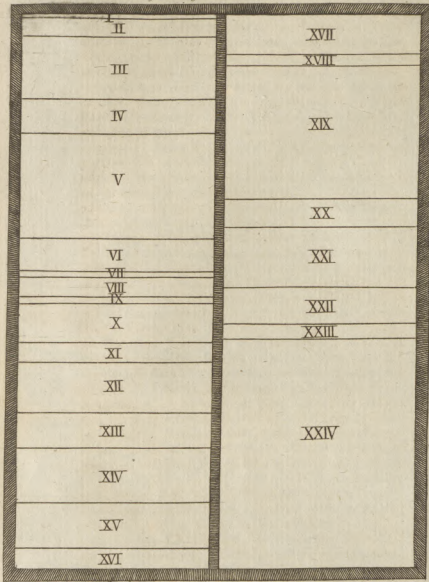

It appears also (from the corol.) that the velocity *per* second (in feet) at the end of the fall, will be determined by multiplying the number of seconds in the fall by 32. Thus it is found, that a ball, at the end of 10 seconds, has acquired a velocity of 320 feet *per* second. After the same manner, by having any two of the four following quantities, *viz.* the force, the times, the velocity, and distance, the other two may be determined; for let the space freely descended by a ball, in the first second of time (which is as the accelerating force) be denoted by  $F$ ; also let  $T$  denote the number of seconds wherein any distance,  $D$ , is descended; and let  $V$  be the velocity *per* second, at the end of the descent: then will  $V=2FT=2\sqrt{FD}=2DT=\sqrt{D}=V=$

$$2DD=FTT=VV=TVF=D=V=VV.$$

$$\frac{V}{\sqrt{D}} = \frac{2FT}{2T} = \frac{2\sqrt{FD}}{2T} = \frac{2DT}{2T} = \frac{\sqrt{D}}{1} = \frac{V}{1}$$

Stereographic PROJECTION of the sphere.

Projectiles. All which equations are very easily deduced from the two original ones,  $D=FTT$ , and  $V=2FT$ , already demonstrated; the former in the proposition itself, and the latter in the corollary to it; by which it appears, that the measure of the velocity at the end of the first second is  $2F$ ; whence the velocity ( $V$ ) at the end of ( $T$ ) seconds must consequently be expressed by  $2FT$  or  $2T^2$ .

Plate CCXLV.

**Theorem 1.** A projected body, whose line of direction is parallel to the plane of the horizon, describes by its fall a parabola. If the heavy body is thrown by any extrinsecal force, as that of a gun or the like, from the point A, (fig. 2. n° 1.) so that the direction of its projection is the horizontal line AD; the path of this heavy body will be a semi-parabola. For if the air did not resist it, nor was it acted on by its gravity, the projectile would proceed with an equable motion, always in the same direction; and the times wherein the parts of space AB, AC, AD, AE, were passed over, would be as the spaces AB, AC, AD, &c. respectively. Now if the force of gravity is supposed to take place, and to act in the same tenour as if the heavy body were not impelled by any extrinsecal force, that body would constantly decline from the right-line AE; and the spaces of descent, or the deviations from the horizontal line AE, will be the same as if it had fallen perpendicularly. Wherefore if the body falling perpendicularly by the force of its gravity, passed over the space AK in the time AB, descended through AL in the time AC, and through AM in the time AD; the spaces AK, AL, AM, will be as the squares of the times, that is, as the squares of the right-lines AB, AC, AD, &c. or KF, LG, MH. But since the impetus in the direction parallel to the horizon always remains the same, (for the force of gravity, that only sollicit the body downwards, is not in the least contrary to it), the body will be equally promoted forwards in the direction parallel to the plane of the horizon, as if there was no gravity at all. Wherefore, since in the time AB, the body passes over a space equal to AB; but being compelled by the force of gravity, it declines from the right-line AB through a space equal to AK; and BF being equal and parallel to AK, at the end of the time AB, the body will be in F; so in the same manner, at the end of the time AE, the body will be in I, and the path of the projectile will be in the curve AFGHI; but because the squares of the right lines KF, LG, MH, NI, are proportionable to the abscisses AK, AL, AM, AN. The curve AFGHI will be a semi-parabola. The path, therefore, of a heavy body projected according to the direction AE, will be a semi-parabola.

**Theorem 2.** The curve line that is described by a heavy body projected obliquely and upwards, according to any direction, is a parabola.

Let AF (ibid. n° 2.) be the direction of projection, any ways inclined to the horizon, gravity being supposed not to act, the moving body would always continue its motion in the same right-line, and would describe the spaces AB, AC, AD, &c. proportional to the times. But by the action of gravity it is compelled continually to decline from the path AF, and to move in a curve, which will be a parabola. Let us suppose the heavy body falling perpendicularly in the time AB, through the space AQ, and in the time AC,

through the space AR, &c. The spaces AQ, AR, AS, will be as the squares of the times, or as the squares of AB, AC, AD. It is manifest from what was demonstrated in the last theorem, that if in the perpendicular BG, there is taken  $BM=AQ$ , and the parallelogram be completed, the place of the heavy body at the end of the time AB, will be M, and so of the rest; and all the deviations BM, &c. from the right-line AF, arising from the times, will be equal to the spaces AQ, AR, AS, which are as the squares of the right-lines AB, AC, AD. Through A draw the horizontal right-line AP, meeting the path of the projectile P. From P raise the perpendicular PE, meeting the line of direction in E; and by reason the triangles ABG, ACH, &c. are equiangular, the squares of the right-lines AB, AC, &c. will be proportionable to the squares of AG, AH, &c. so that the deviations BM, CN, &c. will be proportionable to the squares of the right lines AG, AH, &c. Let the line L be a third proportional to EP and AP; and it will be (by 17 El. 6.)  $L \times EP = AP \times P$ , but  $AP \times P : AG \times G :: EP : BM :: L \times EP : L \times BM$ ; whence since it is  $L \times EP = AP \times P$ , it will be  $L \times BM = AG \times G$ . In like manner it will be  $L \times CN = AH \times H$ , &c. But because it is  $BG : AG :: (EP : AP ::$  by hypothesis)  $AP : L$ ; it will be  $L \times BG = AG \times AP = AG \times AG + AG \times GP = AG \times G + AG \times GP$ . But it has been shown that it is  $L \times BM = AG \times G$ , wherefore it will be  $L \times BG - L \times BM = AG \times GP$ , that is,  $L \times MG = AG \times GP$ . By the same way of reasoning it will be  $L \times NH = AH \times HP$ , &c. Wherefore the rectangle under MG and L, will be equal to the square of AG, which is the property of the parabola; and so the curve AMNOPK wherein the projectile is moved will be a parabola.

**Cor. 1.** Hence the right line L is the latus rectum or parameter of the parabola, that belongs to its axis.

**Cor. 2.** Let  $AH=HP$ , and it will be  $L \times CN = AH \times H = L \times NH$ , whence it will be  $NH=CN$ ; and consequently the right-line AF being the line of direction of the projectile, will be a tangent to the parabola.

**Cor. 3.** If a heavy body is projected downwards, in a direction oblique to the horizon, the path of the projectile will be a parabola.

**Theorem 3.** The impetus of a projected body in different parts of the parabola, are as the portions of the tangents intercepted betwixt two right-lines parallel to the axis; that is, the impetus of the body projected in the points A and B, (ibid. n° 3.) to which AD and BE are tangents, will be as CD and EB, the portions of the tangents intercepted betwixt two right-lines, CB and DE, parallel to the axis.

These calculations and demonstrations, however, are all founded on a supposition that the projectiles move in an unresisting medium, or in one whose resistance is but small. Hence they answer with tolerable exactness where the motions are not very quick; but in those cases where the projectiles are moved with immense velocity, the resistance of the air occasions errors of such enormous magnitude, that a musket-ball, which, by calculation, ought to fly 17 miles, seldom exceeds three quarters of a mile. See the article GUNNERY, *passim*.

**PROJECTION**, in mechanics, the act of communicating motion to a body, from thence called *projectile*. See the preceding article.

**Projection.** PROJECTION, in perspective, the appearance or representation of an object on the perspective plane. See PERSPECTIVE.

PROJECTION of the Sphere, in geography and astronomy, signifies the laying down upon paper those imaginary circles of the sphere by which the degrees of longitude and latitude are counted on celestial and terrestrial maps.

Projection of the sphere is either orthographic or stereographic. The orthographic projection supposes the eye placed at an infinite distance; whereas, in the stereographic projection, it is supposed to be only  $90^\circ$  distant from the primitive circle, or placed in its pole, and thence viewing the circles on the sphere. The primitive circle is that great circle which limits or bounds the representation or projection; and the place of the eye is called the projecting point. See GEOGRAPHY, n<sup>o</sup> 13, &c.

The laws of the orthographic projection are these: 1. The rays by which the eye, placed at an infinite distance, perceives any object are parallel. 2. A right-line, perpendicular to the plane of the projection, is represented by a point, where it cuts the plane of the projection. 3. A right-line, as AB, or CD, (fig. 3. n<sup>o</sup> 1.) not perpendicular, is projected into a right-line, as FE and GH, and is always comprehended between the extreme perpendiculars AF and BE, and CG and GH. 4. The projection of the right-line, AB, is the greatest when it is parallel to the plane of projection; being projected in a right-line equal to itself. 5. But an oblique line is always projected into one less than itself; and the more so, the nearer it approaches to a perpendicular, which, as already observed, is projected into a point. 6. A plane surface, as ABCD, (ibid. n<sup>o</sup> 2.) at right angles to the plane of the projection, is projected into the right line AB, in which it cuts the plane of the projection; and any arch, as Bc, cc, or cA, is projected into the corresponding lines Bc, oo, and oA. 7. A circle parallel to the plane of projection, is represented by a circle equal to itself; and a circle oblique to the plane of projection, is represented by an ellipse.

As to the stereographic projection, its laws are these: 1. The representations of all circles, not passing thro' the projecting point, will be circles. Thus, let ACEDB (fig. 4. n<sup>o</sup> 1, 2, 3.) represent a sphere, cut by a plane RS, passing thro' the centre I, at right angles to the diameter EH, drawn from E the place of the eye; and let the section of the sphere by the plane RS, be the circle CFDL, whose poles are H and E. Suppose now AGB is a circle on the sphere to be projected, whose pole most remote from the eye is P; and the visual rays from the circle AGB meeting in E, form the cone AGBE, whereof the triangle AEB is a section thro' the vertex E, and diameter of the base AB: then will the figure *agbf*, which is the projection of the circle AGB, be itself a circle: for if the plane RS is supposed to revolve on the line CD, till it coincides with the plane of the circle ACEB; then will the circle CFDL coincide with the circle CEDH, and the projected circle *afbg* with the circle *anbk*. Hence, the middle of the projected diameter is the centre of the projected circle, whether it be a great circle or a small one; the poles and centres of all circles, parallel to the plane of projection, fall in the centre of the projection; and all oblique great circles cut the primitive

circle in two points diametrically opposite. 2. The projected diameter of any circle subtends an angle at the eye equal to the distance of that circle from its nearest pole, taken on the sphere; and that angle is bisected by a right line, joining the eye and that pole. Thus let the plane RS (ibid. n<sup>o</sup> 4.) cut the sphere HFEQ through its centre I; and let ABC be any oblique great circle, whose diameter AC is projected in *ac*; and KOL, any small circle parallel to ABC, whose diameter KL is projected in *kl*. The distances of those circles from their pole P, being the arches AHP, KHP; and the angles *aEe*, *kEl*, are the angles at the eye, subtended by their projected diameters, *ac*, *kl*. Then is the angle *aEe* measured by the arch AHP, and the angle *kEl* measured by the arch KHP, and those angles are bisected by EP. 3. Any point of a sphere is projected at the distance of the tangent of half the arch intercepted between that point and the pole opposite to the eye, from the centre of projection; the semi-diameter of the sphere being radius. Thus, let C $\theta$ EB (ibid. n<sup>o</sup> 5.) be a great circle of the sphere, whose centre is c, GH the plane of projection cutting the diameter of the sphere in b, B; E, C, the poles of the section by that plane; and a, the projection of A. Then is *ca* = the tangent of half the arch AC, as is evident by drawing CF = the tangent of half that arch, and joining cF. 4. The angle made by two projected circles, is equal to the angle which these circles make on the sphere. For let IACE and ABL (ibid. n<sup>o</sup> 6.) be two circles on a sphere intersecting in A; E, the projecting point; and RS, the plane of projection, wherein the point A is projected in a, in the line IC the diameter of the circle ACE. Also let DH, FA, be tangents to the circles ACE, ABL. Then will the projected angle *daf* be equal to the spheric angle BAC. 5. The distance between the poles of the primitive circle and an oblique circle, is equal to the tangent of half the inclination of those circles; and the distance of their centres is equal to the tangent of their inclination, the semi-diameter of the primitive being radius. For let AC (ibid. n<sup>o</sup> 7.) be the diameter of a circle, whose poles are P and Q, and inclined to the plane of projection in the angle AIF; and let *a*, *c*, *p*, *q* be the projections of the points A, C, P; also let HAE be the projected oblique circle, whose centre is q. Now when the plane of projection becomes the primitive circle, whose pole is I; then is *Iq* = tangent of half the angle AIF, or of half the arch AF; and *Iq* = tangent of AF, or of the angle FHa = AIF. 6. If through any given point in the primitive circle, an oblique circle be described; then the centres of all other oblique circles passing through that point, will be in a right line drawn through the centre of the first oblique circle at right angles to a line passing through that centre, the given point, and the centre of the primitive. Thus let GACE (ibid. n<sup>o</sup> 8.) be the primitive circle, ADEI a great circle described through D, its centre being B. HK is a right line drawn through B perpendicular to a right line, CI, passing through D, B, and the centre of the primitive circle. Then the centres of all other great circles, as FDG, passing through D, will fall into the line HK. 7. Equal arcs of any two great circles of the sphere, will be intercepted between two other circles drawn on the sphere through the remotest poles of those great circles. For let

**Projecture** || **Promethæus** PBEA (ibid. n° 9.) be a sphere, whereon AGE, CFD, are two great circles, whose remotest poles are E, P; and through these poles let the great circle PBEC, and the small circle PGE, be drawn, intersecting the great circles AGE, CFD, in the points B, G, and D, F. Then are the intercepted arches EG, and DF equal to one another. 8. If lines be drawn from the projected pole of any great circle, cutting the peripheries of the projected circle and plane of projection, the intercepted arches of those circumferences are equal; that is, the arch  $GB=fd$ , (ibid.) 9. The radius of any small circle, whose plane is perpendicular to that of the primitive circle, is equal to the tangent of that lesser circle's distance from its pole; and the secant of that distance, is equal to the distance of the centres of the primitive and lesser circle. For let P (ibid. n° 10.) be the pole, and AB the diameter of a lesser circle, its plane being perpendicular to that of the primitive circle, whose centre is C: then  $d$  being the centre of the projected lesser circle,  $dc$  is equal to the tangent of the arch PA, and  $dC$  = secant of PA.

**PROJECTURE**, in architecture, the outjetting and prominence, or embossing, which the mouldings and other members have beyond the naked wall, column, &c.

**PROLAPSUS**, in surgery, a prolapsion or falling out of any part of the body from its natural situation: thus we say, *prolapsus intestini*, a prolapsion of the intestine, &c. See **SURGERY**.

**PROLATE**, in geometry, an epithet applied to a spheroid produced by the revolution of a semi-ellipse about its larger diameter.

**PROLEGOMENA**, in philology, certain preparatory observations or discourses prefixed to a book, &c. containing something necessary for the reader to be apprised of, to enable him the better to understand the book, or to enter deeper into the science, &c.

**PROLEPSIS**, a figure in rhetoric, by which we anticipate or prevent what might be objected by the adversary. See **ORATORY**, n° 80.

**PROLEPTIC**, an epithet applied to a periodical disease which anticipates, or whose paroxysm returns sooner and sooner every time; as is frequently the case in agues.

**PROLIFER FLOS**; (*proles*, an "offspring;" and *flos*, to "bear;") a prolific flower, or flower which from its own substance produces another; a singular degree of luxuriance, to which full flowers are chiefly incident.

**PROLIFIC**, something that has the qualities necessary for generating.

**PROLIXITY**, in discourse, the fault of entering into too minute a detail, or being too long, precise, and circumstantial, even to a degree of tediousness.

**PROLOGUE**, in dramatic poetry, a discourse addressed to the audience before the drama or play begins. The original intention was to advertise the audience of the subject of the piece, and to prepare them to enter more easily into the action, and sometimes to make an apology for the poet.

**PROMETHEUS**, the son of Japhet, supposed to have been the first discoverer of the art of striking fire by flint and steel; which gave rise to the fable of his stealing fire from heaven: A renowned warrior; but

whose history is involved in fable. He flourished about 1687 B.C. The poetical account is, that he formed a man of clay of such exquisite workmanship, that Prometheus, charmed with his ingenuity, offered him whatever in heaven could contribute to finish his design; and for this purpose took him up with her to the celestial mansions, where he stole some fire from the chariot of the sun, which he used to animate his image. At this theft Jupiter was so enraged, that he ordered Vulcan to chain him down on mount Caucasus, and sent an eagle or vulture to prey on his liver; which every night was renewed, in proportion to the quantity eaten up in the day-time, until at last he was delivered by Hercules, who killed the vulture.

**PROMISE**, in law, is, when upon any valuable consideration one binds himself by word of mouth to another, to perform a thing agreed on. See **ASSUMPSIT**.

**PROMONTORY**, in geography, a high point of land or rock projecting out into the sea; the extremity of which towards the sea is called a *cape* or *headland*. See 2<sup>d</sup> Plate CXVI.

**PROMPTER**, in the drama, an officer posted behind the scenes, whose business it is to watch attentively the actors speaking on the stage, in order to suggest and put them forward, when at a stand, to correct them when amiss, &c. in their parts.

**PROMULGATED**, or **PROMULGED**, something published or proclaimed, and generally applied to a law, to denote the publishing or proclaiming it to the people.

**PRONAOS**, in the ancient architecture, a porch to a church, palace, or other spacious building. See the article **PORCH**.

**PRONATION**, among anatomists. The radius of the arm has two kinds of motions, the one called *pronation*, the other *supination*. Pronation is that whereby the palm of the hand is turned downwards; and supination, the opposite motion thereto, is that whereby the back of the hand is turned downwards. The peculiar muscles whereby pronation is performed are called *pronatores*, as those by which supination is performed are termed *supinatores*. See **ANATOMY**, *Table of the Muscles*, and *Plates*.

**PRONOUN**, **PRONOMEN**, in grammar, a declinable part of speech, which being put instead of a noun, points out some person or thing.

Pronouns are divided into the six following classes, viz. Demonstrative pronouns; relative pronouns; possessive pronouns; gentle pronouns, or such as denote a person's country, as *nostras*, *vestras*, and *cujas*; interrogative pronouns; and reciprocal pronouns.

**PRONUNCIATION**, in grammar, the manner of articulating or sounding the words of a language.

Pronunciation makes the most difficult part of written grammar; in regard that a book expressing itself to the eyes, in a matter that wholly concerns the ears, seems next akin to that of teaching the blind to distinguish colours: hence it is that there is no part so defective in grammar as that of pronunciation, as the writer has frequently no term whereby to give the reader an idea of the sound he would express; for want of a proper term, therefore, he substitutes a vicious and precarious one. To give a just idea of the pronunciation of a language, it seems necessary to fix as nearly

Pronounce  
||  
Pronunciation.

Pronunciation.

as possible all the several sounds employed in the pronunciation of that language. Cicero tells us, that the pronunciation underwent several changes among the Romans; and indeed it is more precarious in the living languages, being, as Du Bos tells us, subservient to fashion in these. The French language is clogged with a difficulty in pronunciation from which most others are free; and it consists in this, that most of their words have two different pronunciations, the one in common prose, the other in verse.

As to the pronunciation of the English language, the ingenious Mr Martin, in his Spelling-Book of Arts and Sciences, lays down the following rules: 1. The final (*e*) lengthens the sound of the foregoing vowel; as in *can, cane; rob, robe; tun, tune, &c.* 2. The final (*e*) in words ending in *re*, is sounded before the *r* like *u*; as *massacre, massa-cur; lucre, lu-cur, &c.* 3. The Latin diphthongs *ae, as*, are sounded like *e*; as *Etna, Etna; economy, economy, &c.*: but at the end of the words *oe* sounds like *o*; as in *toe, foe, &c.* 4. Also the English improper diphthongs, *ea, eo, eu, ue*, sound only the *e* and *u*; as *tea and te; seoffee or seffee; due or du; true or tru, &c.* though sometimes *eo* and *ea* are pronounced like *ee*, as in *people, fear, near, &c.* 5. Sometimes the diphthong (*ie*) is pronounced like *e* in *cieling*, like *ee* in *field*, and, at the end of words, always like *y*, as in *lie, &c.*; and *ei* is pronounced either like *e* or *ai*, as in *deceit, reign, &c.* 6. The triphthong *eau* is pronounced like *o*, in *beau and jet d'eau*; and *ieu* sounds like *u* in *lieu, adieu, &c.* 7. The sound of *c* his hard before the vowels *a, o, u*, as in *call, cold, cup, &c.*; also sometimes before *b*, as in *chart, cold, &c.*; and before *l* and *r*, as in *clear, creep, &c.* It is otherwise generally soft, as in *city, cell, cyder, child, &c.* 8. In French words *ch*, is sounded like *sh*, as in *chagreen, machine*; and sometimes like *gn*, as in *choir*. 9. The sound of *g* is hard before *a, o, u, l, r*, as in *gall, gos, gum, glean, grope*; also before *ai*, as in *guilt, guild, &c.*; and before *b*, as in *ghost*; sometimes before *i*, as in *gibbous, gibberish*. It is also generally hard before *e*, as in *get, gold, &c.*; but soft in many words derived from the Greek and Latin, as in *geometry, genealogy, genus, &c.* Two *gg* are always hard, as in *dagger, &c.* The sound of *g*, when soft, is like that of *j*. 10. In any part of a word, *ph* sounds like *f*, as in *philosophy, &c.* 11. The sound of *qu*, at the end of French words, is like *k*, as in *risque, &c.* 12. The syllables *ti* and *ci*, if followed by a vowel, sound like *si* or *shi*; as in *sition, logician, &c.* 13. When *cc* occurs before *i*, the first is hard and the latter is soft; as in *staccid, &c.* 14. The letter *p* is not pronounced at the beginning of syllables, before *f* and *t*; as in *psalm, ptarmick, &c.* As to other peculiarities, regarding the pronunciation of single letters, many of them have been taken notice of at the beginning of each, in the course of this work.

But it is not enough to know the just pronunciation of single letters, but also of words: in order to which, the accenting of words ought to be well understood; since nothing is more harsh and disagreeable to the ear, than to hear a person speak or read with wrong accents. And, indeed, in English, the same word is often both a noun and a verb, distinguished only by the accent, which is on the first syllable of the noun, and on

the last of the verb; as *ferment and ferment, record and record, &c.* We are to observe also, that in order to a just expression of words, some require only a single accent on the syllable, as in *torment, &c.*; but in others it should be marked double, as in *animal*, because it is pronounced as if the letter was wrote double, viz. *animal*. The best directory in this matter is the excellent Dictionary of Mr Sheridan, lately published.

PRONUNCIATION is also used for the fifth and last part of rhetoric, which consists in varying and regulating the voice agreeably to the matter and words, so as most effectually to persuade and touch the hearers. See ORATORY, Part II.

PROOF, in law, &c. denotes the mediums or arguments used to evince the truth of any thing.

PROOF of Artillery and Small Arms, is a trial whether they stand the quantity of powder allotted for that purpose. The rule of the board of ordnance is, that all guns, under 24-pounders, be loaded with powder as much as their shot weighs; that is, a brass 24-pounder with 21 lb. a brass 32-pounder with 26 lb. 12 oz. and a 42-pounder with 31 lb. 8 oz.; the iron 24-pounder with 18 lb. the 32-pounder with 21 lb. 8 oz. and the 42-pounder with 25 lb.

The brass light field-pieces are proved with powder that weighs half as much as their shot, except the 24-pounder, which is loaded with 10 lb. only.

Government allows 11 bullets of lead in the pound for the proof of muskets, and 14.5, or 29 in two pounds, for service; 17 in the pound for the proof of carabines, and 20 for service; 28 in the pound for the proof of pistols, and 34 for service.

When guns of a new metal, or of lighter construction, are proved; then, besides the common proof, they are fired 200 or 300 times, as quick as they can be, loaded with the common charge given in actual service. Our light 6 pounders, were fired 300 times in 3 hours 27 minutes, loaded with 1 lb. 4 oz. without receiving any damage.

PROOF of Powder, is in order to try its goodness and strength. See GUN-Powder.

PROOF of Cannon, is made to ascertain their being well cast, their having no cavities in their metal, and, in a word, their being fit to resist the effort of their charge of powder. In making this proof, the piece is laid upon the ground, supported only by a piece of wood in the middle, of about 5 or 6 inches thick, to raise the muzzle a little; and then the piece is fired against a solid butt of earth.

Tools used in the proof of Cannon are as follow: Searcher, an iron socket with branches, from 4 to 8 in number, bending outwards a little, with small points at their ends: to this socket is fixed a wooden handle, from 8 to 12 feet long, and 1½ inch in diameter. This searcher is introduced into the gun after each firing, and turned gently round to discover the cavities within: if any are found, they are marked on the outside with chalk; and then the

Searcher with one point is introduced: about which point a mixture of wax and tallow is put, to take the impression of the holes; and if any are found of ¼ of an inch deep, or of any considerable length, the gun is rejected as unserviceable to the government.

Reliever, is an iron ring fixed to a handle, by means

Property.

Property.

means of a socket, so as to be at right angles: it serves to disengage the first searcher, when any of its points are retained in a hole, and cannot otherwise be got out. When guns are rejected by the proof-masters, they order them to be marked X thus, which the contractors generally alter WP thus; and after such alteration, dispose of them to foreign powers for Woolvich proof.

The most curious instrument for finding the principal defects in pieces of artillery, was lately invented by lieutenant-general Desaguliers, of the royal regiment of artillery. This instrument, grounded on the truest mechanical principles, is no sooner introduced into the hollow cylinder of the gun, than it discovers its defects, and more particularly that of the piece not being truly bored; which is a very important one, and to which most of the disasters happening to pieces of artillery are in a great measure to be imputed; for, when a gun is not truly bored, the most expert artillerist will not be able to make a good shot.

PROOF of Mortars and Howitzers, is made to ascertain their being well cast, and of strength to resist the effort of their charge. For this purpose the mortar or howitzer is placed upon the ground, with some part of their trunnions or breech sunk below the surface, and resting on wooden billets, at an elevation of about 70 degrees.

The mirror is generally the only instrument to discover the defects in mortars and howitzers. In order to use it, the sun must shine; the breech must be placed towards the sun, and the glass over-against the mouth of the piece: it illuminates the bore and chamber sufficiently to discover the flaws in it.

PROOF of Foreign Brass-Artillery. 1st. The Prussians. Their battering-train and garrison-artillery are proved with a quantity of powder equal to  $\frac{1}{2}$  the weight of the shot, and fired 75 rounds as fast as in real service; that is, 2 or 3 rounds in a minute. Their light field-train, from a 12-pounder upwards, are proved with a quantity of powder = 1.3d of the weight of the shot, and fired 150 rounds, at 3 or 4 rounds in a minute. From a 12-pounder downwards, are proved with a quantity of powder = 1.5th of the shot's weight, and fired 300 rounds, at 5 or 6 rounds each minute, properly sponged and loaded. Their mortars are proved with the chambers full of powder, and the shells loaded. Three rounds are fired as quick as possible.

2d. The Dutch prove all their artillery by firing each piece 5 times; the two first rounds with a quantity of powder = 2.3ds of the weight of the shot; and the three last rounds with a quantity of powder =  $\frac{1}{2}$  the weight of the shot.

3d. The French the same as the Dutch.

PROOF, in brandy and other spirituous liquors, is a little white lather which appears on the top of the liquor when poured into a glass. This lather, as it diminishes, forms itself into a circle called by the French the *chapelet*, and by the English the *bead* or *bubble*.

PROPAGATION, the act of multiplying the kind. See GENERATION.

PROPER, something natural and essentially belonging to any thing.

PROPERTIUS (Sextus Aurelius), a celebrated Latin poet, born at Mevania, a city of Umbria, now

called *Bevagna*, in the duchy of Spoleto. He went to Rome after the death of his father, a Roman knight, who had been put to death by order of Augustus, for having followed Antony's party during the triumvirate. Propertius in a short time acquired great reputation by his wit and abilities, and had a considerable share in the esteem of Mæcenas and Cornelius Gallus. He had also Ovid, Tibullus, Bassus, and the other ingenious men of his time, for his friends. He died at Rome 19 B. C. He is printed with almost all the editions of Tibullus and Catullus: but the best edition of him is that which was given separately of him by Janus Brouckhuysen at Amsterdam 1702, in 4to. and again in 1714, 4to. *cum curis secundis ejusdem*. We have four books of his Elegies or Amours with a lady called *Hestia*, or *Hesilia*, to whom he gave the name of *Cynthia*.

PROPERTY, in a general sense, that which constitutes or denominates a thing proper; or is a particular virtue or quality which nature has bestowed on some things exclusive of all others: thus, colour is a property of light; extension, figure, divisibility, and impenetrability, are properties of body.

PROPERTY, in law, is described to be the highest right which a person has or can have to any thing.

There is nothing which so generally strikes the imagination, and engages the affections of mankind, as the right of property; or that sole and despotic dominion which one man claims and exercises over the external things of the world, in total exclusion of the right of any other individual in the universe. And yet there are very few that will give themselves the trouble to consider the original and foundation of this right. Pleased as we are with the possession, we seem afraid to look back to the means by which it was acquired, as if fearful of some defect in our title; or at best we rest satisfied with the decision of the laws in our favour, without examining the reason or authority upon which those laws have been built. We think it enough that our title is derived by the grant of the former proprietor, by descent from our ancestors, or by the last will and testament of the dying owner: not caring to reflect, that (accurately and strictly speaking) there is no foundation in nature or in natural law, why a set of words upon parchment should convey the dominion of land; why the son should have a right to exclude his fellow-creatures from a determinate spot of ground, because his father had done so before him; or why the occupier of a particular field or of a jewel, when lying on his death-bed and no longer able to maintain possession, should be entitled to tell the rest of the world which of them should enjoy it after him. These inquiries, it must be owned, would be useless and even troublesome in common life. It is well if the mass of mankind will obey the laws when made, without scrutinizing too nicely into the reasons of making them. But when law is to be considered not only as a matter of practice, but also as a rational science, it cannot be improper or useless to examine more deeply the rudiments and grounds of these positive constitutions of society.

In the beginning of the world, we are informed by holy writ, the all-bountiful Creator gave to man "dominion over all the earth; and over the fish of the sea, and over the fowl of the air, and over every living

Property. "living thing that moveth upon the earth." This is the only true and solid foundation of man's dominion over external things, whatever airy metaphysical notions may have been started by fanciful writers upon this subject. The earth therefore, and all things therein, are the general property of all mankind, exclusive of other beings, from the immediate gift of the Creator. And, while the earth continued bare of inhabitants, it is reasonable to suppose, that all was in common among them, and that every one took from the public stock to his own use such things as his immediate necessities required.

These general notions of property were then sufficient to answer all the purposes of human life; and might perhaps still have answered them, had it been possible for mankind to have remained in a state of primitive simplicity: as may be collected from the manners of many American nations, when first discovered by the Europeans; and from the ancient method of living among the first Europeans themselves, if we may credit either the memorials of them preserved in the golden age of the poets, or the uniform accounts given by historians of those times wherein *erant omnia communia et indivisa omnibus, veluti unam cunctis patrimonium esse*. Not that this communion of goods seems ever to have been applicable, even in the earliest ages, to aught but the *substance* of the thing; nor could it be extended to the *use* of it. For, by the law of nature and reason, he who first began to use it, acquired therein a kind of transient property, that lasted so long as he was using it, and no longer: or, to speak with greater precision, the *right* of possession continued for the same time only that the *act* of possession lasted. Thus the ground was in common, and no part of it was the permanent property of any man in particular; yet whoever was in the occupation of any determinate spot of it, for rest, for shade, or the like, acquired for the time a sort of ownership, from which it would have been unjust, and contrary to the law of nature, to have driven him by force; but the instant that he quitted the use or occupation of it, another might seize it without injustice. Thus also a vine or other tree might be said to be in common, as all were equally entitled to its produce; and yet any private individual might gain the sole property of the fruit, which he had gathered for his own use. A doctrine well illustrated by Cicero, who compares the world to a great theatre, which is common to the public, and yet the place which any man has taken is for the time his own.

When mankind increased in number, craft, and ambition, it became necessary to entertain conceptions of more permanent dominion; and to appropriate to individuals, not the immediate *use* only, but the very *substance* of the thing to be used. Otherwise innumerable tumults must have arisen and the good order of the world been continually broken and disturbed, while a variety of persons were striving who should get the first occupation of the same thing, or disputing which of them had actually gained it. As human life also grew more and more refined, abundance of conveniences were desired to render it more easy, commodious, and agreeable; as habitations for shelter and safety, and raiment for warmth and decency. But no man would be at the trouble to provide either, so long

as he had only an usufructuary property in them, which was to cease the instant that he quitted possession;—if, as soon as he walked out of his tent, or pulled off his garment, the next stranger who came by would have a right to inhabit the one and to wear the other. In the case of habitations in particular, it was natural to observe, that even the brute creation, to whom every thing else was in common, maintained a permanent property in their dwellings, especially for the protection of their young; that the birds of the air had nests, and the beasts of the field had caverns, the invasion of which they esteemed a very flagrant injustice, and would sacrifice their lives to preserve them. Hence a property was soon established in every man's house and home-stall; which seem to have been originally mere temporary huts or moveable cabins, suited to the design of Providence for more speedily peopling the earth, and suited to the wandering life of their owners, before any extensive property in the soil or ground was established. And there can be no doubt, but that moveables of every kind became sooner appropriated than the permanent substantial soil: partly because they were more susceptible of a long occupancy, which might be continued for months together without any sensible interruption, and at length by usage ripen into an established right; but principally because few of them could be fit for use, till improved and meliorated by the bodily labour of the occupant; which bodily labour, bestowed upon any subject which before lay in common to all men, is universally allowed to give the fairest and most reasonable title to an exclusive property therein.

The article of food was a more immediate call, and therefore a more early consideration. Such as were not contented with the spontaneous product of the earth, fought for a more solid refreshment in the flesh of beasts, which they obtained by hunting. But the frequent disappointments incident to that method of provision, induced them to gather together such animals as were of a more tame and sequacious nature; and to establish a permanent property in their flocks and herds, in order to sustain themselves in a less precarious manner, partly by the milk of their dams, and partly by the flesh of the young. The support of these their cattle made the article of *water* also a very important point. And therefore the book of Genesis (the most venerable monument of antiquity, considered merely with a view to history) will furnish us with frequent instances of violent contentions concerning wells; the exclusive property of which appears to have been established in the first digger or occupant, even in such places where the ground and herbage remained yet in common. Thus we find Abraham, who was but a sojourner, asserting his right to a well in the country of Abimelech, and exacting an oath for his security, "because he had digged that well." And Isaac, about 90 years afterwards, reclaimed this his father's property; and, after much contention with the Philistines, was suffered to enjoy it in peace.

All this while the soil and pasture of the earth remained still in common as before, and open to every occupant: except perhaps in the neighbourhood of towns, where the necessity of a sole and exclusive property in lands (for the sake of agriculture) was earlier felt, and therefore more readily complied with. Otherwise

Blackf.  
Comment.

Property. therwise, when the multitude of men and cattle had consumed every convenience on one spot of ground, it was deemed a natural right to seize upon and occupy such other lands as would more easily supply their necessities. This practice is still retained among the wild and uncultivated nations that have never been formed into civil states, like the Tartars and others in the east; where the climate itself, and the boundless extent of their territory, conspire to retain them still in the same savage state of vagrant liberty, which was universal in the earliest ages, and which Tacitus informs us continued among the Germans till the decline of the Roman empire. We have also a striking example of the same kind in the history of Abraham and his nephew Lot. When their joint subsistence became so great, that pasture and other conveniences grew scarce, the natural consequence was, that a strife arose between their servants; so that it was no longer practicable to dwell together. This contention Abraham endeavoured to compose: "Let there be no strife, I pray thee, between thee and me. Is not the whole land before thee? Separate thyself, I pray thee, from me; If thou wilt take the left hand, then I will go to the right; or if thou depart to the right hand, then I will go to the left." This plainly implies an acknowledged right, in either, to occupy whatever ground he pleased, that was not pre-occupied by other tribes. "And Lot lifted up his eyes, and beheld all the plain of Jordan, that it was well watered every where, even as the garden of the Lord. Then Lot chose him all the plain of Jordan, and journeyed east; and Abraham dwelt in the land of Canaan."

Upon the same principle was founded the right of migration, or sending colonies to find out new habitations, when the mother-country was overcharged with inhabitants; which was practised as well by the Phœnicians and Greeks, as the Germans, Scythians, and other northern people. And, so long as it was confined to the stocking and cultivation of desert uninhabited countries, it kept strictly within the limits of the law of nature. But how far the seizing on countries already peopled, and driving out or massacring the innocent and defenceless natives, merely because they differed from their invaders in language, in religion, in customs, in government, or in colour; how far such a conduct was consonant to nature, to reason, or to Christianity, deserved well to be considered by those who have rendered their names immortal by thus civilizing mankind.

As the world by degrees grew more populous, it daily became more difficult to find out new spots to inhabit, without encroaching upon former occupants; and, by constantly occupying the same individual spot, the fruits of the earth were consumed, and its spontaneous produce destroyed, without any provision for a future supply or succession. It therefore became necessary to pursue some regular method of providing a constant subsistence; and this necessity produced, or at least promoted and encouraged, the art of agriculture. And the art of agriculture, by a regular connection and consequence, introduced and established the idea of a more permanent property in the soil than had hitherto been received and adopted. It was clear that the earth would not produce her fruits in sufficient quantities, without the assistance of tillage: but who

would be at the pains of tilling it, if another might watch an opportunity to seize upon and enjoy the product of his industry, art, and labour? Had not therefore a separate property in lands, as well as moveables, been vested in some individuals, the world must have continued a forest, and men have been mere animals of prey; which, according to some philosophers, is the genuine state of nature. Whereas now (so graciously has Providence interwoven our duty and our happiness together) the result of this very necessity has been the ennobling of the human species, by giving it opportunities of improving its *rational* faculties, as well as of exerting its *natural*. Necessity begat property: and in order to insure that property, recourse was had to civil society, which brought along with it a long train of inseparable concomitants; states, government, laws, punishments, and the public exercise of religious duties. Thus connected together, it was found that a part only of society was sufficient to provide, by their manual labour, for the necessary subsistence of all; and leisure was given to others to cultivate the human mind, to invent useful arts, and to lay the foundations of science.

The only question remaining is, How this property became actually vested; or what it is that gave a man an exclusive right to retain in a permanent manner that specific land, which before belonged generally to every body, but particularly to nobody? And as we before observed, that *occupancy* gave the right to the temporary *use* of the soil; so it is agreed upon all hands, that *occupancy* gave also the original right to the permanent property in the *substance* of the earth itself; which excludes every one else but the owner from the use of it. There is indeed some difference among the writers on natural law, concerning the reason why *occupancy* should convey this right, and invest one with this absolute property: Grotius and Puffendorf insisting, that this right of *occupancy* is founded upon a tacit and implied assent of all mankind, that the first occupant should become the owner; and Barbeyrac, Titius, Mr Locke, and others, holding, that there is no such implied assent, neither is it necessary that there should be; for that the very act of *occupancy*, alone, being a degree of bodily labour, is from a principle of natural justice, without any consent or compact, sufficient of itself to gain a title. A dispute that favours too much of nice and scholastic refinement. However, both sides agree in this, that *occupancy* is the thing by which the title was in fact originally gained; every man seizing to his own continued use such spots of ground as he found most agreeable to his own convenience, provided he found them unoccupied by any one else.

Property, both in lands and moveables, being thus originally acquired by the first taker, which taking amounts to a declaration that he intends to appropriate the thing to his own use, it remains in him, by the principle of universal law, till such time as he does some other act which shows an intention to abandon it; for then it becomes, naturally speaking, *publici juris* once more, and is liable to be again appropriated by the next occupant. So if one is possessed of a jewel, and casts it into the sea or a public highway, this is such an express dereliction, that a property will be vested in the first fortunate finder that will seize it

Property. to his own use. But if he hides it privately in the earth, or other secret place, and it is discovered, the finder acquires no property therein; for the owner hath not by this act declared any intention to abandon it, but rather the contrary: and if he loses or drops it by accident, it cannot be collected from thence, that he designed to quit the possession; and therefore in such case the property still remains in the loser, who may claim it again of the finder. And this, we may remember, is the doctrine of our law with relation to *TREASURE-TRUVV*.

But this method, of one man's abandoning his property, and another seizing the vacant possession, however well founded in theory, could not long subsist in fact. It was calculated merely for the rudiments of civil society, and necessarily ceased among the complicated interests and artificial refinements of polite and established governments. In these it was found, that what became inconvenient or useless to one man, was highly convenient and useful to another; who was ready to give in exchange for it some equivalent that was equally desirable to the former proprietor. This mutual convenience introduced commercial traffic, and the reciprocal transfer of property by sale, grant, or conveyance: which may be considered either as a continuance of the original possession which the first occupant had; or as an abandoning of the thing by the present owner, and an immediate successive occupancy of the same by the new proprietor. The voluntary dereliction of the owner, and delivering the possession to another individual, amount to a transfer of the property; the proprietor declaring his intention no longer to occupy the thing himself, but that his own right of occupancy shall be vested in the new acquirer. Or, taken in the other light, if I agree to part with an acre of my land to Titius, the deed of conveyance is an evidence of my intending to abandon the property; and Titius, being the only or first man acquainted with such my intention, immediately steps in and seizes the vacant possession: thus the consent expressed by the conveyance, gives Titius a good right against me; and possession, or occupancy, confirms that right against all the world besides.

The most universal and effectual way of abandoning property, is by the death of the occupant: when, both the actual possession and intention of keeping possession ceasing, the property, which is founded upon such possession and intention, ought also to cease of course. For, naturally speaking, the instant a man ceases to be, he ceases to have any dominion: else, if he had a right to dispose of his acquisitions one moment beyond his life, he would also have a right to direct their disposal for a million of ages after him; which would be highly absurd and inconvenient. All property must therefore cease upon death, considering men as absolute individuals, and unconnected with civil society: for then, by the principles before established, the next immediate occupant would acquire a right in all that the deceased possessed. But as, under civilized governments, which are calculated for the peace of mankind, such a constitution would be productive of endless disturbances, the universal law of almost every nation (which is a kind of secondary law of nature) has either given the dying person a power of continuing his property, by disposing of his posses-

sions by will; or, in case he neglects to dispose of it, or is not permitted to make any disposition at all, the municipal law of the country then steps in, and declares who shall be the successor, representative, or heir of the deceased; that is, who alone shall have a right to enter upon this vacant possession, in order to avoid that confusion which its becoming again common would occasion. And farther, in case no testament be permitted by the law, or none be made, and no heir can be found so qualified as the law requires, still, to prevent the robust title of *occupancy* from again taking place, the doctrine of *elcheats* is adopted in almost every country; whereby the sovereign of the state, and those who claim under his authority, are the ultimate heirs, and succeed to those inheritances to which no other title can be formed.

The right of inheritance, or descent to the children and relations of the deceased, seems to have been allowed much earlier than the right of devising by testament. We are apt to conceive at the first view that it has nature on its side; yet we often mistake for nature what we find established by long and inveterate custom. It is certainly a wise and effectual, but clearly a political, establishment; since the permanent right of property, vested in the ancestor himself, was no *natural*, but merely a *civil*, right. It is true, that the transmission of one's possessions to posterity has an evident tendency to make a man a good citizen and a useful member of society: it sets the passions on the side of duty, and prompts a man to deserve well of the public, when he is sure that the reward of his services will not die with himself, but be transmitted to those with whom he is connected by the dearest and most tender affections. Yet, reasonable as this foundation of the right of inheritance may seem, it is probable that its immediate original arose not from speculations altogether so delicate and refined, and, if not from fortuitous circumstances, at least from a plainer and more simple principle. A man's children or nearest relations are usually about him on his death-bed, and are the earliest witnesses of his decease. They became therefore generally the next immediate occupants, till at length in process of time this frequent usage ripened into general law. And therefore also in the earliest ages, on failure of children, a man's servants born under his roof were allowed to be his heirs; being immediately on the spot when he died. For we find the old patriarch Abraham, expressly declaring, that "since God had given him no seed, his steward Eliezer, one born in his house, was his heir."

While property continued only for life, testaments were useless and unknown; and when it became inheritable, the inheritance was long indefeasible, and the children or heirs at law were incapable of exclusion by will. Till at length it was found, that to strict a rule of inheritance made heirs disobedient and headstrong, defrauded creditors of their just debts, and prevented many provident fathers from dividing or charging their estates as the exigence of their families required. This introduced pretty generally the right of disposing of one's property, or a part of it, by *testament*; that is, by written or oral instructions properly witnessed and authenticated, according to the *pleasure* of the deceased; which we therefore emphatically style his *will*. This was established in some countries much later than

in others. With us in England, till modern times, a man could only dispose of one-third of his moveables from his wife and children; and, in general, no will was permitted of lands till the reign of Henry VIII. and then only of a certain portion: for it was not till after the restoration that the power of devising real property became so universal as at present.

Wills, therefore, and testaments, rights of inheritance, and successions, are all of them creatures of the civil or municipal laws, and accordingly are in all respects regulated by them; every distinct country having different ceremonies and requisites to make a testament completely valid; neither does any thing vary more than the right of inheritance under different national establishments. In England particularly, this diversity is carried to such a length, as if it had been meant to point out the power of the laws in regulating the succession to property, and how futile every claim must be that has not its foundation in the positive rules of the state. In personal estates, the father may succeed to his children; in landed property, he never can be their immediate heir, by any the remotest possibility: in general, only the eldest son, in some places only the youngest, in others all the sons together, have a right to succeed to the inheritance: In real estates, males are preferred to females, and the eldest male will usually exclude the rest; in the division of personal estates, the females of equal degree are admitted together with the males, and no right of primogeniture is allowed.

This one consideration may help to remove the scruples of many well-meaning persons, who set up a mistaken conscience in opposition to the rules of law. If a man disinherits his son, by a will duly executed, and leaves his estate to a stranger, there are many who consider this proceeding as contrary to natural justice; while others ho scrupulously adhere to the supposed intention of the dead, that if a will of lands be attested by only two witnesses instead of three, which the law requires, they are apt to imagine, that the heir is bound in conscience to relinquish his title to the devisee. But both of them certainly proceed upon very erroneous principles: as if, on the one hand, the son had by nature a right to succeed to his father's lands; or as if, on the other hand, the owner was by nature entitled to direct the succession of his property after his own decease. Whereas the law of nature suggests, that on the death of the possessor the estate should again become common, and be open to the next occupant, unless otherwise ordered, for the sake of civil peace, by the positive law of society. The positive law of society, which is with us the municipal law of England, directs it to vest in such person as the last proprietor shall by will, attended with certain requisites, appoint; and, in defect of such appointment, to go to some particular person, who, from the result of certain local constitutions, appears to be the heir at law. Hence it follows, that, where the appointment is regularly made, there cannot be a shadow of right in any one but the person appointed: and, where the necessary requisites are omitted, the right of the heir is equally strong and built upon as solid a foundation, as the right of the devisee would have been, supposing such requisites were observed.

But, after all, there are some few things, which, not-

withstanding the general introduction and continuance of property, must still unavoidably remain in common; being such wherein nothing but an usufructuary property is capable of being had: and therefore they still belong to the first occupant, during the time he holds possession of them, and no longer. Such (among others) are the elements of light, air, and water; which a man may occupy by means of his windows, his gardens, his mills, and other conveniences: such also are the generality of those animals which are said to be *fero natura*, or of a wild and untameable disposition; which any man may seize upon and keep for his own use or pleasure. All these things, so long as they remain in possession, every man has a right to enjoy without disturbance; but if once they escape from his custody, or he voluntarily abandons the use of them, they return to the common stock, and any man else has an equal right to seize and enjoy them afterwards.

Again, there are other things in which a permanent property may subsist, not only as to the temporary use, but also the solid substance; and which yet would be frequently found without a proprietor, had not the wisdom of the law provided a remedy to obviate this inconvenience. Such are forests and other waste grounds, which were omitted to be appropriated in the general distribution of lands: such also are wrecks, estrays, and that species of wild animals, which the arbitrary constitutions of positive law have distinguished from the rest by the well-known appellation of *game*. With regard to these and some others, as disturbances and quarrels would frequently arise among individuals contending about the acquisition of this species of property by first occupancy, the law has therefore wisely cut up the root of dissension, by vesting the things themselves in the sovereign of the state; or else in his representatives appointed and authorized by him, being usually the lords of manors. And thus our legislature has universally promoted the grand ends of civil society, the peace and security of individuals, by steadily pursuing that wise and orderly maxim, of assigning to every thing capable of ownership a legal and determinate owner.

PROPHECY, a prediction made by divine inspiration.

PROPHET, in general, a person who foretels future events; but is particularly applied to such inspired persons among the Jews as were commissioned by God to declare his will and purposes to that people. Among the canonical books of the Old Testament, we have the writings of 16 prophets, four of whom are denominated the *greater prophets*, viz. Isaiah, Jeremiah, Ezekiel, and Daniel; so called from the length or extent of their writings, which exceed those of the others, viz. Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Haggai, Zechariah, and Malachi, who are called the *lesser prophets*, from the shortness of their writings. The Jews do not place Daniel among the prophets, because, they say, he lived the life of a courtier rather than that of a prophet. An account of the several writings of the prophets may be seen each under its particular head. See the article ISAAH, &c.

PROFITATION, in theology, a sacrifice offered to God to allay his wrath, and render him propitious. Among the Jews there were both ordinary and public sacrifices, as holocausts, &c. offered by way of

thank-

**Propolis** thanksgiving; and extraordinary ones, offered by particular persons guilty of any crime, by way of propitiation. The Romish church believe the mass to be a sacrifice of propitiation for the living and the dead. The reformed churches allow of no propitiation but that one offered by Jesus Christ on the cross.

**Proportion-als.**

**PROPOLIS**, the name of a certain substance more tenacious than wax, with which the bees stop up all the holes or cracks in the sides of their hives. See **APIS**, n° 13.

**PROPONTIS**, or *SEA of Marmora*, divides Europe from Asia; having to Bosphorus on the north-east, by which it has a communication with the Euxine Sea; and the Hellespont on the south-west, by which it communicates with the Archipelago. It is 120 miles long, and in some places upwards of 40 miles broad.

**PROPORTION**. When two quantities are compared with one another in respect of their greatness or smallness, the comparison is called *ratio* or *proportion*. See **ARITHMETIC**, **GEOMETRY**, &c.

**PROPORTION**, or *Rule of Three*. See **ARITHMETIC**, n° 13, 14.

**PROPORTION** is also used for the relation between unequal things of the same kind, whereby their several parts correspond to each other with an equal augmentation or diminution.

Thus, in reducing a figure into little, or in enlarging it, care is taken to observe an equal diminution, or enlargement, through all its parts; so that if one line, *e. gr.* be contracted by one third of its length, all the rest shall be contracted in the same proportion.

**PROPORTION**, in architecture, denotes the just magnitude of the members of each part of a building, and the relation of the several parts to the whole; *e. gr.* of the dimensions of a column, &c. with regard to the ordonnance of a whole building.

One of the greatest differences among architects, M. Perrault observes, is in the proportions of the heights of entablatures with respect to the thickness of the columns, to which they are always to be accommodated.

In effect, there is scarce any work, either of the ancients or moderns, wherein this proportion is not different; some entablatures are even near twice as high as others:—yet it is certain, this proportion ought of all others to be most regulated; none being of greater importance, as there is none wherein a defect is sooner *spid*, nor any wherein it is more shocking.

**HARMONIC PROPORTION**, is when three terms are so disposed, that as the difference of the first and second: the difference of the second and third :: first : third; and they are said to be harmonically proportional. Thus, 10, 15, 30, are harmonically proportional. For as the difference of 10 and 15, is to the difference of 15 and 30, so is 10 to 30.

**COMPASS OF PROPORTION**, a name by which the French, and after them some English authors, call the **SECTOR**.

**PROPORTIONAL**, relating to proportion. Thus we say, proportional compasses, parts, scales, spirals, &c.

**PROPORTIONALS**, in geometry, are quantities, either linear or numeral, which bear the same ratio, or relation to each other.

**PROPOSITION**, in logic, part of an argument wherein some quality, either negative or positive, is attributed to a subject. Proposition  
Prosecution

**PROPOSITION**, in mathematics, is either some truth advanced and shown to be such by demonstration, or some operation proposed and its solution shown. If the proposition be deduced from several theoretical definitions compared together, it is called a *theorem*; if from a *praxis*, or series of operations, it is called a *problem*. See the articles **THEOREM** and **PROBLEM**.

**PROPOSITION**, in oratory. See **ORATORY**, n° 28, 124.

**PROPOSITION**, in poetry, the first part of a poem, wherein the author proposes briefly, and in general, what he is to say in the body of his work. It should comprehend only the matter of the poem, that is, the action and persons that act. Horace prescribes modesty and simplicity in the proposition, and would not have the poet promise too much, nor raise in the reader too great ideas of what he is going to relate.

**PROPREFECT**, among the Romans, the prefect's lieutenant, or an officer whom the prefect of the pretorium commissioned to do part of his duty in his place.

**PROPRETOR**, a Roman magistrate, who, having discharged the office of pretor at home, was sent into a province to command there with his former pretorial authority. It was also an appellation given to those who, without having been pretors at Rome, were sent extraordinarily into the provinces to administer justice with the authority of pretors.

**PRO RATA**, in commerce, a term sometimes used by merchants for *in proportion*; as each person must reap the profit or sustain the loss, *pro rata* to his interest, that is, in proportion to his stock.

**PROROGATION**, the act of prolonging, adjourning, or putting off to another time. The difference between a prorogation and an adjournment of parliament is, that by prorogation the session is ended, and such bills as passed in either house, or both houses, and had not the royal assent, must at the next assembly begin again.

**PROSCRIPTION**, a publication made in the name of the chief or leader of a party, whereby he promises a reward to any one who shall bring him the head of one of his enemies.

Sylla and Marius by turns proscribed each other's adherents.—Under the triumvirate, a great part of the best and bravest of the Romans fell by proscription.

The term took its rise from the practice of writing down a list of the persons names, and posting it in public: from *pro*, and *scribo* "I write."

**PROSE**, the natural language of mankind, loose, and unconfined by poetical measures, rhymes, &c.—In which sense it stands opposed to verse.

The word comes from the Latin *prosa*, which some will have derived from the Hebrew *paras*, which signifies *expedit*: others deduce it from the Latin *profora*, of *proforus*, "going forwards;" by way of opposition to *versus*, or "turning backwards," as is necessary in writing.

**PROSECUTION**, in the criminal law. The next step towards the punishment of offenders after **COMMITMENT**, is their prosecution, or the manner of their formal

**Prosecutor** formal accusation. And this, in the English law, is either upon a previous finding of the fact by an inquest or grand jury; or without such previous finding.

The former way is either by PRESENTMENT or INDICTMENT. See these articles.

The remaining methods of prosecution are without any previous finding by a jury, to fix the authoritative stamp of verisimilitude upon the accusation. One of these, by the common law, was when a thief was taken with the mainour, that is, with the thing stolen upon him, *in manu*. For he might, when so detected, *flagrante delicto*, be brought into court, arraigned, and tried, without indictment: as by the Danish law he might be taken and hanged upon the spot, without accusation or trial. But this proceeding was taken away by several statutes in the reign of Edward III. though in Scotland a similar process remains to this day. So that the only species of proceeding at the suit of the king, without a previous indictment or presentment by a grand jury, now seems to be that of INFORMATION; which see.

These are all the methods of prosecution at the suit of the king. The yet remains another, which is merely at the suit of the subject, and is called an *appeal*. See that article.

But of all the methods of prosecution, that by indictment is the most general. See INDICTMENT.

**PROSECUTOR**, in law, he that pursues a cause in another's name.

**PROSERPINE**, in fabulous history, the daughter of Jupiter and Ceres, was carried off by Pluto as she was gathering flowers with her companions. Ceres, disconsolate for the loss of her daughter, after having long sought her, heard where she was, and intreated Jupiter to let her return from hell. This request Jupiter granted, on condition he had tasted nothing in Pluto's dominions. Ceres therefore went to fetch her; but when her daughter was preparing to return, Acalaphus gave information that he had seen Proserpine eat some grains of a pomegranate she had gathered in Pluto's garden, on which she was sentenced to continue in Tartarus in quality of Pluto's spouse, and the queen of those gloomy regions: but to mitigate the grief of Ceres for her disappointment, Jupiter granted that her daughter should only spend six months together in hell with her husband, and the other six on earth with her mother.

Some mythologists imagine that the latter part of the fable alludes to the corn, which must remain all the winter hid in the earth, in order to sprout forth in the spring, and produce the harvest.

**PROSELYTE**, a new convert to some religion, or religious sect.

**PROSEUCHE**, in antiquity, properly signifies *prayer*; but it is taken for the places of prayer of the Jews, and was pretty near the same as their synagogues. But the synagogues were originally in the cities, and were covered places: whereas, for the most part, the proseuches were out of the cities and on the banks of rivers; having no covering, except perhaps the shade of some trees or covered galleries. The word is Greek, *προσευχη*, "prayer."

**PROSLAMBANOMENE**, the name of a musical note in the Greek system.

As the two tetrachords of the Greeks were conjunctive, or, in other words, as the highest note of the first served likewise for the lowest note of the second, it is plain that a complete octave could not be formed. To remedy this deficiency, therefore, one note beneath the lowest tetrachord was added, as an octave to the highest of the last tetrachord. Thus, if we suppose the first to have begun on B, the last must have ended upon A, to which one note subjoined immediately beneath the lowest B in the diatonic order must have formed an octave. This note was called *proslambanomene*. But it appears from authors who have scrutinized antiquity with some diligence, and perhaps with as much success as the data upon which they proceeded could produce, that the names of the notes in the Greek system, which originally signified their natural situation in the scale of ascending or descending sounds, were afterwards applied to their positions in the lyre. *Higher* or *lower*, then, according to this application, did not signify their degrees of acuteness or gravity, but their higher or lower situation upon this instrument.

**PROSODY**, that part of grammar which treats of the quantities and accents of syllables, and the manner of making verses.

The English prosody turns chiefly on two things, numbers and rhyme. See POETRY, n° 20. and Part III.

**PROSOPOPŒIA**, a figure in oratory, whereby we raise qualities of things inanimate into persons. See ORATORY, n° 48.

**PROSTATE**, in anatomy, a gland, generally supposed to be two separate bodies, though in reality but one, situated just before the neck of the bladder, and surrounding the beginning of the urethra. See ANATOMY, n° 371, n.

**PROSTYLE**, in architecture, a range of columns in the front of a temple.

**PROTAGORAS**, a famous Greek philosopher, born at Abdera, was the disciple of Democritus, and the legislator of the Thurians. He was more subtle than solid in his reasonings; however, he taught at Athens with great reputation, but was at length banished from thence for the impiety of his doctrines. He then travelled, and visited the islands in the Mediterranean, where it is said that he was the first philosopher who taught for money. He died in a voyage to Sicily, in a very advanced age. He commonly reasoned by dilemmas, and left the mind in suspense with respect to all the questions he proposed. Plato wrote a dialogue against him. He flourished 400 B. C.

**PROTEA**, the SILVER-TREE; a genus of the monogynia order, belonging to the tetrandria class of plants. There are three species: 1. The conifera, with linear, spear-shaped, entire leaves, grows to the height of 10 or 12 feet, with a straight regular stem. The branches naturally form a large regular head. The leaves are long and narrow, of a shining silver colour; and as they remain the whole year, make a fine appearance in the green-house. 2. The argentea, commonly called *silver-tree*, has a strong upright stem covered with purplish bark, dividing into several branches which grow erect, garnished with broad, shining, silvery leaves, which make a fine appearance when intermixed with other exotics. 3. The nitida, or wage-boom,

Profody  
|  
Protea.

Bursey's  
Hist. of  
Musc.  
Dissert. § 1.

**Protasis** boom, greatly resembles the second fort: the leaves are very silky and white, with erect purple branches. All these plants, being tender exotics, require to be continually kept in the green-house during winter. The first may be propagated by cuttings, which should be cut off in April, just before the plants begin to shoot; the second and third forts may be propagated by seeds.

**PROTASIS**, in the ancient drama, the first part of a comic or tragic piece, wherein the several persons are shown, their characters intimated, and the subject of the piece proposed and entered upon.

It might reach as far as our two first acts, and where it ended the epitasis commenced. See the article **EPITASIS**.

**PROTECTOR**, a person who undertakes to shelter and defend the weak, helpless, and distressed.

Every Catholic nation, and every religious order, has a protector residing at the court of Rome, who is a cardinal, and is called the *cardinal protector*.

Protector is also sometimes used for a regent of a kingdom, made choice of to govern it during the minority of a prince.

Cromwell assumed the title and quality of *lord protector of the common-wealth of England, &c.*

**PROTESILAI TURRIS**, the sepulchre of Proteus, with a temple, at which Alexander sacrificed, (Arian): situate at the south extremity of the Hellespont, next the Chersonesus Thracia. Proteus was the first Greek who landed on the coast of Troy, and the first Greek slain by the Trojans, (Homer, Ovid.) His wife Laodamia, to assuage her grief, begged the gods for a fight of his shade; and obtaining her request, she expired in his embraces, (Hyginus.) Proteus was also called *Phylacides*, from Phylace, a town of the Thessaly.

**PROTEST**, in law, is a call of witness, or an open affirmation that a person does, either not at all, or but conditionally, yield his consent to any act, or to the proceeding of any judge in a court in which his jurisdiction is doubtful, or to answer upon his oath farther than he is bound by law.

Any of the lords in parliament have a right to protest their dissent to any bill passed by a majority: which protest is entered in form. This is said to be a very ancient privilege. The commons have no right to protest. See **PARLIAMENT**.

**PROTEST**, in commerce, a summons written by a notary-public to a merchant, banker, or the like, to accept or discharge a bill of exchange drawn on him, after his having refused either to accept or pay it. See **BILL of Exchange**.

**PROTESTANT**, a name first given in Germany to those who adhered to the doctrine of Luther; because in 1529, they protested against a decree of the emperor Charles V. and the diet of Spire; declaring that they appealed to a general council. The same name has also been given to those of the sentiments of Calvin; and is now become a common denomination for all those of the reformed churches.

**PROTEUS**, in heathen mythology. See **EGYPT**, n<sup>o</sup> 6.

**PROTHONOTARY**, a term which properly signifies *first notary*, and which was anciently the title

of the principal notaries of the emperors of Constanti-Protogenes nople.

Prothonotary with us is used for an officer in the court of king's-bench and common-pleas; the former of which courts has one, and the latter three. The prothonotary of the king's bench records all civil actions sued in that court, as the clerk of the crown-office does all criminal causes. The prothonotaries of the common pleas enter and enrol all declarations, pleadings, affizes, judgments, and actions: they also make out all judicial writs, except writs of *habeas corpus*, and *disfranchis jurator*, for which there is a particular office, called the *habeas corpora office*: they likewise enter recognizances acknowledged, and all common recoveries; make exemplifications of records, &c.

In the court of Rome there is a college of 12 prelates, called *apostolical prothonotaries*, empowered to receive the last wills of cardinals, to make all informations and proceedings necessary for the canonization of saints, and all such acts as are of great consequence to the Papacy: for which purpose they have the right of admission into all consistories, whether public or half public. They also attend on the pope, whenever he performs any extraordinary ceremony out of Rome.

**PROTO**, a Greek term, frequently used in composition of priority: thus, *proto-collum*, in the ancient jurisprudence, signifies the first leaf of a book; *protomartyr*, the first martyr; *proto-plata*, the first man formed, &c.

**PROTOGENES**, a celebrated ancient painter, was born at Caunas, a city of Caria, subject to the Rhodians, and flourished 300 years before the birth of our Saviour. He was at first obliged to paint ships for his livelihood; but afterwards acquired the highest reputation for history-painting; though Apelles blamed him for finishing his pieces too lightly, and not knowing when to have done. The finest of his pictures was that of Jafius, which is mentioned by several ancient authors, though none of them give any description of it. He worked seven years on this picture; during which time he lived entirely upon lupines and water, being of opinion that this light and simple nourishment left him greater freedom of fancy. Apelles, on seeing this picture, was struck with such admiration, that he was unable to speak, or to find words sufficient to express his idea of its beauty. It was this picture that saved the city of Rhodes when besieged by Demetrius king of Macedon; for being able to attack it only on that side where Protopogenes worked, which he intended to burn, he chose rather to abandon his design than to destroy so fine a piece. Pliny says, that Apelles asking him what price he had for his pictures, and Protopogenes naming an inconsiderable sum, Apelles, concerned at the injustice done to the beauty of his productions, gave him 50 talents, about 10,000*l.* for one picture only, declaring publicly that he would sell it for his own. This generosity made the Rhodians sensible of the merit of Protopogenes; and they were so eager to purchase the picture Apelles had bought, that they paid him a much greater price for it than he had given.

**PROTOTYPE**, is the original or model after which a thing was formed; but chiefly used for the patterns of things to be engraved, cast, &c.

PRO-

Protasis  
Prothonotary.

Protogenes  
Prototype.

**PROTRACTOR**, the name of an instrument used for protracting or laying down on paper the angles of a field, or other figure. See **PLOTTING**.

**PROTUBERANCE**, in anatomy, is any eminence, whether natural or preternatural, that projects or advances out beyond the rest.

**PROVEDITOR**, an officer in several parts of Italy, particularly at Venice, who has the direction of matters relating to policy.

**PROVENCE**, a province or government of France, bounded by Dauphine on the north, by Piedmont on the east, by the Mediterranean on the south, and by the river Rhone, which separates it from Languedoc, on the west: it is about 100 miles long, and near as many broad.

**PROVEND**, or **PROVENDER**, originally signified a kind of vessel containing the measure of corn daily given to a horse, or other beast of labour, for his subsistence; but now is generally used to signify the food for cattle, whatever it is.

**PROVERB**, according to Camden, is a concise, witty, and wise speech, grounded upon experience, and for the most part containing some useful instructions.

**Book of PROVERBS**, a canonical book of the Old Testament, containing a part of the proverbs of Solomon the son of David king of Israel. The first 24 chapters are acknowledged to be the genuine work of that prince; the next five chapters are a collection of several of his proverbs made by order of king Hezekiah; and the two last seem to have been added though belonging to different and unknown authors, Agur the son of Jakeh, and king Lemuel.

In this excellent book are contained rules for the conduct of all conditions of life; for kings, courtiers, masters, servants, fathers, mothers, children, &c.

**PROVIDENCE**, the conduct and direction of the several parts of the universe by a superior intelligent Being. The notion of a providence is founded on this supposition, that the Creator has not so fixed and ascertained the laws of nature, nor so connected the chain of second causes, as to leave the world to itself; but that he still preserves the reins in his own hands, and occasionally alters, enforces, restrains, and suspends those laws by a particular interposition.

Some, with the Epicureans, deny a providence, as imagining it inconsistent with the happiness of the divine nature.

Others again deny the existence of a providence, on account of the seemingly unjust distribution of good and evil.

Simplicius argues thus for a providence: If God do not look to the affairs of the world, it is either because he cannot or will not; but the first is absurd, since to govern cannot be difficult, when to create was easy; and the latter is both absurd and blasphemous.

The sentiments of Cicero are likewise very precise and pertinent to this purpose. He thinks it impossible for one who duly considers the innumerable objects of the universe, and their invariable order and beauty, to entertain the least doubt, but that there is some efficient cause who presides over and directs the mighty fabric! Nay, he lays it down as a fundamental principle of all societies, that there is a divine Providence, which directs all events, observes the actions of mankind, whether good or bad, discerns the very intentions

of the heart, and will certainly make a difference between good men and the wicked.

**PROVIDENCE-Plantation**, a colony of New-England, which, with Rhode-island, formerly constituted a charter government. Its chief town is Newport.

**PROVIDENCE**, one of the least of the Bahama islands in the American ocean, but the best of those planted and fortified by the English. It is seated on the east side of the gulf of Florida. W. Long. 77. 35. N. Lat. 25. 0.

**PROVINCE**, in Roman antiquity, a country of considerable extent, which, upon being entirely reduced under the Roman dominion, was new-modelled according to the pleasure of the conquerors, and subjected to the command of annual governors sent from Rome; being commonly obliged to pay such taxes and contributions as the senate thought fit to demand.

Of these countries, that part of France next the Alps was one, and still retains the name *Provence*.

Nicod derives the word *à procul vivendo*, "living afar off;" but it is better deduced from *pro*, and *vincio* "I overcome."

**PROVINCE**, in geography, a division of a kingdom or state, comprising several cities, towns, &c. all under the same government, and usually distinguished by the extent either of the civil or ecclesiastical jurisdiction.

The church distinguishes its provinces by archbishoprics; in which sense, England is divided into two provinces, Canterbury and York.

The United Provinces are seven provinces of the Netherlands, who, revolting from the Spanish dominion, made a perpetual alliance offensive and defensive, at Utrecht, anno 1579. See **UNITED PROVINCES**.

**PROVINCIAL**, something relating to a province. It also denotes, in Romish countries, a person who has the direction of the several convents of a province.

**PROVISIONS**, in a military sense, implies all manner of catables, food or provender, used in an army, both for man and beast.

**PROVOST** of a city or town, is the chief municipal magistrate in several trading cities, particularly Edinburgh, Paris, &c. being much the same with mayor in other places. He presides in city-courts, and, together with the bailies, who are his deputies, determines in all differences that arise among citizens.

The provost of Edinburgh, as well as all the other considerable towns in Scotland, has the title of *lord*; and the former calls yearly conventions of the royal boroughs to Edinburgh by his missives.

**PROVOST**, or *Provost Royal*, a sort of inferior judge established throughout France, to take cognizance of all civil, personal, real, and mixed causes, among the people only.

**Grand Provost of France**, or of the Household, has jurisdiction in the king's house, and over the officers therein; looks to the policy thereof, the regulation of provisions, &c.

**Grand Provost of the Constable**, a judge who manages processes against the soldiers in the army who have committed any crime.

He has four lieutenants distributed throughout the army, called *provosts of the army*, and particularly provosts in the several regiments.

**Provost Marshal of an Army**, is an officer appointed to seize and secure deserters, and all other criminals.

Protractor

Provost  
|  
Pruning.

nals. He is to hinder soldiers from pillaging, to indict offenders, and see the sentence passed on them executed. He also regulates the weights and measures, and the price of provisions, &c. in the army. For the discharge of his office, he has a lieutenant, a clerk, and a troop of marshal-men on horseback, as also an executioner.

There is also a provost-marshal in the navy, who hath charge over prisoners, &c.

The French have a provost-general of the marines, who is to prosecute the marines when guilty of any crime, and make report thereof to the council of war; besides a marine provost in every vessel, who is a kind of gaoler, and takes the prisoners into his care, and keeps the vessel clean.

PROVOSTS of the *Marshals*, are a kind of lieutenants of the marshals of France; of these there are 180 seats in France; their chief jurisdiction regards highwaymen, footpads, house-breakers, &c.

PROVOST of the *Mint*, a particular judge instituted for the apprehending and prosecuting of false coiners.

PROVOST, or *Prevost*, in the king's stables; his office is to attend at court, and hold the king's stirrup when he mounts his horse. There are four provosts of this kind, each of whom attends in his turn, monthly.

PROW, denotes the head or forepart of a ship, particularly in a galley; being that which is opposite to the poop or stern.

PROXIMITY, denotes the relation of nearness, either in respect of place, blood, or alliance.

PRUDENTIUS, or AURELIUS PRUDENTIUS CLEMENS, a famous Christian poet, under the reign of Theodosius the Great, who was born in Spain in the year 348. He first followed the profession of an advocate, was afterwards a judge, then a soldier, and at length had an honourable employment at court. We have a great number of his poems, which, from the choice of his subjects, may be termed *Christian poems*; but the style is barbarous, and very different from the purity of the Augustan age. The most esteemed editions of Prudentius's works are that of Amsterdam, in 1667, with Heinsius's Notes, and that of Paris in 1687, in *usum Delphini*.

PRUNES, are plumbs dried in the sunshine, or in an oven.

PRUNING, in gardening and agriculture, is the lopping off the superfluous branches of trees, in order to make them bear better fruit, grow higher, or appear more regular.

Pruning, though an operation of very general use, is nevertheless rightly understood by few. Nor is it to be learned by rote, but requires a strict observation of the different manners of growth of the several sorts of fruit-trees; the proper method of doing which cannot be known without carefully observing how each kind is naturally disposed to produce its fruit: for some do this on the same year's wood, as vines; others, for the most part, upon the former year's wood, as peaches, nectarines, &c.; and others upon spurs which are produced upon wood of three, four, &c. to fifteen or twenty years old, as pears, plums, cherries, &c. Therefore, in order to the right management of fruit-trees, provision should always be made to have a sufficient quantity of bearing wood in every part of the trees; and at the same time there should not be a

superfluity of useless branches, which would exhaust the strength of the trees, and cause them to decay in a few years.

The reasons for pruning of fruit-trees; are, 1. To preserve them longer in a vigorous bearing-state; 2. To render them more beautiful; and, 3. To cause the fruit to be larger and better tasted.

The general instructions for pruning are as follow.

The greatest care ought to be taken of fruit-trees in the spring, when they are in vigorous growth; which is the only proper season for procuring a quantity of good wood in the different parts of the tree, and for displacing all useless branches as soon as they are produced, in order that the vigour of the tree may be entirely distributed to such branches only as are designed to remain. For this reason trees ought not to be neglected in April and May, when their shoots are produced; however, those branches which are intended for bearing the succeeding year should not be shortened during the time of their growth, because this would cause them to produce two lateral shoots, from the eyes below the place where they were stopped, which would draw much of the strength from the buds of the first shoot: and if the two lateral shoots are not entirely cut away at the winter-pruning, they will prove injurious to the tree. This is to be chiefly understood of stone-fruit and grapes; but pears and apples, being much harder, suffer not so much, tho' it is a great disadvantage to those also to be thus managed. It must likewise be remarked, that peaches, nectarines, apricots, cherries, and plums, are always in the greatest vigour when they are least maimed by the knife; for where large branches are taken off, they are subject to gum and decay. It is therefore the most prudent method to rub off all useless buds when they are first produced, and to pinch others, where new shoots are wanted to supply the vacancies of the wall; by which management they may be so ordered as to want but little of the knife in winter-pruning. The management of pears and apples is much the same with these trees in summer; but in winter they must be very differently pruned: for as peaches and nectarines, for the most part, produce their fruit upon the former year's wood, and must therefore have their branches shortened according to their strength, in order to produce new shoots for the succeeding year; so, on the contrary, pears, apples, plums, and cherries, producing their fruit upon spurs, which come out of the wood of five, six, and seven years old, should not be shortened, because thereby those buds which were naturally disposed to form these spurs, would produce wood-branches; by which means the trees would be filled with wood, but would never produce much fruit. The branches of standard-trees should never be shortened unless where they are very luxuriant, and, by growing irregularly on one side of the trees, attract the greatest part of the sap, by which means the other parts are either unfurnished with branches, or are rendered very weak; in which case the branch should be shortened down as low as is necessary, in order to obtain more branches to fill up the hollow of the tree: but this is only to be understood of pears and apples, which will produce shoots from wood of three, four, or more years old; whereas most sorts of stone-fruit will gum and decay after such amputations:

when-

Pruning.

whenever this happens to stone-fruit, it should be remedied by stopping or pinching those shoots in the spring, before they have obtained too much vigour, which will cause them to push out side branches; but this must be done with caution. You must also cut out all dead or decaying branches, which cause their heads to look ragged, and also attract noxious particles from the air: in doing of this, you should cut them close down to the place where they were produced, otherwise that part of the branch which is left will also decay, and prove equally hurtful to the rest of the tree; for it seldom happens when a branch begins to decay, that it does not die quite down to the place where it was produced, and if permitted to remain long uncut, often infects some of the other parts of the tree. If the branches cut off are large, it will be very proper, after having smoothed the cut part exactly even with a knife, chisel, or hatchet, to put on a plaster of grafting clay, which will prevent the wet from soaking into the tree at the wounded part. All such branches as run a-crofs each other, and occasion a confusion in the head of the tree, should be cut off; and as there are frequently young vigorous shoots on old trees, which rise from the old branches near the trunk, and grow upright into the head, these should be carefully cut out every year, lest, by being permitted to grow, they fill the tree too full of wood.

As to the pruning of forest-trees, if they be large, it is best not to prune them at all; yet, if there be an absolute necessity, avoid taking off large boughs as much as possible. And, 1. If the bough be small, cut it smooth, close, and sloping. 2. If the branch be large, and the tree old, cut it off at three or four feet from the stem. 3. If the tree grow crooked, cut it off at the crook, sloping upward, and nurse up one of the most promising shoots for a new stem. 4. If the tree grow top-heavy, its head must be lightened, and that by thinning the boughs that grow out of the main branches. But if you would have them spring, rub off the buds, and shroud up the side-shoots. 5. If the side-boughs still break out, and the top be able to sustain itself, give the boughs that put forth in spring a pruning after Midsummer, cutting them close.

PRUNUS, in botany; a genus of the monogynia order, belonging to the icosandra class of plants.

*Species.* 1. The domestica, or common plum-tree, grows 20 or 30 feet high, garnished with oval, spear-shaped leaves, and with the pedunculi for the most part single, terminated by flowers, succeeded by plums of many different colours, sizes, and shapes in the varieties. 2. The insititia, wild-plum, or bullace-tree, grows 12 or 15 feet high; the branches somewhat spinous; the leaves oval, hairy underneath; and the pedunculi by pairs, terminated by white flowers succeeded by small, round, plum-like, fruit of different colours in the varieties. 3. The spinosa, black-thorn, or sloe-tree, grows 10 or 12 feet high, very branched and bushy quite from bottom, armed with strong, sharp spines, small, spear-shaped, smooth leaves, pedunculi growing singly, terminated by flowers, succeeded by small, round, black cherries in autumn. It grows wild every where in hedges and woods; and is very proper for planting field hedges, being of very quick

and close growth. 4. The cerasus, or common cherry-tree, grows 20 feet or more in height, garnished with oval clusters of lanceolate, smooth leaves, umbellate flowers, succeeded by clusters of red roundish fruit of different sizes and properties in the varieties. 5. The avium, or great wild-cherry tree, grows 40 or 50 feet high, having oval, spear-shaped leaves, downy underneath, with umbellate sessile clusters of white flowers, succeeded by small round fruit of different properties in the varieties. 6. The padus, or common bird-cherry tree, grows 15 or 20 feet high, of a shrub-like growth, with a spreading head, large, oblong, rough serrated leaves, having two glands at the back of the base like the other, and with shorter, more compact clusters of flowers, succeeded by large red fruit. This grows wild in hedges in the north parts of England. 7. The Virginiana, or Virginian bird-cherry, grows 30 feet high, dividing into a very branched head, having a dark purple bark, oval, slightly serrated, shining green leaves, having two glands at the forepart of the base, and long clusters of white flowers, succeeded by small, round, berry-like, black fruit: 8. The Canadensis, or Canada dwarf bird cherry, grows but four or five feet high, branching horizontally near the ground with smooth branches; broad, spear-shaped, rough downy leaves without glands; and long clusters of white flowers, succeeded by small, round, berry-like, black fruit, ripe in autumn. 9. The mahaleb, or perfumed cherry, grows 10 or 15 feet high, with smooth whitish branches, small, oval shining green leaves, and corymbose clusters of white flowers, succeeded by small fruit. 10. The armeniaca, or apricot tree, grows 20 feet high, with a large spreading head, having reddish shoots, large nearly heart shaped leaves, and close-fitting pale-red flowers rising all along the sides of the young branches; succeeded by large, roundish fruit of a yellow and reddish colour in different varieties.

*Culture.* All the different varieties of plums have at first been raised from the stones, and are afterwards preserved by budding and grafting on any plum-stock. The same method is applicable to cherries; only these are grafted to most advantage upon stocks of the wild black and red cherry raised from the stones of the fruit. The apricot-trees are propagated by budding on any kind of plum-stocks.

PRUSA, (anc. geog.); a town situate at mount Olympus in Mylia, built by Prusias, who waged war with Croesus, (Strabo); with Cyrus, (Stephanus); both cotemporary princes. Now called *Bursa* or *Prussa*, capital of Bithynia, in Asia Minor. E. Long. 29. 10. Lat. 40. 30.

PRUSIAS, the name of several king of BITHYNIA. PRUSIAS, a town of Bithynia, anciently called *Cios*, from a cognominal river, and giving name to the Sinus Ciansus of the Propontis; rebuilt by Prusias the son of Zela, after having been destroyed by Philip, the son of Demetrius: it stood on the Sinus Ciansus, at the foot of mount Arganthonius. This is the Prusias who harboured Annibal, after the defeat of Antiochus.—Of this place was Asclepiades, surnamed *Prusicus*, the famous physician.

PRUSSIA, a modern, but deservedly celebrated kingdom of Europe, whose monarch, along with Prussia Proper, possesses also the electorate of Brandenburg,

Prussia. denburg, and some other territories of considerable extent. The district properly called *Prussia* is of great extent, and divided into the Ducal and Regal Prussia, the latter belonging to the republic of Poland till the late partition of the Polish territories. Both together are of great extent; being bounded on the north by the Baltic, on the south by Poland and the duchy of Mazovia, on the west by Pomerania, and on the east by Lithuania and Samogitia. The name is by some thought to be derived from the *Borussi*, a tribe of the Sarmatians, who, migrating from the foot of the Rhipzean mountains, were tempted by the beauty and fertility of the country to settle there. Others think that the name of this country is properly *Porussia*, *Po* in the language of the natives signifying *near*, and *Porussia* signifying *near Russia*. To the latter etymology we find the king of Prussia himself assenting in the treatise intitled *Memoirs of the House of Brandenburg*. However, it must be owned, that these or any other etymologies of the word are very uncertain, and we find nothing like it mentioned by historians before the tenth century.

footing in  
the country.

The ancient state of Prussia is almost entirely unknown. However, the people are said to have been very savage and barbarous; living upon raw flesh, and drinking the blood of horses at their feasts, according to Stella, even to intoxication (A). Nay, so extremely savage were this people, that they were even unacquainted with the method of constructing huts, and took up their dwelling in caves and cavities of rocks and trees, where they protected themselves and children from the inclemencies of the weather. Among such a people it is vain to expect that any transactions would be recorded, or indeed that any thing worthy of being recorded would be transacted. We shall therefore begin our history of Prussia with the time when the Teutonic knights first got footing in the country. (See *TEUTONIC KNIGHTS*.)

On the expulsion of the Christians from the Holy Land by Saladin, a settlement was given to the Teutonic knights in Prussia by Conrade duke of Mazovia, the competitor of Boleslaus V. for the crown of Poland. Their first residence in this country was Culm; to which territory they were confined by the conditions of the donation, excepting what they could conquer from their pagan neighbours, all which the emperor granted to them in perpetuity.

Encouraged by this grant, the knights conquered the greatest part of the country which now goes by the name of *Prussia*; and, not content with this, become very troublesome to Poland, insomuch that the monarchs of that kingdom were sometimes obliged to carry on a dangerous and bloody wars with them; for an account of which, we refer to the article *POLAND*.

The Teutonic order continued in Prussia till the year 1531. Their last grand-master was Albert marquis of Brandenburg, and nephew to Sigismund I. king of Poland. He was preferred to this dignity in hopes that his affinity to Sigismund might procure a restitution of some of the places which had been taken from the order during the former unsuccessful wars

with Poland; but in this the fraternity were disappointed. Albert, however, was so far from endeavouring to obtain any favour from his uncle by fair means, that he refused to do homage to him, and immediately began to make preparations for throwing off his dependence altogether, and recovering the whole of Prussia and Pomerania by force of arms. In this he was so far from succeeding, that, being foiled in every attempt, he was forced to resign the dignity of grand-master; in recompense for which, his uncle bestowed on him that part of Prussia now called *Ducal*, in quality of a secular duke. It was now the interest of the house of Brandenburg to assist in the expulsion of the fraternity; and accordingly, being at last driven out of Prussia and Pomerania, they transferred their chapter to Mariendal in Franconia; but in that and other provinces of the empire where they settled, little more than the name of the order once so famous now remains.

Prussia.

Expelled.

5  
History of  
Brandenburg.

The other most considerable part of his Prussian majesty's dominions is the Electorate of Brandenburg. Like other parts of Germany, it was anciently possessed by Barbarians, of whom no history can be given. These were subdued by Charlemagne, as is related under the article *FRANCE*; but being on every occasion ready to revolt, in 927 Henry the Fowler established margraves, or governors of the frontiers, to keep the barbarians in awe. The first margrave of Brandenburg was Sigefroy brother-in-law to the above-mentioned emperor; under whose administration the bishoprics of Brandenburg and Havelberg were established by Otho I. From this Sigefroy to the succession of the house of Hohenzollern, from whom the present elector is descended, there are reckoned eight different families, who have been margraves of Brandenburg; namely, the family of the Saxons, of Walbeck, Staden, Plenck, Anhalt, Bavaria, Luxemburg, and Misnia. The margraves of the four first races had continual wars with the Vandals and other barbarous people; nor could their ravages be stopped till the reign of Albert surnamed *the Bear*, the first prince of the house of Anhalt. He was made margrave by the emperor Conrad III. and afterwards raised to the dignity of elector by Frederic Barbarossa, about the year 1100. Some years afterwards, the king of the Vandals dying without issue, left the middle March by his last will to the elector, who was besides possessed of the old March, upper Saxony, the country of Anhalt, and part of Lusatia. In 1352 this line became extinct, and the electorate devolved to the empire. It was then given by the emperor Louis of Bavaria to his son Lonis, who was the first of the sixth race. Louis the Roman succeeded his brother; and as he also died without children, he was succeeded by Otho, his third brother, who sold the electorate to the emperor Charles IV. of the house of Luxemburg for 200,000 florins of gold. Charles IV. gave the March to his son Winceslaus, to whom Sigismund succeeded. This elector, being embarrassed in his circumstances, sold the new March to the knights of the Teutonic order. Joffe succeeded Sigismund; but, aspiring to the empire,

(A) This author does not mention any particular method by which they communicated an inebriating quality to the blood of animals. Possibly, however, the vital fluid may have a property of this kind, though unknown in our days where such barbarous customs are diffused. Drunkenness from drinking blood is frequently mentioned in Scripture, but whether literally or metaphorically must be decided by the learned.

Prussia. empire, fold the electorate to William duke of Misnia; who, after he had possessed it for one year, fold it again to the emperor Sigismund. In 1417, Frederic VI. burgrave of Nuremberg received the investiture of the country of Brandenburg at the diet of Constance from the hands of the emperor Sigismund; who, two years before, had conferred upon him the dignity of elector, and arch-chamberlain of the Holy Roman empire.

This prince, the first of the family of Hohenzollern, found himself possessed of the Old and Middle Marche, but the dukes of Pomerania had usurped the March Ukraïn. Against them, therefore, the elector immediately declared war, and soon recovered the province. As the New Marche still continued in the hands of the Teutonic knights, to whom it had been sold as we have already mentioned, the elector, to make up for this, took possession of Saxony, which at that time happened to be vacant by the death of Albert the last elector of the Anhalt line. But the emperor, not approving of this step, gave the investiture of Saxony to the duke of Misnia; upon which Frederic voluntarily desisted from his acquisitions. This elector made a division of his possessions by will. His eldest son was deprived of his right on account of his having too closely applied himself to search for the philosopher's stone; so he left him only Voigtland. The electorate was given to his second son Frederic; Albert, surnamed *Achilles*, had the duchies of Franconia; and Frederic, surnamed the *Fat*, had the old March; but by his death it returned to the electorate of Brandenburg.

Frederic I. was succeeded by his son called also *Frederic*, and surnamed *Iron-tooth* on account of his strength. He might with as great reason have been surnamed the *Magnanimous*, since he refused two crowns, viz. that of Bohemia, which was offered him by the pope, and the kingdom of Poland to which he was invited by the people; but Frederic declared he would not accept of it unless Casimir brother to Ladislaus the late king refused it. These instances of magnanimity had such an effect on the neighbouring people, that the states of Lower Lusatia made a voluntary surrender of their country to him. But as Lusatia was a fief of Bohemia, the king of that country immediately made war on the elector, in order to recover it. However, he was so far from being successful, that, by a treaty of peace concluded in 1462, he was obliged to yield the perpetual sovereignty of Corbus, Peits, Sommerfeld, and some other places, to the elector. Frederic then, having redeemed the new March from the Teutonic order for the sum of 100,000 florins, and still further enlarged his dominions, resigned the sovereignty in 1469 to his brother Albert, surnamed the *Achilles*.

<sup>6</sup> exploits of Albert surnamed the Achilles. Albert was 57 years old when his brother resigned the electorate to him. Most of his exploits for which he had the surname of *Achilles* had been performed while he was burgrave of Nuremberg. He declared war against Lewis duke of Bavaria, defeated and took him prisoner. He gained eight battles against the Nurembergers, who had rebelled and contested his rights to the burgraviate. In one of these he fought singly against 16 men, till his people came up to his assistance. He made himself master of the town of

Greiffenburg in the same manner that Alexander the Great took the capital of the Oxydrace, by leaping from the top of the walls into the town, where he defended himself singly against the inhabitants, till his men forced the gates and rescued him. The confidence which the emperor Frederic III. placed in him, gained him the direction of almost the whole empire. He commanded the imperial armies against Lewis the Rich, duke of Bavaria; and against Charles the Bold, duke of Burgundy, who had laid siege to Nois, but concluded a peace at the interposition of Albert. He gained the prize at 17 tournaments, and was never dismounted.

All these exploits, however, had been performed before Albert obtained the electorate. From that time Prussia and we meet with no very important transactions till the year 1594, when John Sigismund having married Anne the only daughter of Albert duke of Prussia, this united that duchy to the electorate; to which it has continued to be united ever since; and obtained pretensions to the countries of Juliers, Berg, Cleves, Marck, Ravensburg, and Ravenstein, to the succession of which Anne was heiress.

Sigismund died in 1619, and was succeeded by his son George William; during whose government the electorate suffered the most miserable calamities. At this time it was that the war commenced between the Protestants and Catholics, which lasted 30 years. The former, although leagued together, were on the point of being utterly destroyed by the Imperialists under the command of Count Tilly and Wallenstein, when Gustavus Adolphus of Sweden turned the scale in their favour, and threatened the Catholic party with utter destruction \*. But by his death at the battle of Lutzen, the fortune of war was once more changed. At last, however, peace was concluded with the emperor; and, in 1640, the elector died, leaving his dominions to his son Frederic William, surnamed the *Great*.

This young prince, though only 20 years of age at the time of his accession, applied himself with the utmost diligence to repair the losses and devaluations occasioned by the dreadful war which had preceded. He received the investiture of Prussia personally from the king of Poland, on condition of paying 100,000 florins annually, and not making truce or peace with the enemies of that crown. His envoy likewise received the investiture of the electorate from the emperor Ferdinand III. The elector then thought of recovering his provinces from those who had usurped them. He concluded a truce for 20 years with the Swedes, who evacuated the greatest part of his cities. He likewise paid 140,000 crowns to the Swedish garrisons, which still possessed some of his towns; and he concluded a treaty with the Hessians, who delivered up a part of the duchy of Cleves; and obtained of the Hollanders the evacuation of some other cities.

In the mean time the powers of Europe began to be weary of a war which had continued for such a length of time with such unrelenting fury. The cities of Osnaburg and Munster being chosen as the most proper places for negotiation, the conferences were opened in the year 1645; but, by reason of the multiplicity of business, they were not concluded till two

Prussia.

years after. France, which had espoused the interests of Sweden, demanded that Pomerania should be ceded to that kingdom as an indemnification for the expences which the war had cost Gustavus Adolphus and his successors. Although the empire and the elector refused to give up Pomerania, it was at last agreed to give up to the Swedes Hither Pomerania, with the isles of Rugen and Wollin, also some cities; in return for which cession, the bishoprics of Halberstadt, Minden, and Camin, were secularized in favour of the elector, of which he was put in possession, together with the Lordships of Hohenstein and Richtenstein, with the reversion of the archbishopric of Magdeburg. This was the treaty of Westphalia, concluded in 1648, and which serves as a basis to all the possessions and rights of the German princes. The elector then concluded a new treaty with the Swedes, for the regulation of limits, and for the acquittal of some debts, of which Sweden would only pay a fourth; and next year the electorate, Pomerania, and the duchies of Cleves, were evacuated by the Swedes.

10  
Treaty of Westphalia concluded.

11  
The elector succeeds against the Swedes.

Notwithstanding all these treaties, however, the Swedes soon after invaded Pomerania, but were entirely defeated by the elector near the town of Fehrbellin. Three thousand were left dead on the spot, among whom were a great number of officers; and a great many were taken prisoners. The elector then pursued his victory, gained many advantages over the Swedes, and deprived them of the cities of Stralsund and Gripswald. On this the Swedes, hoping to oblige the elector to evacuate Pomerania, which he had almost totally subdued, invaded Prussia, from Livonia, with 16,000 men; and, advancing into the country, they burned the suburbs of Memel, and took the cities of Tilse and Insterburg. The elector, to oppose the invaders, left Berlin on the 10th of January 1679, at the head of 9000 men. The Swedes retired at his approach, and were greatly harassed by the troops on their march. So successful indeed was the elector on this occasion, that the Swedes lost almost one half of their army killed or taken prisoners. At last, having crossed the bay of Frisch-haff and Courland on the ice, he arrived on the 19th of January, with his infantry, within three miles of Tilse, where the Swedes had their head-quarters. The same day, his general, Tresenfeldt, defeated two regiments of the enemy near Splitter; and the Swedes who were in Tilse abandoned that place, and retired towards Courland. They were pursued by General Gortz, and entirely defeated with such slaughter, that scarce 3000 of them returned to Livonia. Yet, notwithstanding all these victories, the elector, being pressed on the other side by the victorious generals of France M. Turenne and the prince of Coude, was obliged to make peace with the Swedes. The conditions were, that the treaty of Westphalia should serve for a basis to the peace; that the elector should have the property of the customs in all the ports of Further Pomerania, with the cities of Camin, Gartz, Griffenburg, and Wildenbruck: on his part, he consented to give up to the Swedes all that he had conquered from them, and to give no assistance to the king of Denmark, upon condition that France delivered up to him his provinces in Westphalia, and paid him 300,000 ducats, as an indemnification for the damages done by the

12  
Is obliged to conclude a treaty with them.

French to his states. This treaty was styled the peace of St Germain.

Prussia.

With the treaty of St Germain terminated the military exploits of Frederic William, who passed the last years of his administration in peace. His great qualities had rendered him respected by all Europe, and had even been heard of in Tartary. He received an embassy from Murad Geray, cham of the Tartars, courting his friendship. The barbarian ambassador appeared in such tattered clothes as scarce covered his nakedness, so that they were obliged to furnish him with other clothes before he could appear at court. His interpreter had a wooden nose and no ears. In 1684, Frederic received into his dominions great numbers of Protestants who fled out of France from the persecutions of Lewis XIV. after he had revoked the edict of Nantes. Twenty thousand of them are said to have settled at this time in the electorate, where they introduced new arts and manufactures, that were of the utmost benefit to the country. By this, however, he disobligeed Lewis XIV. for which reason he concluded an alliance with the emperor; and having furnished him with 8000 troops against the Turks in Hungary, the emperor yielded to him the circle of Schwibus in Silesia, as an equivalent for all his rights in that province.

13  
A strange embassy from the cham of Tartary.

In 1688, the elector Frederic William died, and was succeeded by his son Frederic III. This prince was remarkably fond of show and ceremony, which, during the course of his government, involved him in much expence. The regal dignity seemed to be the greatest object of his ambition. To obtain this, he joined with the emperor in the alliance against France, in which he was engaged by William III. king of Britain. He also yielded up the circle of Schwibus, which had been given to his predecessor; and, in 1700, obtained from the emperor that dignity which he had so earnestly desired. The terms on which it was obtained were, 1. That Frederic should never separate from the empire those provinces of his dominions which depended on it. 2. That he should not, in the emperor's presence, demand any other marks of honour than those which he had hitherto enjoyed. 3. That his Imperial majesty, when he wrote to him, should only give him the title of *Royal Dilection*. 4. That nevertheless the ministers which he had at Vienna should be treated like those of other crowned heads. 5. That the elector should maintain 6000 men in Italy at his own expence, in case the emperor should be obliged to make war on account of the succession of the house of Bourbon to the crown of Spain. 6. That those troops should continue there as long as the war lasted.

14  
Frederic III. obtains the title of King of Prussia.

Thus was the kingdom of Prussia established thro' the friendship of the emperor, with whom Frederic I. so called as being the first king of Prussia, continued all his life in strict alliance. Indeed he was a pacific prince; and though contemptible in his person, and incapable of achieving great things, had this merit, that he always preserved his dominions in peace, and thus consulted the true interest of his subjects much more than those monarchs who have dazzled the eyes of the world by their military exploits. He was indeed vain, and fond of show, as we have already observed; but had a good heart, and is said never to have violated

Prussia. lated his conjugal vow; though it does not appear that he was greatly beloved by his royal consorts (of whom he had three) on that or any other account.

Frederic II. died in the beginning of 1713, and was succeeded by Frederic II. father to the present monarch. He was in almost every thing the reverse of Frederic I. His dispositions were altogether martial; so that he applied himself entirely to the augmentation of his army, and perfecting them in their exercise, by which means they became the most expert soldiers in Europe. His foible was an ambition of having his army composed of men above the ordinary size: but as these could not be procured, he composed a regiment of the tallest men he could find; and as his officers made no scruple of picking up such men wherever they could find them, for his majesty's use, the neighbouring states were frequently offended, and a war was often likely to ensue even from this ridiculous cause. However, his Prussian majesty was never engaged in any martial enterprize of consequence; but having put his army on the most respectable footing of any in the world, and filled his coffers, for he was of a very saving disposition, he put it in the power of his son to perform those exploits which have been matter of attainment of all Europe.

It was in this king's reign, that Prussia first perceived her natural enemy and rival to be the house of Austria, and not France as had been formerly supposed. Hence frequent bickerings took place between these two powers, for which the persecution of the Protestants by some of the Catholic states of the empire afforded a pretence; and though a war never actually took place, yet it was easy to see that both were mortal enemies to each other. But when Frederic II. died in 1740, this enmity broke out in full force. The empress of Germany was then left in a very disagreeable situation, as has been observed under the article BRITAIN, n<sup>o</sup> 405. Of this Frederic III. took the advantage, to do himself justice, as he said, with regard to Silesia, of which his ancestors had been unjustly deprived. This province he seized at that time, but it cost him dear; for the empress, having at last overcome all difficulties, formed against him the most terrible combination that ever was known in Europe.

The treaty was hardly concluded with the king of Prussia, by which the reluctantly yielded up the province of Silesia, and with it a clear revenue of L. 800,000 a-year, before the queen of Hungary entered into another with the court of Petersburg, which was concluded May 22. 1746. This treaty, as far as it was made public, was only of a defensive nature; but six secret and separate articles were added to it. By one of these it was provided, that in case his Prussian majesty should attack the empress queen, or the empress of Russia, or even the republic of Poland, it should be considered as a breach of the treaty of Dresden, by which Silesia was given up. It was also stipulated, that, notwithstanding that treaty (which indeed had been dictated by the king of Prussia himself) the right of the empress-queen to Silesia still continued, and for the recovery of that province the contracting powers should mutually furnish an army of 60,000 men. To this treaty, called the treaty of Pe-

terburg, the king of Poland was invited to accede; but he, being in a manner in the power of the king of Prussia, did not think proper to sign it: however, he verbally acceded to it in such a manner, that the other parties were fully convinced of his design to cooperate with all their measures; and in consequence of this intention, it was agreed that he should have a share in the partition of the king of Prussia's dominions, in case of a successful event of their enterprizes.

In consequence of these machinations, every art was used to render the king of Prussia personally odious to the empress of Russia; the queen of Hungary made vast preparations in Bohemia and Moravia; and the king of Poland, under pretence of a military amusement, drew together 16,000 men, with whom he occupied a strong post at Pirna. The queen of Hungary, still further to strengthen herself, concluded a treaty with the court of France at Versailles, dated May 1. 1756. But in the mean time the king of Prussia, having understood by his emissaries what was going forward, resolved to be beforehand with his enemies, and at least to keep the war out of his own country; and therefore entered Saxony with a considerable army. At first he affected only to demand a free passage for his troops, and an observance of the neutrality professed by the king of Poland; but, having good reasons to doubt this neutrality, he demanded, as a preliminary, that these Saxon troops should immediately quit the strong post they occupied, and disperse themselves. This demand was refused; on which his Prussian majesty blockaded the Saxon camp at Pirna, resolving to reduce it by famine, since its strong situation rendered an attack very dangerous. At that time there were in Bohemia two Saxon armies, one under the command of M. Brown, and the other under M. Piccolomini. To keep these in awe, the king had sent M. Schwerin with an army into Bohemia from the country of Glatz, and M. Keith had penetrated into the same kingdom on the side of Misnia. But still the king of Prussia did not entirely confide in these dispositions; and therefore, fearing lest M. Brown might afford some assistance to the Saxons, he joined his forces under Keith, and on December 1. attacked and defeated the Austrian general, so that the latter found it impossible to relieve the Saxons, who, after a vain attempt to retire from their post, were all taken prisoners. The king of Poland quitted his dominions in Germany, and the Prussians took up their winter-quarters in Saxony. Here they seized on the revenues, levied exorbitant contributions, and obliged the country to furnish them with recruits. The king of Prussia at this time made himself master of the archives of Dresden, by which means he procured the originals of those pieces above-mentioned, which, when produced to the world, gave a full proof of the combination that had been formed against him, and consequently justified the measures he had taken for his own defence.

No sooner had the king entered Saxony, in the manner already related, than a process was commenced against him in the emperor's Aulic council, and before the diet of the empire; where he was soon condemned for contumacy, and put to the ban of the empire. The various circles of the empire were ordered to furnish their contingents of men and money

to put this sentence in execution; but these came in so slowly, that, had it not been for the assistance of the French under the prince de Soubise, the army would probably have never been in a condition to act. The Austrians, in the mean time, made great preparations, and raised 100,000 men in Bohemia, whom they committed to the care of prince Charles of Lorraine assisted by M. Brown. The Czarina sent a body of 60,000 men under M. Apraxin, to invade the Ducal Prussia; whilst a strong fleet was equipped in the Baltic, in order to co-operate with that army. The king of Sweden also acceded to the confederacy, in hopes of recovering the possessions in Pomerania which his ancestors had enjoyed; and the duke of Mecklenburg took the same party, promising to join the Swedish army with 6000 men as soon as it should be necessary. On the king of Prussia's side appeared nobody excepting an army of between 30 and 40,000 Hanoverians commanded by the duke of Cumberland; and these were outnumbered and forced to yield to a superior army of French commanded by M. D'Etrees.

<sup>23</sup> He invades Bohemia, and totally defeats the Austrian army.

In the mean time, his Prussian majesty, finding that he must depend for assistance solely on his own abilities, resolved to make the best use of his time. Accordingly, in the spring 1757, his armies poured into Bohemia from two different quarters, while the king himself prepared to enter it from a third. M. Schwerin entered from Silesia; the prince of Bevern from Lusatia, where he defeated an army of 28,000 Austrians that opposed his passage. As the intentions of the king himself were not known, the Austrians detached a body of 20,000 men from their main army to observe his motions. This was no sooner done than the king cut off all communication between the detachment and the main body; and having joined his two generals with incredible celerity, he engaged the Austrians near Prague, totally defeated them, took their camp, military chest, and cannon; but lost the brave general Schwerin, who was killed at the age of 82, with a colonel's standard in his hand. On the Austrian side M. Brown was wounded, and died in a short time, though, it is supposed, more from the chagrin he suffered than from the dangerous nature of the wound itself.

<sup>24</sup> Besieges and bombards Prague.

About 40,000 of the Austrian army took refuge in Prague, while the rest fled different ways. The city was instantly invested by the king, and all succours were cut off. The great number of troops which it contained rendered an attack unadvisable, but seemed to render the reduction of it by famine inevitable; however, the king, to accomplish his purpose the more speedily, prepared to bombard the town. On the 29th of May, after a most dreadful storm of thunder and lightning, four batteries began to play on the city. From these were thrown, every 24 hours, 288 bombs, besides a vast number of red-hot balls, so that it was soon on fire in every quarter. The garrison made a vigorous defence, and one well-conducted fall; but had the misfortune to be repulsed with great loss. The magistrates, burghers, and clergy, seeing their city on the point of being reduced to an heap of rubbish, supplicated the commander in the most earnest manner to capitulate; but he was deaf to their intreaties, and drove 12,000 of the most useless mouths

Prussia.

out of town, who were quickly driven in again by the Prussians.

<sup>25</sup>

Thus the affairs of the empress queen seemed verging to destruction, when Leopold count Daun took upon him the command of the remains of M. Brown's army. This general had arrived within a few miles of Prague the day after the great battle. He immediately collected the scattered fugitives with the greatest diligence, and retired with them to a strong post in the neighbourhood, from whence he gave the troops in Prague hopes of a speedy relief. It was now the king of Prussia's business, either to have attempted to make himself master of the city by one desperate effort, or entirely to have abandoned the enterprize, and driven count Daun from his post before his troops had recovered from the terror of their late defeat; but, by attempting to do both, he rendered himself incapable of doing either. Though the army of count Daun already amounted to 60,000 men, and though they were strongly entrenched, and defended by a vast train of artillery, his majesty thought proper to send no more than 32,000 men. This body made the arduous attempt on the 18th of June; but though they did all that human courage and conduct could do, and though the king himself at last charged at the head of his cavalry, the Prussians were driven out of the field with great loss. This engagement was named *the battle of Colin*.

<sup>26</sup> Defeats the Prussians at Colin.

The first consequence of the battle of Colin was, that the king of Prussia was obliged to raise the siege of Prague; soon after which, he was obliged to quit Bohemia, and take refuge in Saxony. The Austrians harassed him as much as possible; but, notwithstanding their great superiority, their armies were not in a condition to make any decisive attempt upon him, as the frontiers of Saxony abounded with situations easily defended. In the mean time the Russians, who had hitherto been very dilatory in their motions, began to exert themselves, and enter Ducal Prussia, under M. Apraxin and Fermor, where they committed innumerable cruelties and excesses. A large body of Austrians entered Silesia, and penetrated as far as Breslau. Then they made a turn backwards, and besieged Schweidnitz. Another body entered Lusatia, and made themselves masters of Zittau. An army of 22,000 Swedes entered Prussian Pomerania, took the towns of Anclam and Demmein, and laid the whole country under contribution. The French too, being freed from all restraint by the capitulation of the duke of Cumberland at Closter Seven, made their way into Halberstadt and the Old Marche of Brandenburg, first exacting contributions, and then plundering the towns. The army of the empire, being reinforced by that of the prince de Soubise, after many delays, was on full march to enter Saxony; which left the Austrians at liberty to exert the greatest part of their force in the reduction of Silesia. General Haddick penetrated through Lusatia, passed by the Prussian armies, and suddenly appeared before the gate of Berlin, which city he laid under contribution. He retired on the approach of a body of Prussians; yet he still found means to keep such a post as interrupted the king's communication with Silesia. The destruction of the king of Prussia therefore now seemed inevitable. Every exertion which he had made, though brave

<sup>27</sup> Siege of Prague raised.

<sup>28</sup> See BRITAIN, n<sup>o</sup> 438.

<sup>29</sup> Berlin laid under contribution.

and

Prussia. and well-conducted, had been unsuccessful. His general Lehwald, who opposed the Russians, had orders to attack them at all events. He obeyed his orders; and with 30,000 men attacked 60,000 of the enemy strongly entrenched at a place called *Norkitten*. The Prussians behaved with the greatest valour; but after having killed five times more of the enemy than they themselves lost, they were obliged to retire, though more formidable after their defeat than the Russians after their victory. The king, in the mean time, exerted himself on every side, and his enemies fled every where before him; but whilst he pursued one body, another gained upon him in some other part, and the winter came on fast, while his strength decayed, and that of his adversaries seemed to increase on every quarter.

The Prussian monarch, however, though distressed, did not abandon himself to despair, or lose that wonderful presence of mind which has so eminently distinguished him in all his military enterprises. He industriously delayed a decisive action till the approach of winter; but at last, after various movements, on November 5th 1757, he met at *Rosbach* with the united army of his enemies commanded by the Prince of *Saxe Hilburghaufen* and the Prince de *Soubise*. The allied army amounted to 50,000 men complete; but most of the troops of the *Circles* were new-raised, and many of them not well affected to the cause. The Prussians did not exceed 25,000 men; but they were superior to any troops in the world, and were inspired, by the presence of their king, with the most enthusiastic valour. The Austrians were defeated, with the loss of 3000 killed, eight generals, 250 officers of different ranks, and 6000 private soldiers taken prisoners, while night alone prevented the total destruction of the army.

By this battle the king was set free on one side, but this only gave him an opportunity of renewing his labours on another. The Austrians had a great force, and now began to make a proportionable progress in *Silesia*. After a siege of 16 days, they had reduced the strong fortrefs of *Schweidnitz*, and obliged the Prussian garrison of 4000 men to surrender prisoners of war. Hearing then of the victory at *Rosbach*, and that the king of Prussia was in full march to relieve *Silesia*, they resolved to attack the Prince of *Bevern* in his strong camp under the walls of *Breslau*. They attacked the Prince's army on November 22d; but their attack was frustrated with the greatest resolution. The slaughter of the Austrians was prodigious. A great part of the enemy had retired from the field of battle, and the rest were preparing to retire, when all at once the Prussian generals took the same resolution. Their army had suffered much in the engagement, and they became apprehensive of a total defeat in case their intrenchments should be forced in any part; for which reason they quitted their strong post, and retired behind the *Oder*. Two days after, the prince of *Bevern*, going to reconnoitre without escort, attended only by a groom, was taken prisoner by an advanced party of *Croats*, a small body of whom had crossed the *Oder*.

On this the town of *Breslau* immediately surrendered; where, as well as at *Schweidnitz*, the Austrians found great quantities of provisions, ammunition, and money.

All *Silesia* was on the point of falling into their hands, and the Prussian affairs were going into the utmost distraction, when the king himself by a most rapid march passed through *Thuringia*, *Misnia*, and *Lusatia*, in spite of the utmost efforts of the generals *Haddick* and *Marshal*, who were placed there to oppose him; and, entering *Silesia* on the 2d of December, joined the prince of *Bevern's* corps, who repassed the *Oder* to meet him. The garrison of *Schweidnitz*, who, as we have already observed, had been made prisoners of war, also joined the king's army unexpectedly; and their presence contributed not a little, notwithstanding the smallness of their number, to raise the spirits of the whole army. They had submitted to the capitulation with the greatest reluctance; but as the Austrians were conducting them to prison, they happened to receive intelligence of the victory at *Rosbach*: on which they immediately rose on the escort that conducted them, and entirely dispersed it; and afterwards marching in such a direction as they thought might most readily lead them to their king, they accidentally fell in with his army.

His Prussian majesty now approached *Breslau*; on which the Austrians, confiding in their superiority, (for they exceeded 70,000, while the Prussians scarce amounted to 36,000) abandoned their strong camp, the same which the prince of *Bevern* had formerly occupied, and advanced to give him battle. The king did not intend by any means to disappoint them, but advanced on his part with the greatest celerity. The two armies met on December 5th, near the village of *Leuthen*. *Count Daun* made the best dispositions possible. The ground occupied by his army was a plain, with small eminences in some parts. These eminences they surrounded with artillery; and as the ground was also interspersed with thickets, they sought to turn these likewise to their advantage. On their right and left were hills, on which they planted batteries of cannon. The ground in their front was intersted by many caufeways; and to make the whole more impracticable, the Austrians had felled a great number of trees, and scattered them in the way. It was almost impossible at the beginning of the engagement for the Prussian cavalry to act, on account of these impediments; but, by a judicious disposition made by the king himself, all difficulties were overcome. His majesty had placed four battalions behind the cavalry of his right wing; foreseeing that *General Nadasti*, who was placed on the enemy's left with a corps de reserve, designed to attack him in flank. It happened as he had foreseen: that general's cavalry attacked the Prussian right wing with great fury; but he was received with such a severe fire from the four battalions, that he was obliged to retire in disorder. The king's flank then, well covered and supported, was enabled to act with such order and vigour as repulsed the enemy. The Austrian artillery was also silenced by that of the Prussians; however, the Austrians continued to make a gallant resistance during the whole battle. After having been once thrown into disorder, they rallied all their forces about *Leuthen*, which was defended on every side by entrenchments and redoubts. The Prussians attacked them with the utmost impetuosity, and at last became masters of the post; on which the enemy fled on all sides, and a total rout ensued. In this battle the Au-

36  
Breslau re-  
taken.

The consequences of this victory were very great. Breslau was immediately invested, and surrendered on December 29th; the garrison, amounting to 13,000 men, were made prisoners of war. The blockade of Schweidnitz was formed as closely as the season of the year would permit; while detached Prussian parties over-ran the whole country of Silesia, and reduced every place of less importance. The Russians, who had ravaged and destroyed the country in such a manner that they could not subsist in it, thought proper to retire out of the Prussian dominions altogether. Thus General Lehwald was left at liberty to act against the Swedes; and them he quickly drove out of Prussian Pomerania, the whole of which country he not only recovered, but also some part of Swedish Pomerania. This the duchy of Mecklenburg being left quite exposed, the king took ample vengeance on it by exacting the most severe contributions of men and money. To complete this monarch's good fortune also, the French, who had retired after the battle of Rofsach, were now opposed by the Hanoverians under prince Ferdinand, who kept them so well employed, that, during the rest of the war, the king of Prussia had no more trouble from them. See BRITAIN, n<sup>o</sup> 439.

37  
Swedes dri-  
ven out of  
Pomerania

The beginning of the year 1758 was favourable to the arms of his Prussian majesty. On the 3d of April he commenced his operations against Schweidnitz, and pushed the siege so vigorously, that the place surrendered in 13 days. He then disposed his forces in such a manner as might best guard his dominions against his numerous enemies. For this purpose count Dohna commanded a body of troops on the side of Pomerania; another considerable body was posted between Wohlau and Glogau, in order to cover Silesia from the Russians, in case they should make their inroad that way. An army, in a little time after, was formed in Saxony, commanded by the king's brother prince Henry. This army consisted of 30 battalions and 45 squadrons, and was designed to make head against the army of the empire; which, by great efforts made during the winter, and the junction of a large body of Austrians, was again in a condition to act. Between all these armies a ready communication was kept up by a proper choice of posts. After the reduction of Schweidnitz, the king having made a show of invading Bohemia, suddenly burst into Moravia, where in a short time he made himself master of the whole country, and on the 27th of May laid siege to Olmutz the capital. Of this M. Daun was no sooner informed, than he took his route to Moravia through Bohemia: and, though he was not in a condition to risk a battle, nor indeed would have done so unless he had had a very considerable advantage; yet, by placing himself in a strong situation where he could not be attacked, by harassing the king's troops and cutting off their convoys, he at last obliged him to abandon the enterprize. The king, however, who frequently owed a good part of his success to the impenetrable secrecy with which he covered all his designs, gave not the least hint of his intention to raise the siege of Olmutz. On the contrary, the very day before the siege was raised, the firing continued as brisk as ever; but in the night, (July 1.) the whole army took the Bo-

hemia in two columns, and gained an entire march upon the Austrians. Thus, notwithstanding the utmost efforts of his enemies, the Prussian army reached Bohemia with very little molestation. Here he seized upon a large magazine at Lieutomiffel; defeated some corps of Austrians who had attempted to interrupt his progress; and arrived at Konigsgratz, of which he took possession, after driving from it 7000 Austrians who were entrenched there. This city and several other districts he laid under contribution: but soon after entered Silesia, and marched with the utmost rapidity to encounter the Russians, who had at that time united their forces under generals Brown and Fermor, entered the New Marche of Bra. denburg, and laid siege to Cufrin.

Prussia.

The king arrived at this city at a very critical period. The Russians had laid siege to it on the 15th of August; and though they were not well skilled in managing artillery, yet, by furious and unremitting discharges at random, they threw in such a number of bombs and red-hot balls, that the town was soon on fire in every quarter. Some of the wretched inhabitants were burned; others buried in the ruins of their houses, or killed by the balls which fell like hail in the streets; while many of the survivors abandoned their habitations, and fled out of the town on that side where it was not invested. The governor did every thing for the defence of the place; but as the walls were built after the old manner, it was impossible that the town could have made a defence for any length of time, especially as the principal magazine of the besieged had been blown up. The avenger of all these injuries, however, was now at hand. The king came in sight of the Russians on the 25th of August, after a march of 56 days, and beheld the country every where desolated and the villages in flames by the depredations of his cruel enemy, who had raised the siege at his approach, and retired towards a neighbouring village named Zorndorff. At 9 o'clock in the morning, a most

40  
The Rus-  
sians besiege  
Cufrin.

terrible fire of cannon and mortars poured destruction on the right wing of the Russian army for two hours without intermission. The slaughter was such as might have been expected; but the Russians kept their ground with astonishing resolution, new regiments still pressing forward to supply the places of those that fell. When the first line had fired away all their charges, they rushed forward on the Prussians with their bayonets; and all at once these brave troops, though encouraged by the presence of their king, gave way and fled before an enemy already half defeated. The Russian generals ought now to have attacked with their cavalry the disordered infantry of their enemies, which would have completed the defeat, and in all probability given the finishing stroke to the king of Prussia's affairs. This opportunity, however, they lost: but the king was not so negligent; for, by a very rapid and masterly motion, he brought all the cavalry of his right wing to the centre, and falling on the Russian foot uncovered by their horse, and even disordered by their own success, they pushed them back with most miserable slaughter, at the same time that the repulsed battalions of infantry, returning to the charge, and exasperated at their late disgrace, rendered the victory no longer doubtful. The Russians were now thrown into the most dreadful confusion. The wind blew the dust and smoke

41

feated at  
Zorndorff.

Prussia. smoke into their faces, so that they could not distinguish friends from foes; they fired on each other, plundered their own baggage which stood between the lines, and intoxicated themselves with brandy: the ranks fell in upon one another; and, being thus crammed together into a narrow space, the fire of the Prussians had a full and dreadful effect, while their enemies kept up only a scattered and ineffectual fire, generally quite over their heads. Yet even in this dismal situation the Russians did not fly; but suffered themselves to be slaughtered till seven at night, when their generals having caused an attack to be made on the Prussian right wing, the attention of the enemy was drawn to that quarter, and they had time to retire a little from the field of battle to recover their order.

In this engagement, which was called the *battle of Zorndorff*, the Russians lost 21,529 men, while that of the Prussians did not exceed 2000. A vast train of artillery was taken, together with the military chest, and many officers of high rank. The consequence was, that the Russian army retreated as far as Landberg on the frontiers of Poland, and the king was left at liberty to march with his usual expedition to the relief of prince Henry in Saxony.

The Prince was at this time sorely pressed by M. Daun. As soon as the king had left Bohemia in the manner already related, M. Daun, considering that it would have been to no purpose to follow him, resolved to turn his arms towards Saxony. Towards that country, therefore, he took his route through Lusatia, by Zittau, Gorlitz, and Bautzen. On the 3d of September he invested the strong fortrefs of Sonnelein; which unaccountably surrendered, after a single day's resistance, to one of his generals named *Maquire*. He then began to favour the operations of general Laudohn, who had advanced through the Lower Lusatia to the confines of Brandenburg; and, by drawing the attention of the Prussian forces which were left in Silesia to the northward of that duchy, he facilitated the progress of the generals Harsch and de Ville in the southern parts. He then proposed that prince Henry should be attacked by the army of the empire, while that of the Austrians should pass the Elbe, and, falling at the same time on the Prussians, second the attack of the Imperialists, and cut off the retreat of their enemies from Dresden. The sudden appearance of the king of Prussia, however, put an end to this plan; general Laudohn abandoned all his conquests in Lower Lusatia, and retired towards M. Daun, while that general himself retired from the neighbourhood of Dresden as far as Zittau. The army of the empire only kept its ground; possessing itself of the strong post at Pirna, formerly mentioned, but did not undertake any thing. As for the Swedes, who had directed their motions by those of the Russians, they no sooner heard of the victory of Zorndorff, than they retreated with much more expedition than they had advanced.

Thus the king of Prussia's affairs seemed to be pretty well retrieved, when by one fatal piece of negligence he was brought to the verge of ruin. M. Daun had possessed himself of an advantageous camp at Stolphen, by which he preserved a communication with the army of the empire. On the other hand, the king of Prussia, having taken possession of an important post at Bautzen, extended his right wing to the village of Hoch-

Prussia. kirchen, by which he preserved a communication with his brother prince Henry, protected Brandenburg, and was better situated than he could be any where else for throwing succours into Silesia. The two armies kept a watchful eye on the motions of each other; and as the principal aim of M. Daun was to cut off the king's communication with Silesia, and of the king to cut off M. Daun's communication with Bohemia, a battle seemed inevitable, though great danger seemed to await that party which should begin the attack.

In this critical posture of affairs the Austrian general formed a design of attacking the Prussian camp in the night. In what manner he came to surprize such a vigilant enemy, has never been accounted for; but that such a surprize was actually accomplished on the 14th of October, is certain. In the dead of the preceding night, the Austrian army began to march in three columns towards the camp of the king of Prussia: and though the night was exceedingly dark, and they had a considerable way to go, they all arrived at the same time, in safety, without being discovered, and without the least confusion; and at five in the morning, began a regular and well-conducted attack. The Prussians were in a moment thrown into confusion; Marshal Keith, one of their best generals, received two musquet balls, and fell dead on the spot. Prince Francis of Brunswick had his head shot off by a cannon-ball as he was mounting his horse; and every thing seemed to announce the total destruction of the army. Still, however, the king preserved his wonderful presence of mind, which indeed he never appears to have lost on any occasion. He ordered some detachments from his left to support his right wing; but the moment that these orders were received, the left itself was furiously attacked. General Ketzow, who commanded in that quarter, repulsed the Austrians with difficulty, and was not able to afford any considerable assistance to the right; which alone was obliged to sustain the weight of the grand attack. The Austrians, in the beginning of the engagement, had driven the Prussians out of the village of Hoch-kirchen; and as the fate of the day depended on the possession of that post, the hottest dispute was there. The Prussians made three bloody and unsuccessful attacks on the village; on the fourth they carried it; but the Austrians, continually pouring in fresh troops, at last drove them out with prodigious slaughter on all sides. The king then ordered a retreat, which was conducted in good order, without being pursued; however, this bloody action cost him 7000 men, together with a great number of cannon. The Austrians computed their own loss at 5000.

His Prussian majesty, having thus happily escaped such imminent danger, took every possible measure to prevent the enemy from gaining any considerable advantage from his defeat. Perceiving that the only advantage they wished to derive from it was to cover the operations of their armies in Silesia, and that he had now nothing to fear on the side of Saxony, he largely reinforced his own army from that of prince Henry, and hastened into Silesia, in order to raise the siege of Neiss, which had been completely invested on the 4th of October. On the 24th of that month, therefore, he quitted his camp, and, making a great compass, to avoid obstructions from the enemy, arrived in the plains of Gorlitz. A body of the Austrians had in vain attempted:

Prussia. tempted to secure this post before him, and some who arrived after him were defeated with the loss of 800 men. From this place the king pursued his march with the utmost diligence; but was followed by general Laudohn, at the head of 24,000 men, who constantly hung on his rear, and harassed his army. The king, however, knowing the importance of his expedition, continued his march without interruption, and suffered his antagonist to obtain many little advantages without molestation. Daun, however, not content with the opposition given by Laudohn, sent a large body of horse and foot by another route to reinforce the generals Karfch and de Ville, who had formed the siege of Niefs and the blockade of Cosel, while he himself passed the Elbe and advanced towards Dresden.

All these precautions, however, were of little avail. The generals Karfch and de Ville, notwithstanding their reinforcement, no sooner heard of the king of Prussia's approach, than they raised the siege of both places, and retired, leaving behind them a considerable quantity of military stores. The end of the Prussian monarch's march being thus accomplished, he instantly returned by the same way he came, and hastened to the relief of Saxony, the capital of which (Dresden) was in great danger from Marshal Daun. The place was but indifferently fortified, and garrisoned only by 12,000 men; so that it could not promise to hold out long against a numerous and well-appointed army. It was besides commanded by a large suburb, of which, if once the enemy got possession, all defence of the city must then be vain. For this reason M. Schmettau, the Prussian governor, determined to set these suburbs on fire, which was actually done November 10th, with an incredible loss to the inhabitants, as in the suburbs were carried on most of those valuable manufactures which render the city of Dresden remarkable. This disappointed the designs of M. Daun; but, though the action was agreeable to the laws of war, and had been executed with all the caution and humanity of which such an action was capable, yet the Austrians exclaimed against it as a piece of the most unprovoked and wanton cruelty recorded in history.

45  
Suburbs of

burnt.

46  
Saxony op-  
pressed by  
the king of  
Prussia.

After the king of Prussia had approached Dresden, all the Austrian armies retired into Bohemia, where they took up their winter-quarters, as the king of Prussia did in Saxony. This unhappy country he said he would now consider as his own by right of conquest. But instead of treating the conquered people as his lawful subjects, he oppressed them in all possible ways, by levying the most severe and exorbitant contributions, surrounding the exchange with soldiers, and confining the merchants in narrow lodgings on straw beds till they drew upon their correspondents for such sums as he wanted.

In 1759, as early as the 23d of February, the Prussians commenced their military operations. General Woberlow marched with a body of troops into Poland, where he destroyed several very large magazines belonging to the Russians, and returned into Silesia without any loss on the 18th of April. In the mean time, by some movements of the king of Prussia himself, the greatest part of the Austrian troops had been drawn towards the frontiers of Silesia. Prince Henry immediately took advantage of this opening, and on the 15th of April entered Bohemia with his army di-

47  
Bohemia  
invaded by  
prince  
Henry.

vided into two columns. One, commanded by himself, marched towards Peterfwade; the other, under general Hulsen, passed by the towns of Palberg and Commottau. That commanded by prince Henry himself penetrated as far as Loboschütz and Leitmeritz; the enemy flying every where before them, and burning or abandoning the vast magazines which they had amassed in these parts. The body under general Hulsen had a more active employment. A strong pass at Palberg was defended by a considerable body of Austrians. General Hulsen, having conducted his cavalry by another way in such a manner as to fall directly on their rear, attacked them in front with his infantry, drove them out of their intrenchments, and totally defeated them with the loss of a great number killed and 2000 taken prisoners, while that of the Prussians did not exceed 70 in killed and wound. After this exploit they returned into Saxony, with hostages for the contributions which they had largely exacted during the course of their expedition.

Prussia.

48  
A body of  
Austrians  
defeated by  
general  
Hulsen.

Some other successes obtained by Prince Henry cleared the country of Franconia of his enemies; but now the approach of the Russians seemed once more to bring the affairs of the king of Prussia to a crisis. Notwithstanding the destruction of their magazines, they had continued to advance into Silesia, where they were opposed by count Dohna; but as the troops he had with him were very far inferior to his enemies, he found it impossible to do more, at least with any appearance of success, than to observe their motions and harass them on their march. But this was so displeasing to the king, that he disgraced this general, and appointed Wedel to succeed him, with orders to attack the Russians at all events. To enable him, however, in some measure to comply with this desperate order, he sent him some reinforcements, which brought his army up to near 30,000. With these, on the 23d of July 1759, general Wedel attacked 70,000 Russians posted in the most advantageous manner at Zulichau, and defended by a numerous artillery. Tho' the Prussians marched on to certain destruction and disgrace, they sustained the attack for a long time with unparalleled resolution. At last, however, they gave way, and were obliged to retire with the loss of 4700 killed or taken prisoners, and 3000 wounded.

49  
Prussians  
defeated at  
Zulichau.

The consequences of this victory were, that the Russians penetrated into the king's territories, and took possession of the towns of Croffen and Frankfort on the Oder, which made it absolutely necessary for the king to come in person to oppose them. Accordingly, on the 4th of August, he joined Wedel with a considerable body of forces, having left the best part of his army in Saxony under prince Henry. But as Marshal Daun had sent a body of 12,000 horse and 8000 foot under general Laudohn to the assistance of the Russians, the king still found himself unable to fight them; as, with this and some other reinforcements, their army now amounted to upwards of 90,000. He therefore recalled general Finck, whom he had sent into Saxony with 9000 men; but with all his reinforcements, it was found impossible to augment his army to 50,000 complete. His situation, however, was now so critical, that a battle was unavoidable; and therefore, on the 12th of August, with this inferiority of number, the king attacked his enemies strongly

Oder.

<sup>51</sup> Prussia. strongly entrenched, and defended by a prodigious number of cannon. In this action his principal effort was against the left wing of the Russian army. He began the attack, according to custom, with a heavy cannonade; which having produced the desired effect, he attacked that wing with several battalions disposed in columns. The Russian entrenchments were forced with great slaughter, and 72 pieces of cannon were taken. But still there was a defile to be passed, and several redoubts which covered the village of Cunnerdorf to be mastered. They were attacked with the same resolution, and taken one after another. The enemy made another stand at the village, and endeavoured to preserve their ground there by pushing forward several battalions of horse and foot: but this also proved unsuccessful; they were driven from post to post quite to the last redoubts. For upwards of six hours the Prussians were successful, and every where broke the enemy with prodigious slaughter; drove them from almost all the ground they had occupied before the battle, took more than half their artillery, and scarce any thing seemed wanting to make the victory complete. In these circumstances, the king wrote the following billet to the queen: "Madam, we have beat the Russians from their intrenchments. In two hours expect to hear of a glorious victory." Of this victory, however, he deprived himself, by an excessive eagerness for conquest. The enemy, defeated in almost every quarter, found their left wing, shattered as it was, to be more entire than any other part of their army. Count Soltikoff, the Russian general, therefore assembled the remains of his right wing, and, gathering as many as he could from his centre, reinforced the left, and made a stand at a redoubt which had been erected on an advantageous eminence in a place called *the Jews burying-ground*. All the king's generals are said to have been of opinion that he ought to allow the Russians the peaceable possession of this post. Their army had already suffered so much, that it would have been impossible for them to have attempted any enterprize of consequence after the battle; but their artillery was still numerous, the post very strong, and the Prussian troops greatly fatigued. These reasons for a few moments had some weight with the king: but the natural impetuosity of his temper getting the better of his reason, he led on his wearied troops again and again; till at last, when their strength was in a manner totally exhausted, they were attacked and utterly routed by the Austrian and Russian cavalry, the former of which had hitherto remained quite inactive, and were therefore quite fresh, and irresistible by the enfeebled Prussians. The night, and the prudent use of some eminences, prevented the total destruction of the army; however, their loss amounted to 20,000 men killed and wounded. The king, when he found the victory totally lost, sent another billet to the queen, expressed in the following manner: "Remove from Berlin with the royal family; let the archives be carried to Poesdam; the town may make conditions with the enemy."

Immediately after this defeat, the king set himself about repairing his losses with the utmost diligence. In a few days every thing was again put in order in his camp. He replaced his artillery from Berlin; recalled general Klieft with 5000 men from Pomerania; detached

6000 from his own army to the defence of Saxony; and, with the remainder put himself between the Russians and Great Glogau, covering that city which had been the chief object of their designs; and in short, notwithstanding their victory, obliged them to return to Poland without accomplishing any thing besides the carnage at Cunnerdorf.

The misfortunes of the Prussian monarch, however, were not at an end. Prince Henry indeed, by a most extraordinary and well-conducted march, entered Saxony, which was now totally over-run by the armies of the enemy. At the same time, strong detachments having been sent into that country under generals Finck and Wunsch, the whole was in a short time recovered except Dresden. Towards this place Marshal Daun retired, and in all probability would soon have been obliged to leave Saxony entirely. But the king's impatience could not be satisfied without cutting off his retreat, and forcing him to a battle; for which purpose he sent general Finck with upwards of 12,000 men according to the Prussian account, but 20,000 according to the Austrians, to seize some passes thro' which M. Daun could only take his route towards Bohemia. This commission was executed with great exactness; but the Prussian general, having probably advanced too far into these defiles, and neglected to preserve a communication with the main army, gave his enemy an opportunity of surrounding him, and at last forcing him and his whole army to surrender prisoners of war. This disaster was soon after followed by another. General Durceke was posted at the right of the Elbe, opposite to Messen; but on the approach of a large body of Austrians, they prepared to retreat over the river into a place where they hoped to be more secure. But having been obliged by an hard frost to withdraw their bridge of boats, a thaw supervened, when they attempted to lay a bridge of pontoons, so that they were again obliged to have recourse to their boats. In this situation their rear-guard was attacked with great fury by the Austrians, and all the soldiers who composed it killed or taken. The loss of the Prussians on this occasion was computed at 3000 men.

The year 1760 showed the Prussian monarch in a more dangerous situation than he had ever yet experienced. Indeed his affairs now seemed to be altogether desperate. His losses were not to be measured by the number of the killed or prisoners, but by armies destroyed or taken. Forty generals had died or been killed in his service since the beginning of October 1756, exclusive of those who were wounded or taken prisoners. This of itself would have been an irreparable loss, had not the very wars which destroyed these furnished others equally capable of filling their places. But another deficiency, which could not be remedied, still remained. The king had, by his indefatigable industry and exertions, supplied all the deficiencies of men in his armies, but they were not the same men as before. The hardy veterans, with whom he had originally taken the field, were now no more, and their places were supplied by others who had neither the same experience nor discipline; so that now he was obliged to supply this deficiency by his own genius and heroism.

But whatever abilities the Prussian monarch might

<sup>53</sup> Desperate situation of the king of Prussia.

Prussia.

possess, and though he undoubtedly exerted them to the utmost, it seemed only to be contending against fate, and his enemies gained still greater and greater advantages. General Laudohn, with whom none but the king himself seems to have been able to cope, by a series of artful movements, drew into a disadvantageous situation M. Fouquet, one of the Prussian generals, with a strong body of forces. Perceiving it impossible for them to escape, Laudohn then made a violent attack on their entrenchments in the dead of the night of June 23. The Prussians made a gallant defence, but at last were all killed or taken prisoners except about 300. Of the Prussians were killed 4000, and 7000 taken prisoners; 58 pieces of cannon, and a great number of colours, were also lost. The victory, however, was dear bought: for the Austrians lost above 12,000 men in killed and wounded; whom, however, they could better spare than the Prussians, on account of their numbers.—This action was called the *battle of Landsbut*.

55  
Glatz taken  
by the Au-  
strians.

Baron Laudohn failed not to improve this victory to the utmost. He instantly turned back from Landsbut, and fell upon the city of Glatz; which he took in a very short time, with the garrison who defended it, consisting of 2000 men. In the place were found 101 pieces of brass cannon, with immense quantities of provisions and military stores. From thence he marched against Breslau, and immediately invested it. But in the mean time the king of Prussia, whose motions had been all this time counteracted by M. Daun in Saxony, marched with his usual rapidity towards Silesia. By this means he drew M. Daun out of Saxony; and indeed the Austrian general used such expedition, that he gained two full days on the king. This was no sooner known to his Prussian majesty, than he returned with the same expedition that he had advanced, and fat down before Dresden. Of this M. Daun soon received intelligence, and returned also. In the mean time, however, the buildings of the city were terribly shattered by the king's cannon and bombs which continually played on it. His endeavours, however, proved ineffectual to reduce it before the arrival of M. Daun. The siege had been begun on the 13th of July, and on the 19th M. Daun appeared within a league of Dresden. The Prussians then redoubled their efforts. They had that day received reinforcements of heavy cannon and mortars, with which they battered the place incessantly. The cathedral church, new Square, several principal streets and some palaces, and the noble manufactory of porcelain, were entirely destroyed. The siege was continued till the 22d: but, on the night of the 27th, M. Daun had thrown 16 battalions into the city; which rendered it impossible for the king to continue longer before it with any prospect of success. He therefore raised the siege, and retired without molestation, though there were three considerable armies of the enemy in the neighbourhood. Breslau was fiercely bombarded by Laudohn, but the approach of prince Henry obliged him to desist from his enterprise on the 5th of August.

But in the mean time the fortune of the king seemed likely to be terminated by one fatal stroke. Finding it impossible for him to carry on a defensive war, he marched towards Silesia with such astonishing ra-

pidity, that before the middle of August he had advanced 200 miles, leaving marshal Daun with his army far behind him. This expedition he undertook in order to engage general Laudohn before he could have time to affect a junction with Daun and Lacy, another Austrian general, which triple union seemed to threaten him with unavoidable destruction at once. This, however, he found it impossible to prevent: and the three armies, when joined, formed a most tremendous line of encampments, extending no less than 30 English miles; at the same time that every one of their posts was strong, and the communication between them easy. The king was strongly encamped at Lignitz; and for several days employed all his military skill in attempting to induce one of the bodies to detach itself from the rest, or to attack them at some disadvantage; but without effect. At last, the Austrian generals, having maturely weighed all circumstances, resolved to attack the king's camp itself, strong as it was; and marshal Daun, remembering the advantage he had gained at Hoch-kirchen by an attack in the night-time, resolved to follow the same plan now. The plan therefore was laid in the following manner. The whole army, as soon as it should begin to grow dark, was to march from their several posts to such situations as were marked out for each corps: they were to strike their tents, but yet to keep up the fires in their camps, and to have the drums beat the tattoo as usual, by which means they had a probability of surprising the enemy; or if not, they judged it absolutely impossible for him to escape them, though he should be ever so much on his guard. In what manner the king of Prussia became acquainted with this plan, is not known. His friends attributed it to his own penetration and knowledge of the stratagems of war; the Austrians, to intelligence given him by deserters. But, in whatever way he became acquainted with this design, it is certain that he took the most effectual methods of preventing it. As the Austrian plan was to surround his camp, and this could not be done without the division of their army which he had so long desired, he resolved to intercept one of the parties; and if that should be disabled from acting, he could then more easily deal with the other two. Therefore, in the very evening calculated for the decisive attack on his camp, he quitted it with the utmost privacy, and took an advantageous post on the road through which general Laudohn was to pass. The nature of this post was such; that at the same time that it stopped the progress of Laudohn in front, Daun would lie under great difficulties if he should attempt his rear; at the same time that for his further security the king strengthened the rear with several batteries. As soon as his army was drawn up, he divided it; leaving his right on the ground where it had been formed, to observe marshal Daun, and to maintain that post; whilst with his left he turned in order to fall on the corps under general Laudohn. In the mean time that commander, ignorant of the fate which was awaiting him, advancing with the utmost expedition towards the place which had been assigned him, in order to share in the glory of destroying the Prussian monarch; when, at three in the morning, on the 15th of August, a thick fog which covered the ground, suddenly clearing up, dis-

covered, like the opening of a great scene, the dreadful front of the Prussian army regularly embattled and advantageously posted. Laudohn, though surprised, made the best dispositions that circumstances would admit of, and an oblique engagement ensued; in which, however, he was at last obliged to yield to the superior skill of his adversary, with the loss of 10,000 killed, wounded, and prisoners, 82 pieces of cannon, and 23 pair of colours.

The victory, though complete, gave but a partial relief to the king of Prussia. The most essential service it did was the preventing of the Russians from joining those enemies which he already had. Count Czernichev had been advancing with 24,000 men, and had even passed the Oder; but was so intimidated by this news, that he instantly repassed that river on the same bridges which he had lately built, even though M. Daun sent him a strong body of troops in order to encourage him to advance. Soon after this battle, the king joined his brother prince Henry at New Marcke; and marched against Daun, who had begun to form the blockade of Schweidnitz, fell upon a corps under general Beck, made two battalions of Croats prisoners, and dispersed the rest, which obliged the enemy to abandon the enterprise they had just undertaken. About the same time General Hulsen gained a considerable advantage over the imperial army in Saxony, with very trifling loss on his part, by which he effectually prevented them from cutting off his communication with the city of Torgau.

By these successes the affairs of his Prussian majesty seemed to revive: but there was no end of his enemies. The late manœuvres had drawn him so far into Silesia, that his communication with Brandenburg was almost wholly cut off. The Russian army, which after it had repassed the Oder began to move out of Silesia, sent forward a powerful detachment under Count Czernichev towards the march of Brandenburg. A body of 15,000 Austrians, under the generals Lacy and Brentiano, and the whole united body of Austrians and Imperialists which acted in Saxony, began their march in concert with the Russians, and proposed to unite at the gates of Berlin. These armies amounted to 40,000 men. To oppose this formidable power, general Hulsen called to his assistance general Werner, who had been sent with a body of troops into Pomerania; but, after being joined by him, their united forces were found not to exceed 15,000 or 16,000 men. To attempt a defence of the capital with this force would have been little short of madness: and therefore these commanders were obliged to leave Berlin to its fate; which indeed, considering the barbarity of the Russians and the animosity of the Austrians, seemed to be a dreadful one. However, by the powerful mediation of several foreign ministers, the town obtained terms which were not altogether intolerable; but the magazines, arsenals, and founderies, were destroyed, and an immense quantity of military stores seized, with a number of cannon and other arms. The city was first obliged to pay 800,000 guilders, after which a contribution of 1,900,000 crowns was laid on: yet, notwithstanding this, many violences were committed, and the king's palace was plundered and the furniture abused in a scandalous manner.

59  
by the  
Prussians  
Ruf.

The combined armies staid in Berlin only four days; dreading the severe vengeance of the king of Prussia, who they heard was advancing towards that place with great expedition. But so great were the embarrassments which now attended that monarch, that it seemed absolutely beyond human power to retrieve his affairs. The Imperialists, on their return from Berlin, having no army to oppose them, made themselves masters of Leipzig, Torgau, Meissen, and Wirtemberg; in which last city they found the grand magazine of the Prussians immensely stored with provisions, ammunition, &c. M. Stainville also, with a detachment from Broglie the French general's army, laid the city and duchy of Halberstadt under contribution. In Eastern Pomerania, the Russians had besieged Colberg by sea and land. In the Western Pomerania, the Swedes advanced with great celerity, hoping to share in the plunder of Berlin. In Silesia, the king no sooner began his march to the northward, than Laudohn advanced, and laid siege to the important fortress of Cosel; and, to complete this distress and embarrassment, the king himself was attended at every step by count Daun with a superior army well prepared to take every advantage.

Prussia.  
60  
Extreme  
embarras-  
ment of the  
king.

In this desperate situation the king, being joined by his generals Hulsen and prince Eugene of Wittemberg with the corps under their command, advanced up the Elbe, while M. Daun fell back to cover Leipzig and Torgau: but the latter, finding that the Prussians directed their march towards the Elbe, encamped within reach of Torgau; one part of his army extending to the Elbe, by which he was covered on that side, whilst on the other he was covered by hills and woods, so that it was impossible to choose a more advantageous situation. The Prussian army did not amount to 50,000 men, whilst that of the Austrians exceeded 86,000: yet such were the unfortunate circumstances of the king, that he was obliged to fight under all these disadvantages; and therefore he caused his army to be informed, that he was now to lead them to a most desperate attempt, that his affairs required it, and that he was determined to conquer or die. His soldiers unanimously declared that they would die with him.

The 3d of November 1760, was the day on which this important affair was decided. The king divided his forces into three columns. General Hulsen was to take post with one in a wood that lay on the left of the Austrian army, and had orders not to move until he found the rest of the Prussians engaged. General Zieten was to charge on the right; and the great attack in front was to be conducted by the king in person. His forces were disposed in such a manner, that either his right or left must take the enemy in rear and close them in, so as to disable them from undertaking any thing against the part where he intended to effect his principal attack. On the other hand, M. Daun perceiving the king to be serious in his design of fighting, to prevent confusion, sent all his baggage over the Elbe, across which he threw three bridges in case a retreat should be necessary. At the same time he caused Torgau to be evacuated; and then, extending his first line to a village called *Zinne* on the left, he stretched it to another called *Croschwitz* on the right; supporting the right of his second line upon the Elbe. In this disposition he was found, when, about two o'clock in

6r  
He defeats  
Count Daun  
at Torgau.

Prussia.

the afternoon, the king began his attack. He was received by the fire of 200 pieces of cannon, which were disposed along the Austrian front. The Prussians were thrice led on to the attack; but were every time repulsed and broken with terrible slaughter. The king at length commanded a fresh body of troops to advance, which at first compelled the Austrians to retire; but new reinforcements continually coming in, this cavalry was in its turn obliged to fall back, and the Prussians maintained themselves with extreme difficulty, until General Ziethen, with the right wing, attacked the enemy in the rear, repulsed them, and possessed himself of some eminences which commanded the whole Austrian army. Encouraged by this success, the Prussian infantry once more advanced, mastered several of the enemy's intrenchments, and made way for a new attack of their cavalry, which broke in with irresistible fury on the Austrians, and threw several bodies of them into irreparable disorder. It was now about 9 o'clock, and of consequence both armies were involved in thick darkness; yet the fire continued without intermission, and the battalions with a blind rage discharged at one another without distinguishing friend from foe. M. Daun received a dangerous wound in the thigh, and was carried from the field, which probably hastened the defeat of his troops. The command then devolved on Count O'Donnell; who, finding the greatest part of his troops in disorder, the night advanced, and the enemy possessed of some eminences which commanded his camp, and from which it was in vain to think of driving them, ordered a retreat, which was conducted with wonderful order and exactness; none were lost in passing the bridges, and by far the greater part of their artillery was preserved. The loss of the Prussians was estimated at 10,000 killed and wounded, and 3000 taken prisoners. That of the Austrians in killed and wounded is not known; but 8000 were taken prisoners, with 216 officers, among which were four generals.

The consequence of the victory of Torgau was, that the king recovered all Saxony except Dresden; and in the mean time General Werner having marched into Pomerania, the Russians raised the siege of Colberg, and retired into Poland, without having effected any thing further than wasting the open country. Werner then flew to the assistance of Western Pomerania, where he defeated a body of Swedes, and at last drove them totally out of the country. General Laudohn too abruptly raised the blockade of Cosel; and afterwards, abandoning Landshut, he retired into the Austrian Silesia, leaving the Prussian part entirely in quiet. M. Daun placed one part of his army in Dresden, and the other in some strong posts which lie to the south and west of it, by which he commanded the Elbe, and preserved his communication with Bohemia. The army of the empire retired into Franconia, and placed its headquarters at Bamberg.

Though these successes had, to appearance, retrieved the king's affairs in some measure, yet his strength seemed now to be wholly exhausted; and in the campaign of 1761, he made no such vigorous efforts as he had formerly done. The Russians, dividing themselves into two bodies, invaded Silesia and Pomerania. In the former country they laid siege to Breslau, and in the latter to Colberg. Tottleben also, who had com-

manded the Russian armies, was now removed on a suspicion that he had corresponded with the king of Prussia, and general Romanzow put in his place; by which it was expected that the Russian operations would be more brisk this year than formerly.

The king continued strongly encamped near Schweidnitz; where he was so closely watched by generals Daun and Laudohn, that he could attempt nothing. However, he defeated the designs of the Russians against Breslau, by sending general Platen to destroy their magazines; which he accomplished with great success, at the same time cutting off a body of 4000 of their troops. But this only brought the more sure destruction upon Colberg; to which place that body of Russians immediately marched, cruelly wasting the country as they went along. The king of Prussia could do nothing but send detachments of small parties, which, though they could not oppose their enemies in the field, yet he hoped, by cutting off the convoys of the enemy, might distress them to such a degree as to oblige them to abandon the siege, or at least protract it till the severity of the winter should render it impossible for them to carry on their operations. Thus he weakened his own army so much, that it was found requisite to draw 4000 men out of Schweidnitz in order to reinforce it; and no sooner was this done, than general Laudohn suddenly attacked and took that fortress by a coup de main. Colberg made a brave defence; but the troops sent to its relief being totally unable to cope with the Russian army consisting of 50,000 men, it was obliged to surrender on the 3d of December; and thus the fate of the Prussian monarch seemed to be decided, and almost every part of his dominions lay open to the invaders.

In the midst of these gloomy appearances the emperor of Russia, the king's most inveterate and insupportable enemy, died on the 23d of January 1762. Her successor, Peter III. instead of being the king's enemy, was his most sanguine friend. As early as the 23d of February, in a memorial delivered to the ministers of the allied courts, he declared, that, "in order to the establishment of peace, he was ready to sacrifice all the conquests made in this war by the arms of Russia, in hopes that the allied courts will on their parts equally prefer the restoration of peace and tranquillity, to the advantages which they might expect from the continuance of the war, but which they cannot obtain but by a continuance of the effusion of human blood."—This address was not so well relished by the allies; however, they were very willing to make peace, provided it was for their own interest; but they recommended to his attention fidelity to treaties, which constitutes a no less valuable part of the royal character, than humanity and disinterestedness. This answer made no impression on the czar; a suspension of hostilities took place on the 16th of March, which was followed by a treaty of alliance on the 5th of May. In this treaty the czar stipulated nothing in favour of his former confederates; on the contrary, he agreed to join his troops to those of the king of Prussia, in order to act against them. Sweden, which had for a long time acted under the direction of Russian counsels, now followed the example of her mistress, and concluded a peace with Prussia on the 22d of May.

Prussia.

65  
cesses of  
the king of  
ussia.

It is not to be supposed that the king of Prussia would remain long inactive after such an unexpected turn in his favour. His arms were now every where attended with success. Prince Henry drove the Imperialists from some important posts in Saxony, by which he secured all that part which the Prussians possessed; and though the Austrians frequently attempted to recover these posts, they were constantly repulsed with great slaughter. The king was not joined by his new allies till the latter end of June; after which he drove M. Daun before him to the extremity of Silesia, leaving the town of Schweidnitz entirely uncovered, and which the king immediately prepared to invest. In the mean time different detachments of Prussians, some on the side of Saxony, and others on that of Silesia, penetrated deep into Bohemia, laid many parts of the country under contribution, and spread an universal alarm. A considerable body of Russian irregulars also made an irruption into Bohemia, where they practised on the Austrians the same cruelties which they had long been accustomed to practise on the Prussians.

66  
new re-  
volution in  
ussia.

But while the king was thus making the best use of his time, he was all at once threatened with a fatal reverse of fortune by a new revolution in Russia. The emperor was deposed, and his deposition was soon after followed by his death. The empress, who succeeded him, suspected that her husband had been misled by the counsels of his Prussian majesty, against whom, therefore, she entertained a mortal enmity. She could not, however, in the very beginning of her reign, undertake again a war of so much importance as that which had been just concluded. She therefore declared her intention of observing the peace concluded by the late emperor; but, at the same time, of recalling her armies from Silesia, Prussia, and Pomerania; which indeed the unsettled state of the kingdom now made in some degree necessary. At the same time a discovery was made with regard to the king of Prussia himself, which turned the scale greatly in his favour. The Russian senate, flaming with resentment against this monarch, and against their late unfortunate sovereign; and the empress, full of suspicion that the conduct of the latter might have been influenced by the counsels of the former, searched eagerly amongst the papers of the late emperor for an elucidation or proofs of this point. They found indeed many letters from the Prussian monarch; but in a strain absolutely different from what they had expected. The king had, as far as prudence would permit, kept a reserve and distance with regard to the too rash advances of this unhappy ally; and, in particular, counselled him to undertake nothing against the empress his consort. The hearing of these letters read is said to have had such an effect upon the empress, that she burst into tears, and expressed her gratitude towards the Prussian monarch in the warmest terms. Still, however, the Russian army was ordered to separate from the Prussians; but all the important places which the former had taken during the whole war were faithfully restored.

The king, finding that the Russians were no more to take an active part in his favour, resolved to profit by their appearance in his camp; and therefore, the very day after the order for their return had arrived, he attacked the Austrian army, and drove their right wing from some eminences and villages where they were ad-

vantageously posted; by which means he entirely cut off their communication with Schweidnitz, so that nothing could be attempted for its relief. Prince Henry kept them in continual alarms for Bohemia; and a great part of their attention, and no small part of their forces, were engaged on that side. Marshal Daun, now finding himself rendered almost incapable of undertaking any thing, detached general Laudohn, with a force very much superior, to attack the prince of Bevern, and drive him from the advantageous post he occupied. But the prince defended himself with such resolution, that all the efforts of Laudohn could not succeed before the king had time to come to his assistance. The Austrians, being then put between two fires, were routed and pursued with terrible slaughter; after which, the king met with no more disturbance in his preparations for the siege, and the trenches were opened on the 18th of July. Marshal Daun made no attempts to relieve the place; but the garrison being very strong, it held out for near two months from the opening of the trenches. It is said that the attack was conducted, and the defence made, by two engineers who had written on the subject of the attack and defence of fortified places; and they were now practically engaged to prove the superiority of their systems. At last, however, the garrison, to the number of 8000 men, surrendered prisoners of war; and the whole body, except nine, were soon after drowned at the mouth of the Oder, on their passage to their intended confinement at Konigsberg.

Prussia.

67  
General  
Laudohn  
utterly de-  
feated.

The king of Prussia, now become master of Schweidnitz, turned his attention towards Saxony, where he considerably reinforced his brother's army, and made preparations for laying siege to Dresden. In this country the Austrians had lately met with some success, and driven prince Henry back as far as Freyberg; but on the 29th of October, they were attacked by the Prussian army thus reinforced, and totally routed. Great numbers were slain, and near 6000 taken prisoners. This victory proved decisive; and the empress-queen, finding herself deserted by all her allies, was glad to conclude a treaty; the substance of which was, that a mutual restitution and oblivion should take place, and both parties sit down at the end of the war in the same situation in which they began it. This treaty is called the *peace of Hubertsburg*.

67  
The Austrians  
entirely de-  
feated at  
Freyberg,  
which pro-  
duces no  
peace.

The war was no sooner concluded than the king of Prussia turned his attention to domestic policy, and the recovery of his dominions from those innumerable calamities which had befallen them during the war. He immediately distributed lands to his disbanded soldiers, and gave them the horses of his artillery to assist them in their cultivation. By his wife and prudent management, the horrors of war were soon forgot; and the country is now in as flourishing a state as ever. Notwithstanding this pacific disposition, however, the king has never slackened his endeavours for the defence of his country, by keeping a respectable army on foot; Indeed it is probable that his army is now much more formidable than ever.

In the year 1778, a new difference with the house of Austria took place, concerning the duchy of Bavaria. But tho' the most enormous warlike preparations were made on both sides, and immense armies brought into the field, nothing of consequence was effected. What little advantage

68  
war  
commences.

**Prussia.** advantage there was, seems to have been on the Prussian side, since they made themselves masters of several towns, and kept the war in the enemy's country. However, the emperor acted with so much caution, and showed such skill in a defensive war, that all the manoeuvres of his Prussian Majesty could gain no material advantage; as, on the other hand, his adversary was too wise to venture an engagement. A peace therefore was very soon concluded, and since that time the history of Prussia has afforded no remarkable event.

69  
Air, soil, and population of Prussia.

The air of Prussia is wholesome, and the soil fruitful in grain; affording, besides, plenty of pitcoal and other fuel. The rivers and lakes are well stored with fish; and amber is found on its coast towards the Baltic. The principal rivers are the Vistula, Bregel, Memel, the Passarge, and the Elbe; all of which frequently do damage by their inundations.

The inhabitants of this country were, by Dr Bussching, computed at 635,998 persons capable of bearing arms; and by another German author, at 450,000. Since the year 1719 it is computed that about 34,000 colonists have removed hither from France, Switzerland, and Germany; of which number one half were Saltzburger. These emigrants have built 400 small villages, 11 towns, 50 new churches, and founded 1000 village-schools. The manners of the people differ but little from those of the Germans. The established religions are those of Luther and Calvin, but chiefly the former; though almost all other sects are tolerated.

70  
Commerce and manufactures.

The present king of Prussia, by the assistance of an excellent police, has brought the commerce and manufactures of this country to a very flourishing state, which is daily improving. The manufactures, of Prussia consist in glass, iron-work, paper, gun-powder, copper, and bras-mills; manufactures of cloth, camblet, linen, silk, gold and silver lace, stockings, and other articles. The inhabitants export variety of naval stores; amber, lint-feed and hemp-feed, oat-meal, fish, mead, tallow, and caviar; and it is said that 500 ships are loaded with those commodities every year, chiefly from Koningsberg.

71  
Constitution.

His Prussian majesty is absolute through all his dominions, but is too wise to oppress his subjects, though he avails himself to the full of his power. The government of this kingdom is by a regency of four chancellors of state, viz. 1. The great-masser; 2. The great-burggrave; 3. The great-chancellor; and 4. The great-marhal. There are also some other councils, and 37 bailiwicks. The state consists, 1. Of counsellors of state; 2. Of deputies from the nobility; and 3. From the commons. Besides these institutions, his majesty has erected a board for commerce and navigation.

72  
Revenues.

His Prussian majesty, by means of the happy situation of his country, its inland navigation, and his own excellent regulations, derives an amazing revenue from this country, which, about a century and a half ago, was the seat of boors and barbarism. It is said, that amber alone brings him in 26,000 dollars annually. His other revenues arise from his demesnes, his duties of customs and tolls, and the subsidies yearly granted by the several states; but the exact sum is not known, though we may conclude that it is very considerable, from the immense charges of the late war.

The military regulations introduced by his majesty, have a wonderful quick operation in forming his troops and recruiting his armies. Every regiment has a particular district assigned it, where the young men proper for bearing arms are registered; and when occasion offers, they join their regiment, and being incorporated with veterans they soon become well disciplined troops. The Prussian army, in time of peace, consists of 175,000 of the best disciplined troops in the world; and during the last war, that force was augmented to 300,000 men.

Prussian, Prynne. 73  
Military strength, &c.

The royal arms of Prussia are argent, an eagle displayed sable, crowned, or, for Prussia: azure, the Imperial sceptre, or, for Courland: argent, an eagle displayed, gules, with semi-circular wreaths, for the marquisate of Brandenburg: to these are added the respective arms of the several provinces subject to the Prussian crown.

There are two orders of knighthood; the first, that of the Black Eagle, instituted by Frederic I. on the day of his coronation at Koningsberg, with this motto, *Suum cuique*. The sovereign is always grand-masser; and the number of knights, exclusive of the royal family, is limited to 30. Next to this is the order of Merit, instituted by his present majesty; the motto is, *Pour le merite*.

PRUSSIAN BLUE. See CHEMISTRY, n° 287.

PRYNNE (William), an English lawyer, much distinguished in the civil commotions under Char. I. was born at Swainwick in Somersetshire in 1600. His *Histriomastix*, written against stage-plays in 1632, containing some reflections that offended the court, he was sentenced by the star-chamber to pay a fine of 5000 l. to stand in the pillory, to lose his ears, and to perpetual imprisonment. During his confinement, he wrote several more books; particularly, in 1637, one entitled *News from Ipswich*, which reflecting severely on the bishops, he was again sentenced by the star-chamber to another fine of 5000 l. to lose the remainder of his ears in the pillory, to be branded on both cheeks with S. L. for seditious libeller, and to be perpetually imprisoned in Caernarvon castle. Nothing but cutting off his hands could have prevented Prynne from writing: he wrote still; and in 1640, being set at liberty by the house of commons, he entered London in a kind of triumph, was elected into parliament for Newport in Cornwall, and opposed the bishops with great vigour, being the chief manager of archbishop Laud's trial. In the long parliament he was zealous in the Presbyterian cause; but when the independents gained the ascendancy, he opposed them warmly, and promoted an agreement with the king. When the army garbled the house and refused him entrance, he became a bitter enemy to them and their leader Cromwel, and attacked them with his pen so severely that he was again imprisoned: but he pleaded the liberty of the subject so successfully, that he was enlarged, to write more controversial books. Being restored to his seat after Cromwel's death, with the other secluded members, he assisted in promoting the restoration, and was appointed keeper of the Tower records; a place excellently well calculated for him, and where he was very useful by the collections he published from them. He presented 40 volumes of his works, in folio and 4to, to

Lincoln's

rytanes  
||  
psalmana-  
zar.

Lincoln's-inn library, of which society he was a member; and, dying in 1669, was buried under the chapel.

PRYTANES, in Grecian antiquity, were the presidents of the senate, whose authority consisted chiefly in assembling the senate; which, for the most part, was done once every day.

The senate consisted of 500, 50 senators being elected out of each tribe: after which, lots were cast, to determine in what order the senators of each tribe should preside; which they did by turns, and during their presidentship were called *prytanes*. However, all the 50 *prytanes* of the tribes did not govern at once, but one at a time, viz. for seven days; and after 35 days, another tribe came into play, and presided for other five weeks; and so of the rest.

PSALM, a divine song or hymn; but chiefly appropriated to the 150 Psalms of David, a canonical book of the Old Testament.

Most of the psalms have a particular title, signifying either the name of the author, the person who was to set it to music or sing it, the instrument that was to be used, or the subject and occasion of it. Some have imagined that David was the sole author of the Book of Psalms; but the titles of many of them prove the contrary, as psalm xix. which appears to have been written by Moses. Many of the psalms are inscribed with the names *Korah*, *Jeduthun*, &c. from the persons who were to sing them.

PSALMANAZAR (George), the fictitious name of a pretended Formosan, a person of learning and ingenuity. He was born in France, and educated in a free-school, and afterwards in a college of Jesuits, in an archiepiscopal city, the name of which, as likewise those of his birth-place and of his parents, are unknown. Upon leaving the college, he was recommended as a tutor to a young gentleman; but soon fell into a mean rambling life, that involved him in disappointments and misfortunes. His first pretence was that of being a sufferer for religion. He procured a certificate that he was of Irish extraction, that he left that country for the sake of the Catholic faith, and was going on a pilgrimage to Rome. Being unable to purchase a pilgrim's garb, and observing one in a chapel, dedicated to a miraculous saint, which had been set up as a monument of gratitude by some wandering pilgrim, he contrived to take both the staff and cloak away; and, being thus accoutred, begged his way in fluent Latin, accosting only clergymen or persons of figure, whom he found so generous and credulous, that, before he had gone 20 miles, he might easily have saved money, and put himself in a much better dress: but as soon as he had got what he thought was sufficient, he begged no more; but viewed every thing worth seeing, and then retired to some inn, where he spent his money as freely as he had obtained it. Having heard the Jesuits speak much of China and Japan, he started the wild scheme, when he was in Germany, of passing for a native of the island of Formosa; and what he wanted in knowledge, he supplied by a pregnant invention. He formed a new character and language on grammatical principles, which, like other oriental languages, he wrote from right to left with great readiness; and planned a new religion, and a division of the year into 20 months,

with other novelties, to credit his pretensions. He was now a Japanese convert to Christianity, travelling for instruction, with an appearance more wretched than even that of common beggars. He then entered as a soldier in the Dutch service: but, still desirous of passing for a Japanese, he altered his plan to that of being an unconverted heathen; and at Sluys, brigadier Lauder, a Scots colonel, introduced him to the chaplain, who, with a view of recommending himself to the bishop of London, resolved to carry him over to England. At Rotterdam, some persons having put shrewd questions to him, that carried the air of doubt, he took one more whimsical step, which was to live upon raw flesh, roots, and herbs; which strange food he thought would remove all scruples. The bishop of London patronized him, with credulous humanity; and Psalmanazar found a large circle of friends, who extolled him as a prodigy. Yet were there some who entertained a just opinion of him, particularly the Drs Halley, Mead, and Woodward; but their endeavours to expose him as a cheat, only made others think the better of him, especially as those gentlemen were esteemed no great admirers of revelation. But in this instance at least, easiness of belief was no great evidence of penetration. He was employed to translate the church-catechism into the Formosan language, which was examined, approved, and laid up as a valuable MS; and the author, after writing his well-known *History of Formosa*, was rewarded and sent to Oxford to study what he liked, while his patrons and opponents were learnedly disputing at London on the merits of his work. The learned members of the university were no better agreed in their opinions, than those at London; but at length the sceptics triumphed. Some absurdities were discovered in his history, of such a nature as to discredit the whole narration, and saved him the trouble of an open declaration of his imposture, which however he owned at length to his private friends. For the remainder of his life, his learning and ingenuity enabled him to procure a comfortable support by his pen; he being concerned in several works of credit, particularly *The Universal History*. He lived irreproachably for many years, and died in 1763.

PSALMODY, the art or act of singing psalms. See PSALMS.

Psalmody was always esteemed a considerable part of devotion, and usually performed in the standing posture: and as to the manner of pronunciation, the plain song was sometimes used, being a gentle inflection of the voice, not much different from reading, like the chant in cathedrals; at other times more artificial compositions were used, like our anthems.

As to the persons concerned in singing, sometimes a single person sung alone; sometimes the whole assembly joined together, which was the most ancient and general practice. At other times, the psalms were sung alternately, the congregation dividing themselves into two parts, and singing verse about, in their turns. There was also a fourth way of singing, pretty common in the fourth century, which was, when a single person began the verse, and the people joined with him in the close: this was often used for variety, in the same service with alternate psalmody.

The use of musical instruments, in the singing of psalms, seems to be as ancient as psalmody itself; the

Psalmana-  
zar,  
Psalmody,

Psalter  
||  
Pseudo.

first psalm we read of, being sung to the timbrel, viz. that of Moses and Miriam, after the deliverance of the Israelites from Egypt: and afterwards, musical instruments were in constant use in the temple of Jerusalem. When the use of organs was introduced into the Christian church, is not certainly known; but we find, about the year 660, that Constantine Copronymus, emperor of Constantinople, sent a present of an organ to Pepin king of France.

PSALTER, the same with the book of psalms. See the article PSALM.

Among the religions in the Popish countries, the term *psalter* is also given to a large chaplet or rosary, consisting of 150 beads, according to the number of psalms in the psalter.

PSALTERY, a musical instrument, much in use among the ancient Hebrews, who called it *nebel*.

We know little or nothing of the precise form of the ancient psaltery. That now in use is a flat instrument, in form of a trapezium or triangle truncated at top: it is strung with 13 wire-chorde, set to unison or octave, and mounted on two bridges, on the two sides: it is struck with a plectrum, or little iron rod, and sometimes with a crooked stick. Its chest or body resembles that of a spinet.

PSAMMETICUS, or PSAMMITICHUS, a renowned conqueror, who, subduing 11 other petty kings of Egypt, became the founder of the kingdom of Egypt, about 670 B. C. He is memorable likewise for taking the city of Azot, after a siege of 29 years; and for discovering the sources of the river Nile.

PSEUDO, from *ψευδος*, a Greek term used in the composition of many words, to denote *falsè* or *spurious*: as the pseudo-acacia, or bastard-acacia; pseudo-fumaria, or bastard-fumitory; pseudo-ruta, or bastard-rue, &c.

We also say a pseudo-apostle, or false apostle; a pseudo-prophet, or false prophet, &c.

PSEUDO-TINEA, in natural history, the name of a very remarkable species of insect described by M. Reaumur, approaching to the nature of the *linea*, or *clothes-moth* while in the worm-state, but not making themselves coats of the substance of leaves, cloth, &c. tho' they form a sort of cases for their defence against a very terrible enemy.

These creatures are of the caterpillar kind, and have, in the manner of many of these insects, 16 legs. They feed on wax, and for food enter the bee-hives; where they boldly engage the bees, and are not to be prevented by them from feeding, though at the expence of their habitations and the cells of their reservoirs of honey: so that it is no uncommon thing for a swarm of bees to be forced to change their place of habitation, and make new combs elsewhere; leaving the old ones to this contemptible victor, whom they know not how to drive out or dispose of.

Virgil and Aristotle, and all the authors who have written on bees, have complained of this destructive animal. It never eats the honey, but feeds only on the wax; attacking principally those waxy cells where the female bee deposits her eggs for the future progeny.

The bees, who are a match for most other creatures by means of their stings, would easily destroy these weak creatures, were it not for the impervious

armour they are covered with. They form themselves a coat of armour of a double matter. The first, which immediately covers the body, is of a kind of silk of their own spinning; and the outer covering over this is of the bees wax: this is laid considerably thick; and the creature, just thrusting out its head to feed, goes on devouring the cells undisturbed, while a whole army of the inhabitants are in vain buzzing about him, and attempting to pierce him with their stings. He never forsakes his covering, but lengthens and enlarges it as he goes; and gnawing down the sides of the cells in his march, without staying to eat them one by one, the havoc and destruction he occasions are scarce to be conceived. When the time of the change of this creature approaches, it contracts its body within its double covering, and there changes into the nymph state; whence, after a proper time, it comes forth in form of a moth, with granulated horns and a crooked proboscis.

The bees have cunning enough to know their destructive enemy in this new form; and as this is a weak and defenceless state, they attack and destroy all the moths of this species they can meet with. They seldom are so fortunate, however, as to kill the whole race as soon as produced; and if only one escapes, it is able to lay a foundation of revenge for the death of its brethren. All the flies of the moth kind lay a vast number of eggs, and this is behind hand with none of them in that particular: the young ones produced from the eggs of one surviving female of this species, are sufficient to destroy many honey-combs; nay, many hives of them. The moth produced by this caterpillar flies but little; yet it is very nimble in avoiding danger, by running, which it does with great swiftness.

There is a species of these pseudo-tineæ, or wax-eating caterpillars, which infest the subterraneous hives of wasps and other creatures which make wax: the manner of living, feeding, and defending themselves from their enemies, is the same in all the species. These last, if they are at any time distressed for food, will eat their own dung; the wax having passed almost unaltered through their bodies, and being still wax and capable of affording them more nourishment on a second digestion. These species, though they naturally live on this soft food, yet if by any accident they meet with harder only, they know how to live upon it; and can eat a way into the covers and leaves of books, and make themselves cases and coverings of the fragments of these substances. The accurate author † of these observations describes also a kind of *pseudo-tineæ* which feeds on wool, and another that eats leather; both making themselves houses also on the materials they feed on.

There is also another kind very destructive of corn: these make themselves a covering by fastening together a great number of the grains, and there living and eating in secret. All these creatures, whatever be their food or habitation, finally become *phalena*, or moths; and may be distinguished, even in this state, from the other species, by having granulated horns of a remarkable structure, and all of them a proboscis, or trunk, more or less incurved.

PSEUDONYMUS, among critics, an author who publishes a book under a false or feigned name: as

Pseudo,  
Pseudonymus.

† Reaumur,  
History of  
Insects.

*Psidium*, *Psyll.* *cryptonymus* is given to him who publishes one under a disguised name, and *anonymus* to him who publishes without any name at all.

**PSIDIUM**, the **GUAVA**; a genus of the monogynia order, belonging to the icofandria class of plants. There are two species: 1. The pyriferum, or white guava; 2. The pomiferum, or red guava. Both these are thought to be only varieties of the same plant. The red guava rises to the height of 20 feet, and is covered with a smooth bark; the branches are angular, covered with oval leaves, having a strong midrib, and many veins running towards the sides, of a light green colour, standing opposite upon very short footstalks. From the wings of the leaves the flowers come out upon footstalks an inch and a half long: they are composed of five large roundish concave petals, within which are a great number of stamina shorter than the petals, and tipped with pale yellow tops. After the flower is past, the germen becomes a large oval fruit shaped like a pomegranate.

A decoction of the roots of guava, is employed with success in dysenteries: a bath of a decoction of the leaves is said to cure the itch and other cutaneous eruptions. Guayava, or guava, is distinguished, from the colour of the pulp, into the two species above-mentioned, the white and the red; and, from the figure of the fruit, into the round, and the pear-fashioned or perfumed guava. The latter has a thicker rind, and a more delicate taste than the other. The fruit is about the bigness of a large tennis-ball; the rind or skin generally of a russet stained with red. The pulp within the thick rind is of an agreeable flavour, and interspersed with a number of small white seeds. The rind, when stewed, is eaten with milk, and preferred to any other stewed fruit. From the same part is made marmalade; and from the whole fruit is prepared the finest jelly in the world. The fruit is very astringent, and nearly of the same quality with the pomegranate; so should be avoided by all who are subject to be costive. The seeds are so hard as not to be affected by the fermentation in the stomachs of animals; so that when voided with the excrements, they take root, germinate, and produce thriving trees. Whole meadows in the West Indies are covered with guavas, which have been propagated in this manner. The buds of guava, boiled with barley and liquorice, produce an excellent ptisan for diarrheas, and even the bloody-flux, when not too inveterate. The wood of the tree, employed as fuel, makes a lively, ardent, lasting fire.

**PSYLLI**, (Strabo, Ptolemy): a people in the south of Cyrenaica, so called from king Psyllus, (Agathargides, quoted by Pliny;) almost all overwhelmed by sand driven by a south wind, (Herodotus). They had something in their bodies fatal to serpents, and their very smell proved a charm against them, according to Pliny, Lucan, &c.

Though we may justly look upon it as fabulous that these people had any thing in their bodies different from others, it is however certain that there are in Egypt at this day some persons who have a method of handling the most poisonous serpents without any hurt. Of these Mr Hasselquist gives the following account.

“ They take the most poisonous vipers with their bare hands, play with them, put them in their bo-

oms, and use a great many more tricks with them, as I have often seen. I have frequently seen them handle those that were three or four feet long, and of the most horrid sort. I inquired and examined whether they had cut out the vipers poisonous teeth; but I have with my own eyes seen they do not. We may therefore conclude, that there are to this day Psilli in Egypt; but what art they use, is not easily known. Some people are very superstitious, and the generality believe this to be done by some supernatural art which they obtain from invisible beings. I do not know whether their power is to be ascribed to good or evil; but I am persuaded that those who undertake it use many superstitions.” He afterwards says, “ He had vipers of four different sorts brought him by a Psilli, who put him, together with the French consul Lironcourt, and all the French nation present, in confinement. They gathered about us to see how he handled the most poisonous and dreadful creatures alive and brisk, without their doing, or even offering to do, her the least harm. When she put them into the bottle where they were to be preserved, she took them with her bare hands, and handled them as our ladies do their laces. She had no difficulty with any but the *viperæ officinales*, which were not fond of their lodging. They found means to creep out before the bottle could be corked. They crept over the hands and bare arms of the woman, without occasioning the least fear in her: she with great calmness took the snakes from her body, and put them into the place destined for their grave. She had taken these serpents in the field with the same ease she handled them before us: this we were told by the Arab who brought her to us. Doubtless this woman had some unknown art which enabled her to handle these creatures. It was impossible to get any information from her; for on this subject she would not open her lips. The art of fascinating serpents is a secret amongst the Egyptians. It is worthy the endeavours of all naturalists, and the attention of every traveller, to learn something decisive as to this affair. How ancient this art is among the Africans, may be concluded from the ancient Marri and Psylli, who were from Africa, and daily showed proofs of it at Rome. It is very remarkable that this should be kept a secret for more than 2000 years, being known only to a few, when we have seen how many other secrets have within that time been revealed. The circumstances relating to the fascination of serpents in Egypt, related to me, were principally,

1. That the art is only known to certain families, who propagate it to their offspring. 2. The person who knows how to fascinate serpents, never meddles with other poisonous animals, such as scorpions, lizards, &c. There are different persons who know how to fascinate these animals; and they again never meddle with serpents. 3. Those that fascinate serpents, eat them both raw and boiled, and even make broth of them, which they eat very commonly amongst them; but in particular, they eat such a dish when they go out to catch them. I have been told, that serpents fried or boiled are frequently eat by the Arabians both in Egypt and Arabia, though they know not how to fascinate them, but catch them either alive or dead. 4. After they have eat their soup, they procure a blessing from their schek (priest or lawyer) who

Pistacus  
Pforales.

uses some superstitious ceremonies, and amongst others spits on them several times with certain gestures. This manner of getting a blessing from the priest is pure superstition, and certainly cannot in the least help to fascinate serpents; but they believe, or will at least persuade others, that the power of fascinating serpents depends upon this circumstance."

**PSITTACUS**, in ornithology, a genus belonging to the order of picæ. The beak is hooked, the superior mandible being furnished with a moveable wax; the nostrils are placed at the base of the beak; and the tongue is fleshy, blunt, and entire; and the feet are fitted for climbing. There are 45 species, distinguished by their colour and the length of their tails. This genus includes the parrot kind, which are all natives of warm climates.

The parrot is a well-known bird, of which there are several very beautiful kinds. Its head is large, and beak and skull extremely hard and strong. It might seem a wonder why nature has destined to this, which is not naturally a bird of prey, but feeds on fruits and vegetable substances, the crooked beak allotted to the hawk and other carnivorous birds: but the reason seems to be, that the parrot being a heavy bird, and its legs not very fit for service, it climbs up and down trees by the help of this sharp and hooked bill, with which it lays hold of any thing and secures itself before it stirs a foot; and besides this, it helps itself forward very much, by pulling its body on with this hold.

Of all animals, the parrot and crocodile are the only ones which move the upper jaw; all creatures else moving the lower only. As some particular animals besides are fond of particular foods, so the parrot loves nothing so much as the seeds of the carthamus, or saffron; and eats them without any hurt, though they are a purge when given to other creatures.

The parrots are common both in the East and West Indies: they are a brisk and lively bird in the warmer countries; but with us lose much of their vigour. They lay two or three eggs in the hollow of a tree.

In all the known parrots the nostrils are round, and placed very high upon the beak, and very near one another.

Parrots are divided into three kinds: 1. The larger, which are as big as a moderate fowl, called *macaors* and *cockatoons*; these have very long tails. 2. The middle-sized ones, commonly called *parrots*, which have short tails, and are a little larger than a pigeon. And, 3. The small ones, which are called *paroquets*, and have long tails, and are not larger than a lark or blackbird.

**PSOAS**, in anatomy. See there, *Table of the Muscles*.

**PSORALEA**, in botany, a genus of the decandria order, belonging to the diadelphica class of plants. The most remarkable species are, 1. The *primata*, or pinnated pforalea, rises with a woody soft stem, branching five or six feet high, pinnated leaves of three or four pair of narrow lobes terminated by an odd one, and at the axillas close-fitting blue flowers with white keels. It is a native of Ethiopia. 2. The *bituminosa*, or bituminous trifoliolate pforalea, rises with a shrubby

stalk, branching sparingly, about two or three feet high, with ternate or three-lobed leaves of a bituminous scent, and blue flowers in close heads. Grows in Italy and in France. 3. The *aculeata*, or aculeated prickly pforalea, rises with a shrubby branching stem three or four feet high, with ternate leaves, having wedge-shaped lobes, terminating in a recurved sharp point, and the branches terminated by roundish heads of blue flowers. Grows in Ethiopia. These plants flower here every summer; the first fort greatest part of that season, and the others in July and August; all of which are succeeded by seeds in autumn. Keep them in pots in order for removing into the green-house in winter. They are propagated by seeds, sown in a hot-bed in the spring; and when the plants are two or three inches high, prick them in separate small pots, and gradually harden them to the open air, so as to bear it fully by the end of May or beginning of June. They may also be propagated by cuttings any time in summer, planted in pots and plunged in a little heat, or covered close with hand-glasses, shaded from the sun and watered.

**PTARMIGAN**, in ornithology. See **TETRAO**.

**PTELEA**, SHRUB-TREFOIL; a genus of the monogynia order, belonging to the tetrandria class of plants. The species are, 1. The *trifoliata*, or Carolina shrub-trefoil, hath a shrubby upright stem, dividing into a branchy head eight or ten feet high, covered with a smooth purplish bark, trifoliolate leaves formed of oval-spear shaped folioles, and the branches terminated by large bunches of greenish-white flowers, succeeded by roundish, bordered capsules. 2. The *viscosa*, or viscous Indian ptelea, rises with several strong shrubby stems, branching erectly 12 or 15 feet high, having a light brown bark, spear-shaped, stiff, simple leaves, and the branches terminated by clusters of greenish flowers.

The first species is a hardy deciduous shrub, and a proper plant for the shrubby and other ornamental plantations to increase the variety. It is propagated by seeds, layers, and cuttings.

The second species is a stove-plant, and is propagated commonly by seeds.

**PTERIS**, in botany, a genus of the order of filices, belonging to the cryptogamia class of plants. There are 19 species; the most remarkable is the *aquilina*, or common female fern. The root of this is viscid, nauseous, and bitterish; and like all the rest of the fern tribe, has a salt, mucilaginous taste. It creeps under the ground in some rich soils to the depth of five or six feet, and is very difficult to be destroyed: frequent mowing in pasture-grounds, plentiful dunging in arable lands, but, above all, pouring urine upon it, are the most approved methods of killing it. It has, however, many good qualities to counterbalance the few bad ones. Fern cut while green, and left to rot upon the ground, is a good improver of land; for its ashes, if burnt, will yield the double quantity of salt that most other vegetables will.—Fern is also an excellent manure for potatoes; for if buried beneath their roots, it never fails to produce a good crop.—Its atringency is so great, that it is used in many places abroad in dressing and preparing kid and chamois leather.—In several places in the north, the inhabitants mow it green, and, burning it to ashes, make those

Ptarmigan  
Pteris.

ashes up into balls, with a little water, which they dry in the sun, and make use of them to wash their linen with instead of soap. In many of the western isles the people gain a very considerable profit from the sale of the ashes to soap and glass makers.—In Glen Elg in Invernesshire, and other places, the people thatch their houses with the stalks of this fern, and fasten them down with ropes made either of birch-bark or heath. Sometimes they use the whole plant for the same purpose, but that does not make so durable a covering.—Swine are fond of the roots, especially if boiled in their wash.—In some parts of Normandy we read that the poor have been reduced to the miserable necessity of mixing them with their bread. And in Siberia, and some other northern countries, the inhabitants brew them in their ale, mixing one-third of the roots to two-thirds of malt.—The ancients used the root of this fern, and the whole plant, in decoctions and diet-drinks, in chronic disorders of all kinds, arising from obstructions of the viscera and the spleen. Some of the moderns have given it a high character in the same intentions, but it is rarely used in the present practice. The country people, however, still continue to retain some of its ancient uses; for they give the powder of it to destroy worms, and look upon a bed of the green plant as a sovereign cure for the rickets in children.

**PTISAN**, is properly barley decorticated, or deprived of its hulls, by beating in a mortar, as was the ancient practice: though the cooling potion obtained by boiling such barley in water, and afterwards sweetening the liquor with liquorice-root, is what at present goes by the name of *ptisan*; and to render it laxative, some add a little sena or other ingredient of the same intention.

**PTOLEMAIC System of Astronomy**, is that invented by Claudius Ptolemæus. See **PTOLEMY** (Claudius).

**PTOLEMAIS**, (anc. geog.); the port of Arsinoë, situated on the west branch of the Nile, which concurs to form the island called *Nomos Heracleotes*, to the south of the vertex of the Delta.

**PTOLEMAIS**, (Strabo); the largest and most considerable town of the Thebais, or Higher Egypt, and in nothing short of Memphis; governed in the manner of a Greek republic: situated on the west side of the Nile, almost opposite to Coptos.—Another, of Cyrenaica, anciently called *Barce*.—A third of the Troglodytica, surnamed *Epitheras*, from the chase of wild beasts, as elephants: lying in the same parallel with Meroë, (Strabo); on the Arabian gulf, (Pliny); 4820 stadia to the south of Berenice.—A fourth, of Galilee, anciently called *Aca*, or *Acon*; made a Roman colony under the emperor Claudius, (Pliny).—A fifth, of Pamphylia; situate near the river Melas, on the borders of Cilicia Aspera.

**PTOLEMY** (Soter, or Lagus), king of Egypt, a renowned warrior, and an excellent prince: he established an academy at Alexandria, and was himself a man of letters. Died 284 B. C. aged 92.

**PTOLEMY** (Philadelphus), his second son, succeeded him to the exclusion of Ptolemy Ceraunus. Renowned as a conqueror, but more revered for his great virtues and political abilities. He established and augmented the famous Alexandrian library, which had been be-

gun by his father. He greatly increased the commerce of Egypt, and granted considerable privileges to the Jews, from whom he obtained a copy of the Old Testament, which he caused to be translated into Greek, and deposited in his library. This is supposed to have been the version called the *Septuagint*. He died 246 years B. C. aged 64.

**PTOLEMY** (Ceraunus), the elder brother, fled to Seleucus king of Macedon, who received him hospitably; in return for which he assassinated him, and usurped his crown. He then invited Arsinoë, who was his widow and his own sister, to share the government with him; but as soon as he got her in his power, he murdered her and her children. He was at length defeated, killed, and torn limb from limb by the Gauls, 279 B. C.

**PTOLEMY** (Claudius), a celebrated mathematician and astrologer, was born at Pelusium, and surnamed by the Greeks *Most Divine* and *Most Wise*. He flourished at Alexandria in the second century, under the reigns of Adrian and Marcus Aurelius, about the 138th year before the Christian æra. There are still extant his Geography, and several learned works on astronomy, the principal of which are, 1. The *Almagest*. 2. *De Judiciis Astrologicis*. 3. *Planisphærium*. His system of the world was for many years adopted by the philosophers and astronomers; but the learned have rejected it for the system of Copernicus. See **ASTRONOMY**, p. 748, 770.

**PTYALISM**, in medicine, a salivation, or frequent and copious discharge of saliva. The word is Greek, formed from *πτυω* “to spit.”

**PUBERTY**, denotes the age at which a person is capable of procreating or begetting children.

**PUBERTY**, in law, is fixed at the age of 12 in females, and 14 in males; after which they are reckoned to be fit for marriage. But as to crimes and punishments, the age of puberty is fixed at 14 in both sexes.

**PUBES**, in anatomy, denotes the middle part of the hypogastric region in men or women, lying between the two inguina or groins.

*Section of the PUBES*. See **MIDWIFERY**, p. 528. and **SIGAUPTIAN Operation**.

**PUBES**, in botany, the hair or down on the leaves of some plants. See **HAIR**.

**PUBLICAN**, among the Romans, one who farmed the taxes and public revenues.

**PUBLICATION**, the art of making a thing known to the world, the same with promulgation.

**PUCERONS**, VINE-FRETTERS, or *Plant-lice*. See **APHIS**.

**PUDENDA**, the parts of generation in both sexes. See **ANATOMY**, n° 371, 372.

**PUERILITY**, in discourse, is defined by Longinus to be a thought, which, by being too far fetched, becomes flat and insipid. Puerility, he adds, is the common fault of those who affect to say nothing but what is brilliant and extraordinary.

**PUFFENDORF** (Samuel de) was born in 1631 at Fleh, a little village in Misnia, a province in Upper Saxony; and was son of Elias Puffendorf, minister of that place. After having made great progress in the sciences at Leipzig, he turned his thoughts to the study of the public law, which in Germany consists of

**Puffendorf**, the knowledge of the rights of the empire over the princes and states of which it is composed, and those of the princes and states with respect to each other. But though he used his utmost efforts to distinguish himself, he despised those pompous titles which are so much sought for at universities, and never would take the degree of doctor. He accepted the place of governor to the son of Mr Coyet, a Swedish nobleman, who was then ambassador from Sweden to the court of Denmark. For this purpose he went to Copenhagen, but continued not long at ease there; for the war being renewed some time after between Denmark and Sweden, he was seized with the whole family of the ambassador. During his confinement, which lasted eight months, as he had no books, and was allowed to see no person, he amused himself by meditating on what he read in Grotius's treatise *De Jure Belli et Pacis*, and the political writings of Mr Hobbes. Out of these he drew up a short system, to which he added some thoughts of his own, and published it at the Hague in 1660, under the title of *Elementa Jurisprudentiæ Universalis*. This recommended him to the elector Palatine, who invited him to the university of Heidelberg, where he founded in his favour a professorship of the law of nature and nations, which was the first of that kind established in Germany. Puffendorf remained at Heidelberg till 1673, when Charles XI. of Sweden gave him an invitation to be professor of the law of nature and nations at Lunden, which place the elector Palatine reluctantly allowed him to accept. He went thither the same year, and after that time his reputation greatly increased. Some years after, the king of Sweden sent for him to Stockholm, and made him his historiographer, and one of his counsellors. In 1688, the elector of Brandenburg obtained the consent of his Swedish Majesty, that he should come to Berlin, in order to write the history of the elector William the Great; and in 1694, made him a baron. But he died that same year, of an inflammation in his feet, occasioned by cutting his nails; having attained his grand climacteric. Of his works, which are numerous, the following are the principal: 1. A treatise on the Law of Nature and Nations, written in German; of which there is an English translation with Barbeyrac's Notes. 2. An Introduction to the History of the Principal States which at present subsist in Europe; written in German; which has been also translated into English. 3. The History of Sweden, from Gustavus Adolphus's expedition into Germany, to the abdication of Queen Christina. 4. The History of Charles Gustavus, in two volumes folio, &c.

**PUGET** (Peter Paul), one of the greatest painters and sculptors France ever produced, though but little noticed by their own writers, was born at Marseilles in 1623. In his youth he was the disciple of Roman, an able sculptor; and then went to Italy, where he studied painting and architecture. In painting he so well imitated the manner of Peter de Cortona, that this painter desired to see him, and entered into a friendship with him. In 1657, a dangerous disorder obliged him to renounce the pencil, and devote himself to sculpture; and his reputation causing him to be invited to Paris, he enjoyed a pension of 1200 crowns, as sculptor and director of the works relating

to vessels and galleys. He died at Marseilles in 1695, and has left a number of admirable statues behind him both in France and Italy.

**PUGIL**, in physic, &c. such a quantity of flowers, seeds, or the like, as may be taken up between the thumb and two fore-fingers. It is reckoned the eighth part of the manipulus or handful.

**PULTENEY** (William), the famous opposer of Sir Robert Walpole in parliament, and afterward earl of Bath, was descended from one of the most ancient families in the kingdom, and was born in 1682. Being well qualified in fortune, he early procured a seat in the house of commons, and distinguished himself as a warm partisan against queen Anne's ministry; whose errors he had sagacity to detect, and spirited eloquence to expose. When king George I. came to the throne, Mr Pulteney was made secretary at war, and soon after cofferer to the king's household; but the good understanding between this gentleman and Sir Robert Walpole, who then acted as prime minister, was interrupted in 1725, on a suspicion that Walpole was desirous of extending the limits of prerogative, and of promoting the interests of Hanover to the prejudice of those of Britain. His opposition to Sir Robert was indeed carried to such indiscriminate lengths, that some have been of opinion he often acted against measures beneficial to the public merely from personal motives. It would be impracticable here to trace his parliamentary conduct: so it must suffice to observe in general, that he became so obnoxious to the crown, that in 1731 the king called for the council-book, and with his own hand struck out his name from the list of privy-counsellors; a proceeding that only served to inflame his resentment and increase his popularity. Thus he still continued to attack the minister with a severity of eloquence and sarcasm that worked every antagonist; so that Sir Robert was heard to declare, he dreaded that man's tongue, more than another man's sword. At length when Walpole found the place of prime minister no longer tenible, and resigned in 1741, among other promotions Mr Pulteney resumed his place in the privy-council, and was created earl of Bath; a title purchased at the expence of that popularity which afterward he naturally enough affected to contemn. In 1760, toward the close of the last war, he published *A Letter to two great men*, recommending proper articles to be insisted on in a treaty of peace; which, though the writer was then unknown, was greatly applauded, and went through several impressions. He died in 1764; and as his only son died before him, the title became extinct.

**PULEX**, the *FLEA*, in zoology, a genus of insects belonging to the order of aptera. It has two eyes, and six feet fitted for leaping; the feelers are like threads; the rostrum is inflected, fetaceous, and armed with a sting; and the belly is setaceous.

The generation of this familiar vermin affords something very curious, first discovered by Sig. Diacinto Celloro.

Fleas bring forth eggs, or nits, which they deposit on animals that afford them a proper food: these eggs being very round and smooth, usually slip straight down; unless detained by the piles, or other inequalities, of the cloaths, hairs, &c.

Of these eggs are hatched white worms, of a shining pearl colour, which feed on the scurfy substance of the cuticle, the downy matter gathered in the piles of clothes, or other the like substances.

In a fortnight they come to a tolerable size, and are very lively and active; and, if at any time disturbed, they suddenly roll themselves into a kind of ball.

Soon after this, they come to creep, after the manner of silk-worms, with a very swift motion. When arrived at their size, they hide themselves as much as possible, and spin a silken thread out of their mouth, wherewith they form themselves a small round bag, or case, white within as paper, but without always dirty, and fouled with dust. Here, after a fortnight's rest, the animalcule bursts out, transformed into a perfect flea; leaving its exuviae in the bag.

While it remains in the bag, it is milk-white, till the second day before its eruption; when it becomes coloured, grows hard, and gets strength; so that upon its first delivery, it springs nimbly away.

The flea, when examined by the microscope, affords a very pleasing object. It is covered all over with black, hard, and shelly scales or plates, which are curiously jointed, and folded over one another in such a manner, as to comply with all the nimble motions of the creature. These scales are all curiously polished, and are beset about the edges with short spikes in a very beautiful and regular order. Its neck is finely arched, and much resembles the tail of a lobster: the head also is very extraordinary; for from the snout-part of it there proceed the two fore-legs, and between these is placed the piercer or sucker with which it penetrates the skin to get its food.

Its eyes are very large and beautiful, and it has two short horns or feelers. It has four other legs joined all at the breast. These, when it leaps, fold short one within another; and then, exerting their spring all at the same instant, they carry the creature to a surprising distance. The legs have several joints, and are very hairy, and terminate in two long and hooked sharp claws.

The piercer or sucker of the flea is lodged between its fore-legs, and includes a couple of darts or lancets; which, after the piercer has made an entrance, are thrust farther into the flesh, to make the blood flow from the adjacent parts, and occasion that round red spot, with a hole in the centre of it, vulgarly called a *flea-bite*.

This piercer, its sheath opening sidewise and the two lancets within it, are very difficult to be seen; unless the two fore-legs, between which they are hid, be cut off close to the head: for the flea rarely puts out its piercer, except at the time of feeding, but keeps it folded inwards; and the best way of seeing it is by cutting off first the head, and then the fore-legs, and then it is usually seen thrust out in convulsions.

By keeping fleas in a glass tube corked up at both ends, but so as to admit fresh air, their several actions may be observed, and particularly their way of coupling, which is performed tail to tail; the female, which is much the larger, standing on the male. They may also be thus seen to lay their eggs, not all at once, but ten or twelve in a day, for several days successively; which eggs will be afterwards found to hatch successively

in the same order. The flea may easily be dissected in a drop of water; and by this means the stomach and bowels, with their peristaltic motion, may be discovered very plainly, as also their testes and penis, with the veins and arteries, though minute beyond all conception. Mr Lieuwenhoek affirms also, that he has seen innumerable animalcules, shaped like serpents, in the semen masculinum of a flea.

*Pulex-Arboreus*, in natural history, the name given by Mr Reaumur to a very large genus of small animals. They are a kind of half-winged creatures: they have granulated antennæ; and some of them, in their most perfect state, have complete wings. These are distinguished from the others by the name of *musca-pulex* or the *winged-pulex*.

The several species of these creatures are of different colours: some are brown, others yellow; but the most frequent are green. They all feed upon the leaves of trees, which become withered and curled up on their eroding them; and they are so common, that wherever a leaf of a tree is found curled up, or of a different form from the others, it is highly probable these animals are on it, or that it is their work. Among trees the willow and the rose are the most infested by them; and among plants, the bean and the poppy. They live a social life, multitudes of males and females being found together. The females are easily distinguished from the males, by their being thicker in the body, and having larger bellies.

It is very wonderful, that of all the known animals of the winged kind, these are the only ones which are viviparous. This is easily seen beyond a possibility of doubt: for, on examining a cluster of them together, it is a common thing to see, by the help of a small magnifier, a female in the act of parturition; and the author † of this account frequently saw the young pulex protruded out, from a passage near the anus of the female, perfectly formed. He had suspected this from the total want of eggs among so numerous a tribe of animals, and from their remarkably speedy propagation, and was thus convinced of it by ocular demonstration.

They are armed with a tender and flexile proboscis; with which they seize hold of the young shoots of the tree they live upon, twisting the proboscis round it. These creatures are always seen naked and exposed, standing on the outside of the stalks and leaves, and sucking in their juices for nourishment with their proboscis. But there is another species of them, which are alike viviparous, and agree with them in all respects except in their manner of living. These get into the inner substance of the leaves, like the worms called *gallerides*; and feed on the parenchyma, being defended from all injuries by living between the integuments. In this case, the leaves they bury themselves in become scabrous and deformed, and produce a sort of galls: so that Malpighi erred in supposing all the galls of trees to be produced by the animals hatched of the eggs of ichneumon flies; since these animals, which are viviparous, and are of a very different kind from the worms of the ichneumon flies, equally produce them. A female of the species here treated of has been seen to bring forth seven young ones in a day; and thus, from residing alone in the tubercles which she had formed on a leaf, she in a little time becomes the mother of

of a numerous family; each of which raises its own tumour or gall on the leaf, which at first are small and round, and of a beautiful red like kermes.

Such of these as are of the male species have a certain time of rest, in which they lie buried in a silky matter, and afterwards become winged, flying nimbly about; whereas the females never are able to fly, but remain always half-winged. It is to be observed, however, that there is a different species of winged insects frequently found flying about the female pulices, as well as their own males; so that all the small-winged insects about them are not to be thought of their own species. These do not greatly differ in figure; but the one are harmless, and the others have stings, and hurt any part of the body on which they fix.

*PULEX-Eaters*, a name given by naturalists to a sort of worms frequently found on the leaves of trees, where they devour the animals called *pulices arboris*.

Of these there are several species, which owe their origin to the eggs of different creatures; for there are none of them in their ultimate state in this their time of feeding. According to the different animals whose eggs they are hatched from, these are of different form and structure. Some are hexapodes, or endowed with six feet: these belong to the beetle-tribe, and finally change into beetles like the parent-animal from whose eggs they sprung. Others have no legs, and are produced from the eggs of flies of various kinds. And finally, others are genuine caterpillars, though small; but these are the most rare of all.

The two general kinds are the hexapodes, or beetle-worms; and the apodes, or fly-worms. The fly which gives origin to the last of these is a four-winged one, and takes care always to deposit her eggs in a place where there are plenty of the pulices, usually on the stalk or young branches of a tree in the midst of large families of them. The worm, as soon as hatched, finds itself in the midst of abundance of food, preying at pleasure on these animals, which are wholly defenceless. The stalks of the elder and woodbine are frequently found covered over with these pulices; and among them there may usually be found one or more of these destroyers feeding at will, sucking in the juices from their bodies, and then throwing away the dry skins. Besides the worms of this four-winged fly, there is one of a two-winged wasp-fly, very destructive of these animals.

**PULLEY**, in mechanics, one of the five mechanical powers. See *MECHANICS*, n° 51.

**PULMO**, the **LUNGS**, in anatomy. See there, n° 381.

**PULMONARIA**, **LUNGWORT**; a genus of the monogynia order, belonging to the pentandria class of plants. There are several species; of which the most remarkable is the officinalis, common spotted lungwort, or Jerusalem cowslip. This is a native of woods and shady places in Italy and Germany, but has been cultivated in Britain for medicinal use. The leaves are of a green colour, spotted with white; and of a mucilaginous taste, without any smell. They are recommended in phthisis, ulcers of the lungs, &c. but their virtues in these diseases are not warranted by experience.

**PULP**, in pharmacy, the fleshy and succulent parts of fruits extracted by infusion or boiling, and passed

through a sieve.

**PULPIT**, an elevated place in a church, whence sermons are delivered. The French give the same name to a reading-desk.

**PULSE**, in the animal economy, denotes the beating or throbbing of the heart and arteries.

No doctrine has been involved in more difficulties than that of pulses; since, in giving a physiological account of them, physicians have espoused quite opposite sentiments; whilst some doubt whether the pulse is owing to the systole or diastole; as also, whether the motion of the heart and arteries, is one and the same, for a moment of time.

With regard to motion, the pulses are reckoned only four; great and little, quick and slow. When quickness and greatness are joined together, it becomes violent; and when it is little and slow, it is called a *weak pulse*. They are also said to be *frequent and rare, equal and unequal*; but these are not the essential affections of motion. Frequency and quickness are often confounded with each other. A pulse is said to be *hard or soft*, with regard to the artery, according as it is tense, remittent, and hard, or flaccid, soft, and lax: for the disposition of the arteries contributes greatly to the change of the pulse; wherefore it sometimes happens, that the pulse in both arms is not alike, which is very common in a hemiplexy. Add to these a convulsive pulse, which does not proceed from the blood, but from the state of the artery; and is known by a tremulous subfultory motion, and the artery seems to be drawn upwards: this, in acute fevers, is the sign of death; and is said to be the pulse in dying persons, which is likewise generally unequal and intermitting. A *great pulse* shews a more copious afflux of the blood to the heart, and from thence into the arteries; a *little pulse*, the contrary.

The pulses of persons differ according to the largeness of the heart and vessels, the quantity and temperiness of the blood, the elastic force of the canals; as also with regard to the sex, age, season, air, motion, food, sleep, watchings, and passions of the mind. The pulse is larger and more quick in men than in women; in the bilious and sanguineo-bilious, than in the phlegmatic and melancholic. Those who are lean, with tense fibres and large vessels, have a greater and a stronger pulse, than those that are obese, with lax fibres and small vessels; whence they are more healthy, robust, and apt for labour. In children, the pulse is quick and soft; in adults, greater and more violent. In the old, it is commonly great, hard, and slow. Labour, motion, and exercise of the body, increase the circulation of the blood, the excretions, and particularly respiration; rest renders the circulation slow and weak; intense speaking increases the circulation, and consequently renders the pulse large and quick. In watching, the pulse is more evident; in sleep, more slow and languid. After drinking hot things, such as coffee and tea, or hot bath-waters, as well as after meals, the pulse vibrates more quick. But nothing produces a greater change in the pulse than affections of the mind: in terror, it is unequal, small, and contracted; in joy, frequent and great; in anger, quick and hard; in sadness, slow, small, deep, and weak; and in intense study, languid and weak. With regard to the air, when, after the predominancy of a west or

Pulse  
Pumice.

south wind, it becomes north or east, the pulse is stronger and larger; as also when the quicksilver rises in the barometer. But when the atmosphere is dense, humid, rainy, with a long south wind; as also where the life is sedentary, the sleep long, and the season autumnal, the pulse is languid and small, and the perspiration decreased. In May it is great, and sometimes violent; in the middle of summer, quick but weak; in the autumn, slow, soft, and weak; in the winter, hard and great. A draught purge and an emetic render the pulse hard, quick, and weak, with loss of strength; chalybeates, and the bark, render it great and robust, and the complexion lively; volatiles amplify and increase the pulse; acids and nitrous remedies refrigerate the body, and appease the pulse; opiates and the like, render it small and weak, and decrease the elasticity of the solids; and poisons render it small, contracted, and hard. When the quantity of the blood is too great, bleeding raises the pulse:

**PULSE**, is also used for the stroke with which any medium is affected by the motion of light, sound, &c. through it.

Sir Isaac Newton demonstrates, that the velocities of the pulses in an elastic fluid medium (whose elasticity is proportionable to its density) are in a ratio compounded of half the ratio of the elastic force directly, and half the ratio of the density inversely; so that in a medium whose elasticity is equal to its density, all pulses will be equally swift.

**PULSE**, in botany, a term applied to all those grains or seeds which are gathered with the hand; in contradistinction to corn, &c. which are reaped, or mowed: or, It is the seed of the leguminous kind of plants, as beans, vetches, &c. but is by some used for artichokes, asparagus, &c.

**PULVERIZATION**, the art of pulverizing, or reducing a dry body into a fine powder; which is performed in friable bodies, by pounding or beating them in a mortar, &c. but to pulverize malleable ones, other methods must be taken. To pulverize lead, or tin, the method is this: Rub a round wooden box all over the inside, with chalk; pour a little of the melted metal nimbly into the box; when shutting the lid, and shaking the box briskly, the metal will be reduced to powder.

**PUMICE**, in natural history, a slag or cinder of some fossil originally bearing another form, and only reduced to this state by the action of the fire, though generally ranked by authors among the native stones. It is a lax and spongy matter, frequently of an obscure, striated texture in many parts, and always very cavernous and full of holes; it is hard and harsh to the touch, but much lighter than any other body that comes under the class of stones. It is found in masses of different sizes, and of a perfectly irregular shape, from the bigness of a pigeon's egg to that of a bushel. We have it from many parts of the world, but particularly from about the burning mountains *Ætna*, *Vesuvius*, and *Hecla*, by whose eruptions it is thrown up in vast abundance; and being by its lightness supported in the air, is carried into seas at some distance by the winds, and thence to distant shores. The great use of the pumice among the ancients seems to have been as a dentifrice, and at present it is retained in the shops

on the same account.

**PUMP**, an hydraulic machine for raising water by means of the pressure of the atmosphere. See **HYDROSTATICS**, n<sup>o</sup> 23, &c.

**Naval PUMP**, a well-known machine, used to discharge the water from the ship's bottom into the sea.

The common pump is a long wooden tube, whose lower end rests upon the ship's bottom, between the timbers, in an apartment called the *well*, inclosed for this purpose near the middle of the ship's length.

This pump is managed by means of the brake, and the two boxes or pistons. Near the middle of the tube, in the chamber of the pump, is fixed the lower box, which is furnished with a staple, by which it may at any time be hooked and drawn up in order to examine it. To the upper box is fixed a long bar of iron, called the *spear*, whose upper end is fastened to the end of the brake, by means of an iron bolt passing through both. At a small distance from this bolt the brake is confined by another bolt between two cheeks, or ears, fixed perpendicularly on the top of the pump. Thus the brake acts upon the spear as a lever, whose fulcrum is the bolt between the two cheeks, and discharges the water by means of the valves, or clappers, fixed on the upper and lower boxes.

These sorts of pumps, however, are very rarely used in ships of war, unless of the smallest size. The most useful machine of this kind, in large ships, is the chain-pump, which is universally used in the navy. This is no other than a long chain, equipped with a sufficient number of valves, at proper distances, which passes downward through a wooden tube, and returns upward in the same manner on the other side. It is managed by a roller or winch, whereon several men may be employed at once; and thus it discharges, in a limited time, a much greater quantity of water than the common pump, and that with less fatigue and inconvenience to the labourers.

This machine is nevertheless exposed to several disagreeable accidents by the nature of its construction. The chain is of too complicated a fabric, and the proket-wheels employed to wind it up the ship's bottom, are deficient in a very material circumstance, *viz.* some contrivance to prevent the chain from sliding or jerking back upon the surface of the wheel, which frequently happens when the valves are charged with a considerable weight of water, or when the pump is violently worked. The links are evidently too short; and the immechanical manner in which they are connected, exposes them to a great friction in passing round the wheels. Hence they are sometimes apt to break or burst asunder in very dangerous situations, when it is extremely difficult or impracticable to repair the chain.

The consideration of the known inconveniences of the above machine has given rise to the invention of several others which should better answer the purpose. They have been offered to the public one after another with pompous recommendations by their respective projectors, who have never failed to report their effects as considerably superior to that of the chain-pump with which they have been tried. It is, however, much to be lamented, that in these sort of trials

Pump.

there:

Pump.

there is not always a scrupulous attention to what may be called *mechanical justice*. The artist, who wishes to introduce a new piece of mechanism, has generally sufficient address to compare its effects with one of the former machines which is crazy or out of repair. A report of this kind indeed favours strongly of the evidence of a false witness; but this finesse is not always discovered. The persons appointed to superintend the comparative effects of the different pumps, have not always a competent knowledge of hydraulics to detect these artifices, or to remark with precision the defects and advantages of those machines as opposed to each other. Thus the several inventions proposed to supplant the chain-pump have hitherto proved ineffectual, and are now no longer remembered.

Of late, however, some considerable improvements have been made on the naval chain-pump, by Mr Cole, under the direction of Captain Bentinck. The chain of this machine is more simple and mechanical, and much less exposed to damage. It is exactly similar to that of the fire engine; and appears to have been first applied to the pump by Mr Mylne, to exhaust the water from the caissons at Blackfriars bridge. It has thence been transferred to the marine by Captain Bentinck, after having received some material additions to answer that service. The principal superiority of this pump to the former is, 1. That the chain is more simple and more easily worked, and of course less exposed to injuries by friction. 2. That the chain is secured upon the wheel, and thereby prevented from jerking back when charged with a column of water. 3. That it may be easily taken up and repaired when broken or choked with ballast, &c. 4. That it discharges a much greater quantity of water with an inferior number of men.

In Plate CCXLVII. a section of this machine at large is exhibited, as fixed in a frigate of war, fig. 5, wherein *A* is the keel, *V* the floor-timbers, *X* the keelson, *aaa* the several links of the chain, *bb* the valves, *C* the upper wheels, *D* the lower wheels, *c c* the cavities upon the surface of the wheels to receive the valves as they pass round thereon, and *dd* the bolts fixed across the surface of the wheels to fall in the interval between every two links to prevent the chain from sliding back.

The links of the chain, which are no other than two long plates of iron with a hole at each end, and fixed together by two bolts serving as axles are represented on a larger scale, as *aaa*. The valves are two circular plates of iron with a piece of leather between them: these are also exhibited at large by *bb*.

Upon a trial of this machine with the old chain-pump aboard the *Seaford* frigate, it appears, in a report signed by rear-admiral Sir John Moore, 12 captains, and 11 lieutenants of his majesty's navy, that its effects, when compared with the latter, were as follows.

New Pump.			Old Pump.		
Number of Men.	Fons of Water.	Seconds of Time.	Number of Men.	Fons of Water.	Seconds of Time.
4	1	43½	7	1	76
2	1	55	4	1	81

The subscribers further certify, that the chain of

Pump.

the new pump was dropped into the well, and afterwards taken up and repaired and set to work again in two minutes and a half; and that they have seen the lower wheel of the said pump taken up to show how readily it might be cleared and refitted for action after being choked with sand or gravel, which they are of opinion may be performed in four or five minutes.

*Air-PUMP.* See PNEUMATICS, sect. ii.

One of the principal causes of imperfection in the common air-pump, arises from the difficulty of opening the valves at the bottom of the barrels: to avoid which inconvenience, Mr Smeaton has made use of seven holes instead of one; by which means, the valve is supported at proper distances, by a kind of grating, made by the solid parts between these holes: and to render the points of contact, between the bladder and grating, as few as possible, the holes are made hexagonal, and the partitions filed almost to an edge. He has also made the breadth of each hexagon  $\frac{1}{10}$  of an inch, so that its surface is more than nine times greater than common; upon which account, as well as by reason of the greater number of holes, the valve may be raised with a sixth part of the force commonly necessary.

Another imperfection is owing to the piston's not fitting exactly, when put down close to the bottom; which leaves a lodgment for air that is not got out of the barrel, and proves of bad effect by hindering the rarefaction from being carried on beyond a certain degree: for as the piston rises, the air will expand itself; but still pressing upon the valve, according to its density, it hinders the air within the receiver from coming out. Hence, were this vacancy to equal the 150th part of the capacity of the whole barrel, no air could ever come out of the receiver when once expanded 150 times; though the piston were constantly drawn to the top. This inconvenience Mr Smeaton has endeavoured to overcome, by shutting up the top of the barrel with a plate, having in the middle a collar of leathers, thro' which the cylindrical rod works, that carries the piston. By this means the external air is prevented from pressing upon the piston; but that the air which passes through the valve of the piston from below may be discharged out of the barrel, there is also a valve applied to the plate at the top, that opens upwards. The consequence of this construction is, that when the piston is put down to the bottom of the cylinder, the air in the lodgment under the piston will evacuate itself so much the more as the valve of the piston opens more easily, when pressed by the rarified air above it, than when pressed by the whole weight of the atmosphere. Hence, as the piston may be made to fit as nearly to the top of the cylinder as it can to the bottom, the air may be rarified as much above the piston as it could before have been in the receiver. It follows, therefore, that the air may now be rarified in the receiver, in the duplicate proportion of what it could be upon the common principle; every thing else being supposed perfect.

Mr Smeaton has also improved upon the gages commonly used for measuring the expansion of the air; which his gage will do with much certainty, to much less than the 1000th part of the whole. It consists of a bulb of glass, something in the shape of a pear, and sufficient

Fig. 4.

PLATALEA or Spoon-Bill.

Fig. 2.  
FOE-BIRD.

Pump.

Pump.

sufficient to hold about half a pound of quicksilver. It is open at one end, and at the other end is a tube hermetically closed at top. By the help of a nice pair of scales, he found what proportion of weight a column of mercury of a certain length, contained in the tube, bore to that which filled the whole vessel; and, by these means, was enabled to mark divisions upon the tube; answering to the  $\frac{1}{1000}$ th part of the whole capacity; which being about  $\frac{1}{2}$ th of an inch each, may, by estimation, be easily subdivided into lesser parts. This gage, during the exhaulting of the receiver, is suspended therein by a slip-wire; and when the pump is worked as much as shall be thought necessary, the gage is pushed down, till the open end is immersed in a cistern of quicksilver placed underneath: the air being then let in, the quicksilver will be driven into the gage, till the air remaining in it becomes of the same density with the external air; and as the air always takes the highest place, the tube being uppermost, the expansion will be determined by the number of divisions occupied by the air at top.

He has also endeavoured to render the pneumatic apparatus more simple and commodious, by making the air-pump act as a condensing engine at pleasure, by only turning a cock: this renders the pump an universal engine for showing any effect that arises from an alteration in the density or spring of the air; and with a little addition of apparatus, it shows the experiments of the air-fountain, wind-gun, &c. This is done in the following manner: The air above the piston being forcibly driven out of the barrel at each stroke, and having no where to escape but by the valve at top; if this valve be connected with the receiver by means of a pipe, and at the same time the valve at the bottom, instead of communicating with the receiver, be made to communicate with the external air, the pump will then perform as a condenser. The mechanism is thus ordered: There is a cock with three pipes placed round it, at equal distances. The key is to be pierced, that any two may be made to communicate, while the other is left open to the external air. One of these pipes goes to the valve at the bottom of the barrel; another goes to the valve at the top; and a third goes to the receiver. Thus, when the pipe from the receiver, and that from the bottom of the barrel, are united, the pump exhaults: but turn the cock round till the pipe from the receiver and that from the top of the barrel communicate, and it then condenses. The third pipe in one case, discharges the air taken from the receiver into the barrel; and, in the other, lets it into the barrel, that it may be forced into the receiver.

But the following figures will serve to render the structure and use of this excellent machine still more plain. Fig. 1. is a perspective view of the several parts of the pump together. A is the barrel; B the cistern, in which are included the cock, with several joints: these are covered with water, to keep them air-tight. A little cock to set the water out of the cistern, is marked *b*. *Ccc* is the triangular handle of the key of the cock; which, by the marks on its arms, shows how it must be turned, that the pump may produce the effect desired. DH is the pipe of communication between the cock and the receiver; E is the pipe that communicates between the cock and the valve, on the

upper plate of the barrel. F is the upper plate of the pump, which contains the collar of leathers *d*; and V, the valve, which is covered by the piece *f*. GI is the siphon-gage, which screws on and off, and is adapted to common purposes. It consists of a glass tube hermetically sealed at *e*, and furnished with quicksilver in each leg; which, before the pump begins to work, lies level in the line *ab*; the space *bc* being filled with air of the common density. When the pump exhaults, the air in *bc* expands, and the quicksilver in the opposite leg rises till it become a counterbalance to it. Its rise is shown upon the scale *le*, by which the expansion of the air in the receiver may be nearly judged of. When the pump condenses, the quicksilver rises in the other leg, and the degree may be nearly judged of by the contraction of the air in *bc*; marks being placed at  $\frac{1}{2}$  and  $\frac{2}{3}$  of the length of *bc* from *e*, which shows when the receiver condenses double or treble its common quantity. KL is a screw-frame to hold down the receiver in condensing experiments, which takes off at pleasure; and is sufficient to hold down a receiver, the diameter of whose base is 7 inches, when charged with a treble atmosphere: in which case it acts with a force of about 1200 pounds against the screw-frame. M is a screw that fastens a bolt, which slides up and down in that leg, by means whereof the machine is made to stand fast on uneven ground.

Plate  
CCXLVII.

Fig. 1. represents a perpendicular section of the barrel and cock, &c. of the pump; where AB is the barrel, CD the rod of the piston, which passes through MN, the plate that closes the top of the barrel. K is the collar of leathers through which the piston-rod passes. When the piston is at the bottom of the cylinder, the upper part of K is covered by the cap at D, to keep out dust, &c. L is the valve on the upper plate, which is covered by the piece OP, which is connected with the pipe QR, which makes the communication between the valve and cock. CE is the piston, and EFF the piston-valves. II are two little holes to let the air pass from the piston-valves into the upper part of the barrel. GG is the principal valve at the bottom of the cylinder. HH is a piece of metal, into which the valve GG is screwed, and closes the bottom of the cylinder; out of which is also composed SS the cock, and KTT the duct from the cock to the bottom of the barrel. WW is the key of the cock, X the stem, and VV the handle.

Fig. 2. is an horizontal section of the cock, through the middle of the duct TT. AB represents the bigness of the circular plate that closes the bottom of the barrel, and CD the bigness of the inside of the barrel. EFG is the body of the cock; the outward shell being pierced with three holes at equal distances, and corresponding to the three ducts HH, II, KK, whereof HH is the duct that goes to the bottom of the barrel; II, the duct that communicates with the top of the barrel; and KK, the duct that passes from the cock to the receiver. LMN is the key, or solid part of the cock, moveable round in the shell EFG. When the canal LM answers to the ducts HH and KK, the pump exhaults, and the air is discharged by the perforation N. But the key LMN being turned till the canal LM answers to the ducts II and KK, the perforation N will then answer to the duct HH, and in this

Plate  
CCXLIV.

*Pump.* this case the pump condenses. Lastly, when N answers to KK, the air is then left in or discharged from the receiver, as the circumstance requires.

Fig. 3. is the plan of the principal valve; where ABCD represents the bladder fastened in four places, and stretched over the seven holes IK, formed into an hexagonal grating, which Mr Smeaton chooses to call the *honeycomb*. EFGH, shows where the metal is a little protuberant, to hinder the piston from striking against the bladder.

Fig. 4. represents the new gage, called from its shape the *pear-gage*, which is open at A. BC is the graduated tube, which is hermetically closed at C, and is suspended by the piece of brass DE; which is hollowed into a cylinder, and clasps the tube.

In the 67th volume of the philosophical transactions we have an account of a number of experiments made by Mr Nairne with an air-pump constructed after the method recommended by Mr Smeaton; in which several unexpected and for some time unaccountable anomalies were observed. These consisted in certain differences between Mr Smeaton's pear-gage, and the common barometer gage. By the former, a degree of exhaustion would be indicated equal to 4000, 10,000, or perhaps 100,000; while the barometer gage indicated only an exhaustion of 200 or 300, or perhaps much less. The reason of this phenomenon was at last explained by Mr Cavendish in the following manner. "Water, whenever the pressure of the atmosphere on it is diminished to a certain degree, is immediately turned into vapour; and is as immediately turned back again into water, on restoring the pressure. This degree of pressure is different according to the heat of the water: when the heat is 72° of Fahrenheit's scale, it turns into vapour as soon as the pressure is no greater than three quarters of an inch of quicksilver, or one-fortieth part of the usual pressure of the atmosphere; but when the heat is only 41°, the pressure of the atmosphere must be reduced to that of a quarter of an inch before it turns into vapour. Hence it follows, that when the receiver is exhausted to the abovementioned degree, the moisture adhering to the various parts of the machine will turn into vapour, and supply the place of the air which is continually drawn away by the working of the pump; so that the fluid in the pear-gage, as well as that in the receiver, will consist in a good measure of vapour. Now, letting the air into the receiver, all the vapour in the pear-gage will be reduced to water, and only

the real air will remain uncondensed. Consequently the pear-gage shows only how much real air is left in the receiver, and not how much the pressure or spring of the included fluid is diminished; whereas the common gages shew how much the pressure of the included fluid is diminished, and that equally whether it consist of air or vapour."

To put the truth of this theory to the test, Mr Nairne having wiped the receiver and every part of the machine as clean as possible from moisture, excluded the air by a cement put round the outside of the receiver. In these circumstances the pump being worked for 10 minutes, both the barometer and pear-gage indicated very nearly the same degree of exhaustion, viz. 600. He then began to inquire how far different substances, which might occasionally be put into the receiver, would produce this vapour; and the results of his experiments were as follow.

1. A piece of white sheep-skin, of about four inches diameter, soaked in oil and tallow about a year before, being put into the receiver, and the pump worked for 10 minutes, the barometer-gage indicated an exhaustion of about 300, and the pear-gage of 4000. 2. The piece of leather being taken out, and the pump worked as before, both gages stood at 600. 3. A cylindrical piece of boxwood, an inch in diameter, and three inches broad, being put into the receiver, the barometer gage indicated 300, and the pear-gage 16,000. 4. With two ounces of tallow, the barometer gage was 431, the pear-gage 600. 5. With two ounces of oil the numbers were 377 and 480. 6. With two ounces of alum they were 370 and 580. 7. But with a piece of leather, weighing 100 grains, in the same state in which it came from the leather-sellers, the numbers were 152 and 100,000. 8. With the same piece of leather soaked in the tallow and oil which had been already tried, the exhaustions were 432 and 800.

"From these experiments (say our author) it appears, that the elastic vapour which caused so great a difference in the testimony of the gages, arose principally from the leather, and but little from the tallow, oil, or alum: it even appears by the seventh experiment, that it came from the leather, and supplied the place of the exhausted air so fast, that I could not (at least in the 10 minutes) make the barometer gage indicate a degree of exhaustion of more than 159."

"To determine whether it was the moisture in the leather from which the vapour arose, I made the following experiments."

Substances put into the receiver.

	Weight when put into the receiver.	Degrees of exhaustion according to		Variation in weight during the experiments.
		Barom. gage.	Pear-gage.	
Exp. 9. A piece of white leather, fresh from the leather-sellers,	100 grains	134	100,000	lost 2 grains.
Exp. 10. The same piece of leather, dried by the fire till it would lose no more of its weight,	80 grains	268	280	gained 2 grs.
Exp. 11. The same piece of leather held in the steam of hot water till it had regained the 20 grains it had been deprived of,	100 grains	147	100,000	lost 2 grains.

Air PUMP.

Fig. 3.

Fig. 3.

Fig. 2.

Pump.

Pump.

" In this last experiment, it was full three quarters of an hour before the leather regained the 20 grains of weight, although it was held very near the surface of the hot water.

" The same piece of leather used in the 8th experiment was put into a damp cellar, where it was left till the next day; it was then put again into the receiver, and the degree of exhaustion according to the barometer-gage was 300, and according to the pear-

gage 3500.

" Being now perfectly satisfied that the variation in the testimony of the pear and barometer gages was occasioned by the moisture contained in the substances I had put into the receiver assuming the form of vapour, I determined next to try what would be the effect of the vapour which might arise from small quantities of different fluids, and from some other substances containing moisture of various kinds.

Substances put into the receiver.	Weight when put in.	Degree of exhausting according to		Change in weight during the experiment.
		Barom. gage.	Pear-gage.	
Exp. 12. Water in a watch-glass,	3 grains	148	24,000	lost 1½ grain.
Exp. 13. Water in a glass cup, diameter two inches	100 grains	89	8000	lost 2 grains.
Exp. 14. Spirit of wine in the same cup,	100 grains	54	6000	lost 9 grains.
Exp. 15. Vitriolic acid,	100 grains	340	220	gained 1 gr.
Exp. 16. A piece of the inside of a China orange with some of the rind,	100 grains	160	100,000	lost 2½ grs.
Exp. 17. A piece of the inside of an onion,	100 grains	160	100,000	lost 1½ grain.
Exp. 18. A piece of tainted beef,	100 grains	152	100,000	lost 2½ grs.
Exp. 19. A piece of fresh beef,	100 grains	136	100,000	lost 2½ grs.
Exp. 20. Spirit of turpentine,	100 grains	301	1800	lost 2 grains.
Exp. 21. Pearl-ash,	2 ounces	118	5000	
Exp. 22. The same pearl-ash made very hot,		198	420	
Exp. 23. A lighted candle held in the receiver till it went out,		297	1800	
Exp. 24. A piece of charcoal,		129	1800	
Exp. 25. The receiver heated by holding several pieces of lighted charcoal in it, and then the above piece being thoroughly lighted was put into the receiver, and the pump worked,		650	600	
Exp. 26. Camphire,	100 grains	304	520	lost barely ½ a grain.
Exp. 27. Sulphur made to burn on a piece of brass		247	320	

" Observing by these experiments, that the small quantity of moisture which exhaled from the substances under the receiver prevented the pump from exhausting it to any very considerable degree, I began to suspect, that whenever wet leather had been used to connect the receiver with the plate, there must have risen to so great a quantity of vapour as to have prevented the degree of exhaustion from being near so great as in some of the foregoing instances. These suspicions induced me to make the following experiments.

	Degrees of exhaustion according to	
	Barom. gage.	Pear-gage.
Exp. 28. The receiver was taken off, and after the cement was wiped clean from it, and every part made perfectly dry, it was put again on the pump plate, and a little oil only was poured round the outside edge	nearly 600	full 600

	Degrees of exhaustion according to	
	Barom. gage.	Pear-gage.
Exp. 29. The receiver was taken off again; and instead of the oil it was set on a piece of leather, which had been soaked two days in water,	51	16,000
Exp. 30. The last experiment repeated with the same piece of leather,	51	1500
Exp. 31. The last experiment repeated again with the same piece of leather,	51	1000
Exp. 32. The receiver was taken off, and instead of the leather soaked in water, there was put on a piece of the same sort of leather soaked in a mixture of water and spirit of wine, such as Mr Smeaton used,	47	12,000
Exp. 33. The last experiment repeated with the same leather,	47	1150
Exp. 34. The last experiment repeated again with the same leather,	47	500

" The great difference in the testimony of the pear-gage

Pump. gage in these six last experiments appeared to me exceedingly astonishing, for the leathers seemed each of them to be as moist at last as at first.

“ By these experiments I was convinced how effectually the use of leather soaked in water, or in water and spirit of wine, prevents the pump from exhauſting to any conſiderable degree. I have made a number of experiments of the ſame kind as theſe; but have never been able to exhauſt, under ſuch circumſtances, to a greater degree than between 50 and 60, when the heat of the room was about 57° by a thermometer of Fahrenheit's ſcale: but the following experiments will ſhow how much ſome different degrees of heat affect the degree of exhauſtion.

	Height of the Therm.	Degrees of exhauſtion according to	
		Barom. gage.	Pear-gage.
Exp. 35. Receiver ſet on leather which had lain all night in water,	46	84	20,000
Exp. 36. Receiver ſet on a leather ſoaked all night in two parts water and one of ſpirit of wine,			

“ The pump having been put in a room of the heat of 57° of Fahrenheit's ſcale for ſeven hours together, with the leathers put in the ſame water and the ſame ſpirit of wine and water which they had been ſoaked in all night, and which had been uſed in the two laſt experiments, the following experiments were made.

	Height of the Therm.	Degree of exhauſtion according to	
		Barom. gage.	Pear-gage.
Exp. 73. The receiver ſet on the leather ſoaked in water,	57	56	16,000
Exp. 38. Receiver placed on a leather ſoaked in water and ſpirit of wine,			

“ The following table will ſhow the comparative excellency between the pump on Mr Smeaton's principle with which the chief of theſe experiments have been tried, and one of my common double-barreled table air-pumps under the ſame circumſtances. The leather on the piſtons of both was ſoaked in oil and tallow, and the receiver cemented down to each plate; the pumps were both of them freſh oiled.

Pump on Mr Smeaton's principle. Common pump.

Degrees of exhauſtion according to

Barom. gage.	Pear-gage.	Barom. gage.	Pear-gage.
--------------	------------	--------------	------------

Exp. 39. A piece of leather, weighing 100 grains, as it came from the leather-fellers, was put into the receiver of each pump, both pieces being cut from the ſame ſkin cloſe by each other,	152	100,000	108	12,000
Exp. 40. The ſame pieces of leather dried by the fire till they would loſe no more of their weight,				
	506	520	160	165

“ The following experiments will ſhow the effect of water uſed in the barrels of pumps to make the piſtons move air-tight in them.

“ I took the ſame common air-pump uſed in the laſt experiment, and having taken off the leathers ſoaked in oil and tallow from the piſtons of this pump, and wiped the barrels as clean as poſſible, I then put new leathers which had been ſoaked in water, and new bladder valves; the receiver was then cemented to the pump-plate as before.

	Degrees of exhauſtion according to	
	Barom. gage.	Pear-gage.
Exp. 41. The pump was then worked as uſual,	37	38
Exp. 42. The laſt experiment repeated with another common pump, the leathers of the piſtons of which were alſo ſoaked in water,		
	34	37

“ From theſe experiments it evidently appears, that the air-pump of Otto Guericke, and thoſe contrived by Mr Gratorix and Dr Hooke, and the improved one by Mr Pappin, both uſed by Mr Boyle, alſo Haukbee's, S'Gravande's, Muſchenbrook's, and thoſe of all who have uſed water in the barrels of their pumps, could never have exhauſted to more than between 40 and 50, if the heat of the place was about 57; and although Mr Smeaton, with his pump, where no water was in the barrel, but where leather ſoaked in a mixture of water and ſpirit of wine was uſed to ſet the receiver on the pump-plate, may have exhauſted all

Pump.

all but a thousandth or even a ten-thousandth part of the common air, according to the testimony of his pear-gage; yet so much vapour must have arisen from the wet leather, that the contents of the receiver could never be less than a 70th or 80th part of the density of the atmosphere. Nevertheless, it does not seem that any deficiency in the construction of Mr Smeaton's pump was the cause of his not being able to exhaust beyond the low degrees of 70 or 80. Had he been aware of the bad effects of setting the receiver upon leather soaked in water and spirit of wine, and had he made use of the precaution to free all parts of his pump as much as possible from moisture, I make not the least doubt but the air-pump which he executed himself would have exhausted to as great a degree, as that pump has been seen to have done with which the chief of these experiments were made.

“ Having read the principal part of this paper to Mr Smeaton, and shown him some of the experiments; one, in particular, where the pear-gage, as he observed himself, was filled to no less than 100,000th part of the whole content; he remarked from memory, that he had in several trials exceeded 1000 times, and once, as he remembered, near or about 10,000 times; but as he never could account how this happened, which appeared to him perfectly accidental, and therefore could not depend upon doing it at pleasure, he contented himself with putting down 1000 times, as being what (under the circumstances mentioned in his papers) he had a tolerable certainty of.

“ I must here again observe, that if we only wish to know the quantity of permanent air remaining in the receiver after it is as much exhausted as possible, it seems that it is by Mr Smeaton's gage only that we can know it. Again, when, by the assistance of his gage and the barometer-gage together, we have discovered that there is a vapour which arises and occupies the place of the permanent air which is exhausted, it seems that it is by the means of his gage only that we can discover what part of the remaining contents of the receiver consists of this vapour, and what part of permanent air.”

In some other experiments the case was surprisingly reversed; for the pear-gage indicated a less degree of exhaustion than the barometer. This happened particularly when the vitriolic acid was put into the receiver. When 100 grains of this acid were put into the receiver in a glass cup of two inches diameter, the acid gained one grain in weight, the barometer gage indicated an exhaustion of 602, and the pear-gage only of 380. The same experiment being repeated in the same cup, and with the acid which had already gained one grain, the barometer indicated an exhaustion of 502, the pear-gage only of 350, and the acid gained half a grain more. On a third trial with the same materials, the acid gained a quarter of a grain, the barometer indicated an exhaustion of 502, and the pear-gage of 340. Neither was this circumstance entirely removed by taking away the vitriolic acid; for even when this was done, and the receiver and plate of the pump wiped as clean as possible, the barometer gage indicated an exhaustion of 502, and the pear-gage only of 370.

On this experiment Mr Nairne has the following remarks. “ I know of no circumstance attending

Pump.

this experiment that differed from those in which my former experiments were made when the gages agreed so nearly, unless it was that of the weather: I recollect that it was then very damp, and now it had been very dry for some time. How this circumstance could make so great an alteration in the result of these experiments, I cannot pretend to say.” The true reason, however, seems to be this. Air, though it will expand itself to a great degree, yet has a certain limit to its expansion; that is, if we suppose any quantity of air to be included in a vessel, and the capacity of that vessel to be increased indefinitely, we must at last arrive at a certain bulk, when the gravity of the aerial particles would overcome their repulsive power, and the air would expand no farther though the vessel should be enlarged ever so much. If this is the case, it must follow, that when we come near to this limit, the resistance of the air will be less in proportion than at a considerable distance from it. Thus, let us suppose the resistance of air in its natural state to be 100, and the utmost limit of expansion also to be 100: we cannot imagine, that, at the expansion of 100, the resistance would be 1; for air can only resist by the difference between the gravity and repulsive power of its particles. As, therefore, at the expansion of 100 the gravitating and repulsive powers of the aerial particles exactly balance each other, the resistance could be nothing. In like manner, at the expansion 98, the difference between the powers above-mentioned being only  $\frac{2}{100}$ , the resistance could be no more than 1.02, instead of 2 which it ought to be if the air's expansion was unlimited. By the same method we shall find, that when the expansion is only 10, the resistance is 90; but this is greater than the other proportion, for according to it the resistance should only have been 88. Hence we may see, that in great degrees of exhaustion, when the spring of the air is much weakened, the instrument which measures the resistance in the expanded state must always indicate a greater degree of exhaustion, or a smaller degree of resistance, than that which measures the resistance of the small quantity of air which remains in the receiver after it has been again condensed.

Hence we see, that, in all cases where the air is very pure, the pear-gage will indicate a smaller degree of exhaustion than the barometer; but where there is a quantity of water mixed with it, it may show an equal, or much greater degree of exhaustion than the other. This seems to have been the reason of the difference between Mr Nairne's experiments when the air was moist, and when it was dry. For air always contains some quantity of water, part of which is deposited on the receiver and plate of the pump when the elasticity of the air begins to be weakened. When this water is again changed into vapour in consequence of a greater degree of exhaustion, it affects the barometer but not the pear-gage. and thus the degrees of exhaustion indicated by both may be equal, as was the case with Mr Nairne's experiment in damp weather, when the quantity of water in the air was considerable; but in dry weather, when the quantity of water was less, or rather when the air was less readily disposed to part with it, the pear-gage indicated a smaller degree of exhaustion than the barometer. The same thing necessarily happened when vitriolic

Pun  
||  
Puncheon.

triotic acid was put into the receiver; for thus the air was deprived of that quantity of water which it was most readily disposed to part with, and thus the difference became very remarkable.

To the same cause, viz. the extrication of some quantity of elastic vapour, are we to ascribe that other phenomenon likewise taken notice of by Mr Nairne, viz. that when he had worked the pump for some minutes, it would indicate a pretty perfect degree of exhaustion, which would afterwards become considerably less by working it farther. But for a full account of the generation of vapours in the vacuum of an air-pump, see the articles *EVAPORATION*, *VACUUM*, and *VAPOUR*.

**PUN**, or **PUNN**, a conceit arising from the use of two words that agree in sound but differ in sense. Aristotle describes two or three kinds of puns among the beauties of good writing, and produces instances of them out of some of the greatest authors in the Greek tongue. Cicero has sprinkled several of his works with puns; and, in that work where he lays down the rules of Oratory, quotes abundance of sayings, which he calls *pieces of wit*, that upon examination prove perfect puns.

**PUNCH**, an instrument of iron or steel, used in several arts, for the piercing or stamping holes in plates of metal, &c. being so contrived as not only to perforate, but to cut out and take away the piece. The punch is a principal instrument of the metal-button makers, shoe-makers, &c.

**PUNCH**, is also a name for a sort of compound drink, much used here, and in many parts abroad, particularly in Jamaica and several other parts of the West Indies.

Its basis is spring-water; which being rendered cooler, brisker, and more acid, with lemon or lime juice, and sweetened again to the palate with fine sugar, makes what they call *sberbet*; to which a proper quantity of spirituous liquor, as brandy, rum, or arrack, being added, the liquor commences punch.

**PUNCHEON**, **PUNCHIN**, or *Punchion*, a little block or piece of steel, on one end whereof is some figure, letter, or mark, engraven either in creux or relief, impressions whereof are taken on metal, or some other matter, by striking it with a hammer on the end not engraved. There are various kinds of these puncheons used in the mechanical arts; such, for instance, are those of the goldsmiths, cutlers, pewterers, &c.

The puncheon, in coining, is a piece of iron steeled, whereon the engraver has cut in relief the several figures, arms, effigy, inscription, &c. that there are to be in the matrices, wherewith the species are to be marked. Minters distinguish three kinds of puncheons, according to the three kinds of matrices to be made; that of the effigy, that of the cross or arms, and that of the legend or inscription. The first incudes the whole portrait in relief: the second are small, each only containing a piece of the cross or arms; for instance, a fleur-de-lis, an harp, a coronet, &c. by the assemblage of all which the entire matrix is formed. The puncheons of the legend only contain each one letter, and serve equally for the legend on the effigy side and the cross side. See the article *COINING*.

For the puncheons used in stamping the matrices wherein the types of printing characters are cast, see *Letter-Foundery*.

Puncheon  
Punctua-  
tion.

**PUNCHEON** is also used for several iron-tools, of various sizes and figures, used by the engravers in creux on metals. Seal-gravers particularly use a great number for the several pieces of arms, &c. to be engraven, and many stamp the whole seal from a single puncheon.

**PUNCHEON**, is also a common name for all those iron instruments used by stone-cutters, sculptors, blacksmiths, &c. for the cutting, inciding, or piercing their several matters.

Those of sculptors and statuaries serve for the repairing of statues when taken out of the moulds. The locksmiths use the greatest variety of puncheons; some for piercing hot, others for piercing cold; some flat, some square, some rounds, others oval, each to pierce holes of its respective figure in the several parts of locks.

**PUNCHEON**, in carpentry, is a piece of timber placed upright between two posts, whose bearing is too great, serving, together with them, to sustain some large weights.

This term is also used for a piece of timber raised upright, under the ridge of a building, wherein the little forces, &c. are jointed.

**PUNCTUATION**, in grammar, the art of pointing, or of dividing a discourse into periods, by points expressing the pauses to be made thereof.

The points used herein are four, viz. the period, colon, semi-colon, and comma. See the particular use of each under its proper article, *COMMA*, *COLON*, *PERIOD*, and *SEMI-COLON*.

In the general, we shall only here observe, that the comma is to distinguish nouns from nouns, verbs from verbs, and such other parts of a period as are not necessarily joined together.—The semi-colon serves to suspend and sustain the period when too long:—the colon, to add some new, supernumerary reason, or consequence, to what is already said:—and the period, to close the sense and construction, and release the voice.

Punctuation is a modern art. The ancients were entirely unacquainted with the use of our commas, colons, &c. and wrote not only without any distinction of members and periods, but also without distinction of words: which custom, Lipsius observes, continued till the hundred and fourth olympiad; during which time the sense alone divided the discourse.

What within our own knowledge at this day puts this beyond dispute, is the Alexandrian manuscript, which is at present in the king's library at the British Museum. Whoever examines this, will find, that the whole is written *continuo ductu*, without distinction of words, or sentences. How the ancients read their works written in this manner, is not easy to conceive.

After the practice of joining words together ceased, notes of distinction were placed at the end of every word. In all the editions of the *Fastii Capitolini* these points occur. The same are to be seen on the *Columna Rostrata*. For want of these, we find such confusion in the *Chronicon Marcomarum*, and the covenant between the Smyræans and Magnesiens, which are both now at Oxford. Salmasius's edition of *Dedicatio statue*

*statue rigille Herodis*, the like confusion occurs, where we find *ΔΕΤΡΠΤΕ* and *ΔΥΡ ΠΤΕ*.

Of these marks of distinction, the Walcote inscription found near Bath may serve for a specimen.

IVLIUS VITALIS V FABRI  
CESIS V LEG V XXV V V V  
STIPENDIORUM V &c.

After every word here, except at the end of a line, we see this mark V. There is an inscription in Mount-faucon, which has a capital letter laid in an horizontal position, by way of interstitial mark, which makes one apt to think that this way of pointing was sometimes according to the fancy of the graver.

P. FERRARIUS HERMES  
CAECINIAE ↗ DIGNAE  
CONIVGI ↗ KARRISSIMAE  
NVMERIAE ↗ &c.

Here we observe after the words a T laid horizontally, but not after each word, which proves this to be of a much later age than the former.

Having now considered that the present usage of fops was unknown to the ancients, we proceed to assign the time in which this useful improvement of language began.

As it appears not to have taken place while manuscripts and monumental inscriptions were the only known methods to convey knowledge, we must conclude that it was introduced with the art of printing. The 14th century, to which we are indebted for this mystery, did not, however, bestow those appendages we call *steps*: whoever will be at the pains to examine the first printed books, will discover no fops of any kind; but arbitrary marks here and there, according to the humour of the printer. In the 15th century, we observe their first appearance. We find, from the books of this age, they were not all produced at the same time; those we meet with there in use, being only the comma, the parenthesis, the interrogation, and the full point. To prove this, we need but look into Bale's Acts of English Votaries, black-letter, printed 1550. Indeed, in the dedication of this book, which is to Edward VI. we discover a colon: but, as this is the only one of the kind throughout the work, it is plain this stop was not established at this time, and so warily put in by the printer; or if it was, that it was not in common use. Thirty years after this time, in that sensible and judicious performance of Sir Thomas Elyot, entitled *The Governour*, imprinted 1580, we see the colon as frequently introduced as any other stop; but the semi-colon and the admiration were still wanting, neither of these being visible in this book. In Hackluyt's voyages, printed 1599, we see the first instance of a semi-colon: and, as if the editors did not fully apprehend the propriety of its general admission, it is but sparingly introduced. The admiration was the last stop that was invented; and seems to have been added to the rest in a period not so far distant from our own time.

Thus we see, that these notes of distinction came into use, as learning was gradually advanced and improved, one invention indeed; but enlarged by several additions.

**PUNCTUM SALIENS**, in anatomy, the first rudiments of the heart in the formation of the fœtus, where a throbbing motion is perceived. This is said to be

easily observed with a microscope in a brood-egg, wherein, after conception, we see a little speck or cloud, in the middle whereof is a spot that appears to beat or leap a considerable time before the fœtus is formed for hatching. See the article **FŒTUS**.

**PUNCTURE**, in surgery, any wound made by a sharp-pointed instrument.

**PUNCTURE**, in farrery. See there, § xl.

**PUNICA**, the POMEGRANATE TREE; a genus of the monogynia order, belonging to the icofandria class of plants.

*Species.* 1. The granatum, or common pomegranate, rises with a tree stem branching numerously all the way from the bottom, growing 18 or 20 feet high; with spear-shaped, narrow opposite leaves; and the branches terminated by most beautiful large red flowers, succeeded by large roundish fruit, as big as an orange, having a hard rind filled with soft pulp and numerous seeds. There is a variety with double flowers, remarkably beautiful; and one with striped flowers. 2. The nana, or dwarf American pomegranate, rises with a shrubby stem branching four or five feet high, with narrow short leaves and small red flowers, succeeded by small fruit; begins flowering in June, and continues till October.

*Culture.* Both these species are propagated by layers: the young branches are to be chosen for this purpose, and autumn is the proper time for laying them. Those of the common sort may be trained either as half or full standards or as dwarfs. But those designed for walls must be managed, as directed for peaches.

*Uses.* The dried flowers of the double-flowered pomegranate are possessed of an astringent quality; for which reason they are recommended in diarrhœas, dysenteries, &c. where astringent medicines are proper. The rind of the fruit is also a strong astringent, and as such is occasionally made use of.

**PUNISHMENT**, in law, the penalty which a person incurs on the commission of a crime. See the article **CRIME** and *Punishment*.

**PUPIL**, in the civil law, a boy or girl not yet arrived at the age of puberty; *i. e.* the boy under 14 years, the girl under 12.

**PUPIL** is also used in universities, &c. for a youth under the education or discipline of any person.

**PUPIL**, in anatomy, a little aperture in the middle of the uvea and iris of the eye, thro' which the rays of light pass to the crystalline, in order to be painted on the retina, and cause vision. See **ANAT.** n<sup>o</sup> 406, m.

**PURCELL** (Henry), a justly celebrated master of music, began early to distinguish himself. As his genius was original, it wanted but little forming, and he rose to the height of his profession with more ease than others pass through their rudiments. He was made organist to Westminster abbey in the latter end of the reign of Charles II. In that of William, he set several songs for Dryden's *Amphytrion*, and his *King Arthur*, which were received with just applause. His notes in his operas were admirably adapted to his words, and so echoed to the sense, that the sounds alone seemed capable of exciting those passions which they never failed to do in conjunction. His music was very different from the Italian. It was entirely English, and perfectly masculine. His principal

Purchas  
Purgation.

pal works have been published under the title of *Orpheus Britannicus*. He died in 1695, in the 37th year of his age; and was interred in Westminster abbey, where a monument is erected to his memory.

PURCHAS (Samuel), an English divine, famous for compiling a valuable collection of voyages, was born in 1577, at Thackfield in Essex. After studying at Cambridge, he obtained the vicarage of Eastwood in his native country; but leaving that cure to his brother, he settled in London, in order to carry on the great work in which he was engaged. He published the first volume in folio in 1613, and the four last, 12 years after, under the title of *Purchas his Pilgrimage, or Relations of the world, and the Religions observed in all ages and places*. Mean while he was collated to the rectory of St Martin's, Ludgate, in London, and made chaplain to Dr Abbot, archbishop of Canterbury. His *Pilgrimage*, and the learned Hackluyt's *Voyages*, led the way to all the other collections of that kind, and have been justly valued and esteemed. But unhappily by his publishing, he involved himself in debt: however, he did not die in prison, as some have asserted; but at his own house, about the year 1628.

PURCHASE, in law, the buying or acquiring of lands, &c. with money, by deed or agreement, and not by descent or right of inheritance.

PURCHASE, in the sea-language, is the same as *draw in*: thus, when they say, the captain purchases a-pace, they only mean, it draws in the cable a-pace.

PURE, something free from any admixture of foreign or heterogeneous matters.

PURFLEW, a term in heraldry, expressing ermins, peans, or any of the furs, when they compose a bordure round a coat of arms: thus they say, he beareth gulcs a bordure, purflew, vary; meaning, that the bordure is vary.

PURGATION, the art of purging, scouring, or purifying a thing, by separating, or carrying off any impurities found therein. Thus,

In pharmacy, purgation is the cleansing of a medicine by retrenching its superfluities. In chemistry, it is used for the several preparations of metals and minerals intended to clear them of their impurities, more usually called *purification* and *refining*. See REFINING.

In medicine, purgation is an excretory motion arising from a quick and orderly contraction of the fleshy fibres of the stomach and intestines, whereby the chyle, corrupted humours, and excrements lodged therein, are protruded further and further, and at length quite excluded the body by stool. See CATMARTICS.

For the menitral purgation of women, see MENSES.

PURGATION, in law, signifies the clearing a person's self of a crime of which he is suspected and accused before a judge. This purgation is either canonical or vulgar. Canonical purgation is prescribed by the canon-law, and the form thereof in the spiritual court is usually thus: The person suspected takes his oath that he is innocent of the crime charged against him; and at the same time brings some of his neighbours to make oath that they believe he swears truly. Vulgar purgation was anciently by fire or water, or else by combat, and was practised here till abolished by our canons. See BATTLE in law, ORDEAL, &c.

PURGATIVE or PURGING Medicines; medicinalments which evacuate the impurities of the body by stool, called also *cathartics*.

PURGATORY, a place in which the just, who depart out of this life, are supposed to expiate certain offences which do not merit eternal damnation.

Broughton has endeavoured to prove, that this notion has been held by Pagans, Jews, and Mahometans, as well as by Christians.

The doctrine of purgatory is a very lucrative article to the clergy of the Romish church, who are very liberally paid for masses and prayers for the souls of the deceased. We are told by some of their doctors, that purgatory is a subterraneous place, situated over the hell of the damned, where such souls as have not yet made satisfaction to Divine justice for their sins, are purged by fire, after a wonderful and incomprehensible manner: and here they are purified from those dregs which hinder them from entering into their eternal country, as the catechism of the council of Trent expresses it.

PURIFICATION, in matters of religion, a ceremony which consists in cleansing any thing from a supposed pollution or defilement.

The Pagans, before they sacrificed, usually bathed or washed themselves in water; and they were particularly careful to wash their hands, because with these they were to touch the victims consecrated to the gods. It was also customary to wash the vessel with which they made their libations. The Mahometans use purifications as previous to the duty of prayer; these also are of two kinds, either bathing, or only washing the face, hands, and feet. The first is required only in extraordinary cases, as after having lain with a woman, touched a dead body, &c. But less necessary a preparation for their devotions should be omitted, either where water cannot be had, or when it may be of prejudice to a person's health, they are allowed in such cases to make use of fine sand, or dust instead of it; and then they perform this duty by clapping their open hands on the sand, and passing them over the parts, in the same manner as if they were dipped in water.

There were also many legal purifications among the Hebrews. When a woman was brought to bed of a male child, she was esteemed impure for 40 days; and when of a female, for 60: at the end of which time she carried a lamb to the door of the temple to be offered for a burnt-offering, and a young pigeon or turtle for a sin-offering; and by this ceremony she was cleansed or purified.

PURIM, or *The Feast of Lots*, a solemn festival of the Jews, instituted in memory of the deliverance they received, by means of Mordecai and Esther, from Haman's wicked attempt to destroy them.

PURITAN, a name formerly given in derision to the dissenters from the church of England, on account of their professing to follow the pure word of God, in opposition to all traditions and human constitutions.

PURLINS, in building, those pieces of timber that lie across the rafters on the inside, to keep them from sinking in the middle of their length.

By the act of parliament for rebuilding of London, it is provided, that all purlins from 15 feet 6 inches, to 18 feet 6 inches long, be in their square 9 inches

and

Purloe  
||  
Pus.

and 8 inches; and all in length from 18 feet 6 inches, to 21 feet 6 inches, be in their square 12 inches and 9 inches.

**PURLIUE**, signifies all that ground near any forest, which being made forest by king Henry II. Richard I. and king John, was afterwards by perambulations and grants of Henry III. fevered again from the fame, and made purloe; that is to say, pure and free from the laws of the forest.—The word is derived from the French *pur* “pure,” and *lieu* “place.”

**PURITY**, the freedom of any thing from foreign admixture.

**PURITY of Style.** See **ORATORY**, n° 41.

**PURPLE**, a colour composed of a mixture of red and blue. See **COLOUR-Making**, n° 28. and **DYEING**, n° 12.

**PURPURA**, in natural history. See **MUREX**.

**PURPURE**, in heraldry. The colour so called, which signifies *purple*, is in engraving represented by diagonal lines from the left to the right. See **HERALDRY**, p. 3584, and Plate CXLIV. fig. ii. n° 6.

It may serve to denote an administrator of justice, a lawgiver, or a governor equal to a sovereign; and, according to G. Leigh, if it is compounded with

Or,	} signifies	Riches.
Arg.		Quietness.
Gul.		Politics.
Az.		Fidelity.
Ver.		Cruelty.
Sab.		Sadness.

**PURSER**, an officer aboard a man of war, who receives her victuals from the victualler, sees that it be well stowed, and keeps an account of what he every day delivers to the steward. He also keeps a list of the ship's company, and sets down exactly the day of each man's admission, in order to regulate the quantity of provisions to be delivered out, and that the paymaster or treasurer of the navy may issue out the deburements, and pay off the men, according to his book.

**PURSLAIN**, in botany. See **PORTULACA**.

**PURVIEW**, a term used by some lawyers for the body of an act of parliament, or that part which begins with “Be it enacted, &c.” as contradistinguished from the preamble.

**PURULENT**, in medicine, something mixed with, or partaking of, pus or matter.

**PUS**, in medicine, a white or yellowish matter, denominated by nature for the healing and cementing of wounds and sores.

The origin and formation of pus is as much unknown as that of any other animal fluid. In an inaugural dissertation published at Edinburgh by Dr HENDY, the author supposes pus to be a secreted fluid. It has been thought by many, that pus is either a sediment from serum when beginning to putrify, or that it is the same fluid inspissated by the heat of the body. But both these opinions are refuted by some experiments of our author, which show, that pus is much less inclined to putrefaction than serum, and the putrefaction of both is hastened by an addition of some of the red part of the blood. Some other experiments were made in order to try whether pus could be artificially produced. A thin piece of lamb's flesh,

applied to an ulcer discharging laudable pus, and covered over with lead, did not assume the appearance of pus, but became fetid, and was much lessened. Serum, in its inflammatory and in its ordinary state, and lymph in different states, were applied to the fame ulcer, which still discharged good pus: but none of these were converted into pus; on the contrary, they became very putrid.

In opposition to these arguments of our author, however, it may be alleged, that if pus was a secreted fluid, the vessels by which it was secreted would certainly be visible: but no such thing has ever been observed; on the contrary, it is certain that pus cannot be formed unless the air is excluded from the wound. These disputes, however, are of no great consequence; but in some cases it becomes a matter of real importance to distinguish pus from mucus; as thus we may be enabled to know whether a cough is consumptive, or merely catarrhus. A premium was proposed for this some years ago at Edinburgh, and was gained by Mr Charles Darwin, who showed by a number of experiments, that pus may be distinguished from mucus by means of the vitriolic acid and caustic fixed alkali. See the article **MUCUS**.

**PUSTULE**, a pimple, or small eruption on the skin full of pus; such as the eruptions of the small-pox.

**PUTAMINEÆ**, (from *putamen*, “a shell,”) the name of the 25th order of Linnæus's fragments of a natural method; consisting of a few genera of plants allied in habit, whose fleshy seed-vessels or fruit is frequently covered with a hard woody shell. See **BOTANY**, p. 1309.

**PUTEOLI**, (Livy, Strabo:) a town of Campania; so called either from its wells, there being many hot and cold springs thereabouts; or from its stench, *putor*, caused by sulphureous exhalations, (Varro, Strabo): Anciently called *Dicaearchia*, from its equal and just government.—The port of Cumæ, a place of great trade, probably built by the Cumæans; situated on the brow of a hill. (*id.*) A Roman colony, (Livy); furnished *Augusta*, under Nero, (Frontinus). *Puteolani*, the people, (Cicero). Now *Pozzuoli*, nine miles to the west of Naples. E. Long. 14. 40. N. Lat. 41. 15.

**PUTORIUS**, in zoology. See **MUSTELA**.

**PUTREFACTION**, one of the natural processes, directly opposite to the life of animals and vegetables, by which organized bodies are dissolved, and reduced to what may be called their *original elements*.

Putrefaction differs from chemical solution; because, in the latter, the dissolved bodies are kept in their state of solution by being combined with a certain agent from which they cannot easily be separated; but in putrefaction, the agent which dissolves the body appears not to combine with it in any manner of way, but merely to separate the parts from each other.—It differs also from the resolution of bodies by distillation with violent fire; because, in distillation new and permanent compounds are formed, but by putrefaction every thing seems to be resolved into substances much more simple and indelible than those which are the result of any chemical process.

The bodies most liable to putrefaction are those of animals and vegetables, especially when full of juices.

Putfule  
||  
Putrefac-  
tion.

Putrefac-  
tion.

Stones, though by the action of the weather they will moulder into dust, yet seem not to be subject to any thing like a real putrefaction, as they are not resolved into any other substance than sand, or small dust, which still preserves its lapideous nature. In like manner, vegetables of any kind, when deprived of their juices by drying, may be preserved for many ages without being subjected to any thing like a putrefactive process. The same holds good with respect to animals, the parts of which, by simple drying, may be preserved in a sound state for a much longer time than they could be without the previous exhalation of their juices.

Putrefaction is generally allowed to be a kind of fermentation, or rather to be the last stage of that process; which, beginning with the vinous fermentation, goes on through the acetous, to the stage of putridity, where it stops. It is argued, however, and seemingly not without a great deal of reason, that if putrefaction is a fermentation, it must necessarily be a kind distinct from either the vinous or acetous; since we frequently observe that it takes place where neither the vinous nor the acetous stages have gone before; of consequence it must be, in some cases at least, entirely independent of and unconnected with them. In several other respects it differs so much from these processes, that it seems in some degree doubtful whether it can with propriety be called a *fermentation* or not. Both the vinous and acetous fermentations are attended with a considerable degree of heat: but in the putrefaction of animal matters especially, the heat is for the most part so small, that we cannot be certain whether there is any degree of it or not produced by the process. In cases, indeed, where the quantity of corrupting animal matter is very great, some heat may be perceived; and accordingly Dr Monro tells us, that he was sensible of heat on thrusting his hand into the flesh of a dead and corrupting whale. But the most remarkable difference between the putrefactive fermentation and that of the vinous and acetous kinds is, that the end of both these processes is to produce a new and permanent compound; but that of the putrefactive process is not to produce any new form, but to destroy, and resolve one which already exists into the original principles from which all things seem to proceed. Thus, the vinous fermentation produces ardent spirits; the acetous, vinegar; but putrefaction produces nothing but earth, and some effluvia, which, tho' most disagreeable and even poisonous to the human body, yet, being imbibed by the earth and vegetable creation, give life to a new race of beings. It is commonly supposed, indeed, that volatile alkali is a production of the putrefactive process: but this seems liable to dispute. The vapour of pure volatile alkali is not hurtful to the human frame, but that of putrefying substances is exceedingly so; and, excepting in the case of urine, the generation of volatile alkali in putrid substances is very equivocal. This substance, which produces more alkali than any other, is much less offensive by its putrid fetor than others; and all animal substances produce a volatile alkali on being exposed to the action of fire, of quicklime, or of alkaline salts. In these cases the volatile alkali is not supposed to be produced by the quicklime or fixed salt, but only to be extricated from a kind of ammoniacal salt pre-existing in the animal matters; the probability is the same in the other case, *viz.* that volatile alkali is not produced, but only extricated from these substances by putrefaction.

Putrefac-  
tion.

The only thing in which the putrefactive fermentation agrees with the other kinds is, that in all the three there is an extrication of fixed air. In the putrefactive process, it has been thought that this escape of the fixed air deprives the body of its cohesion; and Dr Macbride has wrote a treatise in which he endeavours to prove, that fixed air is the very power of cohesion itself, and that all bodies when deprived of their fixed air entirely lose their cohesion. According to this, the cause of putrefaction is the escape of fixed air: but it is impossible to give a reason why fixed air, after having so long remained in a body, and preserved its cohesion, should of a sudden begin to fly off without being acted upon by something else. To a similar objection the hypothesis of those is liable, who suppose putrefaction to be occasioned by the escape of phlogiston; for phlogiston will not fly off without something to carry it off, any more than fixed air. Animalcules have been thought to be the cause of putrefaction: but if animal substance are covered so as to exclude the access of flies or other insects, no such animalcules are to be discovered tho' putrefaction has taken place; and indeed it requires little proof to convince us, that animals are produced in corrupted bodies only because such substances prove a proper nidus for the eggs of the parent insects.

To understand the true cause of putrefaction, we must take notice of the circumstances in which the process goes on most rapidly. These are, heat, a little moisture, and confined air. Extreme cold prevents putrefaction, as well as perfect dryness; and a free circulation of air carries off the putrid effluvia, a stagnation of which seems to be necessary for carrying on the process. It seems also to hold pretty generally, that putrefying bodies swell and become specifically lighter; for which reason the carcases of dead animals, after having sunk in water, rise to the top and float. This last phenomenon, as has been observed under the article BLOOD, n<sup>o</sup> 29. shows that these bodies have received a certain quantity of an elastic principle from the air, which thus swells them up to a such a size. It may be said indeed, that this increase of size in putrefying bodies is owing only to the extrication of air within themselves: but this amounts to the same thing; for the air which exists internally in the body of any animal, is entirely divested of elasticity while it remains there, and only shows its elastic properties upon being extricated. The elastic principle which combines with the air fixed in the animal substance, therefore, must come from the external atmosphere; and consequently the agent in putrefaction must be the elastic principle of the atmosphere itself, probably the same with elementary fire.

But, granting this to be true, it is difficult to show why putrefaction should not take place in a living body as well as in a dead one; seeing the one is as much exposed to the action of the air as the other. This difficulty, however, is not peculiar to the present hypothesis; but will equally occur whatever we may suppose the cause of putrefaction to be. The difficulty seems to be a little cleared up by Dr Priestley, who shows, that, by means of respiration, the body is freed from many noxious effluvia which would undoubtedly destroy it, and by the retention of which, he thinks, a living body would putrefy as soon as a dead one. The way in which respiration prevents the putrefaction

Putrefac-  
tion.

of the body, is evidently the same with that in which the wind prevents fish or flesh hung up in it from becoming putrid. The constant inspiration of the air is like a stream of that element continually blown upon the body, and that not only upon its surface, but into it, by which means putrefaction is prevented in those parts that are most liable to become putrid. On the other hand, the elastic principle received from the air

\* See Blood,  
no 29.

by the blood\*, by invigorating the powers of life, quickening the circulation, and increasing perspiration, enables the body to expell noxious particles from other parts of the body which cannot conveniently be expelled by the lungs. This leads us to consider the reason why a free exposure to the air prevents the coming on of putrefaction, or why the confining of the putrid effluvia should be so necessary to this process. Here it will be proper to recollect, that putrefaction is a simple resolution of the body into earth, air, &c. of which it seems originally to have been composed. This resolution is evidently performed by an expansive power seemingly situated in every particle of the body. In consequence of this principle, the body first swells, then bursts, flies off in vapour, and its particles fall asunder from each other. The action of the putrefactive process, then, is analogous to that of fire, since these are the very properties of fire, and the very effects which follow the action of fire upon any combustible body. It is therefore exceedingly probable, that the agent in the air which we have all along considered as the cause of putrefaction is no other than fire itself; that is, the ethereal fluid expanding itself every where, as from a centre to a circumference. The force of the fluid, indeed, is much less in putrefaction than in actual ignition; and therefore the effects also take place in a much smaller degree, and require a much longer time: nevertheless, the same circumstances that are necessary for keeping up the action of fire, are also necessary for keeping up the putrefactive process. One of these is a free access of air, yet without too violent a blast; for as fire cannot burn without air, neither can it endure too much of it: thus a candle goes out, if put under a receiver, and the air exhausted; and it will do the same, if we blow violently upon it. In like manner, putrefaction requires a certain quantity of air, much less indeed than fire: and as it requires less to support it, so it can also endure much less air than fire; for a stream of air which would not put out a fire, will effectually prevent putrefaction. The cause of this in both is the same. Fire cannot burn because the vapour is carried off too fast; and thus the latent heat, which ought to support the flame †, is entirely dissipated. In like manner putrefaction is as certainly attended with an emission of phlogistic vapours as fire is with an emission of flame.

‡ See the ar-  
ticle Flame.

§ See the  
article Phlo-  
giston, no 17  
—23.

These vapours contain a great quantity of latent heat ‡, or of the expansive principle already mentioned; and if these are carried off with greater rapidity than the heat of the atmosphere can produce them, the consequence must be, that an opposite principle to that which produces putrefaction, namely, a principle of cold, or condensation, instead of expansion, must take place, and the body cannot putrefy. That this must be the case is evident from the property which all evaporations have of producing cold §; and it is well known that a brisk current of air promotes evaporation to a great de-

\* See Eva-  
poration,  
no 7.

Putrefac-  
tion.

gree. Hence also the reason is evident why bodies are preserved uncorrupted by cold; for thus the action of the expansive principle is totally overcome and suspended, so that none of its effects can be perceived.

Thus we may see, that one reason why an animal body does not putrefy while alive, is its ventilation, as we may call it, by respiration; and another is, the continual accession of new particles, less disposed to putrefy than itself, by the food and drink which is constantly taken in. But if either of these ways of preventing the commencement of this process are omitted, then putrefaction will take place as well in a living as in a dead body. Of the truth of this last fact we have innumerable instances. When air is infected with the putrid effluvia of marshes, and thus the natural effluvia are not carried off from the human body, but, on the contrary, some enter into it which are not natural to it, the most putrid diseases are produced. The same thing happens from the putrid effluvia of dead bodies. Of this we have a remarkable instance in the fever which took place in Germany in the war of 1755: one reason of which is said to have been an infection of the air by the vast numbers of people killed in battle, to which was added a calm in the atmosphere for a long time; the putrid effluvia being by this prevented from flying off\*. When Mr Holwell with 145 others were imprisoned in the black-hole at Calcutta, after passing a night in that dismal habitation, he found himself in a high putrid fever. When sailors in long voyages are obliged to feed upon putrid aliments; when, thro' stormy weather, they are much exposed to wet; in the one case the putrescent effluvia being kept from flying off, and in the other a greater quantity being thrown into the body than what it naturally contains, the scurvy, malignant fevers, &c. make their appearance. Neither can these diseases be removed without removing every one of the causes just now mentioned: for as putrid diseases will be the consequence of confined air, nastiness, &c. though the provisions be ever so good; so on the other hand, if the provisions be bad, the best air, and most exact cleanliness, nay, the best medicines in the world, will be of no service; as hath been often observed in the scurvy.

\* See Me-  
dicine,  
no 251.

From this account of the nature, cause, and method of preventing putrefaction by means of a current of air, we may easily see the reason why it does not take place in some other cases also. Bodies will not putrefy in *vacuo*, because there the atmosphere has not access to impart its elastic principle; and though in the vacuum itself the principle we speak of does undoubtedly exist, yet its action there is by far too weak to decompose the structure of an animal body. In extreme cold, the reason why putrefaction does not take place has been already shown. If the heat is extremely great, the process of ignition or burning takes place instead of putrefaction. If the body is very dry, putrefaction cannot take place, because the texture is too firm to be decomposed by the weak action of the elastic principle. Putrefaction may also be prevented by the addition of certain substances; but they are all of them such as either harden the texture of the body, and thus render it proof against the action of the elastic fluid, or, by dissolving its texture entirely, bring it into a state similar to what it would be brought by the utmost power of putrefaction, so that the pro-

Putrefaction. eefs cannot then take place. Thus, various kinds of salts and acids harden the texture of animal substances, and thus are successfully used as antiseptics. The same thing may be said of ardent spirits; while oils and gums of various kinds prove antiseptic by a total exclusion of air, which is necessary in some degree for carrying on the process of putrefaction. Many vegetables, by the astringent qualities they possess, harden the texture of animal substances, and thus prove powerfully antiseptic; while on the other hand, fixed alkaline salts, quicklime, and caustic volatile alkali, though they prevent putrefaction, yet they do it by dissolving the substances in such a manner that putrefaction could do no more though it had exerted its utmost force. There is only one other antiseptic substance whose effects deserve to be considered, and that is sugar. This, tho' neither acid nor alkaline, is yet one of the most effectual means of preventing putrefaction: and this seems to be owing to its great tendency to run into the vinous fermentation, which is totally inconsistent with that of putrefaction; and this tendency is so great, that it can scarce be counteracted by the tendency of animal substances to putrefy in any circumstances whatever.

Some kinds of air are remarkably antiseptic, though this subject has not been so fully inquired into as could be wished. The most powerful of them in this respect is the nitrous air; next to it, is fixed air: but the powers of dephlogisticated and inflammable air are not so well known. It is probable that the antiseptic properties of fixed and nitrous air are owing to their quality of extinguishing fire, or at least that the principle is the same; but, till the nature of these two kinds of air are better known, little can be said with certainty on the subject.

Sir John Pringle has made experiments to determine the powers of certain substances to promote or to prevent putrefaction. From these experiments he has formed the following Table, shewing the relative antiseptic powers of the saline substances mentioned. Having found that two drams of beef put in a phial with two ounces of water, and placed in a heat equal to 90° of Fahrenheit's thermometer, became putrid in 14 hours, and that 60 grains of sea-salt preserved a similar mixture of beef and water more than 30 hours, he made the antiseptic power of the sea-salt a standard, to which he compared the powers of the other salts. The algebraic character + signifies, that the substance to which it is annexed had a greater antiseptic power than is expressed by the numbers.

Sea-salt, or the standard	1
Sil-gem	1 +
Vitriolated tartar	2
Spiritus Mindereri	2
Soluble tartar	2
Sal diureticus	2 +
Crude sal ammoniac	3
Saline mixture	3
Nitre	4 +
Salt of hartshorn	4 +
Salt of wormwood	4 +
Borax	12
Salt of amber	20
Alum	30

N. B. The quantities of spiritus Mindereri and of

the saline mixture were such, that each of them contained as much alkaline salt as the other neutral salts.

Myrrh, aloes, asafetida, and terra Japonica, were found to have an antiseptic power 30 times greater than the standard. Gum ammoniacum and fagapenum showed little antiseptic power.

Of all resinous substances, camphor was found to resist putrefaction most powerfully. Sir John Pringle believes that its antiseptic power is 300 greater than that of sea-salt.

Chamomile flowers, Virginian snake-root, pepper, ginger, saffron, contrayerva root, and galls, were found to be 12 times more antiseptic than sea-salt.

Infusions of large quantities of mint, angelica, ground-ivy, green tea, red roses, common wormwood, mullein, and horse-radish, and also decoctions of poppy-heads, were more antiseptic than sea-salt.

Decoctions of wheat, barley, and other farinaceous grains, checked the putrefaction by becoming flour.

Chalk, and other absorbent powders, accelerated the putrefaction, and resolved meat into a perfect mucus. The same powders prevented an infusion of farinaceous grains from becoming mucilaginous and sour.

One dram of sea-salt was found to preserve two drams of fresh beef in two ounces of water, above 30 hours, uncorrupted, in a heat equal to that of the human body, or above 20 hours longer than meat is preserved in water without salt: but half a dram of salt did not preserve it more than two hours longer than pure water. Twenty-five grains of salt had little or no antiseptic quality. Twenty-grains, 15 grains, but especially 10 grains only of sea-salt were found to accelerate and heighten the putrefaction of two drams of flesh. These small quantities of sea-salt did also soften the flesh more than pure water.

The same learned and ingenious physician made experiments to discover the effects of mixing vegetable with animal matters.

Two drams of raw beef, as much bread, and an ounce of water, being beat to the consistence of pap, and exposed to 90° of heat according to Fahrenheit's thermometer, began to ferment in a few hours, and continued in fermentation during two days. When it began to ferment and swell, the putrefaction had begun; and in a few hours afterwards, the smell was offensive. Next day the putrid smell ceased, and an acid taste and smell succeeded. Fresh alimentary vegetables, as spinach, asparagus, scurvy-grass, produced similar effects as bread on flesh, but in a weaker degree. From several other experiments he found, that animal substances excite the fermentation of vegetable substances, and that the latter substances correct the putrescence of the former.

By adding saliva to a similar mixture of flesh, bread, and water, the fermentation was retarded, moderated, but rendered of twice the usual duration, and the acid produced at last was weaker than when no saliva was used.

By adding an oily substance to the common mixture of flesh, bread, and water, a stronger fermentation was produced, which could not be moderated by the quantity of saliva used in the former experiment, till some fixed alkaline salt was added, which salt was found, without saliva, to stop suddenly very high fermentations.

Putrefaction  
||  
Pyaneſia.

He did not find that ſmall quantities of the following ſalts, ſal ammoniac, nitre, vitriolated tartar, ſal diureticus, ſalt of hartſhorn, ſalt of wormwood, were ſeptic, as ſmall quantities of ſea-ſalt were.

Sugar was found to reſiſt putrefaction at firſt, as other ſalts do, and alſo to check the putrefaction after it had begun by its own fermentative quality, like bread and other fermentative vegetables.

Lime-water made ſome ſmall reſiſtance to putrefaction.

Port-wine, ſmall-beer, infuſions of bitter vegetables, of bark, and the juice of antiſcorbutic plants, retarded the fermentation of mixtures of fleſh and bread. But an unſtrained decoction of bark conſiderably increaſed that fermentation.

Crabs-eyes accelerated and increaſed the fermentation of a mixture of fleſh and bread.

Lime-water neither retarded nor haſtened the fermentation of ſuch a mixture: but when the fermentation ceaſed, the liquor was neither putrid nor acid, but ſmelt agreeably.

Fleſh pounded in a mortar was found to ferment ſooner than that which had not been bruifed.

The tough inflammatory cruſt of blood was found to be moſt putrefcent; next to which the craſſamentum, or red coagulated maſs; and laſtly the ſerum.

Dr Macbride's experiments confirm many of thoſe above related, eſpecially thoſe which ſhow that the fermentation of vegetable ſubſtances is increaſed by a mixture of animal or putrefcent matter; that the putrefcency of the latter is correcteſt by the fermentative quality of the former; and that the putrefaction and fermentation of mixtures of animal and vegetable ſubſtances were accelerated by additions of abſorbent earths and of Peruvian bark. He alſo found, that although unburnt calcareous earths were ſeptic, quicklime and lime-water prevented putrefaction, but that they deſtroyed or diſſolved the texture of fleſh.

The experiments of the author of the *Eſſai pour ſervir à l'Hiftoire de la Putrefaction*, ſhow that metallic ſalts, refinous powders, extracts of bark, and opium, are very powerfully antiſeptic, and that ſalts with earthy baſes are leſs antiſeptic than any other ſalts.

PUTTY, in its popular ſenſe, is a kind of paſte compounded of whiting and lint-feed oil, beaten together to the conſiſtence of a thick dough.

It is uſed by glaſiers for the ſtaining in the ſquares of glaſs in ſaſh-windows, and by painters for ſtopping up the crevices and clefts in timber and wainſcots, &c.

PUTTY ſometimes alſo denotes the powder of calcined tin, uſed in poliſhing and giving the laſt gloſs to works of iron and ſteel.

PYANEPSIA, in antiquity, an Athenian feſtival celebrated on the ſeventh day of the month *Pyaneſſion*; which, according to the generality of critics, was the fame with our September.

Plutarch refers the invention of this feaſt to Theſeus, who, after the funeral of his father, on this day paid his vows to Apollo, becauſe the youths who returned with him ſafe from Crete then made their entry into the city. On this occaſion, theſe young men putting all that was left of their provisions into one kettle, ſeaſed together on it, and made great rejoicing. Hence was derived the cuſtom of boiling puſt on this feſtival. The Athenians likewiſe carried about an olive

branch, bound about with wool, and crowned with all ſorts of firſt-fruits, to ſignify that ſcarcity and barrenneſs were ceaſed, ſinging in proceſſion a ſong. And when the Solemnity was over, it was uſual to erect the olive-branch before their doors, as a preſervative againſt ſcarcity and want.

PYCNOSTYLE, in the ancient architecture, is a building where the columns ſtand very cloſe to each other; only one diameter and a half of the column being allowed for the intercolumniations.

According to Mr Evelyn, the pycnoſtyle chiefly belonged to the compoſite order, and was uſed in the moſt magnificent buildings; as at preſent in the peristyle at St Peter's at Rome, which conſiſts of near 300 columns; and in ſuch as yet remain of the ancients, among the ruins of Palmyra.

PYGARGUS, in ornithology, a ſpecies of Falco.

PYGMALION, in fabulous hiſtory, a king of Cyprus, who, being diſgulleſt at the diſſolute lives of the women of his iſland, reſolved to live in perpetual caſtity; but making a ſtatue of ivory, he fell ſo paſſionately in love with it, that the high feſtival of Venus being come, he fell down before the altar of that goddeſs, and beſought her to give him a wife like the ſtatue he loved. At his return home, he embraced, as uſual, his ivory form, when he perceived that it became ſenſible by degrees, and was at laſt a living maid, who found herſelf in her lover's arms the moment ſhe ſaw the light. Venus bleſſed their union; and, at the end of nine months, ſhe was delivered of a boy, who was named *Paphos*.

PYGMY, a perſon not exceeding a cubit in height. This appellation was given by the ancients to a fabulous nation inhabiting Thrace; who brought forth young at five years of age, and were old at eight: theſe were famous for the bloody war they waged with the cranes. As to this ſtory, and for the natural hiſtory of the true pygmy, ſee *SIMIA*.

PYLORUS, in anatomy, the under orifice of the ſtomach. See *ANATOMY*, n<sup>o</sup> 352, b.

PYLUS, (auc. geog.), a town of Elis; its ruins to be ſeen on the road from Olympia to Elis, (Pauſanias); ſituate between the mouths of the Peneus and Sellees, near mount Scollis, (Strabo.) Built by Pylas of Megara, and deſtroyed by Hercules, (Pauſanias.)—Another Pylus in Triphylia, (Strabo); by which the Alpheus runs, (Pauſanias); on the confines of Arcadia, and not in Arcadia itſelf, (id.)—A third in Meſſenia, (Strabo, Ptolemy); ſituate at the foot of mount Ægaleus, on the ſea-coaſt, over-againſt the iſland Sphaeria or Sphaeria; built by Pylas, and ſettled by a colony of Leleges from Megara; but thence expelled by Neleus and the Pelagi, and therefore called *Nelea*, (Homer). A ſandy territory. The royal reſidence of Neleus, and of Neſtor his ſon: the more ancient and more excellent Pylus; whence the proverb, *Pylus ante Pylum*, (Ariſtophanes, Plutarch), uſed when we want to repreſs the arrogance and pride of any one: ſaid to be afterwards called *Coryphaſium*. It made a figure in the Peloponneſian war; for being rebuilt by the Athenians, it proved of great benefit to them for the ſpace of 15 years, and of much annoyance to the Lacedæmonians, (Thucydides.) All the three *Pyli* were ſubjeſt to Neſtor, (Strabo.)

PYRAMID, in geometry, a ſolid ſtanding on a trian-

Pycnoſtyle  
||  
Pyramid.

Pyramid, triangular, square, or polygonal basis, and terminating in a point at the top; or, according to Euclid, it is a solid figure, consisting of several triangles, whose bases are all in the same plane and have one common vertex.

Pyramids are sometimes used to preserve the memory of singular events; and sometimes to transmit to posterity the glory and magnificence of princes. But as they are esteemed a symbol of immortality, they are most commonly used as funeral monuments. Such is that of Cælius at Rome; and those other celebrated ones of Egypt, as famous for the enormity of their size as their antiquity. These are situated on the west side of the Nile, almost opposite to Grand Cairo: the base of the largest covers more than 10 acres of ground; and is, according to some, near 700 feet high, though others make it 600, and some but little more than 500. The pyramid is said to have been, among the Egyptians, a symbol of human life; the beginning of which is represented by the base, and the end by the apex; on which account it was, that they used to erect them over sepulchres. See EGYPT, n° 10.

PYRAMIDALES, in anatomy, one of the muscles of the abdomen. See ANATOMY, *Table of the Muscles.*

PYRENEAN MOUNTAINS, are some of the most

celebrated in Europe. They divide France from Spain, and extend from the Mediterranean sea to the ocean; being above 200 miles in length, and are overpread with high trees. There are but five passages over them, which are all extremely difficult.

PYRITES, a kind of mineral from which sulphur and green vitriol may be produced. See CHEMISTRY, n° 110. MINERALOGY, n° 196. and METALLURGY, p. 4919, 4936.

PYRMONT, a town of Lippe in Germany, in the circle of Westphalia, and capital of a county of the same name. It has a castle, kept by a governor, who is under the counts of Waldeck. At a small distance from hence there are mineral waters, which are much esteemed. The Protestants have here the free exercise of their religion. It is seated on the confines of the duchy of Brunswick, 40 miles south-west of Hanover. E. Long. 9. 0. N. Lat. 52. 0.

PYROMANCY, a kind of divination by means of fire. See DIVINATION, n° 6.

PYROMETER, an instrument for measuring the expansion of bodies by heat. See MECHANICS, n° 20.

PYROPHORUS, a chemical preparation, which has the singular property of taking fire as soon as it is exposed to the air. See CHEMISTRY, n° 485.

## P Y R O T E C H N Y ;

THE art of fire, or a science which teaches the management and application of fire in several operations. See FIRE, FURNACE, CHEMISTRY, DISTILLATION, METALLURGY, &c.

But the term is more particularly used to denote the doctrine of artificial fire-works and fire-arms, teaching the structure and use, 1. Of those used in war, the attacking of fortifications, &c. for which see the articles GUN, GUNNERY, GUN-Powder, FUSEE, &c. and MINE in the APPENDIX; and, 2. Of those made for amusement's sake, as rockets, stars, serpents, &c. the preparation and construction of which fall to be explained in the present article.

### SECT. I. Of Ingredients and Compositions.

#### 1. Saltpetre.

SALTPETRE being the principal ingredient in fire-works, and a volatile body, by reason of it aqueous and aerial parts, is easily rarified by fire; but not so soon when foul and gross, as when purified from its crude and earthy parts, which greatly retard its velocity; therefore, when any quantity of fireworks are to be made, it should be examined; for if it is not well cleaned, and of a good sort, your works will not have their proper effect; neither will it agree with the standing proportions of compositions. Therefore,

To refine it, put into a copper, or any other vessel, 100 lb. of rough nitre with 14 gallons of clean water; let it boil gently half an hour, and as it boils take off the scum; then stir it, and before it settles put it into your filtering bags, which must be hung on a rack, with glazed earthen pans under them, in which must be sticks laid across for the crystals to adhere to: it must stand in the pans two or three days to shoot; then take out the crystals and let them dry. The water that remains in the pans boil again an hour, and drain it

into the pans as before, and the saltpetre will be quite clear and transparent: if not, it wants more refining; to do which proceed as usual, till it is well cleaned of all its earthy parts.

N. B. Those who do not choose to procure their saltpetre by the above method, may buy it ready done, which for fire-works in general will do.

To pulverise Saltpetre. Take a copper kettle, whose bottom must be spherical, and put into it 14 lb. of refined saltpetre, with 2 quarts or 5 pints of clean water: then put the kettle on a slow fire; and when the saltpetre is dissolved, if any impurities arise, skim them off, and keep constantly stirring with two large spatulas, till all the water exhales; and when done enough, it will appear like white sand, and as fine as flour; but if it should boil too fast, take the kettle off the fire, and set it on some wet tank, which will prevent the nitre from sticking to the kettle. When you have pulverised a quantity of saltpetre, be careful to keep it in a dry place.

To extract Saltpetre from damaged Gun-powder. Have some filtering bags, hung on a rack, with glazed earthen pans under them, in the same manner as those for refining saltpetre: then take any quantity of damaged powder, and put it into a copper, with as much clean water as will cover it: when it begins to boil, take off the scum; and after it has boiled a few minutes, stir it up: then take it out of the copper with a small hand kettle for that purpose, and put some into each bag, beginning at one end of the rack, so that by the time you have got to the last bag, the first will be ready for more. Continue thus, till all the bags are full: then take the liquor out of the pans; which boil and filter, as before, two or three times, till the water run quite clear, which you must let stand in the pans some time, and the saltpetre will appear at top. To get the salt-

Composi-  
tions.

petre entirely out of the powder, take the water from that already extracted, to which add some fresh and the dregs of the powder that remain in the bags, and put them in a vessel, to stand as long as you please: and when you want to extract the nitre, you must proceed with this mixture as with the powder at first, by which means you will draw out all the saltpetre; but this process must be boiled longer than the first.

### 2. Sulphur, or Brimstone.

SULPHUR is one of the principal ingredients in gun-powder, and almost in all compositions of fire-works; and therefore great care must be taken of its being good, and brought to the highest perfection. To know when sulphur is good, you are to observe that it is of a high yellow; and if, when held in one's hand, it crackles and bounces, it is a sign that it is fresh and good: but as the method of reducing brimstone to a powder is very troublesome, it is better to buy the flour ready made, which is done in large quantities, and in great perfection; tho' when a grand collection of fire-works are to be made, the strongest and best sulphur is the lump brimstone ground in the manner directed in art 8.

### 3. Charcoal.

CHARCOAL is a preservative by which the saltpetre and the brimstone are made into gun-powder, by preventing the sulphur from suffocating the strong and windy exhalation of the nitre. Charcoal for fire-works must always be soft and well burnt, which may be bought ready done.

### 4. Gun-powder.

See GUN-Powder in the order of the alphabet. To grind or meal it, is directed in art 8.

### 5. Camphor.

THIS may be had in the shops; and is of two kinds, differing in regard to the degree of their purity, and distinguished by the name of *rough* and *refined*. Refined camphor must be chosen of a perfectly clean white colour, very bright and pellucid, of the same smell and taste with the rough, but more acrid and pungent. It is so volatile that merchants usually inclose it in lintseed, that the viscosity of that grain may keep its particles together.

### 6. Benjamin.

THIS is a resin found of different sorts; and distinguished by their colours, viz. yellow, grey, and brown; but the best is that which is easy to break, and full of white spots. It is one of the ingredients in odoriferous fire-works, when reduced to a fine flour; which may be done by putting into a deep and narrow earthen pot 3 or 4 oz. of benjamin grossly pounded; cover the pot with paper, which tie very close round the edge; then set the pot on a slow fire, and once in an hour take off the paper, and you will find some flour sticking to it, which return again in the pot; this you must continue till the flour appears white and fine. There is also an oil of benjamin, which is sometimes drawn from the dregs of the flour; it affords a very good scent, and may be used in wet compositions.

### 7. Spur-fire.

THIS fire is the most beautiful and curious of any yet known; and was invented by the Chinese, but now is in greater perfection in England than in China. As it requires great trouble to make it to perfection, it will be necessary that beginners should have full instruc-

tions; therefore care should be taken that all the ingredients are of the best, that the lamp-black is not damp and clodded, that the saltpetre and brimstone are thoroughly refined. This composition is generally rammed in 1 or 2 oz. cafes about 5 or 6 inches long, but not drove very hard; and the cafes must have their concave stroke struck very smooth, and the choak or vent not quite so large as the usual proportion: this charge, when driven and kept a few months, will be much better than when rammed; and will not spoil, if kept dry, in many years.

As the beauty of this composition cannot be seen at so great a distance as brilliant fire, it has a better effect in a room than in the open air, and may be fired in a chamber without any danger: it is of so innocent a nature, that, though with an improper phrase, it may be called a *cold fire*; and so extraordinary is the fire produced from this composition, that, if well made, the sparks will not burn a handkerchief when held in the midst of them; you may hold them in your hand while burning, with as much safety as a candle; and if you put your hand within a foot of the mouth of the cafe, you will feel the sparks like drops of rain. When any of these spur-fires are fired singly, they are called *artificial flower-pots*; but some of them placed round a transparent pyramid of paper, and fired in a large room, make a very pretty appearance.

The composition consists of saltpetre 4 lb. 8 oz. sulphur 2 lb. and lamp-black 1 lb. 8 oz.; or, saltpetre 1 lb. sulphur  $\frac{1}{2}$  lb. and lamp-black 4 quarts. This composition is very difficult to mix. The saltpetre and brimstone must be first sifted together, and then put into a marble mortar, and the lamp-black with them, which you work down by degrees with a wooden pestle, till all the ingredients appear of one colour, which will be something greyish, but very near black; then drive a little into a cafe for trial, and fire it in a dark place; and if the sparks, which are called *stars*, or *pinks*, come out in clusters, and afterwards spread well without any other sparks, it is a sign of its being good, otherwise not; for if any drossy sparks appear, and the stars not full, it is then not mixed enough; but if the pinks are very small, and soon break, it is a sign that you have rubbed it too much.

This mixture, when rubbed too much, will be too fierce, and hardly show any stars; and, on the contrary, when not mixed enough, will be too weak, and throw out an obscure smoke, and lumps of dross, without any stars. The reason of this charge being called the *spur-fire*, is because the sparks it yields have a great resemblance to the rowel of a spur, from whence it takes its name.

### 8. To meal Gun-powder, Brimstone, and Charcoal.

THERE have been many methods used to grind these ingredients to a powder for fire-works, such as large mortars and pestles made of ebony and other hard wood, and horizontal mills with brass barrels: but none have proved so effectual and speedy as the last invention, that of the mealing table, represented in fig. 1. made of elm, with a rim round its edge 4 or 5 inches high; and at the narrow end, A, is a slider that runs in a groove and forms part of the rim; so that when you have taken out of the table as much powder as you can with the copper shovel fig. 2. sweep all clean out at the slider A. When you are going to meal a quantity.

tions.

ity of powder, observe not to put too much in the table at once; but when you have put in a good proportion, take the muller fig. 3, and rub it till all the grains are broke: then searce it in a lawn sieve that has a receiver and top to it; and that which does not pass through the sieve, return again to the table and grind it, till you have brought it all fine enough to go through the sieve. Brimstone and charcoal are ground in the same manner, only the muller must be made of ebony; for these ingredients being harder than powder, would stick in the grain of elm, and be difficult to grind: as brimstone is apt to rick and clod to the table, it will be best to keep one for that purpose, by which means you will always have your brimstone clean and well ground.

2<sup>d</sup> 8. *To make Wheels and other works incombustible.*

It being necessary, when your works are new, to paint them of some dark colour; therefore, if, instead of which, you make use of the following composition, it will give them a good colour, and in a great measure prevent their taking fire so soon as if painted. Take brick dust, coal ashes, and iron filings, of each an equal quantity, and mix them with a double size, made hot. With this wash over your works, and when dry wash them over again; this will preserve the wood greatly against fire. Let the brick dust and ashes be beat to a fine powder.

9. *To prepare Cast-iron for gerbes, white fountains, and Chinese fire.*

CAST iron being of so hard a nature as not to be cut by a file, we are obliged to reduce it into grains, though somewhat difficult to perform; but if we consider what beautiful sparks this sort of iron yields, no pains should be spared to granulate such an essential material: to do which, get at an iron foundry some thin pieces of iron, such as generally run over the mould at the time of casting: then have a square block made of cast iron, and an iron square hammer about 4 lb weight; then, having covered the floor with cloth or something to catch the beatings, lay the thin pieces of iron on the block, and beat them with the hammer till reduced into small grains; which afterwards searce with a very fine sieve, to separate the fine dust, which is sometimes used in small cafes of brilliant fire, instead of steel dust; and when you have got out all the dust, sift what remains with a sieve a little larger, and so on with sieves of different sizes, till the iron passes through about the bigness of small bird-shot: your iron thus beat and sifted, put each sort into wooden boxes or oiled paper, to keep it from rusting. When you use it, observe the difference of its size, in proportion to the cafes for which the charge is intended; for the coarse sort is only designed for very large gerbes of 6 or 8 lb.

10. *Charges for Sky-rockets, &c.*

*Rockets of four ounces.* Mealed powder 1 lb. 4 oz. faltrete 4 oz. and charcoal 2 oz.

*Rockets of eight ounces.* I. Mealed powder 1 lb. faltrete 4 oz. brimstone 3 oz. and charcoal 1½ oz. II. Mealed powder 1½ lb. and charcoal 4½ oz.

*Rockets of one pound.* Mealed powder 2 lb. faltrete 8 oz. brimstone 4 oz. charcoal 2 oz. and steel-filings 1½ oz.

*Shy-rockets in general.* I. Saltpetre 4 lb. brimstone

1 lb. and charcoal 1½ lb. II. Saltpetre 4 lb. brimstone 1½ lb. charcoal 1 lb. 12 oz. and meal-powder 2 oz.

*Large shy-rockets.* Saltpetre 4 lb. meal-powder 1 lb. and brimstone 1 lb.

*Rockets of a middling size.* I. Saltpetre 8 lb. sulphur 3 lb. meal-powder 3 lb. II. Saltpetre 3 lb. sulphur 2 lb. meal-powder 1 lb. charcoal 1 lb.

11. *For Rocket Stars.*

*White stars.* Meal-powder 4 oz. faltrete 12 oz. sulphur vivum 6 oz. oil of spike 2 oz. and camphor 5 oz.

*Blue stars.* Meal-powder 8 oz. faltrete 4, sulphur 2, spirits of wine 2, and oil of spike 2.

*Coloured or variegated stars.* Meal-powder 8 drams, rochpetre 4 oz. sulphur vivum 2, and camphor 2.

*Brilliant stars.* Saltpetre 3½ oz. sulphur 1½, and meal-powder ½, worked up with spirits of wine only.

*Common stars.* Saltpetre 1 lb. brimstone 4 oz. antimony 4½, isinglass ½, camphor ½, and spirits of wine ½.

*Tailed stars.* Meal-powder 3 oz. brimstone 2, faltrete 1, and charcoal (coarsely ground) ½.

*Drave stars.* I. Saltpetre 3 lb. sulphur 1 lb. brimstone 12 oz. antimony 3. II. Saltpetre 1 lb. antimony 4 oz. and sulphur 8.

*Fixed pointed stars.* Saltpetre 8½ oz. sulphur 2, antimony 1 oz. 10 dr.

*Stars of a fine colour.* Sulphur 1 oz. meal-powder 1, faltrete 1, camphor 4 dr. oil of turpentine 4 dr.

12. *Rains.*

*Gold rain for shy-rockets.* I. Saltpetre 1 lb. meal-powder 4 oz. sulphur 4, brimstone 1, saw-dust 2½, and glass-dust 6 dr. II. Meal-powder 12 oz. faltrete 2, charcoal 4. III. Saltpetre 8 oz. brimstone 2, glass-dust 1, antimony ½, brimstone ½, and saw-dust 12 dr.

*Silver rain.* I. Saltpetre 4 oz. sulphur, meal-powder, and antimony, of each 2 oz. sal prunella ½ oz. II. Saltpetre ½ lb. brimstone 2 oz. and charcoal 4. III. Saltpetre 1 lb. brimstone ½ lb. antimony 6 oz. IV. Saltpetre 4 oz. brimstone 1, powder 2, and steel-dust ½ oz.

13. *Water Rockets.*

I. Meal-powder 6 lb. faltrete 4, brimstone 3, charcoal 5. II. Saltpetre 1 lb. brimstone 4½ oz. charcoal 6. III. Saltpetre 1 lb. brimstone 4 oz. charcoal 12. IV. Saltpetre 4 lb. brimstone 1½ lb. charcoal 1 lb. 12 oz. V. Brimstone 2 lb. faltrete 4 lb. and meal-powder 4. VI. Saltpetre 1 lb. meal-powder 4 oz. brimstone 8½, charcoal 2. VII. Meal-powder 1 lb. faltrete 3, brimstone 1; sea-coal 1 oz. charcoal 8½, saw-dust ½, steel-dust ½, and coarse charcoal ½ oz. VIII. Meal powder 1½ lb. faltrete 3, sulphur 1½, charcoal 12 oz. saw-dust 2.

*Sinking charge for water-rockets.* Meal-powder 8 oz. charcoal ¾ oz.

14. *Of wheels.*

*Wheel cafes from two ounces to four pound.* I. Meal-powder 2 lb. faltrete 4 oz. iron-filings 7. II. Meal-powder 2 lb. faltrete 12 oz. sulphur 4, steel-dust 3. III. Meal-powder 4 lb. faltrete 1 lb. brimstone 8 oz. charcoal 4½. IV. Meal-powder 8 oz. faltrete 4, saw-dust

dust 1½, sea-coal ½. V. Meal-powder 1 lb. 4 oz. brimstone 4 oz. to dr. salt-petre 8 oz. glass-dust 2½. VI. Meal-powder 12 oz. charcoal 1, saw-dust ½. VII. Saltpetre 1 lb. 9 oz. brimstone 4 oz. charcoal 4½. VIII. Meal-powder 2 lb. salt-petre 1, brimstone ½, and sea-coal 2 oz. IX. Saltpetre 2 lb. brimstone 1, meal-powder 4, and glass-dust 4 oz. X. Meal-powder 1 lb. salt-petre 2 oz. and steel-dust 3½. XI. Meal-powder 2 lb. and steel-dust 2½ oz. with 2½ of the fine dust of beat iron. XII. Saltpetre 2 lb. 13 oz. brimstone 8 oz. and charcoal.

*Slow fire for wheels.* I. Saltpetre 4 oz. brimstone 2, and meal-powder 1½. II. Saltpetre 4 oz. brimstone 1, and antimony 1 oz. 6 dr. III. Saltpetre 4½ oz. brimstone 1 oz. and mealed powder 1½.

*Dead fire for wheels.* I. Saltpetre 1½ oz. brimstone ½, lapis-calaminaris ½, and antimony 2 dr.

15. *Standing or fixed cafes.*

I. Meal-powder 4 lb. salt-petre 2, brimstone and charcoal 1. II. Meal-powder 2 lb. salt-petre 1, and steel-dust 8 oz. III. Meal-powder 1 lb. 4 oz. and charcoal 4 oz. IV. Meal-powder 1 lb. and steel-dust 4 oz. V. Meal-powder 2½ lb. brimstone 4 oz. and sea-coal 6. VI. Meal-powder 3 lb. charcoal 5 oz. and saw-dust 1½.

16. *Sun cafes.*

I. Meal-powder 8½ lb. salt-petre 1 lb. 2 oz. steel-dust 2 lb. 10 oz. brimstone 4. II. Meal-powder 3 lb. salt-petre 6 oz. and steel-dust 7½.

17. *A brilliant fire.*

Meal-powder 11 lb. salt-petre 1, brimstone 4 oz. steel-dust 1½ lb.

18. *Gerbes.*

Meal-powder 6 lb. and beat-iron 2 lb. 1½ oz.

19. *Chinese fire.*

Saltpetre 12 oz. meal-powder 2 lb. brimstone 1 lb. 2 oz. and beat iron 12 oz.

20. *Tourbillons.*

*Charge for four-ounce Tourbillons.* Meal-powder 2 lb. 4 oz. and charcoal 4½ oz.

*Eight-ounce tourbillons.* Meal-powder 2 lb. and charcoal 4½ oz.

*Large tourbillons.* Meal-powder 2 lb. salt-petre 1, brimstone 8 oz. and beat iron 8.

N. B. Tourbillons may be made very large, and of different coloured fires: only you are to observe, that the larger they are, the weaker must be the charge; and, on the contrary, the smaller, the stronger their charge.

21. *Water balloons.*

I. Saltpetre 4 lb. brimstone 2, meal-powder 2, antimony 4 oz. saw-dust 4, and glass-dust 1½. II. Saltpetre 9 lb. brimstone 3 lb. meal-powder 6 lb. rosin 12 oz. and antimony 8 oz.

22. *Water squibs.*

I. Meal-powder 1 lb. and charcoal 1 lb. II. Meal-powder 1 lb. and charcoal 9 oz.

23. *Mine ports or serpents.*

I. Meal-powder 1 lb. and charcoal 1 oz. II. Meal-powder 9 oz. charcoal 1 oz.

24. *Port-fires.*

*For firing rockets, &c.* I. Saltpetre 12 oz. brimstone 4 oz. and meal-powder 2 oz. II. Saltpetre 8 oz. brimstone 4 oz. and meal-powder 2 oz. III. Saltpetre 1 lb. 2 oz. meal-powder 1½ lb. and brimstone

Vol. IX.

10 oz. This composition must be moistened with one gill of linseed oil. IV. Meal-powder 6 oz. salt-petre 2 lb. 2 oz. and brimstone 10 oz. V. Saltpetre 1 lb. 4 oz. meal-powder 4 oz. brimstone 5 oz. saw-dust 8 oz. VI. Saltpetre 8 oz. brimstone 2 oz. and meal-powder 2 oz.

*For illuminations.* Saltpetre 1 lb. brimstone 8 oz. and meal-powder 6 oz.

25. *Cones or spiral wheels.*

Saltpetre 1½ lb. brimstone 6 oz. meal-powder 14 oz. and glass-dust 14 oz.

26. *Crowns or globes.*

Saltpetre 6 oz. brimstone 2 lb. antimony 4 oz. and camphor 2 oz.

27. *Air balloon fuses.*

I. Saltpetre 1 lb. 10 oz. brimstone 8 oz. and meal-powder 1 lb. 6 oz. II. Saltpetre 1½ lb. brimstone 8 oz. and meal-powder 1 lb. 8 oz.

28. *Serpents for pots des brins.*

Meal-powder 1 lb. 8 oz. salt-petre 12 oz. and charcoal 2 oz.

29. *Fire pumps.*

I. Saltpetre 5 lb. brimstone 1 lb. meal-powder 1½ lb. and glass-dust 1 lb. II. Saltpetre 5 lb. 8 oz. brimstone 2 lb. meal-powder 1 lb. 8 oz. and glass-dust 1 lb. 8 oz.

30. *A slow white flame.*

I. Saltpetre 2 lb. brimstone 3 lb. antimony 1 lb. II. Saltpetre 3½ lb. sulphur 2½ lb. meal-powder 1 lb. antimony ½ lb. glass-dust 4 oz. brimstone 1 oz.

N. B. These compositions, driven 1½ inch in a 1 oz. case, will burn one minute, which is much longer time than an equal quantity of any composition, yet known, will last.

31. *Amber lights.*

Meal-powder 9 oz. amber 3 oz. This charge may be drove in small cafes, for illuminations.

32. *Lights of another kind.*

Saltpetre 3 lb. brimstone 1 lb. meal-powder 1 lb. antimony 10½ oz. All these must be mixed with the oil of spike.

33. *A red fire.*

Meal-powder 3 lb. charcoal 12 oz. and saw-dust 8 oz.

34. *A common fire.*

Saltpetre 3 lb. charcoal 10 oz. and brimstone 2 oz.

35. *To make an artificial earthquake.*

Mix the following ingredients to a paste with water, and then bury it in the ground, and in a few hours the earth will break and open in several places. The composition: sulphur 4 lb. and steel-dust 4 lb.

36. *Compositions for stars of different colours.*

I. Meal-powder 4 oz. salt-petre 2 oz. brimstone 2 oz. steel dust 1½ oz. and camphor, white amber, antimony, and mercury-sublimate, of each ½ oz. II. Rochepetre 10 oz. brimstone, charcoal, antimony, meal powder, and camphor, of each ½ oz. moistened with oil of turpentine. These compositions are made into stars, by being worked to a paste with aqua vite, in which has been dissolved some gum-tragacanth; and after you have rolled them in powder, make a hole through the middle of each, and firing them on quick-match, leaving about 2 inches between each. III. Saltpetre 8 oz. brimstone 2 oz. yellow amber 1 oz. antimony 1 oz. and powder 3 oz. IV. Brimstone 2½ oz. salt-petre 6 oz. oilibanum or frankincense

Ingredients  
and  
Composi-  
tions.

in drops 4 oz.; maffick, and mercury-sublimatè, of each 4 oz. meal-powder 5 oz. white amber, yellow amber, and camphor, of each 1 oz. antimony and orpiment  $\frac{1}{2}$  oz. each. V. Saltpetre 1 lb. brimstone  $\frac{1}{2}$  lb. and meal powder 8 oz. moisten'd with petrolioil. VI. Powder  $\frac{1}{2}$  lb. brimstone and saltpetre, of each 4 oz. VII. Saltpetre 4 oz. brimstone 2 oz. and meal-powder 1 oz.

*Stars that carry tails of sparks.* I. Brimstone 6 oz. antimony crude 2 oz. saltpetre 4 oz. and rofin 4 oz. II. Saltpetre, rofin, and charcoal, of each 2 oz. brimstone 1 oz. and pitch 1 oz.

These compositions are sometimes melted in an earthen pan, and mixed with chopped cotton-match, before they are rolled into flars; but will do as well if wetted, and worked up in the usual manner.

*Stars that yield some sparks.* I. Camphor 2 oz. saltpetre 1 oz. meal-powder 1 oz. II. Saltpetre 1 oz. ditto melted  $\frac{1}{2}$  oz. and camphor 2 oz. When you would make flars of either of these compositions, you must wet them with gum-water, or spirit of wine, in which has been dissolved some gum-arabic, or gum-tragacanth, that the whole may have the consistence of a pretty thick liquid; having thus done, take 1 oz. of lint, and stir it about in the composition till it becomes dry enough to roll into flars.

*Stars of a yellowish colour.* Take 4 oz. of gum-tragacanth or gum-arabic, pounded and sifted through a fine sieve, camphor dissolved in brandy 2 oz. saltpetre 1 lb. sulphur  $\frac{1}{2}$  lb. coarse powder of glass 4 oz. white amber  $1\frac{1}{2}$  oz. orpiment 2 oz. Being well incorporated, make them into flars after the common method.

*Stars of another kind.* Take 1 lb. of camphor, and melt it in a pint of spirit of wine over a slow fire; then add to it 1 lb. of gum-arabic that has been dissolved; with this liquor mix 1 lb. of saltpetre, 6 oz. of sulphur, and 5 oz. of meal-powder; and after you have stirred them well together, roll them into flars proportionable to the rockets for which you intend them.

### 37. Colours produced by the different compositions.

As variety of fires adds greatly to a collection of works, it is necessary that every artist should know the different effect of each ingredient. For which reason, we shall here explain the colours they produce of themselves, and likewise how to make them retain the same when mixed with other bodies: as for example, sulphur gives a blue, camphor a white or pale colour, saltpetre a clear white-yellow, amber a colour inclining to yellow, sal-armoniac a green, antimony a reddish, rofin a copper colour, and greek-pitch a kind of bronze or between red and yellow. All these ingredients are such as shew themselves in a flame, viz.

*White flame.* Saltpetre, sulphur, meal-powder, and camphor; the saltpetre must be the chief part.

*Blue flame.* Meal-powder, saltpetre, and sulphur vivum; sulphur must be the chief: Or meal-powder, saltpetre, brimstone, spirit of wine, and oil of spike; but let the powder be the principal part.

*Flame inclining to red.* Saltpetre, sulphur, antimony, and greek-pitch; saltpetre the chief.

By the above method may be made various colours of fire, as the practitioner pleases; for, by making a

few trials, he may cause any ingredient to be predominant in colour.

### 38. Ingredients that shew in sparks when rammed in soaked cases.

These set colours of fire produced by sparks are divided into 4 sorts, viz. the black, white, grey, and red. The black charges are composed of 2 ingredients, which are meal-powder and charcoal; the white of 3, viz. saltpetre, sulphur, and charcoal; the grey of 4, viz. meal-powder, saltpetre, brimstone, and charcoal; and the red of 3, viz. meal-powder, charcoal, and saw-dust.

There are, besides these 4 regular or set charges, 2 others, which are distinguished by the names of *compound* and *brilliant charges*; the compound being made of many ingredients, such as meal-powder, saltpetre, brimstone, charcoal, saw-dust, sea-coal, antimony, glass dust, brass dust, steel filings, cast iron, tanner's dust, &c. or any thing that will yield sparks; all which must be managed with discretion. The brilliant fires are composed of meal-powder, saltpetre, brimstone, and steel dust; or with meal-powder and steel filings only.

### 39. Cotton quick-match,

Is generally made of such cotton as is put in candles, of several sizes, from 1 to 6 threads thick, according to the pipes it is designed for, which pipe must be large enough for the match, when made, to be pushed in easily without breaking it. Having doubled the cotton into as many threads as you think proper, coil it very lightly into a flat-bottomed copper or earthen pan; then put in the saltpetre and the liquor, and boil them about 20 minutes; after which coil it again into another pan, as in fig 4. and pour on it what liquor remains; then put in some meal-powder, and press it down with your hands till it is quite wet; afterwards place the pan before the wooden frame, fig. 5. which must be suspended by a point in the centre of each end; and place yourself before the pan, tying the upper end of the cotton to the end of one of the sides of the frame.

When every thing is ready, you must have one to turn the frame round, while you let the cotton pass through your hands, holding it very lightly, and at the same time keeping your hands full of the wet powder; but if the powder should be too wet to flick to the cotton, put more in the pan, so as to keep a continual supply till the match is all wound up; you may wind it as close on the frame as you please, so that it do not flick together; when the frame is full, take it off the points, and sift dry meal-powder on both sides the match, till it appear quite dry: in winter the match will be a fortnight before it is fit for use; when it is thoroughly dry, cut it along the outside of one of the sides of the frame, and tie it up in skains for use.

N. B. The match must be wound tight on the frames.

*The ingredients for the match, are,* cotton 1 lb. 12 oz. saltpetre 1 lb. spirit of wine 2 quarts, water 3 quarts, isinglass 3 gills, and meal-powder 10 lb. To dissolve 4 oz. of isinglass, take 3 pints of water.

### 2d 39. Touch paper for capping of serpents, crackers, &c.

Dissolve, in spirits of wine or vinegar, a little saltpetre; then take some purple or blue paper, and wet it with this liquor, and when dry it will be fit for use; when a.

Plate  
CCXLVIII.

Of Moulds, Cafes, &c. when you paste this paper on any of your works, take care that the paste does not touch that part which is to burn. The method of using this paper is by cutting it into slips, long enough to go once round the mouth of a serpent, cracker, &c. When you paste on these slips, leave a little above the mouth of the cafe not paited; then prime the cafe with meal-powder, and twist the paper to a point.

SECT. II. Of Moulds, Cafes, Mixture, Instruments, &c.

40. Rocket moulds.

As the performance of rockets depends much on their moulds, it is requisite to give a definition of them and their proportions: they are made and proportioned by the diameter of their orifice, which are divided into = parts. Fig. 6. represents a mould made by its diameter AB: its height from C to D is 6 diameters and 2 thirds; from D to E is the height of the foot, which is 1 diameter and 2 thirds; F the choke, or cylinder, whose height is 1 diameter and 1-3d; it must be made out of the same piece as the foot, and fit tight in the mould; G an iron pin that goes thro' the cylinder, to keep the foot fast; H the nipple, which is  $\frac{1}{2}$  a diameter high and 2-3ds thick, and of the same piece of metal as the former I, whose height is  $3\frac{1}{2}$  diameters, and at the bottom is 1-3d of the diameter thick, and from thence tapering to 1-6th of the diameter. The best way to fix the piercer in the cylinder, is to make that part below the nipple long enough to go quite through the foot, and rivet at bottom. Fig. 7. is a former or roller for the cafes, whose length from the handle, is  $7\frac{1}{2}$  diameters, and its diameter 2-3ds of the bore. Fig. 8. the end of the former, which is of the same thickness, and 1 diameter and 2-3ds long; the small part, which fits into the hole in the end of the roller when the cafe is pinching, is 1-6th and  $\frac{1}{2}$  of the mould's diameter thick. Fig. 9. the first drift, which must be 6 diameters from the handle; and this, as well as all other rammers, must be a little thinner than the former, to prevent the facking of the paper when you are driving in the charge. In the end of this rammer is a hole to fit over the piercer: the line K marked on this is 2 diameters and 1-3d from the handle; so that, when you are filling the rocket, this line appears at top of the cafe: you must then take the 2d rammer, fig. 10. which from the handle is 4 diameters, and the hole for the piercer is  $1\frac{1}{2}$  diameter long. Fig. 11. is the short and solid drift which you use when you have filled the cafe as high as the top of the piercer.

Rammers must have a collar of brads at the bottom, to keep the wood from spreading or splitting, and the same proportion must be given to all moulds, from 1 oz. to 6 lb. We mentioned nothing concerning the handles of the rammers; however, if their diameter be equal to the bore of the mould, and 2 diameters long, it will be a very good proportion: but the shorter you can use them the better; for the longer the drift, the less will be the pressure on the composition by the blow given with the mallet.

Dimensions for Rocket Moulds, in the Rockets are rammed solid.

Weight of rock-ets.	Length of the moulds without their feet.	Interior diameter of the moulds.	Height of the nipples.
lb. oz.	Inches.	Inches.	Inches.
6 0	34,7	3,5	1,5
4 0	38,6	2,9	1,4
2 0	13,35	2,1	1,0
1 0	12,25	1,7	0,85
0 8	10,125	1,333, &c.	0,6
0 4	7,75	1,125	0,5
0 2	6,2	0,9	0,45
0 1	4,9	0,7	0,35
0 $\frac{1}{2}$	3,9	0,55	0,25
6 drams	3,5	0,5	0,225
4 drams	2,2	0,3	0,2

The diameter of the nipple must always be equal to that of the former.

The thickness of the moulds is omitted, being very immaterial, provided they are substantial and strong.

Our author advises those who make rockets for private amusement, not to ram them solid; for it requires a very skilful hand, and an expensive apparatus for boring them, which will be shown hereafter. Driving of rockets solid is the most expeditious method, but not so certain as ramming them over a piercer.

41. Moulds for wheel-cafes or serpents.

Fig. 12. represents a mould, in which the cafes are drove solid; L the nipple (A), with a point (B) at top, which, when the cafe is filling, serves to stop the neck, and prevent the composition from falling out, which without this point it would do; and, in consequence, the air would get into the vacancy in the charge, and at the time of firing cause the cafe to burst. These sort of moulds are made of any length or diameter, according as the cafes are required; but the diameter of the rollers must be equal to half the bore, and the rammers made quite solid.

42. To roll rocket and other cafes.

Sky-rocket cafes are to be made  $6\frac{1}{2}$  of their exterior diameter long; and all other cafes that are to be filled in moulds must be as long as the moulds, within half its interior diameter.

Rocket cafes, from the smallest to 4 or 6 lb. are generally made of the strongest sort of cartridge paper, and rolled dry; but the large sort are made of paited pasteboard. As it is very difficult to roll the ends of the cafes quite even, the best way will be to keep a pattern of the paper for the different sorts of cafes; which pattern should be somewhat longer than the cafe it is designed for, and on it marked the number of sheets required, which will prevent any paper being cut to waste. Having cut your papers of a proper size, and the last sheet for each cafe with a slope at one end, so that when the cafes are rolled it may form a spiral line round the outside, and that this slope may

36 U 2 al

(A) The nipple and cylinders to bear the same proportion as those for rockets.

(B) A round bit of brads, equal in length to the nick of the cafe, and flat at the top.

Of Moulds,  
Cafes, &c.

always be the same, let the pattern be so cut for a guide. Before you begin to roll, fold down one end of the first sheet, so far that the fold will go 2 or 3 times round the former: then, on the double edge lay the former with its handle off the table; and when you have rolled on the paper within 2 or 3 turns, lay the next sheet on that part which is loose, and roll it all on.

Having thus done, you must have a smooth board, about 20 inches long, and equal in breadth to the length of the case. In the middle of this board must be a handle placed length-wise. Under this board lay your case, and let one end of the board lie on the table; then press hard on it, and push it forwards, which will roll the paper very tight: do this 3 or 4 times before you roll on any more paper. This must be repeated every other sheet of paper, till the case is thick enough; but if the rolling board be drawn backwards, it will loosen the paper: you are to observe, when you roll on the last sheet, that the point of the slope be placed at the small end of the roller. Having rolled your case to fit the mould, push in the small end of the former F, about 1 diameter from the end of the case, and put in the end-piece within a little distance of the former; then give the pinching cord one turn round the case, between the former and the end-piece; at first pull easy, and keep moving the case, which will make the neck smooth, and without large wrinkles. When the cases are hard to choak, let each sheet of paper (except the first and last, in that part where the neck is formed) be a little moistened with water: immediately after you have struck the concave stroke, bind the neck of the case round with small twine, which must not be tied in a knot, but fastened with two or three hitches.

Having thus pinched and tied the case so as not to give way, put it into the mould without its foot, and with a mallet drive the former hard on the end-piece, which will force the neck close and smooth. This done, cut the case to its proper length, allowing from the neck to the edge of the mouth half a diameter, which is equal to the height of the nipple; then take out the former, and drive the case over the piercer with the long rammer, and the vent will be of a proper size. Wheel-cases must be drove on a nipple with a point to close the neck, and make the vent of the size required; which, in most cases, is generally  $\frac{1}{2}$  of their interior diameter: as it is very often difficult, when the cases are rolled, to draw the roller out, you may make a hole through the handle, and put in it a small iron pin, by which you may easily turn the former round and pull it out. Fig. 17. shows the method of pinching cases; P a treddle, which, when pressed hard with the foot, will draw the cord tight, and force the neck as close as you please; Q a small wheel or pulley, with a groove round it for the cord to run in.

Cases are commonly rolled wet, for wheels and fixed pieces; and when they are required to contain a great length of charge, the method of making those cases is thus: Your paper must be cut as usual, only the last sheet must not be cut with a slope; having your paper ready, paste each sheet on one side; then fold down the first sheet as before directed: but be careful that the paste do not touch the upper part of

the fold; for if the roller be wetted, it will tear the paper in drawing it out. In palling the last sheet, observe not to wet the last turn or two in that part where it is to be pinched; for if that part be damp, the pinching cord will stick to it, and tear the paper; therefore, when you choak these cases, roll a bit of dry paper once round the case, before you put on the pinching cord; but this bit of paper must be taken off after the case is choaked. The rolling board, and all other methods, according to the former directions for the rolling and pinching of cases, must be used to these as well as all other cases.

#### 43. To make *tourbillon* cases.

Those sort of cases are generally made about 8 diameters long; but if very large, 7 will be sufficient: *tourbillons* will answer very well from 4 oz. to 2 lb. but when larger there is no certainty. The cases are best rolled wet with paste, and the last sheet must have a straight edge, so that the case may be all of a thickness: when you have rolled your cases after the manner of wheel cases, pinch them at one end quite close; then with the rammer drive the ends down flat, and afterwards ram in about 1-3d of a diameter of dried clay. The diameter of the former for these cases must be the same as for sky-rockets.

N. B. *Tourbillons* are to be rammed in moulds without a nipple, or in a mould without its foot.

#### 44. *Balloon* cases, or *paper shells*.

FIRST, you must have an oval former turned of smooth wood; then paste a quantity of brown or cartridge paper, and let it lie till the paste has quite soaked through; this done, rub the former with soap or grease, to prevent the paper from sticking to it; then lay the paper on in small slips, till you have made it 1-3d of the thickness of the shell intended. Having thus done, set it to dry; and when dry, cut it round the middle, and the 2 halves will easily come off: but observe, when you cut, to leave about 1 inch out cut, which will make the halves join much better than if quite separated. When you have some ready to join, place the halves even together, paste a slip of paper round the opening to hold them together, and let that dry; then lay on paper all over as before, every where equal, excepting that end which goes downwards in the mortar, which may be a little thicker than the rest; for that part which receives the blow from the powder in the chamber of the mortar consequently requires the greatest strength. When the shell is thoroughly dry, burn a round vent at top, with square iron, large enough for the fuze: this method will do for balloons from 4 inches 2-5ths, to 8 inches diameter; but if they are larger, or required to be thrown a great height, let the first shell be turned of elm, instead of being made of paper.

For a balloon of 4 inches 2-5ths, let the former be 3 inches 1-8th diameter, and  $5\frac{1}{2}$  inches long. For a balloon of  $5\frac{1}{2}$  inches diameter the diameter of the former must be 4 inches, and 8 inches long. For a balloon of 8 inches, let the diameter of the former be 5 inches and 15-16ths, and 11 inches 7-8ths long. For a 10-inch balloon, let the former be 7 inches 3-16ths diameter, and  $14\frac{1}{2}$  inches long. The thickness of a shell for a balloon of 4 inches 2-5ths, must be  $\frac{1}{2}$  inch. For a balloon of  $5\frac{1}{2}$  inches, let the thickness of the paper be 5-8ths of an inch. For an 8-inch balloon, 7-8ths of an inch.

Of Moulds,  
Cafes, &c.

Of Moulds, inch. And for a 10-inch balloon, let the shell be 1  
Cafes, &c. inch 1-8th thick.

Shells that are designed for stars only, may be made quite round, and the thinner they are at the opening, the better; for if they are too strong, the stars are apt to break at the burling of the shell: when you are making the shell, make use of a pair of calibres, or a round gauge, so that you may not lay the paper thicker in one place than another; and also to know when the shell is of a proper thickness. Balloons must always be made to go easy into the mortars.

*Cafes for illumination Port-fires.* These must be made very thin of paper, and rolled on formers, from 2 to 5 8ths of an inch diameter, and from 2 to 6 inches long: they are pinched close at one end, and left open at the other. When you fill them, put in but a little composition at a time, and ram it in lightly, so as not to break the case: 3 or 4 rounds of paper, with the last round pasted, will be strong enough for these cafes.

*Cafes and moulds for common Port-fires.* Common port-fires are intended purposely to fire the works, their fire being very slow, and the heat of the flame so intense, that, if applied to rockets, leaders, &c. it will fire them immediately. Port-fires may be made of any length, but are seldom made more than 21 inches long: the interior diameter of port-fire moulds should be 10-16ths of an inch, and the diameter of the former  $\frac{1}{4}$  an inch. The cafes must be rolled wet with paste, and one end pinched, or folded down. The moulds should be made of brass, and to take in 2 pieces lengthwise; when the case is in the 2 sides, they are held together by brass rings, or hoops, which are made to fit over the outside. The bore of the mould must not be made quite through, so that there will be no occasion for a foot. Those port-fires, when used, are held in copper sockets, fixed on the end of a long stick: these sockets are made like port-crayons, only with a screw instead of a ring.

#### 45. Of mixing the compositions.

THE performance of the principal part of fire-works depends much on the compositions being well mixed; therefore great care must be taken in this part of the work, particularly for the composition for sky-rockets. When you have 4 or 5 pounds of ingredients to mix, which is a sufficient quantity at a time (for a larger proportion will not do so well) first put the different ingredients together; then work them about with your hands, till you think they are pretty well incorporated: after which put them into a lawn sieve with a receiver and top to it; and if, after it is sifted, any remains that will not pass through the sieve, grind it again till fine enough; and if it be twice sifted, it will not be amiss: but the compositions for wheels and common works are not so material, nor need be so fine. But in all fixed works, from which the fire is to play regular, the ingredients must be very fine, and great care taken in mixing them well together; and observe, that, in all compositions where in are steel or iron filings, the hands must not touch; nor will any works, which have iron or steel in

their charge, keep long in damp weather, unless properly prepared, according to the following directions.

#### 46. To preserve steel or iron filings.

It sometimes may happen, that fire-works may be required to be kept a long time, or sent abroad: neither of which could be done with brilliant fires, if made with filings unprepared; for this reason, that the saltpetre being of a damp nature, it causes the iron to rust; the consequence of which is, that when the works are fired, there will appear but very few brilliant sparks, but instead of them a number of red and drossy sparks; and besides, the charge will be so much weakened, that if this was to happen to wheels, the fire will hardly be strong enough to force them round. But to prevent such accidents, prepare your filings thus: Melt in a glazed earthen pan some brimstone over a slow fire, and when melted throw in some filings; which keep stirring about till they are covered with brimstone: this you must do while it is on the fire; then take it off, and stir it very quick till cold, when you must roll it on a board with a wooden roller, till you have broke it as fine as corn-powder; after which sift from it as much of the brimstone as you can. There is another method of preparing filings, so as to keep 2 or 3 months in winter; this may be done by rubbing them between the strongest sort of brown paper, which before has been moistened with linseed oil.

N. B. If the brimstone should take fire, you may put it out, by covering the pan close at top: it is not of much signification what quantity of brimstone you use, so that there is enough to give each grain of iron a coat; but as much as will cover the bottom of a pan of about 1 foot diameter, will do for 5 or 6 pound of filings, or cast-iron for gerbes.

#### 47. To drive or ram Sky Rockets, &c.

ROCKETS drove over a piercer must not have so much composition put in them at a time, as when drove solid; for the piercer, taking up great part of the bore of the case, would cause the rammer to rise too high; so that the pressure of it would not be so great on the composition, nor would it be drove every where equal. To prevent this, observe the following rule: That for those rockets which are rammed over a piercer, let the ladle (c) hold as much composition as, when drove, will raise the drift  $\frac{1}{2}$  the interior diameter of the case, and for those drove solid to contain as much as will raise it  $\frac{1}{4}$  the exterior diameter of the case: ladles are generally made to go easy in the case, and the length of the scoop about  $1\frac{1}{2}$  of its own diameter.

The change of rockets must always be drove 1 diameter above the piercer, and on it must be rammed 1-3d of a diameter of clay; through the middle of which bore a small hole to the composition, that, when the charge is burnt to the top, in may communicate its fire, through the hole, to the stars in the head. Great care must be taken to strike with the mallet, and with an equal force, the same number of strokes to each ladle-full of charge; otherwise the rockets will not rise with a uniform motion, nor will the composition burn equal and regular: for which reason they cannot carry a proper tail; for it will break

(c) A copper scoop with a wooden handle.

Instruments  
&c.

break before the rocket has got half way up, instead of reaching from the ground to the top, where the rocket breaks and disperses the stars, rains, or whatever is contained in the head. When you are ramming, keep the drift constantly turning or moving; and when you use the hollow rammers, knock out of them the composition now and then, or the piercer will split them. To a rocket of 4 oz. give to each ladle-full of charge 16 strokes; to a rocket of 1 lb. 28; to a 2-pounder, 36; to a 4-pounder, 42; and to a 6-pounder, 56: but rockets of a larger fort cannot be drove well by hand, but must be rammed with a machine made in the same manner as those for driving piles.

The method of ramming of wheel-cases, or any other fort, in which the charge is drove solid, is much the same as sky-rockets; for the same proportion may be observed in the ladle, and the same number of strokes given, according to their diameters, all cases being distinguished by their diameters. In this manner, a case, whose bore is equal to a rocket of 4 oz. is called a 4-oz. case, and that which is equal to an 8-oz. rocket an 8-oz. case, and so on, according to the different rockets.

Having taught the method of ramming cases in moulds, we shall here say something concerning those filled without moulds; which method, for strong pasted cases, will do extremely well, and save the expence of making so many moulds. The reader must here observe, when he fills any sort of cases, to place the mould on a perpendicular block of wood, and not on any place that is hollow; for we have found by experience, that when cases were rammed on driving benches, which were formerly used, the works frequently miscarried, on account of the hollow resistance of the benches, which oft jarred and loosened the charge in the cases; but this accident never happens when the driving blocks are used (D).

When cases are to be filled without moulds, proceed thus. Have some nipples made of brass or iron, of several sorts and sizes, in proportion to the cases, and to screw or fix in the top of the driving block; when you have fixed in a nipple, make, at about  $1\frac{1}{2}$  inch from it, a square hole in the block, 6 inches deep and 1 inch diameter; then have a piece of wood, 6 inches longer than the case intended to be filled, and 2 inches square; on one side of it cut a groove almost the length of the case, whose breadth and depth must be sufficient to cover near  $\frac{1}{2}$  the case; then cut the other end to fit the hole in the block, but take care to cut it so that the groove may be of a proper distance from the nipple: this half mould being made and fixed tight in the block, cut, in another piece of wood nearly of the same length as the case, a groove of the same dimensions as that in the fixed piece; then put the case on the nipple, and with a cord tie it and the 2 half-moulds together, and your case will be ready for filling.

The dimensions of the above-described half moulds, are proportionable for cases of 8 ounces; but notice must be taken, that they differ in size in proportion to the cases.

Note, The clay, mentioned in this article, must be

prepared after this manner: Get some clay, in which there is no stones nor sand, and bake it in an oven till quite dry; then take it out and beat it to a powder, and afterwards sift it through a common hair-sieve, and it will be fit for use.

48. *Proportion of Mallets.*

The best wood for mallets is dry beech. If a person uses a mallet of a moderate size, in proportion to the rocket, according to his judgment, and if the rocket succeeds, he may depend on the rest, by using the same mallet; yet it will be necessary that cases of different sorts be drove with mallets of different sizes.

The following proportion of the mallets for rockets of any size, from 1 oz. to 6 lb. may be observed; but as rockets are seldom made less than 1 oz. or larger than 6 lb. we shall leave the management of them to the curious; but all cases under 1 oz. may be rammed with an oz. rocket mallet. Your mallets will strike more solid, by having their handles turned out of the same piece as the head, and made in a cylindrical form. Let their dimensions be worked by the diameters of the rocket: for example; let the thickness of the head be 3 diameters, and its length 4, and the length of the handle 5 diameters, whose thickness must be in proportion to the head.

49. *Proportion of Sky Rockets, and manner of heading them.*

FIG. 13. represents a rocket complete without its stick, whose length from the neck is 5 diameters 1-6th: the cases should always be cut to this length after they are filled. M is the head, which is 2 diameters high, and 1 diameter  $1\frac{1}{6}$ th in breadth; N the cone or cap, whose perpendicular height must be 1 diameter 1-3d. FIG. 14. the collar to which the head is fixed; this is turned out of deal or any light wood, and its exterior diameter must be equal to the interior diameter of the head; 1-6th will be sufficient for its thickness, and round the outside edge must be a groove; the interior diameter of the collar must not be quite so wide as the exterior diameter of the rocket: when this is to be glued on the rocket, you must cut 2 or 3 rounds of paper off the case, which will make a shoulder for it to rest upon. FIG. 15. a former for the head: 2 or 3 rounds of paper well pasted will be enough for the head, which, when rolled, put the collar on that part of the former marked O, which must fit the inside of it; then, with the pinching cord pinch the bottom of the head into the groove, and tie it with small twine. FIG. 16. a former for the cone. To make the caps, cut your paper in round pieces, equal in diameter to twice the length of the cone you intend to make; which pieces being cut into halves, will make 2 caps each, without waiting any paper; having formed the caps, paste over each of them a thin white paper, which must be a little longer than the cone, so as to project about  $\frac{1}{4}$  an inch below the bottom: this projection of paper, being notched and pasted, serves to fasten the cap to the head.

When you load the heads of your rockets with stars, rains, serpents, crackers, scrolls, or any thing else, according to your fancy, remember always to put 1 ladle-full of meal-powder into each head, which will be enough to bury the head, and disperse the stars,

or

(D) A piece of hard wood in the form of an anvil block.

Instruments or whatever it contains: when the heads are loaded with any sort of cases, let their mouths be placed downwards; and after the heads are filled, paste on the top of them a piece of paper, before you put on the caps. As the size of the stars oft differ, it would be needless to give an exact number for each rocket; but this rule may be observed, that the heads may be nearly filled with whatever they are loaded.

50 *Decorations for Sky Rockets.*

SKY-rockets bearing the pre-eminence of all fireworks, it will not be improper to treat of their various kinds of decorations, which are directed according to fancy. Some are headed with stars of different sorts, such as tailed, brilliant, white, blue and yellow stars, &c.; some with gold and silver rain; others with serpents, crackers, firecralls, marrons; and some with small rockets, and many other devices, as the maker pleases.

*Dimensions and poise of Rocket-sticks.*

L. oz.	Length of Thickness the stick.		Breadth at top.		Square at bottom.	Poise from the point of the cone.	
	F. in.	Inches.	Inches.	Inches.	Inches.	F. in.	
6 0	14 0	1,5	1,85	0,75	4	1,5	
4 0	12 10	1,25	1,40	0,625	3	9,	
2 0	9 4	1,125	1,	0,525	2	9,	
1 0	8 2	0,725	0,80	0,375	2	1,	
8 6	6 6	0,5	0,70	0,25	1	10,5	
4 5	3	0,3750	0,55	0,35	1	8,5	
2 4	1	0,3	0,45	0,15	1	3,	
1 3	6	0,25	0,35	0,10	11	0,	
2 4	4	0,125	0,20	0,16	8	0,	
$\frac{1}{2}$	1	10 $\frac{1}{2}$	0,1	0,15	0,5	5	0,5

The last column on the right, in the above table, expresses the distance from the top of the cone, where the stick, when tied on, should balance the rocket, so as to stand in an equilibrium on one's finger or the edge of a knife. The best wood for the sticks is dry deal, made thus. When you have cut and planed the sticks according to the dimensions given in the table, cut, on one of the flat sides at the top, a groove the length of the rocket, and as broad as the stick will allow; then, on the opposite flat side, cut 2 notches for the cord, which ties on the rocket, to lie in; one of these notches must be near the top of the stick, and the other facing the neck of the rockets; the distance between these notches may easily be known, for the top of the stick should always touch the head of the rocket. When your rockets and sticks are ready, lay the rockets in the grooves in the sticks, and tie them on. Those who, merely for curiosity, may choose to make rockets of different sizes, from those expressed in the table of dimensions, may find the length of their sticks, by making them for rockets, from  $\frac{1}{2}$  oz. to 1 lb. 60 diameters of the rocket long; and for rockets above 1 lb. 50 or 52 diameters will be a good length; their thickness at top may be about  $\frac{1}{2}$  a diameter, and their breadth a very little more; their square at bottom is generally equal to  $\frac{1}{4}$  the thickness at top. But although the dimensions of the sticks be very nicely observed, you must depend only on their balance; for, without a proper

counterpoise, your rockets, instead of mounting perpendicularly, will take an oblique direction, and fall to the ground before they are burnt out.

51 *Boring Rockets which have been drove solid.*

Fig. 18. represents the plan of an apparatus, or lathe, for boring of rockets. A the large wheel, which turns the small one B, that works the rimmer C: these rammers are of different sizes according to the rockets; they must be of the same diameter as the top of the bore intended, and continue that thickness a little longer than the depth of the bore required, and their points must be like that of an auger: the thick end of each rammer must be made square, and all of the same size, so as to fit into one socket, wherein they are fastened by a screw D. E the guide for the rammer, which is made to move backwards and forwards: so that, after you have marked the rammer  $3\frac{1}{2}$  diameters of the rocket from the point, set the guide, allowing for the thickness of the fronts of the rocket boxes, and the neck and mouth of the rocket, so that when the front of the large box is close to the guide, the rammer may not go too far up the charge. F, boxes for holding the rockets, which are made so as to fit one in another; their sides must be equal in thickness to the difference of the diameters of the rockets, and their interior diameters equal to the exterior diameters of the rockets. To prevent the rocket's turning round while boring, a piece of wood must be placed against the end of the box in the inside, and pressed against the tail of the rocket; this will also hinder the rammer from forcing the rocket backwards. G, a rocket in the box. H, a box that slides under the rocket-boxes to receive the borings for the rockets, which fall through holes made on purpose in the boxes; these holes must be just under the mouth of the rocket, one in each box, and all to correspond with each other.

Fig. 19. is a front view of the large rocket-box. I, an iron plate, in which are holes of different sizes, through which the rammer passes: this plate is fastened with a screw in the centre, so that when you change the rammer, you turn the plate round, but always let the hole you are going to use be at the bottom: the fronts of the other boxes must have holes in them to correspond with those in the plate. K, the lower part of the large box; which is made to fit the inside of the lathe, that all the boxes may move quite steady.

Fig. 20. is a perspective view of the lathe. L, the guide for the rammer, which is set by the screw at bottom.

Fig. 21. A view of the front of the guide facing the rammer. M, an iron plate, of the same dimensions as that on the front of the box, and placed in the same direction, and also to turn on a screw in the centre. N, the rocket-box which slides backwards and forwards: when you have fixed a rocket in the box, push it forwards against the rammer; and when you think the scoop of the rammer is full, draw the box back, and knock out the composition: this you must do till the rocket is bored, or it will be in danger of taking fire; and if you bore in a hurry, wet the end of the rammer now and then with oil to keep it cool.

Having bored a number of rockets, you must have

Instruments  
&c.

taps of different sorts according to the rockets. These taps are a little longer than the bore: but when you use them, mark them  $3\frac{1}{2}$  diameters from the point, allowing for the thickness of the rocket's neck; then, holding the rocket in one hand, you tap it with the other. One of these taps is represented by fig. 22. They are made in the same proportion as the fixed piercers, and are hollowed their whole length.

52. *Hand Machine used for boring of Rockets instead of a Lathe.*

These sort of machines answer very well, tho' not so expeditious as the lathes. But they are not so expensive to make, and they may be worked by one man; whereas the lathe will require three. Fig 23. represents the machine. O, the rocket boxes, which are to be fixed, and not to slide as those in the lathe. P Q are guides for the rammers, that are made to slide together, as the rammer moves forward: the rammers for these sort of machines must be made of a proper length, allowing for the thickness of the front of the boxes, and the length of the mouth and neck of the case; and the square end of these rammers, must be a round shoulder of iron, to turn against the outside of the guide Q, by which means the guides are forced forwards. R, the stock which turns the rammer, and while turning must be pressed towards the rocket by the body of the man who works it; all the rammers are to be made to fit one stock.

To make large Gerbes.

Plate  
CCXLIX.

FIG. 1. represents a wooden former; fig. 2. a gerbe complete, with its foot or stand. The cafes for gerbes are made very strong, on account of the strength of the composition; which, when fired, comes out with great velocity: therefore, to prevent their bursting, the paper should be pasted, and the cafes made as thick at the top as at the bottom. They should also have very long necks, for this reason; first, that the particles of iron will have more time to be heated, by meeting with greater resistance in getting out, than with a short neck, which would be burnt too wide before the charge be consumed, and spoil the effect: secondly, that with long necks the stars will be thrown to a great height, and will not fall before they are spent, or spread too much; but, when made to perfection, will rise and spread in such a manner as to form exactly a wheat-sheaf.

In the ramming of gerbes, there will be no need of a mould, the cafes being sufficiently strong to support themselves. But you are to be careful, before you begin to ram, to have a piece of wood made to fit in the neck; for if this be not done, the composition will fall into the neck, and leave a vacancy in the case, which will cause the case to burst so soon as the fire arrives at the vacancy. You must likewise observe, that the first ladle of charge, or second, if you think proper, be of some weak composition. When the case is filled, take out the piece of wood, and fill the neck with some slow charge. Gerbes are generally made about 6 diameters long, from the bottom to the top of the neck; their bore must be 1-5th narrower at top than at bottom. The neck S is 1-6th diameter and  $\frac{1}{2}$  long. T, a wooden foot or stand, on which the gerbe is fixed. This may be made with a choak or cylinder 4 or 5 inches long to fit the inside of

Instruments  
&c.

the case, or with a hole in it to put in the gerbe; both these methods will answer the same. Gerbes produce a most brilliant fire, and are very beautiful when a number of them are fixed in the front of a building or a collection of fireworks.

N. B. Gerbes are made by their diameters, and their cafes at bottom  $\frac{1}{2}$  thick. The method of finding the interior diameter of a gerbe is thus: Supposing you would have the exterior diameter of the case, when made, to be 5 inches, then, by taking 2-4ths for the sides of the case, there will remain  $2\frac{1}{2}$  inches for the bore, which will be a very good size. These sort of gerbes should be rammed very hard.

54. *Small gerbes, or white fountains,*

May be made of  $\frac{1}{4}$  oz. 8 oz. or 1 lb. cafes, pasted and made very strong, of what length you please: but, before you fill them, drive in clay one diameter of their orifice high; and when you have filled a case, bore a vent through the centre of the clay to the composition: the common proportion will do for the vent, which must be primed with a slow charge. These sort of cafes, without the clay, may be filled with Chinese fire.

55. *To make pasteboard and paper mortars.*

Fig. 3. represents a former, and fig. 4. an elm foot, for the mortar. Fig. 5. represents a mortar complete: these mortars are best when made with pasteboard, well pasted before you begin; or, instead of paste, you may use glue. For a cochon mortar, which is  $\frac{1}{2}$  inches 2-5ths diameter, roll the pasteboard on the former 1-6th of its diameter thick; and, when dry, cut one end smooth and even; then nail and glue it on the upper part of the foot: when done, cut off the pasteboard at top, allowing for the length of the mortar  $2\frac{1}{2}$  diameters from the mouth of the powder-chamber; then bind the mortar round with a strong cord wetted with glue. U, the bottom part of the foot is 1 diameter 2-3ds broad, and 1 diameter high; and that part which goes into the mortar is 2 3ds of its diameter high. W, is a copper chamber for powder, made in a conical form; and is 1-3d of the diameter wide,  $1\frac{1}{2}$  of its own diameter long. In the centre of the bottom of this chamber, make a small hole a little way down the foot; this hole must be met by another of the same size, made in the side of the foot, as is shown in the figure. If these holes are made true, and a copper pipe fitted into both, the mortar when loaded will prime itself; for the powder will naturally fall to the bottom of the first hole; then by putting a bit of quick-match in the side hole, your mortar will be ready to be fired.

Mortars of  $5\frac{1}{2}$ , 8 and 10 inches diameter, may be made of paper or pasteboard, by the above method, and in the same proportion; but if larger, it will be best to have them made of brass. N. B. The copper chamber must have a small rim round its edge with holes in it, for screws to make it fast in the foot.

SECT. III. *To load Air-Balloons, with the number of Stars, Serpents, Snakes, Rain-falls, &c. in Shells of each nature.*

56. *Mortars to throw Aigrettes, &c.*

When you fill your shells, you must first put in the fer-

Air-Bal  
loons, &c.

serpents, rains, stars, &c. or whatever they are composed of; then the blowing powder; but the shells must not be quite filled. All those things must be put in at the fuze hole; but marrons being too large to go in at the fuze hole, must be put in before the inside shell be joined. When the shells are loaded, glue and drive in the fuzes very tight. For a coehorn balloon, let the diameter of the fuze hole be  $\frac{7}{8}$ ths of an inch. For a royal balloon, which is near  $5\frac{1}{2}$  inches diameter, make the fuze hole 1 inch 1-6th diameter; for an 8-inch balloon, 1 inch 3-8ths; and for a 10-inch balloon, 1 inch 5-8ths.

Air-balloons are divided into 4 sorts, viz. first, illuminated balloons; second, balloons of serpents; third, balloons of reports, marrons, and crackers; and fourth, compound balloons. The number and quantities of each article for the different shells are as follow.

<i>Coehorn balloon illuminated.</i>		oz.
Meal	} powder {	1 $\frac{1}{2}$
Corn		0 $\frac{1}{2}$
Powder for the mortar		2

Length of the fuze composition,  $\frac{3}{4}$  of an inch; 1 oz. drove or rolled stars, as many as will nearly fill the shell.

<i>Coehorn balloon of serpents.</i>		oz.
Meal	} powder {	1 $\frac{1}{4}$
Corn		1
Powder for the mortar		2 $\frac{1}{2}$

Length of the fuze composition 13-16ths of an inch: half-oz. cafes drove 3 diameters and bounced 3 diameters, and half-oz. cafes drove 2 diameters and bounced 4, of each an equal quantity, and as many of them as will fit in easily placed head to tail.

<i>Coehorn balloon of crackers and reports.</i>		oz.
Meal	} powder {	1 $\frac{1}{2}$
Corn		0 $\frac{3}{4}$
Powder for the mortar		2

Length of the fuze composition  $\frac{3}{4}$  of an inch. Reports 4, and crackers of 6 bounces as many as will fill the shell.

<i>Compound coehorn balloons.</i>		oz. dr.
Meal	} powder {	1 4
Corn		0 12
Powder for the mortar		2 4

Length of the fuze composition 13-16ths of an inch:  $\frac{1}{2}$  oz. cafes drove  $3\frac{3}{4}$  diameters and bounced 2, 16;  $\frac{1}{2}$  oz. cafes drove 4 diameters and not bounced 10; blue string stars, 10; rolled stars, as many as will complete the balloon.

<i>Royal balloons illuminated.</i>		oz. dr.
Meal	} powder {	1 8
Corn		0 12
Powder for the mortar.		3 0

Length of the fuze composition 15-16ths of an inch: 2 oz string stars, 34; rolled stars, as many as the shell will contain, allowing room for the fuze.

<i>Royal balloons of serpents.</i>		oz. dr.
Meal	} powder {	1 0
Corn		1 8
Powder for the mortar		3 8

Length of the fuze composition 1 inch: 1 oz. cafes drove  $3\frac{3}{4}$  and 4 diameters, and bounced 2, of each an equal quantity, sufficient to load the shell.

<i>Royal balloons with crackers and marrons.</i>		oz. dr.
Meal	} powder {	1 8
Corn		1 4
Powder for firing the mortar		3 0

Length of the fuze composition 14-16ths of an inch; reports 12, and completed with crackers of 8 bounces.

<i>Compound royal balloons.</i>		oz. dr.
Meal	} powder {	1 5
Corn		1 6
Powder for the mortar		3 12

Length of the fuze composition 1 inch:  $\frac{1}{2}$  oz. cafes drove and bounced 2 diameters, 8; 2-ounce cafes filled 3-8ths of an inch with star composition, and bounced 2 diameters, 8; silver rain-falls, 10; 2 oz. tailed stars, 16; rolled brilliant stars, 30. If this should not be sufficient to load the shell, you may complete it with gold rain-falls.

<i>Eight-inch balloons illuminated.</i>		oz. dr.
Meal	} powder {	2 8
Corn		1 4
Powder for the mortar		9 0

Length of the fuze composition 1 inch 1-8th: 2 oz. drove stars, 48; 2 oz. cafes drove with star composition 3-8ths of an inch, and bounced 3 diameters, 12; and the balloon completed with 2 oz. drove brilliant stars.

<i>Eight-inch balloons of serpents.</i>		oz. dr.
Meal	} powder {	2 0
Corn		2 0
Powder for the mortar		9 8

Length of the fuze composition 1 inch 3-16ths: 2 oz. cafes drove  $1\frac{1}{2}$  diameter and bounced 2, and 1 oz. cafes drove 2 diameters and bounced  $2\frac{1}{2}$ , of each an equal quantity sufficient for the shell.

N. B. The star-composition drove in bounced cafes must be managed thus: First, the cafes must be pinched close at one end, then the corn-powder put in for a report, and the cafe pinched again close to the powder, only leaving a small vent for the star-composition, which is drove at top, to communicate to the powder at the bounce end.

<i>Compound eight-inch balloons.</i>		oz. dr.
Meal	} powder {	2 8
Corn		1 12
Powder for the mortar		9 4

Length of the fuze composition 1-8th: 4 oz. cafes drove with star-composition 3-8ths of an inch, and bounced 3 diameters, 16; 2 oz. tailed stars, 16; 2 oz. drove brilliant stars, 12; silver rain-falls, 20; 1 oz. drove blue stars, 20; and 1 oz. cafes drove and bounced 2 diameters, as many as will fill the shell.

<i>Another of eight inches.</i>		oz. dr.
Meal	} powder {	2 8
Corn		1 12
Powder for the mortar		9 4

Length of the fuze composition 1 inch 1-8th: crackers of 6 reports, 10; gold rains, 14; 2 oz. cafes drove with star-composition 3-8ths of an inch, and bounced 2 diameters, 16; 2 oz. tailed stars, 16; 2 oz. drove brilliant stars, 12; silver rains, 10; 1 oz. drove blue stars, 20; and 1 oz. cafes drove with a brilliant charge 2 diameters and bounced 3, as many as the shell will hold.

		<i>A compound ten-inch balloon.</i>	oz. dr.
Meal	} powder {	- - -	3 4
Corn		- - -	2 8
Powder for the mortar		- - -	12 8
Length of the fuze composition 15-16ths of an inch: 1 oz. cafes drove and bounced 3 diameters, 16. Crackers of 8 reports, 12; 4 oz. cafes drove $\frac{1}{2}$ inch with star-composition, and bounced 2 diameters, 14; 2 oz. cafes drove with brilliant fire $1\frac{1}{2}$ diameter, and bounced 2 diameters, 16; 2 oz. drove brilliant stars, 30; 2 oz. drove blue stars, 3; goold rains, 20; silver rains, 20. After all these are put in, fill the remainder of the cafe with tailed and rolled stars.			
		<i>Ten-inch balloons of three charges.</i>	oz. dr.
Meal	} powder {	- - -	3 0
Corn		- - -	3 2
Powder for the mortar		- - -	13 0

Length of the fuze composition 1 inch. The shell must be loaded with 2 oz. cafes, drove with star composition  $\frac{1}{2}$  of an inch, and on that 1 diameter of gold fire, then bounced 3 diameters; or with 2 oz. cafes first filled 1 diameter with gold fire, then  $\frac{2}{3}$  of an inch with star composition, and on that  $1\frac{1}{2}$  diameter of brilliant fire. These cafes must be well secured at top of the charge, lest they should take fire at both ends; but their necks must be larger than the common proportion.

#### 57. To make Balloon Fuzes.

FUZES for air balloons are sometimes turned out of dry beech, with a cup at top to hold the quick-match, as you see in fig. 5. but if made with pasted paper, they will do as well: the diameter of the former for fuzes for cohorn balloons, must be  $\frac{1}{2}$  an inch; for a royal fuze, 5-8ths of an inch; for an 8-inch fuze,  $\frac{1}{2}$  of an inch; and for a 10-inch fuze, 7-8ths of an inch. Having rolled your cafes, pinch and tie them almost close at one end; then drive them down, and let them dry. Before you begin to fill them, mark on the outside of the cafe the length of the charge required, allowing for the thickness of the bottom; and when you have rammed in the composition, take two pieces of quick-match about 6 inches long, and lay one end of each on the charge, and then a little meal-powder, which ram down hard; the loose ends of the match double up into the top of the fuze, and cover it with a paper cap to keep it dry. When you put the shells in the mortars, uncap the fuzes, and pull out the loose ends of the match, and let them hang on the sides of the balloons. The use of the match is, to receive the fire from the powder in the chamber of the mortar in order to light the fuze: the shell being put in the mortar with the fuze uppermost, and exactly in the centre, sprinkle over it a little meal-powder, and it will be ready to be fired. Fuzes made of wood must be longer than those of paper, and not bored quite through, but left solid about  $\frac{1}{2}$  an inch at bottom; and when you use them, saw them off to a proper length, measuring the charge from the cup at top.

#### 58. Tourbillons.

HAVING filled some cafes within about  $1\frac{1}{2}$  diameter, drive in a ladleful of clay; then pinch their ends close, and drive them down with a mallet. When done, find the centre of gravity of each cafe; where you nail and tie a stick, which should be  $\frac{1}{2}$  an inch broad at the middle, and run a little narrower to the ends: these

sticks must have their ends turned upwards, so that the cafes may turn horizontally on their centres: at the opposite sides of the cafes, at each end, bore a hole close to the clay with a gimblet, the size of the neck of a common cafe of the same nature; from these holes draw a line round the cafe, and at the under part of the cafe bore a hole with the same gimblet, within  $\frac{1}{2}$  diameter of each line towards the centre; then from one hole to the other draw a right line. This line divide into three equal parts; and at X and Y, fig. 6. bore a hole; then from these holes to the other two, lead a quick-match, over which paste a thin paper. Fig. 7. represents a tourbillon as it should lie to be fired, with a leader from one side-hole A, to the other B. When you fire tourbillons, lay them on a smooth table, with their sticks downwards, and burn the leader through the middle with a port-fire. They should spin three or four seconds on the table before they rise, which is about the time the composition will be burning from the side-holes to those at bottom.

To tourbillons may be fixed reports in this manner: In the centre of the cafe at top make a small hole, and in the middle of the report make another; then place them together, and tie on the report, and with a single paper secure it from fire: this done, your tourbillon is completed. By this method you may fix on tourbillons small cones of stars, rains, &c. but be careful not to load them too much. One-eighth of an inch will be enough for the thickness of the sticks, and their length equal to that of the cafes.

#### 59. To make Mortars to throw Agrettes, and to load and fire them.

MORTARS to throw agrettes are generally made of pasteboard, of the same thickness as balloon mortars, and  $2\frac{1}{2}$  diameters long in the inside from the top of the foot: the foot must be made of elm without a chamber, but flat at top, and in the same proportion as those for balloon mortars; these mortars must also be bound round with a cord as before-mentioned: sometimes 8 or 9 of these mortars, of about three or four inches diameter, are bound all together so as to appear but one: but when they are made for this purpose, the bottom of the foot must be of the same diameter as the mortars, and only  $\frac{1}{2}$  diameter high. Your mortars being bound well together, fix them on a heavy solid block of wood. To load these mortars, first put on the inside bottom of each a piece of paper, and on it spread  $1\frac{1}{2}$  oz. of meal and corn powder mixed; then tie your serpens up in parcels with quick-match, and put them in the mortar with their mouths downwards; but take care the parcels do not fit too tight in the mortars, and that all the serpens have been well primed with powder wetted with spirit of wine. On the top of the serpens in each mortar lay some paper or tow; then carry a leader from one mortar to the other all round, and then from all the outside mortars into that in the middle: these leaders must be put between the cafes and the sides of the mortar, down to the powder at bottom: in the centre of the middle mortar fix a fire-pump, or brilliant fountain, which must be open at bottom, and long enough to project out of the mouth of the mortar; then paste paper on the tops of all the mortars.

Mortars thus prepared are called a *nest of serpens*, as represented by fig. 8. When you would fire these mor-

Air-Bal-  
loons, &c.Rockets,  
&c.

mortars, light the fire-pump C, which when consumed will communicate to all the mortars at once by means of the leaders. For mortars of 6, 8, or 10 inches diameter, the serpents should be made in 1 and 2 oz. cafes 6 or 7 inches long, and fired by a leader brought out of the mouth of the mortar, and turned down the outside, and the end of it covered with paper, to prevent the sparks of the other works from setting it on fire. For a six-inch mortar, let the quantity of powder for firing be 2 oz.; for an 8-inch,  $2\frac{1}{2}$  oz.; and for a 10-inch,  $3\frac{1}{2}$  oz. Care must be taken in these, as well as small mortars, not to put the serpents in too tight, for fear of bursting the mortars. These mortars may be loaded with flars, crackers, &c.

If the mortars, when loaded, are sent to any distance, or liable to be much moved, the firing powder should be secured from getting amongst the serpents, which would endanger the mortars, as well as hurt their performance. To prevent which, load your mortars thus: First put in the firing powder, and spread it equally about; then cut a round piece of blue touch-paper, equal to the exterior diameter of the mortar, and draw on it a circle equal to the interior diameter of the mortar, and notch it all round as far as that circle; then paste that part which is notched, and put it down the mortar close to the powder, and stick the pasted edge to the mortar: this will keep the powder always smooth at bottom, so that it may be moved or carried any where, without receiving damage. The large single mortars are called *pots des aigrettes*.

#### 60. Making, loading, and firing of Pots des Brins.

These are formed of pasteboard, and must be rolled pretty thick. They are usually made 3 or 4 inches diameter, and 4 diameters long; and pinched with a neck at one end, like common cafes. A number of these are placed on a plank thus: Having fixed on a plank two rows of wooden pegs, cut in the bottom of the plank a groove the whole length under each row of pegs; then, through the centre of each peg, bore a hole down to the groove at bottom, and on every peg fix and glue a pot, whose mouth must fit tight on the peg: through all the holes run a quick-match, one end of which must go into the pot, and the other into the groove, which must have a match laid in it from end to end, and covered with paper, so that when lighted at one end it may discharge the whole almost instantaneously: in all the pots put about 1 oz. of meal and corn powder; then in some put flars, and others rains, snakes, serpents, crackers, &c. when they are all loaded, paste paper over their mouths. Two or three hundred of these pots being fixed together make a very pretty show, by affording to great a variety of fires. Fig. 9. is a range of pots des brins, with a leader A, by which they are fired.

#### 61. Pots des Saucissons

ARE generally fired out of large mortars without chambers, the same as those for aigrettes, only somewhat stronger. Saucissons are made of 1 and 2 oz. cafes, 5 or 6 inches long, and choaked in the same manner as serpents. Half the number which the mortar contains must be drove  $1\frac{1}{2}$  diameter with composition, and the other half two diameters, so that when fired they may give two volleys of reports. But if the mortars are very strong, and will bear a sufficient charge to throw the saucissons very high, you may make three

volleys of reports, by dividing the number of cafes into three parts, and making a difference in the height of the charge. After they are filled, pinch and tie them at top of the charge almost close; only leaving a small vent to communicate the fire to the upper part of the cafe, which must be filled with corn-powder very near the top; then pinch the end quite close, and tie it: after this is done, bind the cafe very tight with waxed pack-thread, from the choak at top of the composition to the end of the cafe; this will make the cafe very strong in that part, and cause the report to be very loud. Saucissons should be rolled a little thicker of paper than the common proportion. When they are to be put in the mortar, they must be primed in their mouths, and fired by a cafe of brilliant fire fixed in their centre.

The charge for these mortars should be 1-6th or 1-8th more than for *pots des aigrettes* of the same diameter.

#### SECT. IV. Different kinds of Rockets, with their Appendages and Combinations.

##### 62. To fix one Rocket on the top of another.

WHEN sky-rockets are thus managed, they are called *towering rockets*, on account of their mounting so very high. Towering rockets are made after this manner: Fix on a pound-rocket a head without a collar; then take a 4 oz. rocket, which may be headed or bounced, and rub the mouth of it with meal-powder wetted with spirit of wine: when done, put it in the head of the large rocket with its mouth downwards; but before you put it in, stick a bit of quick-match in the hole of the clay of the pound-rocket, which match should be long enough to go a little way up the bore of the small rocket, to fire it when the large is burnt out: the 4 oz. rocket being too small to fill the head of the other, roll round it as much tow as will make it stand upright in the centre of the head: the rocket being thus fixed, paste a single paper round the opening of the top of the head of the large rocket. The large rocket must have only half a diameter of charge rammed above the piercer; for, if filled to the usual height, it would turn before the small one takes fire, and entirely destroy the intended effect: when one rocket is headed with another there will be no occasion for any blowing powder; for the force with which it sets off will be sufficient to disengage it from the head of the first fired rocket. The sticks for these rockets must be a little longer than for those headed with flars, rains, &c.

##### 63. Caduceus Rockets,

In rising, form two spiral lines, or double worm, by reason of their being placed obliquely, one opposite the other; and their counterpoise in their centre, which causes them to rise in a vertical direction. Rockets for this purpose must have their ends choaked close, without either lead or bounce, for a weight at top would be a great obstruction to their mounting; though I have known them sometimes to be bounced, but then they did not rise so high as those that were not; nor do any caduceus rockets ascend so high as single, because of their serpentine motion, and likewise the resistance of air, which is much greater than two rockets of the same size would meet with if fired singly.

By 2<sup>d</sup> fig. 9. you see the method of fixing these rock-

ets: the sticks for this purpose must have all their sides alike, which sides should be equal to the breadth of a stick proper for a sky-rocket of the same weight as those you intend to use, and to taper downwards as usual, long enough to balance them, one length of a rocket from the cross stick; which must be placed from the large stick 6 diameters of one of the rockets, and its length 7 diameters; so that each rocket, when tied on, may form with the large stick an angle of 60 degrees. In tying on the rockets, place their heads on the opposite sides of the cross stick, and their ends on the opposite sides of the long stick; then carry a leader from the mouth of one into that of the other. When these rockets are to be fired, suspend them between two hooks or nails, then burn the leader through the middle, and both will take fire at the same time. Rockets of 1 lb. are a good size for this use.

#### 64. *Honorary Rockets,*

ARE the same as sky-rockets, except that they carry no head nor report, but are closed at top, on which is fixed a cone; then on the cafe, close to the top of the stick, you tie on a 2 oz. cafe, about 5 or 6 inches long, filled with a strong charge, and pinched close at both ends; then in the reverse sides, at each end, bore a hole in the same manner as in tourbillons; from each hole carry a leader into the top of the rocket. When the rocket is fired, and arrived to its proper height, it will give fire to the cafe at top; which will cause both rocket and stick to spin very fast in their return, and represent a worm of fire descending to the ground.

There is another method of placing the small cafe, which is by letting the stick rise a little above the top of the rocket, and tying the cafe to it, so as to rest on the rocket: these rockets have no cones.

There is also a third method by which they are managed, which is thus: In the top of a rocket fix a piece of wood, in which drive a small iron spindle; then make a hole in the middle of the small cafe, through which put the spindle; then fix on the top of it a nut, to keep the cafe from falling off; when this is done, the cafe will turn very fast, without the rocket: but this method does not answer so well as either of the former.

Fig. 10. is the honorary rocket complete. The best sized rockets for this purpose are those of 1 lb.

#### 65. *To divide the Tail of a Sky Rocket so as to form an Arch when ascending.*

HAVING some rockets made, and headed according to fancy, and tied on their sticks; get some sheet tin, and cut it into round pieces about 3 or 4 inches diameter; then on the stick of each rocket, under the mouth of the cafe, fix one of these pieces of tin 16 inches from the rocket's neck, and support it by a wooden bracket, as strong as possible: the use of this is, that when the rocket is ascending the fire will play with great force on the tin, which will divide the tail in such a manner that it will form an arch as it mounts, and will have a very good effect when well managed; if there is a short piece of port-fire, of a strong charge, tied to the end of the stick, it will make a great addition; but this must be lighted before you fire the rocket.

#### 66. *To make several Sky Rockets rise in the same direction, and equally distant from each other.*

TAKE six, or any number of sky rockets, of what size you please, then cut some strong pack-thread into pieces of 3 or 4 yards long, and tie each end of these pieces

to a rocket in this manner: Having tied one end of your pack-thread round the body of one rocket, and the other end to another, take a second piece of pack-thread and make one end of it fast to one of the rockets already tied, and the other end to a third rocket, so that all the rockets, except the two outside, will be fastened to two pieces of pack-thread: the length of thread from one rocket to the other may be what the maker pleases; but the rockets must be all of a size, and their heads filled with the same weight of stars, rains, &c.

Having thus done, fix in the mouth of each rocket a leader of the same length; and when you are going to fire them, hang them almost close; then tie the ends of the leaders together, and prime them: this prime being fired, all the rockets will mount at the same time, and divide as far as the strings will allow; which division they will keep, provided they are all rammed alike, and well made. They are called by some *chained rockets*.

#### 67. *Signal Sky-Rockets*

ARE made of several kinds, according to the different signals intended to be given: but in artificial fireworks, two sorts are only used, which are one with reports and the other without; but those for the use of the navy and army are headed with stars, serpents, &c.—Rockets which are to be bounced must have their cafes made  $\frac{1}{2}$  or 2 diameters longer than the common proportion; and after they are filled, drive in a double quantity of clay, then bounce and pinch them after the usual manner, and fix on each a cap.

Signal sky-rockets without bounces, are only sky-rockets closed and capped: these are very light, therefore do not require such heavy sticks as those with loaded heads; for which reason you may cut one length of the rocket off the stick, or else make them thinner.

Signal rockets with reports, are fired in small flights; and often both these, and those without reports, are used for a signal to begin firing a collection of works.

#### 68. *To fix a Sky Rocket with its stick on the top of another.*

ROCKETS thus managed make a pretty appearance, by reason of a fresh tail being seen when the second rocket takes fire, which will mount to a great height. The method of preparing these rockets is thus: Having filled a two-pounder, which must be filled only half a diameter above the piercer, and its head not more than 10 or 12 stars; the stick of this rocket must be made a little thicker than common; and when made, cut it in half the flat way, and in each half make a groove, so that, when the 2 halves are joined, the hollow made by the grooves may be large enough to hold the stick of a half-pound rocket; which rocket make and head as usual: put the stick of this rocket into the hollow of the large one, so far that the mouth of the rocket may rest on the head of the two-pounder; from whose head carry a leader into the mouth of the small rocket; which being done, your rockets will be ready for firing.

#### ad 68. *To fix two or more Sky Rockets on one stick.*

Two, three, or six sky-rockets, fixed on one stick, and fired together, make a grand and beautiful appearance; for the tails of all will seem but as one of an immense size, and the breaking of so many heads at

Rockets,  
&c.Rockets,  
&c.

once will resemble the bursting of an air balloon. The management of this device requires a skilful hand; but if the following instructions be well observed, even by those who have not made a great progress in this art, there will be no doubt of the rockets having the desired effect.

Rockets for this purpose must be made with the greatest exactness, all rammed by the same hand, in the same mould, and out of the one proportion of composition; and after they are filled and headed, must all be of the same weight. The stick must also be well made (and proportioned) to the following directions: first, supposing your rockets to be  $\frac{1}{2}$  pounders, whose sticks are 6 feet 6 inches long, then if 2, 3, or 6 of these are to be fixed on 1 stick, let the length of it be 9 feet 9 inches; then cut the top of it into as many sides as there are rockets, and let the length of each side be equal to the length of 1 of the rockets without its head; and in each side cut a groove (as usual); then from the grooves plane it round, down to the bottom, where its thickness must be equal to half the top of the round part. As their thickness cannot be exactly ascertained, we shall give a rule which generally answers for any number of rockets above two: the rule is this; that the stick at top must be thick enough, when the grooves are cut, for all the rockets to lie, without pressing each other, though as near as possible.

When only 2 rockets are to be fixed on 1 stick, let the length of the stick be the last given proportion, but shaped after the common method, and the breadth and thickness double the usual dimensions. The point of poise must be in the usual places, (let the number of rockets be what they will;) if sticks made by the above directions should be too heavy, plane them thinner; and if too light, make them thicker; but always make them of the same length.

When more than two rockets are tied on one stick, there will be some danger of their flying up without the stick, unless the following precaution is taken: For cases being placed on all sides, there can be no notches for the cord which ties on the rockets to lie in; therefore, instead of notches, drive a small nail in each side of the stick, between the necks of the cases; and let the cord, which goes round their necks, be brought close under the nails; by this means the rockets will be as secure as when tied on singly. Your rockets being thus fixed, carry a quick-match, without a pipe, from the mouth of one rocket to the other; this match being lighted will give fire to all at once.

Though the directions already given may be sufficient for these rockets, we shall here add an improvement on a very essential part of this device, which is, that of hanging the rockets to be fired; for before the following method was hit upon, many essays proved unsuccessful. Instead, therefore, of the old and common manner of hanging them on nails or hooks, make use of this contrivance: Have a ring made of strong iron wire, large enough for the stick to go in as far as the mouths of the rockets; then let this ring be supported by a small iron, at some distance from the post or stand to which it is fixed; then have another ring, fit to receive and guide the small end of the stick. Rockets thus suspended will have

nothing to obstruct their fire; but when they are hung on nails or hooks, in such a manner that some of their mouths are against or upon a rail, there can be no certainty of their rising in a vertical direction.

#### 69. To fire Sky-rockets without Sticks.

You must have a stand, of a block of wood, a foot diameter, and make the bottom flat, so that it may stand steady: in the centre of the top of this block draw a circle 2 $\frac{1}{2}$  inches diameter, and divide the circumference of it into three equal parts; then take 3 pieces of thick iron wire, each about 3 feet long, and drive them into the block, 1 at each point made on the circle; when these wires are drove in deep enough to hold them fast and upright, so that the distance from one to the other is the same at top as at bottom, the stand is complete.

The stand being thus made, prepare your rockets thus: Take some common sky-rockets, of any size, and head them as you please; then get some balls of lead, and tie to each a small wire 2 or 2 $\frac{1}{2}$  feet long, and the other end of each wire tie to the neck of a rocket. These balls answer the purpose of sticks when made of a proper weight, which is about 2-3ds the weight of the rocket; but when they are of a proper size, they will balance the rocket in the same manner as a stick, at the usual point of poise. To fire these, hang them, one at a time, between the tops of the wires, letting their heads rest on the point of the wires, and the balls hang down between them: if the wires should be too wide for the rockets, press them together till they fit; and if too close, force them open: the wires for this purpose must be softened, so as not to have any spring, or they will not keep their position when pressed close or opened.

#### 70. Rain falls and Stars for Sky-rockets, Double and Single.

GOLD and silver rain compositions are drove in cases that are pinched quite close at one end; if you roll them dry, 4 or 5 rounds of paper will be strong enough; but if they are pasted, 3 rounds will do; and the thin sort of cartridge-paper is best for those small cases, which in rolling you must not turn down the inside edge as in other cases, for a double edge would be too thick for so small a bore. The moulds for rain-falls should be made of brass, and turned very smooth in the inside; or the cases, which are so very thin, would tear in coming out; for the charge must be drove in tight; and the better the case fits the mould, the more driving it will bear. These moulds have no nipple, but instead thereof they are made flat. As it would be very tedious and troublesome to shake the composition out of such small ladles as are used for these cases, it will be necessary to have a funnel made of thin tin, to fit on the top of the case, by the help of which you may fill them very fast. For single rain-falls for 4 oz. rockets, let the diameter of the former be 2-16ths of an inch, and the length of the case 2 inches; for 8 oz. rockets, 4-16ths and 2 diameters of the rocket long; for 1 lb. rockets, 5-16ths, and 2 diameters of the rocket long; for 2 lb. rockets, 5-16ths, and 3 $\frac{1}{2}$  inches long; for 4 lb. rockets, 6-16ths, and 4 $\frac{1}{2}$  inches long; and for 6-pounders, 7-16ths diameter; and 5 inches long.

Of double rain-falls there are 2 sorts. For example,

ample, some appear first like a star, and then as rain; and some appear first as rain, and then like a star. When you would have stars first, you must fill the cafes, within  $\frac{1}{2}$  inch of the top, with rain-composition, and the remainder with star-composition; but when you intend the rain should be first, drive the cafe  $\frac{1}{2}$  an inch with star-composition, and the rest with rain. By this method may be made many changes of fire; for in large rockets you may make them first burn as stars, then rain, and again as stars; or they may first show rain, then stars, and finish with a report; but when they are thus managed, cut open the first rammed end, after they are filled and bounced, at which place prime them. The star-composition for this purpose must be a little stronger than for rolled stars.

*Strung stars.* First take some thin paper, and cut it into pieces of  $1\frac{1}{2}$  inch square, or thereabouts; then on each piece lay as much dry star-composition as you think the paper will easily contain; then twist up the paper as tight as you can; when done, rub some paste on your hands, and roll the stars between them; then set them to dry: your stars being thus made, get some flax or fine tow, and roll a little of it over each star; then paste your hands and roll the stars as before, and set them again to dry; when they are quite dry, with a piercer make a hole through the middle of each, into which run a cotton quick-match, long enough to hold 10 or 12 stars at 3 or 4 inches distance: but any number of stars may be strung together by joining the match.

*Tailed stars.* These are called *tailed stars*, because there are a great number of sparks issue from them, which represent a tail like that of a comet. Of these there are two sorts, which are *rolled* and *drove*: when rolled, they must be moistened with a liquor made of half a pint of spirit of wine, and half a gill of thin size, of this as much as will wet the composition enough to make it roll easy; when they are rolled, sift meal-powder over them, and set them to dry.

When tailed stars are drove, the composition must be moistened with spirit of wine only, and not made so wet as for rolling: 1 and 2 oz. cafes, rolled dry, are best for this purpose; and when they are filled, unroll the cafe within 3 or 4 rounds of the charge, and all that you unroll cut off; then paste down the loose edge: 2 or 3 days after the cafes are filled, cut them in pieces 5 or 6-8ths of an inch in length; then melt some wax, and dip one end of each piece into it, so as to cover the composition: the other end must be rubbed with meal-powder wetted with spirit of wine.

*Drawn stars.* Cafes for drove stars are rolled with paste, but are made very thin of paper. Before you begin to fill them, damp the composition with spirit of wine that has had some camphor dissolved in it: you may ram them indifferently hard, so that you do not break or sack the cafe; to prevent which, they should fit tight in the mould. They are drove in cafes of several sizes, from 8 drams to 4 oz. When they are filled in  $\frac{3}{4}$  oz. cafes, cut them in pieces of  $\frac{1}{2}$  of an inch long; if 1 oz. cafes, cut them in pieces of 1 inch; if 2 oz. cafes, cut them in pieces of  $1\frac{1}{2}$  inch long; and if 4 oz. cafes, cut them in pieces of  $1\frac{1}{2}$  inch long: having cut your stars of a proper size, prime both ends with wet meal-powder. These stars are seldom put in

rockets, they being chiefly intended for air balloons, and drove in cafes, to prevent the composition from being broke by the force of the blowing powder in the shell.

*Rolling stars* are commonly made about the size of a musket-ball: though they are rolled of several sizes, from the bigness of a pistol-ball to 1 inch diameter; and sometimes very small, but are then called *sparks*. Great care must be taken in making stars, first, that the several ingredients are reduced to a fine powder; secondly, that the composition is well worked and mixed. Before you begin to roll, take about a pound of composition, and wet it with the following liquid, enough to make it stick together and roll easy: Spirit of wine 1 quart, in which dissolve  $\frac{1}{2}$  of an ounce of isinglass. If a great quantity of composition be wetted at once, the spirit will evaporate, and leave it dry, before you can roll it into stars: having rolled up one proportion, shake the stars in meal-powder, and set them to dry, which they will do in 3 or 4 days; but if you should want them for immediate use, dry them in an earthen pan over a slow heat, or in an oven. It is very difficult to make the stars all of an equal size, when the composition is taken up profusiously with the fingers; but by the following method they may be made them very exact: When the mixture is moistened properly, roll it on a flat smooth stone, and cut it into square pieces, making each square large enough for the stars you intend. There is another method used by some to make stars, which is by rolling the composition in long pieces, and then cutting off the star, so that each star will be of a cylindrical form: but this method is not so good as the former; for, to make the composition roll this way, it must be made very wet, which makes the stars heavy, as well as weakens them. All stars must be kept as much from air as possible, otherwise they will grow weak and bad.

#### 71. Scrolls for Sky Rockets.

Cases for scrolls should be made 4 or 5 inches in length, and their interior diameter 3-8ths of an inch: one end of these cafes must be pinched quite close, before you begin to fill; and when filled, close the other end: then in the opposite sides make a small hole at each end, to the composition, in the same manner as in tourbillons; and prime them with wet meal-powder. You may put in the head of a rocket as many of these cafes as it will contain: being fired they turn very quick in the air, and form a scroll or spiral line. They are generally filled with a strong charge, as that of serpents, or brilliant fire.

#### 72. Swarmeries, or small Rockets.

ROCKETS that go under the denomination of *swarmeries*, are those from 2 oz. downwards. These rockets are fired sometimes in flights, and in large water-works, &c. Swarmeries of 1 and 2 oz. are bored, and made in the same manner as large rockets, except that, when headed, their heads must be put on without a collar: the number of strokes for driving 1 oz. must be 8, and for 2 oz. 12.

All rockets under 1 oz. are not bored, but must be filled to the usual height with composition, which generally consists of fine meal-powder 4 oz. and charcoal or steel-dust 2 drams: the number of strokes for ramming these small swarmeries is not material, provided they

Rockets, &c. they are rammed true, and moderately hard. The necks of unbored rockets must be in the same proportion as in common cases.

73. *Stands for Sky-Rockets.*

CARE must be taken, in placing the rockets when they are to be fired, to give them a vertical direction at their first setting out; which may be managed thus. Have two rails of wood, of any length, supported at each end by a perpendicular leg, so that the rails be horizontal, and let the distance from one to the other be almost equal to the length of the sticks of the rockets intended to be fired; then in the front of the top rail drive square hooks at 8 inches distance, with their points turning sideways, so that when the rockets are hung on them, the points will be before the sticks and keep them from falling or being blown off by the wind: in the front of the rail at bottom must be staples, drove perpendicular under the hooks at top; through these staples put the small ends of the rocket-sticks. Rockets are fired by applying a lighted port-fire to their mouths.

N. B. When sky-rockets are made to perfection, and fired, they will stand 2 or 3 seconds on the hook before they rise, and then mount up briskly, with a steady motion, carrying a large tail from the ground all the way up, and just as they turn break and disperse the stars.

74. *Girandole Chests, for Flights of Rockets.*

THERE are generally composed of four sides, of equal dimensions; but may be made of any diameter, according to the number of rockets designed to be fired; its height must be in proportion to the rockets, but must always be a little higher than the rockets with their sticks. When the sides are joined, fix in the top, as far down the chest as the length of one of the rockets with its cap on. In this top, make as many square or round holes to receive the rocket-sticks, as you intend to have rockets; but let the distance between them be sufficient for the rockets to stand without touching one another; then from one hole to another cut a groove large enough for a quick-match to lie in: the top being thus fixed, put in the bottom, at about 1½ foot distance from the bottom of the chest; in this bottom must be as many holes as in the top, and all to correspond; but these holes need not be so large as those in the top.

To prepare your chest, you must lay a quick-match, in all the grooves, from hole to hole; than take some sky-rockets, and rub them in the mouth with wet meal-powder, and put a bit of match up the cavity of each, which match must be long enough to hang a little below the mouth of the rocket. Your rockets and chest being prepared according to the above directions, put the sticks of the rockets through the holes in the top and bottom of the chest, so that their mouths may rest on the quick-match in the grooves: by which all the rockets will be fired at once; for by giving fire to any part of the match, it will communicate to all the rockets in an instant. As it would be rather troublesome to direct the sticks from the top to the proper holes in the bottom, it will be necessary to have a small door in one of the sides, which when opened, you may see how to place the sticks. Flights of rockets being seldom set off at the beginning of any fireworks, they are in danger of being fired by

the sparks from wheels, &c. therefore, to preserve them, a cover should be made to fit on the chest, and the door in the side kept shut.

75. *Serpents or Snakes for Pots of Aigrettes, small Mortars, Sky-Rockets, &c.*

SERPENTS for this use are made from 2½ inches to 7 inches long, and their formers from 3-16ths to 5-8ths of an inch diameter; but the diameter of the cases must always be equal to 2 diameters of the former. They are rolled and choaked like other cases, and filled with composition from 5-8ths of an inch to 1½ inch high, according to the size of the mortars or rockets they are designed for; and the remainder of the cases bounced with corn-powder, and afterwards their ends pinched and tied close: before they are used, their mouths must be primed with wet meal-powder.

76. *Leaders, or Pipes of Communication.*

THE best paper for leaders is elephant; which you cut into long slips 2 or 3 inches broad, so that they may go 3 or 4 times round the former, but not more: when they are very thick, they are too strong for the paper which fastens them to the works, and will sometimes fly off without leading the fire. The formers for these leaders are made from 2 to 6 16ths of an inch diameter; but 4-16ths is the size generally made use of. The formers are made of smooth brass wire: when you use them, rub them over with grease, or keep them wet with paste, to prevent their sticking to the paper, which must be patted all over. In rolling of pipes, make use of a rolling-board, but use it lightly: having rolled a pipe, draw out the former with one hand, holding the pipe as light as possible with the other; for if it press against the former, it will stick and tear the paper.

N. B. Make your leaders of different lengths, or in clothing of works you will cut a great many to waste. Leaders for marron batteries must be made of strong cartridge paper.

77. *Crackers.*

Cut some cartridge paper into pieces 3½ inches broad, and 1 foot long; one edge of each fold down lengthwise about ¼ of an inch broad; then fold the double edge down ½ of an inch, and turn the single edge back half over the double fold; then open it, and lay all along the channel, which is formed by the folding of the paper, some meal-powder; then fold it over and over till all the paper is doubled up, rubbing it down every turn; this done, bend it backwards and forwards, 2½ inches, or thereabouts, at a time, as oft as the paper will allow; then hold all these folds flat and close, and with a small pinching cord give one turn round the middle of the cracker, and pinch it close; then bind it with a pack-thread as tight as you can; then, in the place where it was pinched, prime one end of it, and cap it with touch-paper. When these crackers are fired, they will give a report at every turn of the paper: if you would have a great number of bounces, you must cut the paper longer, or join them after they are made; but if they are made very long before they are pinched, you must have a piece of wood with a groove in it, deep enough to let in half the cracker; this will hold it straight while it is pinching. Fig. 12, represents a cracker complete.

Rockets, &c.

78. *Single Reports.*

CASES for reports are generally rolled on 1 and 2 oz. formers, and seldom made larger but on particular occasions; they are made from 2 to 4 inches long, and very thick of paper. Having rolled a case, pinch one end quite close, and drive it down: then fill the case with corn-powder, only leaving room to pinch it at top; but before you pinch it, put in a piece of paper at top of the powder. Reports are fired by a vent, bored in the middle, or at one end, just as required.

79. *Marrons.*

FORMERS for marrons are from  $\frac{1}{2}$  of an inch to  $1\frac{1}{2}$  diameter. Cut the paper for the cases twice the diameter of the former broad, and long enough to go three times round: when you have rolled a case, patte down the edge and tie one end close; then with the former drive it down to take away the wrinkles, and make it flat at bottom; then fill the case with corn-powder  $\frac{1}{2}$  diameter and  $\frac{1}{2}$  high, and fold down the rest of the case tight on the powder. The marron being thus made, wax some strong pack-thread with shoemakers wax; this thread wind up in a ball, then unwind two or three yards of it, and that part which is near the ball make fast to a hook; then take a marron, and stand as far from the hook as the pack-thread will reach, and wind it lengthwise round the marron as close as you can, till it will hold no more that way; then turn it, and wind the pack-thread on the short way, then lengthwise again, and so on till the paper is all covered; then make fast the end of the pack-thread, and beat down both ends of the marron to bring it in shape. The method of firing marrons is by making a hole at one end with an awl, and putting in a piece of quick-match; then take a piece of strong paper, in which wrap up the marron with two leaders, which must be put down to the vent, and the paper tied tight round them with small twine: these leaders are bent on each side, and their loose ends tied to other marrons, and are nailed in the middle to the rail of the stand, as in fig. 13. The use of winding the pack-thread in a ball is, that you may let it out as you want it, according to the quantity the marron may require; and that it may not be tied in knots, which would spoil the marron.

80. *Marron Batteries.*

If well managed, will keep time to a march, or a slow piece of music. Marron batteries are made of several stands, with a number of cross rails for the marrons; which are regulated by leaders, by cutting them of different lengths, and nailing them tight or loose according to the time of the music. In marron batteries you must use the large and small marrons, and the nails for the pipes must have flat heads.

81. *Line Rockets.*

ARE made and drove as the sky-rockets, but have no heads, and the cases must be cut close to the clay: they are sometimes made with 6 or 7 changes, but in general not more than 4 or 5. The method of managing those rockets is thus: First, have a piece of light wood, the length of one of the rockets, turned round about 2 $\frac{1}{2}$  inches diameter, with a hole through the middle lengthwise, large enough for the line to go easily through: if you design four changes, have four grooves cut in the swivel, one opposite the other, to lay the rockets in.

The mouths of the rockets being rubbed with wet

meal-powder, lay them in the grooves head to tail, and tie them fast; from the tail of the first rocket carry a leader to the mouth of the second, and from the second to the third, and so on to as many as there are on the swivel, making every leader very secure; but in fixing these pipes, take care that the quick-match does not enter the bores of the rockets: the rockets being fixed on the swivel and ready to be fired, have a line 100 yards long, stretched and fixed up tight, at any height from the ground; but be sure to place it horizontal: this length of line will do for  $\frac{1}{2}$  lb. rockets; but if larger, the line must be longer. Before you put up the line, put one end of it through the swivel; and when you fire the line rocket, let the mouth of that rocket which you fire first face that end of the line where you stand; then the first rocket will carry the rest to the other end of the line, and the second will bring them back; and so they will run out and in according to the number of rockets: at each end of the line there must be a piece of flat wood for the rocket to strike against, or its force will cut the line. Let the line be well soaped, and the hole in the swivel very smooth.

82. *Different decorations for Line Rockets.*

To line rockets may be fixed great variety of figures, such as flying dragons, Mercuries, ships, &c. Or they may be made to run on the line like a wheel; which is done in this manner. Have a flat swivel made very exact, and on it tie two rockets obliquely, one on each side, which will make it turn round all the way it goes, and form a circle of fire; the charge for these rockets should be a little weaker than common. If you would show two dragons fighting, get two swivels made square, and on each tie three rockets together on the under side; then have two flying dragons made of tin, and fix one of them on the top of each swivel, so as to stand upright; in the mouth of each dragon put a small case of common fire, and another at the end of the tail; you may put two or three port-fires, of a strong charge, on one side of their bodies, to show them. This done, put them on the line, one at each end; but let there be a swivel in the middle of the line to keep the dragons from striking together: before you fire the rockets, light the cases on the dragons; and if care be taken in firing both at the same time, they will meet in the middle of the line, and seem to fight. Then they will run back and return with great violence; which will have a very pleasing effect. The line for these rockets must be very long, or they will strike too hard together.

83. *Chinese Flyers.*

CASES for flyers may be made of different sizes, from 1 to 8 oz.: they must be made thick of paper, and 8 interior diameters long; they are rolled in the same manner as tourbillons, with a straight patted edge, and pinched close at one end. The method of filling them is, the case being put in a mould, whose cylinder, or foot, must be flat at top without a nipple, fill it within  $\frac{1}{2}$  a diameter of the middle; then ram in  $\frac{1}{2}$  a diameter of clay, on that as much composition as before, on which drive  $\frac{1}{2}$  a diameter of clay; then pinch the case close, and drive it down flat: after this is done bore a hole exactly thro' the centre of the clay in the middle; then in the opposite sides, at both ends, make a vent; and in that side you intend to fire first make a small hole to the composition near the clay in the middle, from

Of Wheels, from which carry a quick-match, covered with a single paper, to the vent at the other end; then, when the charge is burnt on one side, it will, by means of the quick-match, communicate to the charge on the other, (which may be of a different fort). The flyers being thus made, put an iron pin, that must be fixed in the work on which they are to be fired, and on which they are to run, through the hole in the middle; on the end of this pin must be a nut to keep the flyer from running off. If you would have them turn back again after they are burnt, make both the vents at the ends on the same side, which will alter its course the contrary way.

84. *Table Rockets,*

ARE designed merely to show the truth of driving, and the judgment of a fire-worker, they having no other effect, when fired, than spinning round in the same place where they begin, till they are burnt out, and showing nothing more than an horizontal circle of fire.

The method of making these rockets is—Have a cone turned out of hard wood  $2\frac{1}{2}$  inches diameter, and as much high; round the base of it draw a line; on this line fix four spokes, two inches long each, so as to stand one opposite the other; then fill 4 nine-inch 1 lb cafes with any strong composition, within 2 inches of the top: these cafes are made like tourbillons, and must be rammed with the greatest exactness.

Your rockets being filled, fix their open ends on the short spokes; then in the side of each cafe bore a hole near the clay; all these holes, or vents, must be so made that the fire of each cafe may act the same way; from these vents carry leaders to the top of the cone, and tie them together. When you would fire the rockets, set them on a smooth table, and light the leaders in the middle, and all the cafes will fire together (see fig. 14.) and spin on the point of the cone.

These rockets may be made to rise like tourbillons, by making the cafes shorter, and boring four holes in the under side of each at equal distances: this being done, they are called *double tourbillons*.

*Note,* All the vents in the under side of the cafes must be lighted at once; and the sharp point of the cone cut off, at which place make it spherical.

SECT. V. *Of Wheels and other Works.*85. *Single Vertical Wheels.*

THERE are different forts of vertical wheels; some having their fells of a circular form, others of an hexagon, octagon, or decagon form, or any number of sides, according to the length of the cafes you design for the wheel: your spokes being fixed in the nave, nail slips of tin, with their edges turned up, so as to form grooves for the cafes to lie in, from the end of one spoke to another; then tie your cafes in the grooves head to tail, in the same manner as those on the horizontal water-wheel, so that the cafes successively taking fire from one another, will keep the wheel in an equal rotation. Two of these wheels are very oft fired together, one on each side of a building; and both lighted at the same time, and all the cafes filled alike, to make them keep time together; which they will do if made by the following directions. In all the cafes of both wheels, except the first, on each wheel drive two or three ladles full of slow fire, in any part of the cafes;

but be careful to ram the same quantity in each cafe, and in the end of one of the cafes, on each wheel, you may ram one ladle full of dead-fire composition, which must be very lightly drove; you may also make many changes of fire by this method.

Let the hole in the nave of the wheel be lined with brags, and made to turn on a smooth iron spindle. On the end of this spindle let there be a nut, to screw off and on; when you have put the wheel on the spindle, screw on the nut, which will keep the wheel from flying off. Let the mouth of the first cafe be a little raised. See fig. 15. Vertical wheels are made from 10 inches to 3 feet diameter, and the size of the cafes must differ accordingly; 4-oz. cafes will do for wheels of 14 or 16 inches diameter, which is the proportion generally used. The best wood for wheels of all forts, is a light and dry beech.

86. *Horizontal Wheels,*

ARE best when their fells are made circular; in the middle of the top of the nave must be a pintle, turned out of the same piece as the nave, two inches long, and equal in diameter to the bore of one of the cafes of the wheel: there must be a hole bored up the centre of the nave, within half an inch of the top of the pintle. The wheel being made, nail at the end of each spoke (of which there should be 6 or 8) a piece of wood, with a groove cut in it to receive the cafe. Fix these pieces in such a manner that half the cafes may incline upwards and half downwards, and that, when they are tied on, their heads and tails may come very near together; from the tail of one cafe to the mouth of the other carry a leader, which secure with pasted paper. Besides these pipes, it will be necessary to put a little meal-powder inside the pasted paper, to blow off the pipe, that there may be no obstruction to the fire from the cafes. By means of these pipes the cafes will successively take fire, burning one upwards and the other downwards. On the pintle fix a cafe of the same sort as those on the wheel; this cafe must be fired by a leader from the mouth of the last cafe on the wheel, which cafe must play downwards: instead of a common cafe in the middle, you may put a cafe of Chinese fire, long enough to burn as long as two or three of the cafes on the wheel.

Horizontal wheels are oft fired two at a time, and made to keep time like vertical wheels, only they are made without any slow or dead fire; 10 or 12 inches will be enough for the diameter of wheels with 6 spokes. Fig. 16. represents a wheel on fire, with the first cafe burning.

87. *Spiral Wheels,*

ARE only double horizontal wheels, and made thus: The nave must be about 6 inches long, and somewhat thicker than the single fort; instead of the pintle at top, make a hole for the cafe to be fixed in, and two sets of spokes, one set near the top of the nave, and the other near the bottom. At the end of each spoke cut a groove wherein you tie the cafes, there being no fell; the spokes should not be more than  $3\frac{1}{2}$  inches long from the nave, so that the wheel may not be more than 8 or 9 inches diameter; the cafes are placed in such a manner, that those at top play down and those at bottom play up, but let the third or fourth cafe play horizontally. The cafe in the middle may begin with any of

Of Wheels, the others you please: 6 spokes will be enough for each set, so that the wheel may consist of 12 cafes, besides that on the top: the cafes 6 inches each.

88. *Plural Wheels,*

ARE made to turn horizontally, and to consist of three sets of spokes, placed 6 at top, 6 at bottom, and 4 in the middle, which must be a little shorter than the rest: let the diameter of the wheel be 10 inches; the cafes must be tied on the ends of the spokes in grooves cut on purpose, or in pieces of wood nailed on the ends of the spokes, with grooves cut in them as usual: in clothing these wheels, make the upper set of cafes play obliquely downwards, the bottom set obliquely upwards, and the middle set horizontally. In placing the leaders, you must order it so that the cafes may burn thus, *viz.* first up, then down, then horizontal, and so on with the rest. But another charge may be made, by driving in the end of the 8th cafe two or three ladles full of slow fire, to burn till the wheel has stopped its course; then let the other cafes be fixed the contrary way, which will make the wheel run back again: for the cafe at top you may put a small gerbe; and let the cafes on the spokes be short, and filled with a strong brilliant charge.

89. *Illuminated Spiral Wheel.*

FIRST have a circular horizontal wheel made two feet diameter, with a hole quite through the nave; then take three thin pieces of deal, three feet long each, and  $\frac{1}{2}$  of an inch broad each: one end of each of these pieces nail to the fell of the wheel, at an equal distance from one another, and the other end nail to a block with a hole in its bottom, which must be perpendicular with that in the block of the wheel, but not so large. The wheel being thus made, have a hoop planned down very thin and flat; then nail one end of it to the fell of the wheel, and wind it round the three sticks in a spiral line from the wheel to the block at top: on the top of this block fix a cafe of Chinese fire; on the wheel you may place any number of cafes, which must incline downwards, and burn two at a time. If the wheel should consist of 10 cafes, you may let the illuminations and Chinese fire begin with the second cafes. The spindle for this wheel must be a little longer than the cone, and made very smooth at top, on which the upper block is to turn, and the whole weight of the wheel to rest. See fig. 17.

90. *Double Spiral Wheel.*

FOR this wheel the block, or nave, must be as long as the height of the worms, or spiral lines, but must be made very thin, and as light as possible. In this block must be fixed several spokes, which must diminish in length, from the wheel to the top, so as not to exceed the surface of a cone of the same height. To the ends of these spokes nail the worms, which must cross each other several times: these worms clothe with illuminations, the same as those on the single wheels; but the horizontal wheel you may clothe as you like. At top of the worm place a cafe of spur-fire, or an amber light. See fig. 18. This figure is shown without leaders, to prevent a confusion of lines.

91. *Balloon Wheels,*

ARE made to turn horizontally: they must be made 2 feet diameter, without any spokes; and very strong, with any number of sides. On the top of a wheel range and fix in pots, 3 inches diameter and 7 inches

high each, as many of these as there are cafes on the wheel: near the bottom of each pot make a small vent; into each of these vents carry a leader from the tail of each cafe; some of the pots load with stars, and some with serpents, crackers, &c. As the wheels turn, the pots will successively be fired, and throw into the air a great variety of fires.

92. *Fruitioni Wheels.*

FIRST have a nave made 9 inches long and 3 in diameter: near the bottom of this nave fix 8 spokes, with a hole in the end of each, large enough to receive a 2 or 4 ounce cafe: each of these spokes may be 14 inches long from the block. Near the top of this block fix 8 more of the same spokes, exactly over the others, but not so long by 2 inches. As this wheel is to run horizontally, all the cafes in the spokes must play obliquely upwards, and all them in the spokes at bottom obliquely downwards. This being done, have a small horizontal wheel made with 8 spokes, each 5 inches long from the block: on the top of this wheel place a cafe of brilliant fire: all the cafes on this wheel must play in an oblique direction downwards, and burn 2 at a time, and those on the large wheel 4 at a time; that is, 2 of those in the top set of spokes, and 2 of those in the bottom set of spokes.

THE 4 first cafes on the large wheel, and the 2 first on the small, must be fired at the same time, and the brilliant fire at top, at the beginning of the last cafes. The cafes of the wheels may be filled with a grey charge. When these wheels are completed, you must have a strong iron spindle, made 4 feet 6 inches long, and fixed perpendicular on the top of a stand: on this put the large wheel, whose nave must have a hole quite through from the bottom to the top. This hole must be large enough to turn easy round the bottom of the spindle, at which place there must be a shoulder, to keep the wheel from touching the stand: at the top of the spindle put the small wheel, and join it to a large one with a leader, in order to fire them both together.

93. *Cascades of Fire,*

ARE made of any size; but one made according to the dimensions of that shewn in fig. 1. will be large enough for 8-oz. cafes. Let the distance from A to B, be 3 feet; from B to C, 2 feet 6 inches; and from CD, 2 feet; and let the cross piece at A, be 4 feet long: then from each end of this piece, draw a line to D; then make the other cross pieces so long as to come within those lines. The top piece D may be of any length, so as to hold the cafes, at a little distance from each other; all the cross pieces are fixed horizontally, and supported by brackets; the bottom cross piece should be about 1 foot 6 inches broad in the middle, the second 1 foot, the third 9 inches, and the top piece 4 inches: the cafes may be made of any length, but must be filled with a brilliant charge. On the edges of the cross pieces must be nailed bits of wood, with a groove cut in each piece, large enough for a cafe to lie in. These bits of wood are fixed so as to incline downwards, and that the fire from one tier of cafes may play over the other. All the cafes being tied fast on, carry leaders from one to the other; and let there be a pipe hung from the mouth of one of the cafes, covered at the end with a single paper, which you burn to fire the cascade.

Of Wheels,  
&c.

Plate  
CCL.

94. *The Fire-Tree.*

To make a fire-tree, as shewn by fig. 2. you must first take a piece of wood 6 feet long, and 3 inches square; then at E, 9 inches from the top, make a hole in the front, and in each side; or, instead of holes, you may fix short pegs, to fit the inside of the cafes. At F, 9 inches from E, fix 3 more pegs; at G, 1 foot 9 inches from F, fix 3 pegs; at H, 9 inches from G, fix 3 pegs; at I, 9 inches from H, fix 3 pegs, inclining downwards; but all the other pegs must incline upwards, that the cafes may have the same inclination as you see in the figure: then at top place a 4-inch mortar, loaded with flars, rains, or crackers. In the middle of this mortar place a cafe filled with any sort of charge, but let it be fired with the other cafes: a brilliant charge will do for all the cafes; but the mortar may be made of any diameter, and the tree of any size; and on it any number of cafes, provided they are placed in the manner described.

95. *Chinese Fountains.*

To make a Chinese fountain, you must have a perpendicular piece of wood 7 feet long and 2½ inches square. Sixteen inches from the top, fix on the front a cross-piece 1 inch thick, and 2½ broad, with the broad side up: below this, fix 3 more pieces of the same width and thickness, at 16 inches from each other: let the bottom rail be 5 feet long, and the others of such a length as to allow the fire-pumps to stand in the middle of the intervals of each other. The pyramid being thus made, fix in the holes made in the bottom rail, 5 fire-pumps, at equal distances: on the 2d rail, place 4 pumps; on the 3d, 3; on the 4th, 2; and on the top of the post, 1; but place them all to incline a little forwards, that, when they throw out the flars, they may not strike against the cross rails. Having fixed your fire pumps, clothe them with leaders, so that they may all be fired together. See fig. 3.

96. *Of illuminated Globes with horizontal Wheels.*

THE hoops for these globes may be made of wood, tin, or iron wire, about 2 feet diameter. For a single globe take 2 hoops, and tie them together, one within the other, at right angles; then have a horizontal wheel made, whose diameter must be a little wider than the globe, and its nave 6 inches long; on the top of which the globe is fixed, so as to stand 3 or 4 inches from the wheel: on this wheel you may put any number of cafes, filled with what charge you like; but let 2 of them burn at a time: they may be placed horizontally, or to incline downwards, just as you choose. Now, when the wheel is clothed, fix on the hoops as many illuminations as will stand within 2½ inches of each other: these you fasten on the hoops with small iron binding wire; and when they are all on, put on your pipes of communication, which must be so managed as to light them all with the 2d or 3d cafe on the wheel. The spindle on which the globe is to run must go through the block of the wheel, up to the inside of the top of the globe; where must be fixed a bit of brass, or iron, with a hole in it to receive the point of the spindle, on which the whole weight of the wheel is to bear, as in fig. 4. which represents a globe on its spindle. By this method may be made a crown, which is done by having the hoops bent in the form of a crown. Sometimes globes and crowns are ordered so as to stand still, and the wheel only to turn

round; but when you would have the globe or crown to stand still, and the wheel to run by itself, the block of the wheel must not be so long, nor the spindle any longer than to just raise the globe a little above the wheel; and the wheel-cafes and illumination must begin together.

97. *Dodecaedron.*

So called because it nearly represents a twelve-sided figure, is made thus. First have a ball turned out of some hard wood, 14 inches diameter: when done, divide its surface into 14 equal parts, from which bore holes 1½ inch diameter, perpendicular to the centre, so that they may all meet in the middle: then let there be turned in the inside of each hole a female screw; and to all the holes but one, must be made a round spoke 5 feet long, with 4 inches of the screw at one end to fit the holes; then in the screw-end of all the spokes bore a hole, 5 inches up, which must be bored slanting, so as to come out at one side, a little above the screw; from which cut a small groove along the spoke, within 6 inches of the other end, where you make another hole through to the other side of the spoke. In this end fix a spindle, on which put a small wheel of 3 or 4 fides, each side 6 or 7 inches long: these sides must have grooves cut in them, large enough to receive a 2 or 4 oz. cafe. When these wheels are clothed, put them on the spindles, and at the end of each spindle put a nut to keep the wheel from falling off. The wheels being thus fixed, carry a pipe from the mouth of the first cafe on each wheel, through the hole in the side of the spoke, and from thence along the groove, and through the other hole, so as to hang out at the screw-end about an inch. The spokes being all prepared in this manner, you must have a post, on which you intend to fire the work, with an iron screw in the top of it, to fit one of the holes in the ball: on this screw fix the ball; then in the top hole of the ball put a little meal-powder, and some loose quick-match: then screw in all the spokes; and in one side of the ball bore a hole, in which put a leader, and secure it at the end; and your work will be ready to be fired. By this leader the powder and match in the centre is fired, which will light the match at the ends of the spokes all at once, whereby all the wheels will be lighted at once. There may be an addition to this piece, by fixing a small globe on each wheel, or one on the top wheel only. A grey charge will be proper for the wheel-cafes.

98. *The Yew-Tree of brilliant fire.*

Is represented by fig. 5, as it appears when burning. First, let A be an upright piece of wood, 4 feet long, 2 inches broad, and 1 thick: at top of this piece, on the flat side, fix a hoop 14 inches diameter; and round its edge and front place illuminations, and in the centre a 5-pointed star; then at B, which is 1½ foot from the edge of the hoop, place 2 cafes of brilliant fire, one on each side: these cafes should be one foot long each: below these fix 2 more cafes of the same size, and at such a distance, that their mouths may almost meet them at top: then close to the ends of these cafes, fix 2 more of the same cafes; they must stand parallel to them at E. The cafes being thus fixed, clothe them with leaders; so that they, with the illuminations and star at top, may all take fire together.

Of Wheels,  
&c.

## 99. Stars with points for regulated pieces, &amp;c.

THESE stars are made of different sizes, according to the work for which they are intended: they are made with cafes from 1 oz. to 1 lb. but in general with 4-oz. cafes, 4 or 5 inches long: the cafes must be rolled with paste, and twice as thick of paper as a rocket of the same bore. Having rolled a cafe, pinch one end of it quite close: then drive in  $\frac{3}{4}$  a diameter of clay; and when the cafe is dry, fill it with composition, 2 or 3 inches to the length of the cafes with which it is to burn: at top of the charge drive some clay; as the ends of these cafes are seldom punched, they would be liable to take fire. Having filled a cafe, divide the circumference of it at the pinched end close to the clay into 5 equal parts; then bore 5 holes with a gimblet, about the size of the neck of a common 4-oz. cafe, into the composition: from one hole to the other carry a quick-match, and secure it with paper: this paper must be put on in the manner of that on the ends of wheel-cafes, so that the hollow part, which projects from the end of the cafe, may serve to receive a leader from any other works, to give fire to the points of the stars. These stars may be made with any number of points.

## 100. Fixed Sun with a transparent face.

To make a sun of the best fort there should be two rows of cafes, as in fig. 6. which will show a double glory, and make the rays strong and full. The frame, or sun-wheel, must be made thus: Have a circular flat nave made very strong, 12 inches diameter: to this fix 6 strong flat spokes, A, B, C, D, E, F. On the front of these fix a circular fell, 5 feet diameter; within which fix another fell, the length of one of the fun-cafes less in diameter; within this fix a 3d fell, whose diameter must be less than the 2d by the length of 1 cafe and 1.3d. The wheel being made, divide the fells into so many equal parts as you would have cafes, (which may be done from 24 to 44): at each division fix a flat iron staple; these staples must be made to fit the cafes, to hold them fast on the wheel; let the staples be so placed, that one row of cafes may lie in the middle of the intervals of the other.

In the centre of the block of the sun drive a spindle, on which put a small hexagon wheel, whose cafes must be filled with the same charge as the cafes of the sun: 2 cafes of this wheel must burn at a time, and begin with them on the fells. Having fixed on all the cafes, carry pipes of communication from one to the other, as you see in the figure, and from one side of the sun to the wheel in the middle, and from thence to the other side of the sun. These leaders will hold the wheel steady while the sun is fixing up, and will also be a sure method of lighting both cafes of the wheel together. A sun thus made is called a *brilliant sun*, because the wood work is entirely covered with fire from the wheel in the middle, so that there appears nothing but sparks of brilliant fire: but if you would have a transparent face in the centre, you must have one made of pasteboard of any size. The method of making a face is, by cutting out the eyes, nose, and mouth, for the sparks of the wheel to appear through; but instead of this face, you may have one painted on oiled paper, or Persian silk, strained tight on a hoop; which hoop must be supported by 3 or 4 pieces of wire at 6 inches distance from the wheel in the centre,

so that the light of it may illuminate the face. By this method you may have, in the front of a fun, *VIVAR REX*, cut in pasteboard, or Apollo painted on silk; but, for a small collection, a sun with a single glory, and a wheel in front, will be most suitable. Half-pound cafes, filled 10 inches with composition, will be a good size for a sun of 5 feet diameter; but, if larger, the cafes must be greater in proportion.

## 101. Three Vertical Wheels illuminated, which turn on their own naves upon a horizontal table.

A plan of this is shown by fig. 7. Let D be a deal table three feet in diameter: this table must be fixed horizontally on the top of a post; on this post must be a perpendicular iron spindle, which must come through the centre of the table: then let A, B, C, be 3 spokes joined to a triangular flat piece of wood, in the middle of which make a hole to fit easily over the spindle: let E, F, G, be pieces of wood, 4 or 5 inches long each, and 2 inches square, fixed on the under sides of the spokes; in these pieces make holes lengthwise to receive the thin part of the blocks of the wheels, which, when in, are prevented from coming out by a small iron pin being run through the end of each. K, L, M, are 3 vertical octagon wheels, 18 inches diameter each: the blocks of these wheels must be long enough for 3 or 4 inches to rest on the table; round which part drive a number of sharp points of wire, which must not project out of the blocks more than  $\frac{1}{16}$ th of an inch: the use of these points is, that, when the blocks run round, they will stick in the table, and help the wheels forward: if the naves are made of strong wood, one inch will be enough for the diameter of the thin part, which should be made to turn easy in the holes in the pieces E, F, G. On the front of the wheels make 4 or 5 circles of strong wire, or flat hoops, and tie on them as many illuminations as they will hold at 2 inches from each other: instead of circles, you may make spiral lines, clothed with illuminations, at the same distance from each other as those on the hoops. When illuminations are fixed on a spiral line in the front of a wheel, they must be placed a little on the slant, the contrary way that the wheel runs: the cafes for these wheels may be filled with any coloured charge, but must burn only one at a time.

The wheels being thus prepared, you must have a globe, crown, or spiral wheel, to put on the spindle in the middle of the table: this spindle should be just long enough to raise the wheel of the globe, crown, or spiral wheel, so high that its fire may play over the 3 vertical wheels: by this means their fires will not be confused, nor will the wheels receive any damage from the fire of each other. In clothing this work, let the leaders be so managed, that all the wheels may light together, and the illuminations after 2 cafes of each wheel are burnt.

## 102. Illuminated Chandelier.

ILLUMINATED works are much admired by the Italians, and indeed are a great addition to a collection of works: in a grand exhibition an illuminated piece should be fired after every 2 or 3 wheels, or fixed pieces of common and brilliant fires; and likewise illuminated works may be made cheap, quick, and easy.

To make an illuminated chandelier, you must first have one made of thin wood. See fig. 8. The chandelier

PYROTECHNY.

Fig. 10.

Fig. 11.

Of Wheels  
&c.

delier being made, bore in the front of the branches, and in the body, and also in the crown at top, as many holes for illuminations as they will contain at 3 inches distance from each other: in these holes put illuminations filled with white, blue, or brilliant charge. Having fixed in the port-fires, clothe them with leaders, so that the chandelier and crown may light together. The small circles on this figure represent the mouths of the illuminations, which must project straight from the front.

103. *Illuminated Yew-Tree.*Plate  
CCL.

First have a tree made of wood, such as is shewn by fig. 9. The middle piece, or stem, on which the branches are fixed, must be 8 feet 6 inches high: at the bottom of this piece draw a line, at right angles, 2 feet 6 inches long at each side; then from L, which is 1 foot 6 inches from the bottom, draw a line on each side to C and D: these lines will give the length of the 2 first branches. Then put on the 2 top branches parallel to them at bottom: let the length of each of these branches be 1 foot from the stem: from the ends of these 2 branches draw a line to C and D: then fix on 5 more branches at an equal distance from each other, and their length will be determined by the lines AC and ED. When the branches are fixed, place illuminating port-fires on the top of each, as many as you choose: behind the top of the stem fasten a gerbe, or white fountain, which must be fired at the beginning of the illuminations on the tree.

104. *Flaming Stars with brilliant Wheels.*

To make a flaming star, you must first have made a circular piece of strong wood about 1 inch thick and 2 feet diameter: round this block fix 8 points, 2 feet 6 inches long each; 4 of these points must be straight and 4 flaming: these points being joined on very strong, and even with the surface of the block, nail tin or pasteboard on their edges, from the block to the end of each, where they must be joined: this tin must project in front 8 inches, and be joined where they meet at the block; round the front of the block fix 4 pieces of thick iron wire, 8 inches long each, equally distant from each other: this being done, cut a piece of pasteboard round, 2 feet diameter, and draw on it a star, as may be seen in fig. 10. Cut out this star, and on the back of it paste oiled paper; then paint each point half red and half yellow, lengthwise; but the body of the star must be left open, wherein must run a brilliant wheel, made thus: Have a light block turned 9 inches long: at each end of it fix 6 spokes; at the end of each spoke put a 2-oz. case of brilliant fire: the length of these cases must be in proportion to the wheel, and the diameter of the wheel when the cases are on must be a little less than the diameter of the body of the small star: the cases on the spokes in front must have their mouths incline outwards, and those on the inside spokes must be placed so as to form a vertical circle of fire. When you place your leaders, carry the first pipe from the tail of 1 of the cases in front to the mouth of 1 of the inside cases, and from the tail of that to another in front, and so on to all the cases. Your wheel being made, put it on a spindle, in the centre of the star; this spindle must have a shoulder at bottom, to keep the wheel at a little distance from the block. This wheel must be kept on the spindle by a nut at the end; having fixed on the wheel, fasten the transparent star

to the 4 pieces of wire: when you fire it, you will only see a common horizontal wheel; but when the first case is burnt out, it will fire one of the vertical cases, which will show the transparent star, and fill the large flames and points with fire; then it will again appear like a common wheel, and so on for 12 changes.

105. *Projected regulated Piece of nine Mutations.*

A regulated piece, if well executed, is as curious as any in fire-works: it consists of fixed and moveable pieces on one spindle, representing various figures, which take fire successively one from another, without any assistance after lighting the first mutation. See fig. 11.

I. Names of the mutations, with the colour of fire and size of the case belonging to each.

*First mutation* is a hexagon vertical wheel, illuminated in front with small port-fires tied on the spokes; this wheel must be clothed with 2-oz. cases, filled with black charge; the length of these cases is determined by the size of the wheel, but must burn singly.

*Second mutation* is a fixed piece, called a *golden glory*, by reason of the cases being filled with four-fire. The cases must stand perpendicular to the block on which they are fixed, so that, when burning, they may represent a glory of fire. This mutation is generally composed of five or seven 2-oz. cases.

*Third mutation* is moveable; and is only an octagon vertical wheel, clothed with 4-oz. cases, filled with brilliant charge: 2 of these cases must burn at a time. In this wheel you may make changes of fire.

*Fourth mutation*, is a fixed sun of brilliant fire, consisting of 12 4-oz. cases: the necks of these cases must be a little larger than those of 4-oz. wheel-cases. In this mutation may be made a change of fire, by filling the cases half with brilliant charge, and half with grey.

*Fifth mutation*, is a fixed piece, called the *porcupine's quills*. This piece consists of 12 spokes, standing perpendicular to the block in which they are fixed; on each of these spokes, near the end, must be placed a 4-oz. case of brilliant fire. All these cases must incline either to the right or left, so that they may all play one way.

*Sixth mutation*, is a standing piece, called the *cross fire*. This mutation consists of 8 spokes fixed in a block; near the end of each of those spokes must be tied two 4-oz. cases of white charge, one across the other, so that the fires from the cases on one spoke may intersect the fire from the cases on the other.

*Seventh mutation*, is a fixed wheel, with 2 circular fells, on which are placed 16 8-ounce cases of brilliant fire, in the form of a star. This piece is called a *fixed star of wild-fire*.

*Eighth mutation*. This is a beautiful piece, called a *brilliant star-piece*. It consists of 6 spokes, which are strengthened by 2 fells of a hexagon form, at some distance from each other: at the end of each spoke, in the front, is fixed a brilliant star of 5 points; and on each side of every star is placed a 4-oz. case of black or grey charge: these cases must be placed with their mouths sidewise, so that their fires may cross each other.

*Ninth mutation*, is a wheel-piece. This is composed of

Of Wheels,  
&c.

Of Wheels, &c. of 6 long spokes, with a hexagon vertical wheel at the end of each; these wheels run on spindles in the front of the spokes; all the wheels are lighted together: 2 oz. cafes will do for these wheels, and may be filled with any coloured charge.

II. Proportions of the mutations, with the method of conveying the fire from one to the other, and the distance they stand one from the other on the spindle.

*First mutation*, must be a hexagon vertical wheel, 14 inches diameter; on one side of the block, whose diameter is  $2\frac{1}{2}$  inches, is fixed a tin barrel, A, (see fig. 11. n<sup>o</sup> 1.) This barrel must be a little less in diameter than the nave; let the length of the barrel and block be 6 inches. Having fixed the cafes on the wheel, carry a leader from the tail of the last cafe into the tin barrel through a hole made on purpose, 2 inches from the block; at the end of this leader let there be about 1 inch or 2 of loose match; but take care to secure well the hole wherein the pipe is put, to prevent any sparks falling in, which would light the second mutation before its time, and confuse the whole.

*Second mutation* is thus made. Have a nave turned  $2\frac{1}{2}$  inches diameter, and 3 long; then let  $\frac{1}{2}$  an inch of that end which faces the first wheel be turned so as to fit easy into the tin barrel of the first mutation, which must turn round it without touching. On the other end of the block fix a tin barrel, B, n<sup>o</sup> 2. This barrel must be 6 inches long, and only half an inch of it to fit on the block. Round the nave fix 5 spokes,  $1\frac{1}{2}$  inch long each; the diameter of the spokes must be equal to a 2-oz. former. On these spokes put five 7-inch 2-oz. cafes of spur-fire, and carry leaders from the mouth of one to the other, that they may all light together. Then from the mouth of one of the cafes, carry a leader thro' a hole bored slantwise in the nave, from between the spokes, to the front of the block near the spindle hole: the end of this leader must project out of the hole into the barrel of the first mutation, so that when the pipe which comes from the end of the last cafe on the first wheel flashes, it may take fire, and light the 2d mutation. To communicate the fire to the 3d mutation, bore a hole near the bottom of one of the 5 cafes to the composition, and from thence carry a leader into a hole made in the middle of the barrel B: this hole must be covered with pasted paper.

*Third mutation*, may be either an octagon or hexagon wheel, 20 inches diameter; let the nave be  $3\frac{1}{2}$  inches diameter, and  $3\frac{1}{2}$  in length;  $1\frac{1}{2}$  inch of the front of the nave must be made to fit in the barrel B. On the other end of the block fix a tin barrel, C, N<sup>o</sup> 3. This barrel must be  $6\frac{1}{2}$  inches in length, one inch of which must fit over the block. The cafes of this wheel must burn 2 at a time; and from the mouths of the 2 first cafes carry a leader, through holes in the nave, into the barrel of the second mutation, after the usual manner: but besides these leaders let a pipe go across the wheel from one first cafe to the other; than from the tail of one of the last cafes carry a pipe into a hole in the middle of the barrel C: at the end of this pipe let there be some loose quick-match.

*Fourth and fifth mutations*. These may be described under one head, as their naves are made of one piece, which from E to F is 14 inches; E, a block 4 inches

diameter, with 10 or 12 short spokes, on which are fixed 11-inch 8-oz cafes: let the front of this block be made to fit easy in the barrel C, and clothe the cafes so that they may all light together; and let a pipe be carried through a hole in the block into the barrel C, in order to receive the fire from the leader brought from the last cafe on the wheel. G is the nave of the 5th mutation, whose diameter must be  $4\frac{1}{2}$  inches: in this nave fix 10 or 12 spokes  $1\frac{1}{2}$  foot in length each; these spokes must stand 7 inches distant from the spokes of the 4th mutation; and at the end of each spoke tie a 4-oz. cafe, as N<sup>o</sup> 5. All these cafes are to be lighted together, by a leader brought from the end of one of the cafes on N<sup>o</sup> 4. Let F and H be of the same piece of wood as E and G, but as much thinner as possible, to make the work light.

*Sixth and seventh mutations*. The blocks of these 2 mutations are turned out of one piece of wood, whose length from F to P is 15 inches. L, a block 5 inches diameter, in which are fixed 8 spokes, each 2 foot 4 inches long; at the end of each spoke tie two 4-oz. cafes, as N<sup>o</sup> 6. All these cafes must be fired at the same time, by a pipe brought from the end of one of the cafes on the 5th mutation. Let the distance between the spokes at L, and those in the 5th mutation, be 7 inches. M, the nave of the 7th mutation, whose diameter must be  $5\frac{1}{2}$  inches: in this nave fix 8 spokes, and on the front of them 2 circular fells, one of 4 feet 8 inches diameter, and one of 3 feet 11 diameter; on these fells tie 16 8-oz. or pound cafes as in N<sup>o</sup> 7, and carry leaders from one to the other, so that they may be all fired together. This mutation must be fired by a leader brought from the tail of one of the cafes on the 6th mutation.

*Eighth and ninth mutations*. The blocks of these may be turned out of one piece, whose length from P to D must be 12 inches. O, the block of the 8th mutation, which must be 6 inches diameter; and in it must be fixed 6 spokes, each 3 feet in length, strengthened by an hexagon fell within 3 or 4 inches of the ends of the spokes: close to the end of each spoke, in the front, fix a five-pointed brilliant star; then 7 inches below each star, tie two 10-inch 8 oz. cafes, so that the upper ends of the cafes may rest on the fells, and their ends on the spokes: Each of these cafes must be placed parallel to the opposite fell: (see N<sup>o</sup> 8.) NNN, &c. are the cafes, and kkk, &c. the stars.

The 9th mutation is thus made. Let D be a block 7 inches diameter. In this block must be fired 6 spokes, 6 feet long each, with holes and grooves for leaders, as those in the dodecaedron; at the end of each spoke, in the front, fix a spindle for a hexagon vertical wheel, 10 inches diameter, as in N<sup>o</sup> 9. When these wheels are on, carry a leader from each into the block, so that they may all meet; then lead a pipe from the end of one of the cafes of the 8th mutation, through a hole bored in the block D, to meet the leaders from the vertical wheels, so that they may all be fired together.

The spindles for larger pieces are required to be made very strong, and as exact as possible: for a piece of 9 mutations, let the spindle be at the large end 1 inch diameter, and continue that thickness as far as the 7th mutation; and thence to the 5th, let its diameter be  $\frac{1}{2}$  of an inch; from the 5th to the 4th, 5-8ths

Of Wheels, 5-8ths of an inch; from the 4th to the 2d.  $\frac{3}{8}$  inch; and from the 2d to the end, 3-8ths of an inch. At the small end must be a nut to keep on the first wheel, and at the thick end must be a large nut, as shown by the figure; so that the screw part of the spindle being put through a post, and a nut screwed on tight, the spindle will be held fast and steady; but you are to observe, that that part of the spindle on which the moveable pieces are to run be made long enough for the wheels to run easy without sticking; the fixed pieces being made on different blocks, the leaders must be joined, after they are fixed on the spindle. The best method of preventing the fixed mutations from moving on the spindle is, to make that part of the spindle which goes through them square; but as it would be difficult to make them square holes through such long blocks as are sometimes required, it will be best to make them thus: Bore a hole a little larger than the diameter of the spindle; and at each end of the block, over the hole, fasten a piece of brass with a square hole in it to fit the spindle.

106. *To make an Horizontal Wheel change to a Vertical Wheel with a Sun in front.*

THE sudden change of this piece is very pleasing; and gives great surprize to those who are not acquainted with the contrivance. A wheel for this purpose should be about three feet diameter, and its fell circular; on which tie 16 half-pound cafes filled with brilliant charge: two of these cafes must burn at a time; and on each end of the nave must be a tin barrel of the same construction as those on the regulated piece. The wheel being completed, prepare the post or stand thus: First have a stand made of any height, about three or four inches square; then saw off from the top a piece two feet long; this piece join again at the place where it was cut, with a hinge on one side, so that it may lift up and down in the front of the stand; then fix on the top of the bottom-part of the stand, on each side, a bracket; which brackets must project at right angles with the stand, one foot from the front, for the short piece to rest on. These brackets must be placed a little above the joint of the post, so that when the upper stand falls, it may lie between them at right angles with the bottom stand: which may be done by fixing a piece of wood, one foot long, between the brackets, and even with the top of the bottom stand; then, as the brackets rise above the bottom stand, they will form a channel for the short post to lie in, and keep it steady without straining the hinge. On the side of the short post, opposite the hinge, nail a piece of wood, of such a length, that, when the post is perpendicular, it may reach about  $1\frac{1}{2}$  foot down the long post; to which being tied, it will hold the short stand upright. The stand being thus prepared, in the top of it fix a spindle 10 inches long: on this spindle put the wheel: then fix on a brilliant fun with a single glory; the diameter of this fun must be 6 inches less than that of the wheel. When you fire this piece, light the wheel first, and let it run horizontally till four cafes are consumed: then from the end of the fourth cafe carry a leader into the tin barrel that turns over the end of the stand: this leader must be met by another brought through the top of the post, from a cafe filled with a strong port-fire charge, and tied to the bottom post, with its mouth facing the pack-thread which holds up

the stand; so that when this cafe is lighted, it will burn the pack-thread, and let the wheel fall forward, by which means it will become vertical: then from the last cafe of the wheel, carry a leader into the barrel next the fun, which will begin as soon as the wheel is burnt out.

107. *Grand Volute illuminated with a projected Wheel in front.*

FIRST have two hoops made of strong iron wire, one of 6 feet diameter, and one of 4 feet 2 inches; these hoops must be joined to scrolls A, A, A, &c. as in fig. 1. These scrolls must be made of the same sort of wire as the hoops; on these scrolls tie, with iron-binding wire, as many illuminating port-fires as they will hold, at two inches distance; clothe these port-fires with leaders, so that they may all take fire together. Then let C be a circular wheel of four spokes, 3 feet 6 inches diameter; and on its fell tie as many 4-oz. cafes, head to tail, as will complete the circle, only allowing a sufficient distance between the cafes, that the fire may pass free; which may be done by cutting the upper part of the end of each cafe a little shelving: on each spoke fix a 4-oz. cafe, about three inches from the fell of the wheel: these cafes are to burn one at a time, and the first of them to begin with those on the fell, of which four are to burn at a time; so that the wheel will last no longer than  $\frac{1}{2}$  of the cafes on the fell, which in number should be 16 or 20. On the front of the wheel form a spiral line with strong wire, on which tie port-fires, placing them on a slant, with their mouths to face the same way as the cafes on the wheel: all these port-fires must be fired with the second cafes of wheel. Let D, D, D, &c. be spokes of wood, all made to screw into a block in the centre; each of these spokes may be in length about 4 feet 6 inches; in the top of each fix a spindle, and on each spindle put a spiral wheel of 8 spokes, such as E, E, E, &c. The blocks of these wheels must have a hole at top for the centre cafes, and the spindle must have nuts screwed on their ends; which nuts should fit in the holes at top of the blocks, so that all the wheels must be put on before you fix in the centre cafes: as some of these wheels, by reason of their situation, will not bear on the nut, it will be necessary to have smooth shoulders made on the spindles for the blocks to run on. The cafes of these wheels are to burn double; and the method of firing them is, by carrying a leader from each down the spokes into the block in the centre, as in the dodecaedron, but the centre cafe of each wheel must begin with the two last cafes as usual. It is to be observed, that the large circular wheel in front must have a tin barrel on its block, into which a pipe must be carried from one of the second cafes on the wheel; this pipe being met by another from the large block, in which the 8 spokes are screwed, will fire all the spiral wheels and the illuminating port-fires at the same time. The cafes of the projected wheel may be filled with a white charge, and those of the spiral wheels with a grey.

108. *Moon and Seven Stars.*

LET fig. 2. be a smooth circular board 6 feet diameter: out of the middle of it cut a circular piece 12 or 14 inches diameter; and over the vacancy put white Persian silk, on which paint a moon's face: then let I, I, I, &c. be stars, each 4 or 5 inches diameter, cut out with five points, and covered with oiled silk: on

the front of the large circular board: draw a 7-pointed star, as large as the circle will allow; then on the lines which form this star, bore holes, wherein fix pointed flars. When this case is to be fired, it must be fixed upon the front of a post, on a spindle, with a wheel of brilliant fire behind the face of the moon: so that, while the wheel burns, the moon and flars will appear transparent; and when the wheel has burnt out, they will disappear, and the large star in front, which is formed of pointed flars, will begin, being lighted by a pipe of communication from the last case of the vertical wheel, behind the moon; this pipe must be managed in the same manner as those in regulated pieces.

109. *Double Cone-Wheel illuminated.*

This piece is represented by fig. 3. Let A be a strong decagon wheel, 2 feet 6 inches diameter; then on each side of it fix a cone B and C: these cones are to consist of a number of hoops, supported by 3 or 4 pieces of wood, in the manner of the spiral wheels. Let the height of each cone be 3 feet 6 inches; and on all the hoops tie port-fires horizontally, with their mouths outwards, and clothe the wheel with 8-oz. cafes, all to play horizontally, two at a time: the cones may be fired with the first or second cafes. The spindle for this piece must go through both the cones, and rise three feet above the point of the cone at top; so that its length will be 10 feet 4 inches from the top of the post H, in which it is fixed, allowing four inches for the thickness of the block of the wheel. The whole weight of the wheel and cones must bear on a shoulder in the spindle, on which the block of the wheel must turn. Near the top of the spindle must be a hole in the front, into which serew a small spindle, after the cones are on: then on this small spindle fix a sun, D, composed of sixteen 9-inch 4-oz. cafes of brilliant fire; which cafes must not be placed on a fell, but only stuck into a block of 6 inches diameter: then in the front of this sun must be a circular vertical wheel, 16 inches diameter; on the front of this wheel form with iron-wire a spiral line, and clothe it with illuminations after the usual method. As this wheel is not to be fired till the cones are burnt out, the method of firing it is thus: Let the hole in the block, at the top of the uppermost cone, be a little larger than the spindle which passes thro' it. Then, from the first case of the vertical wheel before the sun, carry a leader down the side of the spindle to the top of the block of the horizontal wheel, on which must be a tin barrel: then this leader being met by another brought from the end of the last case of the horizontal wheel, will give fire to the vertical wheel so soon as the cones are extinguished: but the sun, D, must not be fired till the vertical wheel is quite burnt out.

110. *Fire-Pumps.*

Cases for fire-pumps are made as those for tourbilions; only they are palled, instead of being rolled dry. Having rolled and dried your cafes, fill them: first put in a little meal-powder, and then a star; on which ram lightly a ladle or two of composition, then a little meal-powder, and on that a star, then again composition; and so on till you have filled the case. Stars for fire-pumps should not be round; but must be made either square, or flat and circular, with a hole through the middle: the quantity of powder for throwing the flars must increase as you come near the top of the

case; for, if much powder be put at the bottom, it will burst the case. The flars must differ in size in this manner: Let the star which you put in first be about  $\frac{1}{2}$  less than the bore of the case; but let the next star be a little larger, and the third star a little larger than the second, and so on: let them increase in diameter till within two of the top of the case, which two must fit in tight. As the loading of fire-pumps is somewhat difficult, it will be necessary to make two or three trials before you depend on their performance: when you fill a number of pumps, take care not to put in each an equal quantity of charge between the flars, so that when they are fired they may not throw up too many flars together. Cafes for fire-pumps should be made very strong, and rolled on 4 or 8 oz. formers, 10 or 12 inches long each.

111. *Vertical Scroll Wheel.*

This wheel may be made of any diameter, but must be constructed as in fig. 4. to do which proceed thus: Have a block made of a moderate size, in which fix four flat spokes, and on them fix a flat circular fell of wood; round the front of this fell place port-fires; then on the front of the spokes form a scroll, either with a hoop or strong iron wire; on this scroll tie cafes of brilliant fire, in proportion to the wheel, head to tail, as in the figure. When you fire this wheel, light the first case near the fell; then, as the cafes fire successively, you will see the circle of fire gradually diminish: but whether the illuminations on the fell begin with the scroll or not, is immaterial, that being left entirely to the maker.

N. B. This wheel may be put in the front of a regulated piece, or fired by itself, occasionally.

112. *Pin-Wheels.*

First roll some paper pipes, about 14 inches long each; these pipes must not be made thick of paper, two or three rounds of elephant paper being sufficient. When your pipes are thoroughly dried, you must have a tin tube 12 inches long, to fit easy into the pipes; at one end of this tube fix a small conical cup, which cone is called a *funnel*; then bend one end of one of the pipes, and put the funnel in at the other as far as it will reach, and fill the cup with composition: then draw out the funnel by a little at a time, shaking it up and down, and it will fill the pipe as it comes out. Having filled some pipes, have some small blocks made about one inch diameter and half an inch thick: round one of these blocks wind and paste a pipe, and to the end of this pipe join another; which must be done by twisting the end of one pipe to a point, and putting it into the end of the other with a little paste: in this manner join four or five pipes, winding them one upon the other so as to form a spiral line. Having wound on your pipes, paste two slips of paper across them to hold them together: besides these slips of paper, the pipes must be pasted together.

There is another method of making these wheels, viz. by winding on the pipes without paste, and sticking them together with sealing-wax at every half turn; so that when they are fired, the end will fall loose every time the fire passes the wax, by which means the circle of fire will be considerably increased. The formers for these pipes are made from  $\frac{1}{2}$  to  $\frac{1}{4}$ -16ths of an inch diameter; and the composition for them is as follows: Meal-powder 8 oz. saltpetre 2 oz. and

Different  
Pieces of  
Fireworks.

and sulphur is among these ingredients may be mixed a little steel-filings or the dust of cast iron: this composition should be very dry, and not made too fine, or it will stick in the funnel. These wheels may be fired on a large pin, and held in the hand safely.

113. *Fire-Globes.*

THERE are two sorts of fire-globes; one with projected cafes; the other with the cafes concealed, thus: Have a globe made of wood, of any diameter you choose, and divide the surface of it into 14 equal parts, and at each division bore a hole perpendicular to the centre: these holes must be in proportion to the cafes intended to be used: in every hole except one, put a cafe filled with brilliant, or any other charge, and let the mouths of the cafes be even with the surface of the globe; then cut in the globe a groove, from the mouth of one cafe to the other, for leaders, which must be carried from cafe to cafe, so that they may all be fired together; this done, cover the globe with a single paper, and paint it. These globes may be used to ornament a building.

Fire-globes with projected cafes are made thus: Your globe being made with 14 holes bored in it as usual, fix in every hole except one, a cafe, and let each cafe project from the globe two thirds of its length; then clothe all the cafes with leaders, so that they may all take fire at the same time. Fire-globes are supported by a pintle, made to fit the hole in which there is no cafe.

114. *To thread and join Leaders, and place them on different works.*

JOINING and placing leaders is a very essential part of fire-works, as it is on the leaders that the performance of all complex works depends; for which reason the method of conducting pipes of communication shall be here explained in as plain a manner as possible. Your works being ready to be clothed, proceed thus: Cut your pipes of a sufficient length to reach from one cafe to the other; then put in the quick-match, which must always be made to go in very easy: when the match is in, cut it off within about an inch of the end of the pipe, and let it project as much at the other end; then fasten the pipe to the mouth of each cafe with a pin, and put the loose ends of the match into the mouths of the cafes, with a little meal-powder: this done to all the cafes, paste over the mouth of each two or three bits of paper. The preceding method is used for large cafes, and the following for small, and for illuminations: First thread a long pipe; then lay it on the tops of the cafes, and cut a bit of the under side, over the mouth of each cafe, so that the match may appear: then pin the pipe to every other cafe; but before you put on the pipes, put a little meal-powder in the mouth of each cafe. If the cafes thus clothed are port-fires on illuminated works, cover the mouth of each cafe with a single paper; but if they are choaked cafes, situated so that a number of sparks from other works may fall on them before they are fired, secure them with three or four papers, which must be pasted on very smooth, that there may be no creases for the sparks to lodge in, which oft set fire to the works before their time. Avoid as much as possible placing the leaders too near, or one across the other so as to touch, as it may happen that the flash of one will fire the other; therefore if your works should be fo

formed that the leaders must cross or touch, be sure to make them very strong, and secure at the joints, and at every opening.

When a great length of pipe is required, it must be made by joining several pipes in this manner: Having put on one length of match as many pipes as it will hold, paste paper over every joint; but, if a still greater length is required, more pipes must be joined, by cutting about an inch off one side of each pipe near the end, and laying the quick-match together, and tying them fast with small twine; after which, cover the joining with pasted paper.

115. *Placing Fire-works to be exhibited.*

NOTHING adds more to the appearance of fire-works than the placing them properly; though the manner of placing them chiefly depends on the judgment of the maker. The following are the rules generally observed, whether the works are to be fired on a building or on stands: If they are a double set, place one wheel of a sort on each side of the building; and next to each of them, towards the centre, place a fixed piece, then wheels, and so on; leaving a sufficient distance between them for the fire to play from one without burning the other. Having fixed some of your works thus in front, place the rest behind them, in the centre of their intervals: The largest piece, which is generally a regulated or transparent piece, must be placed in the centre of the building, and behind it a sun, which must always stand above all the other works: A little before the building, or stands, place your large gerbes; and at the back of the works fix your marron batteries, *pots des aigrettes*, *pots des brins*, *pots des saucissons*, air-balloons, and flights of rockets: The rocket stands may be fixed behind, or any where else, so as not to be in the way of the works.

Single collections are fired on stands; which stands are made in the same manner as theodolite stands, only the top part must be long or short occasionally: these stands may be fixed up very soon without much trouble.

Pieces of  
Fireworks.

25. One pot des fauciffons
26. Two plural wheels
27. Marron battery
28. Two chandeliers illuminated.
29. Range of pots des brins
30. Twelve sky-rockets
31. Two yew-trees of fire
32. Nest of ferns
33. Two double cones illuminated
34. Regulating piece of seven mutations, viz.
  1. Vertical wheel illuminated
  2. Golden glory
  3. Octagon vertical wheel
  4. Porcupine's quills.
  5. Crofs fires
  6. Star-piece with brilliant rays
  7. Six vertical wheels
35. Brilliant fun
36. Large flight of rockets.

When water-works are to be exhibited, divide them into several sets, and fire one set after every fifth or sixth change of land and air-works. Observe this rule in firing a double set of works: Always begin with sky-rockets, then two moveable pieces, then two fixed pieces, and so on; ending with a large flight of rockets, or a marron battery: if a single collection, fire a fixed piece after every wheel or two, and now and then some air and water works.

117. *Fountain of Sky-rockets.*

Plate CCL. fig. 5. represents a fountain of 30 rockets. Let A be a perpendicular post, 16 feet high from the ground, and 4 inches square. Let the rail, or cross piece C, be 1 foot 6 inches long, 3 inches broad, and 1 inch thick. The rail D, at bottom, must be 6 feet long, 1 foot broad, and 1 inch thick. F and G are the two sides which serve to supply the rails D, E, H, I, C: these sides are 1 foot broad at bottom, and cut in the front with a regular slope, to 3 inches at top; but their back edges must be parallel with the front of the pots A. The breadth of the rails E, H, I, will be determined by the breadth of the sides: all the rails must be fixed at 2 feet distance from each other, and at right angles with the pots. Having placed the rails thus, bore in the bottom rail 10 holes, at equal distances, large enough to receive the stick of a one-pound rocket: in the back edge of this rail cut a groove from one end to the other, fit to contain a quick-match; then cut a groove in the top of the rail, from the edge of each hole, into the groove in the back: in the same manner cut in the second rail, E, 8 holes and grooves; in the third rail, H, 6 holes and grooves; in the fourth rail, I, 4 holes and grooves; and in the top rail, 2 holes and grooves. B, a rail with holes in it to guide the ends of the rocket-sticks: this rail must be fixed 6 feet from the rail D. The fountain frame being thus made, prepare your rockets thus: Tie round the mouth of each a piece of thin paper, large enough to go twice round, and to project about  $1\frac{1}{4}$  inch from the mouth of the rocket, which must be rubbed with wet meal-powder; in the mouth of each rocket put a leader, which secure well with the paper that projects from the mouth of the case: these leaders must be carried into the grooves in the back of the rails, in which lay a quick-match from one end to the other, and cover it with pasted paper;

holes must be made in the rail D, to receive the ends of the sticks of the rockets, in the rail E, and so on to the fourth rail; so that the sticks of the rockets at top will go through all the rails. The rockets being so prepared, fix a gerbe, or white flower-pot, on each rail, before the post, with their mouths inclining a little forwards: these gerbes must be lighted all at once. Behind or before each gerbe, fix a case of brilliant or slow fire: these cases must be filled so that they may burn out one after the other, to regulate the fountain; which may be done by carrying a leader from the end of each flow or brilliant fire, into the groove in the back of each rail. Different fixed rockets may be used in these fountains: but it will be best to fill the heads of the rockets on each rail with different sorts of things, in this manner; those at top with crackers, the next with rains, the third with serpents, the fourth with tailed stars, and the last flight with common or brilliant stars.

118. *Palm Tree.*

This piece, tho' made of common fires, and of a simple construction, has a very pleasing effect; owing to the fires intersecting so often, that they resemble the branches of trees. Let A (fig. 6.) be a perpendicular post, of any thickness, so that it is sufficiently strong to hold the cases; let the distance from B to C be 2 feet 6 inches, and C to D 2 feet 6 inches, and let the length of each cross piece be 2 feet; on each end of each fix a five-pointed star; then fix, on pegs made on purpose, 12-inch half-pound cases of brilliant fire, as in the figure. All the cases and stars must be fired at once. This piece should be fixed high from the ground.

119. *Illuminated Pyramid, with Archimedean Screws, a Globe and vertical Sun,*

MAY be of any size. One made according to the dimensions of fig. 7. will be a good proportion, whose height is 21 feet; from C to D, 6 feet; from E to F, 9 feet: the space between the rails must be 6 inches, and the rails as thin as possible: in all the rails stick port-fires at 4 inches distance. The Archimedean screws, G, K, are nothing more than double spiral wheels, with the cases placed on their wheels horizontally instead of obliquely. The vertical fun, I, need not consist of more than 12 rays, to form a single glory. The globe at top must be made in proportion to the pyramid; which being prepared according to the preceding directions, place your leaders so that all the illuminating portfires, screws, globe, and fun, may take fire together. The pyramid must be supported by the two sides, and by a support brought from a pole, which must be placed two feet from the back of the pyramid, that the wheels may run free.

120. *Rose-piece and Sun.*

A rose-piece may be used for a mutation of a regulated piece, or fired by itself: it makes the best appearance when made large; if its exterior diameter be 6 feet, it will be a good size. Fig. 8. shows the manner it appears in before it is fired. Let the exterior fell be made of wood, and supported by; wooden spokes: all the other parts, on which the illuminations are fixed, must be made of strong iron wire: on the exterior fell place as many half-pound cases of brilliant charge as you think proper, but the more the better; for the nearer the cases are placed, the stronger will be the

Fireworks.

the rays of the sun: the illuminations should be placed within 3 inches of each other: they must all be fired together, and burn some time before the sun is lighted; which may be done by carrying a leader from the middle of one of the illuminations, to the mouth of one of the fun cafes.

121. *Transparent Stars with illuminated rays.*

Plate CCLI. fig. 9. represents an illuminated star. Let the diameter from A to B be 2 feet, and from C to D 7 feet. First make a strong circular back or body of the star, 2 feet diameter, to which you fix the illuminated rays: in the centre of the front of the body fix a spindle, on which put a double triangular wheel, 6 inches diameter, clothed with 2-ounce cafes of brilliant charge; the cafes on this wheel must burn but one at a time. Round the edge of the body nail a hoop made of thin wood or tin: this hoop must project in front 6 or 7 inches: in this hoop cut 3 or 4 holes to let out the smoke from the wheel. The star and garter may be cut out of strong pasteboard or tin, made in this manner: Cut a round piece of pasteboard, or tin, 2 feet diameter, on which draw a star, and cut it out; then over the vacancy paste Persian silk; paint the letters yellow; 4 of the rays yellow, and 4 red; the crosses in the middle may be painted half red and half yellow, or yellow and blue. This transparent star must be fastened to the wooden hoop by a screw, to take off and on; and the illuminated rays are made of thin wood, with tin foekets fixed on their sides within 4 inches of each other; in these foekets stick illuminating port-fires; behind the point of each ray fix a half-pound case of grey, black, or Chinese fire.

N. B. The illuminated rays to be lighted at the same time as the triangular wheel, or after it is burnt out; which may be done by a tin barrel being fixed to the wheel, after the manner of those in the regulated pieces. Into this barrel carry a leader from the illuminated rays, thro' the back of the star; which leader must be met by another, brought from the tail of the last case on the wheel.

122. *Transparent Table Star illuminated.*

Plate CCLII. Fig. 1. represents a table star, whose diameter, from E to F, is 12 feet; and from E to I, 4 feet. This proportion, observed on each side, will make the centre frame 4 feet square: in this square fix a transparent star, as in the figure. This star may be painted blue, and its rays made as those of the flaming stars described before. The wheel for this star may be composed of different coloured fires, with a charge or two of slow fire: the wheels *a, a, a, a*, may be clothed with any number of cafes, so that the star-wheel consist of the same: the illuminating port-fires, which must be placed very near each other on the frames, must be so managed as to burn as long as the wheels, and lighted at the same time.

123. *The regulated illuminated Spiral Piece, with a projected Star-wheel illuminated.*

This piece is represented by fig. 2, and is thus made. Have a block made 8 inches diameter; in this block serew 6 iron spokes, which must serve for spindles for the spiral wheels: these wheels are made as usual, each  $1\frac{1}{2}$  foot diameter, and 3 feet in height: the spindles must be long enough to keep the wheels 4 or 5 inches from one another: at the end of each spindle must be a screw-nut, on which the wheels that

hang downwards will run; and on the spindles which stand upwards must be a shoulder, for the blocks of the wheels to run on.

The projected star-wheel must turn on the same spindle on which the large block is fixed: this spindle must be long enough to allow the star-wheel to project a little before the spiral wheels: the exterior diameter of the star-wheel must be 3 feet 5. On this wheel fix 3 circles of iron wire, and on them port-fires; on the block place a transparent star, or a large 5-pointed brilliant star. The cafes on this wheel may burn 4 at once, as it will contain near twice the number of one of the spiral wheels: the cafes on the spiral wheels must be placed parallel to their fellows, and burn two at a time.

125. *A Figure-piece illuminated with five-pointed Stars.*

The construction of this piece is very easy, as shown by fig. 3, whose diameter from B to C is 8 feet, and from D to F 2 feet: the vertical wheel in the centre must be 1 foot diameter, and consist of 6 four-ounce cafes of different-coloured charge, which cafes must burn double: on the frames fix 5-pointed brilliant or blue stars, rammed 4 inches with composition: let the space between each star be 8 inches; at each point fix a gerbe, or case of Chinese fire. When to be fired, let the gerbe, stars, and wheel, be lighted at the same time.

125. *The Star-wheel illuminated.*

This beautiful piece is shown by fig. 4. Its exterior fell is made of wood, 3 feet 6, or 4 feet diameter; within this fell, form with iron wire 3 circles, one less than the other, so that the diameter of the least may be about 10 inches: place the port-fires on these fells with their mouths inclining outwards, and the port-fires on the points of the star with their mouths projecting in front: let the exterior fell be clothed with 4-ounce cafes of grey charge: these cafes must burn 4 at a time, and be lighted at the same time as the illuminations.

126. *Pyramid of Flower-pots.*

FIG. 5. represents this curious piece, which must be made thus. Let the distance from A to B be 6 feet; and from one rail to the other, 2: on the bottom rail fix 5 paper mortars, each  $3\frac{1}{2}$  inches diameter; these mortars load with serpents, crackers, stars, &c.

In the centre of each mortar fix a case of spur-fire: on the second rail fix 4 mortars, so as to stand exactly in the middle of the intervals of them on the bottom rail; on the third rail place 3 mortars; on the fourth, 2; and on the top of the posts, 1: the bottom rail must be 6 feet long: all the mortars must incline a little forwards, that they may easily discharge; and the spur-fires rammed exactly alike, that the mortars may all be fired at the same time. Having prepared your pyramid according to the preceding directions, carry pipes of communication from one spur-fire to the other.

127. *The illuminated Regulating Piece.*

FIG. 6. represents one half of this piece. A, A, A, are flat wooden spokes, each 5 feet long: at the end of each place a vertical wheel, 10 inches diameter, clothed with 6 four-ounce cafes of brilliant fire: these cafes must burn but 1 at a time: on two of the spokes of each wheel place 2 port fires, which must be

Different  
Pieces of  
Fireworks.

Aquatic  
Fireworks.

lighted with the first cafe of the wheel; on each spoke A, A, &c. behind the wheels, place 6 cafes of the same size with those on the wheels; these cafes must be tied across the spokes with their mouths all one way, and be made to take fire successively one after the other, so that they may assist the whole pieces to turn round.

The diameter of the wheel B must be  $2\frac{1}{2}$  feet; and its fell made of wood, which must be fixed to the large spokes: on this wheel place 24 cafes of the same sort with those on the small wheels; these cafes must burn 4 at a time: in this wheel make 3 circles with iron wire, and on them place illuminating port-fires, as in the figure: the star-points on the large spokes may be made of thin ash-hoops; the diameter of these points close to the centre-wheel must be 11 inches: on these points place port-fires, at  $3\frac{1}{2}$  inches distance one from the other.

Fig. 7. represents the blocks of this piece. The diameters of these blocks, at A and B, must be 8 inches; and C and D,  $4\frac{1}{2}$  inches: the length of each of these blocks must be 6 inches: at the small ends of these blocks fix an iron wheel 5 inches diameter, which wheels must have teeth, to turn the wheel E: this wheel is fixed on a small spindle screwed into the large spindle, which goes thro' the two blocks, and on which they run.

Supposing fig. 8. to be on the block A, in fig. 7. and to turn to the right, and another piece of the same construction on the block B, with its fires placed so as to turn it to the left; you will find them move very true and fast, by the help of the 3 iron wheels, which serve to regulate their motions, as well as to assist them in turning: let the iron circles in the front of the great wheels be of different diameters, so that when fired there may appear 6 circles. When this piece is fired, all the wheels and illuminations must be lighted at one time.

#### SECT. VI. Aquatic Fire-works.

WORKS that sport in the water are much esteemed by most admirers of fire-works, particularly water rockets; and as they seem of a very extraordinary nature to those who are unacquainted with this art, they merit a particular explanation.

##### 128. Water Rockets.

MAY be made from 4 oz. to 2 lb. If larger, they are too heavy; so that it will be difficult to make them keep above water without a cork float, which must be tied to the neck of the cafe; but the rockets will not dive so well with, as without floats.

Cafes for these are made in the same manner and proportion as sky-rockets, only a little thicker of paper. When you fill those which are drove solid, put in first 1 ladle-full of slow fire, then 2 of the proper charge, and on that 1 or 2 ladles of sinking charge, then the proper charge, then the sinking charge again, and so on, till you have filled the cafe within 3 diameters; then drive on the composition 1 ladle-full of clay; through which make a small hole to the charge; then fill the cafe, within  $\frac{1}{2}$  a diameter, with corn-powder, on which turn down 2 or 3 rounds of the cafe in the inside; then pinch and tie the end very tight; having filled your rockets; (according to the

Aquatic  
Fireworks.

above directions), dip their ends in melted rosin or sealing wax, or else secure them well with grease. When you fire these rockets, throw in 6 or 8 at a time; but, if you would have them all sink, or swim, at the same time, you must drive them with an equal quantity of composition, and fire them all together.

##### 129. To make Pipes of Communications, which may be used under Water.

PIPES for this purpose must be a little thicker of paper than those for land. Having rolled a sufficient number of pipes, and kept them till dry, wash them over with drying oil, and set them to dry; but when you oil them, leave about  $1\frac{1}{2}$  inch at each end dry, for joints: if they were oiled all over, when you come to join them, the paste would not stick where the paper is greasy: after the leaders are joined, and the paste dry, oil the joints. These pipes will lie many hours under water, without receiving any damage.

##### 130. Horizontal Wheels for the Water.

FIRST get a large wooden bowl without a handle; than have an octagon wheel made of a flat board 18 inches diameter, so that the length of each side will be near 7 inches: in all the sides cut a groove for the cafes to lie in. This wheel being made, nail it on the top of the bowl; than take 8 4 oz. cafes, filled with a proper charge, each about 6 inches in length. Now, to clothe the wheel with these cafes, get some whitish-brown paper, and cut it into slips 4 or 5 inches broad, and 7 or 8 long: these slips being pasted all over on one side, take one of the cafes, and roll one of the slips of paper about  $1\frac{1}{2}$  inch on its end, so that there will remain about  $2\frac{1}{2}$  inches of the paper hollow from the end of the cafe: this cafe tie on one of the sides of the wheel, near the corners of which must be holes bored, through which you put the packthread. To tie the cafes: having tied on the first cafe at the neck and end, put a little meal powder in the hollow paper; then paste a slip of paper on the end of another cafe, the head of which put into the hollow paper on the first, allowing a sufficient distance from the tail of one to the head of the other for the pasted paper to bend without tearing: the second cafe tie on as you did the first: and so on with the rest, except the last, which must be closed at the end, unless it is to communicate to any thing on the top of the wheel, such as fire-pumps or brilliant fires, fixed in holes cut in the wheel, and fired by the last or second cafe, as the fancy directs: 6, 8, or any number, may be placed on the top of the wheel, provided they be not too heavy for the bowl.

Before you tie on the cafes, cut the upper part of all their ends, except the last, a little shelving, that the fire from one may play over the other, without being obstructed by the cafe. Wheel-cafes have no clay drove in their ends, nor pinched, but are always left open, only the last, or those which are not to lead fire, which must be well secured.

##### 131. Water Mines.

FOR these mines you make a bowl with a wheel on it, made in the same manner as the water-wheel; only in its middle there must be a hole, of the same diameter you design to have the mine. These mines are tin pots, with strong bottoms, and a little more than 2 diameters in length: your mine must be fixed

Aquatic  
Fireworks.

in the hole in the wheel, with its bottom resting on the bowl; then loaded with serpents, crackers, stars, small water-rockets, &c. in the same manner as pots of aigrettes; but in their centre fix a case of Chinese fire, or a small gerbe, which must be lighted at the beginning of the last case on the wheel. These wheels are to be clothed as usual.

132. *Fire-Globes for the Water.*

BOWLS for water-globes must be very large, and the wheels on them of a decagon form: on each side of which nail a piece of wood 4 inches long; and on the outside of each piece cut a groove, wide enough to receive about  $\frac{1}{4}$  of the thickness of a 4-oz. case: these pieces of wood must be nailed in the middle of each face of the wheel, and fixed in an oblique direction, so that the fire from the cases may incline upwards: the wheel being thus prepared, tie in each groove a 4-oz. case, filled with a grey charge; then carry a leader from the tail of one case to the mouth of the other.

Globes for these wheels are made of 2 tin hoops, with their edges outwards, fixed one within the other, at right angles. The diameter of these hoops must be somewhat less than that of the wheel. Having made a globe, drive in the centre of a wheel an iron spindle, which must stand perpendicular, and its length 4 or 6 inches more than the diameter of the globe.

This spindle serves for an axis, on which the globe is fixed, which, when done, must stand 4 or 6 inches from the wheel: round one side of each hoop must be soldered little bits of tin,  $2\frac{1}{2}$  inches distance from each other; which pieces must be 2 inches in length each, and only fastened at one end, the other ends being left loose, to turn round, the small port-fires, and hold them on: these port-fires must be made of such a length, as will suit out the cases on the wheel. You are to observe, that there need not be any port-fires at the bottom of the globe within 4 inches of the spindle; for, if there were, they would have no effect, but only burn the wheel: all the port-fires must be placed perpendicular from the centre of the globe, with their mouths outwards; and must all be clothed with leaders, so as all to take fire with the second case of the wheel; which cases must burn two at a time, one opposite the other. When two cases of a wheel begin together, two will end together; therefore the two opposite end cases must have their ends pinched and secured from fire. The method of firing such wheels is, by carrying a leader from the mouth of one of the first cases to that of the other; which leader being burnt through the middle, will give fire to both at the same time.

133. *Odoriferous Water Balloons.*

THESE balloons are made in the same manner as air-balloons, but very thin of paper, and in diameter  $\frac{1}{2}$  inch, with a vent of  $\frac{1}{4}$  inch diameter. The shells being made, and quite dry, fill them with any of the following compositions, which must be rammed in tight: these balloons must be fired at the vent, and put into a bowl of water. Odoriferous works are generally fired in rooms.

*Composition I.* Saltpetre 2 oz. flour of sulphur 1 oz. camphor  $\frac{1}{2}$  oz. yellow amber  $\frac{1}{2}$  oz. charcoal-dust  $\frac{1}{2}$  oz. flour of benjamin or assa odorata  $\frac{1}{2}$  oz. all powdered very fine and well mixed.

*II.* Saltpetre 12 oz. meal-powder 3 oz. frankincense 1 oz. myrrh  $\frac{1}{2}$  oz. camphor  $\frac{1}{2}$  oz. charcoal 3 oz. all moistened with the oil of spike.

*III.* Saltpetre 2 oz. sulphur  $\frac{1}{2}$  oz. antimony  $\frac{1}{2}$  oz. amber  $\frac{1}{2}$  oz. cedar rapings  $\frac{1}{2}$  oz. all mixed with the oil of roses and a few drops of bergamot.

*IV.* Saltpetre 4 oz. sulphur 1 oz. saw-dust of juniper  $\frac{1}{2}$  oz. saw-dust of cyprus 1 oz. camphor  $\frac{1}{2}$  oz. myrrh 2 drams, dried rosemary  $\frac{1}{2}$  oz. cortex elaterii  $\frac{1}{2}$  oz. all moistened a little with the oil of roses.

*N. B.* Water rockets may be made with any of the above compositions, with a little alteration, to make them weaker or stronger, according to the size of the cases.

134. *Water Balloons.*

HAVING made some thin paper-shells, of what diameter you please, fill some with the composition for water balloons, and some after this manner: Having made the vent of the shells pretty large, fill them almost full with water rockets, marrons, squibs, &c. Then put in some blowing powder, sufficient to burst the shells; and afterwards fix in the vent a water-rocket, long enough to reach the bottom of the shell, and its neck to project a little out of the vent; this rocket must be open at the end, to fire the powder in the shell, which will burst the shell, and disperse the small rockets, &c. in the water. When you have well secured the large rocket in the vent of the shell, take a cork float with a hole in its middle, which fit over the head of the rocket, and fasten it to the shell: this float must be large enough to keep the balloon above water.

135. *Water Squibs.*

ARE generally made of 1-oz. serpent cases 7 or 8 inches long, filled two thirds with charge, and the remainder bounced. The common method of firing them is this: Take a water-wheel, with a tin mortar in its centre, which load with squibs after the usual method; but the powder in the mortar must be no more than will just throw the squibs out (easily into the water): you may place the cases on the wheel either obliquely or horizontally; and on the top of the wheel, round the mortar, fix six cases of brilliant fire, perpendicular to the wheel: these cases must be fired at the beginning of the last case of the wheel, and the mortar at the conclusion of the fame.

136. *A Six Eight with small Ships, and to prepare a Fire Ship for it.*

HAVING procured four or five small ships, of two or three feet in length, (or as many as you design to fight), make a number of small reports, which are to serve for guns. Of these range as many as you please on each side of the upper decks; then at the head and stern of each ship fix a 2-oz. case, 8 inches long, filled with a slow port fire receipt; but take care to place it in such a manner that the fire may fall in the water, and not burn the rigging: in these cases bore holes at unequal distances from one another, but make as many in each case as half the number of reports, so that one case may fire the guns on one side, and the other those on the opposite. The method of firing the guns is, by carrying a leader from the holes in the cases to the reports on the decks; you must make these leaders very small, and be careful in calculating the burning of the slow-fire in the regulating cases, that more than two guns be not fired at a time. When you would have a  
broad-

broadside given, let a leader be carried to a cracker, placed on the outside of the ship; which cracker must be tied loose, or the reports will be too slow: in all the ships put artificial guns at the port-holes.

Having filled and bored holes in two port-fires for regulating the guns in one ship, make all the rest exactly the same; then, when you begin the engagement, light one ship first, and set it a sailing, and so on with the rest, sending them out singly, which will make them fire regularly, at different times, without confusion; for the time between the firing of each gun will be equal to that of lighting the slow fires.

The fire-ship may be of any size; and need not be very good, for it is always lost in the action. To prepare a ship for this purpose, make a port-fire equal in size with those in the other ships, and place it at the stern; in every port place a large port-fire, filled with a very strong composition, and painted in imitation of a gun, and let them all be fired at once by a leader from the slow fire, within two or three diameters of its bottom; all along both sides, on the top of the upper deck, lay star-composition about half an inch thick and one broad, which must be wetted with thin size, then primed with meal-powder, and secured from fire by palting paper over it; in the place where you lay this composition, drive some little tacks with flat heads, to hold it fast to the deck: this must be fired just after the sham guns, and when burning will show a flame all round the ship: at the head take up the decks, and put in a tin mortar loaded with crackers, which mortar must be fired by a pipe from the end of the slow fire; the firing of this mortar will sink the ship, and make a pretty conclusion. The regulating port-fire of this ship must be lighted at the same time with the first fighting ship.

Having prepared all the ships for fighting, we shall next proceed with the management of them when on the water. At one end of the pond, just under the surface of the water, fix two running blocks, at what distance you choose the ships should fight; and at the other end of the pond, opposite to each of these blocks, under the water, fix a double block; then on the land, by each of the double blocks, place two small windlasses; round one of them turn one end of a small cord, and the other end put through one of the blocks; then carry it through the single one at the opposite end of the pond, and bring it back through the double block again, and round the other windlass: to this cord, near the double block, tie as many small strings as half the number of the ships, at what distance you think proper; but these strings must not be more than two feet each: make fast the loose end of each to a ship, just under her bow-sprit; but if tied to the keel, or too near the water, it will overset the ship. Half the ships being thus prepared, near the other double block fix two more windlasses, to which fasten a cord, and to it tie the other half of the ships as before: when you fire the ships, pull in the cord with one of the windlasses, to get all the ships together; and when you have set fire to the first, turn that windlass which draws them out, and so on with the rest, till they are all out in the middle of the pond; then by turning the other windlasses, you may draw them back again; by which method you may make them change sides, and tack about backwards and forwards at pleasure. For the fire-ship,

fix the blocks and windlasses between the others, so that when she sails out, she will be between the other ships: you must not let this ship advance till the guns at her ports take fire.

137. *To fire Sky-rockets under water,*

You must have stands made as usual, only the rails must be placed flat instead of edgewise, and have holes in them for the rocket sticks to go through; or if they were hung upon hooks, the motion of the water would throw them off: the stands being made, if the pond is deep enough, sink them at the sides, so deep, that, when the rockets are in, their heads may just appear above the surface of the water; to the mouth of each rocket fix a leader, which put through the hole with the stick; then a little above the water must be a board, supported by the stand, and placed along one side of the rockets; then the ends of the leaders are turned up through holes made in this board, exactly opposite the rockets. By this means you may fire them singly or all at once. Rockets may be fired by this method in the middle of a pond, by a Neptune, a swan, a water-wheel, or any thing else you choose.

138. *To represent Neptune in his Chariot.*

To do this to perfection, you must have a Neptune made (made of wood, or basket work) as big as life, fixed on a float large enough to bear his weight; on which must be two horses heads and necks, so as to seem swimming, as shown by fig. 11. For the wheels of the chariot, there must be two vertical wheels of black fire, and on Neptune's head a horizontal wheel of brilliant fire, with all its cafes, to play upwards. When this wheel is made, cover it with paper or paste-board, cut and painted like Neptune's coronet; then let the trident be made without prongs, but instead of them, fix three cafes of a weak grey charge, and on each horse's head put an 8-oz. cafe of brilliant fire, and on the mouth of each fix a short cafe, of the same diameter, filled with the white-flame receipt, enough to last out all the cafes on the wheels: these short cafes must be open at bottom, that they may light the brilliant fires; for the horses eyes, put small port-fires, and in each nostril put a small cafe filled half with grey charge, and the rest with port-fire composition.

If Neptune is to give fire to any building on the water; at his first setting out, the wheels of the chariot, and that on his head, with the white flames on the horses heads, and the port-fires in their eyes and nostrils, must all be lighted at once; then from the bottom of the white flames carry a leader to the trident. As Neptune is to advance by the help of a block and cord, you must manage it so as not to let him turn about, till the brilliant fires on the horses and the trident begin; for it is by the fire from the horses, (which plays almost upright) that the building, or work, is lighted; which must be thus prepared. From the mouth of cafe which is to be first fired, hang some loose quick-match to receive the fire from the horses. When Neptune is only to be shown by himself, without setting fire to any other works; let the white flames on the horses be very short, and not to last longer than one cafe of each wheel, and let two cafes of each wheel burn at a time.

139. *Swans and Ducks in water.*

If you would have the swans or ducks discharge rockets into the water, they must be made hollow, and

of paper, and filled with small water rockets, with some blowing powder to throw them out: but if this is not done, they may be made of wood, which will last many times. Having made and painted some swans, fix them on floats: then in the places where their eyes should be, bore holes two inches deep, inclining downwards, and wide enough to receive a small port-fire; the port-fire cafes for this purpose must be made of brags, two inches long, and filled with a slow bright charge. In the middle of one of these cafes make a little hole; then put the port-fire in the eye-hole of the swan, leaving about half an inch to project out; and in the other eye put another port-fire, with a hole made in it: then in the neck of the swan, within two inches of one of the eyes, bore a hole slantwise, to meet that in the port-fire; in this hole put a leader, and carry it to a water-rocket, that must be fixed under the tail with its mouth upwards. On the top of the head place two 1-oz. cafes, 4 inches long each, drove with brilliant fire; one of these cafes must incline forwards, and the other backwards: these must be lighted at the same time as the water-rocket; to do which, bore a hole between them in the top of the swan's head, down to the hole in the port-fire, to which carry a leader: if the swan is filled with rockets, they must be fired by a pipe from the end of the water-rocket under

the tail. When you set the swan a swimming, light the two eyes,

## 140. Water Fire-fountains.

To make a fire-fountain, you must first have a float made of wood, three feet diameter; then in the middle fix a round perpendicular post, four feet high, and two inches diameter; round this post fix three circular wheels made of thin wood, without any spokes. The largest of these wheels must be placed within two or three inches of the float, and must be nearly of the same diameter. The second wheel must be 2 feet 2 inches diameter, and fixed at two feet distance from the first. The third wheel must be 1 foot 4 inches diameter, and fixed within six inches of the top of the post: the wheels being fixed, take 18 four or eight oz. cafes of brilliant fire, and place them round the first wheel with their mouths outwards, and inclining downwards; on the second wheel place 13 cafes of the same, and in the same manner as those on the first; and on the third, place 8 more of these cafes, in the same manner as before, and on the top of the post fix a gerbe; then clothe all the cafes with leaders, so that both they and the gerbe may take fire at the same time. Before you fire this work, try it in the water to see if the float is properly made, so as to keep the fountain upright.

## P Y R

PYROTICS, in medicine, caustics, or remedies either actually or potentially hot; and which accordingly will burn the flesh, and raise an eschar. See CAUSTICS. PYRRHICHA, in antiquity, a kind of exercise on horse-back, or a feigned combat, for the exercise of the cavalry.

It was thus called from its inventor Pyrrhichus, or Pyrrhus of Cydonia, who first taught the Cretans to march in measure and cadence to battle, and to observe the pace of the Pyrrhic foot.—Others derive the name from Pyrrhus the son of Achilles, who instituted this exercise at the obsequies of his father. Aristotle says, that it was Achilles himself who invented it.

The Romans also called it *Indus Trojanus*, the "Trojan game;" and Aulus Gellius, *decurfus*.—It is doubtless this exercise that we see represented on medals by two cavaliers in front running with lances, and the word *decurfus* in the exergum.

PYRRHICHIUS, in the Greek and Latin poetry, a foot consisting of two syllables, both short;—as, *Deus*.—Among the ancients this foot is also called *pe-riambus*; by others, *hegemon*.

PYRRHO, a Greek philosopher, born at Elis in Peloponnesus, flourished about 300 B. C. He was the disciple of Anaxarchus, whom he accompanied as far as India. He had made painting his profession, before he devoted himself to the study of philosophy. He established a sect whose fundamental principle was, That there is nothing true or false, right or wrong, honest or dishonest, just or unjust; or that there is no standard of any thing beyond law or custom, and that uncertainty and doubt belong to every thing. From this continual seeking after truth and never finding it, the sect obtained the name of *Sceptics* or *Pyrrhonianis*, from the founder.

PYRRHUS, the name of two kings of EPIRUS. See that article.

## P Y R

PYRRHONIANS, a sect of ancient philosophers, the followers of the doctrines of PYRHO. See the preceding article.

PYRUS, the PEAR-TREE; a genus of the pentagynia order, belonging to the icofandria class of plants. To this genus Linnaeus has joined the apple and quince; but, on account of the remarkable difference between the fruits, the last is treated under the article CYDONIA. The other species are,

1. The communis, or common pear-tree, rises with an upright large trunk, branching 30 or 40 feet high, in some widely around, in others more erectly, and forming a conical head; oval, lanceolated, serrated leaves, and corymbose clusters of white flowers from the sides of the branches, succeeded by large fruit extended at the base. Under this species are comprehended almost endless varieties, all bearing the above description. They bear their flowers and fruit upon spurs, arising from the sides of the branches from two or three years old and upwards; the same branches and spurs continuing fruitful for a great number of years. The different varieties furnish fruit for use from the beginning of July till the months of May and June next year; which, according to their times of ripening, may be divided into three classes, summer-pears, autumn-pears, and winter-pears. The summer-pears ripen in different sorts from the beginning of July until the middle or end of September, and are generally fit to eat from the tree, or at least do not keep a week or two before they rot. The autumn-pears come to their perfection in October, November, and December; some ripening nearly on the tree in October and the beginning of November, others requiring to lie some time in the fruitery, while some will keep two months: but all the winter-pears, though they attain their full growth on the tree by the end of October and in November, yet they do not acquire perfection for

Pyrus.

for eating till from the end of November to April and May. Those of each class have different properties; some being melting, others breaking, some mealy, and some hard and austere fit only for kitchen uses. As many of the finest sorts were first obtained from France, they are still continued in most catalogues by French names.

2. The malus, or common apple-tree, grows 20 or 30 feet high, having oval serrated leaves, and sessile umbels of whitish red flowers, succeeded by large, roundish, and oblong fruit, concave at the base. The varieties of this species are amazingly great with respect to the differences of the fruit. The botanists contend, that the wilding, or crab-apple of the woods and hedges, is the original kind, and from the seeds of which the cultivated apple was first obtained. The varieties of this last no doubt are multiplied to some hundreds in different places, having been all first accidentally obtained from the seed or kernels of the fruit, and the approved sorts continued and increased by grafting upon crabs or any kind of apple-stocks: but although the number of varieties is very considerable, there are not above 40 or 50 sorts retained in the nurserymen's catalogue. These varieties arrive at full growth in successive order from July to the end of October, improve in perfection after being gathered, and several of the winter kinds in particular keep good for many months, even till the arrival of apples next summer.

3. The coronaria, or sweet-scented crab of Virginia, grows 12 or 15 feet high, having angular, serrated leaves, pedunculated umbels of whitish-red, sweet-scented flowers, succeeded by small round crabs, remarkably four and austere. There is one variety, called the *evergreen Virginian crab-tree*.

*Culture.* All the varieties of the pear-tree are hardy, and will succeed in any common soil of a garden or orchard. They are propagated by grafting and budding upon any kind of pear-stocks; also occasionally upon quince-stocks, and sometimes upon white-thorn stocks; but pear-stocks are greatly preferable to all others for general use.—All kinds of apples are propagated in the same manner; using apple-stocks instead of pear-stocks. They will succeed in any common soil of a garden or orchard, and in any free situation except in a low and very moist soil, in which they are apt to canker, and very soon go off. In a liable loam they are generally very successful.

PYTHAGORAS, a most celebrated philosopher of Samos, was born about 500 years before Christ, and flourished in the time of Tarquin the last king of Rome. He travelled for knowledge to Egypt, Babylon, and various parts of Greece; but settled at Croton in Italy, where he opened a school that was frequented from all parts. After the manner of the Egyptians, he inculcated his doctrines by symbols. He forbade the eating of flesh, taught the transmigration of souls, made considerable discoveries in arts and sciences, and delivered a great variety of precepts for civil and political conduct. His maxims of morality were admirable; for he was for having the study of philosophy solely tend to elevate man to a resemblance of the Deity. He believed that God is a soul diffused through all nature, and that from him human souls are

derived; that they are immortal, and that men need only take pains to purge themselves of their vices, in order to be united to the Deity. He made unity the principle of all things; and believed, that between God and man there are various orders of spiritual beings, who are the ministers of the Supreme Being. He condemned all images of the Deity, and would have him worshipped with as few ceremonies as possible. His disciples brought all their goods into a common stock, contemned the pleasures of sense, abstained from swearing, eat nothing that had life, and believed in the doctrine of a metempsychosis. See the article ΜΕΤΕΜΨΥΧΩΣΙΣ.

Pythagoras made his scholars undergo a severe noviciate of silence for at least two years; and it is said, that, where he discerned too great an itch for talking, he extended it to five: his disciples were therefore divided into two classes, of which the first were simple hearers, and the last such as were allowed to propose their difficulties, and learn the reasons of all that was taught there. The Pythagoreans, it is said, on their rising from bed, roused the mind with the sound of the lyre, in order to make them more fit for the actions of the day; and at night resumed the lyre, in order to prepare themselves for sleep, by calming all their tumultuous thoughts. The figurative manner in which he gave his instructions, was borrowed from the Hebrews, Egyptians, and other orientals. Some think he derived his philosophy from the books of Moses, and that he conversed with Ezekiel and Daniel at Babylon: but this is mere conjecture.

The circumstances of his death are variously related. Some say that he was burnt at Milo's house at Crotona, together with his disciples. Others say that he escaped from the flames; and, being pursued out of the city, stopped in a field of beans, and chose rather to be killed than open his mouth. Dicaearchus says, that he fled to the temple of the Muses at Metapontus, where he died of hunger. Others assert that he was killed, with all his disciples, by the Agrigentines. Arnobius affirms, that he was burnt alive in a temple, &c. But Justin seems to insinuate, that after his having lived 20 years at Crotona, he died in peace in a very advanced age at Metapontum, to which city he had retired. His memory was held in such veneration, that his house was converted into a temple, and he was honoured as a god.

Some authors say, that he left nothing in writing; but Laërtius and others attribute several treatises to him. His golden verses, attributed by some to one of his disciples, are allowed to be an exact copy of the sentiments of that divine philosopher, from whose school proceeded the greatest philosophers and legislators.

PYTHAGOREANS, a sect of ancient philosophers, so called from being the followers of Pythagoras. See the preceding article.

PYTHIA, in antiquity, the priestess of the temple of Apollo at Delphos, who delivered the oracles. See ORACLE.

PYTHIAN GAMES, in Grecian antiquity, sports instituted near Delphos in honour of Apollo, on account of his slaying the serpent Python. See ΑΡΧΑΙΟΛΟΓΙΑ.—These games, at their first institution, were celebrated

Python celebrated only once in nine years; but afterwards every fifth year, from the number of the Parnassian nymphs who came to congratulate Apollo, and to make him presents on his victory. The victor was crowned with garlands.

PYTHON, in fabulous history, a monstrous serpent, produced by the earth after Deucalion's deluge.

Juno being exasperated at Latona, who was beloved by Jupiter, commanded this serpent to destroy her; but flying from the pursuit of the monster, she escaped to Delos, where she was delivered of Diana and Apollo, the latter of whom at length destroyed Python with his arrows, in memory of which victory the Pythian games were instituted. See APOLLO.

Python.  
Quadrans.

Q.

Q, or q, the 16th letter and 12th consonant of our alphabet; but is not to be found either in the Greek, old Latin, or Saxon alphabets; and indeed some would entirely exclude it, pretending that k ought to be used wherever this occurs. However, as it is formed in the voice in a different manner, it is undoubtedly a distinct letter: for, in expressing this sound, the cheeks are contracted; and the lips, particularly the under one, are put into a cannular form, for the passage of the breath.

The q is never founded alone, but in conjunction with u, as in *quality, question, quite, quote, &c.* and never ends any English word.

As a numeral, Q stands for 500; and with a dash over it, thus Q̄, for 500,000.

Used as an abbreviation, q signifies *quantity*, or *quantum*. Thus, among physicians, *q. pl.* is *quantum placet*, i. e. "as much as you please" of a thing; and *q. s.* is *quantum sufficit*, i. e. "as much as is necessary." Q. E. D. among mathematicians, is *quod erat demonstrandum*, i. e. "which was to be demonstrated;" and Q. E. F. is *quod erat faciendum*, i. e. "which was to be done." Q. D. among grammarians, is *quasi dictum*, i. e. "as if it were said;" or, "as who should say." In the notes of the ancients, Q. stands for *Quintus*, or *Quintius*; Q. B. V. for *quod bene vertat*; Q. S. S. S. for *quæ supra scripta sunt*; Q. M. for *Quintus Mutius*, or *quomodo*; Quint. for *Quintilius*; and Quæf. for *quæstor*.

QUACK, among physicians, the same with empiric. See the article EMPIRIC.

QUADI, (Tacitus); a people of Germany, situated to the south-east of the mountains of Bohemia, on the banks of the Danube, and extending as far as the river Marus, or March, running by Moravia, which country they occupied.

QUADRAGESIMA, a denomination given to Lent, from its consisting of 40 days. See LENT.

QUADRANGLE, in geometry, the same with a quadrilateral figure, or one consisting of four sides and four angles.

QUADRANS, the quarter or fourth part of any thing, particularly the *as*, or pound.

QUADRANS, in English money, the fourth part of a penny. Before the reign of Edward I. the smallest coin was a *sterling*, or penny, marked with a cross; by the guidance of which a penny might be cut into halves or a halfpenny, or into quarters or four parts for farthings; till, to avoid the fraud of unequal cut-

tings, that king coined halfpence and farthings in distinct round pieces.

QUADRANT, in geometry, the arch of a circle, containing 90°, or the fourth part of the entire periphery.

Sometimes also the space or area, included between this arch and two radii drawn from the centre to each extremity thereof, is called a *quadrant*, or, more properly, a *quadrantal space*, as being a quarter of an entire circle.

QUADRANT, also denotes a mathematical instrument of great use in astronomy and navigation, for taking the altitudes of the sun and stars, as also for taking angles in surveying, &c.

This instrument is variously contrived, and furnished with different apparatus, according to the various uses it is intended for; but they all have this in common, that they consist of a quarter of a circle, whose limb is divided into 90°. Some have a plummet suspended from the centre, and are furnished with sights to look through.

The principal and most useful quadrants are the common surveying quadrant, astronomical quadrant, Adams's quadrant, Cole's quadrant, Gunter's quadrant, Hadley's quadrant, horodical quadrant, Sutton's or Collins's quadrant, and the finical quadrant, &c. of each of which in order.

1. The common surveying quadrant, ABC, fig. 1. is made of brass, wood, or any other solid substance; the limb of which BC is divided into 90°, and each of these farther divided into as many equal parts as the space will allow, either diagonally or otherwise. On one of the semi-diameters AC, are fitted two moveable sights; and to the centre is sometimes also fixed a label, or moveable index AD, bearing two other sights; but in lieu of these last sights there is sometimes fitted a telescope: also from the centre there is hung a thread with a plummet; and on the under side or face of the instrument is fitted a ball and socket, by means of which it may be put into any position.

The general use of it is for taking angles in a vertical plane, comprehended under right lines going from the centre of the instrument, one of which is horizontal, and the other is directed to some visible point. But besides the parts already described, there is frequently added on the face, near the centre, a kind of compartment, EF, called the *quadrat*, or *geometrical square*. See QUADRAT.

This quadrant may be used in different situations:

Plate  
CCLIII,

**Quadrant.** for observing heights or depths, its plane must be disposed perpendicularly to the horizon; but to take horizontal distances, its plane is disposed parallel thereto. Again, heights and distances may be taken two ways, viz. by means of the fixed sights and plummet, or by the label: As to which, and the manner of measuring angles, see GEOMETRY, p. [12.] [13.]

2. The astronomical quadrant is a large one, usually made of brass, or wooden bars faced with iron plates; having its limb, FE, (fig. 2.) nicely divided, either diagonally or otherwise, into degrees, minutes, and seconds; and furnished with two telescopes, one fixed on the side of the quadrant, at AB; and the other, CD, moveable about the centre, by means of the screw G. The dented wheels I, H, serve to direct the instrument to any object or phenomenon.—The use of this curious instrument, in taking observations of the sun, planets, and fixed stars, is obvious; for being turned horizontally upon its axis, by means of the telescope AB, till the object is seen thro' the moveable telescope, then the degrees, &c. cut by the index give the altitude required. See ASTRONOMY, n<sup>o</sup> 177, 182, &c.

3. Cole's quadrant is a very useful instrument invented by Mr Benjamin Cole. It consists of six parts, viz. the staff AB, (fig. 3.); the quadrantal-arch DE; three vanes A, B, C; and the vernier, FG. The staff is a bar of wood about two feet long, an inch and a quarter broad, and of a sufficient thickness to prevent it from bending or warping. The quadrantal arch is also of wood; and is divided into degrees, and third-parts of a degree, to a radius of about nine inches; to its extremities are fitted two radii, which meet in the centre of the quadrant by a pin, round which it easily moves. The sight-vane A is a thin piece of brass, almost two inches in height, and one broad, placed perpendicularly on the end of the staff A, by the help of two screws passing through its foot. Through the middle of this vane is drilled a small hole, thro' which the coincidence or meeting of the horizon and solar spot is to be viewed. The horizon vane B is about an inch broad, and two inches and a half high, having a slit cut thro' it of near an inch long and a quarter of an inch broad; this vane is fixed in the centre-pin of the instrument, in a perpendicular position, by the help of two screws passing thro' its foot, whereby its position with respect to the sight-vane is always the same, their angles of inclination being equal to 45 degrees. The shade-vane C is composed of two brass plates. The one, which serves as an arm, is about four inches and a half long, and three quarters of an inch broad, being pinned, at one end, to the upper limb of the quadrant by a screw, about which it has a small motion; the other end lies in the arch, and the lower edge of the arm is directed to the middle of the centre-pin: the other plate, which is properly the vane, is about two inches long, being fixed perpendicularly to the other plate, at about half an inch distance from that end next the arch; this vane may be used either by its shade, or by the solar spot cast by a convex lens placed therein. And, because the wood-work is often apt to warp or twist, therefore this vane may be rectified by the help of a screw, so that the warping of the instrument may occasion no error in the observation, which is per-

formed in the following manner: Set the line G on the vernier against a degree on the upper limb of the quadrant, and turn the screw on the backside of the limb forward or backward, till the hole in the sight-vane, the centre of the glass, and the sunk spot in the horizon-vane, lie in a right line.

To find the sun's altitude by this instrument: Turn your back to the sun, holding the instrument by the staff, with your right hand, so that it be in a vertical plane passing thro' the sun; apply your eye to the sight-vane, looking through that and the horizon-vane till you see the horizon; with the left hand slide the quadrantal arch upwards, until the solar spot or shade, cast by the shade-vane, fall directly on the spot or slit in the horizon-vane; then will that part of the quadrantal arch, which is raised above G or S (according as the observation respected either the solar spot or shade) show the altitude of the sun at that time. But, if the meridian altitude be required, the observation must be continued, and, as the sun approaches the meridian, the sea will appear through the horizon-vane, and then is the observation finished; and the degrees and minutes, counted as before, will give the sun's meridian altitude: or the degrees counted from the lower limb upwards will give the zenith-distance.

4. Adams's quadrant differs only from Cole's quadrant, in having an horizontal vane, with the upper part of the limb lengthened; so that the glass, which casts the solar spot on the horizon-vane, is at the same distance from the horizon-vane as the sight-vane at the end of the index.

5. Gunter's quadrant, so called from its inventor Edmund Gunter, is represented by fig. 4; and, besides the apparatus of other quadrants, has a stereographical projection of the sphere on the plane of the equinoctial. It has also a calendar of the months, next to the divisions of the limb.—Use of Gunter's quadrant. 1. To find the sun's meridian altitude for any given day, or the day of the month for any given meridian altitude. Lay the thread to the day of the month in the scale next the limb; and the degree it cuts in the limb, is the sun's meridian altitude. Thus the thread, being laid on the 15th of May, cuts 59° 30', the altitude sought; and, contrarily, the thread, being set to the meridian altitude, shows the day of the month. 2. To find the hour of the day. Having put the bead, which slides on the thread, to the sun's place in the ecliptic, observe the sun's altitude by the quadrant; then, if the thread be laid over the same in the limb, the bead will fall upon the hour required. Thus suppose on the 10th of April, the sun being then in the beginning of Taurus, I observe the sun's altitude by the quadrant to be 36°; I place the bead to the beginning of Taurus in the ecliptic, and lay the thread over 36° of the limb; and find the bead to fall on the hour-line marked 3 and 9; accordingly the hour is either 9 in the morning, or 3 in the afternoon. Again, laying the bead on the hour given, having first rectified or put it to the sun's place, the degree cut by the thread on the limb gives the altitude. Note, the bead may be rectified otherwise, by bringing the thread to the day of the month, and the bead to the hour-line of 12. 3. To find the sun's declination from his place given, and contrariwise. Set the bead to the sun's place in the ecliptic, move the thread.

Quadrant. thread to the line of declination ET, and the bead will cut the degree of declination required. Contrarily, the bead being adjusted to a given declination, and the thread moved to the ecliptic, the bead will cut the sun's place. 4. The sun's place being given, to find his right ascension, or contrarily. Lay the thread on the sun's place in the ecliptic, and the degree it cuts on the limb is the right ascension sought. Contrarily, laying the thread on the right ascension, it cuts the sun's place in the ecliptic. 5. The sun's altitude being given, to find his azimuth, and contrariwise. Rectify the bead for the time, as in the second article, and observe the sun's altitude; bring the thread to the complement of that altitude; thus the bead will give the azimuth sought, among the azimuth-lines. 6. To find the hour of the night from some of the five stars laid down on the quadrant. (1.) Put the bead to the star you would observe, and find how many hours it is off the meridian, by article 2. (2.) Then, from the right ascension of the star, subtract the sun's right ascension converted into hours, and mark the difference; which difference, added to the observed hour of the star from the meridian, shews how many hours the sun is gone from the meridian, which is the hour of the night. Suppose on the 15th of May the sun is in the 4th degree of Gemini, I set the bead to Arcurus; and, observing his altitude, find him to be in the west about 52° high, and the bead to fall on the hour-line of 2 in the afternoon; then will the hour be 11 hours 50 min. past noon, or 10 min. short of midnight: for 62°, the sun's right ascension, converted into time, makes 4 hours 8 minutes; which, subtracted from 13 hours 58 minutes, the right ascension of Arcurus, the remainder will be 9 hours 50 minutes; which added to 2 hours, the observed distance of Arcurus from the meridian, shows the hour of the night to be 11 hours 50 minutes.

6. Hadley's quadrant, (fig. 5.) so called from its inventor J. Hadley, Esq. consists of the following particulars: 1. An octant, or  $\frac{1}{8}$  part of a circle, ABC. 2. An index D. 3. The speculum E. 4. Two horizontal glasses, F, G. 5. Two screens, K, K. 6. Two sight-vanes, H, I.

The octant consists of two radii, AB, AC, which are strengthened by the braces L, M, and the arch BC; which, tho' containing only 45°, is nevertheless divided into 90 primary divisions, each of which stands for degrees, and are numbered 0, 10, 20, 30, &c. to 90; beginning at each end of the arch for the convenience of numbering both ways, either for altitudes or zenith-distances. Again, each degree is subdivided into minutes.

The index D, is a flat bar, moveable round the centre of the instrument; and that part of it which slides over the graduated arch, BC, is open in the middle, with Vernier's scale on the lower part of it; and underneath is a screw, serving to fasten the index against any division.

The speculum E, is a piece of flat glass, quicksilver on one side, set in a brass box, and placed perpendicular to the plane of the instrument, the middle part of the former coinciding with the centre of the latter. And, because the speculum is fixed to the index, the position of it will be altered by the moving of the index along the arch. The rays of an observed

object are received on the speculum, and from thence reflected on one of the horizon-glasses, r, c; which are two small pieces of looking-glasses placed on one of the limbs, their faces being turned obliquely to the speculum, from whence they receive the reflected rays of observed objects. This glass, F, has only its lower part quicksilvered, and set in brass-work; the upper part being left transparent to view the horizon. The glass G has in its middle a transparent slit, thro' which the horizon is to be seen. And because the warping of the wood-work, and other accidents, may distend them from their true situation, there are three screws passing thro' their feet, whereby they may be easily replaced. The screens are two pieces of coloured glass, set in two square brass-frames K, K, which serve as screens to take off the glare of the sun's rays, which would be otherwise too strong for the eye; the one is tinged much deeper than the other, and, as both of them move on the same centre, they may be both or either of them used: in the situation they appear in the figure, they serve for the horizon-glass F; but, when they are wanted for the horizon-glass G, they must be taken from their present situation, and placed on the quadrant above G.

The sight-vanes are two pins, H and I, standing at right angles to the plane of the instrument; that at H has one hole in it, opposite to the transparent slit in the horizon-glass G; the other, at I, has two holes in it, the one opposite to the middle of the transparent part of the horizon-glass F, the other rather lower than the quicksilvered part: this vane has a piece of brass on the back of it, which moves round a centre, and serves to cover either of the holes.

There are two sorts of observations to be made with this instrument: the one, when the back of the observer is turned towards the object, and therefore called the *back observation*; the other, when the face of the observer is turned towards the object, which is called the *fore-observation*.

To rectify the instrument for the fore-observation: Slacken the screw in the middle of the handle behind the glass F; bring the index close to the button b; hold the instrument in a vertical position, with the arch downwards; look thro' the right-hand hole in the vane I, and thro' the transparent part of the glass F, for the horizon; and if it lies in the same right line with the image of the horizon seen on the quicksilvered part, the glass F is rightly adjusted; but, if the two horizontal-lines disagree, turn the screw at the end of the handle backwards or forwards, until those lines coincide; then fasten the middle screw of the handle, and the glass is rightly adjusted.

To take the sun's altitude by the fore-observation. Having fixed the screens above the horizon-glass F, and suited them proportionally to the strength of the sun's rays, turn your face towards the sun, holding the instrument with your right hand, by the braces L, M, in a vertical position, with the arch downwards; put your eye close to the right-hand hole in the vane I, and view the horizon thro' the transparent part of the horizon-glass F, moving at the same time the index D with your left hand, till the reflex solar spot coincides with the line of the horizon; then the degrees counted from C, or that end next your body, will give the altitude of the sun at that time, observing to add

Plate CCLIII.

Quadrant. or subtra<sup>ct</sup> . . . minutes, according as the upper or lower edge of the sun's reflex image is made use of. But to obtain the sun's meridian altitude, which is the thing wanted, in order to find the latitude; the observations must be continued, and, as the sun approaches the meridian, the index D must be continually moved towards B, in order to maintain the coincidence between the reflex solar spot and the horizon; and consequently, as long as this motion can maintain the same coincidence, the observation must be continued, and when the sun has attained the meridian, and begins to descend, the coincidence will require a retrograde motion of the index, or towards C; and then is the observation finished, and the degrees counted, as before, will give the sun's meridian altitude, or those from B the zenith-distance; observing to add 16' = semidiam. ☉, if the sun's lower edge is brought to the horizon; or to subtract 16', when the horizon and upper edge coincide.

To take the altitude of a star by the fore-observation: Through the vane H, and the transparent slit in the glass G, look directly to the star; and at the same time move the index, till the image of the horizon behind you being reflected by the great speculum, is seen in the quicksilver part of C, and meets the star; then will the index show the degrees of the star's altitude.

To rectify the instrument for the back-observation: Slacken the screw in the middle of the handle, behind the glass G; turn the button *b* on one side, and bring the index as many degrees before *o*, as is twice the dip of the horizon at your height above the water; hold the instrument vertical, with the arch downwards; look through the hole of the vane H; and if the horizon, seen through the transparent slit in the glass G, coincides with the image of the horizon seen in the quicksilver part of the same glass, then the glass G is in its proper position; but, if not, set it by the handle, and fasten the screw as before.

To take the sun's altitude by the back observation: Put the stem of the screens K, K, into the hole *r*, and, in proportion to the strength or faintness of the sun's rays, let one, both, or neither of the frames of those glasses be turned close to the face of the limb; hold the instrument in a vertical position, with the arch downwards, by the braces L, M, with your left hand; turn your back towards the sun, and put your eye close to the hole in the vane H, observing the horizon thro' the transparent slit in the horizon-glass G; with your right-hand move the index D, till the reflected image of the sun be seen in the quicksilver part of the glass G, and in a right line with the horizon; swing your body to and fro, and if the observation be well made, the sun's image will be observed to brush the horizon, and the degrees reckoned from C, or that part of the arch farthest from your body, will give the sun's altitude at the time of observation; observing to add 16' = the sun's semidiameter, if the sun's upper edge be used; and subtract 16' from the altitude, if the observation respected the lower edge.

The directions here given for taking of altitudes at sea, would be sufficient, were there not two corrections necessary to be made before the altitude can be accurately assigned, *viz.* one on account the observer's eye being raised above the level of the sea, and the other

on account of the refraction occasioned in small altitudes by the haziness of the atmosphere.

We shall therefore give a table, shewing the corrections necessary to be made to altitudes on both these accounts.

height of the eye in feet.	corrections in minutes in	altitudes in degrees.	corrections in degrees.	altitude in degrees.	corrections in minutes.
5	2'	1	23'	12	4'
10	3'	2	17 <sup>1</sup> / <sub>2</sub> '	15	3 <sup>1</sup> / <sub>2</sub> '
15	4'	3	14'	20	2 <sup>1</sup> / <sub>2</sub> '
20	5'	4	11'	25	2'
25	5 <sup>1</sup> / <sub>2</sub> '	5	9'	30	1 <sup>1</sup> / <sub>2</sub> '
30	6'	5	8'	35	1 <sup>1</sup> / <sub>2</sub> '
35	6 <sup>1</sup> / <sub>2</sub> '	7	7'	40	1'
40	7'	8	6'	50	0 <sup>1</sup> / <sub>2</sub> '
45	7 <sup>1</sup> / <sub>2</sub> '	9	5 <sup>1</sup> / <sub>2</sub> '	60	0 <sup>1</sup> / <sub>2</sub> '
50	8'	10	5'	70	0 <sup>1</sup> / <sub>2</sub> '

General rules for using this table of corrections. 1. In the fore-observations, add the sum of the corrections to the observed zenith-distance, for the true zenith-distance; or, take the sum of the corrections from the observed altitude, and the remainder will be the altitude. 2. In the back-observations, add the dips, or corrections for the height of the eye, and subtract the refractions for altitudes; and for zenith-distances, subtract the dips, and add the refractions.

Example: By a back-observation, the altitude of the sun's lower edge was found by Hadley's quadrant to be 25° 12'; the eye being 30 feet above the horizon. By the table, the dip on 30 feet is 6', and the refraction on 25° is 2'; therefore 25° 12' — 16' (= semidiam. ☉) = 24° 56', and 24° 56' + 6' (by rule 2) = 25° 2', and lastly 25° 2' — 2' = 25° = the true or corrected altitude.

A considerable improvement has been made in the construction of this quadrant by Mr Peter Dollond, famous for his invention of achromatic telescopes. The glasses of the quadrants should be perfect planes, and have their surfaces perfectly parallel to one another. By a practice of several years, Mr Dollond found out methods of grinding them of this form to great exactness; but the advantage which should have arisen from the goodness of the glasses was often defeated by the index glass being bent by the frame which contains it. To prevent this, Mr Dollond contrived the frame so that the glass lies on three points, and the part that presses on the front of the glass has also three points opposite to the former. These points are made to confine the glass by three screws at the back acting directly opposite to the points between which the glass is placed. The principal improvements, however, are in the methods of adjusting the glasses, particularly for the back-observation. The method formerly practised for adjusting that part of the instrument by means of the opposite horizons at sea was attended with so many difficulties that it was scarce ever used: for so little dependence could be placed on the observations taken this way, that the best Hadley's sextants made for the purpose of observing the distances of the moon from the sun

Quadrant. sun or fixed stars have been always made without the horizon-glass for the back-observation; for want of which, many valuable observations of the sun and moon have been lost, when their distance exceeded 120 degrees. To make the adjustment of the back-observation easy and exact, he applied an index to the back horizon-glass, by which it may be moved in a parallel position to the index glass in order to give it the two adjustments in the same manner as the fore horizon-glass is adjusted. Then, by moving the index to which the back horizon-glass is fixed exactly 90 degrees (which is known by the divisions made for that purpose), the glass will be thereby set at right angles to the index glass, and will be properly adjusted for use; and the observations may be made with the same accuracy by this as by the fore-observation. To adjust the horizon-glasses in the perpendicular position to the plane of the instrument, he contrived to move each of them by a single screw, which goes through the frame of the quadrant, and is turned by means of a milled head at the back; which may be done by the observer while he is looking at the object. To these improvements also he added a method invented by Mr Maskelyne, of placing darkening-glasses behind the horizon-glasses. These, which serve for darkening the object seen by direct vision, in adjusting the instrument by the sun or moon, he placed in such a manner as to be turned behind the fore horizon-glass, or behind the back horizon-glass: there are three of these glasses of different degrees of darkness.

We have been the more particular in our description and use of Hadley's quadrant, as it is undoubtedly the best hitherto invented.

7. Horodical quadrant, a pretty commodious instrument, so called from its use in telling the hour of the day.—Its construction is this: From the centre of the quadrant, C, fig. 6. whose limb AB is divided into 90°, describe seven concentric circles at intervals at pleasure; and to these add the signs of the zodiac, in the order represented in the figure. Then, applying a ruler to the centre C and the limb AB, mark upon the several parallels the degrees corresponding to the altitude of the sun when therein, for the given hours; connect the points belonging to the same hour with a curve line, to which add the number of the hour. To the radius CA fit a couple of sights, and to the centre of the quadrant C tie a thread with a plummet, and upon the thread a bead to slide. If now the head be brought to the parallel wherein the sun is, and the quadrant directed to the sun, till a visual ray pass through the sights, the bead will show the hour. For the plummet, in this situation, cuts all the parallels in the degrees corresponding to the sun's altitude. Since then the bead is in the parallel which the sun describes, and through the degrees of altitude to which the sun is elevated every hour there pass hour-lines, the bead must show the present hour. Some represent the hour-lines by arches of circles, or even by straight lines, and that without any sensible error.

8. Sutton's or Collins's quadrant (fig. 7.) is a stereographic projection of one quarter of the sphere between the tropics, upon the plane of the ecliptic, the eye being in its north-pole: it is fitted to the latitude of London. The lines running from the right hand to the left, are parallels of altitude; and those crossing

them are azimuths. The lesser of the two circles, bounding the projection, is one fourth of the tropic of Capricorn; the greater is one fourth of that of Cancer. The two ecliptics are drawn from a point on the left edge of the quadrant, with the characters of the signs upon them; and the two horizons are drawn from the same point. The limb is divided both into degrees and time; and, by having the sun's altitude, the hour of the day may be found here to a minute. The quadrantal arches next the centre contain the calendar of months; and under them, in another arch, is the sun's declination. On the projection are placed several of the most noted fixed stars between the tropics; and the next below the projection is the quadrant and line of shadows.—To find the time of the sun's rising or setting, his amplitude, his azimuth, hour of the day, &c, by this quadrant: lay the thread over the day and the month, and bring the bead to the proper ecliptic, either of summer or winter, according to the season, which is called *retififying*; then, moving the thread, bring the bead to the horizon, in which case the thread will cut the limb in the time of the sun's rising or setting before or after six; and at the same time the bead will cut the horizon in the degrees of the sun's amplitude.—Again, observing the sun's altitude with the quadrant, and supposing it found 45° on the fifth of May, lay the thread over the fifth of May, bring the bead to the summer ecliptic, and carry it to the parallel of altitude 45°; in which case the thread will cut the limb at 55° 15', and the hour will be seen among the hour-lines to be either 41' past nine in the morning, or 19' past two in the afternoon.—Lastly, the bead among the azimuths shows the sun's distance from the south 50° 41'. But note, that if the sun's altitude be less than what it is at six o'clock, the operation must be performed among those parallels above the upper horizon; the bead being rectified to the winter ecliptic.

9. Sinical quadrant (fig. 8.) consists of several concentric quadrantal arches, divided into eight equal parts by radii, with parallel right lines crossing each other at right angles. Now any one of the arches, as BC, may represent a quadrant of any great circle of the sphere, but is chiefly used for the horizon or meridian. If then BC be taken for a quadrant of the horizon, either of the sides, as AB, may represent the meridian; and the other side, AC, will represent a parallel, or line of east and west: and all the other lines, parallel to AB, will be also meridians; and all those parallel to AC, east and west lines, or parallels.—Again, the eight spaces into which the arches are divided by the radii, represent the eight points of the compass in a quarter of the horizon; each containing 11° 15'. The arch BC is likewise divided into 90°, and each degree subdivided into 12', diagonal-wise. To the centre is fixed a thread, which, being laid over any degree of the quadrant, serves to divide the horizon.

If the sinical quadrant to be taken for a fourth part of the meridian, one side thereof, AB, may be taken for the common radius of the meridian and equator; and then the other, AC, will be half the axis of the world. The degrees of the circumference, BC, will represent degrees of latitude; and the parallels to the side AB, assumed from every point of latitude to the axis AC, will be radii of the parallels of latitude, as like-

Quadrant. likewise the fine complement of those latitudes.

Suppose, then, it be required to find the degrees of longitude contained in 83 of the lesser leagues in the parallel of  $48^\circ$ ; lay the thread over  $48^\circ$  of latitude on the circumference, and count thence the 83 leagues on AB, beginning at A; this will terminate in H, allowing every small interval four leagues. Then tracing out the parallel HE, from the point H to the thread; the part AE of the thread shows that 125 greater or equinoctial leagues make  $6^\circ 15'$ ; and therefore that the 83 lesser leagues AH, which make the difference of longitude of the course, and are equal to the radius of the parallel HE, make  $6^\circ 15'$  of the said parallel.

If the ship fails an oblique course, such course, besides the north and south greater leagues, gives lesser leagues easterly and westerly, to be reduced to degrees of longitude of the equator. But these leagues being made neither on the parallel of departure, nor on that of arrival, but in all the intermediate ones, we must find a mean proportional parallel between them. To find this, we have on the instrument a scale of cross latitudes. Suppose then it were required to find a mean parallel between the parallels of  $40^\circ$  and  $60^\circ$ ; with your compasses take the middle between the 40th and 60th degree on the scale: this middle point will terminate against the 51st degree, which is the mean parallel required.

The principal use of the finical quadrant is to form triangles upon, similar to those made by a ship's way with the meridians and parallels; the sides of which triangles are measured by the equal intervals between the concentric quadrants and the lines N and S, E and W: and every fifth line and arch is made deeper than the rest. Now, suppose a ship to have sailed 150 leagues north-east, one fourth north, which is the third point, and makes an angle of  $33^\circ 44'$  with the north-part of the meridian: here are given the course and distance sailed, by which a triangle may be formed on the instrument similar to that made by the ship's course; and hence the unknown parts of the triangle may be found. Thus, supposing the centre A to represent the place of departure; count, by means of the concentric circles along the point the ship sailed on, viz. AD, 150 leagues: then in the triangle AED, similar to that of the ship's course, find AE = difference of latitude, and DE = difference of longitude, which must be reduced according to the parallel of latitude come to.

Plate CCLIII.

10. Gunner's quadrant, (fig. 9.) sometimes called *gunner's square*, is that used for elevating and pointing cannon, mortars, &c. and consists of two branches either of brass or wood, between which is a quadrantal arch divided into 90 degrees, beginning from the shorter branch, and furnished with a thread and plummet, as represented in the figure.—The use of the gunner's quadrant is extremely easy; for if the longest branch be placed in the mouth of the piece, and it be elevated till the plummet cut the degree necessary to hit a proposed object, the thing is done. Sometimes on one of the surfaces of the long branch, are noted the division of diameters and weights of iron bullets, as also the bores of pieces.

QUADRANT of Altitude (fig. 10.) is an appendage of the artificial globe, consisting of a lamina, or slip of brass, the length of a quadrant of one of the great circles of the globe, and graduated. At the end, where the

division terminates, is a nut rivetted on, and furnished with a screw, by means whereof the instrument is fitted on the meridian, and moveable round upon the rivet to all points of the horizon, as represented in the figure referred to.—Its use is to serve as a scale in measuring of altitudes, amplitudes, azimuths, &c. See ASTRONOMY, n<sup>o</sup> 320, &c.

QUADRAT, a mathematical instrument, called also a *Geometrical Square*, and *Line of Shadows*: it is frequently an additional member on the face of the common quadrant, as also on those of Gunter's and Sutton's quadrants. See GEOMETRY, [p. 10.] and Plate CXXXVIII. fig. 1—5.

QUADRAT, in astrology, the same with quartile. See QUARTILE.

QUADRAT, in printing, a piece of metal used to fill up the void spaces between words, &c. There are quadrats of different sizes; as m-quadrats, n-quadrats, &c. which are respectively of the dimensions of these letters, only lower, that they may not receive the ink.

QUADRATIC EQUATIONS, in algebra, those wherein the unknown quantity is of two dimensions, or raised to the second power.

QUADRATRIX, in geometry, a mechanical line, by means whereof we can find right lines equal to the circumference of circles, or other curves, and their several parts.

QUADRATURE, in geometry, denotes the squaring, or reducing a figure to a square. Thus, the finding of a square, which shall contain just as much surface or area as a circle, an ellipsis, a triangle, &c. is the quadrature of a circle, ellipsis, &c. See GEOMETRY.

QUADRATURE, in astronomy, that aspect of the moon when she is  $90^\circ$  distant from the sun; or when she is in a middle point of her orbit, between the points of conjunction and opposition, namely, in the first and third quarters.

QUADRATUS, in anatomy, a name given to several muscles on account of their square figure. See ANATOMY, *Table of the Muscles*.

QUADREL, in building, a kind of artificial stone, so called from its being perfectly square. The quadrals are made of a chalky earth, &c. and dried in the shade for two years. These were formerly in great request among the Italian architects.

QUADRIGA, in antiquity, a car or chariot drawn by four horses. On the reverses of medals, we frequently see the emperor or Victory in a quadriga, holding the reins of the horses; whence these coins are, among the curious, called *nammi quadrigati*, and *victoriatii*.

QUADRILATERAL, in geometry, a figure whose perimeter consists of four angles; whence it is also called a *quadrangular figure*.

QUADRILLE, a little troop or company of cavaliers, pompously dressed, and mounted for the performance of carousals, jousts, tournaments, runnings at the ring, and other gallant diversions.

QUADRILLE, is also the name of a game at cards, to be learned only by practice.

QUADRUPEDS, in zoology; those animals which have four limbs or legs proceeding from the trunk of their body. See ZOOLOGY.

QUAIL, in zoology. See TETRAO.

Quails are to be taken by means of the call, during their

Quadrant  
Quail.

Quail.  
Quakers.

their whole wooing time, which lasts from April to August. The proper times for using the call are at sun-rising, at nine o'clock in the morning, at three in the afternoon, and at sun-set; for these are the natural times of the quail's calling. The notes of the cock and hen quail are very different, and the sportsman who expects to succeed in the taking them must be expert in both: for when the cock calls, the answer is to be made in the hen's note; and when the hen calls, the answer is to be made in the cock's. By this means, they will come up to the person so that he may, with great ease, throw the net over them and take them. If a cock-quail be single, on hearing the hen's note he will immediately come; but if he have a hen already with him, he will not forsake her. Sometimes, though only one quail answers to the call, there will three or four come up; and then it is best to have patience, and not run to take up the first, but slay till they are all entangled, as they will soon be.

The quail is a neat cleanly bird, and will not run much into dirty or wet places: in dewy mornings, they will often fly instead of running to the call; and in this case, it is best to let them go over the net, if it so happens that they fly higher than its top, and the sportsman then changing sides, and calling again, the bird will come back, and then will probably be taken in the net.

The calls are to be made of a small leather purse, about two fingers wide, and four fingers long, and made in the shape of a pear; this is to be stuffed half-full of horse-hair, and at the end of it is to be placed a small whistle, made of the bone of a rabbit's leg, or some other such bone: this is to be about two inches long, and the end formed like a flageolet, with a little soft wax. This is to be the end fastened into the purse; the other is to be closed up with the same wax, only that a hole is to be opened with a pin, to make it give a distinct and clear sound. To make this sound, it is to be held full in the palm of the hand, with one of the fingers placed over the top of the wax, then the purse is to be pressed, and the finger is to shake over the middle of it, to modulate the sound it gives into a sort of shake. This is the most useful call; for it imitates the note of the hen-quail, and seldom fails to bring a cock to the net, if there be one near the place.

The call that imitates the note of the cock, and is used to bring to the hen to him, is to be about four inches long, and above an inch thick; it is to be made of a piece of wire turned round and curled, and covered with leather; and one end of it must be closed up with a piece of flat wood, about the middle of which there must be a small thread or strap of leather, and at the other end is to be placed the same sort of pipe, made of bone, as is used in the other call. The noise is made by opening and closing the spiral, and gives the same sound that the cock does when he gives the hen a signal that he is near her.

QUAKERS, a religious society that began to be distinguished by this name in England, where it first took its rise, about the middle of the last century. Its founder was George Fox, an illiterate person, and by trade a shoemaker. See the article (*George*) Fox.

William Sewel, a Dutchman, published, in the year 1717, the history of this people. He was one

of their persuasion, a man of learning, and known to the public by his Dictionary of the Dutch and English languages. He had access to all their records, corresponded with the most eminent, lived at the time when the facts he recorded were recent, and we have not heard that any part of his history has been controverted; and as we are informed that it has been published by the approbation of the Quakers, we may therefore consider it as an authentic history of their rise, progress, and principal opinions.

The name of *Quaker* was affixed to this people early, by way of reproach. In their assemblies it sometimes happened, that some were so far struck with the remembrance of their past follies and forgetfulness of their condition, others so deeply affected with a sense of God's mercies to them, that they actually trembled and quaked. The nickname so suited the vulgar taste, that it immediately became general. *Friends*, or *The friends of truth*, was the name they were commonly known by to one another; but the epithet above-mentioned was stamped upon them by their adversaries, and perhaps indelibly.

The following abstract from the propositions of our countryman, the eminent Barclay, will perhaps exhibit as clear a summary of their opinions as can well be comprised within the limits allowed to this article.

1. The height of all happiness is placed in the true knowledge of God.
2. The true knowledge of God is alone to be obtained by the revelation of the Spirit of God.
3. The revelation of the Spirit of God to the saints has produced the scriptures of truth.
4. From whence it appears, that mankind in general is fallen and degenerated.
5. That God out of his infinite love hath offered universal redemption by Christ, who tasted death for every man.
6. That there is an evangelical and saving light and grace in all.
7. That as many as resist not this light, but receive the same, in them are produced holiness, righteousness, purity, and the fruits which are acceptable to God.
8. Even so as to arrive at a state of freedom from actual sinning and transgressing the law of God;
9. Yet with a possibility of sinning.
10. That as all true knowledge in things spiritual is received by the Spirit of God, so by it every true minister of the gospel is ordained and prepared for the ministry; and as they have freely received, so are they freely to give.
11. That the true worship of God is in spirit and in truth; not limited to place or time, or subject to the intervention of any person; but is to be performed under the moving of the Holy Spirit in our hearts, yet without derogating from the necessity and utility of public united worship, (in which their sufferings and constancy have been most remarkable).
12. That baptism is a pure and spiritual thing, the baptism of the spirit and fire.
13. That the communion of the body and blood of Christ is inward and spiritual.
14. That it is not lawful for any human authority to force the consciences of others on account of difference in worship or opinion, except such opinions tend to the prejudice or his neighbour in his life or estate, or are inconsistent with human society.
15. That as the end of religion is to redeem man from the spirit of this world, and to lead into inward communion with God; therefore all vain customs and habits are to be rejected, which tend to divert

Quakers.

the mind from a sense of the fear of God, and that evangelical spirit wherewith Christians ought to be leavened.

Such are the sentiments of this people as proposed to the public by their apologist, who has largely commented on these topics in a work that has passed thro' many editions in English, and has been printed in most of the modern languages.

Their particularities of address, language, and behaviour; their declining the use of arms, even in their own defence; their refusing to pay tithes or contribute to the support of ministers in any shape; likewise their refusing to swear or take an oath on any occasion whatever; have subjected them to much obloquy, and many sufferings. On what principles, and by what arguments, they vindicate themselves from the objections raised against them by their adversaries, may be seen in this elaborate performance. Government has, however, in many instances, extended to this people great indulgences; convinced, no doubt, by their patient suffering, that their professions of conscientious scruples were sincere, and that nothing dangerous to society could be apprehended from a people who disclaimed the use of arms both offensive and defensive. The economy of this society likewise deserves our notice. It appears by their history, that soon after the preaching of George Fox had drawn together in many parts of England considerable bodies of people professing the same opinions, he found it expedient for their better government to establish regular meetings for discipline. The following is, as nearly as we can collect, the plan that is established amongst them.

Where there are any Quakers, they meet together every month, to consider of the necessities of their poor, and to provide for their relief; to hear and determine complaints arising among themselves; to inquire into the conversation of their respective members in regard to morality and conformity to their religious sentiments; to allow the passing of marriages; and to enjoin a strict regard to the peace and good order of the society, the proper education of their young people, and a general attention to the principles and practices of their professions. In every country where there are monthly meetings, a meeting of the like kind is held, and for similar purposes, every quarter. This meeting consists of deputies sent from the several monthly meetings, who are charged with answers in writing to queries proposed to them respecting the good order of the society. At these meetings appeals are received, in case of any disputes; and differences settled, if possible. Advices are given as occasions offer; and assistance is afforded to any of the monthly meetings, in case of a larger proportion of poor, or any similar expences. As there are Quakers in most parts of England, there are few counties which have not these quarterly meetings. And from these are deputed 4, 6 or 8 of their members once a-year to their annual assembly at London.

The annual meeting is commonly held in Whitfun-week, not from any superstitious reference, as they say, to the effusion of the Holy Ghost at the time of pentecost, but merely as it is a season most generally convenient to the body. At this anniversary meeting,

consisting of deputies from every quarterly meeting, and a number of the most judicious of their persuasion in London, selected for the purpose of acting on all emergencies for the good of the society, accounts are received of the state of the society in every part of the world where it exists. The deputies bring with them accounts signed by order of the respective quarterly meetings, informing of the yearly meeting, if any disunion appears; if there is any neglect in regard to the religious education of their youth; if the poor are well provided for; if they keep to their testimony against paying tithes, and against bearing arms; if they pay the king his duties, customs, and excise, and forbear to deal in goods suspected to be run. Appeals are here received, and finally determined; propositions received, and considered; and rules formed on particular emergencies; And, lastly, such advices are sent to the subordinate meetings as the particular or general state of the society requires.

Perhaps this is the only society in the world that have allowed any share in the management of their affairs to the female sex; which they do upon the principle that male and female are one in Christ. Accordingly we find them in every department of their institution. They have women-preachers, for whom the celebrated Locke made an excellent apology. These have also their meetings of discipline; in which the like care is taken in regard to the female youth, and the good order of their sex, as is done by the men in respect to their own. And when we reflect what a number of individuals of both sexes are kept in good order by the police of this society, how few of them are brought into courts of justice as delinquents, how peaceable their behaviour, and how exemplary their conduct, we cannot but think their principles deserve a more accurate examination than has hitherto been attempted, owing perhaps to the vulgar prejudices circulated against them. We shall close this article with observing, that, according to the best of our information, neither their ministers, nor those who have the principal care of the society, enjoy any pecuniary emolument or advantages. A few clerks only receive salaries for keeping their records; so that perhaps there is not a religious society now existing, where principle has greater influence in promoting the ends of their institution.

It is remarkable, that all the settlements of the Europeans in America, except the Quaker settlement of Pennsylvania, were made by force of arms, with very little regard to any prior title in the natives. The kings of Spain, Portugal, France, and Britain, together with the States of Holland, then the only maritime powers, gave grants of such parts of America as their people could lay hold on, studying only to avoid interference with their European neighbours. But Mr Penn, being a Quaker, did not think his powers from king Cha. II. a sufficient title to the country since called *Pennsylvania*: He therefore assembled the sachems or princes then in that country, and purchased from them the extent of land that he wanted. The government of this province is mostly in the hands of the Quakers, who never have any quarrels with the natives. When they desire to extend their settlements, they purchase new lands of the sachems, never taking any thing from them by force.

force. How unlike is this conduct to that of the Spaniards, who murdered millions of the natives of Mexico, Terra Firma, Peru, Chili, &c.

**QUALITY**, is defined by Mr Locke to be the power in a subject of producing any idea in the mind.

*Primary and Secondary QUALITIES.* See METAPHYSICS, n<sup>o</sup> 31—35.

*Chemical QUALITIES*, those qualities principally introduced by means of chemical experiments, as fumatation, amalgamation, cupellation, volatilization, precipitation, &c.

**QUALITY**, is also used for a kind of title given to certain persons, in regard of their territories, dignities, or other pretensions.

**QUANGSI**, a province of China, bounded on the north by Koe-Tcheau and Hu-Quang; on the east, by Yunan and Quantong; on the south, by the same and Ton-quin; and on the west, by Yun-nan. It produces great plenty of rice, being watered by several large rivers. The southern part is a flat country, and well cultivated; but the northern is full of mountains covered with trees. It contains mines of all sorts; and there is a gold-mine lately opened. Among other animals there are porcupines and rhinoceroses. The capital town is Que-ling.

**QUANG-TONG**, a province of China, bounded on the east by Kiang-Si and Fokien; on the south, by the ocean; and on the west, by Tonquin. This province is diversified by valleys and mountains; and yields two crops of corn in a year. It abounds in gold, jewels, silk, pearls, tin, quick-silver, sugar, brass, iron, steel, salt-petre, ebony, and several sorts of odoriferous wood; besides fruits of all sorts proper to the climate. They have a prodigious number of ducks, whose eggs they hatch in ovens; and a tree, whose wood is remarkably hard and heavy, and thence called *iron-wood*. The mountains are covered with a sort of oshers which creep along the ground, and of which they make baskets, hurdles, mats, and ropes. Canton is the capital town.

**QUANTITY**, any thing capable of estimation or mensuration; or which, being compared with another thing of the same kind, may be said to be greater or less than it, equal or unequal to it.

**QUANTITY**, in grammar, an affection of a syllable, whereby its measure, or the time wherein it is pronounced, is ascertained; or that which determines the syllable to be long or short.

Quantity is also the object of prosody, and distinguishes verse from prose; and the economy and arrangement of quantities, that is, the distribution of long and short syllables, makes what we call the *number*. See POETRY, Part III.

The quantities are used to be distinguished, among grammarians, by the characters  $\bar{\quad}$ , short, as  $\bar{p}\bar{e}\bar{r}$ ; and  $\text{—}$ , long, as  $\text{—}\bar{r}\bar{o}\text{—}$ . There is also a common, variable, or dubious quantity; that is, syllables that are one time taken for short ones and at another time for long ones; as the first syllable in *Atlas, patres*, &c.

**QUARANTINE**, is a trial which ships must undergo when suspected of a pestilential infection. It may be ordered by the king, with advice of the privy-council, at such times, and under such regulations, as he judges proper. Ships ordered on quarantine must

repair to the place appointed, and must continue there during the time prescribed, (generally six weeks); and must have no intercourse with the shore, except for necessary provisions, which are conveyed with every possible precaution. When the time is expired, and the goods opened and exposed to the air as directed, if there be no appearance of infection they are admitted to port.

Ships infected with the pestilence must proceed to St Helen's Pool in the Scilly islands, and give notice of their situation to the custom-house officers, and wait till the king's pleasure be known.

Persons giving false information to avoid performing quarantine, or refusing to go to the place appointed, or escaping, also officers appointed to see quarantine performed, deserting their office, neglecting their duty, or giving a false certificate, suffer death as felons.

Goods from Turkey, or the Levant, may not be landed without license from the king, or certificate that they have been landed and aired at some foreign port.

**QUARLES** (Francis), the son of James Quarles clerk to the board of green cloth and purveyor to queen Elizabeth, was born in 1592. He was educated at Cambridge; became a member of Lincoln's inn; and was for some time cup-bearer to the queen of Bohemia, and chronologer to the city of London. It was probably on the ruin of her affairs that he went to Ireland as secretary to archbishop Usher; but the troubles in that kingdom forcing him to return, and not finding affairs more at peace in England, some disquiets he met with were thought to have hastened his death, which happened in 1644. His works both in prose and verse are numerous, and were formerly in great esteem, particularly his Divine Emblems: but the obsolete quaintness of his style has caused them to fall into neglect, excepting among particular classes of readers.

**QUARRY**, a place under ground, out of which are got marble, free-stone, slate, limestone, or other matters proper for building. See STRATA.

Some lime-stone quarries in Fife are highly worthy the attention of the curious, on account of an amazing mixture of sea-bodies found in them. One of this kind was opened, about the year 1759, at a farm called *Endersteel*, in the neighbourhood of Kirkaldy, belonging to General St Clair.

The flakes of the stone, which are of unequal thickness, most of them from eight to ten inches, lie horizontally dipping towards the sea. Each of these flakes, when broken, presents to our view an amazing collection of petrified sea bodies, as the bones of fishes, stalks of sea-weed, vast quantities of shells, such as are commonly found on those coasts, besides several others of very uncommon figures. In some places the shells are so numerous, that little else is to be seen but prodigious clusters or concretions of them. In the uppermost stratum the shells are so entire, that the outer crust or plate may be scraped off with the finger; and the stalks of the sea-weed have a darkish colour, not that glossy whiteness which they have in the heart of the quarry. The smallest rays or veins of the shells are deeply indented on the stone, like the impression

Quarry  
Quarter.

of a seal upon wax. In short, no spot at the bottom of the ocean could exhibit a greater quantity of feebodies than are to be found in this solid rock; for we have the skeletons of several fishes, the *antenna* or feelers of lobsters, the roots and stalks of sea-weeds, with the very *capula* which contain the seed. The place where all these curiosities are found, is on an eminence about an English mile from the sea; and as the ground is pretty steep the whole way, it may be 200 feet higher at least.

There are two or three things to be remarked here. 1. That among all the bodies we have mentioned, there are none but what are specifically heavier than water. This holds so constantly true, that the seaweed, which floats in water when the plant is entire, has been stripped of the broad leaves, which make it buoyant, before it has been lodged here. 2. The shells have been all empty; for the double ones, as those of the flat kind, are always found single, or with one side only. 3. The rock seems to have been gradually deserted by the sea, and, for a long time, washed with the tides; for the upper surface is all eaten, and hollowed in many places like an honey-comb, just as we observe in flat rocks exposed every tide to the access and recess of the waters. See the article SEA.

QUARRY, or *Quarrel*, among glaziers, a pane of glass cut in a diamond form.

Quarries are of two kinds, square and long; each of which are of different sizes, expressed by the number of the pieces that make a foot of glass, viz. eighths, tenths, eighteenth, and twentieths: but all the sizes are cut to the same angles, the acute angle in the square quarrels being  $77^{\circ} 19'$ , and  $67^{\circ} 21'$  in the long ones.

QUARRY, among hunters, is sometimes used for a part of the entrails of the beast taken, given by way of reward to the hounds.

QUARRY, in falconry, is the game which the hawk is in pursuit of, or has killed.

QUARTAN, a measure containing the fourth part of some other measure.

QUARTAN, a species of intermitting fever. See MEDICINE, n<sup>o</sup> 134. 263—270.

QUARTATION, is an operation by which the quantity of one thing is made equal to a fourth part of the quantity of another thing. Thus when gold alloyed with silver is to be parted, we are obliged to facilitate the action of the aquafortis, by reducing the quantity of the former of these metals to one fourth part of the whole mass; which is done by sufficiently increasing the quantity of the silver, if it be necessary. This operation is called *quartation*, and is preparatory to the parting; and even many authors extend this name to the operation of parting. See the article PARTING.

QUARTER, the fourth part of any thing, the fractional expression for which is  $\frac{1}{4}$ .

QUARTER, in weights, is generally used for the fourth part of an hundred weight averdupois, or 28 lb.

Used as the name of a dry measure, *quarter* is the fourth part of a ton in weight, or eight bushels.

QUARTER, a term in the manege. To work from quarter to quarter, is to ride a horse three times in upon the first of the four lines of a square; then changing your hand, to ride him three times upon the second.

and so to third and fourth; always changing hands, Quarter and observing the same order.

QUARTERS, with respect to the parts of a horse, is used in various senses: thus the shoulders and fore-legs are called the *fore-quarters*, and the hips and hinder-legs the *hind-quarters*. The quarters of a horse's foot, are the sides of the coffin, comprehending between the toe and the heel: the inner quarters, are those opposite to one another, facing from one foot to the other; and these are always weaker than the outside quarters, which lie on the external sides of the coffin. False quarters, are a cleft in the horn of a horse's hoof, extending from the coronet to the shoe. A horse is said to be quarter-cast, when for any disorder in the coffin we are obliged to cut one of the quarters of the hoof.

QUARTER, in astronomy, the fourth part of the moon's period: thus, from the new moon to the quadrature is the first quarter; from this to full moon, the second quarter, &c.

QUARTER, in heraldry, is applied to the parts or members of the first division of a coat that is quartered, or divided into four quarters.

FRANC-QUARTER, in heraldry, is a quarter single or alone; which is to possess one fourth part of the field. It makes one of the honourable ordinaries of a coat.

QUARTER of a Ship, that part of the ship's side which lies towards the stern; or which is comprehended between the utmost end of the main chains and the sides of the stern, where it is terminated by the quarter-pieces.

Although the lines by which the quarter and bow of a ship, with respect to her length, are only imaginary, yet experience appears sufficiently to have ascertained their limits: so that if we were to divide the ship's sides into five equal portions, the names of each space would be readily enough expressed. Thus the first, from the stern, would be the quarter; the second, abast the midships; the third, the midships; the fourth, before the midships; and the fifth, the bow. Whether these divisions, which in reality are somewhat arbitrary, are altogether improper, may be readily discovered by referring to the mutual situation or approach of two adjacent vessels. The enemy boarded us on the larboard side! Whereabouts? Abast the midships, before the midships, &c.

Plate CCLIV. fig. 1. represents a geometrical elevation of a quarter of a 74 gun ship. A the keel, with *a* the false keel beneath it. B the stern-post. DD the quarter-gallery, with its ballustrades and windows. EE the quarter-pieces, which limit and form the outlines of the stern. F the taffarel, or upper pieces of the stern. FG the profile of the stern, with its galleries. H the gun-ports of the lower-deck; *h* the gun-ports of the upper and quarter deck. I the after-part of the mizen-channel. K the wing-transom. KC the lower counter. LB the station of the deck-transom. LQ the after-part of the main-wale. DR the after-part of the channel-wale, parallel to the main-wale. SU the sheer-rail, parallel to both wales. T the rudder. A F the rake of the stern. P *i* the drift-rais. TU the after-part of the load *water-line*; *hkl* the curve of the several decks corresponding to those represented in the head. See the article HEAD.

A Bell's sculp.

**Quarter.** Directions are distinguished from each other, are generally more conspicuous on the stern or quarter, than any other part, we have represented some of the quarters, which assume the most different shapes, and form the greatest contrast with each other. Fig. 2. shows the stern and quarter of a Dutch frigate. Fig. 3. the stern and quarter of a cat. Fig. 4. is the stern and quarter of a common galley. Fig. 5. exhibits the quarter of a frigate galley, otherwise called a *gal-leaf*. Fig. 6. the quarter of a Dutch dogger, or galliot. Fig. 7. represents the stern and quarter of a sloop of war.

The quarters of all other ships have a near affinity to those above exhibited. Thus all ships of the line, and East-Indiamen, are formed with a quarter little differing from the principal figure in this plate. Xelæcs have quarters nearly resembling those of galafes, only somewhat higher. Hagboats and pinaks approach the figure of cats, the former being a little broader in the stern, and the latter a little narrower; and the sterns and quarters of cats seem to be derived from those of fly-boats. The sterns of Dutch doggers and galliots are indeed singular, and like those of no other modern vessel: they have nevertheless a great resemblance to the ships of the ancient Grecians, as represented in medals and other monuments of antiquity.

On the **QUARTER**, may be defined an arch of the horizon, contained between the line prolonged from the ship's stern and any distant object, as land, ships, &c. Thus if the ship's keel lies on an east and west line, the stern being westward, any distant object perceived on the north-west or south-west, is said to be on the larboard or starboard quarter.

**QUARTER-Bill**, a roll, or list, containing the different stations, to which all the officers and crew of the ship are quartered in the time of battle, and the names of all the persons appointed to those stations.

**QUARTER-Master**, is an officer, generally a lieutenant, whose principal business is to look after the quarters of the soldiers, their cloathing, bread, ammunition, firing, &c. Every regiment of foot and artillery has a quarter-master, and every troop of horse one, who are only warrant-officers, except in the Blues.

**QUARTER-Master-General**, is a considerable officer in the army; and should be a man of great judgment and experience, and well skilled in geography. His duty is to mark the marches and encampments of an army: he should know the country perfectly well, with its rivers, plains, marshes, woods, mountains, desiles, passages, &c. even to the smallest brook. Prior to a march, he receives the order and route from the commanding general, and appoints a place for the quarter-masters of the army to meet him next morning, with whom he marches to the next camp; where being come, and having viewed the ground, he marks out to the regimental quarter-masters the ground allowed each regiment for their camp: he chooses the head quarters, and appoints the villages for the generals of the army's quarters: he appoints a proper place for the encampment of the train of artillery: he conducts foraging parties, as likewise the troops to cover them against assaults, and has a share in regula-

ting the winter-quarters and cantonments.

**QUARTER-Netting**, a sort of net-work, extended along the rails on the upper part of a ship's quarter. In a ship of war these are always double, being supported by iron cranes, placed at proper distances. The interval is sometimes filled with cork, or old sails; but chiefly with the hammocks of the sailors, so as to form a parapet to prevent the execution of the enemy's small arms in battle.

**QUARTER-Sessions**, a general court held quarterly by the justices of peace of each county.

**QUARTER-Staff**, a long staff borne by foresters, park-keepers, &c. as a badge of their office; and occasionally used as a weapon.

**QUARTERS**, a name given at sea to the several stations where the officers and crew of a ship of war are posted in action. See *NAVAL Tactics*, p. 5325, § 5.

The number of men appointed to manage the artillery is always in proportion to the nature of the guns, and the number and condition of the ship's crew. They are, in general, as follow, when the ship is well manned, so as to fight both sides at once occasionally:

Pounder.	No. of men.	Pounder.	No. of men.
To a 42	- 15	To a 9	- 6
32	- 13	6	- 5
24	- 11	4	- 4
18	- 9	3	- 3
12	- 7		

This number, to which is often added a boy to bring powder to every gun, may be occasionally reduced, and the guns nevertheless well managed. The number of men appointed to the small arms, on board his Majesty's ships and sloops of war, by order of the admiralty, are,

Rate of the ship.	No. of men to the small arms
1st	- 150
2d	- 120
3d of 80 guns	- 100
— of 70 guns	- 80
4th of 60 guns	- 70
4th of 50 guns	- 60
5th	- 50
6th	- 40
Sloops of war	- 30

The lieutenants are usually stationed to command the different batteries, and direct their efforts against the enemy. The master superintends the movements of the ship, and whatever relates to the sails. The boatswain, and a sufficient number of men, is stationed to repair the damaged rigging; and the gunner and carpenter, wherever necessary, according to their respective offices.

The marines are generally quartered on the poop and forecable, or gang-way, under the direction of their officers; although, on some occasions, they assist at the great guns, particularly in distant cannonading.

**QUARTERS**, at a siege, the encampment upon one of the most principal passages round a place besieged, to prevent relief and convoys.

**Head QUARTERS of an Army**, the place where the commander in chief has his quarters. The quarters of generals of horse are, if possible, in villages behind the right and left wings, and the generals of foot are of-

Quarter, Quarters.

Quarters  
||  
Quebec.

ten in the same place: but the commander in chief should be near the centre of the army.

**QUARTERS of Refreshment**, the place or places where troops that have been much harassed are put to recover themselves during some part of the campaign.

**Intrenched QUARTERS**, a place fortified with a ditch and parapet to secure a body of troops.

**Winter QUARTERS**, sometimes means the space of time included between leaving the camp and taking the field; but more properly, the places where the troops are quartered during the winter.

The first business, after the army is in winter-quarters, is to form the chain of troops to cover the quarters well: which is done either behind a river, under cover of a range of strong posts, or under the protection of fortified towns. Hussars are very useful on this service.

It should be observed, as an invariable maxim, in winter-quarters, that your regiments be disposed in brigades, to be always under the eye of a general officer; and, if possible, let the regiments be so distributed, as to be each under the command of its own chief.

**QUARTERING**, in heraldry, is dividing a coat into four or more quarters, or quarterings, by parting, coupling, &c. that is, by perpendicular and horizontal lines, &c.

**QUATUORVIR**, in antiquity, formerly written **III. VIR.** a Roman magistrate, who had three colleagues joined with him in the same administration, and had the care of conducting and settling the colonies sent into the provinces. There were also *quatuorviri* appointed to inspect and take care of repairs, &c.

**QUAVER**, in music, a measure of time equal to half a crotchet, or an eighth part of a semibreve.

**QUAY**. See **KEY**.

**QUEBEC**, a handsome and large town of America, and capital of Canada. The first place taken notice of upon landing here, is a square of an irregular figure, with well-built houses on each side; on the back of which is a rock; on the left it is bounded by a small church; and on the right are two rows of houses, parallel to each other. There is another between the church and the harbour; as also another long row on the side of the bay. This may be looked upon as a kind of suburb; and between this and the great street is a very steep ascent, in which they have made steps for the foot-passengers to go up. This may be called the *Upper Town*, wherein is the bishop's palace; and between two large squares is a fort where the governor lodges. The *Recolets* have handsome houses over-against it, and on the right is the cathedral church: over-against this is the Jesuits college, and between them are well-built houses; for the fort runs two streets, which are crossed by a third, and between these is a church and a convent. In the second square are two descents to the river of St Charles. The *Hotel Dieu* is in the midway; and from thence are small houses, which reach to the house of the intendan. On the other side of the Jesuits college, where the church stands, is a pretty long street in which is a nunnery. Almost all the houses are built of stone, and there are about 7000 inhabitants; the fort is a handsome building, but not quite finished. Quebec is not regularly

fortified: but it cannot be easily taken; for the harbour is flanked with two bastions, which at high tides are almost level with the water. A little above one of the bastions is a demi-bastion, partly taken out of the rock; and above it, on the side of the gallery of the fort, is a battery of 25 pieces of cannon: fill above this is a square fort, called the *citadel*, and the ways from one fortification to another are difficult to pass. To the left of the harbour, on the side of the road, there are large batteries of cannon and some mortars; besides these, there are several other fortifications not very easy to be described. In 1711, the British fitted out a fleet with a design to conquer Canada, which failed on account of the rashness of the admiral, who, contrary to the advice of his pilot, went too near the Seven isles, and so lost his largest ships and 3000 of his best soldiers. It is about 300 miles north-west of Boston in New-England. On October 18, 1759, it was taken by the British, under the command of general Wolfe, who lost his life in the battle, after he had the satisfaction to know that our troops were victorious. Admiral Saunders commanded a squadron of men of war, and did immense service in reducing this place; there being not a man in the navy but what was active on this occasion, not excepting the sailors belonging to the transport vessels. After this valuable acquisition, all Canada came under the jurisdiction of the crown of Great Britain. W. Long. 69. 48. N. Lat. 46. 55.

**QUEDLINGBURG**, a town of Germany, in the circle of Upper Saxony, and on the confines of the duchy of Brunswick. Here is a famous abbey, whose abbess is a princess of the empire, and who sends deputies to the diets. Her contingent is one horseman and ten footmen. E. Long. 11. 31. N. Lat. 51. 58.

**QUEEN**, a woman who holds a crown singly.

The title of *queen* is also given by way of courtesy to her that is married to a king, who is called by way of distinction *queen-consort*; the former being termed *queen-regent*. The widow of a king is also called *queen*, but with the addition of *dowager*. See **ROYAL Family**.

**QUEEN-Gold**, is a royal duty or revenue belonging to every queen of England during her marriage to the king, payable by persons in this kingdom and Ireland, on divers grants of the king by way of fine or oblation, &c. being one full tenth part above the entire fines, on pardons, contracts or agreements, which becomes a real debt to the queen, by the name of *aurum reginae*, upon the party's bare agreement with the king for his fine and recording the same.

**QUEEN'S-County**, a division of the province of Leinster in Ireland; so called from the Popish queen Mary, in whose reign it was first made a county by the earl of Suffex then lord-deputy. It is bounded on the south by Kilkenny and Catherlogh; by King's county on the north and west; part of Kildare and Catherlogh on the east; and part of Tipperary on the west. Its greatest length from north to south is 35 miles, and its breadth near as much; but it is unequal both ways. This county was anciently full of bogs and woods, though now pretty well inclosed, cultivated, and inhabited. The baronies contained in it are seven; and it sends eight members to parliament.

**QUEENBOROUGH**, a town of the isle of Shephey in Kent, which sends two members to parliament, though

Quedling  
burg  
||  
Queenbor  
ough.

Queen's  
||  
Quercus.

though consisting only of about 100 low brick houses, and scarce 350 inhabitants. The chief employment of the people here is oyster drudging; oysters being very plentiful and of a fine flavour. E. Long. *c.* 50. N. Lat. 51. 25.

**QUEENS-FERRY**, a town of Scotland, in the shire of Lothian, seated on the south side of the river Forth, 9 miles west of Edinburgh.

**QUINTIN** (St.), an ancient, famous, and strong town of France, in Picardy, and capital of Vermandois. The church is thought to be one of the finest in France. A famous battle was fought here in 1557, between the French and Spaniards. It is seated on an eminence by the river Somme. E. Long. 3. 22. N. Lat. 49. 50.

**QUERCY**, a province of Guienne in France; bounded on the north by Limousin, on the east by Rouergue and Auvergne, on the south by Upper Languedoc, and on the west by Agenois and Perigord. It is divided into Upper and Lower; and is fertile in corn, wine, and fruits. Cahors is the capital town.

**QUERCUS**, the OAK-TREE; a genus of the polyandria order, belonging to the monocia class of plants.

*Species.* 1. The robur, or common English oak, grows from about 60 or 70 to 100 feet high, with a prodigious large trunk, and monstrous spreading head; oblong leaves, broadest towards the top, the edges acutely sinuated, having the angles obtuse. There is a variety, having the leaves finely striped with white. This species grows in great abundance all over England in woods, forests, and hedge-rows; is naturally of an amazing large growth; there being accounts of some above 100 feet stature, with wonderful large trunks and spreading heads; and is supposed to continue its growth many centuries.

2. The prinus, or chestnut-leaved American oak, grows 50 or 60 feet high; having large oblong-oval smooth leaves pointed both ways, the edges sinuated-ferrated, with the sinuses uniformly round.

3. The phellos, or willow-leaved American oak, grows 40 or 50 high, having long narrow smooth entire leaves like those of the willow. There is a variety called the *dwarf willow-leaved oak*.

4. The alba, or white Virginian oak, grows 30 or 40 feet high, having a whitish bark, with long obliquely-pinnatifid light-green leaves, the sinuses and angles obtuse.

5. The nigra, or black Virginian oak, grows 30 or 40 feet high, having a dark-coloured bark, large wedge-shaped slightly-trilobated leaves.

6. The rubra, or red Virginian oak, grows about 60 feet high, having a dark-greyish bark, long obtusely sinuated leaves, with the sinuses terminated by brittle points, and have sometimes red spotted veins, but generally dying in autumn to a reddish colour, remaining on the trees late in the season.

7. The cæculus of Pliny, or cut-leaved Italian oak, grows about 30 feet high, having a purplish bark, oblong deeply-sinuated smooth leaves, and long slender close-fitting acorns in very large cups.

8. *Ægilops*, or large prickly-cupped Spanish oak, grows 70 or 80 feet high or more, with a very large trunk and widely-spreading head, having a whitish bark, large oblong-oval deeply-ferrated smooth leaves,

the ferratures bowed backward, and large acorns placed in singularly large prickly cups. This is a noble species, almost equal in growth to our common English oak.

Quercus.

9. *Cerris*, or smaller prickly-cupped Spanish oak, grows 30 or 40 feet high, and has oblong lyre-shaped pinnatifid transversely-jagged leaves, downy underneath, and small acorns placed in prickly cups.

10. The ilex, or common evergreen oak, grows 40 or 50 feet high, having a smooth bark, oval and oblong undivided ferrated petiolated leaves, downy and whitish underneath. The varieties are, broad-leaved, narrow-leaved, and sometimes both sorts and other different shaped leaves on the same tree, also sometimes with fawed and prickly leaves.

11. The grammatia, or Montpellier holly-leaved evergreen oak, grows 40 or 50 feet high; and has oblong-oval, close-fitting sinuated spinous leaves, downy underneath, bearing a resemblance to the leaves of holly.

12. The fuber, or cork-tree, grows 30 or 40 feet high, having a thick rough fungous cleft bark, and oblong-oval undivided ferrated leaves, downy underneath. This species furnishes that useful material cork; it being the bark of the tree, which becoming of a thick fungous nature, under which, at the same time, is formed a new bark, and the old being detached for use, the tree still lives, and the succeeding young bark becomes also of the same thick spongy nature in six or seven years, fit for barking, having likewise another fresh bark forming under it, becoming cork like the others in the like period of time; and in this manner these trees wonderfully furnish the cork for our use, and of which is made the corks for bottles, bungs for barrels, and numerous other useful articles. The tree grows in great plenty in Spain and Portugal, and from which countries we receive the cork.

13. The coccifera, scarlet or kermes oak, grows but 14 or 15 feet high, branching all the way, and of bushy growth; with large oval undivided indented spinous leaves; and producing small glandular excrecencies, called *kermes* or *scarlet grain*, used by the dyers. The small scarlet glands found on this tree, is the effect of certain insects depositing their eggs betwixt the bark of the branches and leaves, causes an extravasation of the sap, and forms the excrecence or substance in question, which being dried is the kermes or scarlet paste.

14. The Molucca, Moluccan oak, commonly called *American live oak*, grows about 40 feet high, having oval spear-shaped smooth entire leaves, and small oblong eatable acorns.

All the above 14 species of quercus produce flowers annually in the spring, about April or May, of a yellowish colour, but make no ornamental appearance, and are males and females separated in the same tree; the males being in loose amentums, and the females sitting close to the buds in thick leathery hemispherical calices, succeeded by the fruit or acorns, which are oval nuts fixed by their base into rough permanent cups, and mostly sit quite close, and some on short foot-stalks, ripening in autumn, which in the common English oak is in great abundance, and often in tolerable plenty on some of the other sorts: those of all the kinds serve

*Quercus.* serve for propagating their respective species; they are also excellent food for swine and deer, the common oak in particular.

*Uses, &c.* Oak-trees, of all the above sorts, may be employed in gardening to diversify large ornamental plantations in out grounds, and in forming clumps in spacious lawns, parks, and other extensive open; the evergreen kinds in particular have great merit for all ornamental purposes in gardens. But all the larger growing kinds, both deciduous and evergreens, demand esteem principally as first-rate forest-trees for their timber. The English oak, however, claims precedence as a timber-tree, for its prodigious height and bulk, and superior worth of its wood. Every possessor of considerable estates ought therefore to be particularly assiduous in raising woods of them, which is effected by sowing the acorns either in a nursery and the plants transplanted where they are to remain, or sowed at once in the places where they are always to stand. All the sorts will prosper in any middling soil and open situation, though in a loamy soil they are generally more prosperous: however, there are but few soils in which oaks will not grow; they will even thrive tolerably in gravelly, sandy, and clayey land, as may be observed in many parts of this country of the common oak.

The propagation of the striped-leaved varieties of the common oak, and any particular variety of the other species, must be effected by grafting, as they will not continue the same from seed: the grafting may be performed upon any kind of oakling-stocks raised from the acorns, and train them for standards like the others.

The oak is remarkable for its slowness of growth, bulk, and longevity. It has been remarked that the trunk has attained to the size only of 14 inches in diameter, and of some to 20, in the space of fourscore years. As to bulk, we have an account of an oak belonging to Lord Powis, growing in Broomfield wood, near Ludlow in Shropshire, in the year 1764, the trunk of which measured 68 feet in girth, 23 in length, and which, reckoning 90 feet for the larger branches, contained in the whole 1455 feet of timber round measure, or 29 loads and five feet, at 50 feet to a load. And, with respect to longevity, Linnaeus gives account of an oak 260 years old; but we have had some traditions of some in England (how far to be depended upon we know not) that have attained to more than double that age. Besides the grand purposes to which the timber is employed in navigation and architecture, and the bark in tanning of leather, there are other uses of less consequence, to which the different parts of this tree have been referred. The Highlanders use the bark to dye their yarn of a brown colour, or, mixed with coppers, of a black colour. They call the oak *the king of all the trees in the forest*; and the herdsman would think himself and his flock unfortunate if he had not a staff of it. The saw-dust from the timber, and even the leaves of the tree, have been found capable of tanning, though much inferior to the bark for that purpose. The bark, also, after being used for tanning, are employed in gardening for making bark-beds, forming the most eligible kind of hot-beds for the culture of the pine-apple and all other tender exotics of the hot-house temperature. So great is the astringency

of the bark, that in a larger dose, like the Peruvian kind, it has been known to cure the ague. The expressed juice of the galls or oak-apples (excrecences occasioned by a small insect called  *cynips* ) mixed with vitriol and gum-arabic, will make ink. The leaves of the oak are very subject to be covered with a sweet viscidous juice called  *honey-dew* , which bees and other insects are very fond of. The acorns are a good food to fatten swine and turkeys; and, after the severe winter of the year 1709, the poor people in France were miserably constrained to eat them themselves. There are, however, acorns produced from another species of oak, which are eaten to this day in Spain and Greece, with as much pleasure as chestnuts, without the dreadful compulsion of hunger.

QUESNE (Abraham du), marquis of Quesne, admiral of the naval forces of France, and one of the greatest men of the last age, was born in Normandy in 1610. He contributed to the defeating of the naval power of Spain before Gattari; was dangerously wounded before Barcelona in 1642, and on other occasions: he went into the service of the Swedes, and became vice-admiral; gave the Danes an entire defeat, killed their admiral, and took his ship. He was recalled into France in 1647, and commanded the squadron sent to Naples. The sea-affairs of France being much fallen, he fitted out divers ships for the relief of the royal army that blocked up Bourdeaux; which was the principal cause of the surrender of the town. He was very fortunate in the last war of Sicily, where he beat the Dutch thrice, and De Ruyter was killed. He also obliged the Algerines to sue for peace from France in a very humble manner. In short, Asia, Africa, and Europe, felt the effects of his valour. He was a Protestant; yet the king bestowed on him the land of Bouchet, and to immortalize his memory gave it the name of that great man. He died in 1688.

QUESTION, in logic, a proposition stated by way of interrogation.

QUESTION, or *Torture*. See RACK.

QUESTOR, or *QUESTOR*, in Roman antiquity, an officer who had the management of the public treasure.

The questorship was the first office any person could bear in the commonwealth, and gave a right to sit in the senate.

At first there were only two; but afterwards two others were created, to take care of the payment of the armies abroad, of selling the plunder, booty, &c. for which purpose they generally accompanied the consuls in their expeditions; on which account they were called  *peregrini* , as the first and principal two were called  *urbani* .

The number of questors was afterwards greatly increased. They had the keeping of the decrees of the senate: and hence came the two offices of  *questor principis* , or  *augurs* , sometimes called  *candidatus principis* , whose office resembled in most respects that of our secretaries of state; and the  *questor palatii* , answering in a great measure to our lord chancellor.

QUEUE, in heraldry, signifies the tail of a beast: thus if a lion be borne with a forked tail, he is blazoned double-queued.

QUEVEDO de VILLEGAS (Francisco), a celebrated Spanish poet, born at Madrid in 1570. He was descended

Queche  
||  
Quevedo.

Quicklime.

descended from a noble family, and was made a knight of St James; but was thrown into prison by order of count Olivarez, whose administration he satirized in his verses, and was not set at liberty till after that minister's disgrace. Quevedo wrote some heroic, lyric, and facetious poems. He also composed several treatises on religious subjects, and has translated some authors into Spanish. He died in 1645. The most known of his works are, 1. The Spanish Parnassus. 2. The Adventurer Bufcon. 3. Visions of Hell Reformed, &c.

**QUICK,** or **QUICKSET Hedge**, among gardeners, denotes all live hedges, of whatever sort of plants they are composed, to distinguish them from dead hedges; but in a more strict sense of the word, it is restrained to those planted with the hawthorn, under which name those young plants or sets are sold by the nursery gardeners who raise them for sale. See the article **HEDGE**.

**QUICKLIME**, a general name for all calcareous substances when deprived of their fixed air; such as chalk, limestone, oyster-shells, &c. calcined.

Quicklime has the following properties. 1. It is entirely soluble in water, with which it unites so rapidly as to occasion considerable heat. When exposed to air, it imbibes moisture from thence. When united with as much water as is sufficient to make it a fluid paste, it is called *slaked lime*. Water saturated with quicklime is called *lime water*. According to Brandt, lime-water contains about one part of quicklime to 700 or 800 parts of water. Slaked lime, or lime-water, being exposed to the atmosphere, attracts from thence particles of fixable air which float in it, by which means the quicklime is rendered mild, insoluble in water, and therefore appears on the surface of the lime-water, or of the slaked lime where this combination happens, in the state of mild or combined calcareous earth, convertible by a second calcination into quicklime, and is called *cream of lime*.

If the earth dissolved in lime-water be precipitated from thence by any substance containing fixable air, as by mild alkalies or magnesia, it will unite with this air, become mild, and resume its former weight and properties which it possessed before calcination. But if it be precipitated from the water by means of some substance which does not contain fixable air, but which is more strongly disposed than the earth to unite with the water, for instance, spirit of wine, the earth thus precipitated will be in the state of quicklime, that is, caustic, and soluble in water.

2. Quicklime unites with acids without effervescence, which is nothing else than an extrication of the fixable air, of which quicklime has been already deprived. It nevertheless saturates as much acid as it would have done if it had not been calcined.

3. Quicklime is more powerfully disposed to unite with fixable air than fixed or volatile alkalies, or magnesia. Hence, when treated with these substances, it takes from them their fixable air, and is itself rendered mild, and restored to its original weight and properties. Thus two drams of chalk, having been by calcination reduced to one dram and eight grains of quicklime, were thrown into a filtrated solution of an ounce of mild fixed alkali in two ounces of water, and digested during some time; by which the calcareous

earth became mild, and weighed one dram and 58 grains. By means of magnesia, the calcareous earth may be precipitated from lime-water; and this earth is found to be mild, and to have deprived the magnesia of its fixable air. By depriving alkalies of their fixable air, quicklime renders them more caustic and solvent, for the same reason that itself is by this privation of air rendered more caustic and powerfully solvent. This increase of causticity and dissolving power is consistent with a general rule, namely, that the more simple or less compounded any body is, that is, the less its general tendency to union is satisfied, the more disposed it is to unite with or dissolve other substances.

4. Quicklime has a disposition to unite with sulphur, with which it forms a hepar of sulphur, similar to that made by sulphur united with an alkali, and, like this, soluble in water. It is also disposed to unite with oils and with animal and vegetable matters, with respect to which it discovers a caustic and corrosive property.

4. Quicklime mixed with sand forms a mass which hardens, and is used as a cement or mortar.

All these properties of quicklime have been the objects of consideration to the chemists and philosophers; who have, as usual, been divided in their opinions on the subject. The evident resemblance of the action of quicklime to fire, has given occasion for one party to derive all the active properties of this substance from fire; while, on the other hand, its want of heat, and incapacity of setting bodies on fire, unless by an accession of water, were objections altogether insurmountable. On the other hand, those who denied the materiality of fire, and affirmed that it consists only in a motion mechanically produced among the particles of bodies, were altogether at a loss to show a reason why this motion, or any thing resembling it, should continue perhaps for months after the exciting cause is taken away. To remove this difficulty, some have had recourse to the action of a latent acid communicated to the quicklime by the fire; and which one chemist (Mr Meyer) has distinguished by the name of *acidum pingue* \*. But on this hypothesis it may be remarked in the first place, that the action of acids is as difficult to be explained as that of fire; and, in the second place, that as all substances, by calcination into quicklime, lose considerably of their weight, it seems very improbable that they should acquire an acid or any other substance which could increase their weight. Besides, from the experiments of Dr Black, it appears, that the diminution of weight in calcareous substances, is owing to their parting with a quantity of fixed air, the weight of which is much more considerable than that of any moisture or fatty matter they contain. The loss of this fixed air is now also universally allowed to be the reason of the causticity of the quicklime, as its superior attraction for fixed air is looked upon to be the reason why it renders fixed and volatile alkalies caustic like itself. The only question therefore can be, By what means are the calcareous earths deprived of their fixed air? To this question the answer is evident, namely, that the action of the fire expels the fixed air; and if this is the case, it is evident, that to this action of fire, continued, the caustic properties of the lime are owing.

\* See Airs, p. 16, 17.

Quicklime.

We come now to the discussion of the question, Whether quicklime is to be considered as a pure earth, or a combination of it with something else?—Most of the chemists, since the discovery of fixed air, have been inclined to think, that quicklime is a pure earth uncombined with any thing else, and that it approaches more nearly to the state of elementary earth than any other. But this opinion seems not to have a solid foundation; for there are other earths, such as the basis of alum, which, as far as they can be examined by us, are equally pure with quicklime, and yet discover not the smallest causticity, even after the most violent calcination. Besides, from the property which quicklime has of depriving alkaline salts of their fixed air, we may learn, that there exists in it, when kept by itself, a certain principle which prevents it from absorbing again the fixed air, with which it was once so closely united, except in certain circumstances. It is well known, that fixed alkalies, as well as those which are volatile, will absorb fixed air from the common atmosphere: and hence, tho' they are prepared in the most caustic state, they will in a very short time become mild, by an exposure to the atmosphere; nay, it requires no small degree of care to prevent the atmosphere from having as much access to them as is necessary to change them from a caustic to a mild state. Now, as these substances thus attract the fixed air from the atmosphere, it thence appears that the atmosphere parts very readily with the fixed air which it contains. The quicklime, however, though it has a greater attraction for fixed air than the alkalies, yet does not become near so soon mild from exposure to the air as the alkalies which have less attraction than itself. Hence the necessary inference must be, that quicklime, after being once calcined, instead of attracting, repels fixed air, unless it is placed in certain circumstances, wherein the repelling power is destroyed, and the attractive power again manifests itself. Now it is manifest, that the power which originally repelled the fixed air was the action of fire; and consequently, while the quicklime refuses to attract fixed air, we must conclude that it is the same action which prevents the union. Quicklime, therefore, is not a pure earth, but a combination of a pure earth with fire; just as chalk, or limestone uncalcined, is not a pure earth, but a combination of a pure earth with fixed air. In all chemical trials, then, where quicklime is used, the double elective attraction will manifest itself as much as in a combination of different salts, metals, and acids. Thus, when water is poured on quicklime, the attraction between that element and earth is stronger than the attraction between earth and fire. The consequence is, that the water expels the fire, just as vitriolic acid poured upon sea-salt expels the marine acid. The fire then, having nothing with which it can form a chemical combination, becomes sensible to the touch, first making the lime very hot, and then gradually dissipating in the atmosphere. However, as the water combines with the earth but in very small quantity, it can only expel the fire from that quantity with which it does combine; and consequently the lime still retains its caustic quality, though in a degree somewhat milder than what it was originally. We must also consider, that water itself has a considerable attraction for fire as well as for earth; and the conse-

quence of this must be, that part of the lime will be dissolved in the water, if more of that element is added than what the earth can absorb without losing the form of a dry powder. Hence the origin of lime-water, which is only a small quantity of lime in its caustic state dissolved in a large quantity of water. This dissolution is owing to the double attraction of fire to earth and water; for as long as the water can admit the calcined earth to that intimate union with itself which is called a *chemical combination*, the earth must still retain all the causticity which the fire gives it, and dissolve in the water. When the earth is in too large quantity to be thus combined with the water, the latter is only absorbed into the pores of the earth, where by its bulk it splits the stone or calcined matter all to pieces, and reduces it to an impalpable powder, expelling a proportional quantity of fire from those pores which it now occupies. The water, however, is capable of radically dissolving but a very small portion of calcined earth: and therefore, the same quantity of quicklime will serve for preparing lime-water a great number of times over; but at last a large quantity is left, which seems to be quite inert, and has lost the properties of quicklime. Those who have tried the experiment of lixiviating lime with fresh quantities of water till it ceases to be soluble, have fixed the proportion of soluble matter in the lime at about one-third of the whole; but from Dr Black's experiments it appears that quicklime may all be dissolved in water at once, provided the water is in sufficient quantity. Its inactivity, therefore, after repeated affusions of water, must be owing to some change produced by the water; but whether this is owing to an absorption of all the fire it contained by the great quantity of water, or to a supply of fixed air given by the water, has not yet been determined by any experiment.

If, instead of pouring cold water upon quicklime, we pour that which is already heated, the absorption is much less complete; because the water, having already a superfluous quantity of heat, is resisted by that which is contained in the quicklime in a latent state; and hence it is a general observation, that hot water is less proper for slaking lime than cold. But if we pour on any acid upon quicklime which contains a great quantity of fire in a latent state, and has likewise a violent attraction for the earth, a much greater degree of heat is produced than with simple water. With the vitriolic acid, indeed, this is not so well perceived, if the common calcareous earths are made use of; because their insolubility in this acid diminishes its effect: but if, instead of these earths, we take magnesia newly calcined, the heat is so great, that the aqueous vapour, not having time to evaporate slowly, is driven off with a considerable explosion. If the common calcareous earths, well calcined, are dissolved in the nitrous acid, a most violent degree of heat is produced; more indeed than in any other case where a liquid is concerned: for the nitrous acid itself contains a great deal of latent heat; the quicklime does the same; and by the intimate union of the earth with the acid, all this latent heat, at least a great part of it, both in the quicklime and spirit of nitre, is displaced, and attacks the aqueous fluid as being nearest to it; from whence it is dissipated in the air, or

**Quicklime**, absorbed by the neighbouring substances. The same thing happens, only in a less degree, when the marine acid is employed.

When quicklime is mixed with a solution of mild alkali, a double decomposition, and two new compositions, take place. The quicklime may be considered as a combination of earth and fire, while the alkali in the present case acts as a combination of salt and air. These two substances, therefore, are no sooner put into such circumstances as enable them to act on each other, than the quicklime attracts the air from the alkali, and gives its own fire in exchange, which the alkali takes up, and thus is rendered caustic, while the quicklime becomes mild. Nevertheless, though the alkali here seems to have the greater attraction for fire, and the quicklime for air; yet it appears, that the alkali is by no means capable of keeping the fire which it has imbibed for any length of time; for no sooner is it exposed to the action of the air, than it parts with the fire which it had imbibed, regains its air, and becomes mild. This, however, in all probability is owing to its extreme solubility in water while in a caustic state; for quicklime itself when dissolved in water very easily regains its fixed air, nay, even more than it contains in a natural state. See the article **SALT**.

On the whole, then, the properties of quicklime may be explained in a very easy manner on Dr. Black's principle of latent heat. That heat consists in a latent state in quicklime, as well as in vapour, we have incontestible proofs; because, in all cases where quicklime changes its nature and becomes more mild, a degree of heat is produced, and which is always proportionable to the change made on the quicklime. In the making of quicklime, therefore, the air is expelled, and a proportional quantity of fire enters; in dissolving it in an acid, slaking, &c. an acid, air, or water, expels part of the heat, which then becomes sensible. By long exposure to the air, the heat gradually evaporates; the fixed air resumes its place; and the quicklime, being thus increased in bulk, embraces those bodies very closely which lie nearest to it, inasmuch that, when mixed with sand and stones, it will harden with them almost into the solidity of a rock. See **CEMENT** and **MORTAR**. When mixed with animal or vegetable substances, it destroys or decomposes them both by the action of its internal heat, and by its attraction for a certain acid contained in the animal substances, and an oily matter in the vegetables; and hence its property of burning cloth, though its attraction for the oily matter just mentioned makes it an excellent whitener when properly applied. See **BLEACHING**.

**QUICKSILVER**, or **MERCURY**, a metallic substance, fluid, except in extreme degrees of cold, of a shining white appearance, very much resembling silver; its specific gravity the greatest of all metals next to gold and platinum. For the method of extracting this metal from its ore, see **METALLURGY**, p. 4957. For the various preparations from it, see **CHEMISTRY**, n<sup>o</sup> 153, 205, 250, 414. and **VOL. IX.**

(A) Pure mercury may also be distinguished from that which is very impure, by this circumstance, viz. that a mixture of lead or tin, at least, very much diminishes its attraction of cohesion. For, when pure mercury is contained in a glass or earthen vessel, there will be a hollow space between the metal and the vessel; whereas, if there be lead or tin in it, the whole surface, even to the place of contact with the vessel, will be perfectly level.

**PHARMACY**, n<sup>o</sup> 479, 751, 754, 755, 756, 757, 758, **Quicksilver** 759, 760, 761, 762, 763.

Mercury may easily be cleaned from those extraneous matters which adhere only slightly to it, by making it pass through a new, clean, and close cloth, *Prisley's* vol. iv. and afterwards by heating it. When mercury has been thus purified, and is free from all metallic alloy, it is considerably fluid. A phosphoric light is produced by shaking in the dark flask mercury contained in a barometer. Its integrant parts, like those of melted metals, seem mutually to attract each other, and always acquire a convex or spherical form when they touch bodies with which they have no tendency to unite.

A new method of purifying quicksilver from lead has been discovered by Dr. Prieftley; of which he gives the following account.

"I take a glass phial with a ground stopper (such being generally pretty strong) containing 10 or 12 ounces of water, and fill about one-fourth of it with the foul quicksilver; then, putting in the stopper, I hold it inverted with both my hands, and shake it violently, generally striking the hand that supports it against my thigh. When I have given it 20 or 30 strokes in this manner, I take out the stopper, and blow into the phial with a pair of bellows; which I do in order to change the air that has become in part phlogisticated, and knowing that the purer the air is the faster the process advances.

"After a short time, if the mercury be very foul, the surface will not only become black, but a great quantity of the upper part of it will be, as it were, coagulated, so as to be easily separated from the rest. I therefore invert the phial; and covering the mouth of it with my finger, let out all the mercury that will flow easily, and put the black coagulated part into a cup by itself. This I press repeatedly with the end of my finger, till I make a complete separation of the running mercury from the black powder; and putting the powder by itself, I pour back the mercury to the rest of the mass out of which it was taken, in order to be agitated with it again.

"This process I repeat till I find that no more black matter can be separated; and it is not a little remarkable, that the operator will be at no loss to know when the process is completed. For the same quantity of lead seems to come out of it in equal times of agitation, and consequently the whole becomes pure at once. Also, whereas, while the lead was in the mercury, it felt, as I may say, like soft clay, the moment the lead is separated from it, it begins to rattle as it is shaken, so that any person in the room may perceive when it has been agitated enough (A).

"That the mercury is made quite pure by this process I ascertained by distillation. For having distilled in a glass vessel a large quantity of quicksilver, in which both lead and tin had been purposely dissolved, and which had only been agitated in this manner afterwards, I found nothing more than a light whitish flain on the bottom of the retort.

"When a quantity of the black powder is procured, it

**Quicksilver.** it is very easy, by distillation, to separate the mercury from the calx; and I do not know a readier method of procuring the calx of lead, or tin, and perhaps the calx of other metals also. The quantity of black mercurial powder is very considerable in proportion to the lead or tin mixed with it; though it is not easy to ascertain this with exactness, because, in endeavouring to separate the powder from the running mercury, a good deal of it is, by mere trituration, converted into running mercury; and I do not know but that, in time, the whole might be restored by this means, and the calx of lead, &c. be got quite pure. However, from the following experiments it will be seen what proportion they generally bear to each other, after a tolerably careful separation. It will be seen also, that when all the quicksilver that was converted into black powder is expelled from lead or tin by heat, there will remain more weight of the calx than there was of the metal; as might be expected. But as I applied more heat than was necessary to separate the quicksilver, a good deal of the air, and whatever else contributes to the additional weight of the calx, is, no doubt, expelled with it.

“ Having mixed 1 dwt. of lead with about five pounds of quicksilver, I expelled it all by agitation, in the method described above; when, weighing the black powder, it was found to be 1 oz. to dwt. 5 gr. some particles of the running mercury being, however, still visible in it. When the quicksilver was expelled by heat, the calx of the lead appeared in the form of a brownish powder, and weighed 1 dwt. 5 gr.

“ Having mixed 1 dwt. of tin with the above-mentioned quantity of quicksilver, and having expelled it again by agitation, the black powder, with some small globules of quicksilver mixed with it, weighed 2 oz. 1 dwt. 5 gr. and the calx, which was a tolerably white powder, weighed 1 dwt. 7 gr.

“ The separation of tin from quicksilver by agitation is not effected near so soon as lead. It requires at least four times the labour. It also requires proportionably more time to separate the black powder from the thick amalgam, in the manner described above.

“ Quicksilver is separated from lead or tin when the mass is agitated in water, as well as in air; but it seems to require more time. In this process it is also easily perceived when all the base metal is expelled; the phenomena of the agitation of this amalgam and of pure mercury in water being very remarkably different. It is even easy to perceive, by this means, in a moment, whether the quicksilver be pure or not. For if it be impure, the water becomes opaque the moment the agitation commences; which is by no means the case with pure quicksilver, especially if the water in which it is agitated has not been used for this purpose before. Also, the black matter suspended in the water in which pure quicksilver has been agitated is (except in a case that will be described hereafter) presently deposited; whereas the water in which the amalgam has been agitated does not become clear in several days. It may also be perceived how the quicksilver approaches towards purity, by this deposit being made more or less readily.

“ Also, the phenomena during the agitation in these two cases are strikingly different, tho’ not easily described in words. More especially, the mixture of quicksilver with lead or tin does not seem to admit the water to mix with it; whereas pure quicksilver, by violent agitation, may be so thoroughly mixed with the water, that it will sometimes be several seconds after the agitation is discontinued, before it have entirely disengaged itself from the water; and in doing this it exhibits a very pleasing spectacle. By this means, as in the process without water, it may be perceived at once when the separation of the base metal and the mercury is completely effected.

“ Having a large quantity of water made very black with the agitation of a mixture of quicksilver and lead, I agitated a quantity of common air in it a long time, and let it stand several days; but the air was not sensibly injured by this means; so that though this water and the calcined amalgam suspended in it do contain phlogiston, it is not by this means imparted to the air.

“ I evaporated a pint of the distilled water in which quicksilver and tin had been agitated, and which had stood till it was quite transparent, when a white sediment remained, but it did not weigh more than a few grains.”

By long agitation in water, the purest quicksilver will be converted into a black powder. The process succeeds best when as much water is used as is three or four times the bulk of quicksilver. This black matter, however, is not permanent, but becomes running mercury by being merely exposed to the air, without trituration, or any other kind of operation. Spirit of wine answers the purpose as well as water; and the appearance seems to be occasioned by a small quantity of superfluous phlogiston adhering to the metal.

**QUICK-MATCH**, among artillery men, a kind of combustible preparation formed of three cotton strands drawn into length, and dipped in a boiling composition of white-wine vinegar, saltpetre, and mealed powder. After this immersion it is taken out hot, and laid in a trough where some mealed powder, moistened with spirits of wine, is thoroughly incorporated into the twists of the cotton, by rolling it about therein. Thus prepared, they are taken out separately, and drawn through mealed powder; then hung upon a line till dried, by which they are fit for immediate service.

**QUID PRO QUO**, in law, *q. d.* “ what for what,” denotes the giving one thing of value for another; or the mutual consideration and performance of both parties to a contract.

**QUID PRO QUO**, or **QUI PRO QUO**, is also used in physic to express a mistake in the physician’s bill, where *quid* is wrote for *quo*, i. e. one thing for another; or of the apothecary in reading *quid* for *quo*, and giving the patient the wrong medicine. Hence the term is in the general extended to all blunders or mistakes committed in medicine, either in the prescription, the preparation, or application of remedies.

**QUIDDITY**, **QUIDDITAS**, a barbarous term used in the schools for *essence*. The name is derived hence, that it is by the essence of a thing that it is *sale quid*, fuch

Quicksilver  
Quiddity.

Quiescēt  
Quin.

such a *quid*, or thing, and not another. Hence what is essential to a thing is said to be *quidditate*.

**QUIETISTS**, a religious sect, famous towards the close of the last century.

They were so called from a kind absolute rest and inaction, which they supposed the soul to be in when arrived at that state of perfection which they called the *unitive life*; in which state, they imagined the soul wholly employed in contemplating its God, to whose influence it was entirely submissive, so that he could turn and drive it where and how he would. In this state, the soul no longer needs prayers, hymns, &c. being laid, as it were, in the bosom and between the arms of its God, in whom it is in a manner swallowed up.

The Mahometans seem to be no strangers to quietism. They expound a passage in the seventeenth chapter of the Koran, viz. "O thou soul, which art at rest, return unto thy Lord, &c." of a soul, which, having, by pursuing the concatenation of natural causes, raised itself to the knowledge of that being which produced them and exists of necessity, rests fully contented, and acquiesces in the knowledge, &c. of him, and in the contemplation of his perfection.

**QUILLET** (Claude), an eminent Latin poet of the 17th century, was born at Chinon, in Touraine, and practised physic there with reputation; but having declared against the pretended possession of the nuns of Loudun, in a manuscript treatise, the original of which is now in the library of the Sorbonne, he was obliged to retire into Italy, where he became secretary to the marshal d'Estrees, the French ambassador at Rome. In 1655 Quillet having published in Holland a Latin poem, entitled *Callipædia*, under the name of *Calvidius Letus*, he there inserted some verses against the cardinal Mazarine and his family; but that cardinal making him some gentle reproaches, he retrenched what related to the cardinal, in another edition, and dedicated it to him, Mazarine having, before it was printed, gave him an abbey. He died in 1661, aged 59, after having given Menage all his writings, and 500 crowns to pay the expence of printing them; but the abbé took the money and papers, and published none of them. His *Callipædia*, or the Art of getting beautiful Children, has been translated into English verse.

**QUILLS**, the large feathers taken out of the end of the wing of a goose, crow, &c.

Quills are denominated from the order in which they are fixed in the wing, the second and third quills being the best for writing, as they have the largest and roundest barrels.

Crow-quills are chiefly used for drawing. In order to harden a quill that is soft, thrust the barrel into hot ashes, stirring it till it is soft, and then taking it out, press it almost flat upon your knee with the back of a penknife, and afterwards reduce it to a roundness with your fingers. If you have a number to harden, set water and alum over the fire, and while it is boiling put in a handful of quills, the barrels only, for a minute, and then lay them by.

**QUIN** (James), a celebrated performer on the English stage, was born at London in 1693. He was intended for the bar; but preferring Shakespear to the statutes at large, he on the death of his father, when

it was necessary for him to do something with himself, appeared on the stage at Drury-lane. In 1720, he first displayed his comic powers in the character of Falstaff, and soon after appeared to as great advantage in Sir John Brute; but it was upon Booth's quitting the stage, that **Quin** appeared to full advantage, in the part of Cato. He continued a favourite performer until the year 1748, when on some disgust between him and Mr Rich the manager, he retired to Bath, and only came up annually to act for the benefit of his friend Ryan; until the loss of two front teeth spoilt his utterance for the stage. While Mr **Quin** continued upon the stage, he constantly kept company with the greatest geniuses of the age. He was well known to Pope and Swift; and the earl of Chesterfield frequently invited him to his table: but there was none for whom he entertained a higher esteem, than for the ingenious Mr Thomson, to whom he made himself known by an act of generosity, that does the greatest honour to his character, and of which we have given a particular account in Mr Thomson's life. Mr **Quin's** judgment in the English language recommended him to his royal highness Frederick prince of Wales, who appointed him to instruct his children in speaking and reading with a graceful propriety; and **Quin** being informed of the elegant manner in which his present majesty delivered his first gracious speech from the throne, he cried out in a kind of ecstasy, "Ay—I taught the boy to speak!" Nor did his majesty forget his old tutor; for, soon after his accession to the throne, he gave orders, without any application being made to him, that a genteel pension should be paid to Mr **Quin** during his life. Mr **Quin**, indeed, was not in absolute need of this royal benefaction; for as he was never married, and had none but distant relations, he sunk 2000 l. which was half his fortune, in an annuity, for which he obtained 200 l. a-year; and with about 2000 l. more in the funds, lived in a decent manner during the latter part of his life at Bath, from whence he carried on a regular correspondence with Mr Garrick, and generally paid a visit to his friends in the metropolis once a-year, when he constantly passed a week or two at Mr Garrick's villa at Hampton. He died of a fever in 1766.

**QUINAUT** (Philip), a celebrated French poet, born of a good family at Paris in 1635. He cultivated poetry from his infancy, and 16 dramatic pieces of his were acted between the year 1653 and 1666. In the mean time **Quinaut** was not so much devoted to poetry, but that he applied himself to the study of the law; and made his fortune by marrying the widow of a rich merchant to whom he had been useful in his profession. **Quinaut** afterwards turned his attention to the composing of operas, which were set to music by the famous Lully; and Lully was charmed with a poet whose verses were not too nervous to yield to the capricious airs of music. He died in 1688, after having enjoyed a handsome pension from Lewis XIV. for many years; and we are told he was extremely penitent in his last illness, for all those of his compositions which tended to inspire love and pleasure.

**QUINARIUS**, in antiquity, a little Roman coin, equal to half the denarius. It was properly the Roman halfpenny.

Quia  
Quinarus.

Quince

Quintile.

QUINCE, in botany. See CIDONIA.

QUINCUNX, in Roman antiquity, denotes any thing that consists of five-twelfths of another; but particularly of the ar.

QUINCUNX *Order*, in gardening, is a plantation of trees, disposed originally in a square consisting of five trees, one at each corner, and a fifth in the middle; which disposition, repeated again and again, forms a regular grove, wood, or wilderness.

QUINDECAGON, in geometry, a plain figure with 15 sides and 15 angles.

QUINDECENVIRI, in Roman antiquity, a college of 15 magistrates, whose business it was to preside over the sacrifices. They were also the interpreters of the Sibyl's books; which, however, they never consulted but by an express order of the senate.

QUINQUAGENARIUS, in Roman antiquity, an officer who had the command of 50 men.

QUINQUAGESIMA SUNDAY, Shrove Sunday, so called as being about the 50th day before Easter.

QUINQUATRIA, in Roman antiquity, festivals celebrated in honour of Minerva, with much the same ceremonies as the Panathæna were at Athens.

QUINQUENNALIS, in Roman antiquity, a magistrate in the colonies and municipal cities of that empire, who had much the same office as the ædile at Rome.

QUINQUEREMIS, in the naval architecture of the ancients, a name given to a galley which had five rows of oars. They divided their vessels in general into *monocrota* and *polycrota*. The former had only one tire of rowers: the latter had several tires of them, from two or three, up to 20, 30, or even 40; for such a vessel we have an account of in the time of Philipater, which required no less than 4000 men to row it.

Meibom has taken off from the imaginary improbability of there ever having been such a vessel, by reducing the enormous height supposed necessary for such a number of rows of oars and men to work them, by finding a better way of placing the men than others had thought of. The quinqueremes of the ancients had 420 men in each; 300 of which were rowers, and the rest soldiers. The Roman fleet at Messina consisted of 330 of these ships; and the Carthaginian, at Lilybæum, of 350 of the same size. Each vessel was 150 feet long. Thus 130,000 men were contained in the one, and 150,000 in the other, with the apparatus and provisions necessary for such expeditions as they were intended for. This gives to grand an idea of the ancient naval armaments, that some have questioned the truth of the history; but we find it related by Polybius, an historian too authentic to be questioned, and who expresses his wonder at it while he relates it.

QUINQUEVIRI, in Roman antiquity, an order of five priests, peculiarly appointed for the sacrifices to the dead, or celebrating the rites of Erebus.

QUINQUINA. See CINCHONA.

QUINSY, or QUINZY. See MEDICINE, n<sup>o</sup> 285—288.

QUINTESSENCE, in chemistry, a preparation consisting of the essential oil of some vegetable substance, mixed and incorporated with spirit of wine.

QUINTESSENCE, in alchemy, is a mysterious term, signifying the fifth or last and highest essence of power in a natural body.

QUINTILE, in astronomy, an aspect of the pla-

nets when they are 72 degrees distant from one another, or a fifth part of the zodiac.

QUINTILIANUS (Marcus Fabius), a celebrated Latin orator, and the most judicious critic of his time, was a native of Calagurris, or Calahorra, in Spain; and was the disciple of Domitius Afer, who died in the year 59. He taught rhetoric at Rome for 20 years, with great applause; and not only laid down rules for speaking, but exhibited his eloquence at the bar. Some authors imagine, but with little foundation, that he arrived to the consulship; but it is more certain, that he was preceptor to the grandsons of the emperor Domitian's sister. There is still extant his excellent work entitled *Institutiones Oratorie*, which is a treatise of rhetoric in 12 books; where his precepts, judgment, and taste, are justly admired. These institutions were found entire by Poggius, in an old tower of the abbey of St Gal, and not in a grocer's shop in Germany as some authors have imagined. There is also attributed to Quintilian a dialogue *De causis corruptæ eloquentiæ*; but it is more commonly ascribed to Tacitus. The best editions of Quintilian's works are those of Mr Obrecht, published at Strasburg in 2 vols 4to, in 1698, and of M. Capperonier, in folio. There is an English translation by Mr Guthrie.

Quintilian had a son of the same name, on whom he bestows great praises. This son ought not to be confounded with Quintilian, the father, or rather the grandfather, of him who is the subject of this article, and who wrote 145 declamations. Ugolin of Parma published the first 136 in the 15th century; the nine others were published in 1563 by Peter Ayraut, and afterwards by Peter Pithou in 1580. There have also been 19 other declamations, printed under the name of Quintilian the Orator; but, in the opinion of Vossius, they were written neither by that orator nor his grandfather.

QUINTILIANS, a sect of ancient heretics, thus called from their prophetess Quintilia. In this sect the women were admitted to perform the sacerdotal and episcopal functions. They attributed extraordinary gifts to Eve for having first eaten of the tree of knowledge; told great things of Mary the sister of Moses, as having been a prophetess, &c. They added, that Philip the deacon had four daughters who were all prophetesses and were of their sect. In these assemblies it was usual to see the virgins entering in white robes, performing prophetesses.

QUINTIN, a considerable town of France, in Brittany, with the title of a duchy, and a fine castle. It is seated in a valley on the river Goy, near a large forest of the same name. W. Long. 1. 51. N. Lat. 48. 26.

QUINTIN MATSWP, also called the *Farric of Antwerp*, famous for being transformed, by the force of love, from a blacksmith to a painter. He had followed the trade of a blacksmith and farrier near 20 years; when falling in love with a painter's daughter, who was very handsome, and disliked nothing but his trade, he quitted it, and betook himself to painting, in which he made a very uncommon progress. He was a diligent and careful imitator of ordinary life, and succeeded better in representing the defects than the beauties of nature. Some historical performances of this master deserve commendation, particularly a Descent from the Cross, in the cathedral at Antwerp; but his best known

Quinti-

lianus.

||

Quintin.

Quintine known picture is that of the two Misers in the gallery at Windsor. He died in 1529.

**Quirites.** **QUINTINE** (John de la), a celebrated French gardener, born at Poitiers in 1626. He was brought up to the law; and acquitted himself so well at the bar, as to acquire the esteem of the chief magistrate. M. Tamboneau, president of the chamber of accounts, engaged him to undertake the preceptorship of his only son, which Quintine executed entirely to his satisfaction; applying his leisure hours to the study of writers on agriculture, ancient and modern, to which he had a strong inclination. He gained new lights by attending his pupil to Italy; for all the gardens about Rome being open to him, he failed not to add practice to his theory. On his return to Paris, M. Tamboneau gave up the management of his garden entirely to him; and Quintine applied so closely to it, that he became famous all over France. Lewis XIV. erected a new office purposely for him, that of director of the royal fruit and kitchen gardens; and these gardens, while he lived, were the admiration of the curious. He lived to a good old age, though we learn not the time of his death; his Directions for the Management of Fruit and Kitchen Gardens, are esteemed all over Europe.

**QUINTUS CALABER**, a Greek poet, who wrote a large Supplement to Homer's Iliad, in 14 books, in which a relation is given of the Trojan war from the death of Hector to the destruction of Troy. It is conjectured, from his style and manner, that he lived in the fifth century. Nothing certain can be collected either concerning his person or country. His poem was first made known by cardinal Bessarion, who discovered it in St Nicholas's church, near Otranto in Calabria; from whence the author was named *Quintus Calaber*. He was first published at Venice by Aldus, but it is not said in what year.

**QUINTUS CURTIUS.** See **CURTIUS**.

**QUIRE** of PAPER, the quantity of 24 or 25 sheets.

**QUIRINALIA**, in antiquity, a feast celebrated among the Romans in honour of Romulus.

**QUIRITES**, in Roman antiquity. In consequence of the agreement entered into by Romulus and Tatius king of the Sabines, Rome was to retain its name, taken from Romulus; and the people were to be called *Quirites*, from Cures, the principal town of the Sabines, a name used in all public addresses to the Roman people.—Dion. Hal. says, that each particular citizen was to be called *Romanus*, and the collective body of them *Quirites*; yet it appears by this ancient form of words used at funerals, *Ollus Quiris leto datus est*, that each private citizen was also called *Quiris*.

The origin of the word *Quirites*, which was at first peculiar to the Sabines, and became, in Romulus's time, the general name of the inhabitants of Rome, has been much sought for; and the most probable account antiquity gives us of them, is this. The word *Quiris*, according to Plutarch (p. 36.) and some others, signified in the Sabine language, both

a dart, and a warlike deity armed with a dart. It is uncertain whether the god gave name to the dart, or the dart to the god. But be that as it will, this *Quiris*, or *Quirinus*, was either Mars, or some other god of war; and the worship of *Quiris* continued in Rome all Romulus's reign: but after his death, he was honoured with the name *Quirinus*, and took the place of the god *Quiris*.

**QUIRK**, in a general sense, denotes a subtilty or artful distinction.

**QUIRK**, in building, a piece of ground taken out of any regular ground-plot, or floor: thus, if the ground-plot were oblong or square, a piece taken out of a corner to make a court or yard, &c. is called a *quirk*.

**QUITTER-BONE**, in fariery. See there, § xl. 4.

**QUIT-RENT**, (*Quietus Redditus*, i. e. "quiet rent,") is a certain small rent payable by the tenants of manors, in token of subjection, and by which the tenant goes quiet and free. In ancient records it is called *white rent*, because paid in silver money, to distinguish it from rent corn, &c.

**QUOIN**, or **COIN**, on board a ship, a wedge fastened on the deck close to the breach of the carriage of a gun, to keep it firm up to the ship's side. Cantic quoins are short three-legged quoins put between calks to keep them steady.

**QUOINS**, in architecture, denote the corners of brick or stone walls. The word is particularly used for the stones in the corners of brick buildings. When these stand out beyond the brick-work, their edges being chamfered off, they are called *ruffic quoins*.

**QUOTIDIAN**, any thing which happens every day. Hence, when the paroxysms of an ague recur every day, it is called a *quotidian ague*.

**QUOAD HOC**, is a term used in the pleadings and arguments of lawyers; being as much as to say, As to this thing the law is so and so.

**QUORUM**, a word frequently mentioned in our statutes, and in commissions both of justices of the peace and others. It is thus called from the words of the commission, *quorum A. B. unum esse volumus*. For an example, where a commission is directed to seven persons, or to any three of them, whereof A. B. and C. D. are to be two; in this case, they are said to be of the quorum, because the rest cannot proceed without them: so a justice of the peace and quorum is one without whom the rest of the justices in some cases cannot proceed.

**QUOTIENT**, in arithmetic, the number resulting from the division of a greater number by a smaller; and which shows how often the smaller is contained in the greater, or how often the divisor is contained in the dividend. The word is formed from the Latin, *quoties*; *q. d.* How often is such a number contained in such another?

In division, as the divisor is to the dividend, so is unity to the quotient.—Thus the quotient of 12 divided by 3 is 4; which is thus disposed, 3) 12 (4 quotient.

Quirk  
Quotent.

## R.

R  
||  
Rabelais.

**R**, or r, a liquid consonant, being the 17th letter of our alphabet. Its sound is formed by a guttural extrusion of the breath vibrated through the mouth, with a sort of quivering motion of the tongue drawn from the teeth, and culminated with the tip a little elevated towards the palate. In Greek words it is frequently aspirated with an *h* after it, as in *rhapsody*, *rhetoric*, &c. otherwise it is always followed by a vowel at the beginning of words and syllables.

In the notes of the ancients, R or RO signifies *Roma*; R. C. *Romana civitas*; R. G. C. *rei gerendæ causa*; R. F. E. D. *retie factum & distum*; R. G. F. *regis filius*; R. P. *res publica*, or *Romani principes*; and R. R. R. F. F. F. *res Romana ruet ferro, fame, flamma*.

Used as a numeral, R anciently stood for 80; and with a dash over it, thus  $\bar{R}$ , for 80,000; but the Greek  $\rho$ , or  $\rho$ , signified 100.

In the prescriptions of physicians, R or  $\bar{R}$  stands for *recipes*, i. e. "take."

**RABBETTING**, in carpentry, the planning, or cutting of channels or grooves in boards, &c.

In ship-carpentry, it signifies the letting in of the planks of the ship into the keel; which, in the ræke and run of a ship is hollowed away, that the planks may join the closter.

**RABBI**, or **RABBINS**, a title which the Pharisees and doctors of the law among the Jews assumed, and literally signifies *masters* or *excellents*.

There were several gradations before they arrived at the dignity of a rabbin; which was not conferred till they had acquired the profoundest knowledge of the law and the traditions. It does not however appear that there was any fixed age or previous examination necessary; but when a man had distinguished himself by his skill in the written and oral law, and passed thro' the subordinate degrees, he was saluted a rabbin by the public voice.

Among the modern Jews, for near 700 years past, the learned men retain no other title than that of *rabbi*, or *rabbins*: they have great respect paid them, have the first places or seats in their synagogues, determine all matters of controversy, and frequently pronounce upon civil affairs; they have even a power to excommunicate the disobedient.

**RABBINISTS**, among the modern Jews, an appellation given to the doctrine of the rabbins concerning traditions, in opposition to the Caraites; who reject all traditions. See **CARAITES**.

**RABELAIS** (Francis), a French writer famous for his factiousness, was born at Chinon in Touraine, about the year 1483. He was first a Franciscan friar; but quitting his religious habit, studied physic at Montpellier, where he took his doctor's degree. It is said, that the chancellor du Pratt having abolished the privileges of the faculty of physic at Montpellier by a decree of the parliament, Rabelais had the address to make him revoke what he had done; and that those

who were made doctors of that university wear Rabelais's robe, which is there held in great veneration. Some time after, he came to Rome, in quality of physician in ordinary to cardinal John du Bellay bishop of Paris. Rabelais is said to have used the freedom to jeer pope Paul III. to his face. He had quitted his religious connections for the sake of leading a life more agreeable to his taste; but renewed them on a second journey to Rome, when he obtained, in 1536, a brief to qualify him for holding ecclesiastical benefices; and, by the interest of his friend cardinal John du Bellay, he was received as a secular canon in the abbey of St Maur near Paris. His profound knowledge in physic rendered him doubly useful; he being as ready, and at least as well qualified, to prescribe for the body as for the soul: but as he was a man of wit and humour, many ridiculous things are laid to his charge, of which he was quite innocent. He published several things; but his chief performance is a strange incoherent romance, called *the History of Gargantua and Pantagruel*; being a satire upon priests, popes, fools, and knaves of all kinds. This work contains a wild irregular profusion of wit, learning, obscenity, low conceits, and arrant nonsense: hence the shrewdness of his satire, in some places where he is to be understood, gains him credit for as good meanings where no meaning is discoverable. Some allusions may undoubtedly have been so temporary and local as to be now quite lost, but it is too much to conclude thus in favour of every unintelligible rhapsody: for we are not without English writers of great talents, whose sportive geniuses have betrayed them into puerilities, no less incoherent at the times of writing, than those of Rabelais appear above two centuries after. He died about 1553.

**RABBIT**, in zoology. See **LÉPUS**.

The buck rabbits, like our boar cats, will kill the young ones if they can get at them; and the does in the warrens prevent this, by covering their litters, or nests, with gravel or earth, which they close so artificially up with the hinder part of their bodies, that it is hard to find them out. They never suckle their young ones at any other time than early in the morning and late at night; and always, for eight or ten days, close up the hole at the mouth of the nest, in this careful manner, when they go out. After this they begin to leave a small opening, which they increase by degrees; till at length, when they are about three weeks old, the mouth of the hole is left wholly open that they may go out; for they are at that time grown big enough to take care of themselves, and to feed on grass.

People who keep rabbits tame for profit, breed them in hutches; but these must be kept very neat and clean, else they will be always subject to diseases. Care must be taken also to keep the bucks and does apart till the latter have just kindled; then they are to be turned to the bucks again, and to remain with them till they shun and run from them.

The general direction for the choosing of tame rabbits

Rabelais,  
Rabbit.

Rabbit.

bits is, to pick the largest and fairest; but the breeder should remember that the skins of the silver-haired ones sell better than any other. The food of the tame rabbits may be colewort and cabbage-leaves, carrots, parsneps, apple-rinds, green corn, and vetches, in the time of the year; also vine-leaves, grafs, fruits, oats, and oatmeal, milk-thistles, fow-thistles, and the like: but with these moist foods they must always have a proportionable quantity of the dry foods, as hay, bread, oats, bran, and the like, otherwise they will grow potbellied, and die. Bran and grains mixed together have been also found to be very good food. In winter they will eat hay, oats, and chaff, and these may be given them three times a-day; but when they eat green things, it must be observed that they are not to drink at all, for it would throw them into a dropfy. At all other times a very little drink serves their turn, but that must always be fresh. When any green herbs, or grafs, are cut for their food, care must be taken that there be no hemlock among it; for though they will eat this greedily among other things when offered to them, yet it is sudden poison to them.

Rabbits are subject to two principal infirmities. First, the rot, which is caused by giving them too large a quantity of greens, or from giving them fresh gathered with the dew or rain hanging in drops upon them. It is over-moisture that always causes this disease. The greens therefore are always to be given dry; and a sufficient quantity of hay, or other dry food, intermixed with them, to take up the abundant moisture of their juices. On this account the very best food that can be given them, is the shortest and sweetest hay that can be got, of which one load will serve 200 couples a year; and out of this stock of 200, 200 may be eat in the family, 200 fold to the markets, and a sufficient number keep in case of accidents.

The other general disease of these creatures is a sort of madness: this may be known by their wallowing and tumbling about with their heels upwards, and hopping in an odd manner into their boxes. This distemper is supposed to be owing to the rankness of their feeding; and the general cure is the keeping them low, and giving them the prickly herb called *tare-thistle* to eat.

The general computation of males and females is, that one buck-rabbit will serve for nine does: some allow two to one buck; but those who go beyond this, always suffer for it in their breed.

The wild rabbits are either to be taken by small curdags, or by spaniels bred up to the sport; and the places of hunting those who fraggle from their burrows, is under close hedges or bushes, or among corn-fields and fresh pastures. The owners use to course them with small grehounds; and though they are seldom killed this way, yet they are driven prey to their burrows, and are prevented from being a prey to others. The common method is by nets called *purse-nets*, and ferrets. The ferret is sent into the hole to fetch them out; and the purse-net being spread over the hole, takes them as they come out. The ferrets mouths must be muffled, and then the rabbit gets no harm. For the more certain taking of them, it may not be improper to pitch up a hay-net or two, at a small distance from the burrows that are intended to be hunted: thus very few of the number that are attempted will escape.

Some who have not ferrets smoke the rabbits out of their holes with burning brimstone and orpiment. This certainly brings them out into the nets: but then it is a very troublesome and offensive method; and is very detrimental to the place, as no rabbit will, of a long time, afterwards come near the burrows which have been fumed with those stinking ingredients.

The testicle of a rabbit is a very good object for examining the structure of this part of generation in animals. The whole substance of the testicle in this animal is made up of vessels, which lie in round folds in the manner of the smaller intestines; but then both ends of each roll meet at their insertion, which seems to be made into the *ductus deferens*; and every one of these little rolls is curiously embroidered with other vessels, which, from their red colour, appear to be arteries and veins. The several little rolls lie in ranges, disposed with an uniformity which is very agreeable to the eye. Every one of these rolls is not a single and entire tube, but each consists of several tubes, beside the veins and arteries which embroider it. This is best distinguished by the cutting one of the rolls transversely, and then examining the cut end with a glass, which will appear to be made up of the cut and open ends of four, five, or more parallel tubes, which together form the roll, or single tube, as it appears to the eye, being all wrapped up in one common and very thin membrane. These are so tender that they cannot be explicated and viewed distinct, as De Graeff tells us those of the testicles of a rat and of some other animals may. These however, as well as the others, are only made up of a congeries of vessels, and the liquors, which are their contents, without any intermediate substance, or any thing of that parenchyma which many authors have talked of. The testicles of a bull have the greatest appearance of a fleshy texture of those of any known animal; yet even these afford no particle of parenchyma, or flesh, when examined by glasses in any sort of preparation, whether boiled, raw, soaked in spirits, or in whatever other state. The testicles of various animals are very variously composed, but all in this general manner of vessels variously rolled and folded together: and even the human testicles are of the same sort; being composed solely of rolls of vessels, without any intermediate substance, be it called by whatever name, but only consisting of vessels and their liquors.

RACE, in general, signifies running with others in order to obtain a prize, either on foot, or by riding on horseback, in chariots, &c.

The race was one of the exercises among the ancient Grecian games, which was performed in a course containing 125 paces; and those who contended in these foot-races were frequently clothed in armour. Chariot and horse races also made a part of these ancient games.

Races were known in England in very early times. Fitz Stephen, who wrote in the days of Henry II. mentions the great delight that the citizens of London took in the diversion. But by his words, it appears not to have been designed for the purposes of gaming, but merely to have sprung from a generous emulation of showing a superior skill in horsemanship.

Races appear to have been in vogue in the reign of Queen Elizabeth, and to have been carried to such excess as to injure the fortunes of the nobility. The famous

Rabbit

Race.]

Racine, famous George earl of Cumberland is recorded to have wasted more of his estate than any of his ancestors; and chiefly by his extreme love to horse-races, tiltings; and other expensive diversions. It is probable that the parsimonious queen did not approve of it; for races are not among the diversions exhibited at Kenilworth by her favourite Leicester. In the following reign, were places allotted for the sport: Croydon in the south, and Garterly in Yorkshire, were celebrated courses. Camden also says, that in 1607 there were races near York, and the prize was a little golden bell.

RACE, in genealogy, a lineage or extraction continued from father to son. See DESCENT.

RACINE (John) of the French academy, treasurer of France in the generality of Moulins, and secretary to his majesty, was born at Ferre-Milon in 1639. He had a fine genius for the *Belles Lettres*, and became one of the first poets of the age. He produced his *Thebaïde* when but very young; and afterwards other pieces, which met with great success, though they appeared when Corneille was in his highest reputation. In his career, however, he did not fail to meet with all that opposition which envy and cabal are ever ready to set up against a superior genius. It was partly owing to a chagrin from this circumstance that he took a resolution to quit the theatre for ever; although his genius was still in full vigour, being not more than 38 years of age. But he had also imbibed in his infancy a deep sense of religion; and this, though it had been smothered for a while by his connections with the theatre, and particularly with the famous actress Champmele, whom he greatly loved, and by whom he had a son, now at length broke out; and bore down all before it. In the first place, he resolved not only to write no more plays, but to do a rigorous penance for those he had written; and he actually formed a design of becoming a Carthusian friar. His religious director however, a good deal wiser than he, advised him to think more moderately, and to take measures more suitable to his character. He put him upon marrying, and settling in the world: with which proposal this humble and tractable penitent complied; and immediately took to wife the daughter of a treasurer of France for Amiens, by whom he had seven children.

He had been admitted a member of the French academy in 1673, in the room of La Mothe le Vayer deceased; but spoiled the speech he had made upon that occasion, by pronouncing it with too much timidity. In 1677, he was nominated with Boileau, with whom he was ever in strict friendship, to write the history of Lewis XIV.; and the public expected great things from two writers of their distinction, but were disappointed. Boileau and Racine, after having for some time laboured at this work, perceived that it was entirely opposite to their genius.

He spent the latter years of his life in composing a history of the house of Port-Royal, the place of his education; which however, though finely drawn up, as many have asserted, has not been published. Too great sensibility, say his friends, but more properly an impotence of spirit, shortened the days of this poet. Though he had conversed much with the court, he had not learned the wisdom, which is usually learned

there, of disguising his real sentiments. Having drawn up a well-reasoned and well-written memorial upon the miseries of the people, and the means of relieving them, he one day lent it to Madam de Maintenon to read; when the king coming in, and demanding what and whose it was, commended the zeal of Racine, but disapproved of his meddling with things that did not concern him: and said with an angry tone, "Because he knows how to make good verses, does he think he knows every thing? And would he be a minister of state, because he is a great poet?" These words hurt Racine greatly: he conceived dreadful ideas of the king's displeasure; and his chagrin and fears brought on a fever, of which he died the 22d of April 1699.

The king, who was sensible of his great merit, and always loved him, sent often to him in his illness; and finding after his death that he had more glory than riches, settled a handsome pension upon his family. There is nothing in the French language written with more wit and elegance than his pieces in prose. Besides his plays several of his letters have been published; he also wrote spiritual songs, epigrams, &c. Racine's works were printed at Amsterdam in 1722, in 2 vols 12mo. and the next year a pompous edition was printed in 2 vols quarto.

RACING, the riding heats for a plate or other premium.

The first thing to be considered in this sort of gaming is the choosing a rider; for it is not only necessary that he should be very expert and able, but he must also be very honest.

He must have a very close seat, his knees being turned close to the saddle skirts, and held firmly there, and the toes turned inwards, so that the spurs may be turned outward from the horse's belly; his left-hand governing the horse's mouth, and his right the whip. During the whole time of the race, he must take care to sit firm in the saddle, without waving or standing up in the stirrups. Some jockeys fancy this is a becoming seat; but it is certain, that all motions of this kind do really incommode the horse. In spurring the horse, it is not to be done by flicking the calves of the legs close to the horse's sides, as if it were intended to press the wind out of his body; but, on the contrary, the toes are to be turned a little outwards; that the heels being brought in, the spurs may just be brought to touch the sides. A sharp touch of this kind will be of more service toward the quickening a horse's pace, and will sooner draw blood, than one of the common coarse kicks. The expert jockey will never spur his horse until there is great occasion; and then he will avoid striking him under the fore bowels between the shoulders and girth; this is the tenderest part of a horse, and a touch there is to be reserved for the greatest extremity.

As to whipping the horse, it ought always to be done over the shoulder on the near side, except in very hard running and on the point of victory; then the horse is to be struck on the flank with a strong jerk; for the skin is most tender of all there, and most sensible of the lash.

When a horse is whipped and spurred, and is at the top of his speed; if he claps his ears in his pole, or whisks his tail, it is a proof that the jockey heats him

Racing. him hard, and then he ought to give him as much comfort as he can, by sawing the snaffle backwards and forwards in his mouth; and by that means forcing him to open his mouth, which will give him wind, and be of great service. If there be any high wind stirring in the time of riding, the artful jockey will let his adversary lead, holding hard behind him, till he sees an opportunity of giving a loofe; yet, in this case, he must keep to close behind, that the other horse may keep the wind from him; and that he, sitting low, may at once shelter himself under him, and assist the strength of the horse. If the wind happen to be in their back, quite a contrary method is to be taken with it; the expert jockey is to keep directly behind the adversary, that he may have all the advantage of the wind to blow his horse along, as it were, and at the same time intercept it in regard to his adversary.

When running on a level carpet ground, the jockey is to bear his horse as much as the adversary will give him leave, because the horse is naturally more inclined to spend himself on this ground; and on the contrary, on deep earths, he may have more liberty, as he will there spare himself.

In riding up-hill the horse is always to be favoured, by bearing him hard, for fear of running him out of wind; but, in running down-hill, if the horse's feet and shoulders will bear it, and the rider dares venture his neck, he may have a full loofe. If the horse have the heels of the rest, the jockey must always spare him a little, that he may have a reserve of strength, to make a push at the last post.

A great deal depends on the jockey's knowing the nature of the horse that is to run against him; for by managing accordingly, great advantages are to be obtained: thus, if the opposite horse is of a hot and fiery disposition, the jockey is either to run just behind him, or cheek by jowl with him, making a noise with the whip, and by that means forcing him on faster than his rider would have him, and consequently spending him so much the sooner; or else keep just before him, in such a slow gallop, that he may either over-reach, or by treading on the heels of the fore horse endanger tumbling over.

Whatever be the ground that the adversary's horse runs wrot on, the cunning jockey is to ride the most violently over; that by this means it will often happen, that in following he either stumbles or claps on the back sinews.

The several corrections of the hand, the whip, and the spur, are also to be observed in the adversary, and in what manner he makes use of them; and when it is perceived, by any of the symptoms, of holding down the ears, or whisking the tail, or stretching out the nose like a pig, that the horse is almost blown; the business is to keep him on to this speed, and he will be soon thrown out or distanced. If the horse of the opponent looks dull, it is a sign his strength fails him; and if his flanks beat much, it is a sign that his wind begins to fail him, and his strength will soon do for too.

After every heat for a plate, there must be dry straw, and dry cloths both linen and woollen, ready to rub him down all over, after taking off the sweat with what is called a *sweat knife*; that is, a piece of

an old sword blade, or some such thing. Some advise the steeping the cloths in urine and saltpetre the day before, and letting them be dried in the sun for this occasion. After the horse has been well rubbed with these, he should be chafed all over, with cloths wetted in common water till the time of starting again. When it is certainly known that the horse is good at the bottom, and will stick at the mark, he should be rid every heat to the best of his performance; and the jockey is, as much as possible, to avoid riding at any particular horse, or staying for any, but to ride out the whole heat with the best speed he can. If, on the contrary, he has a fiery horse to ride, and one that is hard to manage, hard-mouthed, and difficult to be held, he is to be started behind the rest of the horses with all imaginable coolness and gentleness; and when he begins to ride at some command, then the jockey is to put up to the other horses; and if they ride at their ease, and are hard held, they are to be drawn on faster; and if it be perceived that their wind begins to rake hot, and they want a sob, the business is to keep them up to that speed; and when they all are come within three quarters of a mile of the post, then is the time to push for it, and use the utmost speed in the creature's power.

When the race is over, the horse is to be clothed up and rode home; and immediately on his coming into the stable, the following drink is to be given him. Beat up the yolks of three eggs, and put them into a pint and half of new milk made warm; let there be added to this three pennyworth of saffron, and three spoonfuls of salad oil, and let the whole be given with a horn. After this he is to be rubbed well down, and the saddle place rubbed over with warm sack, and the places where the spurs have touched, with a mixture of urine and salt, and afterwards with a mixture of powder of jet and Venice turpentine; after this he should have a feed of rye-bread, then a good mash, and at some time after these as much hay and oats as he will eat. His legs after this should be bathed sometimes with a mixture of urine and saltpetre.

RACHITIS, the RICKETS. See MEDICINE, n<sup>o</sup> 445.

RACK, an engine of torture, furnished with pulleys, cords, &c. for extorting confession from criminals.

RACK, a spirituous liquor made by the Tartars of Tongusla. This kind of rack is made of mare's milk, which is left to be sour, and afterwards distilled twice or thrice between two earthen pots closely stopp'd; whence the liquor runs through a small wooden pipe. This liquor is more intoxicating than brandy distilled from wine.

RACK, or *Arack*. See ARACK.

Various and contradictory accounts have been delivered as to the real subject that gives origin to this fine spirit. The vulgar suppose it to be rice; some, the juice of the East Indian sugar-canes; and others, a mixture of the juice of this cane and of the cocoa tree; finally, some affirm, that it is prepared from the flesh of animals, and other more costly ingredients.

The juice of the cocoa-trees and palm-trees is what affords us the finest arracks; but there are many other juices distilled into the same kind of liquors, though

Racing  
1  
Rack.

Rack.

though wanting the fine flavour of what is made from these.

The manner of making the arrack is this. The juice of the trees is not procured in the way of tapping the trees, as we do: but the operator provides himself with a parcel of earthen pots, with bellies and necks, like our ordinary bird bottles; he makes fast a parcel of these to his girdle, and any way else that he commodiously can about him. Thus equipped, he swarms up the trunk of a cocoa tree; and when he comes to the boughs, he takes out his knife, and cutting off one of the small knots or buttons, he applies the mouth of the bottle to the wound, fastening it to the bough with a bandage; in the same manner he cuts off the other buttons, and fastens on his pots, till the whole number is used: this is done in the evening; and descending from the tree, he leaves things to themselves till the next morning, when climbing up again he takes off the bottles which are mostly filled, and empties the juice into the proper receptacle. This is repeated every night, till there is a sufficient quantity produced; and the whole being then put together, is left to ferment, which it soon does.

When the fermentation is over, and the liquor, or wash, is grown a little tart, it is put into the still; and a fire being made, the still is suffered to work as long as what comes over has any considerable taste of spirit.

The liquor thus procured is the low wine of arrack; and this is so poor a liquor, that it will soon corrupt and spoil, if not distilled again, to separate some of its phlegm: they therefore immediately after pour back this low wine into the still, and rectify it to that very weak kind of proof-spirit, in which state we find it. The arrack we meet with, notwithstanding its being of a proof test, according to the way of judging by the crown of bubbles, holds but a sixth, and sometimes but an eighth part of alcohol, or pure spirit; whereas our other spirits, when they show that proof, are generally esteemed to hold one half pure spirit.

This shows how very uncertain a way of judging of the strength of spirits, this by the bead or bubble is. And we may from this learn, that it would be much better to have the arrack rectified to the pure alcohol in the East Indies, in which case it would be brought over in one sixth or one eighth part of the room, and might be lowered to its standard with common water here; all that it contains, besides this sixth or eighth part of spirit, being only a poor phlegm, or an acidulated water, valuable only for having been brought from Goa or Batavia. It may appear strange to some, that this spirit should be proof according to the way of judging by the bead or bubble, and yet be so far below the strength which we usually understand to be in proof-spirit. But the truth is, that this standing crown of bubbles may be owing only to the tenacity of the oil that is held in the spirit. Our malt-distillers know very well, that the more oil they work over with the spirit, the stronger proof it will hold, at a somewhat weaker standard of strength than it ought to have; and this case of the arrack shows the fallacy of the other. The finer and more subtle any oil is, the less it refuses to mix with

Rack.

any aqueous menstruum: thus we see that the essential oils of some vegetables, or at least some portion of them, is so fine and subtle, as to mix without turning milky, even with water itself, which is the case in many of our simple distilled waters. Hence, it is no wonder, that so subtle an oil as is contained in that thin and dilute vegetable juice of which arrack is made, should readily mix with such a mixture as that of one part alcohol and six or eight of water, which, though weak considered as a spirit, is much more likely to retain and embody an oil than simple water alone. The oil of the cocoa is thus suspended imperceptibly in the spirit; and that in such quantity as to give tenacity to the whole, and thereby dispose it to form a froth or lather at the top when shook, and the bubbles of that froth to hang well together. Sometimes indeed these come over into England, and more frequently into Holland, arracks that are of the strength of brandy and rum: these chiefly come from the Dutch settlements, and are a piece of frugality of the Dutch to save freight: it is a wonder the saving spirit had not gone a little farther, and the method of reducing rack to alcohol been found out on the same plan.

Besides the common sorts of Goa and Batavia arracks, there are two others less generally known; these are the bitter arrack, and the black arrack. The bitter arrack is supposed to have been impregnated with some kind of bezoar, as that of the porcupine or monkey; which being not generated in the stomachs, as those of other animals, but in the gall-bladder, are of a very strongly bitter taste, and very readily communicate it to other things. Some, on the contrary, are of opinion that there is nothing added to this, but that the taste is owing to the juice of the trees from which the arrack is made; and many think that it is obtained from the juice of that tree which bears the fruit whose inspissated juice is what we call *terra Japonica*.

The black arrack is a very coarse spirit; and is usually drawn higher than any of the finer kinds are, being not drank like them, but employed for coarser purposes. The Turkish arrack, or, as it is usually called, *rackee*, seems to be of this kind. The finer and better kinds of arrack, tho' ever so good when put on board, are apt to grow foul and black in the carriage; if the leager or cask in which they are brought over be decayed on the inside, or the liquor come to touch any nails or rusty iron of any kind: for the spirit presently dissolves part of the ferruginous matter; and thence, upon account of the tincture of the oak, which it had before obtained from the wood of the cask, it will appear inky. Arrack, that is thus accidentally tinged black, is not to be confounded with such arrack as is originally black, and of the coarse kind named before. This, which has obtained the colour by accident, is not the worse in taste for it; and the tinge may be taken off, and the liquor recovered, by putting into the cask a large quantity of new or skimmed milk; and working it well about, as the vintners do in order to whiten their brown wines. When the bottoms are large, they are to be committed to a conical filtre of flannel, through which the arrack runs fine. This art of purifying foul arracks with milk, would be very pardonable, if our dealers only

Rack  
||  
Radcliff.

only imposed that upon us: but they have a shameful way of lowering this spirit with water, and that to such a degree as is scarce credible.

The weakness of some genuine arracks greatly contributes to the countenancing this cheat. This is the principal deceit used in regard to this commodity; for it is not easy to find any other spirit tasteless enough to mix with it, without discovering the cheat with us; and in Holland they are not only more destitute of clean spirits than here, but the price of arrack itself is so low there, that it is hardly worth while to do it if they had proper materials.

The extravagant price that arrack bears in England, has given great occasion to the distillers to endeavour the counterfeiting it. All the attempts which, for cheapness sake, have been made with malt spirit, have naturally proved unsuccessful: but the thing is not impracticable, though these methods have failed. The first requisite must be the making a perfectly tasteless spirit; and the next the treating the juices of vegetables, so as to obtain their flavour, to add to it; or else the obtaining a pulverable dry substance, which would at once mix with the spirit, and prevent the trouble of a second process of distillation. It is possible, also, that the English juices of trees which will bleed freely, such as the birch, maple, sycamore, and the like, may, on proper trials, be found to afford this sort of spirit in some degree of perfection.

*To Rack Wines, &c.* To draw them off from their lees, after having stood long enough to ebb and settle. Hence, rack-vintage is frequently used for the second voyage our wine-merchants use to make into France for racked wines.

**RACKOON**, in zoology, a species of *Ursus*.

**RADCLIFF** (Dr John), an English physician of great eminence in his time, born at Wakefield in Yorkshire in 1650. He was educated at Oxford, and enrolled himself upon the physical line; but it was remarkable that he recommended himself more by his ready wit and vivacity, than by any extraordinary acquisitions in learning. He began to practise at Oxford in 1675: but never paid any regard to established rules, which he censured whenever he thought fit, with great freedom and acrimony; and as this drew all the old practitioners upon him, he lived in a continual state of hostility with them. Nevertheless, his reputation increased with his experience; so that before he had been two years in business, his practice was very extensive among persons of high rank. In 1684, he removed to London, and settled in Bow-street Convent Garden, where in less than a year he got into prime business. In 1687, the princess Anne of Denmark made him her physician: yet when her husband and she joined the prince of Orange, Radcliffe, either not choosing to declare himself, or unwilling to favour the measures then in agitation, excused himself from attending them, on the plea of the multitude of his patients. Nevertheless, he was often sent for to king William and other great personages, though he did not incline to be a courtier. He incurred some censure for his treatment of Queen Mary, who died of the small-pox; and soon after lost his place about the princess Anne, by his attachment to his bottle. He also totally lost the favour of king William by his uncourtly freedom; for, in 1699, when the king shewed

him his swollen ankles, while the rest of his body was emaciated, and asked him what he thought of them? "Why truly I would not have your majesty's two legs for your three kingdoms," replied Radcliffe. He continued increasing in business and insolence as long as he lived, continually at war with his brethren the physicians; who considered him in no other light than that of an active ingenious empiric, whom constant practice had at length brought to some degree of skill in his profession. He died in 1714; and if he never attempted to write any thing himself, has perpetuated his memory by founding a fine library at Oxford to preserve the writings of other men.

**RADIALIS**, the name of two muscles in the arm. See *ANATOMY*, *Table of the Muscles*.

**RADIANT**, in optics, is any point of a visible object from whence rays proceed.

**RADIATED FLOWERS**, in botany, are such as have several femisofcules set round a disk, in form of a radiant star; those which have no such rays are called *discous flowers*.

**RADIATION**, the act of a body emitting or diffusing rays of light all round as from a centre.

**RADICAL**, in general, something that serves as a business or foundation. Hence physicians talk much of a radical moisture. In grammar, we give the appellation *radical* to primitives, in contradistinction to compounds and derivatives. Algebraists also speak of the radical sign of quantities, which is the character expressing their roots.

**RADICLE**, that part of the seeds of all plants which upon vegetating becomes their root, and is discoverable by the microscope. See *PLANT*.

**RADISH**, in botany. See *RAPHANUS*.

**RADIUS**, in geometry, the semidiameter of a circle, or a right line drawn from the centre to the circumference.

In trigonometry, the radius is termed the whole sine, or sine of 90°. See *SINE*.

**RADIUS**, in anatomy, the exterior bone of the arm, descending along with the ulna from the elbow to the wrist.

**RADNOR**, the county-town of Radnorshire, in South Wales, seated near the spring head of the river Somergil, in a pleasant valley, at the foot of a hill which feeds abundance of sheep and cattle; and on the top of it was seated a castle, long since in ruins. This town is governed by a capital council, consisting of 25 persons and the recorder, out of whom are chosen yearly a bailiff and two aldermen. It sends one member to parliament.

**RADNORSHIRE**, a county of South Wales; its air is very sharp and piercing, and the soil barren without great cultivation, it being mountainous and rocky, especially in the north and west parts, which are only fit for feeding cattle. Its extent from east to west is 24 miles, and from north to south about 22. It has several rivers, the chief of which is the Wye. It is bounded on the east by Herefordshire, on the south and west by Brecknockshire, and on the north by Montgomeryshire. It has 52 parishes and four market-towns; the principal of which is Radnor, the county-town.

**RADIX**. See *ROOT*.

**RAFT**, a sort of float, formed by an assemblage

Radialis  
||  
Raft.

Rafters  
||  
Raja.

of various planks, or pieces of timber, fastened together side by side, so as to be conveyed more commodiously by any short distance in a harbour or road, than if they were separate. The timber and plank, with which merchant-ships are laden, in the different parts of the Baltic sea, are attached together in this manner, in order to float them off to the shipping.

**RAFTERS**, in building, are pieces of timber, which standing by pairs on the reason or railing piece, meet in an angle at the top, and form the roof of a building. See **ARCHITECTURE**.

**RAGMAN'S ROLL**, *Rechtus Ragimund's roll*, so called from one Ragimund a legate in Scotland, who calling before him all the beneficed clergymen in that kingdom, caused them on oath to give in *the true value* of their benefices; according to which they were afterwards taxed by the court of Rome: and this roll, among other records, being taken from the Scots by Edward I. was re-delivered to them in the beginning of the reign of Edward III.

**RAGOUT**, or **RAGOON**, a sauce, or seasoning, intended to rouse the appetite when lost or languishing.

This term is also used for any high-seasoned dish prepared of flesh, fish, greens, or the like: by stewing them with bacon, salt, pepper, cloves, and the like ingredients. We have ragouts of celery, of endive, asparagus, cock's-combs, giblets, cray-fish, &c.

The ancients had a ragout called *garum*, made of the putrified guts of a certain fish kept till it dissolved into a mere fumes, which was thought such a dainty, that, according to Pliny, its price equalled that of the richest perfumes.

**RAGSTONE**, a name given by our artificers to a kind of stone, which they use for setting an edge upon knives, chisels, and other tools. It is a greyish coloured stone, containing a large quantity of talcky particles, and splits easily into thin flakes. It is a soft stone, and used only to finish the setting an instrument after the edge has been prepared by grinding or rubbing the tool upon some other stone of a coarser texture. We have this from Newcastle, and many other parts in the north of England, where there are large rocks of it in the hills.

**RAGULED**, or **RAGGED**, in heraldry, jagged or knotted. This term is applied to a cross formed of the trunks of two trees without their branches, of which they show only the stumps. *Raguled* differs from *indented*, in that the latter is regular, the former not.

**RAJA**, the title of the Indian black princes, the remains of those who ruled there before the Moguls. Some of the rajas are said to preserve their independency, especially in the mountainous parts; but most of them pay an annual tribute to the Mogul. The Indians call them *rai*; the Persians *raian*, in the plural; and our travellers *rajahs*, or *ragias*.

**RAJA**, the *Ray-Fish*, in ichthyology; a genus belonging to the order of amphibia nantes. There are five spiracula below towards the peak; the body compressed; and the mouth is situated under the head. The most remarkable species are,

1. The batia, or skate: this species is the thinnest in proportion to its bulk of any of the genus, and also the largest, some weighing near 200 pounds. The

nose, though not long, is sharp pointed; above the eyes is a set of short spines: the upper part is of a pale brown, sometimes streaked with black: the lower part is white, marked with great numbers of minute black black spots. The jaws are covered with small granulated but sharp-pointed teeth. The tail is of a moderate length: near the end are two fins: along the top of it is one row of spines, and on the edges are irregularly dispersed a few others, which makes us imagine with Mr Ray, that in this respect these fish vary, some having one, others more orders of spines on the tail. It is remarked, that in the males of this species the fins are full of spines. Skates generate in March and April; at which time they swim near the surface of the water, several of the males pursuing one female. They adhere so fast together in coition, that the fishermen frequently draw up both together, though only one has taken the bait. The females begin to cast their *purfes*, as the fishermen call them (the bags in which the young are included) in May, and continue doing it till September. In October they are exceedingly poor and thin; but in November they begin to improve, and grow gradually better till May, when they are in the highest perfection. The males go sooner out of season than the females.

2. The oxyrinchus, or sharp-nosed ray, in length near seven feet, and breadth five feet two inches; when just brought on shore, it makes a remarkable snorting noise. The nose is very long, narrow, and sharp-pointed, not unlike the end of a spoutoon. The body is smooth, and very thin in proportion to the size; the upper part ash-coloured, spotted with numerous white spots, and a few black ones. The tail is thick; towards the end are two small fins; on each side is a row of small spines, with another row in the middle, which run some way up the back. The lower part of the fish is quite white. The mouth very large, and furnished with numbers of small sharp teeth bending inwards. This fish has been supposed to be the *bar* of the ancients; which was certainly some enormous species of ray, though we cannot pretend to determine the particular kind. Oppian styles it, *the broadest among fishes*: he adds an account of its fondness of human flesh, and the method it takes of destroying men, by over-laying and keeping them down by its vast weight till they are drowned. Philé (*De propriet. anim.* p. 85.) gives much the same relation. We are inclined to give them credit, since a modern writer, of undoubted authority †, gives the very same account of a fish found in the South Seas, the terror of those employed in the pearl-fishery. It is a species of ray, called there *mantas*, or the *quilt*, from its surrounding and wrapping up the unhappy divers, till they are suffocated; therefore the negroes never go down, without a sharp knife to defend themselves against the assaults of this terrible enemy.

3. The aspera, or rough ray, is found in Loch-Broom in Scotland. The length from the nose to the tip of the tail is two feet nine. The tail is almost of the same length with the body. Nose very short. Before each eye is a large hooked spine; and behind each another, beset with lesser. The upper part of the body is of a cinereous brown mixed with white, and spotted with black; and entirely covered with small spines. On the tail are three rows of great spines: all the

Raja.

† *Ulloa's Voyage*,  
l. 132.

the rest of the tail is irregularly beset with lesser. The fins and under side of the body are equally rough with the upper. The teeth are flat, and rhomboidal.

4. The fullonica, or fuller, derives its Latin name from the instrument fullers make use of in smoothing cloth, the back being rough and spiny. The nose is short and sharp. At the corner of each eye are a few spines. The membrane of nictitation is fringed. Teeth small, and sharp. On the upper part of the pectoral fins are three rows of spines pointing towards the back, crooked like those on a fuller's instrument. On the tail are three rows of strong spines: the middle row reaches up part of the back. The tail is slender, and rather longer than the body. The colour of the upper part of the body is cinereous, marked usually with numerous black spots: the lower part is white. This, as well as most other species of rays, vary a little in colour, according to age. This grows to a size equal to the skate. It is common at Scarborough, where it is called the *white hans*, or *gullet*.

5. The shagreen ray increases to the size of the skate; is fond of launces or sand-eels, which it takes generally as a bait. The form is narrower than that of the common kinds; the nose long and very sharp; pupil of the eye sapphire; on the nose are two short rows of spines; on the corner of the eyes another of a femicircular form; on the tail are two rows, continued a little up the back, small, slender, and very sharp: along the sides of the tail is a row of minute spines, intermixed with innumerable little spiculate. The upper part of the body is of a cinereous brown, covered closely with shagreen-like tubercles, resembling the skin of the dog-fish: the under side of the body is white; from the nose to the beginning of the pectoral fins is a tuberculated space. The teeth slender, and sharp as needles.

6. The torpedo, cramp-fish, or electric ray, is frequently taken in Torbay; has been once caught off Pembroke, and sometimes near Waterford in Ireland. It is generally taken, like other flat fish, with the trawl; but there is an instance of its taking the bait. It commonly lies in water of about 40 fathoms depth; and in company with the congenerous rays. The torpedo brings forth its young at the autumnal equinox, as affirmed by Aristotle. A gentleman of la Rochelle, on dissecting certain females of this species, the 10th of September, found in the matrices several of the fœtuses quite formed, and nine eggs in no state of forwardness: superfœtation seems therefore to be a property of this fish. The food of the torpedo is fish; a surmullet and a plaice have been found in the stomach of two of them. The surmullet is a fish of that swiftness, that it was impossible for the torpedo to take it by pursuit. It is probable, that by their electric stroke they stupefy their prey; yet the crab and sea-leech will venture to annoy them. They will live 24 hours out of the sea; and but very little longer if placed in fresh water. They inhabit sandy places; and will bury themselves superficially in it, by flinging the sand over, by a quick flapping of all the extremities. It is in this situation that the torpedo gives his most forcible shock, which throws down the astonished passenger who inadvertently treads upon him. In our seas it grows to a great size, and above 80 pounds weight. The tail is

thick and round; the caudal fin broad and abrupt. The head and body, which are indistinct, are nearly round; attenuating to extreme thinness on the edges; below the body, the ventral fins form on each side a quarter of a circle. The two dorsal fins are placed on a trunk of the tail. The eyes are small, placed near each other: behind each is a round spiracle, with six small-cutaneous rags on their inner circumference. Mouth small; teeth minute, spicular. Five openings to the gills, as in others of this genus. The skin very where smooth; cinereous brown above, white beneath. See further the article TORPEDO.

7. The clavata, or thornback, is easily distinguished from the others by the rows of strong sharp spines disposed along the back and tail. In a large one seen by Mr Pennant, were three rows on the back, and five on the tail, all inclining towards its end. On the nose, and on the inner side of the forehead, near the eyes, were a few spines, and others were scattered without any order on the upper part of the pectoral fins. The mouth was small, and filled with granulated teeth. The upper part of the body was of a pale ash colour, marked with short streaks of black, and the skin rough, with small tubercles like shagreen. The belly white, crossed with a strong femicular cartilage beneath the skin: in general, the lower part was smooth, having only a few spines on each side. The young fish have very few spines on them; and their backs are often spotted with white, and each spot is encircled with black. This species frequents our sandy shores; are very voracious, and feed on all sorts of flat fish; are particularly fond of herrings and sand-eels; and sometimes eat crustaceous animals, such as crabs. These sometimes weigh 14 or 15 pounds, but with us seldom exceed that weight. They begin to generate in June, and bring forth their young in July and August, which (as well as those of the skate) before they are old enough to breed, are called *maids*. The thornback begins to be in season in November, and continues so later than the skate, but the young of both are good at all times of the year.

8. The pastinaca, or sting ray, does not grow to the bulk of the others: The body is quite smooth, of shape almost round, and is of a much greater thickness and more elevated form in the middle than any other rays, but grows thin towards the edges. The nose is very sharp pointed, but short; the mouth small, and filled with granulated teeth. The irides are of a gold colour: behind each eye the orifice is very large. The tail is very thick at the beginning: the spine is placed about a third the length of the former from the body; is about five inches long, flat on the top and bottom, very hard, sharp pointed, and the two sides thin, and closely and sharply bearded the whole way. The tail extends four inches beyond the end of this spine, and grows very slender at the extremity. These fish are observed to shed their spine, and renew them annually; sometimes the new spine appears before the old one drops off; and the Cornish call this species *cardinal tri-lost*, or *three-tailed*, when so circumstanced. The colour of the upper part of the body is a dirty yellow, the middle part of an obscure blue: the lower side white, the tail and spine dusky. The weapon with which nature has armed this fish, hath supplied the ancient.

cients with many tremendous fables relating to it. Pliny, Aelian, and Oppian, have given it a venom that affects even the inanimate creation: trees that are struck by it instantly lose their verdure and perish, and rocks themselves are incapable of resisting the potent poison. The enchantress Circe armed her son with a spear headed with the spine of the trygon, as the most irresistible weapon she could furnish him with; and with which he afterwards committed parricide, unintentionally, on his father Ulysses. That spears and darts might, in very early times, have been headed with this bone instead of iron, we have no kind of doubt; that of another species of this fish being still used to point the arrows of some of the South American Indians, and is, from its hardness, sharpness, and beards, a most dreadful weapon. But in respect to its venomous qualities, there is not the least credit to be given to the opinion, though it was believed (as far as it affected the animal world) by Rondeletius, Aldrovand, and others, and even to this day by the fishermen in several parts of the kingdom. It is in fact the weapon of offence belonging to the fish, capable of giving a very bad wound, and which is attended with dangerous symptoms when it falls on a tendinous part or on a person in a bad habit of body. As to any fish having a spine charged with actual poison, it seems very dubious, though the report is sanctified by the name of Linnaeus. He instances the *passinaca*, the *torpedo*, and the *tetodon lineatus*. The first is incapable of conveying a greater injury than what results from the mere wound; the second, from its electric effluvia; and the third, by imparting a pungent pain like the sting of nettles, occasioned by the minute spines on its abdomen.

RAIETEA, one of the South Sea islands, named also ULIETEA.

RAIL, in ornithology. See RALLUS.

RAIN, the descent of water from the atmosphere in the form of drops of a considerable size. By this circumstance it is distinguished from dew and fog: in the former of which the drops are so small that they are quite invisible; and in the latter, though their size is larger, they seem to have very little more specific gravity than the atmosphere itself, and may therefore be reckoned hollow spherules rather than drops.

It is universally agreed, that rain is produced by the water previously absorbed by the heat of the sun, or otherwise, from the terraqueous globe, into the atmosphere; but very great difficulties occur when we begin to explain why the water, once so closely united with the atmosphere, begins to separate from it. We cannot ascribe this separation to cold, since rain often takes place in very warm weather; and though we should suppose the condensation owing to the superior cold of the higher regions, yet there is a remarkable fact which will not allow us to have recourse to this supposition. It is certain, that the drops of rain increase in size considerably as they descend. On the top of a hill, for instance, they will be small and inconsiderable, forming only a drizzling shower; but at the bottom of the same hill the drops will be exceedingly large, descending in an impetuous rain; which shows that the atmosphere is disposed to condense the vapours, and actually does so, as well where it is warm as where it is cold.

For some time the suppositions concerning the cause

of rain were exceedingly insufficient and unsatisfactory. It was imagined, that when various congeries of clouds were driven together by the agitation of the winds, they mixed, and run into one body, by which means they were condensed into water. The coldness of the upper parts of the air also was thought to be a great means of collecting and condensing the clouds into water; which, being heavier than the air, must necessarily fall down through it in the form of rain. The reason why it falls in drops, and not in large quantities, was said to be the resistance of the air; whereby being broken, and divided into smaller and smaller parts, it at last arrives to us in small drops. But this hypothesis is entirely contrary to almost all the phenomena: for the weather, when coldest, that is, in the time of severe frost, is generally the most serene; the most violent rains also happen where there is little or no rain to condense the clouds; and the drops of rain, instead of being divided into smaller and smaller ones as they approach the earth, are plainly increased in size as they descend.

Mr Derham accounted for the precipitation of the drops of rain from the vesiculae being full of air, and meeting with an air colder than they contained, the air they contained was of consequence contracted into a smaller space; and consequently the watery shell rendered thicker, and thus specifically heavier, than the common atmosphere. But, under the article EVAPORATION it has been shown, that the vesiculae, if such they are, of vapour, are not filled with air, but with fire, or heat; and consequently, till they part with this latent heat, the vapour cannot be condensed. Now, cold is not always sufficient to effect this, since in the most severe frosts the air is very often serene, and parts with little or none of its vapour for a very considerable time. Neither can we admit the winds to have any considerable agency in this matter, since we find that blowing upon vapour is so far from condensing it, that it unites it more closely with the air, and wind is found to be a great promoter of evaporation.

According to Rohault, the great cause of rain is the heat of the air; which, after continuing for some time near the earth, is raised on high by a wind, and there thawing the snowy villi or flocks of half-frozen vesiculae, reduces them to drops; which, coalescing, descend. Here, however, we ought to be informed by what means these vesiculae are suspended in their half-frozen state; since the thawing of them can make but little difference in their specific gravity, and it is certain that they ascended through the air not in a frozen but in an aqueous state.

Dr Clarke and others ascribe this descent of the rain rather to an alteration of the atmosphere than of the vesiculae; and suppose it to arise from a diminution of the elastic force of the air. This elasticity, which, they say, depends chiefly or wholly upon terrene exhalations, being weakened, the atmosphere sinks under its burden, and the clouds fall. Now, the little vesicles being once upon the descent will continue therein, notwithstanding the increase of resistance they every moment meet with. For, as they all tend to the centre of the earth, the farther they fall, the more coalitions they will make; and the more coalitions, the more matter will there be under the same surface; the surface increasing only as the squares, but the

the solidity as the cubes; and the more matter under the same surface, the less resistance will there be to the same matter. Thus if the cold, wind, &c. act early enough to precipitate the ascending vesicles before they are arrived at any considerable height, the coagulations being but few, the drops will be proportionably small; and thus is formed a dew. If the vapours be more copious, and rise a little higher, we have a mist or fog. A little higher still, and they produce a small rain; if they neither meet with cold nor wind, they form a heavy thick dark sky. This hypothesis is equally unsatisfactory with the others; for, granting that the descent and condensation of the vapours are owing to a diminution of the atmosphere's elasticity, by what is this diminution occasioned? To say that it is owing to terrene exhalations, is only solving one difficulty by another; since we are totally unacquainted both with the nature and operation of these exhalations. Besides, let us suppose the cause to be what it will, if it acts equally and at once upon all the vapour in the air, then all that vapour must be precipitated at once; and thus, instead of gentle showers continuing for a considerable length of time, we would have the most violent water-spouts, continuing only for a few minutes, or perhaps seconds, which, instead of refreshing the earth, would drown and lay waste every thing before them.

Since philosophers have admitted the electric fluid to such a large share in the operations of nature, almost all the natural phenomena have been accounted for by the action of that fluid; and rain, among others, has been reckoned an effect of electricity. But this word, unless it is explained, makes us no wiser than we were before; the phenomena of artificial electricity having been explained on principles which could scarce apply in any degree to the electricity of nature: and therefore all the solution we can obtain of the natural appearances of which we speak comes to this, that rain is occasioned by a moderate electrification, hail and snow by one more violent, and thunder by the most violent of all; but in what manner this electrification is occasioned, hath not yet been explained.—Throughout the various parts of this work where electricity hath been occasionally mentioned, the principles of artificial electricity, laid down in the treatise appropriated to that subject, have been applied to the solution of the phenomena of nature; those which are necessary to be attended to here, are the following.

1. The electric fluid and solar light are the same substance in two different modifications.

2. Electricity is the motion of the fluid when running, or attempting to run, in a continued stream from one place to another: heat is when the fluid has no tendency but to vibrate outwards and inwards to and from a centre; or at least when its streams converge to a point or focus.

3. The fluid acting as electricity, like water, or any other fluid, always tends to the place where there is least resistance.

On these three principles may the phenomena of atmospherical electricity, and the descent of rain by its means, be explained as follows.

1. The light or heat of the sun, acting in that peculiar manner which we call *heat*, unites itself with the moisture of the earth, and forms it into vapour,

which thus becomes specifically lighter than air, and of consequence ascends in the atmosphere to a certain height.

2. Besides the quantity of light which is thus united to the water, and forms it into vapour, a very considerable quantity enters the earth, where it assumes the nature of electric fluid.

3. As the earth is always full of that fluid, every quantity which enters must displace an equal quantity which is already there.

4. This quantity which is displaced must escape either at a distance from the place where the other enters, or very near it.

5. At whatever place a quantity of electric matter escapes, it must electrify the air above that place where it has escaped; and as a considerable quantity of light must always be reflected from the earth into the atmosphere, where it does not combine with the aqueous vapour, we have thence another source of electricity to the air; as this quantity must undoubtedly assume the action of electric fluid, especially after the action of the sun has ceased. Hence the reason why in serene weather the atmospherical electricity is always strongest, and rather more so in the night than in the day.

6. From these considerations, we see an evident reason why there must commonly be a difference between the electricity of the earth, and that of the atmosphere, excepting when an earthquake is about to ensue. The consequence of this must be, that as the action of the solar light continues to bring down the electric matter, and the earth continues to discharge an equal quantity of it into the atmosphere, some part of the atmosphere must at last become overloaded with it, and attempt to throw it back into the earth. This attempt will be vain, until a vent is found for the electricity at some other place; and as soon as this happens, the electrified atmosphere begins to throw off its superfluous electricity, and the earth to receive it. As the atmosphere itself is a bad conductor, and the more so the drier it is, the electric matter attacks the small aqueous particles which are detained in it by means of the latent heat. These, being unable to bear the impetus of the fluid, throw out their latent heat, which easily escapes, and thus makes a kind of vacuum in the electrified part of the atmosphere. The consequences of this are, that the aqueous particles being driven together in large quantity, at last become visible, and the sky is covered with clouds; at the same time a wind blows against these clouds, and, if there is no resistance in the atmosphere, will drive them away.

7. But if the atmosphere all round the cloud is exceedingly electrified, and the earth is in no condition to receive the superfluous fluid excepting in that place which is directly under the cloud; then the whole electricity of the atmosphere for a vast way round will tend to that part only, and the cloud will be electrified to an extreme degree. A wind will now blow against the cloud from all quarters, more and more of the vapour will be extracted from the air by the electric matter, and the cloud will become darker and thicker, at the same time that it is in a manner stationary, as being acted upon by opposite winds;

Rain. winds; though its size is enlarged with great rapidity by the continual supplies of vapour brought by the winds.

8. The vapours which were formerly suspended invisibly by means of the latent heat, are now suspended visibly by the electric fluid which will not let them fall to the earth, until it is in a condition to receive the electric matter descending with the rain. It is easy to see, however, that thus every thing is prepared for a violent storm of thunder and lightning as well as rain. The surface of the earth becomes electrified from the atmosphere: but when this has continued for some time, a zone of earth considerably below the surface acquires an electricity opposite to that of the clouds and atmosphere; of consequence the electricity in the cloud being violently pressed on all sides will at last burst out towards that zone where the resistance is least, as explained under the article LIGHTNING.—The vapours now having lost that which supported them, will fall down in rain, if there is not a sufficient quantity of electric matter to keep them in the same state in which they were before: but if this happens to be the case, the cloud will instantly be charged again, while little or no rain will fall; and hence very violent thunder sometimes takes place without any rain at all, or such as is quite inconsiderable in quantity.

9. When the electricity is less violent, the rain will descend in vast quantity, especially after every flash of lightning; and great quantities of electric matter will thus be conveyed to the earth, inasmuch that sometimes the drops have been observed to shine as if they were on fire, which has given occasion to the reports of fiery rain have fallen on certain occasions. If the quantity of electric matter is smaller, so that the rain can convey it all gradually to the ground, there will be rain without any thunder; and the greater the quantity of electricity, the more violent will be the rain.

From this account of the causes of rain, we may see the reason why in warm climates the rains are excessive, and for the most part accompanied with thunder; for there the electricity of the atmosphere is immensely greater than it is with us. We may also see why in certain places, according to the situation of mountains, seas, &c. the rains will be greater than in others, and likewise why some parts of the world are exempted from rain altogether; but as a particular discussion of these would necessarily include an explanation of the causes and phenomena of THUNDER, we shall for this reason refer the whole to be treated of under that article.

*Preternatural RAINS.* We have numerous accounts, in the historians of our own as well as other countries, of preternatural rains; such as the raining of stones, of dust, of blood, nay, and of living animals, as young frogs, and the like. We are not to doubt the truth of what those who are authors of veracity and credit relate to us of this kind, so far as to suppose that the falling of stones and dust never happened; the whole mistake is, the supposing them to have fallen from the clouds: but as to the blood and frogs, it is very certain that they never fell at all, but the opinion has been a mere deception of the eyes. Men are extremely fond of the marvellous in their relations; but the judicious

reader is to examine strictly whatever is reported of this kind, and is not to suffer himself to be deceived.

There are two natural methods by which quantities of stones and dust may fall in certain places, without their having been generated in the clouds or fallen as rain. The one is by means of hurricanes; the wind which we frequently see tearing off the tiles of houses, and carrying them to considerable distances, being equally able to take up a quantity of stones, and drop them again at some other place. But the other, which is much the most powerful, and probably the most usual way, is for the eruptions of volcanoes and burning mountains to toss up, as they frequently do, a vast quantity of stones, ashes, and cinders, to an immense height in the air: and these, being hurried away by the hurricanes and impetuous winds which usually accompany those eruptions, and being in themselves much lighter than common stones as being half calcined, may easily be thus carried to vast distances; and there falling in places where the inhabitants know nothing of the occasion, they cannot but be supposed by the vulgar to fall on them from the clouds. It is well known, that, in the great eruptions of *Ætna* and *Vesuvius*, showers of ashes, dust, and small cinders, have been seen to obscure the air, and overspread the surface of the sea for a great way, and cover the decks of ships; and this at such a distance, as it should appear scarce conceivable that they should have been carried to: and probably, if the accounts, of all the showers of these substances mentioned by authors be collected, they will all be found to have fallen within such distances of volcanoes; and, if compared as to the time of their falling, will be found to correspond in that also with the eruptions of those mountains. We have known instances of the ashes from *Vesuvius* having been carried thirty, nay, forty leagues, and peculiar accidents may have carried them yet farther. It is not to be supposed that these showers of stones and dust fall for a continuance in the manner of showers of rain, or that the fragments or pieces are as frequent as drops of water; it is sufficient that a number of stones, or a quantity of dust, fall at once on a place, where the inhabitants can have no knowledge of the part from whence they came, and the vulgar will not doubt their dropping from the clouds. Nay, in the canton of *Berne* in Switzerland, the inhabitants accounted it a miracle that it rained earth and sulphur upon them, at a time that a small volcano terrified them; and even while the wind was so boisterous, and hurricanes so frequent, that they saw almost every moment the dust, sand, and little stones torn up from the surface of the earth in whirlwinds, and carried to a considerable height in the air, they never considered, that both the sulphur thrown up by the volcano, and the dust, &c. carried from their feet must fall soon after somewhere. It is very certain that in some of the terrible storms of large hail, where the hail-stones have been of many inches round, that on breaking them there have been found what people have called *stones in their middle*; but these observers needed only to have waited the dissolving of one of these hail stones, to have seen the stone in its centre dissolute also, it being only formed of the particles of loose earthy matter, which the water, exhaled by the sun's heat, had taken up in extremely small molecules with

with it; and this only having served to give an opaque hue to the inner part of the congelation, to which the freezing of the water alone gave the apparent hardness of stone.

The raining of blood has been ever accounted a more terrible sight and a more fatal omen than the other preternatural rains already mentioned. It is very certain that nature forms blood no where but in the vessels of animals, and therefore showers of it from the clouds are by no means to be credited. Those who suppose that what has been taken for blood has been actually seen falling through the air, have had recourse to flying insects for its origin, and suppose it the eggs or dung of certain butterflies discharged from them as they were high up in the air. But it seems a very wild conjecture, as we know of no butterfly whose excrements, or eggs, are of such a colour, or whose abode is so high, or their flocks so numerous, as to be the occasion of this.

It is most probable that these bloody waters were never seen falling; but that people seeing the standing waters blood-coloured, were assured, from their not knowing how it should else happen, that it had rained blood into them. A very memorable instance of this there was at the Hagut in the year 1670. Swammerdam, who relates it, tells us, that one morning the whole town was in an uproar on finding their lakes and ditches full of blood, as they thought; and having been certainly full of water the night before, they agreed it must have rained blood in the night: but a certain physician went down to one of the canals, and taking home a quantity of this blood-coloured water, he examined it by the microscope, and found that the water was water still, and had not at all changed its colour; but that it was full of prodigious swarms of small red animals, all alive, and very nimble in their motions, whose colour and prodigious number gave a red tinge to the whole body of the water they lived in, on a less accurate inspection. The certainty that this was the case, did not however persuade the Hollanders to part with the miracle: they prudently concluded, that the sudden appearance of such a number of animals was as great a prodigy as the raining of blood would have been; and are assured to this day, that this portent foretold the scene of war and destruction which Lewis XIV. afterwards brought into that country, which had before enjoyed 40 years uninterrupted peace.

The animals which thus colour the water of lakes and ponds, are the *pulices arborecentes* of Swammerdam, or the water-fleas with branched horns. These creatures are of a reddish-yellow or flame colour: they live about the sides of ditches, under weeds, and among the mud; and are therefore the less visible, except at a certain time, which is in the end or beginning of June: it is at this time that these little animals leave their recesses to float loose about the water, to meet for the propagation of their species, and by that means become visible in the colour they give the water. This is visible, more or less, in one part or other of almost all standing waters at this season; and it is always at this season that the bloody waters have alarmed the ignorant.

The raining of frogs is a thing not less wonderful in the accounts of authors who love the marvellous, than

those of blood or stones; and this is supposed to happen so often, that there are multitudes who pretend to have been eye-witnesses of it. These rains of frogs always happens after very dry seasons, and are much more frequent in the hotter countries than in the cold ones. In Italy they are very frequent; and it is not uncommon to see the streets of Rome swarming both with young frogs and toads in an instant, in a shower of rain; they hopping every where between the people's legs as they walk, though there was not the least appearance of them before. Nay, they have been seen to fall through the air down upon the pavements. This seems a strong circumstance in favour of their being rained down from the clouds; but, when strictly examined, it comes to nothing: for these frogs that are seen to fall, are always found dead, lamed, or bruised by the fall, and never hop about as the rest; and they are never seen to fall, except close under the walls of houses, from the roofs and gutters of which they have accidentally slipped down. People, who love to add to strange things yet stranger, affirm that people have had the young frogs fall into their hats in the midst of an open field; but this is idle, and wholly false.

People, who cannot agree to their falling from the clouds, have tried to solve the difficulty of their sudden appearance, by supposing them hatched out of the egg, or spawn, by these rains. Nay, some have supposed them made immediately out of the dust; but there are unanswerable arguments against all these suppositions. Equivocal generation, or the spontaneous production of animals out of dust, is now wholly exploded. The fall from the clouds must destroy and kill these tender and soft-bodied animals: and they cannot be at this time hatched immediately out of eggs; because the young frog does not make its appearance from the egg in this form, but has its hinder legs enveloped in a skin, and is what we call a tadpole; and the young frogs are at least 100 times larger at the time of their appearance, than the egg from which they should be hatched.

It is a certainty, that the frogs, which make their appearance at this time, were hatched and in being long before: but that the dry seasons had injured them, and kept them sluggishly in holes, or coverts; and that all the rain does, is the enlivening them, giving new spirits, and calling them forth to seek new habitations, and enjoy the element they were destined in great part to live in. Theophrastus, the greatest of all the naturalists of antiquity, has affirmed the same thing. We find that the error of supposing these creatures to fall from the clouds was as early as that author's time; and also that the truth, in regard to their appearance, was as early known; though, in the ages since, authors have taken care to conceal the truth, and to hand down to us the error. We find this venerable sage, in a fragment of his on the generation of animals which appear on a sudden, bantering the opinion, and asserting that they were hatched and living long before. The world owes, however, to the accurate Signior Redi the great proof of this truth, which Theophrastus only has affirmed: for this gentleman, dissecting some of these new-appearing frogs, found in their stomachs herbs and other half-digested food, and, openly showing this to his credulous countrymen,

Rain.

asked them whether they thought that nature, which engendered, according to their opinion, these animals in the clouds, had also been so provident as to engender grubs there also for their food and nourishment.

To the raining of frogs we ought to add the raining of *grasshoppers*; and *locusts*, which have sometimes appeared in prodigious numbers, and devoured the fruits of the earth. There has not been the least pretence for the supposing that these animals descended from the clouds, but that they appeared on a sudden in prodigious numbers. The naturalist, who knows the many accidents attending the eggs of these and other like animals, cannot but know that some seasons will prove particularly favourable to the hatching them, and the prodigious number of eggs that many insects lay could not but every year bring us such abundance of the young, were they not liable to many accidents, and I had not provident nature taken care, as in many plants, to continue the species by a very numerous stock of seeds, of which perhaps not one in 500 need take root in order to continue an equal number of plants. As it is thus also in regard to insects, it cannot but happen, that if a favourable season encourage the hatching of all those eggs, a very small number of which alone were necessary to continue the species, we must, in such seasons, have a proportionate abundance of them. There appeared about 40 years ago, in London, such a prodigious swarm of the little beetle we call the *lady-cow*, that the very pots in the streets were every where covered with them. But thanks to the progress of philosophy among us, we had no body to assert that it rained cow-ladies, but contented ourselves with saying that it had been a favourable season for their eggs. The prodigious number of a sort of grub which did vast mischief about the same period among the corn and grass by eating off their roots, might also have been supposed to proceed from its having rained grubs by people fond of making everything a prodigy; but our knowledge in natural history assured us, that these were only the hexapode worms of the common hedge-beetle called the *cock-chaffer*.

The raining of *fishes* has been a prodigy also much talked of in France, where the streets of a town at some distance from Paris, after a terrible hurricane in the night, which tore up trees, blew down houses, &c. were found in a manner covered with fishes of various sizes. Nobody here made any doubt of these having fallen from the clouds; nor did the absurdity of fish, of five or six inches long, being generated in the air, at all startle the people, or shake their belief in the miracle, till they found, upon inquiry, that a very well-stocked fish-pond, which stood on an eminence in the neighbourhood, had been blown dry by the hurricane, and only the great fish left at the bottom of it, all the smaller fry having been tossed into their streets.

Upon the whole, all the supposed marvellous rains have been owing to substances naturally produced on the earth, and either never having been in the air at all, or only carried thither by accident.

In Silesia, after a great dearth of wheat in that country, there happened a violent storm of wind and rain, and the earth was afterwards covered, in many places, with small round seeds. The vulgar cried out

that Providence had sent them food, and that it had rained *millet*: but these were, in reality, only the seeds of a species of veronica, or speed-well, very common in that country; and whose seeds being just ripe at that time, the wind had dislodged them from their capsules, and scattered them about. In our own country, we have histories of rains of this marvellous kind, but all fabulous. It was once said to rain *wheat* in Wiltshire, and the people were all alarmed at it as a miracle; till Mr Cole showed them, that what they took for wheat was only the seeds or kernels of the berries of ivy, which being then fully ripe, the wind had dislodged from the sides of houses, and trunks of trees, on which the ivy which produced them crept.

And we even once had a raining of fishes near the coast of Kent in a terrible hurricane, with thunder and lightning. The people who saw small sprats strewn all about afterwards, would have it that they had fallen from the clouds; but those who considered how far the high winds have been known to carry the seawater, did not wonder that they should be able to carry small fish with it so small a part of the way.

RAINBOW. See OPTICS, Part III. sect 1. § 1.

*Lunar RAINBOW*. The moon sometimes also exhibits the phenomenon of an iris, by the refraction of her rays in drops of rain in the night-time.

Aristotle says, he was the first that ever observed it; and adds, that it is never visible but at the time of full moon.

The lunar iris has all the colours of the solar, only fainter.

*Marine RAINBOW*, the *Sea-bow*, is a phenomenon sometimes observed in a much agitated sea, when the wind, sweeping part of the tops of the waves, carries them aloft; so that the rays of the sun are refracted, &c. as in a common shower.

RAISINS, grapes prepared by suffering them to remain on the vine till they are perfectly ripe, and then drying them in the sun, or by the heat of an oven. The difference between raisins dried in the sun, and those dried in ovens, is very obvious: the former are sweet and pleasant; but the latter have a latent acidity with the sweetness, that renders them much less agreeable.

The common way of drying grapes for raisins, is to tie two or three bunches of them together while yet on the vine, and dip them into a hot lixivium of wood-ashes, with a little of the oil of olives in it. This disposes them to shrink and wrinkle, and after this they are left on the vine three or four days separated on sticks in an horizontal situation, and then dried in the sun at leisure, after being cut from the tree. The finest and best raisins are those called in some places *Damascus* and *Jube raisins*; which are distinguished from the others by their size and figures: they are flat and wrinkled on the surface, soft and juicy within, and near an inch long; and, when fresh and growing on the bunch, are of the size and shape of a large olive.

The raisins of the sun, and jar-raisins, are all dried by the heat of the sun; and these are the sorts used in medicine. However, all the kinds have much the same virtues: they are all nutritive and balsamic; they are allowed to be attenuant, are said to be good in nephritic complaints, and are an ingredient in pedoral decoctions; in which cases, as also in all others

where astringency is not required of them, they should have the stones carefully taken out.

## RAISIN-WINE. See WINE.

RAKKATH, (anc. geog.) a town of Upper Galilee, thought to be Tiberias, (Talmud): but this is denied by Reland, who says that Rakkath was a town of the tribe of Naphthali.

RAKE of a SHIP, is all that part of her hull which hangs over both ends of her keel. That which is before is called the *fore-rake*, or *rake forward*; and that part which is at the setting on of the stern-post is called the *rake aft*, or *afterward*.

RALEIGH (Sir Walter), of Fardel in the parish of Cornwood in Devonshire, was born in 1552, at Hayes, in the parish of Budley, a farm belonging to his father. About the year 1568, he was sent to Oriel college in Oxford, where he continued but a short time; for in the following year he embarked for France, being one of the hundred volunteers, commanded by Henry Champernon, who, with other English troops, were sent by queen Elizabeth to assist the queen of Navarre in defending the Protestants. In this service he continued for five or six years; after which he returned to London, and probably resided in the Middle Temple. But his enterprising genius would not suffer him to remain long in a state of inactivity. In 1577 or 1578, he embarked for the Low Countries with the troops sent by the queen to assist the Dutch against the Spaniards, and probably shared the glory of the decisive victory over Don John of Austria in 1578. On his return to England, a new enterprise engaged his attention. His half-brother, Sir Humphrey Gilbert, having obtained a patent to plant and inhabit some parts of North America, Mr Raleigh embarked in this adventure; but, meeting with a Spanish fleet, after a smart engagement they returned, without success, in 1579.

The following year, the king of Spain, in conjunction with the pope, having projected a total conquest of the English dominions, sent troops to Ireland to assist the Desmond's in the Munster rebellion. Raleigh obtained a captain's commission under Lord Grey of Wilton, then deputy of Ireland, and embarked for that kingdom; where, by his conduct and resolution, he was principally instrumental in putting an end to the rebellious attempt. He returned to England; and attracted the notice of queen Elizabeth, on the following occasion, as we are told in Naunton's *Fragmenta Regalia*. It seems, as the queen was one day taking a walk, being stopped by a *plashy* place in the road, our gallant young soldier took off his new plush mantle, and spread it on the ground. Her majesty trod gently over the fair foot-cloth, surprised and pleased with the adventure.

The queen employed him first as an attendant on the French ambassador Simier on his return home, and afterward to escort the duke of Anjou to Antwerp. During this excursion he became personally known to the prince of Orange; from whom, at his return, he brought special acknowledgments to the queen, who now frequently conversed with him. But the inactive life of a courtier did not suit the enterprising spirit of Mr Raleigh. In the year 1583, he embarked with his brother, Sir Humphrey Gilbert, on a second expedition to Newfoundland, in a ship called the *Raleigh*, which he built at his own expence; but was obliged

to return, on account of an infectious distemper on board. He was, however, so little affected by this disappointment, that he now laid before the queen and council a proposal for exploring the continent of North America, and in 1584 obtained a patent empowering him to possess such countries as he should discover in that part of the globe. Accordingly Mr Raleigh fitted out two ships at his own expence, which sailed in the month of April, and returned to England about the middle of September, reporting that they had discovered and taken possession of a fine country called *Windangocoos*, to which the queen gave the name of *Virginia*. About this time he was elected knight of the shire for the county of Devon, and soon after received the honour of knighthood; and to enable him to carry on his designs abroad, the queen granted him a patent for licensing the venders of wine throughout the kingdom. In 1685 he sent a fleet of seven ships to Virginia, commanded by his relation Sir Richard Greenville, who left a colony at Roanah of 107 persons, under the government of Mr Lane. In the same year Sir Walter Raleigh obtained a grant of 12,000 acres of the forfeited lands in the county of Corke in Ireland. About the same time he was made seneschal of the duchy of Cornwall, and warden of the stannaries; and grew into such favour with the queen, that even Leicester was jealous of his influence.

In 1587, he sent another colony of 150 men to Virginia, with a governor, Mr John White, and 12 assistants. About this time we find our knight distinguished by the titles of *Captain of the queen's guards*, and *Lieutenant-general of Cornwall*. From this period to the year 1594, he was continually engaged in projecting new expeditions, sending succours to colonies abroad, defending the kingdom from the insults of the Spaniards, and transacting parliamentary business, with equal ability and resolution. Whilst thus employed, he was publicly charged, in a libel written by the infamous Jesuit Parsons, with being an Atheist; a groundless and ridiculous imputation. In 1594, he obtained from the queen a grant of the manor of Sherborne in Dorsetshire, where he built a magnificent house: but Sir Walter fell under the queen's displeasure on account of an intrigue with the daughter of Sir Nicholas Throgmorton, one of the maids of honour; however, he married the lady, and lived with her in great conjugal harmony. During his disgrace at court, he projected the conquest of Guiana in South America, and in 1595 failed for that country; of which having taken possession, after defeating the Spaniards who were settled there, he returned to England the same year, and soon after published an account of his expedition. In the following year he was one of the admirals in the successful expedition against Cadiz, under the command of Howard and the earl of Essex; and in 1597 he failed with the same commanders against the Azores. Soon after these expeditions, we find him assiduously engaged in parliamentary business, and a distinguished personage in jousts and tournaments. In 1600 he was sent on a joint embassy with Lord Cobham to Flanders, and at his return made governor-of-Jersey.

Queen Elizabeth died in the beginning of the year 1603; and with her Raleigh's glory and felicity sunk, never to rise again. Her successor James was an enemy to every species of virtue and heroism. He was

Raleigh,  
Rallus.

scarce seated on the throne, before this valuable subject was stripped of his preferments, tried, and condemned for high treason: but after a month's imprisonment, in daily expectation of his execution, he was reprieved, and sent to the Tower; and his estates were given to Car, earl of Somerset, the king's favourite. During this confinement he wrote many of his most valuable pieces, particularly his History of the World. In March 1615, after 16 years imprisonment, he obtained his liberty, and immediately began to prepare for another voyage to Guiana. In August 1616, the king granted him a very ample commission for that purpose; and in July, the year following, he sailed from Plymouth: but, strange as it may appear, it is most certain, that the whole scheme was revealed to the Spaniards by the king himself, and thus necessarily rendered abortive.

He returned to England in 1618; where he was soon after seized, imprisoned, and beheaded, not for any pretended misdemeanor on the late expedition, but in consequence of his former attainder. The truth of the matter is, he was sacrificed by the pusillanimous monarch to appease the Spaniards; who, whilst Raleigh lived, thought every part of their dominions in danger. He was executed in Old Palace Yard, and buried in St Margaret's adjoining, in the 66th year of his age. He was a man of admirable parts, extensive knowledge, undaunted resolution, and strict honour and honesty. He was the author of a great many works, some of which have not been printed.

**RALLUS**, the **RAIL**, in ornithology; a genus belonging to the order of grallæ. The beak is thickest at the base, compressed, equal, acute, and somewhat sharp on the back near the point; the nostrils are oval; the feet have four toes, without any web; and the body is compressed. There are 10 species, principally distinguished by their colour. The most remarkable are,

1. The aquaticus, or water-rail, is a bird of a long slender body, with short concave wings. It delights less in flying than running; which it does very swiftly along the edges of brooks covered with bushes: as it runs, it every now and then flirts up its tail, and in flying hangs down its legs; actions it has in common with the water-hen. Its weight is four ounces and a half. The length to the end of the tail is 12 inches: the breadth 16. The bill is slender, slightly incurved, one inch three quarters long: the upper mandible black, edged with red; the lower, orange-coloured: the head, hind part of the neck, the back, and coverts of the wings and tail, are black, edged with an olive brown; the throat, breast, and upper part of the belly, are ash-coloured: the sides under the wings as far as the rump, finely varied with black and white bars. The tail is very short, consists of 12 black feathers; the ends of the two middle tips with rust colour; the feathers immediately beneath the tail white. The legs are placed far behind, and are of a dusky flesh-colour. The toes very long, and divided to their very origin; though the feet are not webbed, it takes the water; will swim on it with much ease, but is often observed to run along the surface.

2. The porzana, or gallinule, is not very frequent in Great Britain, and is said to be migratory. Inhabits the sides of small streams, concealing itself among

the bushes. Its length is nine inches; its breadth, 15; its weight, four ounces five drachms. The head is brown, spotted with black; the neck a deep olive, spotted with white: the feathers of the back are black next their shafts, then olive-coloured, and edged with white: the scapulars are olive, finely marked with two small white spots on each web: the legs of a yellowish green.

3. The crex, crake, or corn-crake, has been supposed by some to be the same with the water-rail, and that it differs only by a change of colour at a certain season of the year: this error is owing to inattention to their characters and nature, both which differ entirely. The bill of this species is short, strong, and thick; formed exactly like that of the water-hen, and makes a generic distinction. It never frequents watery places; but is always found among corn, grass, broom, or furze. It quits the kingdom before winter; but the water-rail endures our sharpest seasons. They agree in their aversion to flight; and the legs, which are remarkably long for the size of the bird, hang down whilst they are on the wing; they trust their safety to their swiftness on foot, and seldom are sprung a second time but with great difficulty. The land rail lays from 12 to 20 eggs, of a dull white colour, marked with a few yellow spots; notwithstanding this, they are very numerous in this kingdom. Their note is singular, resembling the word *crex* often repeated. They are in greatest plenty in Anglesea, where they appear about the 20th of April, supposed to pass over from Ireland, where they abound: at their first arrival it is common to shoot seven or eight in a morning. They are found in most of the Hebrides, and the Orkneys. On their arrival they are very lean, weighing only six ounces; but before they leave this island, grow so fat as to weigh above eight. The feathers on the crown of the head and hind-part of the neck, are black, edged with bay colour: the coverts of the wings of the same colour, but not spotted; the tail is short, and of a deep bay: the belly white; the legs ash-coloured.

**RALPH** (James), a late ingenious historical and political writer, was born, we know not when nor where, being first known as a school-master in Philadelphia in North America. He came to England about the beginning of the reign of George I. and wrote some things in the dramatic way, which were not received with great applause: but though he did not succeed as a poet, he was a very ingenious prose-writer. He wrote A History of England, commencing with the Stuarts, which is much esteemed; as were his political essays and pamphlets, some of which were looked upon as master-pieces. His last publication, The Cafe of Authors by profession, is an excellent and entertaining performance. He died in 1762.

**RAM**, in zoology. See **Ovis**.

**Battering Ram**, in antiquity, a military engine used to batter down the walls of besieged places. See **BATTERING Ram**.

**RAM's Head**, in a ship, is a great block belonging to the fore and main halliards. It has three thives in it, in which the halliards are put; and in a hole at the end are reeved the ties.

**RAMADAN**, a solemn season of fasting among the Mahometans. See **MAHOMETANISM**.

Ramadan.

**Ramah** RAMAH (anc. geog.), a town of Benjamin, near Gibeon, (Judges); called *Rama of Saul* (1 Sam. xxii.), six miles from Jerusalem to the north; memorable for the story of the Levite and his concubine: Taken and fortified by Baasa king of Israel, in order to annoy the kingdom of Judah. This Rama is mentioned Isa. x. Jer. xxxi. and Matth. ii. and is to be distinguished from *Rama of Samuel*, 1 Sam. ix. called also *Ramatha*, 1 Sam. i. 19. and *Ramathaim Zophim*, ibid. i. 1. which lay a great way to the west, towards Joppa, near Lydda, 1 Maccab. ii. the birth-place of Samuel; adjoining to the mountains of Ephraim, and the place of his residence, 1 Sam. xv. &c. (Josephus.) Called *Ramula* in the lower age, (Gul. Tyrius.)

**RAMATH-MIZPE**, (Joshua xiii.); *Ramoth-Maspha*, (Septuagint, Vulgate); *Ramoth in Gilead*, or *Remath Galaad*, (Seventy); a town in that tract of Gilead called *Maspha*, or *Mispe*, one of the cities of refuge.

**RAMAZZINI** (Bernardin), an Italian physician, born at Carpi near Modena in 1633. He was professor of physic in the university of Modena for 18 years; and in 1700 accepted an invitation from Padua, where he was made rector of the college; and died in 1714. His works were collected and published in London, 1716; of which, his treatise *De Morbis Artificum*, "Of the peculiar maladies of artificers," will always be esteemed useful and curious.

**RAMESES**, (anc. geog.); a town built by the Israelites during their bondage in Egypt, and from which the exodus took place, and which must have been towards and not far from the Arabian Gulph, seeing in the third station the Israelites arrived on its shore.

**RAMESES**, king of the Lower Egypt when Jacob went thither with his family, in the 1706th year before the Christian era. Ancient authors mention several other kings of Egypt of the same name; and it is thought that one of those princes erected in the temple of the sun at Thebes, the magnificent obelisk which the emperor Constantine caused to be removed to Alexandria in the year 334, and that prince dying, his son Constantius had the obelisk transported from Alexandria to Rome in 352, where it was erected in the grand Circus. Its height was 132 feet. When the Goths sacked the city of Rome in 409, they overthrew this obelisk, which continued buried in the sand till the time of Sixtus V. in 1587, when it was found broken in three pieces, which being joined together, set up in the square of St John de Lateran. On the four sides of this wonderful obelisk are a number of figures and hieroglyphical characters, which, according to the explication of Ammianus Marcellinus, contain the praises of Rameses.

**RAMIFICATION**, the production of boughs or branches, or of figures resembling branches.

**RAMMER**, an instrument used for driving down stones or piles into the ground; or for beating the earth, in order to render it more solid for a foundation.

**RAMMER of a Gun**, the *Gun-stick*; a rod used in charging of a gun, to drive home the powder, as also the shot, and the wad, which keeps the shot from rolling out.

**RAMPANT**, in heraldry, a term applied to a lion,

or other beast that stands on its hind legs, and rears up his fore-feet in the posture of climbing, showing only half his face, as one eye, &c. It is differed from saliant, in which the beast seems springing forward as if making a fall.

**RAMPART**, in fortification, is an elevation of earth round a place capable of resisting the cannon of an enemy; and formed into bastions, curtains, &c.

**RAMPHASTOS**, in ornithology, a genus belonging to the order of picæ. The bill is very large, convex, and serrated outwardly; the nostrils are situated behind the base of the beak; the feet in most species are toed. There are eight species; of which the most remarkable is the toucan, whose bill is almost as large as the rest of its body. There are four or five varieties, but we shall only describe that which has a red beak. This is about the size of a jack-daw, and shaped like that bird, with a large head to support its monstrous bill: this bill, from the angles of the mouth to its point, is six inches and an half; and its breadth, in the thickest part, is a little more than two. Its thickness near the head, is one inch and a quarter; and it is a little rounded along the top of the upper chap, the under side being round also; the whole of the bill extremely slight, and a little thicker than parchment. The upper chap is of a bright yellow, except on each side, which is of a fine scarlet colour; as is also the lower chap, except at the base, which is purple. Between the head and the bill there is a black line of separation all round the base of the bill; in the upper part of which the nostrils are placed, and are almost covered with feathers; which has occasioned some writers to say, that the toucan has no nostrils. Round the eyes, on each side of the head, is a space of bluish skin, void of feathers; above which the head is black, except a white spot on each side joining to the base of the upper chap. The hinder part of the neck, the back, wings, tail, belly, and thighs, are black. The under side of the head, throat, and the beginning of the breast, are white. Between the white on the breast, and the black on the belly, is a space of red feathers, in the form of a new moon, with its horns upwards. The legs, feet, and claws, are of an ash-colour; and the toes stand like those of parrots, two before, and two behind.

It is reported by travellers, that this bird, though furnished with so formidable a beak, is harmless and gentle, being so easily made tame, as to sit and hatch its young in houses. It feeds chiefly upon pepper, which it devours very greedily, gorging itself in such a manner, that it voids it crude and uncooked. This, however, is no objection to the natives from using it again: they even prefer it before that pepper which is fresh gathered from the tree; and seem persuaded that the strength and heat of the pepper is qualified by the bird, and that all its noxious qualities are thus exhausted.

Whatever be the truth of this report, nothing is more certain than that the toucan lives only upon a vegetable diet; and, in a domestic state, to which it is frequently brought in the warm countries where it is bred, it is seen to prefer such food to all other. Pozzo, who bred one tame, asserts, that it leaped up and down, wagged the tail, and cried with a voice resembling that of a magpie. It fed upon the same things

Rampart,  
Ramp-  
fast.

Ramphos,  
Ramfsden's.

things that parrots do; but was most greedy of grapes, which, being plucked off one by one, and thrown in the air, it would most dextrously catch before they fell to the ground. Its bill, he adds, was hollow, and upon that account very light, so that it had but little strength in so apparently formidable a weapon; nor could it peck or strike smartly therewith. But its tongue seemed to assist the efforts of this unwieldy machine: it was long, thin, and flat, not unlike one of the feathers on the neck of a dunghill cock; this it moved up and down, and often extended five or six inches from the bill. It was of a flesh colour, and remarkably fringed on each side with very small filaments, exactly resembling a feather.

It is probable that this long tongue has greater strength than the thin hollow beak that contains it. It is likely that the beak is only a kind of sheath for this peculiar instrument, used by the toucan, not only in making itself a nest, but also in obtaining its provision. Nothing is more certain, than that this bird builds its nest in holes of trees, which have been previously scooped out for this purpose; and it is not very likely that so feeble a bill could be very serviceable in working upon such hard materials.

Be this as it will, there is no bird secures its young better from external injury than the toucan. It has not only birds, men, and serpents, to guard against; but a numerous tribe of monkeys, still more prying, mischievous, and hungry, than all the rest. The toucan, however, scoops out its nest into the hollow of some tree, leaving only a hole large enough to go in and out at. There it fits, with its great beak, guarding the entrance; and, if the monkey ventures to offer a visit of curiosity, the toucan gives him such a welcome, that he presently thinks proper to pack off, and is glad to escape with safety.

This bird is only found in the warm climates of South America, where it is in great request, both for the delicacy of its flesh, which is tender and nourishing, and for the beauty of its plumage, particularly the feathers of the breast. The skin of this part the Indians pluck off, and, when dry, glue to their cheeks; and this they consider as an irrefragible addition to their beauty.

RAMSDEN'S ENGINE for Dividing MATHEMATICAL INSTRUMENTS, is a late invention by which these divisions can be performed with exceeding great accuracy, such as would formerly have been deemed incredible. On a discovery of the method of constructing this machine, its inventor, Mr Ramsden of Piccadilly, received 65 l. from the commissioners of longitude; engaging himself to instruct a certain number of persons, not exceeding ten, in the method of making and using this machine from the 28th October 1775, to 28th October 1777: also binding himself to divide all octants and sextants by the same engine, at the rate of three shillings for each octant, and six shillings for each brass sextant, with Nonius's divisions to half minutes, for as long time as the commissioners should think proper to let the engine remain in his possession. Of this sum of 65 l. paid to Mr Ramsden, 300 l. was given him as a reward for the improvement made by him in discovering the engine, and the remaining 35 l. for his giving up the property of it to the commissioners. The following description of the engine, is

that given upon oath by Mr Ramsden himself.

"This engine consists of a large wheel of bell-metal, supported on a mahogany stand, having three legs, which are strongly connected together by braces, so as to make it perfectly steady. On each leg of the stand is placed a conical friction-pully, whereon the dividing-wheel rests: to prevent the wheel from sliding off the friction-pullies, the bell-metal centre under it turns in a socket on the top of the stand.

"The circumference of the wheel is ratched or cut (by a method which will be described hereafter) into 2160 teeth, in which an endless screw acts. Six revolutions of the screw will move the wheel a space equal to one degree.

"Now a circle of brass being fixed on the screw arbor, having its circumference divided into 60 parts, each division will consequently answer to a motion of the wheel of 10 seconds, six of them will be equal to a minute, &c.

"Several different arbors of tempered steel are truly ground into the socket in the centre of the wheel. The upper parts of the arbors that stand above the plane are turned of various sizes, to suit the centres of different pieces of work to be divided.

"When any instrument is to be divided, the centre of it is very exactly fitted on one of these arbors; and the instrument is fixed down to the plane of the dividing wheel by means of screws, which fit into holes made in the radii of the wheel for that purpose.

"The instrument being thus fitted on the plane of the wheel, the frame which carries the dividing-point is connected at one end by finger-screws with the frame which carries the endless screw; while the other end embraces that part of the steel arbor, which stands above the instrument to be divided, by an angular notch in a piece of hardened steel: by this means both ends of the frame are kept perfectly steady and free from any shake.

"The frame carrying the dividing-point or tracer, is made to slide on the frame which carries the endless screw to any distance from the centre of the wheel as the radius of the instrument to be divided may require, and may be there fastened by tightening two clamps; and the dividing-point or tracer being connected with the clamps by the double jointed frame, admits a free and easy motion towards or from the centre for cutting the divisions, without any lateral shake.

"From what has been said, it appears, that an instrument thus fitted on the dividing-wheel may be moved to any angle by the screw and divided circle on its arbor, and that this angle may be marked on the limb of the instrument with the greatest exactness by the dividing-point or tracer, which can only move in a direct line tending to the centre, and is altogether freed from those inconveniences that attend cutting by means of a straight edge. This method of drawing lines will also prevent any error that might arise from an expansion or contraction of the metal during the time of dividing.

"The screw frame is fixed on the top of a conical pillar, which turns freely round its axis, and also moves freely towards or from the centre of the wheel, so that the screw-frame may be entirely guided by the frame which connects it with the centre: by this means any eccentricity of the wheel and the arbor would not

Ramfden's Engine. produce any error in the dividing; and, by a particular contrivance, (which will be described hereafter,) the screw when pressed against the teeth of the wheel always moves parallel to itself; so that a line joining the centre of the arbor and the tracer continued, will always make equal angles with the screw.

Figure 1. represents a perspective view of the engine.

Fig. 2. is a plan, of which fig. 3. represents a section on the line AA.

The large wheel A is 45 inches in diameter, and has ten radii, each being supported by edge-bars, as represented in fig. 3. These bars and radii are connected by the circular ring B, 24 inches in diameter, and 3 deep; and, for greater strength, the whole is cast in one piece in bell-metal.

As the whole weight of the wheel A rests on its ring B, the edge-bars are deeper where they join it; and from thence their depth diminishes, both towards the centre and the circumference, as represented in fig. 3.

The surface of the wheel A was worked very even and flat, and its circumference turned true. The ring C, of fine brass, was fitted very exactly on the circumference of the wheel; and was fastened thereon with screws, which, after being screwed as tight as possible, were well riveted. The face of a large chuck being turned very true and flat in the lathe, the flattened surface A of the wheel was fastened against it with hold-falls; and the two surfaces and circumference of the ring C, a hole through the centre and the plane part round (b) it, and the lower edge of the ring B, were turned at the same time.

D is a piece of hard bell-metal, having the hole, which receives the steel-arbor (d), made very straight and true. This bell-metal was turned very true on an arbor; and the face, which rests on the wheel at (b), was turned very flat, so that the steel arbor (d) might stand perpendicular to the plane of the wheel: this bell-metal was fastened to the wheel by six steel screws (l).

A brass socket Z is fastened on the centre of the mahogany stand, and receives the lower part of the bell-metal piece D, being made to touch the bell-metal in a narrow part near the mouth, to prevent any obliquity of the wheel from bending the arbor: good fitting is by no means necessary here; since any shake in this socket will produce no bad effect, as will appear hereafter when we describe the cutting frame.

The wheel was then put on its stand, the lower edge of the ring B resting on the circumference of three conical friction pulleys W, to facilitate its motion round its centre. The axis of one of these pulleys is in a line joining the centre of the wheel and the middle of the endless screw, and the other two placed so as to be at equal distances from each other.

F is a block of wood strongly fastened to one of the legs of the stand; the piece (g) is screwed to the upper side of the block, and has half holes, in which the transverse axis (h) turns: the half holes are kept together by the screws (i).

The lower extremity of the conical pillar P terminates in a cylindrical steel pin (k), which passes through and turns in the transverse axis (h), and is confined by a check and screw.

To the upper end of the conical pillar is fastened the frame G, in which the endless screw turns: the pivots

of the screw are formed in the manner of two frustrums of cones joined by a cylinder, as represented at X. These pivots are confined between half poles, which press only on the conical parts, and do not touch the cylindrical parts: the half holes are kept together by screws (a), which may be tightened at any time, to prevent the screw from flaking in the frame.

On the screw arbor is a small wheel of brass K, Fig. 1, 2, having its outside edge divided into 60 parts, and 45 numbered at every 6th division with 1, 2, &c. to 10. The motion of this wheel is shewn by the index (y) on Fig. 4 and 5. the screw frame G.

H represents a part of the stand, having a parallel slit in the direction towards the centre of the wheel, large enough to receive the upper part of the conical brass pillar P, which carries the screw and its frame: and as the resistance, when the wheel is moved by the endless screw, is against that side of the slit H which is towards the left-hand, that side of the slit is faced with brass, and the pillar is pressed against it by a steel spring on the opposite side: by this means the pillar is strongly supported laterally, and yet the screw may be easily pressed from or against the circumference of the wheel, and the pillar will turn freely on its axis to take any direction given it by the frame L.

At each corner of the piece I are screws (n) of tempered steel, having polished conical points: two of them turn in conical holes in the screw-frame near (o), and the points of the other two screws turn in holes in the piece Q; the screws (p) are of steel, which being tightened prevent the conical pointed screws from unturning when the frame is moved.

L is a brass frame, which serves to connect the endless screw, its frame, &c. with the centre of the wheel: each arm of this frame is terminated by a steel screw, that may be passed through any of the holes (q) in the piece Q, as the thickness of work to be divided on the wheel may require, and are fastened by the finger-nuts (r).

At the other end of this frame is a flat piece of tempered steel (b), wherein is an angular notch: when the endless screw is pressed against the teeth on the circumference of the wheel, which may be done by turning the finger-screw S, to press against the spring (t), this notch embraces and presses against the steel arbor (d). This end of the frame may be raised or depressed by moving the prismatic slide (u), which may be fixed at any height by the four steel-screws (v).

The bottom of this slide has a notch (k), whose plane is parallel to the endless-screw; and by the point of the arbor (d) resting in this notch, this end of the frame is prevented from tilting. The screw S is prevented from unturning by tightening the finger-nut (w).

The teeth on the circumference of the wheel were cut by the following method.

Having considered what number of teeth on the circumference would be most convenient, which in this engine is 2160, or 360 multiplied by 6, I made two screws of the same dimensions, of tempered steel, in the manner hereafter described, the interval between the threads being such as I knew by calculation would come within the limits of what might be turned off the circumference of the wheel: one of these screws,

which

CCLVII.

which was intended for ratching or cutting the teeth, was notched across the threads, so that the screw, when pressed against the edge of the wheel and turned round, cut in the manner of a saw. Then having a segment of a circle a little greater than 60 degrees, of about the same radius with the wheel, and the circumference made true, from a very fine centre, I described an arch near the edge, and set off the chord of 60 degrees on this arch. This segment was put in the place of the wheel, the edge of it was ratched, and the number of revolutions and parts of the screw contained between the interval of the 60 degrees were counted. The radius was corrected in the proportion of 360 revolutions, which ought to have been in 60 degrees, to the number actually found; and the radius, so corrected, was taken in a pair of beam-compasses: while the wheel was on the lath, one foot of the compasses was put in the centre, and with the other a circle was described on the ring; then half the depth of the threads of the screw being taken in dividers was set from this circle outwards, and another circle was described cutting this point; a hollow was then turned on the edge of the wheel of the same curvature as that of the screw at the bottom of the threads: the bottom of this hollow was turned to the same radius or distance from the centre of the wheel, as the outward of the two circles before-mentioned.

Fig. 3. "The wheel was now taken off the lath; and the bell-metal piece D was screwed on as before directed, which after this ought not to be removed.

Fig. 4, 2, 3. "From a very exact centre a circle was described on the ring C, about  $\frac{1}{20}$  of an inch within where the bottom of the teeth would come. This circle was divided with the greatest exactness I was capable of, first into 5 parts, and each of these into 3. These parts were then bisected 4 times: (that is to say) supposing the whole circumference of the wheel to contain 2160 teeth, this being divided into 5 parts, each would contain 432 teeth; which being divided into 3 parts, each of them would contain 144; and this space bisected 4 times would give 72, 36, 18, and 9: therefore each of the last divisions would contain 9 teeth. But, as I was apprehensive some error might arise from quinquesection and trisection, in order to examine the accuracy of the divisions, I described another circle on the ring C,  $\frac{1}{20}$  inch within the former, and divided it by continual bisections, as 2160, 1080, 540, 270, 135, 67 $\frac{1}{2}$ , and 33 $\frac{1}{2}$ ; and, as the fixed wire (to be described presently) crossed both the circles, I could examine their agreement at every 135 revolutions; (after ratching, could examine it at every 33 $\frac{1}{2}$ ): but, not finding any sensible difference between the two sets of divisions, I, for ratching, made choice of the former; and, as the coincidence of the fixed wire with an interfection could be more exactly determined than with a dot or division, I therefore made use of interfections in both circles before described.

Fig. 7. "The arms of the frame L were connected by a thin piece of brass of  $\frac{1}{4}$  of an inch broad, having a hole in the middle of  $\frac{1}{10}$  of an inch in diameter; across this hole a silver wire was fixed exactly in a line to the centre of the wheel; the coincidence of this wire with the interfections was examined by a lens  $\frac{1}{10}$  inch focus,

fixed in a tube which was attached to one of the arms L (A). Now a handle or winch being fixed on the end of the screw, the division marked 10 on the circle K was set to its index, and, by means of a clamp and adjusting screw for that purpose, the interfection marked 1 on the circle C was set exactly to coincide with the fixed wire; the screw was then carefully pressed against the circumference of the wheel, by turning the finger-screw S; then, removing the clamp, I turned the screw by its handle 9 revolutions, till the interfection marked 240 came nearly to the wire; then, unturning the finger-screw S, I released the screw from the wheel, and turned the wheel back till the interfection marked 2 exactly coincided with the wire, and, by means of the clamp before-mentioned, the division 10 on the circle being set to its index, the screw was pressed against the edge of the wheel by the finger-screw S; the clamps were removed, and the screw turned 9 revolutions till the interfection marked 1 nearly coincided with the fixed wire; the screw was released from the wheel by unturning the finger-screw S as before, the wheel was turned back till the interfection 3 coincided with the fixed wire; the division 10 on the circle being set to its index, the screw was pressed against the wheel as before, and the screw was turned 9 revolutions, till the interfection 2 nearly coincided with the fixed wire, and the screw was released; and I proceeded in this manner till the teeth were marked round the whole circumference of the wheel. This was repeated three times round, to make the impression of the screw deeper. I then ratched the wheel round continually in the same direction without ever disengaging the screw; and, in ratching the wheel about 300 times round, the teeth were finished.

Ramfsden's  
Engine.

"Now it is evident, if the circumference of the wheel was even one tooth or ten minutes greater than the screw would require, this error would in the first instance be reduced to  $\frac{1}{10}$  part of a revolution or two seconds and a half; and these errors or inequalities of the teeth were equally distributed round the wheel at the distance of 9 teeth from each other. Now, as the screw in ratching had continually hold of several teeth at the same time, and, these constantly changing, the abovementioned inequalities soon corrected themselves, and the teeth were reduced to a perfect equality. The piece of brass which carries the wire was now taken away, and the cutting screw was also removed, and a plain one (hereafter described) put in its place: on one end of the screw is a small brass circle, having its edge divided into 60 equal parts, and numbered at every sixth division, as before-mentioned. On the other end of the screw is a ratchet-wheel C, having 60 teeth, covered by the hollowed circle (d), which carries two clicks that catch upon the opposite sides of the ratchet when the screw is to be moved forwards. The cylinder S turns on a strong steel arbor F, which passes through and is firmly screwed to the piece Y: this piece, for greater firmness, is attached to the screw-frame G by the braces (v): a spiral groove or thread is cut on the outside of the cylinder S, which serves both for holding the string, and also giving motion to the lever J on its centre by means of a steel tooth (u), that works

(B) The interfections are marked for the sake of illustration, though properly invisible, they lying under the brass plate.

Ramsden's Engine.  
 PL CCLV Plate CCLVI & CCLVII.  
 Fig. 1.  
 Fig. 2.

works between the threads of the spiral. To the lever is attached a strong steel pin (m), on which a brass socket (r) turns: this socket passes thro' a slit in the piece (p), and may be tightened in any part of the slit by the finger-nut (f): this piece serves to regulate the number of revolutions of the screw for each tread of the treadle R.

Fig. 3.  
 Fig. 4.

"T, is a brass box containing a spiral spring; a strong gut is fastened and turned 3 or 4 times round the circumference of this box; the gut then passes several times round the cylinder S, and from thence down to the treadle R. Now, when the treadle is pressed down, the string pulls the cylinder S round its axis, and the clicks catching hold of the teeth on the ratchet carry the screw round with it, till, by the tooth (n) working in the spiral groove, the lever J is brought near the wheel (d), and the cylinder stopped by the screw-head (x) striking on the top of the lever J; at the same time the spring is wound up by the other end of the gut passing round the box T. Now, when the foot is taken off the treadle, the spring unbending itself pulls back the cylinder, the clicks leaving the ratchet and screw at rest till the piece (t) strikes on the end of the piece (p): the number of revolutions of the screw at each tread is limited by the number of revolutions the cylinder is allowed to turn back before the flop strikes on the piece (p).

Fig. 5.  
 Fig. 6.

"When the endless screw was moved round it axis with a considerable velocity, it would continue that motion a little after the cylinder S was stopped: to prevent this the angular lever  $\alpha$  was made; that when the lever J comes near to flop the screw (x), it, by a small chamfer, presses down the piece  $\alpha$  of the angular lever; this brings the other end  $\beta$  of the same lever forwards, and stops the endless screw by the steel pin  $\mu$  striking upon the top of it: the foot of the lever is raised again by a small spring pressing on the brace (v).

Fig. 7, 8, 9.

"D, two clamps, connected by the piece  $z$ , slide one on each arm of the frame L, and may be fixed at pleasure by the four finger-screws  $t$ , which press against steel springs to avoid spoiling the arms: the piece (q) is made to turn without shake between the two conical pointed screws (f), which are preventing from unturning by tightening the finger-nuts N.

Fig. 10.

"The piece M is made to turn on the piece (q), by the conical pointed screws (f) resting in the hollow centers (e).

"As there is frequent occasion to cut divisions on inclined planes, for that purpose the piece  $\gamma$ , in which the tracer is fixed, has a conical axis at each end, which turn in half holes: when the tracer is set to any inclination, it may be fixed there by tightening the steel screws  $\beta$ .

*Description of the Engine by which the endless screw of the Dividing Engine was cut.*

"Fig. 9. represents this engine of its full dimensions seen from one side.

"Fig. 8. the upper side of the same as seen from above.

"A, represents a triangular bar of steel, to which the triangular holes in the pieces B and C are accurately fitted, and may be fixed on any part of the bar by the screws D.

"E is a piece of steel whereon the screw is intended  
 VOL. IX.

to be cut; which, after being hardened and tempered, has its pivots turned in the form of two frustrums of cones, as represented in the drawings of the dividing engine (fig. 5). These pivots were exactly fitted to the half holes F and T, which were kept together by the screws Z.

"H, represents a screw of untempered steel, having a pivot I, which turns in the hole K. At the other end of the screw is a hollow centre, which receives the hardened conical point of the steel pin M. When this point is sufficiently pressed against the screw, to prevent its shaking, the steel pin may be fixed by tightening the screws Y.

"N is a cylindrical nut, moveable on the screw H; which, to prevent any shake, may be tightened by the screws O. This nut is connected with the fiddle-piece P by means of the intermediate universal joint W, thro' which the arbor of the screw H passes. A front view of this piece, with a section across the screw-arbor, is represented at X. This joint is connected with the nut by means of two steel slips S, which turn on pins between the cheeks T on the nut N. The other ends of these slips S turn in like manner on pins (a). One axis of this joint turns in a hole in the cock (b), which is fixed to the fiddle-piece; and the other turns in a hole (d), made for that purpose in the same piece on which the cock (b) is fixed. By this means, when the screw is turned round, the fiddle-piece will slide uniformly along the triangular bar A.

"K is a small triangular bar of well-tempered steel, which slides in a groove of the same form on the fiddle-piece P. The point of this bar or cutter is formed to the shape of the thread intended to be cut on the endless screw. When the cutter is set to take proper hold of the intended screw, it may be fixed by tightening the screw (c), which presses the two pieces of brass G upon it.

"Having measured the circumference of the dividing-wheel, I found it would require a screw about one thread in a hundred coarser than the guide-screw H. The wheels on the guide-screw arbor H, and that on the steel E, on which the screw was to be cut, were proportioned to each other to produce that effect, by giving the wheel L 198 teeth, and the wheel Q 200. These wheels communicated with each other by means of the intermediate wheel R, which also served to give the threads on the two screws the same direction.

"The fiddle-piece P is confined on the bar A by means of the pieces (g), and may be made to slide with a proper degree of tightness by the screws (n).

RAMSDEN'S Portable Barometer. See BAROMETER in the APPENDIX.

RAMSAY (Allan), the Scots pastoral poet, was a barber in Edinburgh in the early part of the present century. His taste in poetry, however, has justly raised him to a degree of fame that may in some measure be considered as a recompence for the frowns of fortune. His songs are in universal esteem; as is also the only dramatic performance attributed to him, viz. *Pattie and Roger*, or *The Gentle Shepherd*, a Scots pastoral. He died in 1743; and was father to the ingenious Mr Ramsay, a celebrated painter of the present age, and who has likewise distinguished himself by some well-written tracts on various branches

Ramsden's Engine, Ramsay.

||  
Rana.

of polite literature, particularly the *Investigator*.'

RAMSAY (Andrew Michael), generally known by the name of the *Chevalier Ramsay*, was a polite Scots writer, born of a good family at Ayre, in 1686. His good parts and learning recommended him to be tutor to the son of the earl of Weems; after which, conceiving a disgust at the religion in which he had been educated, he in the same ill-humour reviewed other Christian churches; and, finding none to his liking, rested for a while in Deism. While he was in this uncertain state of mind, he went to Leyden; where, falling into the company of one Poirat a mystic divine, he received the infection of mysticism: which prompted him to consult M. Fenelon, the famed archbishop of Cambray, who had imbibed principles of the same nature; and who gained him over to the Catholic religion in 1709. The subsequent course of his life received its direction from his friendship and connections with this prelate; and, being appointed governor to the duke de Chateau Thierry, and the prince de Turenne, he was made a knight of the order of St Lazarus. He was sent for to Rome by the chevalier de St George, to undertake the education of his children; but he found so many intrigues and dissensions on his arrival there in 1724, that he obtained the Chevalier's leave to return to Paris. He died in 1743, in the office of intendant to the duke of Bouillon, prince de Turenne. The most capital work of his writing is the *Travels of Cyrus*, which has been several times printed in English.

RAMUS, in general, denotes a branch of any thing, as of a tree, an artery, &c.

RAMUS (Peter), was one of the most famous professors of the 16th century. He was born in Picardy in 1515. A thirst for learning prompted him to go to Paris when very young, and he was admitted a servant in the college of Navarre. Spending the day in waiting on his masters, and the greatest part of the night in study, he made such surprising progress, that when he took his master of arts degree, he offered to maintain a quite opposite doctrine to that of Aristotle. This raised him many enemies; and the two first books he published, *Institutiones Dialecticæ*, and *Aristotelicæ Animadversiones*, occasioned great disturbances in the university of Paris; and the opposition against him was not a little heightened by his deserting the Romish religion, and professing that of the Reformed. Being thus forced to retire from Paris, he visited the universities of Germany, and received great honours wherever he came. He returned to France in 1571, and lost his life miserably in the massacre of St Bartholomew's day. He was a great orator, a man of universal learning, and endowed with very fine moral qualities. He published many books, which Teissier enumerates.

RANA, the FROG, in zoology, a genus belonging to the order of amphibia reptilia. The body is naked, furnished with four feet, and without any tail. There are 17 species. The most remarkable are,

1. The temporaria, or common frog. This is an animal so well known, that it needs no description; but some of its properties are very singular.

Its spring, or power of taking large leaps, is remarkably great, and it is the best swimmer of all four-footed animals. Nature hath finely adapted its parts

for those ends, the fore members of the body being very lightly made, the hind legs and thighs very long, and furnished with very strong muscles.

While in a tadpole state, it is entirely a water animal; the work of generation is performed in that element, as may be seen in every pond during spring, when the female remains oppressed by the male for a number of days.

The work of propagation is extremely singular, it being certain that the frog has not a *penis intrans*. There appears a strong analogy in this case between a certain class of the vegetable kingdom and those animals; for it is well known, that when the female frog deposits its spawn, the male instantaneously impregnates it with what we may call a *farina secundans*, in the same manner as the palm tree-conveys fructification to the flowers of the female, which would otherwise be barren.

As soon as the frogs are released from their tadpole state, they immediately take to land; and if the weather has been hot, and there fall any refreshing showers, you may see the ground for a considerable space perfectly blackened by myriads of these animals, seeking for some secure lurking places. Some philosophers, not giving themselves time to examine into this phenomenon, imagined them to have been generated in the clouds, and showered on the earth; but had they, like our Derham, but traced them to the next pool, they would have found a better solution of the difficulty.

As frogs adhere closely to the backs of their own species, so we know they will do the same by fish. Walton mentions a strange story of their destroying pike; but that they will injure, if not entirely kill carp, is a fact indisputable, from the following relation. A very few years ago, on fishing a pond belonging to Mr Pit, of Encomb, Dorsetshire, great numbers of the carp were found each with a frog mounted on it, the hind legs clinging to the back, and the fore legs fixed in the corner of each eye of the fish, which were thin and greatly wadded, teized by carrying so disagreeable a load. These frogs Mr Pennant supposes to have been males disappointed of a mate.

The croaking of frogs is well known; and from that in fenny countries they are distinguished by ludicrous titles: thus they are styled *Dutch nightingales*, and *Boston walters*.

Yet there is a time of the year when they become mute, neither croaking nor opening their mouths for a whole month: this happens in the hot season, and that is in many places known to the country people by the name of the *padding moon*. It is said, that during that period their mouths are so closed, that no force (without killing the animal) will be capable of opening them.

These, as well as other reptiles, feed but a small space of the year. The food of this genus is flies, insects, and snails. Toads are said to feed also on bees, and to do great injury to those useful insects.

During winter, frogs and toads remain in a torpid state: the last of which will dig into the earth, and cover themselves with almost the same agility as the mole.

2. The esculenta, or edible frog, differs from the former, in having a high protuberance in the middle

of the back, forming a very sharp angle. Its colours are also more vivid, and its marks more distinct; the ground colour being a pale or yellowish green, marked with rows of black spots from the head to the rump. This, and (Mr Pennant thinks) the former, are eaten. He has seen in the markets at Paris whole hampers full, which the venders were preparing for the table, by skinning and cutting off the fore-parts, the loins and legs only being kept; but his strong dislike to these reptiles, prevented a close examination into the species.

3. In the country of Pennsylvania, and some other parts of North America, there is a very large species of frogs called the *bull-frog*. These make a monstrous roaring noise like a bull, only somewhat more hoarse. Their size is superior to that of any other of the genus, and they can spring forward three yards at a leap. By this means they will equal in speed a very good horse in its swiftest course. Their places of abode are ponds, or bogs with stagnant water; but they never frequent streams. When many of them are together, they make such a horrid noise, that two people cannot understand each other's speech. They croak all together, and then stop for a little and begin again. It seems as if they had a captain among them: for when he begins to croak, all the others follow; and when he stops, they also become silent. When this captain gives the signal for stopping, you hear a note like *poop* coming from him. In the day-time they seldom make any great noise unless the sky is covered; but in the night-time they may be heard at the distance of a mile and an half. When they croak, they are commonly near the surface of the water, under the bushes, and have their heads out of the water. By going slowly, therefore, one may get up almost quite close to them before they go away. As soon as they are quite under water, they think themselves safe, though it be ever so shallow. These creatures kill and eat young ducklings and goslings, and sometimes carry off chickens that come too near the water; when beaten, they cry out almost like little children. As soon as the air begins to grow a little cool in autumn, they hide themselves under the mud in the bottom of stagnant waters, and lie there torpid during the winter. As soon as the weather grows mild towards summer, they begin to get out of their holes and croak.

4. The *bufo*, or toad, is the most deformed and hideous of all animals. The body is broad; the back flat, and covered with a pimply dusky hide; the belly large, swagging, and swelling out; the legs short, and its pace laboured and crawling; its retreat gloomy and filthy: in short, its general appearance is such as to strike one with disgust and horror. Yet it is said by those who have resolution to view it with attention, that its eyes are fine: to this it seems that Shakespeare alludes, when he makes his Juliet remark,

Some say the lark and loathed toad change eyes:

As if they would have been better bedfellowed on so charming a songster than on this raucous reptile.

But the hideous appearance of the toad is such as to make this one advantageous feature overlooked, and to have rendered it in all ages an object of horror, and the origin of most tremendous inventions. Ælian makes its venom so potent, that basilisk-like, it conveyed death by its very look and breath; but Juve-

nal is content with making the Roman ladies who were weary of their husbands, form a potion from its entrails, in order to get rid of the good man. This opinion begat others of a more dreadful nature; for in after-times superstition gave it preternatural powers, and made it a principal ingredient in the incantations of nocturnal hags.

This animal was believed by some old writers to have a stone in its head, fraught with great virtues medical and magical: it was distinguished by the name of the reptile, and called the *toad-stone*, *bufoniter*, *crapaudine*, *krottenfeij*; but all its fancied powers vanished on the discovery of its being nothing but the fossil tooth of the sea-wolf\*, or of some other flat-toothed fish, not unfrequent in our island as well as several other countries.

But these fables have long exploded. And as to the notion of its being a poisonous animal, it is probable, that its excessive deformity, joined to the faculty it has of emitting a juice from its pimples, and a dusky liquid from its hind parts, is the foundation of the report.

That it has any noxious qualities there seem to have been no proofs in the smallest degree satisfactory, tho' we have heard many strange relations on that point. On the contrary, there have been many who have taken them in their naked hands, and held them long without receiving the least injury: it is also well known that quacks have eaten them, and have besides squeezed their juices into a glass and drank them with impunity. We may say also, that these reptiles are a common food to many animals; to buzzards, owls, Norfolk plovers, ducks, and snakes, who would not touch them were they in any degree noxious.

So far from having venomous qualities, they have of late been considered as if they had beneficent ones; particularly in the cure of the most terrible of diseases, the cancer, by suction: (See *British Zoology*, vol. iii. Append. p. 389. *et seq.*) But, from all circumstances, they seem only, as Mr Pennant observes, to have rendered a horrible complaint more loathsome.

The most full information concerning the nature and qualities of this animal is contained in the following letters from Mr Arcott and Mr Pittfield to Dr Milles. "It would give me great pleasure (says Mr Arcott) to be able to inform you of any particulars worthy Mr Pennant's notice, concerning the toad who lived so many years with us, and was so great a favourite. The greatest curiosity in it was its becoming so remarkably tame. It had frequented some steps before the hall-door some years before my acquaintance commenced with it, and had been admired by my father for its size (which was of the largest I ever met with), who constantly paid it a visit every evening. I knew it myself above 30 years; and by constantly feeding it, brought it to be so tame, that it always came to the candle, and looked up as if expecting to be taken up and brought upon the table, where I always fed it with insects of all sorts: it was fond of flesh maggots, which I kept in bran; it would follow them, and, when within a proper distance, would fix its eye, and remain motionless for near a quarter of a minute, as if preparing for the stroke, which was an instantaneous throwing its tongue at a great distance upon the insect, which stuck to the tip by a glut-

\* See *A-nars-bicor.*

Rans. glutinous matter: the motion is quicker than the eye can follow (A).

"I always imagined that the root of its tongue was placed in the forepart of its under jaw, and the tip towards its throat, by which the motion must be a half circle; by which, when its tongue recovered its situation, the insect at the tip would be brought to the place of deglutition. I was confirmed in this by never observing any internal motion in its mouth, excepting one swallow the instant its tongue returned. Possibly I might be mistaken; for I never dissected one, but contented myself with opening its mouth, and slightly inspecting it.

"You may imagine, that a toad, generally detested, (although one of the most inoffensive of all animals) so much taken notice of and befriended, excited the curiosity of all comers to the house, who all desired to see it fed; so that even ladies so far conquered the horrors infilled into them by nurses, as to desire to see it. This produced innumerable and improbable reports, making it as large as the crown of a hat, &c. &c."

The following are answers from the same gentleman to some queries proposed by Mr Pennant.

"*First*, I cannot say how long my father had been acquainted with the toad before I knew it; but when I first was acquainted with it, he used to mention it as the old toad I've known so many years; I can answer for 36 years.

"*Secondly*, No toads that I ever saw appeared in the winter season. The old toad made its appearance as soon as the warm weather came, and I always concluded it retired to some dry bank to repose till the spring. When we new-lay'd the steps, I had two holes made in the third step on each, with a hollow of more than a yard long for it, in which I imagine it slept, as it came from thence at its first appearance.

"*Thirdly*, It was seldom provoked: neither that toad (nor the multitudes I have seen tormented with great cruelty) ever showed the least desire of revenge by spitting or emitting any juice from their pimples. Sometimes, upon taking it up, it would let out a great quantity of clear water, which, as I have often seen it do the same upon the steps when quite quiet, was cer-

tainly its urine, and no more than a natural evacuation.

"*Fourthly*, A toad has no particular enmity for the spider; he used to eat five or six with his millepedes (which I take to be its chief food) that I generally provided for it before I found out that flesh maggots, by their continual motion, was the most tempting bait; but, when offered, it eat blowing flies and humble bees that come from the rat-tailed maggot in gutters, or in short any insect that moved. I imagine, if a bee was to be put before a toad, it would certainly eat it to its cost; but as bees are seldom stirring at the same time that toads are, they can seldom come in their way, as they seldom appear after sun-rising or before sun-set. In the heat of the day they will come to the mouth of their hole, I believe, for air. I once from my parlour window observed a large toad I had in the bank of a bowling-green, about 12 at noon, a very hot day, very busy and active upon the grass; so uncommon an appearance made me go out to see what it was, when I found an innumerable swarm of winged ants had dropped round his hole, which temptation was as irresistible as a turtle would be to a luxurious alderman.

"*Fifthly*, Whether our toad ever propagated its species, I know not; rather think not, as it always appeared well, and not lessened in bulk, which it must have done, I should think, if it had discharged so large a quantity of spawn as toads generally do. The females that are to propagate in the spring, I imagine, instead of retiring to dry holes, go into the bottom of ponds, and lie torpid among the weeds: for to my great surprize, in the middle of the winter, having for amusement put a long pole into my pond, and twisted it till it had gathered a large volume of weed, on taking it off I found many toads; and having cut some asunder with my knife, by accident, to get off the weed, found them full of spawn not thoroughly formed. I am not positive, but think there were a few males in March: I know there are 30 males (a) to one female, 12 or 14 of whom I have seen clinging round a female: I have often disengaged her, and put her to a solitary male, to see with what eagerness he would seize her. They impregnate the spawn as it is drawn (c) out in long strings, like a necklace, many yards

(A) This rapid capture of its prey might give occasion to the report of its fascinating powers, Linnæus says, *Insesta in fauces fascino revocat*.

(B) Mr John Hunter has assured me, that during his residence at Belleisle, he dissected some hundreds of toads, yet never met with a single female among them.

(C) I was incredulous as to the *obstetrical* offices of the male toad; but since the end is so well accounted for, and the fact established by such good authority, belief must take place.

Mr Demours, in the Memoirs of the French Academy, as translated by Dr Templeman, vol. i. p. 371, has been very particular in respect to the male toad as acting the part of an *accoucheur*; his account is curious, and claims a place here.

"In the evening of one of the long days in summer, Mr Demours, being in the king's garden, perceived two toads coupled together at the edge of an hole, which was formed in part by a great stone at the top.

"Curiosity drew him to see what was the occasion of the motions he observed, when two facts equally new surprized him. The *first* was the extreme difficulty the female had in laying her eggs, inasmuch that she did not seem capable of being delivered of them without some assistance. The *second* was, that the male was mounted on the back of the female, and exerted all his strength with his hinderfeet in pulling out the eggs, whilst his fore-feet embraced her breast.

"In order to apprehend the manner of his working in the delivery of the female, the reader must observe, that the paws of these animals, as well those of the fore-feet as of the hinder, are divided into several toes, which can perform the office of fingers.

"It must be remarked likewise, that the eggs of this species of toads are included each in a membranous coat that is very firm, in which is contained the embryo; and that these eggs, which are oblong and about two lines in length, being fastened one to another by a short but very strong cord, form a kind of chaplet, the beads of which are distant from each other about the half of their length. It is by drawing this cord with his paw that the male performs the function of a midwife, and acquits himself in it with a dexterity that one would not expect from so lumpy an animal.

Rana. yards long, not in a large quantity of jelly, like frogs spawn.

“ Sixthly, Insects being their food, I never saw any toad show any liking or dislike to any plant (D).

“ Seventhly, I hardly remember any persons taking it up except my father and myself: I do not know whether it had any particular attachment to us.

“ Eighthly, In respect to its end, I answer this last query. Had it not been for a tame raven, I make no doubt but it would have been now living; who one day seeing it at the mouth of its hole, pulled it out, and although I refused it, pulled out one eye, and hurt it so, that notwithstanding its living a twelvemonth it never enjoyed itself, and had a difficulty of taking its food, missing the mark for want of its eye: before that accident, it had all the appearance of perfect health.”

5. The rubeta, or natter-jack, frequents dry and sandy places: it is found on Putney common, and also near Revels by abbey, Lincolnshire. It never leaps, neither does it crawl with the flow pace of a toad, but its motion is liker to running. Several are found commonly together, and, like others of the genus, they appear in the evenings. The upper part of the body is of a dirty yellow, clouded with brown, and covered with porous pimples of unequal sizes: on the back is a yellow line. The upper side of the body is of a paler hue, marked with black spots, which are rather rough. On the fore-feet are four divided toes; on the hind five, a little webbed. The length of the body is two inches and a quarter; the breadth, one and a quarter: the length of the fore-legs, one inch one-sixth; of the hind-legs, two inches. We are indebted to Joseph Banks, Esq; for this account.

7. The pipal, or Surinam toad, is more ugly than even the common one. The body is flat and broad; the head small; the jaws, like those of a mole, are extended, and evidently formed for rooting in the ground: the skin of the neck forms a sort of wrinkled collar: the colour of the head is of a dark chestnut, and the eyes are small: the back, which is very broad, is of a lightish grey, and seems covered over with a number of small eyes, which are round, and placed at nearly equal distances. These eyes are very different from what they seem; they are the animal's eggs, covered with their shells, and placed there for hatching. These eggs are buried deep in the skin, and in the beginning of incubation but just appear; and are very visible when the young animal is about to burst from its confinement. They are of a reddish, shining yellow colour; and the spaces between them are full of small warts, resembling pearls.

This is their situation previous to their coming forth; but nothing so much demands our admiration as the manner of their production. The eggs, when formed

in the ovary, are sent, by some internal canals, which anatomists have not hitherto described, to lie and come to maturity under the bony substance of the back: in this state they are impregnated by the male, whose seed finds its way by pores very singularly contrived, and pierces not only the skin but the perioleum: the skin, however, is still apparently entire, and forms a very thick covering over the whole brood; but as they advance to maturity, at different intervals, one after another, the egg seems to start forward, and burgesons from the back, becomes more yellow, and at last breaks; when the young one puts forth its head: it still, however, keeps its situation until it has acquired a proper degree of strength, and then it leaves the shell, but still continues to keep upon the back of the parent. In this manner the pipal is seen travelling with her wonderful family on her back, in all the different stages of maturity. Some of the strange progeny, not yet come to sufficient perfection, appear quite torpid, and as yet without life in the egg: others seem just beginning to rise through the skin; others peeping forth from the shell; and there, having entirely forsaken their prison: some are sporting at large upon the parent's back, and others descending to the ground to try their own fortune below. The male pipal is every way larger than the female, and has the skin less tightly drawn round the body. The whole body is covered with pustules, resembling pearls; and the belly, which is of a bright yellow, seems as if it were sewed up from the throat to the vent, a seam being seen to run in that direction. This animal, like the rest of the frog kind, is most probably harmless.

RANCID, denotes a fatty substance that is become rank or milty, or that has contracted an ill smell by being kept close.

RANDOLPH (Thomas), an eminent English poet in the 17th century, born in Northamptonshire 1605. He was educated at Westminster and Cambridge, and very early distinguished for his excellent genius; for at about nine or ten years of age he wrote the History of the Incarnation of our Saviour, in verse. His subsequent writings established his character, and gained him the esteem and friendship of some of the greatest men of that age; particularly of Ben Johnson, who adopted him one of his sons in the muses. He died in 1634, and was honourably interred. He wrote, 1. The Muses Looking-glass, a comedy. 2. Amynas, or the Impossible Dowry, a pastoral, acted before the king and queen. 3. Aristippus, or the Jovial Philosopher. 4. The Conceited Pedlar. 5. The Jealous Lovers, a comedy. 6. Hey for Honesty, down with Knavery, a comedy; and several poems.

RANDOM SHOT, in gunnery, is a shot made when the muzzle of a gun is raised above the horizontal line, and is not designed to shoot directly or point-blank.

The

“ The presence of the observer did not a little discompose the male: for some time he stopped short, and threw on the *curious impertinent* a fixed look that marked his disquietness and fear; but he soon returned to his work with more precipitation than before, and a moment after he appeared undetermined whether he should continue it or not. The female likewise discovered her uneasiness at the sight of the stranger, by motions that interrupted sometimes the male in his operation. At length, whether the silence and steady posture of the spectator had dissipated their fear, or that the *case* was urgent, the male resumed his work with the same vigour, and successfully performed his function.”

(D) This question arose from an assertion of Linnæus, that the toad delighted in filthy herbs. *Delectatur cotula, adæva, Æaclyde festivi.* The unhappy deformity of the animal seems to be the only ground of this as well as another misrepresentation, of its conveying a poison with its pimples, its touch, and even its breath. *Verruce lactescentes: venenata infusa tactu, anhelitu.*

Rana  
||  
Random.

Range  
Ranunculus.

The utmost random of any piece is about ten times as far as the bullet will go point-blank. The bullet will go farthest when the piece is mounted to about 45° above the level range. See GUNNERY.

**RANGE**, in gunnery, the path of a bullet, or the line it describes from the mouth of the piece to the point where it lodges. If the piece lie in a line parallel to the horizon, it is called the *right or level range*; if it be mounted to 45°, it is said to have the utmost range, all others between 00 and 45° are called the *intermediate ranges*.

**RANGER**, a sworn officer of a forest, appointed by the king's letters-patent; whose business is to walk through his charge, to drive back the deer out of the parishes, &c. and to prevent all trespasses within his jurisdiction at the next forest-court.

**RANK**, the order or place assigned a person suitable to his quality or merit.

**RANK**, is a straight line made by the soldiers of a battalion, or squadron, drawn up side by side: this order was established for the marches, and for regulating

the different bodies of troops and officers which compose an army.

**RANK and Precedence**, in the army and navy, as follows:

**Engineers RANK**. Chief, as colonel; director, as lieutenant-colonel; sub-director, as major; engineer in ordinary, as captain; engineer extraordinary, as captain-lieutenant; sub-engineer, as lieutenant; practitioner-engineer, as ensign.

**Navy RANK**. Admiral, or commander in chief of his majesty's fleet, has the rank of a field-marshal; admirals, with their flags on the main-top-mast-head, rank with generals of horse and foot; vice-admirals, with lieutenant-generals; rear-admirals, as major-generals; commodores, with broad pendants, as brigadier-generals; captains of post-ships, after three years from the date of their first commission, as colonels; other captains, as commanding post-ships, as lieutenant-colonels; captains, not taking post, as majors; lieutenants, as captains.

Rank,  
Ranunculus.

RANK between the Army, Navy, and Governors.

ARMY.	NAVY.	GOVERNORS.
General in chief	Admiral in chief	Commander in chief of the forces in America
Generals of horse	Admiral with a flag at the main-top-mast.	Captain-general of provinces
Lieutenant-generals	Vice-admirals	Lieutenant-generals of provinces
Major-generals	Rear-admirals	Lieutenant-governors and presidents
Colonels	Post-captains of 3 years	Lieutenant-governors not commanding
Lieutenant-colonels	Post-captains	Governors of charter colonies
Majors	Captains	Deputy governors
Captains	Lieutenants	Established by the king, 1760

*Doubling of the RANKS*, is the placing two ranks in one, frequently used in the manoeuvres of a regiment.

**RANKS and Files**, are the horizontal and vertical lines of soldiers when drawn up for service.

**RANSOM**, a sum of money paid for the redemption of a slave, or the liberty of a prisoner of war. In our law-books, ransom is also used for a sum paid for the pardon of some great offence, and to obtain the offender's liberty.

**RANULA**, a tumour under a child's tongue, which, like a ligature, hinders it from speaking or sucking.

**RANUNCULUS**, crowfoot; a genus of the polygama order, belonging to the polyandria class of plants.

*Species*. There are near 40 different species of this genus, six or eight of which claim general esteem as flowery plants for ornamenting the gardens, and a great number are common weeds in the fields, waters, and pasture ground, not having merit for garden culture. Of the garden kinds, the principal sort is the Asiatic or Turkey and Persian ranunculus, which com-

prises many hundred varieties of large, double, most beautiful flowers of various colours: but several other species having varieties with fine double flowers, make a good appearance in a collection, though as those of each species consist only of one colour, some white, others yellow, they are inferior to the Asiatic ranunculus, which is large, and diversified a thousand ways in rich colours, in different varieties. However, all the garden kinds in general, effect a very agreeable diversity in assemblage in the flower compartments, &c. and they being all very hardy, succeed in any open beds and borders, &c.

*Culture*. The Asiatic species in all its varieties will succeed in any light, rich, garden earth; but the florists often prepare a particular compost for the fine varieties, consisting of good garden-mould or pasture-earth, sward and all, a fourth-part of rotted cow-dung, and the like portion of sea-sand; and with this they prepare beds four feet wide and two deep: however, in default of such compost, the beds of any good light earth of your garden; or, if necessary, it may be made light and rich with a portion of drift-sand and

Ranunculus.

and rotten dung, cow-dung is most commonly recommended; but they will also thrive in beds of well-wrought kitchen-garden earth, and they often prosper well in the common flower-borders.

The season for planting the roots is both in autumn and spring; the autumn plantings generally flower strongest and soonest by a month at least, and are succeeded by the spring planting in May and June. Perform the autumnal planting in October, and early part of November, but some plant towards the latter end of September in order to have a very early bloom; but those planted in that month and beginning of October often come up with rank leaves soon after, in winter, so as to require protection in hard frosts; those however planted about the middle or latter end of October, and beginning of November, rarely shoot up strong till towards spring, and will not require so much care of covering during winter; and the spring planting may be performed the end of January or beginning of February, or as soon as the weather is settled; they will not require any trouble of covering, and will succeed the autumnal plants regularly in bloom, and will flower in good perfection. Thus by two or three different plantings you may obtain a succession of these beautiful flowers in constant bloom from April till the middle of June; but the autumnal plants, for the general part, not only flower strongest, but the roots increase more in size, and furnish the best off-sets for propagation: it is, however, proper to plant both in spring and autumn.

Prepare for the choicer sorts, four-foot beds of light earth, and rake the surface smooth: then plant the roots in rows lengthwise the beds, either by drilling them in two inches deep, and six inches distance in the row, and the rows six or eight asunder; or may plant them by bedding-in, or by dibble-planting, the same depth and distance.

Those designed for the borders should be planted generally towards the spring, in little clumps or patches, three, four, or five roots in each, putting them in either with a dibble or trowel, two or three inches deep, and three or four asunder in each patch, and the patches from about three to five or ten feet distance, placing them rather forward in the border.

*Propagation.* All the varieties of the Asiatic ranunculus propagate abundantly by off-sets from the roots, and new varieties are gained by seed.—1. By off-sets. The time for separating the off-sets is in summer when the flower is past, and the leaves and stalks are withered: then taking up all the roots in dry weather, separate the off-sets from each main root, and after drying the whole gradually in some shady airy room, put them up in bags till the autumn and spring seasons of planting; then plant them as before, placing all the off-sets in separate beds: many of them will blow the first year, but in the second they will all flower in good perfection.—2. By seed. Save a quantity of seed from the finest semi-double flowers, and sow it either in August, or in March or April, though, to save trouble of winter-covering, some prefer the spring: it should be sowed in light rich mould, either in pots or in an east border, drawing very shallow flat drills five or six inches asunder, in which sow the seeds thinly, and cover them lightly with earth, giving frequent refreshments of water in dry weather,

and in a month or six weeks the plants will rise with small leaves; observing to continue the light waterings in dry weather, to preserve the soil moist during their summer's growth to increase the size of the roots; and in June when the leaves decay, take up the roots and preserve them till the season for planting, then plant them in common beds, as before directed, and they will flower the spring following, when all the doubles of good properties should be marked, and the singles thrown away.

The juice of many species of ranunculus is so acrid as to raise blisters on the skin, and yet the roots may be eaten with safety when boiled.

RAPACIOUS ANIMALS, are such as live upon prey.

RAPE, in law, the carnal knowledge of a woman forcibly and against her will. This, by the Jewish law, was punished with death, in case the damsel was betrothed to another man: and, in case she was not betrothed, then a heavy fine of fifty shekels was to be paid to the damsel's father, and she was to be the wife of the ravisher all the days of his life; without that power of divorce, which was in general permitted by the Mosaic law.

The civil law punishes the crime of ravishment with death and confiscation of goods: under which it includes both the offence of forcible abduction, or taking away a woman from her friends; and also the present offence of forcibly dishonouring her; either of which, without the other, is in that law sufficient to constitute a capital crime. Also the stealing away a woman from her parents or guardians, and debauching her, is equally penal by the emperor's edict, whether she consent or is forced. And this, in order to take away from women every opportunity of offending in this way; whom the Roman laws suppose never to go astray, without the seduction and arts of the other sex; and therefore, by restraining and making so highly penal the solicitations of the men, they meant to secure effectually the honour of the women. But our English law does not entertain quite such sublime ideas of the honour of either sex, as to lay the blame of a mutual fault upon one of the transgressors only; and therefore makes it a necessary ingredient in the crime of rape, that it must be against the woman's will.

Rape was punished by the Saxon laws, particularly those of king Athelstan, with death: which was also agreeable to the old Gothic or Scandinavian constitution. But this was afterwards thought too hard: and in its stead another severe, but not capital, punishment was inflicted by William the Conqueror, viz. castration and loss of eyes; which continued till after Bracon wrote, in the reign of Henry the Third. But in order to prevent malicious accusations, it was then the law, (and, it seems, still continues to be so in appeals of rape), that the woman should, immediately after, go to the next town, and there make discovery to some credible persons of the injury she has suffered; and afterwards should acquaint the high constable of the hundred, the coroners, and the sheriff, with the outrage. This seems to correspond in some degree with the laws of Scotland and Arragon, which require that complaint must be made within 24 hours: though afterwards by statute Westm. 1. c. 13. the time of limitation in England

Rapacious, Rape.

Rape. England was extended to 40 days. At present there is no time of limitation fixed: for, as it is usually now punished by indictment at the suit of the king, the maxim of law takes place, that "nullum tempus occurrit regi:" but the jury will rarely give credit to a stale complaint. During the former period also it was held for law, that the woman (by consent of the judge and her parents) might redeem the offender from the execution of his sentence, by accepting him for her husband; if he also was willing to agree to the exchange, but not otherwise.

In the 3 Edw. I. by the statute Westm. 1. c. 13. the punishment of rape was much mitigated: the offence itself, of ravishing a damsel within age, (that is, twelve years old) either with her consent or without, or of any other woman against her will, being reduced to a trespass, if not prosecuted by appeal within 40 days, and subjecting the offender only to two years imprisonment, and a fine at the king's will. But, this lenity being productive of the most terrible consequences, it was, in ten years afterwards, 13 Edw. I. found necessary to make the offence of forcible rape felony by statute Westm. 2. c. 34. And by statute 18 Eliz. c. 7. it is made felony without benefit of clergy: as is also the abominable wickedness of carnally knowing or abusing any woman child under the age of ten years; in which case the consent or non-consent is immaterial, as by reason of her tender years she is incapable of judgment and discretion. Sir Matthew Hale is indeed of opinion, that such profligate actions committed on an infant under the age of twelve years, the age of female discretion by the common law, either with or without consent, amount to rape and felony; as well since as before the statute of queen Elizabeth: but that law has in general been held only to extend to infants under ten; tho' it should seem that damsels between ten and twelve are still under the protection of the statute Westm. 1. the law with respect to their seduction not having been altered by either of the subsequent statutes.

A male infant, under the age of fourteen years, is presumed by law incapable to commit a rape, and therefore it seems cannot be found guilty of it. For though in other felonies "malitia supplet setatem;" yet, as to this particular species of felony, the law supposes an imbecillity of body as well as mind.

The civil law seems to suppose a prostitute or common harlot incapable of any injuries of this kind: not allowing any punishment for violating the chastity of her, who hath indeed no chastity at all, or at least hath no regard to it. But the law of England does not judge so hardly of offenders, as to cut off all opportunity of retreat even from common strumpets, and to treat them as never capable of amendment. It therefore holds it to be felony to force even a concubine or harlot; because the woman may have forsaken that unlawful course of life: for, as Bracton well observes, "licet meretrix fuerit antea, certe tunc temporis non fuit, cum reclamando nequitia ejus consentire noluit."

As to the material facts requisite to be given in evidence and proved upon an indictment of rape, they are of such a nature, that, though necessary to be known and settled, for the conviction of the guilty

and preservation of the innocent, and therefore are to be found in such criminal treatises as discourse of these matters in detail, yet they are highly improper to be publicly discussed, except only in a court of justice. We shall therefore merely add upon this head a few remarks from Sir Matthew Hale, with regard to the competency and credibility of witnesses; which may, *salvo pudore*, be considered.

And, first, the party ravished may give evidence upon oath, and is in law a competent witness; but the credibility of her testimony, and how far forth she is to be believed, must be left to the jury upon the circumstances of fact that concur in that testimony. For instance: if the witness be of good fame; if she presently discovered the offence, and made search for the offender; if the party accused fled for it; and the like are concurring circumstances, which give greater probability to her evidence. But, on the other side, if she be of evil fame, and stand unsupported by others; if she concealed the injury for any considerable time after she had opportunity to complain; if the place, where the fact was alleged to be committed, was where it was possible she might have been heard, and she made no outcry: these and the like circumstances carry a strong, but not conclusive, presumption that her testimony is false or feigned.

Morcover, if the rape be charged to be committed on an infant under 12 years of age, she may still be a competent witness, if she hath sense and understanding to know the nature and obligations of an oath: and, even if she hath not, it is thought by Sir Matthew Hale that she ought to be heard without oath, to give the court information; though that alone will not be sufficient to convict the offender. And he is of this opinion, first, Because the nature of the offence being secret, there may be no other possible proof of the actual fact; though afterwards there may be concurrent circumstances to corroborate it, proved by other witnesses: and, secondly, Because the law allows what the child told her mother, or other relations, to be given in evidence, since the nature of the case admits frequently of no better proof; and there is much more reason for the court to hear the narration of the child herself, than to receive it at second-hand from those who swear they heard her say so. And indeed, it seems now to be settled, that in these cases infants of any age are to be heard; and, if they have any idea of an oath, to be also sworn: it being found by experience, that infants of very tender years often give the clearest and truest testimony. But in any of these cases, whether the child be sworn or not, it is to be wished, in order to render her evidence credible, that there should be some concurrent testimony, of time, place, and circumstances, in order to make out the fact; and that the conviction should not be grounded singly on the unsupported accusation of an infant under years of discretion. There may be therefore, in many cases of this nature, witnesses who are competent, that is, who may be admitted to be heard; and yet, after being heard, may prove not to be credible, or such as the jury is bound to believe. For one excellence of the trial by jury is, that the jury are triors of the credit of the witnesses, as well as of the truth of the fact.

"It is true, (says this learned judge), that rape is

Raphael  
||  
Raphanus.

“ a most detestable crime, and therefore ought severely and impartially to be punished with death; but it must be remembered, that it is an accusation easy to be made, hard to be proved, but harder to be defended by the party accused, though innocent.” He then relates two very extraordinary cases of malicious prosecution for this crime, that had happened within his own observation; and concludes thus: “ I mention these instances, that we may be the more cautious upon trials of offences of this nature, where in the court and jury may with so much ease be imposed upon, without great care and vigilance; and the heinousness of the offence many times transporting the judge and jury with so much indignation, that they are overhastily carried to the conviction of the person accused thereof, by the confident testimony of sometimes false and malicious witnesses.”

RAPHAEL D'URBINO, the greatest, most sublime, and most excellent painter that has appeared since the revival of the fine arts, was the son of an indifferent painter named *Sanzio*, and was born at Urbino on Good Friday 1482. The pope Julius II. and Leo X. who employed him, loaded him with wealth and honour; and it is said that cardinal de St Bibiana had such a value for him, that he offered him his niece in marriage. He had Peter Perugino for his first master; but he immediately surpassed him, and endeavoured to improve by copying the works of Leonardo da Vinci and Michael Angelo. His genius is admired in all his pictures; his contours are free, his ordonnances magnificent, his designs correct, his figures elegant, his expressions lively, his attitudes natural, his heads graceful; in fine, every thing is beautiful, grand, sublime, just, and adorned with graces. These various perfections he derived not only from his excellent abilities, but from his study of antiquity and anatomy; and from the friendship he contracted with Ariosto, who contributed not a little to the improvement of his taste. His pictures are principally to be found in Italy and Paris. That of the Transfiguration, preserved at Rome in the church of St Peter Monterio, passes for his master-piece. He had a handsome person, was well proportioned, and had great sweetness of temper; was polite, affable, and modest. He, however, lived in the utmost splendor; most of the eminent masters of his time were ambitious of working under him; and he never went out without a crowd of artists and others, who followed him purely through respect. He was not only the best painter in the world, but perhaps the best architect too; on which account Leo X. charged him with building St Peter's church at Rome: but he was too much addicted to pleasure, which occasioned his death at 37 years of age. He left a great number of disciples; among whom were Julio Romano, and John Francis Penni, who were his heirs. Many able engravers, as Raibondi, George Mantuan, and Bloemart, engraved after Raphael.

RAPHAIM, or REPHAIM, (Moses), a name signifying *Giants*, as they really were, and an actual people too, situated in Basan or Batanea, beyond Jordan, separated from the Zanzummim by the river Jabbok. Also a valley near Jerusalem, Joshua x.

RAPHANUS, RADISH; a genus of the siliquosa order, belonging to the tetradynamia class of plants.

There is only one species, viz. the fatuus, or common garden radish; of which there are several varieties. They are annual plants, which being sowed in the spring, attain perfection in two or three months, and shoot up soon after into stalk for flower and seed, which, ripening in autumn, the whole plant, root and top, perishes; so that a fresh supply must be raised annually from seed in the spring, performing the sowings at several different times, from about Christmas until May, in order to continue a regular succession of young tender radishes throughout the season: allowing only a fortnight or three weeks interval between the sowings; for one crop will not continue good longer than that space of time, before they will either run to feed, or become tough, sticky, and too hot to eat.

RAPIER, formerly signified a long old-fashioned sword, such as those worn by the common soldiers: but it now denotes a small sword, as contradicting distinguished from a back-sword.

RAPIN (Rene), a Jesuit and eminent French writer, was born at Tours in 1621. He taught polite literature in the society of the Jesuits with great applause, and was justly esteemed one of the best Latin poets and greatest wits of his time. He died at Paris in 1687. He wrote, 1. A great number of Latin poems, which have rendered him famous throughout all Europe; among which are his *Hortorum libri quatuor*, which is reckoned his master-piece. 2. Reflections on Eloquence, Poetry, History, and Philosophy. 3. Comparisons between Virgil and Homer, Demosthenes and Cicero, Plato and Aristotle, Thucydides and Titus Livius. 4. The History of Jansenism. 5. Several works on religious subjects. The best edition of his Latin poems, is that of Paris in 1723, in 3 vols 12mo.

RAPIN de Thoyras (Paul de), a celebrated historian, was the son of James de Rapin lord of Thoyras, and was born at Castrès in 1661. He was educated at first under a tutor in his father's house; and afterwards sent to Puylaurens, and thence to Saumur. In 1697 he returned to his father, with a design to apply himself to the study of the law, and was admitted an advocate: but some time after, reflecting that his being a Protestant would prevent his advancement at the bar, he resolved to quit the profession of the law, and apply himself to that of the sword; but his father would not consent to it. The revocation of the edict of Nantes in 1685, and the death of his father, which happened two months after, made him resolve to come to England; but as he had no hopes of any settlement here, his stay was but short. He therefore soon after went to Holland, and listed himself in the company of French volunteers at Utrecht, commanded by M. Rapin his cousin-german. He attended the Prince of Orange into England in 1688; and the following year the lord Kingdon made him an ensign in his regiment, with which he went into Ireland, where he gained the esteem of his officers at the siege of Carrickfergus, and had soon a lieutenant's commission. He was present at the battle of the Boyne, and was shot through the shoulder at the siege of Limerick. He was soon after captain of the company in which he had been ensign; but, in 1693, resigned his company to one of his brothers, in order to be tutor to the earl of Portland's son.

fon. In 1699, he married Marianne Testard; but this marriage neither abated his care of his pupil, nor prevented his accomplishing him in his travels. Having finished this employment, he returned to his family, which he had settled at the Hague; and here he continued some years. But as he found his family increase, he resolved to retire to some cheap country; and accordingly removed, in 1707, to Wezel, where he wrote his History of England, and some other pieces. Though he was of a strong constitution, yet seventeen years application (for so long was he in composing the history just mentioned) entirely ruined his health. He died in 1725. He wrote in French, 1. A Dissertation on the Whigs and Tories. 2. His History of England, printed at the Hague in 1727 and 1726, in 9 vols 4to, and reprinted at Trevous in 1728, in 10 vols 4to. This last edition is more complete than that of the Hague. It has been translated into English, and improved with Notes, by the Rev. Mr Tindal, in 2 vols folio. This performance, though the work of a foreigner, is deservedly esteemed as the fullest and most impartial collection of English political transactions extant. The readers of wit and vivacity may be apt to complain of him for being sometimes rather tedious and dull.

**RAPINE**, in law, the taking away another's goods, &c. by violence.

**RAPPERSWIL**, a town of Switzerland, on the confines of the canton of Zurich, and of the territory of Gaster, with an old castle. It is strong by situation, being seated on a neck of land which advances into the lake of Zurich, and over which there is a bridge 850 paces long. It is subject to the cantons of Zurich and Bern. E. long. 8. 57. N. lat. 47. 20.

**RAPPOLSTEIN**, a town of France in Upper Alsace, with the title of a barony. All the musicians of Alsace depend upon this baron, and are obliged to pay him a certain tribute, without which they cannot play upon their instruments. E. long. 7. 28. N. lat. 48. 15.

**RAPTURE**, an ecstasy or transport of mind. See ECSTASY.

**RARE**, in physics, stands opposed to dense; and denotes a body that is very porous, whose parts are at a great distance from one another, and which is supposed to contain but little matter under a large bulk. See the following article.

**RAREFACTION**, in physics, the act whereby a body is rendered rare; that is, brought to possess more room, or appear under a larger bulk, without accession of any new matter.—This is very frequently the effect of fire, as has long been universally allowed. In many cases, however, philosophers have attributed it to the action of a repulsive principle. However, from the many discoveries concerning the nature and properties of the electric fluid and fire, there is the greatest reason to believe that this repulsive principle is no other than elementary fire. See REPULSION.

**RASOR-BILL**. See ALCA.

**RASOR-Fish**. See SOLEN.

**RASTALL** (John), a printer and miscellaneous writer, was born in London, probably about the end of the 15th century, and educated at Oxford. Returning from the university, he settled in the metropolis, and commenced printer, "then esteemed (says Wood)

a profession fit for any scholar or ingenious man." He married the sister of Sir Thomas More, with whom, we are told, he was very intimate, and whose writings he strenuously defended. From the title-page of one of his books, he appears to have lived in Cheapside, at the sign of the mermaid. He died in the year 1536; and left two sons, William and John: the first of whom became a judge in queen Mary's reign, and the latter a justice of peace. This John Rastall, the subject of the present article, was a zealous Papist; but Bale says, that he changed his religion before his death. He wrote, 1. *Natura naturalis*. Pits calls it a copious (*prolixa*) and ingenious comedy, describing Europe, Asia, and Africa; with cuts. What sort of a comedy this was, is not easy to conceive. Probably it is a cosmographical description, written in dialogue, and therefore styled a *comedy*. 2. The pastyme of the people; the chronicles of diverse realms, and most especially of the realm of England, briefly compiled and emprinted in Cheapefyde, at the sign of the mermaid, next Pollygate, *cum privilegio*, fol. 3. *Ecclesia Johannis Rastalli*, 1542. Was one of the prohibited books in the reign of Henry VIII. 4. *Legum Anglicanarum vocabula explicata*. French and Latin. Lond. 1567, 8vo. And some other works.

**RASTAT**, a town of Germany, in the circle of Suabia and marquisate of Baden, with a handsome castle. It is remarkable for a treaty concluded here between the French and Imperialists in 1714; and is seated on the river Merg, near the Rhine. E. long. 9. 14. N. lat. 48. 52.

**RAT**, in zoology. See MUS.

The following receipt is said to have been found effectual for the destruction of rats. Take of the seeds of the flavescere or lousewort, powdered, more or less as the occasion requires, one part; of oat-meal, three parts; mix them well, and make them up into a paste with honey. Lay pieces of it in the holes, and on the places where mice and rats frequent; and it will effectually kill or rid the place of those kind of vermin by their eating thereof.

Some time ago, the society for encouraging arts proposed a premium of 50l. for a preparation capable of alluring or fascinating rats so that they might be taken alive. In consequence of this, a great number of new traps, &c. were invented; and the following methods of alluring the rats to a certain place were published.

One of those most easily and efficaciously practised is the trailing home pieces of their most favourite food, which should be of the kind that has the strongest scent, such as toasted cheese or broiled red herrings, from the holes or entrances of the closet to their recesses in every part of the house or contiguous building. At the extremities, and in different parts of the course of this trailed track, small quantities of meal, or any other kind of their food, should be laid, to bring the greater number into the tracks, and to encourage them to pursue it to the place where they are intended to be taken: at that place, when time admits of it, a more plentiful repast is laid for them, and the trailing repeated for two or three nights.

Besides this trailing and way-baiting, some of the most expert of the rat-catchers have a shorter, and perhaps

Rat.

perhaps more effectual, method of bringing them together; which is, the calling them, by making such a kind of whistling noise as resembles their own call; and by this means, with the assistance of the way-baits, they call them out of their holes, and lead them to the repast prepared for them at the place designed for taking them. But this is much more difficult to be practised than the art of trailing; for the learning the exact notes or cries of any kind of beasts or birds, so as to deceive them, is a peculiar talent which is seldom attained: though some perfous have been known who could call together a great number of cats; and there was a man in London who could bring nightingales, when they were within hearing, about him, and even allure them to perch on his hand, so as to be taken.

In practising either of those methods, of trailing or calling, great caution must be used by the operator to suppress and prevent the scent of his feet and body from being perceived; which is done by overpowering that scent by others of a stronger nature. In order to this, the feet are to be covered with cloths rubbed over with asafœtida, or other strong-smelling substances; and even oil of rhodium is sometimes used for this purpose, but sparingly, on account of its dearsness, though it has a very alluring as well as disguising effect. If this caution of avoiding the scent of the operator's feet, near the track, and in the place where the rats are proposed to be collected, be not properly observed, it will very much obstruct the success of the attempt to take them; for they are very shy of coming where the scent of human feet lies very fresh, as it intimates to their sagacious instinct the presence of human creatures, whom they naturally dread. To the abovementioned means of alluring by trailing, way-baiting, and calling, is added another of a very material efficacy, which is, the use of oil of rhodium, which, like the marum Syriacum in the case of cats, has a very extraordinary fascinating power on these animals. This oil is extremely dear, and therefore sparingly used. It is exalted in a small quantity in the place, and at the entrance of it, where the rats are intended to be taken; particularly at the time when they are to be last brought together, in order to their destruction; and it is used also by smearing it on the surface of some of the implements used in taking by the method below described; and the effect it has in taking off their caution and dread, by the delight they appear to have in it, is very extraordinary.

It is usual, likewise, for the operator to disguise his figure as well as scent, which is done by putting on a sort of gown or cloak, of one colour, that hides the natural form, and makes him appear like a post or some such inanimate thing; which habit must likewise be scented as above, to overpower the smell of his person; and besides this, he is to avoid all motion till he has secured his point of having all the rats in his power.

When the rats are thus enticed and collected, where time is afforded, and the whole in any house and out-buildings are intended to be cleared away, they are suffered to regale on what they most like, which is ready prepared for them, and then to go away quietly for two or three nights; by which means those that are not allured the first night are brought afterwards, either by their fellows, or the effects of the trailing, &c.

and will not fail to come duly again, if they are not disturbed or molested. But many of the rat-catchers make shorter work, and content themselves with what can be brought together in one night or two; but this is never effectual, unless where the building is small and entire, and the rats but few in number.

The means of taking them, when they are brought together, are various. Some entice them into a very large bag, the mouth of which is sufficiently capacious to cover nearly the whole floor of the place where they are collected; which is done by smearing some vessel, placed in the middle of the bag, with oil of rhodium, and laying in the bag baits of food. This bag, which before lay flat on the ground with the mouth spread open, is to be suddenly closed when the rats are all in. Others drive or fright them, by slight noises or motions, into a bag of a long form, the mouth of which, after all the rats are come in, is drawn up to the opening of the place by which they entered, all other ways of retreat being secured. Others, again, intoxicate or poison them, by mixing with the repast prepared for them the coculus Indicus or the nux vomica. They direct four ounces of the coculus Indicus, with twelve ounces of oat-meal, and two ounces of treacle or honey, made into a moist paste with strong-beer; but if the nux vomica be used, a much less proportion will serve than is here given of the coculus. Any similar composition of these drugs, with that kind of food the rats are most fond of, and which has a strong flavour, to hide that of the drugs, will equally well answer the end. If indeed the coculus Indicus be well powdered, and infused in the strong-beer for some time, at least half the quantity here directed will serve as well as the quantity before-mentioned. When the rats appear to be thoroughly intoxicated with the coculus, or sick with the nux vomica, they may be taken with the hand, and put into a bag or cage, the door of the place being first drawn to, lest those who have strength and sense remaining escape.

RAT-Tails, or Arrests. See FARRIERY, § XXVI.

RATAFIA, a fine spirituous liquor, prepared from the kernels, &c. of several kinds of fruits, particularly of cherries and apricots.

Ratafia of cherries is prepared by bruising the cherries, and putting them into a vessel wherein brandy has been long kept; then adding to them the kernels of cherries, with strawberries, sugar, cinnamon, white pepper, nutmeg, cloves; and to 20 pound of cherries, 10 quarts of brandy. The vessel is left open ten or twelve days, and then stopped close for two months before it be tapped. Ratafia of apricots is prepared two ways, viz. either by boiling the apricots in white-wine, adding to the liquor an equal quantity of brandy, with sugar, cinnamon, mace, and the kernels of apricots; infusing the whole for eight or ten days; then straining the liquor, and putting it up for use: or else by infusing the apricots, cut in pieces, in brandy, for a day or two, passing it through a straining bag, and then putting in the usual ingredients.

RATCH, or RASH, in clock-work, a sort of wheel having twelve fangs, which serve to lift up the detents every hour, and make the clock strike. See CLOCK.

RATCHETS, in a watch, are the small teeth at the bottom of the sully, or barrel, which stops it in winding up.

Rat  
||  
Ratchets.

RATE, a standard or proportion, by which either the quantity or value of a thing is adjudged.

RATES, in the navy, the orders or classes into which the ships of war are divided, according to their force and magnitude.

The regulation, which limits the rates of men of war to the smallest number possible, seems to have been dictated by considerations of political economy, or of that of the simplicity of the service in the royal dockyards. The British fleet is accordingly distributed into six rates, exclusive of the inferior vessels that usually attend on naval armaments; as sloops of war, armed ships, bomb-ketches, fire-ships and cutters, or schooners commanded by lieutenants.

Ships of the first rate mount 100 cannon, having 42-pounders on the lower deck, 24-pounders on the middle deck, 12-pounders on the upper deck, and 6-pounders on the quarter-deck and fore-castle. They are manned with 850 men, including their officers, stamens, marines, and servants.

In general, the ships of every rate, besides the captain, have the master, the boatswain, the gunner, the chaplain, the purser, the surgeon, and the carpenter; all of whom, except the chaplain, have their mates or assistants, in which are comprehended the sail-maker, the master at arms, the armourer, the captain's clerk, the gunsmith, &c.

The number of other officers are always in proportion to the rate of the ship. Thus a first rate has six lieutenants, six master's mates, twenty-four midshipmen, and five surgeon's mates, who are considered as gentlemen: besides the following petty officers; quarter-masters and their mates, fourteen; boatswain's mates and yeomen, eight; gunner's mates and assistants, six; quarter-gunners, twenty-five; carpenter's mates, two; besides fourteen assistants; with one steward, and steward's mate to the purser.

If the dimensions of all ships of the same rate were equal, it would be the simplest and most perspicuous method to collect them into one point of view in a table: but as there is no invariable rule for the general dimensions, it must suffice to remark those of some particular ships in each rate: for which purpose we have selected some of the latest construction.

The *Victory*, which is among the last built of our first rates, is 222 feet 6 inches in length, from the head to the stern; the length of her keel, 151 feet 3 inches; that of her gun-deck, or lower deck, 186 feet; her extreme breadth is 51 feet 10 inches; her depth in the hold, 21 feet 6 inches; her burden, 2162 tons; and her poop reaches 6 feet before the mizen-mast.

Ships of the second rate carry 90 guns upon three decks, of which those on the lower battery are 32-pounders; those on the middle, 18-pounders; on the upper deck, 12-pounders; and those on the quarter-deck, 6-pounders, which usually amount to four or six. Their complement of men is 750, in which there are six lieutenants, four master's mates, 24 midshipmen, and four surgeon's mates, 14 quarter-masters and their mates, eight boatswain's mates and yeomen, six gunner's mates and yeomen, with 22 quarter-gunners, two carpenter's mates, with 10 assistants, and one steward and steward's mate.

Ships of the third rate carry from 64 to 80 cannon, which are 31, 18, and 9 pounders. The 80-gun

ships however begin to grow out of repute, and to give way to those of 74, 70, &c. which have only two whole batteries; whereas the former have three, with 28 guns planted on each, the cannon of their upper deck being the same as those on the quarter-deck and fore-castle of the latter, which are 9-pounders. The complement in a 74 is 650, and in a 64, 500 men; having, in peace, four lieutenants, but in war, five; and when an admiral is aboard, six. They have three master's mates, 16 midshipmen, three surgeon's mates, 10 quarter-masters and their mates, six boatswain's mates and yeomen, four gunner's mates and yeomen, with 18 quarter-gunners, one carpenter's mate, with eight assistants, and one steward and steward's mate under the purser.

Ships of the fourth rate mount from 60 to 50 guns, upon two decks, and the quarter-deck. The lower tier is composed of 24-pounders, the upper tier of 12-pounders, and the cannon on the quarter-deck and fore-castle are six-pounders. The complement of a 50 gun ship is 350 men, in which there are three lieutenants, two master's mates, 10 midshipmen, two surgeon's mates, eight quarter-masters and their mates, four boatswain's mates and yeomen, one gunner's mate and one yeoman, with 12 quarter-gunners, one carpenter's mate and six assistants, and a steward and steward's mate.

All vessels of war, under the fourth rate, are usually comprehended under the general name of *frigates*, and never appear in the line of battle. They are divided into the 5th and 6th rates; the former mounting from 40 to 32 guns, and the latter from 28 to 20. The largest of the fifth rate have two decks of cannon, the lower battery being of 18-pounders, and that of the upper deck of 9-pounders; but those of 36 and 32 guns have one complete deck of guns, mounting 12-pounders, besides the quarter-deck and fore-castle, which carry 6-pounders. The complement of a ship of 44 guns, is 280 men; and that of a frigate of 36 guns, 240 men. The first has three, and the second two, lieutenants; and both have two master's mates, six midshipmen, two surgeon's mates, six quarter-masters and their mates, two boatswain's mates and one yeoman, one gunner's mate and one yeoman, with 10 or 11 quarter-gunners, and one purser's steward.

Frigates of the 6th rate carry nine-pounders, those of 28 guns having three-pounders on their quarter-deck, with 200 men for their complement; and those of 24, 160 men: the former has two lieutenants, the latter, one; and both have two master's mates four midshipmen, one surgeon's mate, four quarter-masters and their mates, one boatswain's mate and one yeoman, one gunner's mate and one yeoman, with six or seven quarter-gunners, and one purser's steward.

The sloops of war carry from 18 to 8 cannon, the largest of which have six-pounders; and the smallest, viz. those of 8 or 10 guns, four-pounders. Their officers are generally the same as in the 6th rates, with little variation; and their complements of men are from 120 to 60, in proportion to their force or magnitude. N. B. Bomb-vessels are on the same establishment as sloops; but fire-ships and hospital-ships are on that of fifth rates.

Nothing more evidently manifests the great improvement of the marine art, and the degree of perfection

to which it has arrived in Britain, than the facility of managing our first rates; which were formerly esteemed incapable of government, unless in the most favourable weather of the summer.

Ships of the second rate, and those of the third, which have three decks, carry their sails remarkably well, and labour very little at sea. They are excellent in a general action, or in cannonading a fortress. Those of the third rate, which have two tiers, are fit for the line of battle, to lead the convoys and squadrons of ships of war in action, and in general to suit the different exigencies of the naval service.

The fourth-rates may be employed on the same occasions as the third-rates, and may be also destined amongst the foreign colonies, or on expeditions of great distance; since these vessels are usually excellent for keeping and sustaining the sea.

Vessels of the fifth rate are too weak to suffer the shock of a line of battle; but they may be destined to lead the convoys of merchant ships, to protect the commerce in the colonies, to cruise in different stations, to accompany squadrons, or be sent express with necessary intelligence and orders. The fame may be observed of the sixth rates.

The frigates, which mount from 28 to 38 guns upon one deck, with the quarter-deck, are extremely proper for cruising against privateers, or for short expeditions, being light, long, and usually excellent sailors.

RATEEN, or RATTEN, in commerce, a thick woollen stuff, quilted, woven on a loom with four treddles, like ferges and other stuffs that have the whale or quilling. There are some rateens dressed and prepared like cloths; others left simply in the hair, and others where the hair or knap is frized. Rateens are chiefly manufactured in France, Holland, and Italy, and are mostly used in linings. The frize is a sort of coarse rateen, and the druggist is a rateen half linen half woollen.

RATIFICATION, an act approving of and confirming something done by another in our name.

RATIO, in arithmetic and geometry, is that relation of homogeneous things which determines the quantity of one from the quantity of another, without the intervention of a third.

Two numbers, lines, or quantities, A and B, being proposed, their relation one to another may be considered under one of these two heads: 1. How much A exceeds B, or B exceeds A; and this is found by taking A from B, or B from A, and is called *arithmetical reason, or ratio*. 2. Or how many times, and parts of a time, A contains B, or B contains A; and this is called *geometrical reason or ratio*; (or, as Euclid defines it, it is the *mutual habitude, or respect*, of two magnitudes of the same kind, according to quantity; that is, as to how often the one contains, or is contained in, the other); and is found by dividing A by B, or B by A: and here note, that that quantity which is referred to another quantity, is called the *antecedent of the ratio*; and that to which the other is referred, is called the *consequent of the ratio*; as, in the ratio of A to B, A is the antecedent, and B the consequent. Therefore any quantity, as antecedent, divided by any quantity as a consequent, gives the ratio of that antecedent to the consequent.

Thus the ratio of A to B is  $\frac{A}{B}$ , but the ratio of B to A is  $\frac{B}{A}$ ; and, in numbers, the ratio of 12 to 4 is  $\frac{12}{4}=3$ , or triple; but the ratio of 4 to 12 is  $\frac{4}{12}=\frac{1}{3}$ , or subtriple.

And here note, that the quantities thus compared must be of the same kind; that is, such as by multiplication may be made to exceed one the other, or as these quantities are said to have a ratio between them, which, being multiplied, may be made to exceed one another. Thus a line, how short soever, may be multiplied, that is, produced so long as to exceed any given right line; and consequently these may be compared together, and the ratio expressed: but as a line can never, by any multiplication whatever, be made to have breadth, that is, to be made equal to a superficies, how small soever; these can therefore never be compared together, and consequently have no ratio or respect one to another, according to quantity; that is, as to how often the one contains, or is contained in, the other.

RATIOCINATION, the act of reasoning. See REASONING.

RATION, or RATIAN, in the army, a portion of ammunition, bread, drink, and forage, distributed to each soldier in the army, for his daily subsistence, &c. The horse have ratios of hay and oats when they cannot go out to forage. The rations of bread are regulated by weight. The ordinary ration of a foot soldier is a pound and a half of bread per day. The officers have several rations according to their quality and the number of attendants they are obliged to keep. When the ration is augmented on occasions of rejoicings, it is called a *double ration*. The ship's crews have also their rations or allowances of biscuit, pulse, and water, proportioned according to their stock.

RATIONALE, a solution, or account of the principles of some opinion, action, hypothesis, phenomenon, or the like.

RATIBOR, a town of Germany, in Silesia, and capital of a duchy of the same name, with a castle. It has been twice taken by the Swedes, and is seated on the river Oder, in a country fertile in corn and fruits, 15 miles north-east of Troppaw, and 142 east of Prague. E. Long. 22. 24. N. Lat. 50. 14.

RATISBON, an ancient, large, rich, handsome, and strong city of Germany, in Bavaria, free and imperial, with a bishop's see, whose bishop is a prince of the empire. It is full of gentry; and there are very handsome structures, particularly three monasteries and three abbeyes. The town-house is very magnificent, and in its hall the general diets of the empire meet; only in 1740, there being a war in Germany, the meeting of the diet was transferred to Frankfort on the Main, till after the death of the emperor Charles VII. It is seated on the Danube, and is pretty well fortified, over which river there is a stone bridge of 15 arches, so that in the time of war it is a passage of very great consequence. The inhabitants are Protestants, and all their magistrates must be of that persuasion; however, the Roman Catholics have the liberty of saying mass there once a week. The abbot, and

Ratlines  
Ravenna.

and the two abbeſſes have the rank of prelates of the empire. Proviſions are very plentiful here, and they have a good trade in time of peace, the river on which it ſtands being navigable, and by which it communicates with a great part of Germany. E. Long. 11. 11. N. Lat. 48. 56.

**RATLINES**, or, as the failors call them *ratlines*, thoſe lines which make the ladder ſteps to go up the ſhrouds' and puttocks, hence called the *ratlines* of the ſhrouds.

**RATTLESNAKE**. See **CROTALUS**.

**RATTLESNAKE Root**. See **POLYGALA**.

**RATOLZFELZ**, a ſtrong town of Germany, in Suabia, near the welt end of the lake Conſtance. It is ſeated on that part of it called *Bodenſee*; and belongs to the houſe of Auſtria, who took it from the duke of Wirtemberg, after the battle of Nordingen. It is 12 miles welt of the city of Conſtance.

**RATZBURG**, or **RATZEMBURG**, an ancient town of Germany, in the circle of Lower Saxony, and in the duchy of Lawenburgh, with a biſhop's ſee and a caſtle. The town depends on the duchy of Lawenburgh, and the cathedral church on that of Ratzburg. It is ſeated on an eminence, and almoſt ſurrounded with a lake 25 miles in length and three in breadth. This place is noted for its excellent beer. E. Long. 10. 58. N. Lat. 53. 47.

**RAVA**, a town of Great Poland, and capital of a palatinate of the ſame name, with a fortified caſtle, where they keep ſtate priſoners. The houſes are built of wood, and there is a Jeſuits college. It is ſeated in a morafs covered with water, which proceeds from the river Rava, with which it is ſurrounded. It is 45 miles ſouth of Bloſko, and 50 ſouth-weſt of Warſaw. The palatinate is bounded on the north by that of Bloſko, on the eaſt by that of Mazovia, on the ſouth by that of Sandomer, and on the welt by that of Lencieza.

**RAVELIN**, in fortification, was anciently a flat baſion placed in the middle of a curtain; but now a detached work composed only of two faces, which make a ſaliant angle without any flanks, and raiſed before the counterſcarp of the place. See **FORTIFICATION**.

**RAVEN**, in ornithology. See **CORVUS**.

**RAVENGLAS**, a town of Cumberland in England, ſituated between the rivers Irt and Elk, which, with the ſea, encompass three parts of it; it is a well built place, and has a good road for ſhipping, which brings it ſome trade. E. Long. o. 5. N. Lat. 54. 20.

**RAVENSBURG**, a county of Germany, in Weſtphalia, bounded on the north by the biſhoprics of Osnaburg and Minden, on the eaſt by Lemgow, on the ſouth by the biſhopric of Paderborn, and on the welt by that of Muſter. It belongs to the king of Pruſſia, and has its name from the caſtle of Ravensburg.

**RAVENSBURG**, a free and imperial town of Germany in Algow in the circle of Swabia. It is well built, and the public ſtructures are handſome. The inhabitants are partly Proteſtants and partly Papiſts. It is ſeated on the river Chenis, in E. Long. 9. 46. N. Lat. 47. 44.

**RAVENNA**, (anc. geog.), a noble city of Gallia Ciſpadana; a colony of Theſſalians, on the A-

driatic, in waſhes or a boggy ſituation, which proved a natural ſecurity to it. The houſes all of wood, the communication by bridges and boats, and the town kept ſweet and clean by the tides carrying away the mud and ſoil, (Strabo). Anciently it had a port at the mouth of the Bedefis; Auguſtus added a new port, capacious to hold a fleet, for the ſecurity of the Adriatic, between which and the city lay the Via Cæſaris. In the lower age it was the feat of the Oſtrogoths for 72 years; but being recovered by Narſes, Juſtinian's general, it became the reſidence of the exarchs, magiſtrates ſent by the emperor from Conſtantinople, for 175 years, when it was taken by the Longobards. It is ſtill called *Ravenna*, capital of Romania, in the pope's territory. It had a very flouriſhing trade till the ſea withdrew two miles from it, which has been a great detriment. The fortifications are of little importance, and the citadel is gone to ruin. It is now moſt remarkable for the excellent wine produced in its neighbourhood. The maſoleum of Theodoric is ſtill to be ſeen, remarkable for being covered by a ſingle ſtone 28 feet in diameter and 15 thick. E. Long. 12. 15. N. Lat. 44. 22.

**RAURICUM**, (anc. geog.) a town of the Raurici, ſituate over againſt Abnoba, a mountain from which the Danube takes its riſe. A Roman colony led by L. Manutius Plancus the ſcholar and friend of Cicero: called *Colonia Rauriaca* (Pliny), *Raurica* (Inſcription), *Auguſta Rauricorum*. The town was deſtroyed in Julian's time. It is now commonly called *Augſt*, a village greatly decayed from what it formerly was. It is ſituated on the Rhine, diſtant about two hours to the eaſt of Baſil. The country is now the canton of Baſil.

**RAY** (John), a celebrated botaniſt, was the ſon of Mr Roger Ray, a blackſmith, and was born at Black Notly in Eſſex in 1628. He received the firſt rudiments of learning at the grammar ſchool at Brain-tree; and in 1644 was admitted into Catharine hall in Cambridge, from whence he afterwards removed to Trinity college in that univerſity. He was at length made one of the ſenior fellows of that college, and took the degree of maſter of arts; but his intenſe application to his ſtudies having injured his health, he was obliged at his leiſure hours to exerciſe himſelf by riding or walking in the fields, which led him to the ſtudy of plants. He noted from Johnſon, Parkinson, and the *Phytologia Britannica*, the places where curious plants grew; and in 1658 rode from Cambridge to the city of Cheſter, from whence he went into North Wales, viſiting many places, and among others the famous hill of Snowdon; returning by Shrewſbury and Glouceſter. In 1660 he publiſhed his *Catalogus Plantarum circa Cantabrigiam naſcentium*, and the ſame year was ordained deacon and prieſt. In 1661 he accompanied Francis Willoughby, Eſq; and others in ſearch of plants and other natural curioſities, in the north of England and Scotland; and the next year made a weſtern tour from Cheſter, through Wales, to Cornwall, Devonſhire, Dorſetſhire, Hampſhire, Wiltſhire, and other countries. He afterwards travelled with Mr Willoughby and other gentlemen through Holland, Germany, Italy, France, &c. took ſeveral tours in England, and was admitted fellow

Rauricum  
Ray.

Ray. fellow of the Royal Society. In 1672, his intimate and beloved friend Mr Willoughby died in the 37th year of his age, at Middleton Hall, his seat in Yorkshire; "to the infinite and unspeakable loss and grief (says Mr Ray,) of myself, his friends, and all good men." There having been the closest and sincerest friendship between Mr Willoughby and Mr Ray, who were men of similar natures and tastes, from the time of their being fellow collegians, Mr Willoughby not only confided in Mr Ray, in his life-time, but also at his death: for he made him one of the executors of his will, and charged him with the education of his sons Francis and Thomas, leaving him also for life 60*l.* per annum. The eldest of these young gentlemen not being four years of age, Mr Ray, as a faithful trustee, betook himself to the instruction of them; and for their use composed his *Nomenclator Classicus*, which was published this very year 1672. Francis the eldest dying before he was of age, the younger became lord Middleton. Not many months after the death of Mr Willoughby, Mr Ray lost another of his best friends, bishop Wilkins; whom he visited in London the 18th of November 1672, and found near expiring by a total suppression of urine for eight days. As it is natural for the mind, when it is hurt in one part, to seek relief from another; so Mr Ray, having lost some of his best friends, and being in a manner left destitute, conceived thoughts of marriage; and accordingly, in June 1673, did actually marry a gentlewoman of about 20 years of age, the daughter of Mr Oakley of Launton in Oxfordshire. Towards the end of this year, came forth his "Observations Topographical, Moral, &c." made in foreign countries; to which was added his *Catalogus Stirpium in exteris regionibus observatarum*: and about the same time, his *Collection of unusual or local English words*, which he had gathered up in his travels through the counties of England. After having published many books on subjects foreign to his profession, he at length resolved to publish in the character of a divine, as well as in that of a natural philosopher: in which view he published his excellent demonstration of the being and attributes of God, entitled *The wisdom of God manifested in the works of the Creation*, 8vo. 1697. The rudiments of this work were laid in some college lectures; and another collection of the same kind he enlarged and published under the title of *Three Physico-theological Discourses, concerning the Chaos, Deluge, and Dissolution of the World*, 8vo. 1692. He died in 1705. He was modest, affable, and communicative; and was distinguished by his probity, charity, sobriety, and piety. He wrote a great number of works, the principal of which, besides those already mentioned, are, 1. *Catalogus Plantarum Angliæ*. 2. *Dictionarium Trilingue secundum locos communes*. 3. *Historia Plantarum, Species, hæcenus editas, atque insuper nullas noviter inventas et descriptas complectens*, 3 vols. 4. *Methodus Plantarum nova, cum Tabulis*, 8vo. and several other works on plants. 6. *Synopsis Methodica Animalium quadrupedum et serpentini generis*, 8vo. 5. *Synopsis Methodica Avium et Piscium*. 7. *Historia Insectorum, opus posthumum*. 7. *Methodus Insectorum*. 9. Philological letters. &c.

RAY, in optics, a beam of light emitted from a ra-

diant or luminous body. See LIGHT.

*Inflected RAYS*, those rays of light which, on their near approach to the edges of bodies, in passing by them, are bent out of their course, being turned either from the body or towards it. This property of the rays of light is generally termed *diffraction* by foreigners, and Dr Hooke sometimes called it *deflection*.

*Reflected RAYS*, those rays of light, which, after falling upon the body, do not go beyond the surface of it, but are thrown back again.

*Refracted RAYS*, those rays of light which, after falling upon any medium, enter its surface, being bent either towards or from a perpendicular to the point on which they fell.

*Pencil of RAYS*, a number of rays issuing from a point of an object, and diverging in the form of a cone.

**RAZOR**, a well-known instrument, used by surgeons, barbers, &c. for shaving off the hair from various parts of the body.

**RE**, in grammar, an inseparable particule added to the beginning of words to double or otherwise modify their meaning; as in re-action, re-move, re-export, &c.

**RE ACTION**, in physiology, the resistance made by all bodies to the action or impulse of others that endeavour to change its state whether of motion or rest.

**READING**, the art of delivering written language with propriety, force, and elegance.

Reason and experience demonstrate, that *delivery in reading ought to be less animated than in interested speaking*. In every exercise of the faculty of speech, and those expressions of countenance and gesture with which it is generally attended, we may be considered to be always in one of the two following situations: First, delivering our *basest sentiments* on circumstances which relate to ourselves or others, or, secondly, *repeating* something that was spoken on a certain occasion for the amusement or information of an auditor. Now, if we observe the deliveries natural to these two situations, we shall find, that the first may be accompanied with every degree of expression which can manifest itself in us, from the lowest of sympathy to the most violent and energetic of the superior passions; while the latter, from the speaker's chief business being to repeat what he heard *with accuracy*, discovers only a faint imitation of those signs of the emotions which we suppose agitated him from whom the words were first borrowed.—The use and necessity of this difference of manner is evident; and if we are attentive to these natural signs of expression, we shall find them conforming with the greatest nicety to the slightest and most minute movements of the breast.

This repetition of another's words might be supposed to pass through the mouth of a second or third person; and in these cases, since they were not ear and eye witnesses of him who first spoke them, their manner of delivery would want the advantage necessarily arising from an immediate idea of the original one; hence, on this account, be a still less lively representation than that of the first *repeater*. But as, from a daily observation of every variety of speech and its associated signs of emotion, mankind soon become pretty well

Rays, Reading.

Delivery in reading ought to be less animated than in interested speaking.

Reading

well acquainted with them, and this in different degrees, according to their discernment, sensibility, &c. experience shows us that these latter *repeaters* (as we call them) might conceive and use a manner of delivery, which, though less *characteristic* perhaps, would on the whole be no way inferior to the first, as to the *common* natural expression proper for their situation. It appears therefore, that *repeaters of every degree* may be esteemed upon a level as to animation, and that our twofold distinction above contains accurately enough the whole variety of ordinary delivery;—we say *ordinary*, because

There is another very peculiar kind of delivery sometimes used in the person of a *repeater*, of which it will in this place be necessary to take some notice. What we mean here is *mimicry*; an accomplishment, which, when perfectly and properly displayed, never fails of yielding a high degree of pleasure. But since this pleasure chiefly results from the principle of *imitation* respecting *manner*, and not from the purport of the *matter* communicated; since, comparatively speaking, it is only attainable by few persons, and practised only on particular occasions;—on these accounts it must be refused a place among the modes of useful delivery taught us by *general* nature, and esteemed a qualification purely anomalous.

These distinctions with regard to a speaker's situation of mind premised, let us see to which of them an *author* and his *reader* may most properly be referred, and how they are circumstanced with regard to one another.

The matter of all books is, either what the author says in his *own* person, or an acknowledged recital of the words of *others*: hence an author may be esteemed both an *original* speaker and a *repeater*, according as what he writes is of the first or second kind. Now a reader must be supposed either actually to personate the author, or one whose office is barely to communicate what he has said to an auditor. But in the first of these suppositions he would, in the delivery of what is the author's own, evidently commence *mimic*; which being, as above observed, a character not acknowledged by general nature in this department, ought to be rejected as generally improper. The other supposition therefore must be accounted right; and then, as to the *whole* matter of the book, the reader is found to be exactly in the situation of a *repeater*, save that he takes what he delivers from the page before him instead of his memory. It follows then, in proof of our initial proposition, that, if we are directed by nature and propriety, the manner of our delivery in reading ought to be inferior in warmth and energy to what we should use, were the language before us the spontaneous effusions of our own hearts in the circumstances of those out of whose mouths it is supposed to proceed.

Evident as the purport of this reasoning is, it has not so much as been glanced at by the writers on the subject we are now entered upon, or any of its kindred ones; which has occasioned a manifest want of accuracy in several of their rules and observations. Among the rest, this precept has been long reverberated from author to author as a perfect standard for propriety in reading. "Deliver yourselves in the same manner you would do, were the matter your own original sentiments uttered directly from the heart." As

all kinds of delivery must have many things in common, the rule will in many articles be undoubtedly right; but, from what has been said above, it must be as certainly faulty in respect to several others; as it is certain nature never confounds by like signs two things so very different, as a *copy* and an *original*, an emanation darted immediately from the sun, and its weaker appearance in the lunar reflection.

The precepts we have to offer for improving the abovementioned rule, shall be delivered under the heads of *accent*, *emphasis*, *modulation*, *expression*, *pauses*, &c.

I. *Accent*. In attending to the affections of the voice when we speak, it is easy to observe, that, independent of any other consideration, one part of it differs from another, in *stress*, *energy*, or *force* of utterance. In words we find one syllable differing from another with respect to this mode; and in sentences one or more words as frequently vary from the rest in a similar manner. This stress with regard to *syllables* is called *accent*, and contributes greatly to the variety and harmony of language. Respecting *words*, it is termed *emphasis*; and its chief office is to assist the sense, force, or perspicuity of the sentence—of which more under the next head.

"Accent," as described in the Lectures on Elocution, "is made by us two ways; either by dwelling longer upon one syllable than the rest, or by giving it a smarter percussive motion of the voice in utterance. Of the first of these we have instances in the words *glory*, *father*, *holy*; of the last in *bat'tle*, *hab'it*, *bor'row*. So that accent with us is not referred to tune, but to time; to quantity, not quality; to the more equable or precipitate motion of the voice, not to the variation of the notes or inflexions."

In *theatric declamation*, in order to give it more pomp and solemnity, it is usual to dwell longer than common upon the unaccented syllables; and the author now quoted, has endeavoured to prove (p. 51. 54.) the practice faulty, and to show (p. 55.) that though it (i. e. true solemnity) may demand a slower utterance than usual, yet (it) requires that the same proportion in point of quantity be observed in the syllables, as there is in musical notes when the same tune is played in quicker or slower time." But that this deviation from ordinary speech is not a fault, as our author asserts; nay, that on the contrary it is a real beauty when kept under proper regulation, the following observations it is hoped will sufficiently prove.

(I.) It is a truth of the most obvious nature, that those things which on their application to their proper senses have a power of raising in us certain ideas and emotions, are ever differently modified in their constituent parts when different effects are produced in the mind; and also (II.) that, within proper bounds, were we to suppose these constituent parts to be proportionally increased or diminished as to *quantity*, this effect would still be the same as to *quality*.—For instance: The different ideas of strength, swiftness, &c. which are raised in us by the same species of animals, is owing to the different form of their corresponding parts; the different effects of music on the passions, to the different airs and movements of the melody; and the different expressions of human speech, to a difference

Reading

Accent.

ference

Reading. ference in tone, speed, &c. of the voice. And these peculiar effects would still remain the same, were we to suppose the animals above alluded to, to be *greater or lesser*, within their proper bounds; the movement of the music *quicker or slower*, provided it did not palpably interfere with that of some other species; and the pitch of the voice *higher or lower*, if not carried out of the limits in which it is observed on similar occasions naturally to rove. Farther (III.) since, respecting the emotions more especially, there are no rules to determine *a priori* what effect any particular attribute or modification of an object will have upon a percipient, our knowledge of this kind must evidently be gained from experience. Lastly, (IV.) In every art imitating nature we are pleased to see the characteristic members of the pattern *heightened* a little farther than perhaps it ever was carried in any real example, provided it be not bordering upon some ludicrous and disagreeable provinces of excess.

Now for the application of these premises.—To keep pace and be consistent with the *dignity* of the tragic muse, the delivery of her language should necessarily be dignified; and this it is plain from observation (I.) cannot be accomplished otherwise than by something different in the manner of it from that of ordinary speech; since *dignity* is essentially different from *familiarity*. But how must we discover this different manner? By attending to nature: and in this case she tells us, that besides using a *slower* delivery, and greater *distinctness* of the words (which every thing merely *grave* requires, and gravity is a *concomitant* of dignity, though not its *essence*), we must dwell a little longer upon the *unaccented* syllables than we do in common. As to what our author observes in the above quotation, of *dignity's* only requiring a *slower* utterance than ordinary, while the proportion of the syllables as to quantity continues the same; it is apprehended the remark (II.) respecting *quickness* and *slowness* of movement, will show it to be not altogether true. For since the delivery is not altered in *form*, its expression must be still of the same kind, and perhaps what may be rightly suggested by the term *gravely familiar*.

But something farther may yet be said in defence of this *artificial* delivery, as our author calls it. Is not the movement of any thing, of whatever species, when dignified or solemn, in general of an *equable* and *deliberate* nature (as in the minuet, the military step, &c.)? And in theatrical declamation, is not the propensity to introduce this *equableness* so strong, that it is almost *impossible* to avoid it wholly, were we ever so determined to do it? If these two queries be answered in the affirmative (as I am persuaded they will), while the first supports our argument for the *propriety* of the manner of delivery in question, the second discovers a kind of *necessity* for it. And that this manner may be carried a little farther in quantity on the *stage* than is usual in *real life*, the principle (IV.) of heightening nature will justify, provided fashion (which has ever something to do in these articles) give it a sanction;

Vol. IX.

I

(A) The following lines will illustrate both these kinds of stresses: For, to convey their right meaning, the word ANY is evidently to be pronounced louder and fuller than those with the accents over them.

If not, by ANY means get wealth and place;

POPE.

This couplet is accented in the manner we find it in the *Essay on Elocution* by *Mason*. And if, according to the judg-

Reading. for the *precise* quantity of several heightenings may be varied by this great legislator, almost at will.

II. *Emphasis*. As *emphasis* is not a thing annexed to particular words, as *accent* is to syllables, but owes its rise chiefly to the *meaning* of a passage, and must therefore vary its seat according as that meaning varies, it will be necessary to explain a little farther the general idea given of it above.

Of man's first disobedience, and the fruit  
Of that forbidden tree, whose mortal taste  
Brought death into the world, and all our wo, &c.  
Sing heavenly muse, &c.

Supposing, in reference to the above well-known lines, that originally other beings, besides men, had disobeyed the commands of the Almighty, and that the circumstance were well-known to us, there would fall an *emphasis* upon the word *man's* in the first line, and hence it would be read thus;

Of *man's* first disobedience, and the fruit, &c.

But if it were a notorious truth, that mankind had transgressed in a peculiar manner more than once, the *emphasis* would fall on *first*, and the line be read,

Of man's *first* disobedience, &c.

Again, admitting death (as was really the case) to have been an unheard of and dreadful punishment brought upon man in consequence of his transgression; on that supposition the third line would be read,

Brought death into the world, &c.

But if we were to suppose mankind knew there was such an evil as death in other regions, though the place they inhabited had been free from it till their transgression; the line would run thus,

Brought death into the world, &c.

Now from a proper delivery of the above lines, with regard to any one of the suppositions we have chosen, out of several others that might in the same manner have been imagined, it will appear that the *emphasis* they illustrate is effected by a manifest *delay* in the pronunciation, and a tone something *fuller* and *louder* than is used in ordinary; and that its office is solely to determine the meaning of a sentence with reference to something said before, pre-supposed by the author as general knowledge, or in order to remove an ambiguity where a passage is capable of having more senses given it than one.

But, supposing in the above example, that none of the senses there pointed out were precisely the true one, and that the meaning of the lines were no other than what is obviously suggested by their simple construction; in that case it may be asked, if in reading them there should be no word dignified with the emphatical accompaniments above described?—The answer is, Not one with an *emphasis* of the *same* kind as that we have just been illustrating; yet it is nevertheless true, that on hearing these lines well read, we shall find some words distinguished from the rest by a manner of delivery bordering a little upon it (A). And these

37 H

words

Reading. words will in general be such as seem the most important in the sentence, or on other accounts to merit this distinction. But as at best it only enforces, graces, or embellishes, and not fixes the meaning of any passage, and even caprice and fashion (B) have often a hand in determining its place and magnitude, it cannot properly be reckoned an essential of delivery. However, it is of too much moment to be neglected by those who would wish to be good readers; and for the sake of distinction, we may not unaptly denominate both the kinds of energies in question, by the terms *emphasis of sense*, and *emphasis of force* (C).

Now from the above account of these two species of emphasis it will appear, "that in reading, as in speaking, the first of them must be determined entirely by the *sense* of the passage, and always made alike: But as to the other, *taste* alone seems to have a right of fixing its situation and quantity."—Farther: Since the more essential of these two energies is solely the work of nature (as appears by its being constantly found in the common conversation of people of all kinds of capacities and degrees of knowledge), and the most ignorant person never fails of using it rightly in the effusions of his own heart, it happens very luckily, and ought always to be remembered, that provided we understand what we read, and give way to the dictates of our own feeling, the *emphasis of sense* can scarce ever avoid falling spontaneously upon its proper place.

Here it will be necessary to say something by way of reply to a question which will naturally occur to the mind of every one.—As the rule for the *emphasis of sense* requires we should understand what we read before it can be properly used, it is incumbent upon us

never to attempt to read what we have not previously studied for that purpose? In answer to this, it must be observed, that though such a step will not be without its advantages; yet, as from the fairness of printed types, the well-known pauses of punctuation, and a long acquaintance with the phraseology and construction of our language, &c. experience tells us it is possible to comprehend the sense at the first reading, a previous perusal of what is to be read does not seem necessary to all, though, if they would wish to appear to advantage, it may be expedient to many; and it is this circumstance which makes us venture upon extemporary reading, and give it a place among our amusements.—Similar remarks might be made with regard to modulation, expression, &c. did not what is here observed naturally anticipate them.

III. Modulation (D). Every person must have observed, that, in speaking, the voice is subject to an alteration of sound, which in some measure resembles the movement of a tune. These sounds, however, are evidently nothing like so much varied as those that are strictly musical; and we have attempted to show in the preceding chapter, that, besides this, they have an essential difference in themselves. Nevertheless, from the general similitude of these two articles, they possess several terms in common; and the particular we have now to examine is in both of them called modulation. This affection of the voice, being totally arbitrary, is differently characterized in different parts of the world; and, through the power of custom, every place is inclined to think their own the only one natural and agreeable, and the rest affected with some barbarous twang or ungainly variation (E). It may be observed, however, that though there is a general uniform 4  
Modulation  
cant

judgment of this author, the words thus distinguished are to have an emphatical stress, it must be of the inferior kind above-mentioned, and which a little farther on we call *emphasis of force*; while the word ANY in a different type alone possesses the other sort of energy, and which is there contradistinguished by the term *emphasis of sense*.

(B) Among a number of people who have had proper opportunities of learning to read in the best manner it is now taught, it would be difficult to find two, who, in a given instance, would use the *emphasis of force* alike, either as to place or quantity. Nay some scarce use any at all; and others will not scruple to carry it much beyond any thing we have a precedent for in common discourse; and even now and then throw it upon words for very trifling in themselves, that it is evident they do it with no other view, than for the sake of the variety it gives to the modulation.—This practice, like the introduction of disorders into music, may without doubt be indulged now and then; but, were it too frequent, the capital intent of these energies would manifestly either be destroyed or rendered dubious.

(C) The first of these terms answers to the *simple emphasis* described in the *Lectures on Elocution*, and the second nearly to what is there called *complex*. The difference lies in this. Under *complex emphasis* the author seems (for he is far from being clear in this article) to include the *tones* simply considered of all the emotions of the mind; as well the *tender* and *languid*, as the *forcible* and *exulting*. Our term is intended to be confined to such modes of expression alone as are marked with an apparent *stress* or *increase* of the voice.

(D) The author of the *Introduction to the Art of Reading*, not allowing that there is any variation of tone, as to *high* and *low*, in the delivery of a complete period or sentence, places modulation solely in the diversification of the key-note and the variety of syllables, as to *long* or *short*, *swift* or *slow*, *strong* or *weak*, and *loud* or *soft*. As we are of a different opinion, our idea of modulation is confined purely to *harmonious inflexions of voice*. These qualities of words, it is true, add greatly both to the force and beauty of delivery; yet, since some of them are fixed and not arbitrary, (as *long* and *short*), and the others (of *swift* and *slow*, *strong* and *weak*, *loud* and *soft*) may be considered as modes of execution which do not affect the modulation as to *tone*, it will agree best with our plan to esteem these properties as respectively belonging to the established laws of *pronunciation*, and the *imitative* branch of expression mentioned in the end of the ensuing head.

(E) From what accounts we have remaining of the modulation of the ancients, it appears to have been highly ornamented, and apparently something not unlike our modern *recitatives*; particularly that of their theatric declamation was music in its strictest sense, and accompanied with instruments. In the course of time and the progress of refinement, this modulation became gradually more and more simple, till it has now lost the genius of music, and is entirely regulated by taste. At home here, every one has heard the *Ang-song* cant, as it is called, of

Ti ti dum dum, ti ti dum ti dum de,  
Ti dum ti dum, ti dum ti dum dum de,

which, though disgusting now to all but mere rustics on account of its being out of fashion, was very probably the favourite modulation in which heroic verses were recited by our ancestors. So fluctuating are the taste and practices of

Reading. cast or fashion of modulation peculiar to every country, yet it by no means follows, that there is or can be any thing fixed in its application to particular passages; and therefore we find different people will, in any given instance, use modulations something different, and nevertheless be each of them equally agreeable.

But, quitting these general remarks, we shall (as our purpose requires it) consider the properties of modulation a little more minutely.

First, then, we may observe, that, in speaking, there is a particular found (or *key-note*, as it is often called) in which the modulation for the most part runs, and to which its occasional inflexions, either above or below, may in some respects be conceived to have a reference, like that which common music has to its key-note. Yet there is this difference between the two kinds of modulation, that whereas the first always concludes in the key-note, the other frequently concludes a little below it (F). This key-note, in speaking, is generally the found given at the outset of every complete sentence or period; and it may be observed on some occasions to vary its pitch through the limits of a musical interval of a considerable magnitude. The tones, that fall a little lower than the key at the close of a sentence or period, are called *cadences*. These cadences, if we are accurate in our distinctions, will, with respect to their offices, be found of two kinds; though they meet so frequently together, that it may be best to conceive them only as answering a double purpose. One of these offices is to assist the sense, and the other to decorate the modulation. An account of the first may be seen in the section on *Pauses*; and the latter will be found to shew itself pretty frequently in every thing grave and plaintive, or in poetic description and other highly ornamented language, where the mind is by its influence brought to feel a placid kind of dignity and satisfaction. These two cadences, therefore, may be conveniently distinguished by applying to them respectively the epithets *significant* and *ornamental*.

We have already observed, that reading should in some things differ from speaking; and the particular under consideration seems to be one which ought to vary a little in these arts. For,

Modulation in reading serves a twofold purpose. At the same time that it gives pleasure to the ear on the principles of harmony, it contributes through that medium to preserve the attention. And since written language (when not purely dramatical) is in general more elegant in its construction, and musical in its periods, than the oral one; and since many interesting particulars are wanting in reading, which are present in speaking, that contribute greatly to fix the regard of the hearer; it seems reasonable, in order to do justice to the language, and in part to supply the incite-

2

ments of attention just alluded to, that in the former Reading. of these two articles a modulation should be used something more harmonious and artificial than in the latter. Agreeably to this reasoning, it is believed, we shall find every reader, on a narrow examination, adopt more or less a modulation thus ornamented: tho', after all, it must be acknowledged there are better grounds to believe, that the practice has been hitherto directed intuitively by nature, than that it was discovered by the inductions of reason. We shall conclude this head with a rule for modulation in reading. "In every thing dramatic, colloquial, or of simple narrative, let your modulation be the same as in speaking; but when the subject is flowery, solemn, or dignified, add something to its harmony, diversify the key-note, and increase the frequency of cadences in proportion to the merit of the composition."

It will readily be seen, that the precepts here drawn from a comparison between speaking and reading, would be very inadequate, were they left destitute of the assistance of *taste*, and the opportunity of *frequently hearing and imitating masterly readers*. And indeed to these two great auxiliaries we might very properly have referred the whole matter at once, as capable of giving sufficient directions, had we not remembered that our plan required us to found several of our rules as much on the principles of a philosophical analysis, as on those more familiar ones which will be found of greater efficacy in real practice.

IV. *Expression*. 1. There is no composition in music, <sup>5</sup> *Expression* however perfect as to key and melody, but, in order as to the tones of the voice. to do justice to the subject and ideas of the author, will require, in the performing, something more than an exact adherence to *tune and time*. This something is of a nature too which perhaps can never be adequately pointed out by any thing graphic, and results entirely from the taste and feeling of the performer. It is that which chiefly gives music its power over the passions, and characterises its notes with what we mean by the words *sweet, harsh, dull, lively, plaintive, joyous*, &c. for it is evident every found, considered abstractedly, without any regard to the movement, or high and low, may be thus modified. In practical music, this commanding particular is called *Expression*; and as we find certain tones analogous to it frequently coalescing with the modulation of the voice, which indicate our passions and affections (thereby more particularly pointing out the meaning of what we say), the term is usually applied in the same sense to speaking and reading.

These tones are not altogether peculiar to man. Every animal, that is not dumb, has a power of making several of them. And from their being able, unassisted by words, to manifest and raise their kindred emotions, they constitute a kind of language of themselves. In this language of the heart man is

37 H 2

eminently

of mankind! But whether the power of language over the passions has received any advantage from the change just mentioned, will appear at least very doubtful, when we recollect the stories of its former triumphs, and the inherent charms of musical sounds.

(F) As musical sounds have always an harmonical reference to a key or fundamental note, and to which the mind is still secretly attending, no piece of music would appear perfect, that did not close in it, and so naturally put an end to expectation. But as the tones used in speech are not musical, and therefore cannot refer harmonically to any other found, there can be no necessity that this terminating found (and which we immediately below term the *cadence*), should either be used at all, or follow any particular law as to form, &c. farther than what is imposed by taste and custom.

Reading. eminently conversant; for we not only understand it in one another, but also in many of the inferior creatures subjected by providence to our service.

The expression here illustrated is one of the most essential articles in good reading, since it not only gives a finishing to the sense, but, on the principles of sympathy and antipathy, has also a peculiar efficacy in interesting the heart. It is likewise an article of most difficult attainment; as it appears from what follows, that a masterly reader ought not only to be able to incorporate it with the modulation properly as to quality, but in any degree as to quantity.

Every thing written being a proper imitation of speech, expressive reading must occasionally partake of all its tones. But from what was said above, of the difference between reading and speaking, it follows, that these signs of the emotions should be less strongly characterized in the former article than in the latter. Again, as several of these tones of expression are in themselves agreeable to the mind, and raise in us agreeable emotions (as those of pity, benevolence, or whatever indicates happiness, and goodness of heart), and others disagreeable (as those of a boisterous, malevolent, and depraved nature, &c.) it farther appears, since reading is an art improving and not imitating nature, that, in whatever degree we abate the expressiveness of the tones above alluded to in the first case, it would be eligible to make a greater abatement in the latter. But as to the quantities and proportional magnitudes of these abatements, they, like many other particulars of the same nature, must be left solely to the taste and judgment of the reader.

To add one more remark, which may be of service on more accounts than in suggesting another reason for the doctrine above. Let it be remembered, that though in order to acquit himself agreeably in this article of expression, it will be necessary every reader should feel his subject as well as understand it; yet, that he may preserve a proper ease and masterliness of delivery, it is also necessary he should guard against discovering too much emotion and perturbation.

From this reasoning we deduce the following rule for the tones which indicate the passions and emotions.

“ In reading, let all your tones of expression be borrowed from those of common speech, but something more faintly characterized. Let those tones, which signify any disagreeable passion of the mind, be still more faint than those which indicate their contrary; and preserve yourself so far from being affected with the subject, as to be able to proceed through it with that peculiar kind of ease and masterliness, which has its charms in this as well as every other art.”

We shall conclude this section with the following observation, which relates to speaking as well as reading. When words fall in our way, whose “ sounds seem an echo to the sense,” as *squirr, buzz, hum, rattle, hiss, jarr*, &c. we ought not to pronounce them in such a manner as to heighten the imitation, except in light and ludicrous subjects. For instance, they should not in any other case be sounded *squir.r.r.—buzz.z.z.—hum.m.m.—r.r.rattle*, &c. On the contrary, when the imitation lies in the movement, or slow and structure of a whole passage (which frequently happens in poetry, the delivery may always be allowed to give a

Reading. heightening to it with the greatest propriety; as in the following instances, out of a number more which every experienced reader will quickly recollect.

In these deep solitudes and awful cells,  
Where heav'nly-pensive Contemplation dwells,  
And ever-mingling Melancholy reigns—

Pope's *Episto* to Abbot.

With easy course  
The vessels glide, unless their speed be stopp'd  
By dead calms, that oft lie on these smooth seas.

Dyer's *Fleece*.

Softly sweet in Lydian measure,  
Soon he sooth'd her soul to pleasure.

Dryden's *Ode on St Cecilia's day*.

Still gathering force it smokes, and urg'd amain,  
Whirls, leaps, and thunders down impetuous to the plain.

Pope's *Iliad*, B. 13.

For who to dumb forgetfulness a prey,

This pleasing anxious being e'er resign'd,  
Left the warm precincts of the cheerful day,  
Nor cast one longing ling'ring look behind?

Grey's *Elegy*.

2. Besides the particular tones and modifications of voice above described, which always accompany and express our inward agitations, nature has in these cases endowed us with another language, which, instead of the ear, addresses itself to the eye, thereby giving the communications of the heart a double advantage over those of the understanding, and as a double chance to preserve so inestimable a blessing. This language is what arises from the different, almost involuntary movements and configurations of the face and body in our emotions and passions, and which, like that of tones, every one is formed to understand by a kind of intuition.

When men are in any violent agitation of mind, this co-operating expression (as it is called) of face and gesture is very strongly marked, and totally free from the mixture of any thing which has a regard to gracefulness, or what appearance they may make in the eyes of others. But in ordinary conversation, and where the emotions are not so warm, fashionable people are perpetually insinuating, into their countenance and action, whatever they imagine will add to the ease and elegance of their deportment, or impress on the spectator an idea of their amiableness and breeding. Now though the above-mentioned natural organical signs of the emotions should accompany every thing spoken, yet from what was observed in the introductory part of this article (like the tones we have just treated upon) they should in reading be much less strongly expressed, and those suffer the greatest diminution that are in themselves the most ungainly. And as it was in the last section recommended to the reader to preserve himself as far from being affected in all passionate subjects, as to be able to keep a temperate command over the various affections of the voice, &c.; so under the sanction of this subordinate feeling he may accompany his delivery more frequently with any easy action or change of face, which will contribute to set off his manner, and make it agreeable on the principles of art.

As these calm decorations of action (as we may call them) are not altogether natural, but have their rise from a kind of institution, they must be modelled by the practices of the polite. And though mankind differ from one another scarce more in any particular, than in that of talents for adopting the graceful actions of the body, and hence nothing nothing determinate can be said of their nature and frequency, yet even those,

most

Reading.

Expression  
as to the  
face and ge-  
sture.

Reading. most happily calculated to acquit themselves well in their use, might profit by considering that it is better greatly to abridge the display, than to over-do it ever so little. For the peculiar modesty of deportment, with which the inhabitants of this kingdom are endowed, makes us in common endeavour to suppress many signs of an agitated mind; and in such cases the bodily ones in particular are very sparingly used. We have also a natural and rooted dislike to any kind of affectation; and to no species, that we can recollect, a greater, than to that which is seen in a person who pretends to mimicry and courtly gesture, without possessing the advantages and talents they require, and of which not many people, comparatively speaking, have any remarkable share.

The inference of this is too obvious to need drawing out, and we would particularly recommend it to the consideration of those readers who think the common occurrences of a newspaper, &c. cannot be properly delivered without a good deal of elbow-room.

Although it is impossible to come to particulars in any directions of this kind, yet there is one article of our present subject on which a serviceable remark may be made. In ordinary discourse, when we are particularly pressing and earnest in what we say, the eye is naturally thrown upon those to whom we address ourselves: And in reading, a turn of this organ now and then upon the hearers, when any thing very remarkable or interesting falls in the way, has a good effect in gaining it a proper attention, &c. But this should not be too frequently used; for if so, besides its having a tendency to confound the natural importance of different passages, it may not be altogether agreeable to some to have their own reflections broken in upon by a signal, which might be interpreted to hint at their wanting regulation.

One observation more, and then we shall attempt to recapitulate the substance of this section in the form of a precept. Though it is, when strictly examined, inconsistent, both in speaking and reading, to imitate with action what we are describing, yet as in any thing comic such a practice may suggest ideas that will accord with those of the subject, it may there be now and then indulged in either of these articles.

“ In a manner similar to that directed with regard to tones, moderate your bodily expressions of the signs of the emotions. And in order to supply, as it were, this deficiency, introduce into your carriage such an easy gracefulness, as may be consistent with your acquirements in these particulars, and the necessary dread which should ever be present of falling into any kind of affectation or grimace.”

V. *Pauses.* Speech consisting of a succession of distinct words, must naturally be liable (both from a kind of accident, and a difficulty there may be in beginning certain sounds or portions of phrases immediately on the ending of certain others) to several small

intermissions of voice; of which, as they can have no meaning, nothing farther need here be said. There are, however, some pauses, which the sense necessarily demands, and to these the substance of this section is directed.

The pauses are in part to distinguish the members of sentences from one another, the terminations of complete periods, and to afford an opportunity for taking breath. Besides this, they have a very graceful effect in the modulation, on the same account they are so essential in music.—In both articles, like blank spaces in pictures, they set off and render more conspicuous whatsoever they disjoin or terminate.

Where language made up of nothing but short colloquial sentences, these pauses, though they might do no harm, and would generally be graceful, would however be superseded as to use by the completeness and *narrowness*, as we may say, of the meaning. But in more diffuse language, composed of several detached sentences, and which require some degree of attention in order to take in the sense, the intermissions of voice under consideration are of the greatest service, by signifying to the mind the progress and completion of the whole passage. Now, though in extensive and differently formed periods there may be members whose completeness of sense might be conceived of various degrees, and hence might seem to require a set of pauses equally numerous; yet, since the sense does not altogether depend upon these intermissions, and their ratios to one another, if capable of being properly defined, could not be accurately observed, grammarians have ventured to conceive the whole class of pauses as reducible to the four or five kinds now in use, and whose marks and ratios are well known (G); presuming that under the eye of taste, and with the assistance of a particular to be next mentioned, they would not fail in all cases to suggest intermissions of voice suitable to the sense. But in many of these extensive and complex periods, rounded with a kind of redundancy of matter, where the full sense is long suspended, and the final words are not very important, there would be some hazard of a misapprehension of the termination, had we not more evident and infallible notice of it than that which is given by the pause. This notice is the *cadence*, referred to in the section on *Modulation*; which, as is there observed, besides the ornamental variety it affords, appears from these remarks to be a very necessary and serviceable article in perspicuous delivery.

As this cadence naturally accompanies the end of every entire sense, circuminated as above-mentioned, it may sometimes fall before the *semicolon*; but more generally before the *colon*, as well as the period: For these marks are often found to terminate a complete sense; and in these cases, the relation what follows has to what went before, is signified to the mind by the relative shortness of the stop, and the form of introducing

(G) Supposing the *comma* (,) one time, the *semicolon* (;) will be two; the *colon* (:) three, and the *period* (.) as also the marks of *interrogation* (?) and *admiration* (!) four of these times. The blank line (— or ---), and the *breaks* between *paragraphs*, intimate still greater times, and by the same analogy may be reckoned a double and quadruple period respectively. Now then these blank lines are placed immediately *after* the ordinary points, and then they are conceived only as separating for the eye the different natures of the matter;—as a question from an answer,—precept from example,—premises from inferences, &c. in which case their import is evident. But of late some authors have not scrupled to confound these distinctions; and to make a blank serve for all the pauses universally, or the mark of an indefinite rest, the quantity or which is left to the determination of the reader's taste. A practice, it is imagined, too destructive of the intended precision of these typical notices to be much longer adopted.

Reading.

cing the additional matter. Nor can any bad consequence arise from thus founding distinctions on ratios of time, which it may be said are too nice to be often rightly hit upon; for if a confusion should happen between that of the *colon* and *period*, there is perhaps no trifling a difference between the nature of the passages they succeed, as to make a small inaccuracy of no consequence. And as to the rests of the femicolon and period, it will not be easy to mistake about them, as their ratio is that of two to one. Add to this the power which the matter and introduction of the subsequent passages have to rectify any slight error here made, and we shall be fully satisfied, that the pauses, as usually explained, with the cadence above described, and a proper knowledge of the language, will convey sufficient information to the understanding of the constructive nature of the passages after which they are found.

It may be observed, that in natural speech, according to the warmth and agitation of the speaker, the rests are often short and injudiciously proportioned, and hence that every thing thus delivered cannot be so graceful as it might have been from a proper attention to their magnitude and effects.

Pauses then, though chiefly subjected to the sense, are, as was remarked at the outset, serviceable in beautifying the modulation, &c.—And since books are often inaccurately printed as to points, and people's tastes differ some little about their place and value, it appears, that, "Although in reading great attention should be paid to the stops, yet a greater should be given to the sense, and their correspondent times occasionally lengthened beyond what is usual in common speech;" which observation contains all that we shall pretend to lay down by way of rule for the management of pauses in the delivery of written language.

As there are two or three species of writing, which have something singular in them, and with regard to the manner in which they should be read, a few particular remarks seem necessarily required, we shall conclude this article with laying them before the reader.—

1. OF PLAYS, and such like CONVERSATION-PIECES. Writings of this kind may be considered as intended for two different purposes; one to unfold subject matter for the exercise of theatric powers; and the other to convey amusement, merely as fable replete with pleasing incidents and characteristic manners. Hence there appears to be great latitude for the display of a *consistent* delivery of these performances: for while, on one hand, a good reader of very inferior talents for mimicry may be heard to a tolerable degree of pleasure; on the other, if any person is qualified to give a higher degree of life and force to the dialogue and characters by delivering them as an actor, he must be fully at liberty to start from the confinement of a chair to a posture and area more suited to his abilities, and, if he be not deceived in himself, his hearers will be considerable gainers by the change.—The next article is

2. SERMONS or OTHER ORATIONS, which in like manner may be conceived intended for a double purpose. First, as matter for the display of oratorical powers; and secondly, as persuasive discourses, &c. which may be read like any other book. Therefore it appears (for reasons similar to those above) that according as cler-

Reading

gymen are possessed of the talents of elocution, they may consistently either rehearse their sermons, in the manner of an extemporary harangue, or deliver them in the more humble capacity of one who is content to entertain and instruct his hearers with reading to them his own or some other person's written discourse.

That either of these manners of delivery (or a mixture of them), in either of the cases above-mentioned, is agreeable, we find on a careful examination. For this will show us how frequently they run into one another, and that we are so far from thinking such transitions wrong, that, without a particular attention to that way, we scarce ever perceive them at all.

3. POETRY is the next and last object of our present remarks. This is a very peculiar kind of writing, and as much different from the language of ordinary discourse as the movements of the dance are from common walking. To ornament and improve whatever is subservient to the pleasures and amusements of life, is the delight of human nature. We are also pleased with a kind of *excess* in any thing which has a power to amuse the fancy, inspire us with enthusiasm, or awaken the soul to a consciousness of its own importance and dignity. Hence one pleasure, at least, takes its rise, that we feel in contemplating the performances of every art; and hence the language of poetry, consisting of a measured rhythmus, harmonious cadences, and an elevated picturesque diction, has been studied by the ingenious, and found to have a powerful influence over the human breast in every age and region. There is such an affinity between this language and music, that they were in the earlier ages never separated; and though modern refinement has in a great measure destroyed this union, yet it is with some degree of difficulty in rehearsing these divine compositions we can forget the singing of the muse.

From these considerations (and some kindred ones mentioned in sect. iii.) in repeating verses, they are generally accompanied with a modulation rather more ornamented and musical than is used in any other kind of writing. And accordingly, as there seems to be the greatest propriety in the practice, the rule for this particular in the section just referred to, will allow any latitude in it that can gain the sanction of taste and pleasure.

*Rhymes* in the lighter and more soothing provinces of poetry are found to have a good effect; and hence (for reasons like those just suggested) it is certainly absurd to endeavour to smother them by a feeble pronunciation, and running one line precipitately into another, as is often affected to be done by many of our modern readers and speakers. By this method they not only destroy one source of pleasure intended by the composer (which though not great is nevertheless genuine), but even often supply its place with what is really disagreeable, by making the rhymes, as they are interruptedly perceived, appear accidental blemishes of a different style, arising from an unmeaning recurrence of similar sounds. With regard then to reading verses terminated with rhyme, the common rule, which directs to pronounce the final words *full*, and to distinguish them by a slight pause even where is none required by the sense, seems the most rational, and consequently most worthy of being followed.

READ-

**READING**, a town of Berkshire in England, pleasantly seated on the river Kenneth, near the confluence with the Thames. It had once a fine rich monastery, of which there are large ruins remaining. It had also a castle built by king Henry I. but it was afterwards levelled with the ground. It is a corporation, enjoys several privileges, and sends two members to parliament. The two navigable rivers render it a fit place for trade. W. Long. 1. o. N. Lat. 51. 25.

**READINGS**, or *Various READINGS*, in criticism, are the different manner of reading the texts of authors in ancient manuscripts, where a diversity has arisen from the corruption of time, or the ignorance of copyists. A great part of the business of critics lies in settling the readings by confronting the various readings of the several manuscripts, and considering the agreement of the words and sense.

*Readings*, are also used for a sort of commentary or gloss on a law, text, passage, or the like, to show the sense an author takes it in, and the application he conceives to be made of it.

**REAL** (Cesar Vichard de St), a polite French writer, son of a counsellor to the senate of Chamberry in Savoy. He came young to France, distinguished himself at Paris by several ingenious productions, and resided there a long time without title or dignity, intent upon literary pursuits. He died at Chamberry in 1692, advanced in years, though not in circumstances. He was a man of great parts and penetration, a lover of the sciences, and particularly fond of history. A complete edition of his works was printed at Paris, in 3 vols 4to. 1745, and another in 6 vols 12mo.

**REALISTS**, a sect of school-philosophers formed in opposition to the nominalists.

Under the Realists are included the Scotists, Thomists, and all excepting the followers of Ocham. Their distinguishing tenet is, that universals are realities, and have an actual existence out of an idea or imagination; or, as they express it in the schools, a *parte rei*: whereas the nominalists contend, that they exist only in the mind, and are only ideas, or manners of conceiving things.

**REALITY**, in the schools, a diminutive of *res*, "thing," first used by the Scotists, to denote a thing which may exist of itself; or which has a full and absolute being of itself, and is not considered as a part of any other.

**REALM**, a country which gives its head or governor the denomination of a *king*.

**REAU MUR** (Rene Antoine Ferchault de), a celebrated French philosopher, born of a good family at Rochelle in 1683. He early discovered a genius for mathematics and physics, which he went to Paris to improve; he was admitted a member of the academy of sciences in 1708, and justified their choice by his many observations in various branches of natural philosophy. His capital work was his History of Insects, 6 vols 4to. He died in 1757, in consequence of a fall; and left a great variety of papers and natural curiosities to the academy of sciences. He is represented as a man of most amiable qualities.

**REAR**, a term frequently used in composition, to denote something behind, or backwards, in respect of

another; in opposition to *van*.

**REAR of an Army**, signifies, in general, the hindmost part of an army, battalion, regiment, or squadron; also the ground behind either.

**REAR-GUARD**, is that body of an army which marches after the main-body: for the march of an army is always composed of an advance-guard, a main-body, and a rear-guard; the first and last commanded by a general. The old grand-guards of the camp, always form the rear-guard of the army, and are to see that every thing come safe to the new camp.

**REAR Half files**, are the three hindmost ranks of the battalion, when it is drawn up six deep.

**REAR-Line**, of an army encamped, is always 1200 feet at least from the centre line; both of which run parallel to the front line, as also to the reserve.

**REAR-Rank**, is the last rank of a battalion, when drawn up, and generally 16 or 18 feet from the centre-line when drawn in open order.

**REASON**, a faculty or power of the mind, where-by it distinguishes good from evil, truth from falsehood. See **METAPHYSICS**, n<sup>o</sup> 266—282.

**REASONING**, **RATIOCINATION**, the exercise of that faculty of the mind called *reason*; or it is an act or operation of the mind, deducing some unknown proposition from other previous ones that are evident and known. See **LOGIC**, Part III.

**REBATE**, or **REBATEMENT**, in commerce, a term much used at Amsterdam for an abatement in the price of several commodities, when the buyer, instead of taking time, advances ready money.

**REBATEMENT**, in heraldry, a diminution or abatement of the bearings in a coat of arms. See **ABATEMENT**.

**REBELLION**, *Rebellio*, among the Romans, was where those who had been formerly overcome in battle, and yielded to their subjection, made a second resistance: But with us it is generally used for the taking up of arms traitorously against the king, whether by natural subjects, or others when once subdued; and the word *rebel* is sometimes applied to him who wilfully break a law; also to a villain disobeying his lord.

There is a difference between enemies and rebels. Enemies are those who are out of the king's allegiance: therefore subjects of the king, either in open war, or rebellion, are not the king's enemies, but traitors. And David prince of Wales, who levied war against Edward I. because he was within the allegiance of the king, had sentence pronounced against him as a traitor and rebel. Private persons may arm themselves to suppress rebels, enemies, &c.

**REBELLIOUS ASSEMBLY**, is a gathering together of twelve persons or more, intending or going about to practise or put in use unlawfully, of their own authority, any thing to change the law or statutes of the realm; or to destroy the inclosures of any ground, or banks of any fish-pond, pool, or conduit, to the intent the same shall lie waste and void; or to destroy the deer in any park, or any warden of conies, dove-houses, or fish in ponds; or any house, barns, mills, or bays; or to burn stacks of corn; or abate rents, or prices of victuals, &c.

**REBUTTER**, (from the Fr. *bouter*, i. e. *repellere*, to put back or bar) is the answer of defendant to

plai-

Rebus  
||  
Reclabites.

plaintiff's *surjoinder*; and plaintiff's answer to the rebutter is called a *surrebutter*: but it is very rare the parties go so far in pleading.

Rebutter is also where a man by deed or fine grants to warranty any land or hereditament to another; and the person making the warranty, or his heir, sues him to whom the warranty is made, or his heir or assignee, for the same thing; if he who is so sued, plead the deed or fine with warranty, and pray judgment, if the plaintiff shall be received to demand the thing which he ought to warrant to the party, against the warranty in the deed, &c. this is called a *rebutter*. And if I grant to a tenant to hold without impeachment of waste, and afterwards implead him for waste done, he may debar me of this action by shewing my grant; which is a *rebutter*.

REBUS, an enigmatical representation of some name, &c. by using figures or pictures instead of words, or parts of words. Camden mentions an instance of this absurd kind of wit in a gallant who expressed his love to a woman named *Rose Hill*, by painting in the border of his gown a rose, a hill, an eye, a loaf, and a well; which, in the style of the rebus, reads, "*Rose Hill I love well!*" This kind of wit was long practised by the great, who took the pains to find devices for their names. It was, however, happily ridiculed by Ben Johnson, in the humorous description of Abel Druggers's device in the Alchemists; by the Spectator, in the device of Jack of Newbery; at which time the rebus, being raised to sign-poits, was grown out of fashion at court.

RECAPITULATION, is a summary, or a concise and transient enumeration of the principal things insisted on in the preceding discourse, whereby the force of the whole is collected into one view. See ORATORY, n<sup>o</sup> 35, 127.

RECEIPT, or RECEIT, in commerce, an acquittance, or discharge, in writing, intimating that the party has received a certain sum of money, either in full for the whole debt, or in part, or on account.

RECEIVER, in pneumatics, a glass vessel for containing the thing on which an experiment in the air-pump is to be made.

RECEIVER, *receptor* or *receptor*, in law, is commonly understood in a bad sense, and used for such as knowingly receive stolen goods from thieves, and conceal them. This crime is felony, and the punishment is transportation for 14 years.

RECEPTACULUM, in botany, one of the several parts of fructification defined by Linnæus to be the base which connects or supports the other parts.

RECEPTACULUM CHYLI, or *Pecquet's reservoir*, the reservoir or receptacle for the chyle, situated in the left side of the upper vertebra of the loins, under the aorta and the vessels of the left kidney.

RECHABITES, a kind of religious order among the ancient Jews, instituted by Jonadab the son of Rechab, comprehending only his own family and posterity.

Their founder prescribed them three things: first, not to drink any wine; secondly, not to build any houses, but to dwell in tents; and thirdly, not to sow any corn, or plant vines. These rules the Rechabites observed with great strictness.

RECHEAT, in hunting, a lesson which the hunt-

man plays on the horn, when the hounds have lost their game, to call them back from pursuing a counter scent.

RECIPE, in medicine, a prescription, or remedy, to be taken by a patient: so called because always beginning with the word *recipe*, i. e. *take*; which is generally denoted by the abbreviature R.

RECIPROCAL, in general, something that is mutual, or which is returned equally on both sides, or that affects both parties alike.

RECIPROCAL Terms, among logicians, are those which have the same signification; and consequently are convertible, or may be used for each other.

RECIPROCAL Figures, in geometry, those which have the antecedents and consequents of the same ratio in both figures.

RECITATIVO, or RECITATIVE, in music, a kind of singing, that differs but little from ordinary pronunciation; such as that in which the several parts of the liturgy are rehearsed in cathedrals; or that wherein the actors commonly deliver themselves on the theatre at the opera, when they are to express some action or passion; to relate some event; or reveal some design.

RECKONING, or a *Ship's RECKONING*, in navigation, is that account whereby at any time it may be known where the ship is, and on what course or courses she is to steer, in order to gain her port; and that account taken from the log-board is called the *dead reckoning*. See NAVIGATION.

RECLAIMING, or RECLAIMING, in our ancient customs, a lord's pursuing, prosecuting, and recalling, his vassal, who had gone to live in another place without his permission.

Reclaiming is also used for the demanding of a person, or thing, to be delivered up to the prince or state to which it properly belongs; when, by any irregular means, it is come into another's possession.

RECLAIMING, in falconry, is taming a hawk, &c. and making her gentle and familiar.

A partridge is said to reclaim, when she calls her young ones together, upon their scattering too much from her.

RECLUSE, among the Papists, a person shut up in a small cell of an hermitage, or monastery, and cut off, not only from all conversation with the world, but even with the house. This is a kind of voluntary imprisonment, from a motive either of devotion or penance.

The word is also applied to incontinent wives, whom their husbands procure to be thus kept in perpetual imprisonment in some religious house.

Recluses were anciently very numerous. They took an oath never to stir out of their retreat: and having entered it, the bishop set his seal upon the door; and the recluse was to have every thing necessary for the support of life, conveyed to him through a window. If he was a priest, he was allowed a small oratory, with a window, which looked into the church, thro' which he might make his offerings at the mass, hear the singing, and answer those who spoke to him; but this window had curtains before it, so that he could not be seen. He was allowed a little garden, adjoining to his cell, in which he might plant a few herbs, and breathe a little fresh air. If he had disciples, their

Reches  
||  
Recluse

Recogni-  
tion  
||  
Record.

cells were contiguous to his, with only a window of communication, through which they conveyed necessities to him, and received his instructions. If a recluse fell sick, his door might be opened for persons to come in and assist him, but he himself was not to stir out.

**RECOGNITION**, in law, an acknowledgment; a word particularly used in our law-books for the first chapter of the statute 1 Jac. I. by which the parliament acknowledged, that, after the death of queen Elizabeth, the crown had rightfully descended to king James.

**RECOGNIZANCE**, in law, is an obligation of record, which a man enters into before some court of record or magistrate duly authorized, with condition to do some particular act; as to appear at the assizes, to keep the peace, to pay a debt, or the like. It is in most respects like another bond: the difference being chiefly this, that the bond is the creation of a fresh debt or obligation *de novo*, the recognizance is an acknowledgment of a former debt upon record; the form whereof is, "that A. B. doth acknowledge to owe to our lord the king, to the plaintiff, to C. D. or the like, the sum of ten pounds," with condition to be void on performance of the thing stipulated: in which case the king, the plaintiff, C. D. &c. is called the cognizee, *is cui cognoscitur*; as he that enters into the recognizance is called the cognizor, *is qui cognoscit*. This being certified to, or taken by the officer of some court, is witnessed only by the record of that court, and not by the party's seal: so that it is not in strict propriety a deed, though the effects of it are greater than a common obligation; being allowed a priority in point of payment, and binding the lands of the cognizor from the time of enrolment on record.

**RECOIL**, or **REBOUND**, the starting backward of a fire-arm after an explosion. Merfennus tells us, that a cannon 12 feet in length, weighing 6400 lb. gives a ball of 24 lb. an uniform velocity of 640 feet per second. Putting, therefore,  $W=6400$ ,  $w=14$ ,  $V=640$ , and  $v$  = the velocity with which the cannon recoils; we shall have (because the momentums of the cannon and ball are equal)  $Wv=wV$ ; and so  $v = \frac{wV}{W} = \frac{24 \times 64}{6400} = 2, 4$ ; that is, it would recoil at the rate of  $2\frac{4}{5}$  feet per second, if free to move.

**RECOLLECTION**, a mode of thinking, by which ideas sought after by the mind are found and brought to view.

**RECONNOITRE**, in military affairs, implies to view and examine the state of things, in order to make a report thereof.

Parties ordered to reconnoitre are to observe the country and the enemy; to remark the routes, conveniences, and inconveniences of the first; the position, march, or forces of the second. In either case, they should have an expert geographer, capable of taking plans readily: he should be the best mounted of the whole, in case the enemy happen to scatter the escorte, that he may save his works and ideas. See **WAR**.

**RECORD**, an authentic testimony in writing, contained in rolls of parchment, and preserved in a court of record. See **COURT**.

Record  
||  
Recovery.

*Trial by RECORD*, a species of trial which is used only in one particular instance: and that is where a matter of record is pleaded in any action, as a fine, a judgment, or the like; and the opposite party pleads, *nil tiel record*, that there is no such matter of record existing. Upon this, issue is tendered and joined in the following form, "and this he prays may be inquired of by the record, and the other doth the like;" and hereupon the party pleading the record has a day given him to bring it in, and proclamation is made in court for him to "bring forth the record by him in pleading alleged, or else he shall be condemned;" and, on his failure, his antagonist shall have judgment to recover. The trial, therefore, of this issue, is merely by the record: for, as Sir Edward Coke observes, a record or enrolment is a monument of so high a nature, and importeth in itself such absolute verity, that if it be pleaded that there is no such record, it shall not receive any trial by witness, jury, or otherwise, but only by itself. Thus titles of nobility, as whether earl or no earl, baron or no baron, shall be tried by the king's writ or patent only, which is matter of record. Also in case of an alien, whether alien friend or enemy, shall be tried by the league or treaty between his sovereign and ours; for every league, or treaty is of record. And also, whether a manor be held in ancient demesne or not, shall be tried by the record of domesday in the king's exchequer.

**RECORDER**, a person whom the mayor and other magistrates of a city or corporation associate to them, for their better direction in matters of justice and proceedings in law; on which account this person is generally a counsellor, or other person well skilled in the law.

The recorder of London is chosen by the lord mayor and aldermen; and as he is held to be the mouth of the city, delivers the judgment of the courts therein, and records and certifies the city-customs.

**RECOVERY**, or **Common RECOVERY**, in English law, a species of assurance by matter of record; concerning the original of which it was observed under the article **TAIL**, that common recoveries were invented by the ecclesiastics to elude the statutes of mortmain; and afterwards encouraged by the fineffe of the courts of law in 12 Ed. IV. in order to put an end to all fettered inheritances, and bar not only estates-tail, but also all remainders and reversions expectant thereon. We have here, therefore, only to consider, first, the nature of a common recovery; and, secondly, its force and effect.

1. A common recovery is a suit or action, either *Blackf.* actual or fictitious: and in it the lands are recovered *Comment.* against the tenant of the freehold; which recovery, being a supposed adjudication of the right, binds all persons, and vests a free and absolute fee-simple in the recoveror. To explain this as clearly and concisely as possible, let us, in the first place, suppose David Edwards to be tenant of the freehold, and desirous to suffer a common recovery, in order to bar all entails, remainders, and reversions, and to convey the same in fee-simple to Francis Gilding. To effect this, Gilding is to bring an action against him for the lands; and he accordingly sues out a writ called a *precepto quod reddat*, because these were its initial or most operative words when the law-proceedings were in Latin. In this writ the demandant Gilding alleges, that the defend-

Recovery. ant Edwards (here called the tenant) has no legal title to the land; but that he came into possession of it after one Hugh Hunt had turned the demandant out of it. The subsequent proceedings are made up into a record or recovery roll, in which the writ and complaint of the demandant are first recited: whereupon the tenant appears, and calls upon one Jacob Morland, who is supposed, at the original purchase, to have warranted the title to the tenant; and thereupon he prays, that the said Jacob Morland may be called in to defend the title which he so warranted. This is called the *voucher*, "vocation," or calling of Jacob Morland to warranty; and Morland is called the *vouchee*. Upon this Jacob Morland, the *vouchee*, appears, is implicated, and defends the title. Whereupon Golding the demandant desires leave of the court to imparl, or confer with the *vouchee* in private; which is (as usual) allowed him. And soon afterwards the demandant Golding returns to court; but Morland the *vouchee* disappears, or makes default. Whereupon judgment is given for the demandant Golding, now called the *recoveror*, to recover the lands in question against the tenant Edwards, who is now the *recoveree*: and Edwards has judgment to recover of Jacob Morland lands of equal value, in recompense for the lands so warranted by him, and now lost by his default; which is agreeable to the doctrine of warranty mentioned in the preceding chapter. This is called the *recompense*, or *recovery in value*. But Jacob Morland having no lands of his own, being usually the crier of the court, (who, from being frequently thus vouched, is called the *common vouchee*), it is plain that Edwards has only a nominal recompense for the lands so recovered against him by Golding; which lands are now absolutely vested in the said recoveror by judgment of law, and seisin thereof is delivered by the sheriff of the county. So that this collusive recovery operates merely in the nature of a conveyance in fee-simple, from Edwards the tenant in tail to Golding the purchaser.

The recovery here described, is with a single vouchor only; but sometimes it is with a double, treble, or farther vouchor, as the exigency of the case may require. And indeed it is now usual always to have a recovery with double vouchor at the least: by first conveying an estate of freehold to any indifferent person, against whom the *procipe* is brought; and then he vouches the tenant in tail, who vouches over the common *vouchee*. For, if a recovery be had immediately against tenant in tail, it bars only such estate in the premises of which he is then actually seized; whereas if the recovery be had against another person, and the tenant in tail be vouch'd, it bars every latent right and interest which he may have in the lands recovered. If Edwards therefore be tenant of the freehold in possession, and John Barker be tenant in tail in remainder, here Edwards doth first vouch Barker, and then Barker vouches Jacob Morland the common *vouchee*; who is always the last person vouch'd, and always makes default; whereby the demandant Golding recovers the land against the tenant Edwards, and Edwards recovers a recompense of equal value against Barker the first *vouchee*; who recovers the like against Morland the common *vouchee*, against whom such ideal recovery in value is always ultimately awarded.

This supposed recompense in value is the reason why

the issue in tail is held to be barred by a common recovery. For, if the *recoveree* should obtain a recompense in lands from the common *vouchee* (which there is a possibility in contemplation of law, though a very improbable one, of his doing) these lands would supply the place of those so recovered from him by collusion, and would defend to the issue in tail. The reason will also hold with equal force as to most remaindermen and reversioners, to whom the possibility will remain and revert, as a full recompense for the reality which they were otherwise entitled to: but it will not always hold; and therefore, as Pigott says, the judges have been even *astuti*, in inventing other reasons to maintain the authority of recoveries. And, in particular, it hath been said, that though the estate-tail is gone from the *recoveree*; yet it is not destroyed, but only transferred, and still subsists; and will ever continue to subsist (by construction of law) in the recoveror, his heirs and assigns: and as the estate-tail so continues to subsist for ever, the remainders or reversioners expectant on the determination of such estate-tail can never take place.

To such awkward shifts, such subtle refinements, and such strange reasoning, were our ancestors obliged to have recourse, in order to get the better of that stubborn statute *de donis*. The design for which these contrivances were set on foot, was certainly laudable; the unriveting the fetters of estates-tail, which were attended with a legion of mischiefs to the commonwealth: but, while we applaud the end, we cannot but admire the means. Our modern courts of justice have indeed adopted a more manly way of treating the subject: by considering common recoveries in no other light than as the formal mode of conveyance by which tenant in tail is enabled to alienate his lands. But, since the ill consequences of fettered inheritances are now generally seen and allowed, and of course the utility and expedience of setting them at liberty are apparent, it hath often been wished, that the process of this conveyance was shortened, and rendered less subject to niceties, by either totally repealing the statute *de donis*; which perhaps, by reviving the old doctrine of conditional fees, might give birth to many litigations: or by vesting in every tenant in tail, of full age, the same absolute fee-simple at once, which now he may obtain whenever he pleases, by the collusive fiction of a common recovery; though this might possibly bear hard upon those in remainder or reversion, by abridging the chances they would otherwise frequently have, as no recovery can be suffered in the intervals between term and term, which sometimes continue for near five months together: or, lastly, by empowering the tenant in tail to bar the estate-tail by a solemn deed, to be made in term-time, and enrolled in some court of record; which is liable to neither of the other objections, and is warranted not only by the usage of our American colonies, but by the precedent of the statute 21 Jac. I. c. 19, which, in the case of a bankrupt tenant in tail, empowers his commissioners to sell the estate at any time, by deed indented and enrolled. And if, in so national a concern, the emoluments of the officers concerned in passing recoveries are thought to be worthy attention, those might be provided for in the fees to be paid upon each enrollment.

2. The force and effect of common recoveries may

Recovery  
||  
Recruits.

appear, from what has been said, to be an absolute bar not only of all estates tail, but of remainders and reversions expectant on the determination of such estates. So that a tenant in tail may, by this method of assurance, convey the lands held in tail to the recoverer, his heirs and assigns, absolutely free and discharged of all conditions and limitations in tail, and of all remainders and reversions. But, by statute 34 & 35 H. VIII. c. 20. no recovery had against tenant in tail of the king's gift, whereof the remainder or reversion is in the king, shall bar such estate-tail, or the remainder or reversion of the crown. And by the statute 11 H. VII. c. 20. no woman, after her husband's death, shall suffer a recovery of lands settled on her by her husband, or settled on her husband and her by any of his ancestors. And by statute 14 Eliz. c. 8. no tenant for life, of any sort, can suffer a recovery so as to bind them in remainder or reversion. For which reason, if there be tenant for life, with remainder in tail, and other remainders over, and the tenant for life is desirous to suffer a void recovery, either he, or the tenant to the *præcipe* by him made, must vouch the remainder-man in tail, otherwise the recovery is void: but if he does vouch such remainder-man, and he appears and vouches the common vouchee, it is then good; for if a man be vouched and appears, and suffers the recovery to be had, it is as effectual to bar the estate-tail as if he himself were the recoverer.

In all recoveries, it is necessary that the recoverer, or tenant to the *præcipe*, as he is usually called, be actually seized of the freehold, else the recovery is void. For all actions to recover the seisin of lands must be brought against the actual tenant of the freehold, else the suit will lose its effect; since the freehold cannot be recovered of him who has it not. And, though these recoveries are in themselves fabulous and fictitious, yet it is necessary that there be *actores fabulosi*, properly qualified. But the nicety thought by some modern practitioners to be requisite in conveying the legal freehold, in order to make a good tenant to the *præcipe*, is removed by the provisions of the statute 14 Geo. II. c. 20. which enacts, with a retrospect and conformity to the ancient rule of law, that, though the legal freehold be veiled in lessees, yet those who are entitled to the next freehold estate in remainder, or reversion, may make a good tenant to the *præcipe*; and that, though the deed or fine which creates such tenant be subsequent to the judgment of recovery, yet if it be in the same term, the recovery shall be valid in law; and that though the recovery itself do not appear to be entered, or be not regularly entered on record, yet the deed to make a tenant to the *præcipe*, and declare the uses of the recovery, shall after a possession of 20 years be sufficient evidence on behalf of a purchaser for valuable consideration, that such recovery was duly suffered.

RECREANT, COWARDLY, *Faint-hearted*; formerly a word very reproachful. See BATTLE.

CREMENT, in chemistry, some superfluous matter separated from some other that is useful; in which sense it is the same with *scoria*, *scæces*, and *excrements*.

RECRIMINATION, in law, an accusation brought by the accused against the accuser upon the same fact.

RECRUITS, in military affairs, new-raised soldiers designed to supply the place of those who have lost

their lives in the service, or who are disabled by age or wounds.

RECTANGLE, in geometry, the same with a right-angled parallelogram. See GEOMETRY.

RECTIFICATION, in chemistry, is nothing but the repetition of a distillation or sublimation several times, in order to render the substance purer, finer, and freer from aqueous and earthy parts.

RECTIFICATION of Spirits. See DISTILLATION.

RECTIFIER, in navigation, an instrument consisting of two parts, which are two circles, either laid one upon, or let into the other, and so fastened together in their centres, that they represent two compasses, one fixed, the other moveable; each of them divided into the 32 points of the compass, and 360°, and numbered both ways, from the north and the south, ending at the east and west, in 90°.

The fixed compass represents the horizon, in which the north and all the other points of the compass are fixed and immovable.

The moveable compass represents the mariners compass; in which the north and all other points are liable to variation.

In the centre of the moveable compass is fastened a silk thread, long enough to reach the outside of the fixed compass. But if the instrument be made of wood, there is an index instead of the thread.

Its use is to find the variation of the compass, to rectify the course at sea; having the amplitude or azimuth given.

RECTIFYING the GLOBE. See GEOGRAPHY, n° 33—35.

RECTILINEAR, in geometry, right-lined; thus figures whose perimeter consists of right lines, are said to be rectilinear.

RECTITUDE, in philosophy, refers either to the act of judging or of willing; and therefore whatever comes under the denomination of rectitude is either what is true or what is good, these being the only objects about which the mind exercises its two faculties of judging and willing.

Moral rectitude, or uprightness, is the choosing and pursuing those things which the mind, upon due inquiry and attention, clearly perceives to be good; and avoiding those that are evil.

RECTOR, a term applied to several persons whose offices are very different: as, 1. The rector of a parish is a clergyman that has the charge and cure of a parish, and possesses all the tithes, &c. 2. The same name is also given to the chief elective officer in several foreign universities, particularly in that of Paris. 3. Rector is also used in several convents for the superior officer who governs the house: and the Jesuits give this name to the superiors of such of their houses as are either seminaries or colleges.
