On the proofs of the identity of the vegetable acids with one another, Mr Keir makes the following remarks: "The experiments and obſervations which have been made, prove evidently a ſtrong analogy between the acetous acid, ſpirit of wine, tartar, and acid of ſugar; and they ſeem to ſhow the exiſtence of a common principle or baſis in all of them, modified either by the addition of another principle not common to all of them, or by different proportions of the ſame principle. None of the opinions on this ſubject, however, are quite ſatisfactory. The production of the acetous acid by treating ſpirit of wine with other acids, does not prove that the acetous acid was contained in the ſpirit of wine, but only in concurrence with them, that they contain ſome common principle. There is no fact adduced to ſupport Morveau's opinion, that fixed air is abſorbed during the acetous fermentation; or that the preſence of this fixed air is neceſſary. The decompoſition of all vegetable acids by heat, and the production therefrom of fixed and inflammable gaſes, ſhow that theſe acids contain ſome of the ſame principles as theſe elaſtic fluids, but do not prove that the gaſes exiſted in the fluids. We have good reaſon to believe that acetous acid does not contain any fixed air already formed; for it yields none when vitriolic acid is added to it, or to foliated earth; nevertheleſs, my opinion that vegetable and animal acids are, by heat, in a great meaſure convertible into fixed air, ſeems to be ſufficiently proved by experiments. Thus Hales has ſhown the great quantities of this gas which tartar yields on diſtillation. Berthollet has obtained the fixed and inflammable gaſes from foliated earth; and Dr Higgins has verified this experiment, and deduced the quantities. From 7680 grains of foliated earth, the Doctor obtained.

Indentity of the vegetable acids.

1542 Quantities of the different ſubſtance obtained from foliated earth.

Cauſtic alkali -	3862.994 grains.
Fixed air -	1473.564
Inflammable air -	1047.6018
Oily matter retained in the reſiduum - - -	78
Oil - - -	182
Water condenſed -	340
Deficiency attributed chiefly to water - -	726.9402"

As fixed and inflammable gaſes may be obtained from every vegetable ſubſtance by fire, nothing can be inferred from theſe experiments to explain particularly the nature of the acetous acid, excepting that it contains ſome of the inflammable matter common to the vegetable kingdom, and eſpecially of the matter common to vegetable acids; all which alſo, when analyſed, furniſh large quantities of theſe two gaſes.

1543 Air abſorbed in the formation of all acids.

"Although we are far (adds our author) from the knowledge requiſite to give a complete theory of the acetous fermentation, yet it may be uſeful to explain the ideas that appear moſt probable. In all the inſtances that we know of the formation of acids, whether effected by combuſtion, as the acids of ſulphur and phoſphorus, or by repeated abſtractions of nitrous acid, as in the proceſs for making acid of ſugar, a very ſenſible quantity of pure air is abſorbed. In the caſe of combuſtion we know, from the weight acquired, that there is a great abſorption of air; and in the latter caſe, of acids being produced by application of nitrous acid, as this acid conſiſts of nitrous and pure air, and as in theſe operations a quantity of the nitrous gas is expelled, there ſeems but little doubt that there alſo the pure air of the nitrous acid is united with the ſubſtance employed in the formation of the new acid. Hence, from all that we know, the abſorption of air takes place in all acidifying proceſſes. But it alſo actually takes place in the acetous fermentation, as has been obſerved, particularly by the Abbe Rozier; and it is generally known, that air is neceſſary to the formation of vinegar. The next queſtion is, What is the baſis? And from the experiments already related, of forming the acetous acid by means of ſpirit of wine, it ſeems probable, either that this ſpirit is the baſis of the acetous acid, or that it contains this baſis: and from the convertibility of the acids of tartar and of ſugar

Identity of the vegetable acids.

ſugar into the acetous acid by the proceſſes above deſcribed, it ſeems probable that theſe alſo contain the ſame common baſis; which, being united with a determined quantity of pure air, forms acid of tartar; with a larger quantity, acid of ſugar; and with a ſtill larger, the acetous acid.

1544 Inflammable ſpirit produced from radical vinegar.

“ An inflammable ſpirit is ſaid to appear at the end of the diſtillation of radical vinegar from verdigris. Now, if the ardent ſpirit were contained in the verdigris, as it is more volatile than the acid, it ought to come over firſt; but as it appears only towards the end of the diſtillation, it ſeems to be formed during the operation; and I imagine, that the metal, when almoſt deprived of its acid, attracts ſome of the air of the remaining acid; and the part or baſis of the acid thus deprived of its air becomes then an inflammable ſpirit, and in ſome caſes an oil appears. But as the quantity of acid thus decompoſed is very ſmall, and little air of conſequence remains united with the metallic part of the verdigris, the copper appears rather in a metallic than calciform ſtate after the operation. But zinc, during its ſolution in concentrated vinegar, decompoſes the acid as it does the vitriolic and other ſtrong acids, and accordingly inflammable vapours are produced; and what is remarkable, theſe vapours have a ſulphureous ſmell. Iron always, during its ſolution in concentrated vinegar, produces an expulſion of inflammable vapours; which, however, do not explode like inflammable gas.

1545 Sulphureous inflammable vapours produced from it.

1546 Of the conſtituent parts of the acetous acid.

“ We muſt not imagine that we are yet able to explain completely what paſſes in the acetous fermentation, or that the acetous acid is a compound of mere ſpirit and pure air. Beſides this combination of ſpirit and air, it is obſerved, that a precipitation always takes place before the fermentation is completed, of ſome mucilaginous matter, which diſpoſes the vinegar to putrefy, and from which it therefore ought to be carefully ſeparated. Stahl affirms, that without a depoſition of ſuch ſediment, vinegar cannot be made from ſugar, wine, or other juice. Beſides the matter that is depoſited, probably as much remains in the liquor as can be diſſolved therein; for, by diſtillation, much of a ſimilar extractive matter is left in the retort. What the nature of this matter is, and how it is formed, has not yet been examined. Though diſtillation frees the acid from much of this extractive ſubſtance, yet we have no reaſon to believe that we have ever obtained it entirely free from inflammable matter; as it retains it even when combined with alkalies and with metals. When ſugar of lead and other acetous ſalts are diſtilled with a ſtrong heat, the ſubſtances remaining in the retort have been obſerved to poſſeſs the properties of a pyrophorus; and this will happen whatever pains have been taken to purify the vinegar employed. See the article Pyrophorus. This fact ſhows the exiſtence of an inflammable matter in this acid; and which may perhaps be eſſential in its compoſition, and neceſſary to its properties. Although fermentation is the uſual mode of obtaining acetous acid, yet it appears from the inſtances obſerved by latter chemiſts, that it is not eſſential to its formation, but that it is alſo formed in various chemical proceſſes; and the acid obtained by diſtillation from woods, wax, &c. are very analogous to vinegar. It appears alſo on treating the acid of ſugar with nitrous acid, as has been obſerved both by Weſtrumb and Scheele. The latter further acquaints us, that he obtained it in analyſing a tallow like oil, which remained undiſſolved upon digeſting ſtarch in nitrous acid. As acid of ſugar alſo may be obtained from a variety of animal ſubſtances, and as this acid is convertible into the acetous we have one reaſon more added to many others, to prove that the matters of vegetable and animal ſubſtances are not capable of any chemical diſtinction.”

1547 It is formed in various chemical proceſſes.

Addition to Sect. I. § 20.

XVIII. Addition to Sect. I. § 20. *concerning the volatility of a Mixture of Marine and Nitrous Acids.*

1548 How to deprive aqua-regia of its volatility.

This is much leſs ſenſible when the acids are weak than when they are concentrated. On mixing the two when moderately ſmoking, and which had remained for a long time ſeparate without occaſioning any diſturbance, a vaſtly ſmoking aqua-regia has been produced, which would either drive out the ſtopple, or burſt the bottle in warm weather. On diſtilling a pretty ſtrong nitrous acid from ſal ammoniac, M. Beaumé obſerved, that the vapours which came over were ſo exceedingly elaſtic, that notwithſtanding every precaution which could be taken in ſuch a caſe, the diſtillation could not be continued. By letting this eſcape, however, Mr Cornette obſerved, that the diſtillation of theſe two ſubſtances may be carried on to the end without any inconvenience, and the aqua-regia will then be no longer troubleſome.

XIX. *Test for Acids and Alkalies.*

The general method recommended for diſcovering a ſmall quantity of acid or alkali in any liquid, is by trying it with any vegetable blue, ſuch as ſyrup of violets; when, if the acid prevails in the liquor, the ſyrup will acquire a red colour, more or leſs deep according to the quantity of acid; or if the alkali prevail, it will change the ſyrup green in like proportion. Since the late improvements in chemiſtry, however, the ſyrup has been found deficient in accuracy, and the infuſion of turneſole, or of an artificial preparation called litmus, have been ſubſtituted inſtead of it. The infuſion of litmus is blue, and, like ſyrup of violets, becomes red with acids. It is ſo ſenſible that it will diſcover one grain of oil of vitriol though mixed with 100,000 of water. Unfortunately, however, this infuſion does not change its colour on mixture with alkalies; it is therefore neceſſary to mix it with juſt as much vinegar as will turn the infuſion red, which will then be reſtored to its blue colour by being mixed with any alkaline liquor. The blue infuſion of litmus is alſo a teſt of the preſence of fixed air in water, with which it turns red, as it does with other acids.

1549 Inaccuracy of the common teſts.

The great ſenſibility of this teſt would leave very little reaſon to ſearch for any other, were it always an exact teſt of the point of ſaturation of acids and alkalies; but, from the following fact, this appears to Mr Watt to be dubious. A mixture of phlogiſticated nitrous acid with an alkali will appear to be acid by the teſt of litmus, when other teſts, ſuch as the infuſion of the petals of the ſcarlet roſe, of the blue iris, of violets, and of other flowers, will ſhow the ſame liquor to be alkaline, by turning green ſo evidently as to leave no room to doubt.

When Mr Watt made this diſcovery, the ſcarlet roſes,

ſes, and ſeveral other flowers, whoſe petals change their colour by acids and alkalies, were in flower. Having ſtained paper with their juices, he found that it was not affected by the phlogiſticated nitrous acid, excepting in ſo far as it acted the part of a neutralizing acid; but he found alſo, that, paper ſtained in this manner was much leſs eaſily effected than litmus was; and that, in a ſhort time, it loſt much of the ſenſibility which it poſſeſſed at firſt; and having occaſion in winter to repeat ſome experiments in which the phlogiſticated nitrous acid was concerned, he found his ſtained paper almoſt uſeleſs. Searching, therefore, for ſome other vegetables which might ſerve for a teſt at all ſeaſons of the year, he found the red cabbage to anſwer his purpoſe better than any other; having both more ſenſibility with regard to acids than litmus, being naturally blue, and turning green with alkalies, and red with acids; to all which is joined the advantage of its being no farther affected by the phlogiſticated acid of nitre than as it acts as a real acid.

1550 Red cabbage anſwers the purpoſe beſt.

1551 How to prepare it for uſe.

To prepare this teſt, Mr Watt recommends to take the freſheſt leaves of the cabbage; to cut out the large ſtems, and mince the thin parts of the leaves very ſmall; then to digeſt them in water at about the heat of 120 degrees for a few hours, when they will yield blue liquor; which, if uſed immediately as a teſt, will be found to poſſeſs great ſenſibility: but as in this ſtate it is very apt to turn putrid, ſome of the following methods muſt be uſed for preſerving it.

1. After having minced the leaves, ſpread them on paper, and dry them in a gentle heat; when perfectly dry, put them up in glaſs bottles well corked; and, when you want to uſe them, acidulate ſome water with vitriolic acid, and digeſt or infuſe the dry leaves in it, until they give out their colour; then ſtrain the liquor through a cloth, and add to it a quantity of fine whiting or chalk, ſtirring it frequently, until it becomes of a true blue colour, neither inclining to green nor purple; when you perceive that it has acquired this colour, filter it immediately; otherwiſe it will become greeniſh by ſtanding longer on the whiting. This liquor will depoſit a ſmall quantity of gypſum, and, by the addition of a little ſpirit of wine, will keep good for ſome days; but will then become ſomewhat putrid and reddiſh. If too much ſpirit is added, it deſtroys the colour. If the liquor is wanted to keep longer, it may be neutralized by a fixed alkali inſtead of chalk.

2. As thus the liquor cannot be long preſerved without requiring to be neutralized afreſh juſt before it is uſed; and as the putrid fermentation which it undergoes, and perhaps the alkalies or ſpirit of wine mixed with it, ſeem to leſſen its ſenſibility; in order to preſerve its virtues while kept in a liquid ſtate, ſome freſh leaves of the cabbage, minced as above directed, may be infuſed in a mixture of vitriolic acid and water, of about the degree of acidity of vinegar; and it may be neutralized, as it is wanted, either by means of chalk, or of the fixed or volatile alkali. It muſt be obſerved, however, that if the liquor has an exceſs of alkali, it will ſoon loſe its colour, and become yellow; from which ſtate it cannot be reſtored; care ſhould therefore be taken to bring it very exactly to a blue, and not to let it verge towards a green.

3. In this manner, Mr Watt prepared a red infuſion of violets; which, on being neutralized, formed a very ſenſible teſt, though he did not know how long theſe properties would be preſerved; but he is of opinion that the coloured infuſions of other vegetables may be preſerved in the ſame manner by the antiſeptic power of the vitriolic acid, in ſuch a manner as to loſe little of their original ſenſibility. Paper freſh ſtained with theſe teſts, in their neutral ſtate, has ſufficient ſenſibility for many experiments; but the alum and glue which enter into the preparation of writing paper, ſeem, in ſome degree, to fix the colour; and paper which is not ſized becomes ſomewhat tranſparent when wetted; which renders ſmall changes of colour imperceptible. Where accuracy is required, therefore, the teſt ſhould be uſed in a liquid taſte.

1552 Various other teſts.

4. Our author has found that the infuſion of red cabbage, as well as of various flowers in water, acidulated by means of vitriolic acid, are apt to turn mouldy in the ſummer ſeaſon, and likewiſe that the moulding is prevented by an addition of ſpirit of wine. He has not been able to aſcertain the quantity of ſpirit neceſſary for this purpoſe, but adds it by little and little at a time until the proceſs of moulding is ſtopped.—Very ſenſible teſts are afforded by the petals of the ſcarlet roſe, and of the pink coloured lychnis treated in the abovementioned manner.

XX. *Volatile Alkali.*

1553 Volatile alkali prepared from nitrous acid and tin.

Mr Higgins claims the firſt diſcovery of the conſtituent parts of volatile alkali, or at leaſt of an experiment leading to it. "About the latter end of March 1785 (ſays he), I found that nitrous acid poured on tin filings, and immediately mixed with fixed vegetable alkali, generated volatile alkali in great abundance: ſo ſingular a fact did not fail of deeply impreſſing my mind, though at the time I could not account for it. About a fortnight after, I mentioned the circumſtance to Dr Brockleſby. He told me he was going to meet ſome philoſophical gentlemen at Sir Joſeph Banks's, and deſired I would generate ſome alkali to exhibit before them: accordingly I did; and had the pleaſure of accompanying him thither. The December following I mentioned the fact to Dr Caulet, and likewiſe the copious generation of volatile alkali from Pruſſian blue, vegetable alkali, and water; on which we agreed to make a ſet of experiments upon the ſubject. At preſent I ſhall only give an account of the following, which drew our particular attention. Into a glaſs cylinder, made for the purpoſe, we charged three parts of alkaline air, and to this added one part of dephlogiſticated air; we paſſed the electrical ſpark repeatedly in it, without apparently effecting the ſmalleſt change. When it had received about 100 ſtrong ſhocks, a ſmall quantity of moiſture appeared on the ſides of the glaſs, and the braſs conductors ſeemed to be corroded; when we had paſſed 60 more ſhocks in it, the quantity of moiſture ſeemed to increaſe, and acquire a greeniſh colour, though at this time the column of air ſuffered no diminution. On examining the air, it burned with a languid greeniſh flame, from which we inferred that the dephlogiſticated air was totally condenſed: it ſtill retained an alkaline ſmell; and the alkaline part was not readily abſorbed by water.

1555 Effects of the electric ſpark on it.

Pruſſian blue.

“From Mr Cavendiſh's famous diſcovery of the conſtituent parts of water we could readily account for the loſs of the dephlogiſticated air in this experiment; but the quantity of water was more than we could expect from this: therefore water muſt have been precipitated from the decompoſed alkali; for volatile alkali, from its great attraction to water, muſt keep ſome in ſolution even in its aeriform ſtate. From the above circumſtances it might be expected, that a contraction of the column of air ſhould take place; but it muſt be conſidered, that the union took place gradually in proportion as the alkali was decompoſed; and that, in this caſe, the expanſion muſt equal the condenſation. During the ſpring of 1786 I had often an opportunity of mentioning different facts to Dr Auſtin relating to volatile alkali, who at that time was too much engaged to pay attention to the ſubject. In the end of Auguſt 1787, he gave me an account of a ſet of experiments which he had made, and which actually proved, that volatile alkali conſiſts of light inflammable and phlogiſticated airs; not knowing at that time what Meſſrs Houſman and Berthollet had done. Without depreciating the merit of theſe two gentlemen, Dr Auſtin has an equal claim to the diſcovery, laying aſide priority; as his experiments are as deciſive as theirs. Dr Prieſtley made the firſt ſtep towards our knowledge of volatile alkali.”

1556 True compoſition of volatile alkali.

XXI. *PRUSSIAN BLUE.*

1557 Woulfe's teſt for mineral waters.

THE acid of this ſubſtance, as far as it contains an acid, is ſuppoſed to be that of phoſphorus. Mr Woulfe propoſed a teſt of this kind for diſcovering iron in mineral waters, which, he obſerved, would not be affected by acids; but the lixivium deſcribed by him had the bad property of letting fall the Pruſſian blue it contains in a few weeks. The precipitate of copper, however, treated again with alkali, retained this property upwards of nine months. The volatile alkali, he obſerves, is diſſolved by the Pruſſian acid; and the cryſtals depoſited are rendered blue by the colouring matter, though the colour at firſt is loſt by the union of the alkali with the ſubſtance already made. The metals were precipitated by this teſt of the following colours: Gold of a browniſh yellow, the precipitate afterwards becoming of a full yellow; platina of a deep blue, but when quite pure, of a yellow colour, turning ſlightly green. Silver in the nitrous acid was precipitated of a whitiſh colour; copper from all the different acids was precipitated of a deep brown colour, the liquid remaining greeniſh; green vitriol let fall a deep blue powder, leaving a colourleſs lixivium; ſugar of lead and muriated tin gave a white powder; nitrated mercury a white or yellowiſh precipitate; the Illfeld manganeſe a browniſh, but that from Devonſhire a blue, which firſt became aſh-coloured and then reddiſh. Nitrated biſmuth afforded a white precipitate, and the lixivium was ſlightly green: muriated antimony yielded a white precipitate, with a yellowiſh lixivium: vitriolated zinc a whitiſh: cobalt in aqua-regia a reddiſh white powder: the precipitate of arſenic and the different earths was commonly white.

1558 Effect of it on various metallic ſolutions.

XXIII. *NEW CHEMICAL NOMENCLATURES.*

New chemical nomenclatures.

1. *Of that propoſed in 1787 by Meſſrs Morveau, Berthollet, Fourcroy, and Lavoiſier.*

WHEN this nomenclature was firſt publiſhed, M. Lavoiſier informs us, that ſome blame was thrown upon the authors for changing the language, which had received the ſanction of their maſters, and been adopted by them. In anſwer to this, however, he urges, that Meſſrs Bergman and Macquer had expreſſed a wiſh for ſome reformation in the chemical language. Mr Bergman had even written to M. Morveau on the ſubject in the following terms. “Show no favour to any improper denomination: Thoſe who are already poſſeſſed of knowledge, cannot be deprived of it by new terms; thoſe who have their knowledge to acquire, will be enabled by your improvement on the language of the ſcience to acquire it ſooner.”

1559 Bergman's letter to Morveau on this ſubject.

1560 Lavoiſier's explanation of the new nomenclature.

The following is M. Lavoiſiers explanation of the principles on which his new language is compoſed. “Acids conſiſt of two ſubſtances, belonging to that order which comprehends ſuch as appear to us to be ſimple ſubſtances. The one of theſe is the principle of acidity, and common to all acids; from it therefore ſhould the name of the claſs and genus be borrowed: The other, which is peculiar to each acid, and diſtinguiſhes them from one another, ſhould ſupply the ſpecific name. But in moſt of the acids, the two conſtituent principles, the acidifying and the acidifyed, may exiſt in different proportion, forming different degrees of equilibrium or ſaturation; this is obſerved of the *ſulphuric* and *ſulphureous* acid. Theſe two ſtates of the ſame acid we have expreſſed by varying the termination of the ſpecific name.

“Metallic ſubſtances, after being expoſed to the compound action of air and fire, loſe their metallic luſtre, gain an increaſe of weight, and aſſume an earthy appearance. In this ſtate they are, like acids, compound bodies, conſiſting of one principle common to them all, and another peculiar to each of them. We have therefore in like manner claſſed them under a generic name, derived from the principle which is common to them all. The name which we have adopted is *Oxide*: The peculiar names of the metals from which they are formed, ſerve to diſtinguiſh theſe compounds from one another.

“Combſtuible ſubſtances, which, in acids and metallic oxides, exiſt as ſpecific and peculiar principles, are capable of becoming, in their turn, the common principle of a great number of ſubſtances. Combinations of ſulphur, were long the only compounds of this ſort known: but of late the experiments of Meſſrs Vandermonde, Monge, and Berthollet, have ſhown that coal combines with iron and perhaps with various other metals; and that the reſult of its combination with iron are, according to the proportions, ſteel, plumbago, &c. It is alſo known from the experiments of M. Pelletier, that phoſphorus combines with many metallic ſubſtances. We have therefore arranged theſe different combinations together under generic names, formed from the name of the common ſubſtance, with a termination indicating this analogy; and have diſtinguiſhed them from each other by ſpecific names derived from the names of the peculiar ſubſtances.

"It was found ſomewhat more difficult to form a nomenclature for the compounds of thoſe three ſimple ſubſtances; becauſe they are ſo very numerous, and ſtill more, becauſe it is impoſſible to expreſs the nature of their conſtituent principles, without uſing more compound names. In bodies belonging to this claſs, ſuch as neutral ſalts for inſtance, we had to conſider, 1. the acidifying principle common to them all; 2. the acidifiable principle which peculiarizes the acid; 3. the ſaline, earthy, or metallic baſe, which determines the particular ſpecies of the ſalt. We have derived the name of each claſs of ſalts from that of the acidifiable principle, common to all the individuals of the claſs; and have then diſtinguiſhed each ſpecies by the name of the *ſaline*, *earthy*, or *metallic* baſe peculiar to it.

"As ſalt, conſiſting of any three principles, may, without loſing any of theſe principles, paſs through different ſtates by the variation of their proportions; our nomenclature would have been defective without expreſſions for theſe different ſtates. We have expreſſed them chiefly by a change of termination, making all names of ſalts in the ſame ſtate to end with the ſame termination."

2. *Nomenclature by M. Wiegleb.*

1562 Mr Wiegleb's nomenclature.

In Wiegleb's General Syſtem of Chemiſtry tranſlated by Hopſon, we have another nomenclature formed on different principles. In this he gives to fixed vegetable alkali the name of *Spodium*, from the Greek word σποδος *(aſhes)*. The mineral alkali he calls *natrum*, the name by which it was anciently diſtinguiſhed; and the volatile alkali *ammonium*, from ſal ammoniac which contains it in great quantity. The compound ſalts may be diſtinguiſhed into double, triple, and quadruple; though, in the ſcheme given in the work, the firſt diviſion is omitted, as tending only to create confuſion. The irregular ſalts, conſiſting of thoſe which are triple and quadruple, are admitted. Such as are imperfect by reaſon of an exceſs of acid, he ſays, are beſt denominated by converting the adjective, expreſſive of the baſe, into a participle; a practice which, on many occaſions, though countenanced by the authority of a late eminent writer, ſeems aukward and ſtiff. The exceſs of acid is denominated by the word *hyperoxys*, and a defect of it by *hypoxys*. Hence his denominations are formed in the following manner.

Salts with exceſs of acid. Cream of tartar, or *tartarus ſpodatus*, or *tartaroxys ſpodicus*. Acid vitriolated tartar, or vitriolum ſpodatum, *vitrioloxys ſpodicus*.

The ſalts which are imperfect from a defect of acid have their denominations by mentioning the baſe before the acid, and expreſſing the former ſubſtantively, the latter adjectively. Thus,

Salt of tartar, aerated vegetable alkali, ſpodium aerocraticum,	Oxyſpodium, aerocraticum.
Aerated volatile alkali, ammoniacum aerocraticum,	Oxyammonium aerocraticum.
Chalk, or calx aerocratica,	Oxycalcitis aerocraticus.
Borax, or natrum boracicum.	Oxynatrum boracicum.

With reſpect to other terms, Mr Wiegleb expreſſes the acid with which any baſe is combined, by the termination *cratia*, from the Greek κρατος *(robur)*, added to it; excepting only thoſe with the nitrous and muriatic acids: and theſe (for what reaſon does not appear) he calls *Aponitra* and *Epimuriæ*. His genera of ſalts are as follow.

1. Vitriols *(Sulphurocratia)*. 2. Nitres *(Aponitra)*. 3. Murias *(Epimuriæ)*. 4. Boraxes. 5. Fluoricrates. 6. Arſenicrates. 7. Barylithicrates, (thoſe with acid of tungſten). 8. Molybdænocrates. 9. Photocrates, (with acid of phoſphorus). 10. Electrocrates. 11. Oxycrates, (with the acetous acid); or *epoxycrates*, with the aerated acid). 12. Tartars; or, with the acid changed by fire, *pyro-tartars*. 13. Oxalidicrates. 14. Cecidocrates (with the acid of galls). 15. Citriocrates. 16. Melicrates (with the acid of apples). 17. Benzicrates. 18. Xylocrates. 19. Gummicrates. 20. Camphoricrates. 21. Aerocrates. 22. Galacticrates. 23. Gala-melicrates (with acid of ſugar of milk). 24. Myrmecicrates. 25. Cyanocrates (with the colouring matter of Pruſſian blue). 26. Steatocrates. 27. Bombycicrates. 28. Zoolithocrates, (with acid of calculus).

On the ſubject of nomenclatures it is obvious to remark, that whatever may be the defects of the old one, we are ready to be involved in much greater difficulties by the introduction of a new one. Or ſuppoſing a new language to be adopted, where would be the ſecurity for its permanence? That which appears moſt ſpecious at one period, may ſtill be ſuperſeded by the refinements of another; and colourable pretenſions would never be wanting to ſucceſſive innovators. Hence a continual fluctuation, and an endleſs vocabulary. As the nomenclature firſt abovementioned, however, has attracted no ſmall degree of attention, we ſhall here ſubjoin a ſcheme of it, as well for the ſatisfaction of our readers in general, as for the gratification of thoſe in particular who may have imbibed the doctrines of its authors.

[Follows *The Whole-ſheet Table.*]

A TABLE, EXHIBITING THE CHEMICAL NOMENCLATURE,

Propoſed by Meſſieurs De MORVEAU, LAVOISIER, BERTHOLLET, and De FOURCROY, in May 1787.

		I. SUBSTANCES THAT HAVE NOT BEEN YET DECOMPOSED.		II. THE SAME SUBSTANCES REDUCED INTO THE STATE OF GAS BY THE ADDITION OF CALORIC.		III. THE SAME SUBSTANCES COMBINED WITH OXIGENE.		IV. Nitric acid. *With an exceſs of azote.* Nitrous acid.	*The baſe of nitrous gas.* *White nitrous acid.* *Fuming nitrous acid.*	Nitrous gas. Nitrous acid gas.	—	Nitrate of potaſh. of ſoda, &c. Nitrite of potaſh.	*Common nitre.* *Cubic nitre.*	—	—	5
6		Carbone, *or* the radical principle of the carbonic acid.	*Pure coal.*	—	—	Carbonic acid.	*Fixed air, or cretaceous acid.*	Carbonic acid gas.	*Fixed air, mephitic air.*	Carbonate { of lime. of potaſh, &c of iron, &c.	*Chalk.* *Effervescent alkalies.* *Ruſt of iron, &c.*	Carbure of iron.	*Plumbago.*	6
7		Sulphur, *or* the radical principle of the ſulphuric acid.	—	—	—	Sulphuric acid. *With leſs oxigene,* Sulphureous acid.	*Vitriolic acid.* *Sulphureous acid.*	Sulphureous acid gas.	*Sulphureous acid gas.*	Sulphate { of potaſh. of ſoda. of lime. of aluminous earth. of barytes. of iron, &c. Sulphite of potaſh, &c.	*Vitriolated tartar.* *Glauber ſalt.* *Selenite.* *Alum.* *Ponderous ſpar.* *Vitriol of iron, &c.* *Stahl's ſulphureous ſalt.*	Sulphure { of iron. of antimo. of lead. Sulph. hydrogen. gas. Sulphure of potaſh. Sulphure of ſoda. Alkaline ſulphures with metals ſuſpended in them. Alkaline ſulphure with carbonaceous matters ſuſpended in it.	*Factitious iron pyrites.* *Antimony.* *Galena.* *Hepatic gas.* *Alkaline livers of ſulphur.* *Metallic livers of ſulphur.* *Liver of ſulphur with carbonaceous matters ſuſpended in it.*	7
8		Phoſphore *or* the radical principle of the phoſphoric acid.	—	—	—	Phoſphoric acid. *With a ſmaller proportion of oxigene,* Phoſphorous acid.	*Phoſphoric acid.* *Fuming or volatile phoſphoric acid.*	—	—	Phoſphate of ſoda. Calcareous phoſphate. Superſaturated phoſphate of ſoda. Phoſphite of potaſh, &c	*Phoſphoric ſalt with a baſe of natrum.* *Earth of bones.* *Haupt's ſal perlatum.*	Phoſphoriſed hydrogenous gas. Phoſphure of iron.	*Phoſphoric gas.* *Syderite.*	8
9		Radical principle of the muriatic acid.	—	—	—	Muriatic acid *With an exceſs of oxigene,* Oxigenated muriatic acid.	*Marine acid.* *Dephlogiſticated marine acid.*	Muriatic acid gas. Oxigenated muriatic acid gas.	*Marine acid gas.* *Dephlogiſticated marine acid gas.*	Muriate of potaſh Muriate of ſoda. Calcareous muriate, &c Ammoniacal muriate. Oxigenated muriate of ſoda, &c.	*Febrifuge ſalt of ſylvius.* *Marine ſalt.* *Calcareous marine ſalt.* *Sal ammoniac.*	—	—	9
10		Radical principle of the boracic acid.	—	—	—	Boracic acid.	*Sedative ſalt.*	—	—	Borate [illegible] ſaturated with ſoda, [illegible] Borate of ſoda, &c. *ſoda ſaturated with the acid.*	*Common borax.*	—	—	10
11		Radical principle of the fluor acid.	—	—	—	Fluoric acid.	*Acid of ſpar.*	Fluoric acid gas.	*Spathoſe gas.*	Fluate of lime, &c.	*Fluor ſpar.*	—	—	11
12		Radical principle of the ſuccinic acid.	—	—	—	Succinic acid.	*Volatile ſalt of amber.*	—	—	Succinate of ſoda, &c.	—	—	—	12
13		Radical principle of the acetic acid.	—	—	—	Acetous acid. *With more oxigene,* Acetic acid.	*Diſtilled vinegar.* *Radical vinegar.*	—	—	Acetite { of potaſh. of ſoda. of lime. of ammoniac of lead. of copper. Acetate of ſoda, &c.	*Terra foliata tartari.* *Mineral terra foliata.* *Calcareous acetous ſalt.* *Spirit of Mindererus.* *Saccharum ſaturni.* *Verdigris.*	—	—	13
14		Radical principle of the tartareous acid.	—	—	—	Tartareous acid.	—	—	—	Acidulous tartarite of potaſh. Tartarite of potaſh. Tartarite of ſoda, &c.	*Cream of tartar.* *Vegetable ſalt.* *Salt of Seignette.*	—	—	14
15		Radical principle of the pyro-tartareous acid.	—	—	—	Pyro-tartareous acid.	*Empyreumatic tartareous acid, or ſpirit of tartar.*	—	—	Pyro-tartarite of lime. Pyro-tartarite of iron, &c.	—	—	—	15
16		Radical principle of the oxalic acid.	—	—	—	Oxalic acid.	*Saccharine acid.*	—	—	Acidulous oxalate of potaſh. Oxalate of lime. of ſoda, &c.	*Salt of ſorrel.*	—	—	16
17		Radical principle of the gallic acid.	—	—	—	Gallic acid.	*Aſtringent principle.*	—	—	Gallate of ſoda. of magneſia. of iron, &c.		—	—	17
18		Radical principle of the citric acid.	—	—	—	Citric acid.	*Lemon juice.*	—	—	Citrate of potaſh. of lead, &c.	*Terra foliata with lemon juice.*	—	—	18
19		Radical principle of the malic acid.	—	—	—	Malic acid.	*Acid of apples.*	—	—	Malate of lime, &c.	—	—	—	19
20		Radical principle of the benzoic acid.	—	—	—	Benzoic acid.	*Flowers of benzoin.*	—	—	Alluminous benzoate. Benzoate of iron, &c.	—	—	—	20
21		Radical principle of the pyro-ligneous acid.	—	—	—	Pyro-ligneous acid.	*Spirit of wood.*	—	—	Pyro-lignite of lime. Pyro-lignite of zinc, &c	—	—	—	21
22		Radical principle of the pyro-mucous acid.	—	—	—	Pyro-mucous acid.	*Spirit of honey, ſugar, &c.*	—	—	Pyro-mucite of magne. Ammoniacal, &c. pyro mucite.	—	—	—	22
23		Radical principle of the camphoric acid.	—	—	—	Camphoric acid	—	—	—	Camphorate of ſoda, &c.	—	—	—	23
24		Radical principle of the lactic acid.	—	—	—	Lactic acid.	*Acid of milk.*	—	—	Lactate of lime, &c.	—	—	—	24
25		Radical principle of the ſaccho-lactic acid.	—	—	—	Saccho-lactic acid.	*Acid of ſugar of milk.*	—	—	Saccho-lactate of iron, &c.	—	—	—	25
26		Radical principle of the formic acid.	—	—	—	Formic acid.	*Acid of ants.*	—	—	Ammoniacal, &c. formiate.	*Spirit of magnanimity.*	—	—	26
27		Radical principle of the Pruſſic acid.	—	—	—	Pruſſic acid.	*Colouring matter of Pruſſian blue.*	—	—	Pruſſiate of potaſh, &c. Pruſſiate of iron, &c.	*Phlogiſticated alkali, or Pruſſian alkali.* *Pruſſian blue.*	—	—	27
28		Radical principle of the ſebacic acid.	—	—	—	Sebacic acid.	*Acid of greaſe.*	—	—	Sebate of lime, &c.	—	—	—	28
29		Radical principle of the lithic acid.	—	—	—	Lithic acid.	*Stone in the bladder.*	—	—	Lithiate of ſoda, &c.	—	—	—	29
30		Radical principle of the bombic acid.	—	—	—	Bombic acid.	*Acid of the ſilk-worm.*	—	—	Bombiate of iron, &c.	—	—	—	30
								OXIDES WITH VARIOUS BASES. *						
31	METALLIC SUBSTANCES.	Arſenic.	*Regulus of arſenic.*	—	—	Oxide of arſenic.	*White arſenic, or calx of arſenic.*	Yellow Red } ſulphurated oxide of arſenic. Arſen. oxide of potaſh	*Orpiment.* *Realgar.* *Liver of arſenic.*	Arſeniate of potaſh, &c Arſeniate of copper.	—	Alloy of arſenic and tin.	*Arſenicated tin.*	31
32		Molybdæna.	—	—	—	Oxide of molybdæna. Molybdic acid.	*Calx of molybdæna.*	Sulph. of molybdæna	*Molybdæna.*	Molybdate.	—	Alloy, &c.	—	32
33		Tungſten.	—	—	—	Oxide of tungſten. Tunſtic acid.	*Yellow calx of tungſten.*	—	—	Calcareous tunſtate.	*Swediſh tungſten.*	Alloy, &c.	—	33
34		Manganeſe.	*Regulus of manganeſe.*	—	—	White Black Vitreous } oxide of manganeſe	*Manganeſe.*	—	—	—	—	Alloy of manganeſe and iron.	—	34
35		Nickel.	—	—	—	Oxide of nickel.	*Calx of nickel.*	—	—	—	—	Alloy of nickel, &c.	—	35
36		Cobalt.	*Regulus of cobalt.*	—	—	Grey Vitreous } oxide of cobalt.	*Calx of cobalt.*	Alkaline cobaltic oxides.	*Precipitates of cobalt again diſſolved by alkalies.*	—	—	Alloy, &c.	—	36
37		Biſmuth.	—	—	—	White Yellow Vitreous } oxide of biſmuth.	*Magiſtery of biſmuth, or white paint.* *Yellow calx of biſmuth.* *Glaſs of biſmuth.*	Sulphurated oxide of biſmuth.	*Biſmuth precipitated by liver of ſulphur.*	—	—	Alloy, &c.	—	37
38		Antimony.	*Regulus of antimony.*	—	—	Oxide of antimony { by the nitrous acid, by the muriatic acid, ſublimated. vitreous.	*Diaphoretic antimony.* *Powder of Algaretti.* *Flowers or ſnow of antimony.* *Glaſs of regulus of antimony.*	Grey Red Orange Vitreous } Sulphurated oxide of antimony. Alkaline oxide of antimony.	*Grey calx of antimony.* *Kermes mineral.* *Golden ſulphur.* *Glaſs and liver of antimony.* *Rotrou's ſolvent.*	—	—	Alloy, &c.	—	38
39		Zinc.	—	—	—	Oxide of zinc. Sublimated oxide of zinc.	*Calx of zinc.* *Flowers of zinc, pompholix, &c.*	Sulphurated oxide of zinc.	*Precipitate of zinc by liver of ſulphur or factitious blende.*	—	—	Alloy, &c.	—	39
40		Iron.	—	—	—	Black Red } oxide of iron.	*Martial æthiops,* *Aſtringent ſaffron of Mars.*	Sulphurated oxide of iron.	—	—	—	Alloy, &c.	—	40
41		Tin.	—	—	—	White oxide of tin.	*Calx, or putty of tin.*	Yellow ſulphurated oxide of tin.	*Aurum muſivum.*	—	—	Alloy, &c.	—	41
42		Lead.	—	—	—	White Yellow Red Vitreous } oxide of lead.	*Ceruſe, or white lead.* *Maſſicot.* *Minium.* *Litharge.*	Sulphurated oxide of lead.	—	—	—	Alloy, &c.	—	42
43		Copper.	—	—	—	Red Green Blue } oxide of copper.	*Brown calx of copper.* *Green calx of copper, or verdigris.* *Mountain blue.*	Ammoniacal oxide of copper.	—	—	—	Alloy, &c.	—	43
44		Mercury.	—	—	—	Blackiſh Yellow Red } mercurial oxide.	*Æthiops per ſe.* *Turbith mineral.* *Precipitate per ſe.*	Black Red } ſulphurated oxide of mercury.	*Æthiops mineral.* *Cinnabar.*	—	—	Alloy, *or* amalgam of, &c.	—	44
45		Silver.	—	—	—	Oxide of ſilver.	*Calx of ſilver.*	Sulphurated oxide of ſilver.	—	—	—	Alloy, &c.	—	45
46		Platina.	—	—	—	Oxide of platina.	*Calx of platina.*	—	—	—	—	Alloy of platina & gold	—	46
47		Gold.	—	—	—	Oxide of gold.	*Calx of gold.*	—	—	—	—	Alloy, &c.	—	47
48	EARTHS.	Siliceous earth.	*Vitrifiable earth, quartz, &c.*	—	—	—	—	—	—	—	—	—	—	48
49		Aluminous earth.	*Clay, or earth of alum.*	—	—	—	—	—	—	—	—	—	—	49
		Barytes.	*Terra ponderoſa.*	—	—	—	—	—	—	—	—	—	—	50
50		Lime.	*Calcareous earth.*	—	—	—	—	—	—	—	—	—	—	51
51		Magneſia.	—	—	—	—	—	—	—	—	—	—	—	52
52	ALKALIES.	Potaſh.	*Vegetable fixed alkali of tartar, &c.*	—	—	—	—	—	—	—	—	—	—	53
53				—	—	—	—			—	—			
54		Soda.	*Mineral alkali, marine alkali, natrum.*	—	—	—	—	—	—	—	—	—	—	54
55		Ammoniac.	*Fluor, or cauſtic volatile alkali.*	Ammoniacal gas.	*Alkaline gas.*	—	—	—	—	—	—	—	—	55

* As the ſubſtances in the lower part of this col. cannot be reduced into a gazeous ſtate, and not only they, but ſeveral of thoſe in the upper part; we have therefore changed at this place the title of the column, and ſubſtituted another, which expreſſes the peculiar combinations of the metals

DENOMINATIONS newly appropriated to ſeveral Subſtances, which are more compound in their Nature, yet enter into new Combinations without being decompoſed.

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
New Names.	Mucous matter.	Glutinous matter, or gluten.	Sugar.	Starch.	Fixed oil.	Volatile oil.	The aroma, or aromatous principle.	Reſin.	Extractive matter.	Extracto-reſinous matter. { in which the extractive matter predominates.	Reſinous extractive matter. { in which the reſin predominates.	Feculum	Alcohol, or ſpirit of wine.	Alcohol { of potaſh. of guaiacum. of ſcammoneum. of myrrh, &c.	Nitrous Gallic Muriatic } alcohol.	Sulphuric Muriatic Acetic, &c. } ether.	Alkaline Earthy Acid Metallic } ſoaps. Saponula of turpentine, &c.
Ancient names.	*Mucilage.*	*Glutinous matter.*	*Saccharine matter.*	*Amylaceous matter.*	*Fat oil.*	*Eſſential oil.*	*Spiritus rector.*	*Reſin.*	*Extractive matter.*			*Feculum.*	*Spirit of wine.*	*Alkaline tincture.* *Tincture of guaiacum* *—— ſcammonium.* *—— myrrh, &c.*	*Dulcified ſpirit of wine.* *Tincture of nut-galls.* *Dulcified marine acid.*	*Ether of Frobenius.* *Marine ether.* *Acetous ether, &c.*	*Alkaline earthy, &c. ſoaps.* *Combinations of volatile oils with baſes.*

A TABLE, EXHIBITING THE CHEMICAL NOMENCLATURE,

Propoſed by Meſſieurs De MORVEAU, LAVOISIER, BERTHOLLET, and De FOURCROY, in May 1787.

		I. SUBSTANCES THAT HAVE NOT BEEN YET DECOMPOSED.		II. THE SAME SUBSTANCES REDUCED INTO THE STATE OF GAS BY THE ADDITION OF CALORIC.		III. THE SAME SUBSTANCES COMBINED WITH OXIGENE.		IV. THE SAME SUBSTANCES IN AN OXIGENATED GAZEOUS STATE.		V. THESE OXIGENATED SUBSTANCES NEUTRALIZED BY EHE ADDITION OF BASES.		VI. THE SAME PRIMARY SUBSTANCES COMBINED WITH OTHER SUBSTANCES BUT NOT AICIDIFIED.		
		NAMES NEWLY INVENTED OR ADOPTED.	ANCIENT NAMES.	NAMES NEWLY INVENTED OR ADOPTED.	ANCIENT NAMES.	NAMES NEWLY INVENTED OR ADOPTED.	ANCIENT NAMES.	NAMES NEWLY INVENTED OR ADOPTED.	ANCIENT NAMES.	NAMES NEWLY INVENTED OR ADOPTED.	ANCIENT NAMES.	NAMES NEWLY INVENTED OR ADOPTED.	ANCIENT NAMES.	
1		Light. - -	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	1
2		Caloric. - -	*Latent heat*, or *matter of heat.*	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	2
3		Oxigene. - -	*The baſe of vital air.*	Oxigenous gas. *N.B* It appears that light contributes to the reduction of oxigene into a gazeous ſtate.	*Dephlogiſticated* or *vital air.*	— —	— —	— —	— —	— —	— —	— —	— —	3
4		Hydrogene. - -	*The baſe of inflammable gas.*	Hydrogenous gas.	*Inflammable gas.*	Water. -	*Water.*	— —	— —	— —	— —	— —	— —	4
5		Azote, *or* the radical principle of the nitric acid. -	*The baſe of phlogiſticated air*, or *of atmoſpheric mephitis.*	Azotic gas.	*Phlogiſticated air*, or *atmoſpheric mephitis.*	The baſe of nitrous gas. Nitric acid. - *With an exceſs of azote.* Nitrous acid.	*The baſe of nitrous gas.* *White nitrous acid.* *Fuming nitrous acid.*	Nitrous gas. Nitrous acid gas.	— —	Nitrate of potaſh. of ſoda, &c. Nitrite of potaſh.	*Common nitre.* *Cubic nitre.*	— —	— —	5
6		Carbone, *or* the radical principle of the carbonic acid.	*Pure coal.*	— —	— —	Carbonic acid.	*Fixed air*, or *cretaceous acid.*	Carbonic acid gas.	*Fixed air, mephitic air.*	Carbonate. of lime. of potaſh,&c of iron, &c.	*Chalk.* *Effervescent alkalies.* *Ruſt of iron, &c.*	Carbure of iron.	*Plumbago.*	6
7		Sulphur, *or* the radical principle of the ſulphuric acid.	— —	— —	— —	Sulphuric acid.	*Vitriolic acid.*			Sulphate of potaſh. of ſoda. of lime. of aluminous earth. of barytes. of iron, &c.	*Vitriolated tartar.* *Glauber ſalt.* *Selenite.* *Alum.* *Ponderous ſpar.* *Vitriol of iron, &c.*	Sulphure of iron. of antimo. of lead. Sulph. hydrogen. gas. Sulphure of potaſh. Sulphure of ſoda. Alkaline ſulphures with metals ſuſpended in them.	*Factitious iron pyrites.* *Antimony.* *Galena.* *Hepatic gas.* *Alkaline livers of ſulphur.* *Metallic livers of ſulphur.*	7
						With leſs oxigene, Sulphureous acid.	*Sulphureous acid.*	Sulphureous acid gas.	*Sulphureous acid gas.*	Sulphite of potaſh, &c.	*Stahl's ſulphureous ſalt.*	Alkaline ſulphure with carbonaceous matters ſuſpended in it.	*Liver of ſulphur with carbonaceous matters ſuſpended in it.*	
8		Phoſphore *or* the radical principle of the phoſphoric acid.	— —	— —	— —	Phoſphoric acid.	*Phoſphoric acid.*	— —	— —	Phoſphate of ſoda. Calcareous phoſphate. Superſaturated phoſphate of ſoda.	*Phoſphoric ſalt with a baſe of natrum.* *Earth of bones.* *Haupt's ſal perlatum.*	Phoſphoriſed hydrogenous gas. Phoſphure of iron.	*Phoſphoric gas.* *Syderite.*	8
						With a ſmaller proportion of oxigene, Phoſphorous acid.	*Fuming* or *volatile phoſphoric acid.*			Phoſphite of potaſh,&c				
9		Radical principle of the muriatic acid.	— —	— —	— —	Muriatic acid	*Marine acid.*	Muriatic acid gas.	*Marine acid gas.*	Muriate of potaſh Muriate of ſoda. Calcareous muriate,&c Ammoniacal muriate.	*Febrifuge ſalt of ſylvius.* *Marine ſalt.* *Calcareous marine ſalt.* *Sal ammoniac.*	— —	— —	9
						With an exceſs of oxigene, Oxigenated muriatic acid.	*Dephlogiſticated marine acid.*	Oxigenated muriatic acid gas.	*Dephlogiſticated marine acid gas.*	Oxigenated muriate of ſoda, &c.				
10		Radical principle of the boracic acid.	— —	— —	— —	Boracic acid.	*Sedative ſalt.*	— —	— —	Borate ſuperſaturated with ſoda, *or* borax Borate of ſoda, &c. *ſoda ſaturated with the acid.*	*Common borax.*	— —	— —	10
11		Radical principle of the fluor acid.	— —	— —	— —	Fluoric acid.	*Acid of ſpar.*	Fluoric acid gas.	*Spathoſe gas.*	Fluate of lime, &c.	*Fluor ſpar.*	— —	— —	11
12		Radical principle of the ſuccinic acid.	— —	— —	— —	Succinic acid.	*Volatile ſalt of amber.*	— —	— —	Succinate of ſoda, &c.	— —	— —	— —	12
13	ACIDIFIABLE BASES.	Radical principle of the acetic acid.	— —	— —	— —	Acetous acid.	*Diſtilled vinegar.*	— —	— —	Acetite of potaſh. of ſoda. of lime. of ammoniac of lead. of copper.	*Terra foliata tartari.* *Mineral terra foliata.* *Calcareous acetous ſalt.* *Spirit of Mindererus.* *Saccharum ſaturni.* *Verdigris.*	— —	— —	13
						With more oxigene, Acetic acid.	*Radical vinegar.*			Acetate of ſoda, &c.				
14		Radical principle of the tartareous acid.	— —	— —	— —	Tartareous acid.	— —	— —	— —	Acidulous tartarite of potaſh. Tartarite of potaſh. Tartarite of ſoda, &c.	*Cream of tartar.* *Vegetable ſalt.* *Salt of Seignette.*	— —	— —	14
15		Radical principle of the pyro-tartareous acid.	— —	— —	— —	Pyro-tartareous acid.	*Empyreumatic tartareous acid*, or *ſpirit of tartar.*	— —	— —	Pyro-tartarite of lime. Pyro-tartarite of iron, &c.	— —	— —	— —	15
16		Radical principle of the oxalic acid.	— —	— —	— —	Oxalic acid. -	*Saccharine acid.*	— —	— —	Acidulous oxalate of potaſh. Oxalate of lime. of ſoda, &c.	*Salt of ſorrel.*	— —	— —	16
17		Radical principle of the gallic acid.	— —	— —	— —	Gallic acid. -	*Aſtringent principle.*	— —	— —	Gallate of ſoda. of magneſia. of iron, &c.		— —	— —	17
18		Radical principle of the citric acid.	— —	— —	— —	Citric acid. -	*Lemon juice.*	— —	— —	Citrate of potaſh. of lead, &c.	*Terra foliata with lemon juice.*	— —	— —	18
19		Radical principle of the malic acid.	— —	— —	— —	Malic acid. -	*Acid of apples.*	— —	— —	Malate of lime, &c.	— —	— —	— —	19
20		Radical principle of the benzoic acid.	— —	— —	— —	Benzoic acid. -	*Flowers of benzoin.*	— —	— —	Alluminous benzoate. Benzoate of iron, &c.	— —	— —	— —	20
21		Radical principle of the pyro-ligneous acid.	— —	— —	— —	Pyro-ligneous acid.	*Spirit of wood.*	— —	— —	Pyro-lignite of lime. Pyro-lignite of zinc,&c	— —	— —	— —	21
22		Radical principle of the pyro-mucous acid.	— —	— —	— —	Pyro-mucous acid.	*Spirit of honey, ſugar, &c.*	— —	— —	Pyro-mucite of magne. Ammoniacal, &c. pyro mucite.	— —	— —	— —	22
23		Radical principle of the camphoric acid.	— —	— —	— —	Camphoric acid.	— —	— —	— —	Camphorate of ſoda, &c.	— —	— —	— —	23
24		Radical principle of the lactic acid.	— —	— —	— —	Lactic acid. -	*Acid of milk.*	— —	— —	Lactate of lime, &c.	— —	— —	— —	24
25		Radical principle of the ſaccho-lactic acid.	— —	— —	— —	Saccho-lactic acid.	*Acid of ſugar of milk.*	— —	— —	Saccho-lactate of iron, &c.	— —	— —	— —	25
26		Radical principle of the formic acid.	— —	— —	— —	Formic acid. -	*Acid of ants.*	— —	— —	Ammoniacal, &c. formiate.	*Spirit of magnanimity.*	— —	— —	26
27		Radical principle of	—				*Colouring matter of Pruſ-*				*Phlogiſticated alkali, or*			

		the formic acid.								miate.				
27		Radical principle of the Pruſſic acid.	— —	— —	— —	Pruſſic acid.	*Colouring matter of Pruſſian blue.*	— —	— —	Pruſſiate of potaſh, &c. Pruſſiate of iron, &c.	*Phlogiſticated alkali,* or *Pruſſian alkali.* *Pruſſian blue.*	— —	— —	27
28		Radical principle of the ſebacic acid.	— —	— —	— —	Sebacic acid.	*Acid of greaſe.*	— —	— —	Sebate of lime, &c.	— —	— —	— —	28
29		Radical principle of the lithic acid.	— —	— —	— —	Lithic acid.	*Stone in the bladder:*	— —	— —	Lithiate of ſoda, &c.	— —	— —	— —	29
30		Radical principle of the bombic acid.	— —	— —	— —	Bombic acid.	*Acid of the ſilk-worm.*	— —	— —	Bombiate of iron, &c.	— —	— —	— —	30
								OXIDES WITH VARIOUS BASES. *						
31	METALLIC SUBSTANCES.	Arſenic.	*Regulus of arſenic.*	— —	— —	Oxide of arſenic.	*White arſenic,* or *calx of arſenic.*	Yellow Red ſulphurated oxide of arſenic: Arſen. oxide of potaſh	*Orpiment.* *Realgar.* *Liver of arſenic.*	Arſeniate of potaſh, &c Arſeniate of copper.	— — — —	Alloy of arſenic and tin.	*Arſenicated tin.*	31
32		Molybdæna.	— —	— —	— —	Oxide of molybdæna. Molybdic acid.	*Calx of molybdæna.*	Sulph. of molybdæna	*Molybdæna.*	Molybdate.	— —	Alloy, &c.	— —	32
33		Tungſten.	— —	— —	— —	Oxide of tungſten. Tunſtic acid.	*Yellow calx of tungſten.*	— —	— —	Calcareous tunſtate.	*Swediſh tungſten:*	Alloy, &c.	— —	33
34		Manganeſe.	*Regulus of manganeſe.*	— —	— —	White Black Vitreous oxide of manganeſe	*Manganeſe.*	— —	— —	— —	— —	Alloy of manganeſe and iron.	— —	34
35		Nickel.	— —	— —	— —	Oxide of nickel.	*Calx of nickel.*	— —	— —	— —	— —	Alloy of nickel, &c.	— —	35
36		Cobalt.	*Regulus of cobalt.*	— —	— —	Grey Vitreous oxide of cobalt.	*Calx of cobalt.*	Alkaline cobaltic oxides.	*Precipitates of cobalt again diſſolved by alkalies.*	— —	— —	Alloy, &c.	— —	36
37		Biſmuth.	— —	— —	— —	White Yellow Vitreous oxide of biſmuth.	*Magiſtery of biſmuth,* or *white paint.* *Yellow calx of biſmuth.* *Glaſs of biſmuth.*	Sulphurated oxide of biſmuth.	*Biſmuth precipitated by liver of ſulphur.*	— —	— —	Alloy, &c.	— —	37
38		Antimony.	*Regulus of antimony.*	— —	— —	Oxide of antimony by the nitrous acid, by the muriatic acid, ſublimated. vitreous.	*Diaphoretic antimony.* *Powder of Algarotti.* *Flowers* or *ſnow of antimony.* *Glaſs of regulus of antimony.*	Grey Red Orange Vitreous Sulphurated oxide of antimony- Alkaline oxide of antimony.	*Grey calx of antimony.* *Kermes mineral.* *Golden ſulphur.* *Glaſs and liver of antimony.* *Rotrou's ſolvent.*	— —	— —	Alloy, &c.	— —	38
39		Zinc.	— —	— —	— —	Oxide of zinc. Sublimated oxide of zinc.	*Calx of zinc.* *Flowers of zinc, pompholix,* &c.	Sulphurated oxide of zinc.	*Precipitate of zinc by liver of ſulphur* or *factitious blende.*	— —	— —	Alloy, &c.	— —	39
40		Iron.	— —	— —	— —	Black Red oxide of iron.	*Martial æthiops,* *Aſtringent ſaffron of Mars.*	Sulphurated oxide of iron.	— —	— —	— —	Alloy, &c.	— —	40
41		Tin.	— —	— —	— —	White oxide of tin.	*Calx,* or *putty of tin.*	Yellow ſulphurated oxide of tin.	*Aurum maſſivum.*	— —	— —	Alloy, &c.	— —	41
42		Lead.	— —	— —	— —	White Yellow Red Vitreous oxide of lead.	*Ceruſe,* or *white lead.* *Maſſicot.* *Minium.* *Litharge.*	Sulphurated oxide of lead.	— —	— —	— —	Alloy, &c.	— —	42
43		Copper.	— —	— —	— —	Red Green Blue oxide of copper.	*Brown calx of copper.* *Green calx of copper, or verdigris.* *Mountain blue.*	Ammoniacal oxide of copper.	— —	— —	— —	Alloy, &c.	— —	43
44		Mercury.	— —	— —	— —	Blackiſh Yellow Red mercurial oxide.	*Æthiops* per ſe. *Turbith mineral.* *Precipitate* per ſe.	Black Red ſulphurated oxide of mercury.	*Æthiops mineral.* *Cinnabar.*	— —	— —	Alloy, *or* amalgam of, &c.	— —	44
45		Silver.	— —	— —	— —	Oxide of ſilver.	*Calx of ſilver.*	Sulphurated oxide of ſilver.	— —	— —	— —	Alloy, &c.	— —	45
46		Platina.	— —	— —	— —	Oxide of platina.	*Calx of platina.*	— —	— —	— —	— —	Alloy of platina & gold	— —	46
47		Gold.	— —	— —	— —	Oxide of gold.	*Calx of gold.*	— —	— —	— —	— —	Alloy, &c.	— —	47
48	EARTHS.	Siliceous earth.	*Vitrifiable earth, quartz, &c.*	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	48
49		Aluminous earth.	*Clay,* or *earth of alum.*	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	49
		Barytes.	*Terra ponderoſa.*	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	50
50		Lime.	*Calcareous earth.*	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	51
51		Magneſia.	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	52
52 53	ALKALIES.	Potaſh.	*Vegetable fixed alkali of tartar, &c.*	— — — —	— — — —	— —	— —	— —	— —	— —	— —	— —	— —	53
54		Soda.	*Mineral alkali, marine alkali, natrum.*	— —	— —	— —	— —	— —	— —	— —	— —	— —	— —	54
55		Ammoniac.	*Fluor,* or *cauſtic volatile alkali.*	Ammoniacal gas.	*Alkaline gas.*	— —	— —	— —	— —	— —	— —	— —	— —	55

---

* As the ſubſtances in the lower part of this col. cannot be reduced into a gazeous ſtate, and not only they, but ſeveral of thoſe in the upper part; we have therefore changed at this place the title of the column, and ſubſtituted another, which expreſſes the peculiar combinations of the metals

DENOMINATIONS newly appropriated to ſeveral Subſtances, which are more compound in their Nature, yet enter into new Combinations without being decompoſed.

TABLE, ſhowing the Manner in which Natural Bodies, conſidered in a Chemical View, may be divided into Claſſes; with their ſeveral Subdiviſions; their Properties defined; and the Manner in which they are obtained, pointed out.

NATURAL BODIES, conſidered as the Objects of Chemiſtry, may be divided into the following Claſſes, viz. 1. Salts. 2. Earths. 3. Metals. 4. Inflammables. 5. Waters. 6. Airs.

I. SALTS.

These are ſoluble in water, ſapid, and not inflammable. They are either Acids or Alkalies.

I. *Acids* are diſtinguiſhed by turning ſyrup of violets red, or forming with alkalies neutral ſalts; and are ſuppoſed to conſiſt of dephlogiſticated air condenſed, as their acidifying principle. The different acids yet known are,

1. *Vitriolic, fixed.* The moſt ponderous of all fluids next to mercury, the moſt fixed in the fire, and the moſt powerful as a ſolvent of all the acids. Obtained chiefly from ſulphur by inflammation.

2. *Vitriolic, volatile.* Obtained alſo from ſulphur by inflammation; air being admitted during the proceſs. It acts leſs powerfully as a ſolvent than when in its fixed ſtate.

3. *Nitrous* or *Aquafortis:* a volatile fluid, generally met with of a reddiſh colour, and emitting noxious fumes, when in its concentrated ſtate; though this is found not to be eſſential to it, but owing to a mixture of phlogiſton. In its pure ſtate it is almoſt as colourleſs as water, and ſmokes very little. It is next in ſtrength to the vitriolic acid, and obtained chiefly from nitre. It conſiſts of dephlogiſticated and phlogiſticated air condenſed, and may be obtained by taking the electric ſpark for a long time in a mixture of theſe. By uniting with ſome metals it appears to be converted into volatile alkali.

4. *Muriatic,* or *ſpirit of ſea-ſalt.* A volatile fluid, generally of a fine yellow colour; though this alſo is owing to the admixture of foreign ſubſtances, generally of iron. Inferior in power to the former, and obtained from ſea-ſalt. Naturally this acid ſeems to be in an aerial ſtate, but eaſily contracts an union with water. On mixture with manganeſe, it is wholly converted into a yellow, and almoſt incondenſible vapour, called *dephlogiſticated ſpirit of ſalt;* but which, on mixture with inflammable air, recompoſes the marine acid.

5. *Fluor acid.* Obtained from a ſpecies of ſpar: has little acid power, but is remarkable for its property of corroding glaſs.

6. *Acid of borax,* or *ſedative ſalt.* Obtained from borax in the form of ſcaly cryſtals; found alſo naturally in ſome waters in Italy, and in certain minerals in other countries.

7. *Acetous acid.* Obtained by allowing any fermentable liquor to proceed in the fermentation till paſt the vinous ſtate. It is much leſs corroſive, and leſs powerful as a ſolvent, than the vitriolic, nitrous, or marine acids.

8. *Acid of tartar.* Procured from the hard ſubſtance called *tartar,* depoſited on the ſides of wine veſſels.

9. *Acid of ſugar.* Found naturally in the juice of ſorrel, and procured artificially by means of nitrous acid from ſugar and a great variety of other ſubſtances. Aſſumes a dry form.

10. *Acid of phoſphorus.* Obtained artificially from urine, and in large quantity from calcined bones; found naturally in ſome kinds of lead-ore; and in vaſt quantities in Spain united with calcareous earth. Aſſumes a ſolid form, and melts into glaſs.

11. *Acid of ants.* Procured from the animal from which it takes its name, by expreſſion or diſtillation, in a fluid form.

12. *Acid of amber.* Obtained in a ſolid form from amber.

13. *Acid of arſenic.* Obtained from that ſubſtance by means of nitrous acid. Is extremely fixed in the fire.

14. *Acid of molybdæna.* Procured from that ſubſtance by means of nitrous acid. Reſembles a fine white earth.

15. *Acid of lapis ponderoſus, tungſten,* or *wolfram.* Obtained as an acid, *per ſe,* from this ſubſtance by Mr Scheele; but its real acidity is denied by other chemiſts. Is in the form of a yellow powder.

16. *Acid of milk.* Obtained in a fluid form from that liquor.

17. *Acid of ſugar of milk.* Obtained in form of a white powder, by means of nitrous acid, from ſugar of milk.

18. *Lithiſiac acid* Obtained in a ſolid form from human calculus, by means of nitrous acid.

19. *Acid of benzoin.* Obtained in a ſolid form from that gum by ſublimation or lixiviation with quicklime.

20. *Acid of lemons.* Obtained from the juice of that fruit by cryſtallization.

21. *Sebaceous acid,* or *acid of fat.* Obtained in a fluid ſtate from ſuet by diſtillation.

22. *Acid of citrons.* Obtained in a fluid ſtate from the juice of that and other fruits.

23. *Acid of apples.* Obtained in a fluid ſtate from the juice of apples and other fruits.

24. *Acid of ſorrel.* Obtained in a ſolid form from the juice of that plant; the ſame with acid of ſugar.

II. *Alkalies.* Theſe turn ſyrup of violets green, and with acids form neutral ſalts. They are,

1. *Fixed vegetable,* or *Pot-aſh.* Always obtained from the aſhes of burnt vegetables. A deliqueſcent ſalt.

2. *Fixed foſſile.* A ſolid cryſtalline ſalt, ſometimes found native, as the natrum of Egypt; and ſometimes by burning ſea-weed as kelp.

3. *Volatile.* Obtained from ſal ammoniac, from the ſoot of burning bodies, and from the putrefactive fermentation. It is naturally in the ſtate of an inviſible and elaſtic vapour, conſtituting a ſpecies of aerial fluid, and conſiſts of phlogiſticated and inflammable air.

Acids, by their union with other bodies, form

Neutral Salts.	*Earthy Salts.*	*Metallic Salts.*	*Essential Salts.*
Theſe are always compoſed of an acid and an alkali, and are of many different kinds, as may be ſeen in the following table.	Compoſed of an acid joined to an earthy baſis, as alum and gypſum. See the following table.	Formed of an acid and metal. The principal of theſe are vitriols; the others may be ſeen in the following table.	Obtained from vegetables, and contain an acid joined with the juices of the plant in a particular manner not to be imitated by art. To theſe belong ſugar, manna, honey, and others of that ſort.

II. EARTHS.

II. EARTHS.

These are ſolid bodies, not ſoluble in water, nor inflammable; and if fuſed in the fire, never reſume their earthy form again, but take that of glaſs. They are divided into *abſorbent*, *cryſtalline*, and *argillaceous*.

I. *Absorbent Earths* are capable of being united with acids, and are either calcareous, or not calcareous.

a, The calcareous abſorbent earths are,

1. *Limeſtone*, or *marble*. This is of infinite variety as to colour and texture. Marble is the hardeſt and fineſt. Thoſe kinds of limeſtone which feel unctuous to the touch, are generally impregnated with clay: thoſe that feel gritty, or where the lime is hard and weighty, contain ſand; this is the beſt for building; the other for manure.
2. *Chalk*. A white, friable, ſoft ſubſtance. This is much more free of heterogeneous matters than any limeſtone, and is eaſily calcined into quicklime. It is probably nothing elſe than limeſtone ſuddenly concreted without being cryſtallized.

3 *Sea ſhells*, are likewiſe a calcareous earth, and yield a very fine quicklime. Theſe are uſed in medicine.

4. *Terra ponderoſa*. A fine white earth ſometimes found combined with fixed air, but more commonly with the vitriolic acid; and forming with it a very heavy compound, named *ſpathum ponderoſum*. It is found in mines and veins of rocks.

b, The abſorbent earths which cannot be reduced into quicklime are,

1. *Magneſia alba*. A white earth, uſually found combined with the vitriolic acid, and forming bitter purging ſalt. It is likewiſe obtained from the mother-ley of nitre, the aſhes of burnt vegetables, *&c.*
2. *Earth of alum*. A particular kind of abſorbent earth, found in many places mixed with ſulphureous pyrites, as in Yorkſhire, &c. Clay of any kind may by a particular proceſs be converted into this earth.
3. *Earth of animals*. This is obtained by the calcination of animal ſubſtances, and by precipitation in the proceſs for making acid of milk. It can hardly be converted into glaſs; and is therefore uſed as a baſis for white enamels, &c. It is ſaid to conſiſt of the phoſphoric acid united to calcareous earth.

II *Crystalline or Vitrescent Earths*, are hard, and ſtrike fire with ſteel; may be calcined in the fire; but are not ſoluble in acids. Of this kind are,

1. *Sand* and *Flint*; found plentifully every where. With alkaline ſubſtances they are eaſily changed into glaſs; and hence are termed *vitreſcent*.
2. *Precious ſtones* of all kinds are likewiſe referable to this claſs; but they are of a much greater degree of hardneſs and tranſparency than the others.

III. *Argillaceous Earths* are digſtinguiſhed by acquiring a very hard conſiſtence when formed into a paſte with water, and expoſed to a conſiderable degree of heat; not ſoluble in acids. They are,

1. *Common clay*. It is of many different colours; but chiefly red, yellow, or white. The pureſt is that which burns white in the fire.
2. *Medical boles*. Theſe are of different ſorts; but are only a purer kind of clay, ſometimes mixed with a little iron or other matters.
3. *Lapis nephriticus*, or *ſteatite*. Theſe are indurated clays, found in various parts. They are at firſt ſoft and readily cut; but turn extremely hard in the air. Many other varieties of theſe earths might be mentioned; but as they do not differ in their chemical properties ſo much as in their external appearance, and being all mixed with one another, they more properly belong to the natural hiſtorian than the chemiſt.

III. METALLIC SUBSTANCES.

These are bodies of a hard and ſolid texture; fuſible in the fire, and reſuming their proper form afterwards; not miſcible with water, nor inflammable. They are divided into *Metals and Semimetals*.

I. *Metals* are malleable; and the ſpecies are,

1. *Gold*. The moſt ponderous and fixed in the fire of all bodies except platina, and the moſt ductile of any. It has a yellow colour, and is more commonly found in its metallic ſtate than any other metal. It has no proper ore; but is found in ores of ſilver, and almoſt all ſands contain ſome of it.
2. *Silver* is next to gold in malleability and ductility; but leſs fixed in the fire than either it or platina. It is ſometimes found in its native ſtate; but moſt commonly in that of an ore with ſulphur, ſometimes with arſenic, and aſſuming different appearances.
3. *Platina*. A white metal of a greater ſpecific gravity than gold, and altogether as fixed in the fire; the moſt difficult to be melted of all known ſubſtances; reſiſting the teſts which have uſually been applied for diſcovering the purity of gold, ſuppoſed from hence to be the *ſmiris* of the ancients. Found in South America.
4. *Copper*. Of a reddiſh colour, hard and ſonorous; admits of being extended greatly under the hammer, either hot or cold. Is difficult of fuſion. It is generally found in the ſtate of an ore with ſulphur. There are a great variety of ores of it, extremely beautiful, blue, red, green, and yellow.
5. *Iron*. A grey-coloured metal, extremely ductile when hot; the lighteſt of them all except tin. It is the only metal certainly known to admit of being welded; though platina is likewiſe ſaid to poſſeſs ſome ſhare of this property. It is likewiſe the only one capable of being tempered by cooling. It is found almoſt every where; and its ores are infinitely various.
6. *Tin*. A white ſoft metal, the lighteſt of the whole, and very ductile. The ores of it are generally arſenical, and aſſume a cryſtalline appearance; their colour being moſt uſually of a dark brown, and ſometimes very beautiful.

7. *Lead.* A metal of a dull bluiſh colour, exceedingly ſoft and malleable, and very weighty. Seldom found in its metallic ſtate, but uſually in an ore with ſulphur or arſenic; but ſeldom with ſulphur alone. The principal ores of it are the cubic, called *galena* and the glaſſy, called *ſpar*.

8. *Mercury or quickſilver*; formerly accounted a ſemimetal, on account of its fluidity, but now reckoned among the moſt perfect metals. It is a white, opaque, metallic body; fluid, except in a very intenſe degree of cold; very heavy, and eaſily volatilized by heat. Sometimes found in its fluid form, but uſually in a beautiful red ore with ſulphur, called *cinnabar*.

II. *Semimetals* are brittle, and do not ſtretch under the hammer. They are,

1. *Zinc.* A bluiſh white ſubſtance of a fibrous texture, conſiderably hard and ſonorous, with a ſmall degree of ductility; eaſily fuſed and volatilized. Its principal ore is lapis calaminaris.
2. *Biſmuth* or *tin-glaſs*. A white ponderous, hard, brittle and ſonorous body, of a plated texture; eaſily fuſed and vitrified. It is only reduced to an ore by arſenic. Its appearance much the ſame with regulus of antimony.
3. *Antimony.* A blackiſh ſubſtance, of a fibrous needle-like texture; hard, brittle, and of a conſiderable weight; not difficult of fuſion, and eaſily convertible into glaſs. Its only ore is with ſulphur, which is the crude antimony.
4. *Arſenic.* A bright, ſparkling, whitiſh-coloured ſemimetal; of a plated texture; very brittle, and extremely volatile. It is generally found in the ores of others metals.
5. *Cobalt.* A brittle ſemimetal fuſible in a moderate heat, and eaſily convertible into a beautiful blue glaſs, called *ſmalt*. It is always obtained from an arſenical ore, likewiſe called *cobalt*.
6. *Nickel.* A reddiſh white ſubſtance, of a cloſe texture, and very bright; eaſily melted, but very difficult to vitriſy.

IV. INFLAMMABLE SUBSTANCES,

Are thoſe which continue to burn of themſelves when once ſet on fire. They are divided into *oils*, *ſulphur* or *brimſtone*, *alcohol* or *ardent ſpirits* and *charcoal*.

I. *Oils* are thickiſh, viſcous fluids, not miſcible with water. Divided into *animal*, *vegetable*, and *foſſile*.

a, *b*, The animal and vegetable oils are,

1. *Expreſſed.* Theſe are of a mild and bland taſte, inodorous, and not ſoluble in alcohol. They are obtained by expreſſion, as oil of olives, rape-ſeed, almonds, &c. Animal fats are of the ſame nature, as is alſo wax.
2. *Eſſential.* Theſe are always obtained by diſtillation, poſſeſs the taſte and flavour of the ſubject from whence they are drawn, and are ſoluble in alcohol. Of this kind are oil of cloves, ſpike, &c. The oil of ants is an example in the animal kingdom.
3. *Empyreumatic.* Theſe are obtained by a conſiderable degree of heat, and poſſeſs an acrid taſte and burnt-like flavour, as oil of hartſhorn. They are ſoluble in ſpirit of wine.

c. *Foſſile oils.* Theſe are found in the earth in their native ſtate; and are called, when pure, *naphtha*; which is of an acrid taſte, and extremely volatile, not miſcible with alcohol. A great many inflammable foſſils contain this, as bitumens, pit-coal, &c.

II. *Sulphur or Brimstone.* This is a dry friable ſubſtance, not miſcible with water. It is found in many mineral ſubſtances, metallic ores, &c. but is for the moſt part met with in pyrites. Great quantities of it are found in the neighbourhood of volcanoes.

III. *Alcohol or Ardent Spirits.* This is a fluid of an acrid and volatile nature, miſcible with water; obtained from fermented vegetable juices by diſtillation; as from the juice of the grape, malt-liquors, rice, &c.

IV. *Charcoal.* The reſiduum of moſt inflammable matters after undergoing diſtillation with a ſtrong fire. A black ſubſtance, acted upon with difficulty by acids; ſoluble in hepar-ſulphuris, and entirely diſſipable into inflammable air by a very violent heat. Of great uſe as fuel, and eſſentially neceſſary in metallurgy and other arts.

V. WATER.

A colourleſs inſipid fluid well known. It is either *ſimple* or *mineral*.

I. *Simple*, or *pure-rain-water*, as it called, though the moſt homogeneous fluid of this kind with which we are acquainted, is not perfectly pure, but always contains a portion of mucilaginous matter, which can never be perfectly ſeparated. It is ſuppoſed to conſiſt of dephlogiſticated and inflammable air condenſed.

II. *Mineral waters* are theſe ſpring-waters impregnated with ſaline ſubſtances; the diverſity of which is exceeding great; but they all agree in having an acid joined with them. The moſt common ſorts are impregnated with iron and ſulphur.

VI. AIR.

An inviſible and permanently elaſtic fluid, is of the following kinds: *Dephlogiſticated*, *phlogiſticated*, *fixed* or *fixable*, *inflammable*, *nitrous*, *vitriolic acid air*, *marine acid air*, *dephlogiſticated marine acid*, *alkaline air*, *hepatic air*, *atmoſpherical air*.

1. *Dephlogiſticated.* An elaſtic fluid naturally extricated in the proceſs of vegetation; artificially procured from nitre, minium, mangaueſe, water, &c. eminently capable of ſupporting flame and animal life. One of the component parts of our atmoſphere.

2. *Phlogiſticated.* Produced in great quantities during the putrefactive fermentation; obtained alſo in the calcination of metals and other phlogiſtic proceſſes. Deſtroys animal life, and extinguiſhes flame, but is very friendly to vegetation. Is another of the component parts of our atmoſphere.
3. *Fixed*, or *fixable.* Has its name from the property of adhering to certain bodies, and fixing itſelf in them. Conſiſts of dephlogiſticated air united to charcoal. Is obtained by fermentation, and in all phlogiſtic proceſſes. Manifeſts the properties of an acid: extinguiſhes flame, and deſtroys animal life.
4. *Inflammable.* Conſiſts wholly of charcoal and a little water rarefied by heat; is remarkable for being the lighteſt of all gravitating ſubſtances. Is produced naturally in mines, and from putrid waters; artificially procured from certain metallic ſolutions, by paſſing the ſteam of water over red-hot iron; by diſtilling wood, pit-coal, &c. with a ſtrong heat; or by expoſing charcoal to the heat of a burning lens *in vacuo.* It extinguiſhes flame unleſs it be mixed with a certain proportion of atmoſpherical or dephlogiſticated air; in which caſe it explodes violently, deſtroys animal life, but is friendly to vegetation.
5. *Nitrous.* Procured artificially in diſſolving metallic or other ſubſtances in the nitrous acid. On mixture with dephlogiſticated air both the fluids loſe their elaſticity, and a ſmall quantity of nitrous acid is produced. It inſtantly kills animals, and extinguiſhes flame. By union with ſome metals is converted into volatile alkali. In ſome caſes it may be made to ſupport flame, and even animal life. Its property of condenſing along with phlogiſticated air renders it a teſt of the ſalubrity of the atmoſphere.
6. *Vitriolic acid air.* The ſame with volatile or ſulphureous vitriolic acid.
7. *Marine acid air.* The ſame with marine acid reduced into vapour, and deprived of moſt of its water.
8. *Dephlogiſticated marine acid.* Suppoſed by ſome to be the marine acid deprived of its phlogiſtion; by others to be the ſame acid with an addition of pure air. It deſtroys many kinds of colours; whitens linen, and with inflammable air regenerates common marine acid.
9. *Alkaline air.* The ſame with pure volatile alkali; is formed by an union of phlogiſticated and inflammable air.
10. *Hepatic air.* Produced from the decompoſition of liver of ſulphur by acids, or in the common atmoſphere. It is inflammable, but does not burn with exploſion.
11. *Atmoſpherical air.* Compoſed of dephlogiſticated and phlogiſticated air; and thus ſupports both animal life and vegetation.

TABLE, ſhowing the ſeveral Combinations that the SIMPLE CHEMICAL ELEMENTARY BODIES admit of with one another; the Compound reſulting from that Mixture; and the Manner in which the Union is effected: With ſome Account of the principal Uſes to which theſe are applied in Arts or Manufactures.

N. B. This mark*, put above any word, denotes that there is ſome difficulty in the proceſs, or that the union is not very complete.

VITRIOLIC ACID may be combined with the following ſubſtances, viz.

ACIDS.		NITROUS ACID. A mixture which readily inflames oils. By ſolution, generating heat.
		MURIATIC, VEGETABLE, and all other ACIDS yet known. By ſolution, generating heat. But theſe mixtures are applied to no particular uſe in medicine or arts.
ALKALIES.	VEGETABLE.	*Vitriolated tartar.* By ſolution and cryſtallization, or double elective attraction from a great variety of bodies.
		Nitrum vitriolatum. A vitriolated tartar, obtained by diſtilling from nitre with the vitriolic acid.
		Sal polychreſtum. By deflagrating nitre with ſulphur. There are many other kinds of vitriolated tartar, known formerly by different names, and ſuppoſed to be poſſeſſed of particular properties, but they are now neglected.
	FOSSILE.	*Glauber's ſalt.* By ſolution and cryſtallization. Much uſed in medicine as a gentle purgative.
	VOLATILE.	*Secrêt ammoniac.* By ſolution. Formerly ſuppoſed a moſt powerful menſtruum for metals, &c. but without any juſt foundation.
EARTHS.	CALCAREOUS EARTHS.	A corroded calx. By ſimple corroſion. This when perfectly edulcorated with water is found to be a true gypſum.
		Selenites. By precipitation from a very dilute ſolution of chalk in the nitrous acid, by means of the vitriolic acid.
		Terra ponderoſa. With this it unites in preference to alkalies, forming a very heavy and inſoluble ſubſtance called *ſpathum ponderoſum.*
		Gypſum or *Paris-plaſter.* Often found in a native ſtate. May be artificially formed by precipitating from a ſolution of chalk in a very concentrated nitrous acid. Uſed as a cement: for taking impreſſions from medals, &c.
		Talc aſbeſtos, &c. A native production which connot be perfectly imitated by art. Uſed for holding objects in microſcopes, making incombuſtible cloth, &c.
	MAGNESIA.	*Epſom*, or *magneſia Glauber's ſalt.* By ſolution and cryſtallization. Much uſed in medicine for the ſame purpoſes as real Glauber's ſalt.

EARTHS.

- Earth of Alum. *Alum.* By ſolution, cryſtallization, &c. Uſed by dyers as a preparatory for taking on the colours, papermakers, goldſmiths, &c.
- Earth of Animals, Osteocella, &c. By ſolution. The mixtures of theſe are not applied to any particular uſe.
- Clay*. *Alum.* By digeſting pure clay for ſome time in this acid, and expoſing it for ſome time to the air, an alum is produced; and if the clay is precipitated from this aluminous concrete, it is found to be a pure earth of alum, ſoluble in all acids.
- Flint. A thickiſh coagulum. By digeſting the liquor ſilices in the vitriolic acid.

METALS.

- Gold*. Imperfectly. By a particular proceſs after being ſeparated from aqua-regia.
- Silver*. By ſolution, after it has been precipitated from the nitrous acid by alkalies. The fumes which ariſe in this ſolution are inflammable.
- Copper. *Blue vitriol.* This is ſometimes a native production, but in this way it is never pure. It is artificially prepared by ſolution in a very concentrated acid, and cryſtallizing it.
- Iron.
  - *Green vitriol* or *copperas.* Obtained at large by particular proceſs from pyrites; or by ſolution, &c. in a diluted acid. This is the baſis of all black dyes, ink, &c. as it ſtrikes a black colour with vegetable aſtringents.
  - *Salt of ſteel.* By calcining the cryſtals of green vitriol till they are converted into a white powder.
  - *Colcothar of vitriol.* By continuing the calcination till it aſſumes a brown colour.
- Lead.
  - *Saturnus vitriolicus.* A ſolution in a boiling heat, but is again precipitated when cold.
  - An indiſſoluble concrete. By precipitation from the nitrous acid.
- Tin. *Jupiter corroſivus.* By a boiling heat in a concentrated acid.
- Mercury.
  - *Ignis Gehenne*, or infernalis of Paracelſus. By a boiling heat, and repeated coctions with freſh acid when it is evaporated.
  - *Turpeth mineral*, or mercurius precipitatus flavus. By evaporating to dryneſs, and then waſhing with water.

SEMIMETALS.

- Antimony*. *A metallic ſalt.* By elective attraction from butter of antimony.
- Zinc. *White vitriol.* Often found in its native ſtate. Artificially made by ſolution and cryſtallization in a diluted acid. Uſed by painters for drying.
- Bismuth. A corroded calx. By ſolution in a concentrated acid.
- Arsenic - - - By ditto.
- Cobalt. A roſe-coloured mixture. By ſolution. If this is precipitated by a fixed alkali, and again diſſolved, the liquor appears of a beautiful red.

OILS.

- Expressed. A blackiſh gummy-like maſs. By ſolution, generating a conſiderable heat. Native gums are ſuppoſed to owe their origin to a mixture of this kind.
- Essential. A dark-coloured reſinous maſs. A great heat and violent effervеſcence being produced by this mixture. Native reſins ſuppoſed the ſame.
- Empyreumatic. Little known. By ſolution.
- Fossile. A ſubſtance reſembling amber. By ſolution.

SULPHUR*. Here there is no proper union of ſubſtances; but if ſulphur is boiled in this acid, it becomes leſs inflammable and more fixed than any ordinary ſulphur.

ALCOHOL.

- *Vitriolic ether.* By careful ſolution and diſtillation, the ether being ſeparated by the addition of water.
- *Spiritus vitrioli dulcis.* By ſolution and diſtillation.
- *Oleum dulce.* By continuing the heat after the ether has ariſen.
- *Oleum anodynum minerale.* By rediſtilling the reſiduum of the laſt with alcohol. A medicine much celebrated by Hoffman.
- *Sulphur.* By puſhing the heat after the oil comes over. It is to be obſerved that this is produced in every combination of this acid with inflammables or metals.

WATER. An acidulated water. Sometimes, though ſeldom, found iſſuing along with native ſprings. Applied to no particular uſe.

NITROUS ACID may be combined with the following Subſtances, viz.

ACIDS.

- Vitriolic, as above.
- Muriatic. *Aqua-regia.* By ſolution. This is the only proper menſtruum for gold; and it is a ſolution of tin in this menſtruum which is the baſis of the ſcarlet dye.
- Vegetable, and all others. By ditto. Theſe compounds have no particular names, nor are applied to any particular uſes in medicine or arts.

ALKALIES.

- Vegetable. *Common nitre.* A native production. Made artificially by ſolution and cryſtallization. This deflagrates with oily or metallic bodies, and is the foundation of gun-powder.
- Fossile. *Cubic nitre.* By ſolution.
- Volatile. *Nitrous ammoniac.* By ſolution. This differs from all the other ammonical ſalts, by being ſoluble in alcohol.

EARTHS.

- Calcareous.
  - *Deliqueſcent cryſtals.* By ditto and cryſtallization.
  - *Baldwin's phoſphorus.* By ditto and evaporating to dryneſs.
- Earth of Alum, and all other abſorbent earths. By ſolution. The compounds have no names nor any remarkable properties hitherto diſcovered.
- Crystalline Earths*. By ſolution after precipitation from the liquor ſilices.

METALS.	GOLD*.	*Slightly impregnated.* By a boiling heat in cloſe veſſels, after the ordinary method of ſeparating ſilver from gold by the nitrous acid. It ſpontaneouſly ſubſides in the air.
	SILVER.	*A fluid ſolution.* By ſolution. This when diluted with water ſtains hair and bones black; as alſo marble, agate, jaſper, &c. of different colours.
		Sal metallorum. By ſolution and cryſtallization.
		Catharticum lunare, *lunar cauſtic*, or *lapis infernalis*. By inſpiſſating the ſolution to dryneſs.
	COPPER.	A green-coloured ſolution. By ſolution.
	IRON.	A greeniſh ſolution, if a diluted acid is employed; if otherwiſe, it is of a yellowiſh colour: evaporated to dryneſs, it deliquates in the air.
	LEAD.	A yellow ſolution. By diſſolving in a diluted acid. If much water is added, the metal is precipitated.
		Saturni fulminans. By inſpiſſating the ſolution. This explodes when put upon the fire with greater force than nitre, and has been propoſed to be uſed as an ingredient in gun-powder to augment its force.
	TIN.	A ſolution or corroded calx. By a careful ſolution without heat it remains ſuſpended; if otherwiſe, it falls down in form of a calx. This is commonly ſuppoſed to be the compoſition uſed in dyeing ſcarlet; but by miſtake: for it is a ſolution of tin in aqua-regia that communicates that fine colour to cochineal. The ſame ſolution is the baſis of the powder which tinges glaſs of a ruby colour. It is the precipitate of gold from aqua-regia by means of tin.
	MERCURY.	A limpid ſolution, intenſely corroſive. By ſolution.
		Red precipitate. By evaporating the ſolution to dryneſs, and then calcining till it becomes red.
		Mercurius corroſivus fuſus. By precipitating from the nitrous acid by fixed alkali.
		White precipitate - By ditto with the volatile alkali.
SEMIMETALS.	BISMUTH.	A greeniſh ſolution. By uſing a concentrated acid. This might be applied in ſome caſes in the art of dyeing; but is not yet come into general uſe.
		Magiſtery of biſmuth. By precipitating from the ſolution by means of water. This has been employed as a coſmetic, but is inefficacious and unſafe. If mixed with pomatum, this ſtains hair of a dark colour without injuring it.
	ZINC.	A corroded ſolution. By the ordinary means.
	ANTIMONY.	A colourleſs calx. By ſimple corroſion.
		Bezoardic mineral. By diſtilling from butter of antimony, after having added the nitrous acid.
		Antimonium diaphoreticum. By adding nitre to crude antimony, and deflagrating.
		Ceruſa antimonii. By deflagrating regulus of antimony with nitre.
	COBALT.	A red liquor. By ſolution either in its calcined or metallic ſtate.
		Roſe-coloured cryſtals. By adding muriatic acid, and allowing it to cryſtallize.
		Green ſympathetic ink. By diſſolving theſe cryſtals in water. The ſolution is red when cold, and green when warm; when wrote with, it diſappears when dry; but when held to the fire it becomes green; and again diſappears when cold.
	NICKEL.	A green-coloured liquor. By ſolution.
OILS.	EXPRESSED.	A thick bituminous-like ſubſtance. Upon the mixture a conſiderable degree of heat is generated, and ſometimes, though very ſeldom, actual flame is produced.
	ESSENTIAL.	Ditto. A more violent heat is generated upon the mixture with theſe oils than any other, and with many of them an actual flame is produced.
	EMPYREUMATIC.	This mixture has no name, nor is it applied to any remarkable uſe in arts.
	FOSSILE.	Ditto.
ALCOHOL.		*Nitrous ether.* By digeſting; the ether ariſing to the ſurface.
		Spiritus nitri dulcis. By digeſting a little, and then diſtilling.
WATER.		*Acidulated water.* By ſolution.

The MURIATIC ACID *may be combined with the following Subſtances.* viz.

ACIDS.	VITRIOLIC and NITROUS.	As in the former part of this Table.
	VEGETABLE, and all others yet known.	By ſolution: but as none of theſe mixtures are applied to any particular purpoſe, we take no notice of them.
ALKALIES.	VEGETABLE.	*Digeſtive ſalt.* By ſolution and cryſtallization.
	FOSSILE.	*Common ſalt.* Commonly obtained by evaporating ſea-water to dryneſs; or artificially made by mixing the acid and alkali, and cryſtallizing.
		Sal gem. A native foſſile ſalt, found in mines in Poland, Spain, &c. of the ſame nature as common ſalt, but more pure.
	VOLATILE.	*Common ammoniac.* Obtained at large by a particular proceſs from ſoot. Artificially made by mixing the acid and alkali, and cryſtallizing.
EARTHS.	CALCAREOUS.	*Liquid ſhell.* By ſolution. A ſubſtance whoſe effects in medicine have been greatly extolled.
		Ol. calcis per deliquium. By evaporating liquid ſhell to dryneſs. It naturally deliqueſces.
		Fixed ammoniac. By ſolution and cryſtallization. This ſometimes appears luminous in the dark when ſtruck with a hammer.
	OSTEOCELLA, MAGNESIA, and other abſorbents.	By ſolution: but the properties or uſes of theſe are not known.

METALS.	Gold*.	*A yellow liquor.* By boiling a calx of gold (in whatever way obtained) in this acid. It does not act upon it in its metallic ſtate.
	Silver*.	*A fluid ſolution.* By diſſolving the ore of ſilver in this acid. It does not act upon pure metallic ſilver.
		Luna cornea. By elective attraction from the nitrous acid.
	Platina*.	A fluid ſolution. With difficulty effected, after having been precipitated from aqua-regia by alkalies.
	Copper.	*A green deliqueſcent inflammable ſalt.* By ſolution and inſpiſſating to dryneſs.
	Iron.	*Tinctura martis aurea.* By ſolution. The iron is in ſome meaſure rendered volatile by the operation.
	Lead.	A limpid ſolution. By a boiling heat, and frequent cohobations with freſh acid.
		Cornea Saturni. By precipitation from the nitrous acid.
	Tin*.	A corroded powder. By ſimple corroſion.
		Butter of tin. By diſtilling from corroſive ſublimate.
	Mercury*.	A colourleſs cryſtalline maſs, extremely acrid. By corroſion, employing the fumes of a very concentrated acid.
		Mercur. corroſiv. albus. By precipitation from the nitrous acid.
		Corroſive ſublimate. By ſubliming from ſal ammoniac, common ſalt, or many other bodies.
		Mercurius dulcis. By reſubliming corroſive ſublimate with more quickſilver.
		Mercurial panacea. By ſubliming corr. ſub. nine times, and digeſting for ſome time in ſpirit of wine.
SEMIMETALS.	Bismuth*.	A ſolution very ſlightly impregnated. By employing a very concentrated acid.
	Zinc.	A ſolution of a very ſlight yellow colour.
	Arsenic*.	*Butter of arſenic.* By diſtilling corroſive ſublimate with arſenic; the arſenic uniting with the acid, and leaving the mercury.
	Cobalt.	A reddiſh ſolution. By the ordinary means. It becomes green by a gentle heat.
	Nickel.	A green ſolution. By the ordinary means.
OILS*.		By ſolution. The union here is but imperfect, nor have they any particular name.
ALCOHOL.		*Spiritus ſalis dulcis.* By digeſtion, and afterwards diſtilling. The acid here is never totally dulcified.
WATER.		*Acidulated water.* Generating heat by mixture.

VINEGAR may be combined with the following Subſtances, viz.

ACIDS.	Vitriolic, Nitrous, and Muriatic,	as in the above table. It likewiſe unites with all other acids, generating heat; but the properties or uſes of theſe are not known.
ALKALIES.	Vegetable.	*Regenerated tartar.* By ſolution and cryſtallization.
	Fossile.	*Polychreſt of Rochelle.* By ditto.
	Volatile.	*Spiritus Mindereri* By ſolution.
EARTHS.	Calcareous Earth.	*Earthy ſalts.* Not known in medicine or arts.
	Magnesia.	*Dr Black's purging ſalt.* By ſolution. It unites with all the other abſorbent earths; but the properties of theſe mixts are unknown.
METALS.	Copper.	*Verdegris.* By ſolution and cryſtallization; or at large, by ſtratifying copper-plates with the huſks of the grape.
	Iron.	*Sal martis aperiens.* By ſolution and cryſtallization.
	Lead.	*Ceruſe.* By expoſing, in certain circumſtances, thin plates of lead to the fumes of vinegar.
		Saccharum Saturni. By ſolution and cryſtallization.
	Tin*.	This is not properly diſſolved; but the acid is evidently impregnated. By the ordinary means of ſolution.
	Mercury*.	*A fluid ſolution.* By employing a precipitate of mercury from the nitrous acid by alkalies.
		A red calx. By long digeſtion with fluid mercury.
SEMIMETALS.	Zinc.	A colourleſs ſolution of a ſweetiſh taſte. By digeſting for ſome time.
	Antimony*.	*Vinum benedictum.* This it not a proper ſolution of the metal, but the acid is impregnated with an emetic quality.
	Arsenic.	*Vinum arſenicum.* By ditto. A curious phoſphoric liquor.
	Bismuth.	An auſtere ſtyptic liquor. By ſtrong coction.
OILS*.		The union here is imperfect, nor have any of them obtained particular names.
ALCOHOL.		A mixture much uſed for anointing ſprains, &c.
WATER.		*Acidulated water.*

ACID of TARTAR may be combined with the following ſubſtances, viz.

ALKALIES.	Vegetable.	Cream of tartar with exceſs of acid.
		Soluble tartar, when completely ſaturated.
ALKALIES.	Fossile.	Rochelle ſalt.
	Volatile.	A ſalt very difficult of ſolution with exceſs of acid.
		A beautiful and ſoluble ſalt when perfectly ſaturated.

EARTH.	Calcareous.	An indiſſoluble ſelenite.
METALS.	Copper.	A fine green colour for painting.
	Iron.	A green aſtringent liquid. Chalybeated tartar.
SEMIMETAL.	Regulus of Antimony.	Emetic tartar.

ACID of URINE may be combined with the following ſubſtances, viz.

ACIDS of all kinds.		The nature of theſe not known.
ALKALI.	Fixed Vegetable.	A ſalt not eaſily cryſtallized, the nature of which is not known.
	Fossile.	A fine cryſtallized ſalt uſed in medicine.
	Volatile.	A glaſs-like ſaline ſubſtance called *microcoſmic ſalt*. The acid is always found in this ſtate by evaporating urine.
VITRESCENT EARTHS.		A glaſs of different ſorts. By fuſion.
METALS.	Lead.	An inflammable malleable maſs. By calcining the dry ſalt with lead.
	Tin.	A maſs reſembling zinc; and inflammable. By ditto.
	Iron.	A true *phoſphorus*. By ditto. A bluiſh ſolution. By employing a watery ſolution of the acid.
	Copper.	A corroded powder, or green ſolution. By a boiling heat in a watery ſolution of the acid.
	Mercury.	A ſemi-opaque maſs. By fuſion with the acid, in its ſolid form.
SEMIMETALS.	Zinc.	A corroded powder, ſoluble in water. By ſolution in the acid in a watery ſituation. A true *phoſphorus*. By fuſion with the dry acid.
	Antimony.	A ſolution in the ordinary way. A brilliant ſtriated maſs. By fuſion with the dry acid.
	Bismuth.	A mixture but little changed in appearance from ordinary biſmuth. By fuſion.
	Arsenic.	A whitiſh ſemitranſparent deliqueſcent maſs. By fuſion.
	Cobalt.	A reddiſh tincture. By ſolution.
OILS.		*Baldwin's phoſphorus*. By diſtilling with ſubſtances that contain oils or inflammable matter.

FLUOR ACID, may be combined with the following Subſtances, viz.

ALKALIES.	Fixed Vegetable.	A gelatinous ſaline maſs which cannot be cryſtallized. Great part of it is alſo diſſipated by evaporation to dryneſs.
	Fossile.	A ſubſtance ſimilar to the foregoing.
	Volatile.	Lets fall a quantity of ſiliceous earth, and forms a cryſtallizable ammoniacal ſalt.
EARTHS.	Lime Magnesia. Earth of Alum.	A gelatinous matter.
	Siliceous Earth.	After long ſtanding, cryſtals of quartz.
METALS.	Silver Quicksilver.	The calces of theſe metals partially diſſolved; but the properties of the ſolution unknown
	Copper.	The calx eaſily ſoluble, and affording blue cryſtals; the metal only partially ſo.
	Iron.	Diſſolved with violence with the emiſſion of inflammable vapours into an uncryſtallizable liquor.

ACID of SUGAR may be combined with the following Subſtances, viz.

ALKALIES.	Fixed Vegetable.	A ſalt ſcarce capable of cryſtallization when perfectly neutral.
	Fossile.	A ſalt difficultly ſoluble in water.
	Volatile.	An ammoniacal ſalt ſhooting into quadrangular priſms.
EARTHS.	Lime.	A kind of ſelenite from which the acid cannot be ſeparated by a burning heat.
	Terra Ponderosa.	A ſalt formed into angular cryſtals, ſcarce ſoluble in water.
	Magnesia.	A white powder inſoluble without an exceſs of acid.
	Earth of Alum.	A yellow pellucid maſs incapable of cryſtallization, and liquefying in the air.
METALS.	Gold. Silver. Platina. Quicksilver.	The calces of all theſe metals diſſolved, but the nitre of the ſolutions unknown.
	Iron.	Diſſolved in great quantity, and forming a yellow priſmatic ſalt eaſily ſoluble in water.
SEMIMETAL.	Cobalt.	A yellow-coloured ſalt forming a ſympathetic ink with ſea-ſalt.
INFLAMMABLES.	Alcohol.	An ether which cannot eaſily be ſet on fire unleſs previouſly heated, and burning with a blue flame.

ACID of BORAX or SEDATIVE SALT may be combined with the following Subſtances, viz.

ALKALIES.	Fossle.	*Borax*. A native ſubſtance, which may be imitated by art. It is of great uſe in promoting the fuſion of metals and earths.
	Volatile.	An ammoniacal ſalt ſhooting into ſmall cryſtals, and melting by an intenſe heat into a greyiſh-coloured glaſs.
EARTHS.	Magnesia.	A ſalt cryſtallizable in vinegar and acid of ants. Decompoſed by other acids and ſpirit of wine.
	Earth of Alum.	In certain proportions a ſalt difficult of ſolution; in others a hard maſs reſembling pumice-ſtone, yet partially ſoluble in water.

METAL.	Iron.	An amber-coloured ſolution yielding cryſtals of a yellow colour.
SEMIMETAL.	Arsenic.	A cryſtallizable compound ſhooting into pointed ramifications, or forming a greyiſh, white, or yellow powder.
ALCOHOL.		A ſolution with a conſiderable heat, which burns with a green flame.
WATER.		A ſolution in a conſiderable heat. The other mixtures with this acid not known.

ACID of AMBER may be combined with the following Subſtances, viz.

ALKALIES.	Fixed Vegetable.	A tranſparent and cryſtallizable ſalt, but deliqueſcent.
	Fossile.	A cryſtallizable ſalt not deliqueſcent.
	Volatile.	An ammoniacal ſalt ſhooting into acicular cryſtals.
EARTHS.	Lime	A cryſtallizable ſalt, difficult of ſolution and not deliqueſcent. Decompoſed by common ſal ammoniac.
	Magnesia.	A gummy deliqueſcent ſaline maſs, not cryſtallizable.
	Earth of Alum.	A priſmatic ſalt incapable of decompoſition by alkalies.
METALS.	Silver.	A ſalt ſhooting into thin oblong cryſtals obtained from the precipitate; but no ſolution of the perfect metal.
	Copper.	A cryſtallizable ſalt of a green colour.
	Iron.	A cryſtallizable ſalt of a brown colour.
	Tin.	A cryſtallizable ſalt from the precipitate, ſcarce to be decompoſed by alkalies.
	Lead.	A cryſtallizable ſalt from the precipitate.
SEMIMETALS.	Zinc.	A cryſtallizable ſalt.
	Bismuth.	A cryſtallizable ſalt from the precipitate, not to be decompoſed by alkalies.
	Regulus of Antimony.	A ſolution of the precipitate.

ACID of ANTS may be combined with the following Subſtances, viz.

ALKALIES.	Fixed Vegetable.	A cryſtallizable ſalt, deliqueſcent in the air.
	Fossile.	A ſalt of a ſimilar nature.
	Volatile.	An ammoniacal liquor, cryſtallizable with difficulty.
EARTHS.	Chalk or Coral.	A cryſtallizable ſalt which does not deliquate.
	Magnesia.	A ſaline liquor ſcarcely cryſtallizable.
	Terra Ponderosa.	A cryſtallizable ſalt which does not deliqueſce.
	Earth of Alum.	Unites with difficulty, and ſcarcely to the point of ſaturation. The nature of the compound not known.
METALS.	Silver*.	By ſolution. The calx of ſilver precipitated from aquafortis by alkalies; but does not act upon it in its metallic ſtate.
	Copper.	Beautiful green cryſtals. By diſſolving and cryſtallizing calcined copper. It acts ſlowly upon it in its metallic ſtate.
	Iron.	A cryſtallizable ſalt. It diſſolves this metal with great facility.
	Lead*.	A ſalt reſembling ſaccharum ſaturni. By diſſolving the red calx of lead. But it does not act upon it in its metallic ſtate.
SEMIMETAL.	Zinc.	Elegant cryſtals. By the ordinary means.

The effects of this acid upon other bodies, or the uſes to which theſe combinations might be applied, are not yet ſufficiently known.

ACID of ARSENIC may be combined with the following Subſtances, viz.

ALKALIES.	Fixed Vegetable.	A ponderous ſalt ſhooting into fine cryſtals by ſuperſaturation with acid.
	Fossile.	A ſalt cryſtallizable when perfectly neutral.
	Volatile.	A peculiar kind of ammoniacal ſalt parting with the alkali, and decompoſing ſome of it in a ſtrong fire.
EARTHS.	Chalk.	A cryſtallizable ſalt ſcarcely ſoluble.
	Magnesia.	A gelatinous maſs which cannot be cryſtallized.
	Terra Ponderosa.	An inſoluble white powder.
METALS.	Copper.	A green-coloured ſolution.
	Iron.	A very thick gelatinous ſolution.
	Lead.	A ſolution which cannot be cryſtallized.
	Tin.	A gelatinous ſolution in the moiſt way. A mixture taking fire in cloſe veſſels in the dry way.
SEMIMETALS.	Zinc.	A ſolution in the moiſt way, and in the dry, a mixture taking fire in cloſe veſſels.
	Bismuth.	A partial ſolution.
	Regulus of Antimony.	A partial ſolution.
	Cobalt.	A partial ſolution of a red colour.
	Manganese.	A partial ſolution in its natural ſtate. When the mangaueſe is phlogiſticated, a cryſtallizable ſalt may be obtained.
INFLAMMABLES.	Charcoal.	A mixture taking fire and ſubliming when heated in cloſe veſſels.
	Oil of Turpentine, &c.	A thick black ſubſtance after ſome days digeſtion.
	Sulphur.	A red ſublimate.

ACID of MOLYBDÆNA may be united with the following Subſtances, viz.

ALKALI.	Fixed Vegetable. A cryſtallizable ſalt.
	Volatile. A neutral ſalt, the nature of which is unknown.

ACID of MILK may be combined with the following Subſtances, viz.

ALKALIES.	Fixed Vegetable. A deliqueſcent ſalt ſoluble in alcohol.
	Fossile. A ſalt of a ſimilar nature.
	Volatile. A deliqueſcent ſalt parting with much of the alkali by heat.
EARTHS.	Calcareous and Argillaceous. Deliqueſcent ſalts.
	Magnesia. A ſalt more eaſily cryſtallized, but deliqueſcent.
METALS.	Copper. A blue ſolution, which cannot be cryſtallized.
	Iron. A brown ſolution, with the emiſſion of inflammable air, yielding no cryſtals.
	Lead. An aſtringent ſweetiſh ſolution, which does not cryſtallize.
SEMIMETAL.	Zinc. A cryſtallizable ſalt, with the emiſſion of inflammable air during the ſolution.

ACID of SUGAR of MILK may be combined with the following Subſtances, viz.

ALKALIES.	Fixed Vegetable. A ſalt very difficult of ſolution.
	Fossile. A ſalt more eaſily ſoluble.
	Volatile. A peculiar kind of ammoniac.
EARTHS.	Absorbent and Argillaceous. Inſoluble ſalts.

ACID of APPLES may be combined with the following Subſtances, viz.

ALKALIES.	Fixed Vegetable, Fossile, and Volatile. Deliqueſcent ſalts.
EARTHS.	Calcareous. A ſalt difficult of ſolution unleſs the acid prevail.
	Magnesia. A deliqueſcent ſalt.
	Earth of Alum. A ſalt very difficult of ſolution.
METAL.	Iron. A brown ſolution, which does not cryſtallize.
SEMIMETAL.	Zinc. A fine cryſtallizable ſalt.

ACID of FAT may be combined with the following Subſtances, viz.

ALKALIES.	Fixed, Vegetable, and Fossile. Neutral ſalts of a particular nature.
	Volatile. A concrete volatile ſalt.
EARTHS.	Calcareous. A cryſtallizable ſalt of a brown colour.
	Magnesia. Earth of Alum. A gummy maſs, which refuſes to cryſtallize.
METALS.	Silver. A ſolution of the calx.
	Platina. The calx copiouſly diſſolved, and even the perfect metal attacked by diſtillation to dryneſs.
	Copper. A green ſolution, which cannot be cryſtallized.
	Iron. A cryſtallizable ſalt, which does not deliquate.
	Lead. An aſtringent ſolution of the red calx called *minium*.
	Tin. A ſolution in ſmall quantity.
	Mercury. A ſolution by being twice diſtilled from the metal.
SEMIMETALS.	Zinc. Diſſolved in its metalline ſtate.
	Bismuth. A ſolution of precipitate.
	Regulus of Antimony. A cryſtallizable ſalt, which does not deliquate.
	Manganese. A perfect and clear ſolution.

ACID of BENZOIN may be combined with the following Subſtances, viz.

ALKALIES.	Fixed Vegetable. A ſalt ſhooting into pointed feathery cryſtals.
	Fossile. A ſalt procurable in larger cryſtals.
	Volatile. A deliqueſcent ſalt ſcarce cryſtallizable.
EARTHS.	Calcareous. A cryſtallizable ſalt not eaſily ſoluble.
	Magnesia. A cryſtallizable ſalt eaſily ſoluble.

The FIXED ALKALI, whether Vegetable or Fossile, can be united with the following Bodies; but the Vegetable is beſt known.

ACIDS:	Vitriolic, Nitrous, Muriatic, Vegetable; and acid of Urine, of Amber, of Ants, of Borax, &c. as in the former part of this Table.
ALKALIES	of all ſorts. The uſes of theſe mixtures are not known.
EARTHS.	Crystalline. *Liquor ſilicum.* By fuſion with twice their weight of alkali. *Glaſs.* By fuſion with a much ſmaller proportion of alkali. This is the compoſition of cryſtal glaſs, and all others commonly uſed.
	Absorbents. Argillaceous, and all kinds of earths. *Glaſs.* By fuſion; differing in quality according to the nature of the ingredients. Glaſs is likwiſe produced with it in fuſion with metals.
METALS.	Gold*. After having precipitated it from aqua-regia, it diſſolves it if the alkali has been calcined with animal ſubſtances.
	Silver*. After having precipitated it from the nitrous acid, it diſſolves it if the alkali has been calcined in contact with the flame.

METALS.
- Tin. A corroded powder. By the ordinary means of ſolution.
- Copper. By ditto.
- Lead. A fluid ſolution. By ditto. This ſtains hair black.
- Iron*. A blood-coloured ſolution. By dropping a ſolution of iron in the nitrous acid, into an alkaline lixivium.
- Mercury*. A fluid ſolution. After precipitating it from acids; if the alkali is in too large proportions, it then diſſolves it, eſpecially if the alkali has been calcined in contact with the flame.

SEMIMETALS.
- Zinc*. By ſolution, after having precipitated it from the nitrous acid.
- Bismuth*. By ſolution, after having precipitated it from the nitrous acid.
- Antimony.
  - *Kermes mineral.* By diſſolving antimony in an alkaline lixivium, filtering, and allowing it to ſtand in a cool place till it precipitates.
  - *Golden ſulphur of antimony.* By diſſolving a crude antimony in an alkaline lixivium, and precipitating by an acid.
  - *Hepar antimonii.* By deflagrating crude antimony with nitre.
  - *Crocus metallorum.* Is hepar antimonii pulveriſed and edulcorated with water.
  - *Diaphoretic antimony.* By deflagrating regulus of antimony with nitre.
  - *Antimoniated nitre.* By diſſolving diaphoretic antimony in water, and allowing it to cryſtallize.
  - *Magiſtery of antimony.* By precipitating a ſolution of diaphoretic antimony by adding vinegar.
  - *Regulus antimonii medicinalis.* By fuſing crude antimony with alkali. This is not properly a compound of alkali and antimony, but of another kind. But as it is a term much uſed, it was proper to explain it.
- Arsenic*. A metallic arſenical ſalt. By a particular elective attraction from regulus of antimony and nitre.

OILS.
- Expressed. *Soap.* The beſt hard ſoap is made of olive-oil and foſſile alkali. The ordinary white ſoap of this country is made of tallow and potaſh; black ſoap with whale-oil and potaſh.
- Essential. *Saponaceous maſs.* Beſt made by pouring ſpirit of wine upon cauſtic alkali and then oil, digeſting and ſhaking.
- Empyreumatic. This mixture diſſolves gold when precipitated from aqua regia; and is the baſis of the fine colour called *Pruſſian blue;* and has various other properties, as yet but little known.
- Fossile. This has no name, nor are the properties well known; but from ſome obſervations that have been made on native ſoapy waters, it is probable that it would keep linen much longer white than any other kind of ſoap.

SULPHUR.
- *Hepar ſulphuris.* By injecting alkalies upon melted ſulphur.
- *Lac ſulphuris.* By diſſolving ſulphur in an alkaline lixivium, and precipitating by an acid.

WATER. *Alkaline lixivium,* when cauſtic, or even the ordinary ſolution of mild alkali, is a fluid of great power in waſhing, bleaching, &c.

AIR. Fixed. *Mild alkali.* This is the general ſtate in which alkalies are found; but if they are rendered cauſtic by means of quick-lime or otherwiſe, they again abſorb it from the air, or from many other bodies, by elective attraction. When perfectly mild, this alkali may be made to aſſume a cryſtalline form.

The VOLATILE ALKALI, or SPIRIT of SAL AMMONIAC, can be united with theſe Bodies, viz.

ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable; of Urine, of Amber, of Ants, &c.

ALKALI, as above.

METALS.
- Gold*.
  - *Aurum fulminans.* A powder obtained by precipitating it from aqua regia by volatile alkalies.
  - A liquid ſolution. By adding a large proportion of alkali after it has been precipitated from aqua regia. This depoſites the gold when long expoſed to the air. The curious vegetation called *arbor Dianæ* is formed by adding mercury to this ſolution. A violently fulminating powder obtained by digeſtion.
- Silver*. A ſolution. After it has been precipitated from the nitrous acid. A fulminating powder by digeſtion.
- Platina*. By ſolution, after having precipitated it from aqua regia.
- Copper.
  - A blue-coloured ſolution. By the ordinary means. This when evaporated to dryneſs, and mixed with tallow, tinges the flame green.
  - Sapphire-coloured cryſtals. By cryſtallizing the ſolution.
  - *Venus fulminans.* By evaporating the ſolution to dryneſs.
  - *Aqua cerulea ſapphirina.* By mixing ſal ammoniac, quick-lime, and thin plates of copper, with water, and allowing them to remain a night.
- Iron. By ordinary ſolution.
- Lead. By ditto.
- Tin. The mixts that are produced by theſe metals are little known.

SEMIMETALS.
- Bismuth*. By ſolution, after having precipitated it from the nitrous acid.
- Antimony.
- Cobalt. A reddiſh liquor. By ſolution.
- Nickel. A blue liquor. By ditto.

OILS.
- Expressed. Has no name. By ſolution.
- Essential. *Sal volatile oleoſum.* By ditto with ſome difficulty, unleſs the alkali is in a cauſtic ſtate.
- Empyreumatic. A pungent oily ſubſtance, of great power in medicine. The principal one of this kind in uſe is ſpirit of hartſhorn.
- Fossile. A particular kind of ſoapy ſubſtance.

SULPHUR. Smoking ſpirit of ſulphur. By diſtilling ſal ammoniac, quick-lime, and ſulphur.

ALCOHOL*. By diſtilling alcohol from volatile alkalies, it acquires a cauſtic fiery taſte ; but the union is not complete.

WATER. This ſolution might be of uſe in waſhing or bleaching ; but, unleſs in particular caſes, would be too expenſive. It coagulates with alcohol.

AIR. Fixed Mild volatile alkali. The uſual ſtate in which it is found ; nor has any method yet been diſcovered of rendering it ſolid but in this ſtate.

EXPRESSED OILS *may be combined with the following Subſtances*, viz.

ACIDS : Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Amber, as in the foregoing part of this Table.

ALKALIES : Fixed and Volatile, as above.

CALCAREOUS EARTHS. A kind of plaſter. By mixture when in a cauſtic ſtate.

METALS.
- Tin*. Ditto. By ſolution when the tin is in the ſtate of a calx.
- Lead*. Ditto. By boiling the calx of lead in oils. This is uſed for cements in water-works. The common white paint is a mixture of this leſs perfect.

SEMIMETALS. Zinc*. Ditto. By ditto.

OILS : Eſſential, Empyreumatic, and Foſſile. By mixture but their uſes are not much known.

SULPHUR, *Balſam of Sulphur*. By ſolution in a boiling heat.

ALCOHOL. After expreſſed oils are freed from ſoap or plaſters, they are ſoluble in alcohol ; but not in their ordinary ſtate.

ESSENTIAL OILS *may be combined with the following Subſtances*, viz.

ACIDS : Vitriolic, Nitrous, &c. as above.

ALKALIES : Fixed and Volatile, as above.

METALS.
- Copper. By ſolution.
- Lead. By ditto.

OILS of all kinds. By ſolution or mixture.

SULPHUR. A balſam of ſulphur. By ſolution, imperfectly ; better by adding eſſential oils to the ſolution made by expreſſed oils or hepar ſulphuris.

ALCOHOL.
- Imperfect mixture. By ſolution.
- Aromatic waters. By diſtillation.

WATER. Diſtilled water of the ſhops. By diſtilling recent vegetable ſubſtances with water.

EMPYREUMATIC OILS *may be combined with the following Subſtances*, viz.

ACIDS : Vitriolic and Nitrous, as above.

ALKALIES : Fixed and Volatile, as above.

OILS of all kinds. By mixture.

ALCOHOL. By ſolution. By repeated diſtillations the oils are rendered much more ſubtile.

FOSSILE OILS *may be combined with the following Subſtances*, viz.

ACIDS : Vitriolic and Nitrous, as above.

ALKALIES : Fixed and Volatile, as above.

OILS of all kinds. By mixture.

SULPHUR. With ſome difficulty, by ſolution.

ALCOHOL. - - - By ditto.

SULPHUR *may be combined with the following, Subſtances*, viz.

ACID* : Vitriolic ; with the phenomena above deſcribed.

ALKALIES : Fixed and Volatile, as above.

METALS.
- Silver. A maſs of red-like colour. By adding ſulphur to red-hot ſilver, and fuſing ; found alſo with it in the ſtate of an ore.
- Lead. A ſparkling friable maſs, hardly fuſible. By deflagrating ſulphur with lead. This in a native ſtate forms the ore of lead called *galena*.
- Copper. A Black brittle maſs, eaſily fuſed. By adding ſulphur to red-hot copper, or ſtratifying with ſulphur and fuſing. Naturally in ſome yellow pyrites.
- Iron.
  - A ſpungy-like droſs, eaſily fuſible. By putting ſulphur to red-hot iron. This is alſo found naturally in the common yellow or brown pyrites.
  - A fulminating compound. By mixing filings of iron with ſulphur, moiſtening them with water, and preſſing them hard, they in a few hours burſt out into flame. This compoſition has been employed for imitating earthquakes.
  - *Crocus martis*. By deflagrating with iron.
  - *Crocus martis aperiens*. By calcining the crocus martis in the fire till it aſſumes a red appearance.
  - *Crocus martis aſtringens*. By puſhing the heat ſtill further.
- Tin. A dark-coloured maſs, reſembling antimony. By fuſion.
- Mercury.
  - *Ethiops mineral*. By heating flowers of ſulphur, and pouring the mercury upon it, and ſtirring it well. Its natural ore is called *cinnabar*.
  - *Factitious cinnabar*. By applying the mercury and ſulphur to each other in their pure ſtate, and ſubliming.
  - *Cinnabar of antimony*. By ſubliming corroſive ſublimate and crude antimony ; or the reſiduum, after diſtilling butter of antimony.

SEMIMETALS.
- BISMUTH. A faint greyiſh maſs, reſembling antimony. By fuſion. If in its metalline ſtate, the ſulphur ſeparates in the cold ; but not ſo if the calx has been employed.
- ANTIMONY. *Crude antimony.* By fuſion.
- ZINC*. A very brittle, dark-coloured, ſhining ſubſtance. With ſome difficulty, by keeping it long in a moderate fire, and covering it ſeveral times with ſulphur, and keeping it conſtantly ſtirred.
- ARSENIC.
  - *Yellow arſenic.* By fuſing it with $\frac{1}{10}$th its weight of ſulphur.
  - *Red arſenic.* By ditto with $\frac{1}{5}$th its weight of ſulphur.
  - *Ruby of ſulphur,* or arſenic, or golden ſulphur. By ſubliming when the proportions are equal.
  - *Orpiment.* A natural production; not perfectly imitable by art; compoſed of ſulphur and arſenic. Much uſed as a yellow paint.
- NICKEL. A compound; compact and hard as lead ; of a bright metallic appearance ; internally yellow. By fuſion.

OILS : Expreſſed, Eſſential, and Foſſile, as above.

WATER. *Gas ſylveſtre.* By receiving the fumes of burning ſulphur in water. This ought rather to be called a union of the volatile vitriolic acid with water.

ALCOHOL may be combined with the following Subſtances, viz.

ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable, and of Borax, as above.

ALKALI* : Volatile, as above.

METALLIC calces, in ſome particular caſes.

OILS : Expreſſed, Eſſential, Empyreumatic, and Foſſile, as above.

WATER. By ſolution.

GOLD may be combined with the following Subſtances, viz.

ACIDS : Vitriolic*, Nitrous*, and Muriatic*. In the circumſtances and with the phenomena above deſcribed.

ALKALIES : Fixed*, and Volatile*, as above.

METALS.
- SILVER. By fuſion. And the ſame is to be underſtood of all the combinations of metals, unleſs particularly ſpecified.
- PLATINA. Ductile, and of a duſky colour. This has been employed to debaſe gold, as it is of the ſame ſpecific gravity, and is not diſcoverable by the uſual teſts for diſcovering the purity of gold.
- LEAD. A very brittle maſs. Gold is rendered pale by the leaſt admixture with this.
- TIN. A brittle maſs when the tin is added in conſiderable quantity ; but the former accounts of this have been exaggerated.
- COPPER. Paler and harder than pure gold. This mixture is uſed in all our coins, the copper being called the *alloy*.
- IRON. Silver-coloured, hard and brittle ; very eaſily fuſed.
- MERCURY. Soft like a paſte called an *amalgamum*. By ſolution ; it being in this caſe called *amalgamation* ; and the ſame is to be underſtood of the ſolution of any other metal in quickſilver.

SEMIMETALS.
- ZINC. A bright and whitiſh compound, admitting of a fine poliſh, and not ſubject to tarniſh ; for which qualities it has been propoſed as proper for analyſing ſpecula for teleſcopes.
- ARSENIC. Brittle; and the gold is thus rendered a little volatile.
- ANTIMONY. A fine powder for ſtaining glaſs of a red colour. By calcination.
- BISMUTH*. A brittle whitiſh regulus ; volatile in the fire.
- COBALT.
- NICKEL. White and brittle.

SILVER may be combined with the following Subſtances, viz.

ACIDS : Vitriolic*, Nitrous*, Muriatic*, Vegetable*, and Acid of Ants*, as above.

ALKALIES : Fixed* and Volatile*, as above.

CRYSTALLINE EARTHS and other vitreous matters. A fine yellow opake glaſs. The fineſt yellow paint for porcelain is procured from glaſs mixed with ſilver.

METALS.
- GOLD, as above.
- PLATINA. Pretty pure and malleable. Difficult of fuſion ; and in part ſeparates when cold.
- LEAD. Very brittle.
- TIN. Extremely brittle, as much ſo as glaſs.
- COPPER. Harder than ſilver alone. Uſed in ſmall proportions as alloy in coins.
- IRON. A hard whitiſh compound.
- MERCURY*. By amalgamation with ſilver-leaf, or calx of ſilver precipitated by copper, but not by ſalts. This is uſed for ſilverizing on other metals, in the ſame way as the amalgamum of gold.

SEMIMETALS.
- ZINC. Hard, ſomewhat malleable, and of a white colour.
- ANTIMONY. A brittle maſs.
- BISMUTH. A white ſemi-malleable body.
- ARSENIC. Brittle ; the ſilver being rendered in part volatile.
- COBALT.

SULPHUR, as above.

LEAD may be combined with the following Subſtances, viz.

ACIDS : Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Ants, as above.

ALKALIES : Fixed and Volatile, as above.

CRYSTALLINE EARTHS. A thin glaſs. By fuſion in a moderate heat.

METALS.
- GOLD and Silver, as above.
- PLATINA. Of a leafy or fibrous texture, and purpliſh or blue colour when expoſed to the air. If a large proportion of platina is uſed, it ſeparates in the cold.
- TIN. A little harder than either of the metals, and eaſily fuſed : hence it is uſed as a ſolder for lead ; and it forms the principal ingredients of pewter. If the fire is long continued, the tin floats on the ſurface.
- Copper*. Brittle and granulated, like tempered iron or ſteel when broke. By throwing pieces of copper into melted lead. The union here is very ſlight.
- IRON*. An opaque browniſh glaſs. By a great degree of heat if the iron has been previouſly reduced to the ſtate of a calx ; but never in its metallic ſtate.
- MERCURY*. By amalgamation. Effected only in a melting heat, unleſs ſome biſmuth has been previouſly united with the mercury.

SEMIMETALS.
- ZINC. Hard and brittle. By pouring zinc on melted lead. If the zinc is firſt melted, and the lead injected upon it, it then deflagrates.
- ANTIMONY*.
- BISMUTH. A grey-coloured ſemi-malleable body, eaſily fuſed ; and thence uſed as a ſolder for lead or tin.
- ARSENIC.
  - A grey-coloured brittle maſs, eaſily fuſed, and extremely volatile.
  - A hyacinth-coloured glaſs. By fuſion in a conſiderable heat. This glaſs is eaſily fuſed ; and is a much more powerful flux than pure glaſs of lead.
- COBALT. The nature of this compound is not known.
- NICKEL. A brittle metallic body.

OILS : Expreſſed* and Eſſential, as above.

SULPHUR, as above.

TIN may be combined with the following Subſtances, viz.

ACIDS : Vitriolic*, Nitrous*, Muriatic, Vegetable*, of Urine, as above.

ALKALIES : Fixed and Volatile, as above.

CRYSTALLINE EARTHS or other vitreous matters. An opaque white vitreous maſs, which forms the baſis of white enamels.

METALS.
- GOLD, Silver, and Lead, as above.
- PLATINA. A coarſe hard metal which tarniſhes in the air.
- COPPER. A brittle maſs. When the copper is in ſmall proportions, it is firmer and harder than pure tin. This, in right proportions with a little zinc, forms bell-metal.
- IRON. A white brittle compound. By heating filings of iron red-hot, and pouring melted tin upon them. A metal reſembling the fineſt ſilver is made of iron, tin, and a certain proportion of arſenic.
- MERCURY. This amalganium forms foils for mirrors ; and forms the yellow pigment called *aurum moſaicum.* By being ſublimed with ſulphur and ſal ammoniac.

SEMIMETALS.
- ZINC. Hard and brittle. When the zinc is in ſmall proportions, it forms a very fine kind of pewter.
- ANTIMONY* *Regulus veneris.* By elective attraction from copper and crude antimony.
- BISMUTH. Bright, hard, and ſonorous, when a ſmall proportion of biſmuth is uſed. This is very eaſily fuſed, and employed as a ſolder.
- ARSENIC. A ſubſtance in external appearance reſembling zinc.
- COBALT. By fuſion.
- NICKEL. A brittle metallic maſs.

OIL : Expreſſed*, as above.

SULPHUR, as above.

COPPER may be combined with the following Subſtances, viz.

ACIDS : Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Amber, of Ants, as above.

ALKALIES : Fixed, and Volatile, as above.

METALS.
- GOLD, Silver, Lead*, and Tin, as above.
- PLATINA. A white and hard compound, which does not tarniſh ſo ſoon as pure copper, and admits of a fine poliſh.
- IRON. Harder and paler than copper. Eaſily fuſed.
- MERCURY*. A curious amalgam. Soft at firſt, but afterwards brittle. By triturating mercury with verdigris, common ſalt, vinegar, and water.

SEMIMETALS.
- ZINC.
  - *Braſs.* Commonly made by cementation with calamine. The larger the proportion of zinc, the paler, harder, and more brittle is the braſs.
  - *Prince's metal, pinchbeck,* and other metals reſembling gold. By employing zinc in ſubſtance in ſmall proportions. The beſt pinchbeck about 1-4th of zinc.
  - *Spelter.* A native ſubſtance, found in Cornwall, conſiſting of zinc and copper, and uſed as a ſolder.
- ANTIMONY. By fuſion.
- BISMUTH. A paliſh brittle maſs. Somewhat reſembling ſilver.
- ARSENIC. *White copper.* By pouring arſenic, fuſed with nitre, upon copper in fuſion. If too large a proportion of arſenic is uſed, it makes the compound black and apt to tarniſh.
- COBALT. White and brittle.
- NICKEL. White and brittle, and apt to tarniſh.

OILS : Eſſential, as above.

SULPHUR, as above.

IRON may be combined with the following Subſtances, viz.

ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Amber, of Ants, as above.

ALKALIES: Fixed*, and Volatile, as above.

VITRESCENT EARTHS. A tranſparent glaſs. In general blackiſh; but ſometimes yellow, green, or blue. The colour is influenced by the degree of heat as well as nature of the ingredients.

METALS.
- Gold, Silver*, Lead*, Tin, and Copper, as above.
- Platina. With caſt iron it forms a compound remarkably hard, ſomewhat ductile, and ſuſceptible of a fine poliſh.

SEMIMETALS.
- Zinc. A white ſubſtance reſembling ſilver.
- Antimony. The magnetic quality of the iron is totally deſtroyed in this compound.
- Bismuth. In a ſtrong heat, this emitteth flames.
- Arsenic. A whitiſh, hard, and brittle compound. By fuſing with ſoap or tartar. A metal reſembling fine ſteel is made by fuſing caſt iron with a little arſenic and glaſs.
- Cobalt. A compound remarkably ductile. By fuſion in a moderate heat.
- Nickel. A brittle maſs.

SULPHUR, as above.

MERCURY may be combined with the following Subſtances, viz.

ACIDS: Vitriolic, Nitrious, Muriatic, Vegetable*, of Urine, as above.

ALKALI: Fixed*, as above.

METALS.
- Gold, Silver*, Lead*, Tin, and Copper, as above.
- Platina. The compound reſulting from this mixture is not known.

SEMIMETALS.
- Zinc. An amalgam. Soft or hard, according to the proportions employed.
- Antimony. By melting the regulus, and pouring it upon boiling mercury. By frequently diſtilling from this amalgam, the mercury is rendered much more pure, and then is called *animated mercury.*
- Bismuth. A ſilverizing for iron. By putting this amalgam upon iron, and evaporating the mercury. It has much the appearance of ſilver.
- Cobalt. By mixing firſt with nickel, and then adding mercury.

SULPHUR, as above.

ZINC may be combined with the following Subſtances, viz.

ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Amber, of Ants, as above.

METALS.
- Gold, Silver, Lead, Tin, Copper, and Iron, as above.
- Platina A hard ſubſtance.
- Mercury, as above.

SEMIMETALS.
- Antimony. This mixture is applied to no particular uſe.
- Arsenic. A black and friable maſs.
- Cobalt. The particular nature and properties of this mixt is not known.

OIL: Expreſſed*, as above.

SULPHUR*, as above.

ANTIMONY may be combined with the following Subſtances, viz.

ACIDS: Vitriolic*, Nitrous, Vegetable*, and Urinous. With the phenomena, and by the means above deſcribed.

ALKALIES: Fixed and Volatile, as above.

VITREOUS EARTHS. A thin penetrating glaſs; which is a powerful flux of metals.

METALS.
- Gold, Silver, Lead, Tin*, Copper, and Iron, as above.
- Ptatina. A hard maſs.
- Mercury, and Zinc, as above.

SEMIMETALS.
- Bismuth. A maſs reſembling regulus of Antimony.
- Arsenic. The nature and qualities of this mixt are not known.
- Cobalt. Nature unknown.
- Nickel. Ditto.

SULPHUR, as above.

BISMUTH may be combined with the following Subſtances, viz.

ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable, and Urinous; with the phenomena, *&c.* above deſcribed.

ALKALIES: Fixed*, and Volatile*, as above.

VITREOUS MATTERS. A yellow glaſs. The ore of Biſmuth affords with theſe a blue glaſs; but this is probably owing to ſome mixture of Cobalt with it.

METALS.
- Gold, Silver, Lead, Tin, Copper, and Iron, as above.
- Platina. This mixture changes its colour much on being expoſed to the air.
- Mercury, as above.

SEMIMETALS.
- Antimony, as above.
- Arsenic. Nature not known
- Cobalt*. By mixing firſt with with nickel or regulus of antimony, and then adding cobalt; but it cannot be united by itſelf.
- Nickel. This mixt is not known.

SULPHUR, as above.

ARSENIC may be combined with the following Subſtances, viz.

ACIDS: Vitriolic, Muriatic*, Vegetable*, and Urinous; with the phenomena, *&c.* abovementioned.

ALKALIES : Fixed, and Volatile ; with the phenomena, and by the means mentioned above.

VITREOUS MATTERS. A glaſs which greatly promotes the fuſion of other ſubſtances. The arſenic muſt firſt be prepared by diſſolving and precipitating from alkalies.

METALS. { Gold, Silver, Lead, Tin, Copper, and Iron, as above.
Platina.

SEMIMETALS. { Zinc, Antimony, and Biſmuth, as above.
Cobalt.
Nickel. The phenomena attending theſe mixtures have not been as yet particularly obſerved.

SULPHUR, as above.

PLATINA may be combined with the following Subſtances, viz.

ACIDS : Muriatic*; with the phenomena, *&c.* mentioned above.

ALKALI : Volatile, as above.

METALS : Gold, Silver, Mercury, Tin, Copper, and Iron, as above.

SEMIMETALS. { Zinc, Biſmuth, and Arſenic, as above.
Cobalt.
Nickel. The phenomena attending theſe mixtures not yet obſerved.

COBALT may be combined with the following Subſtances, viz.

ACIDS : Vitriolic, Nitrous, Muriatic, and Urinous ; with the phenomena, *&c.* as above deſcribed.

ALKALI : Volatile, as above.

EARTHS. Calx of Flint. { *Saffre.* By mixing calcined cobalt with calx of flint, and moiſtening them with water, and preſſing them cloſe in wooden tubs.
Smalt. By vitrifying theſe with the addition of a little potaſh.

METALS : Gold, Silver, Platina, Mercury*, Lead, Tin, Copper, and Iron, as above.

SEMIMETALS. { Zinc, Antimony, Biſmuth*, and Arſenic, as above.
Nickel. The properties of this compound not known.

NICKEL may be combined with the following Subſtances, viz.

ACIDS : Nitrous, and Muriatic ; with the phenomena, *&c.* as mentioned above.

ALKALI : Volatile, as above.

METALS : Gold, Platina, Lead, Tin, Copper, and Iron, as above.

SEMIMETALS : Antimony, Biſmuth, Arſenic, and Cobalt, as above.

SULPHUR, as above.

ABSORBENT EARTHS may be combined with the following Subſtances, viz.

ACIDS : Vitriolic, Nitrous, Muriatic, and Vegetable ; with the phenomena, and by the aſſiſtances abovementioned.

ALKALIES : Fixed as above.

EARTHS. { Crystaline. By this mixture they are both much eaſier melted into glaſs than by themſelves, but not without the addition of ſome alkali.
Argillaceous. This mixture eaſily runs into a glaſs without any addition.

WATER. *Lime-water.* By ſolution. It is ſometimes found flowing out of the earth in ſprings ; and as it always quits the water when expoſed to the air, it is there depoſed on the banks of the ſtreams, forming the ſtony incruſtations called *petrifications :* And filtering through the pores of the earth, and dropping through the roofs of ſubterraneous caves, it forms the curious incruſtations found hanging from the roof of ſuch places ; ſometimes aſſuming forms ſtupenduouſly magnificent.

AIR. Fixt. *Lime-ſtone.* It is from the quality that quick-lime has of abſorbing its air, again with it reſuming its ſtony conſiſtence, that it is fitted for a cement in building ; and the great hardneſs of the cements in old buildings is owing to the air being more perfectly united with theſe than in newer works.

CRYSTALLINE or VITRESCENT EARTHS may be combined with the following Subſtances, viz.

ACIDS : Vitriolic*, and Nitrous*; with the phenomena, *&c.* as abovementioned.

ALKALI : Fixed, as above.

ABSORBENT EARTHS : as above.

ARGILLACEOUS EARTHS. A maſs running into glaſs in a moderate heat.

METALS : Lead, Tin, Copper, and Iron, as above.

WATER. Although this is not ſoluble in water by any operation that we are acquainted with ; yet, from its cryſtalline form, it is probable that it has been once ſuſpended ; and certainly it is ſo at this day in thoſe petrifying ſprings whoſe incruſtations are of the cryſtalline ſort.

SEMIMETALS : Antimony, Biſmuth, Arſenic, and Cobalt, as above.

ARGILLACEOUS EARTH may be combined with Abſorbent and Cryſtalline Earths, as above. With water it only unites into a paſte of a mechanical nature.

INDEX.

by

Argonauts,

and

Some late experiments of Dr Prieſtley, have ſhown, that though nitrous acid is produced from the decompoſition of dephlogiſticated and phlogiſticated air, by taking the electric ſpark in the mixture, it is likewiſe produced by the more rapid decompoſition of combuſtion, when inflammable air is made uſe of inſtead of the phlogiſticated kind. In this caſe, though phlogiſticated air ſhould happen to exiſt in the mixture, it is not in the leaſt affected by the proceſs, but remains after the combuſtion of the others, juſt as it was; nay, the Doctor obſerves, that by the addition of phlogiſticated air, the quantity of nitrous acid produced is ſo far from being augmented, that it is much diminiſhed. The acid in theſe proceſſes always appears to be extremely volatile, inſomuch that ſome part of it conſtantly eſcapes. No liquor at all was condenſed when the exploſions were made in quick ſucceſſion, even though the veſſel never became hotter than the hand. In another proceſs, the atmoſpheric air was perfectly excluded, while the pureſt dephlogiſticated air was produced from one of the materials employed, viz. precipitate *per ſe*. In this experiment he found, that a conſiderable quantity of fixed air was produced, and that the water became acid by the abſorption of it. He concludes, therefore, on the whole, that a mixture of dephlogiſticated and inflammable air always produces an acid by combuſtion; but that, when they are in their naſcent ſtate, the aerial acid is generated; when both are completely formed previous to the experiment, the nitrous acid appears.

M. Pelletier has now diſcovered a method of uniting phoſphorus, without any decompoſition, with all the metals, though he cautions againſt the danger with which the proceſs is attended. Gold is phoſphorated by mixing half an ounce of its calx with an ounce of phoſphoric glaſs and about a grain of powdered charcoal; the whole is then put into a crucible, the compoſition covered with a little powdered charcoal, and a degree of heat ſufficient to fuſe the gold applied. A great many phoſphoric vapours ariſe, but part are detained, and unite with the gold which is left at the bottom of the crucible. The metal by this operation loſes its colour, becomes whitiſh, breaks under the hammer, and has a cryſtalline appearance. By continuing the fire a long time the phoſphorus would be entirely diſſipated. The quantity of phoſphoric glaſs and charcoal juſt mentioned is ſufficient to phoſphorate a whole ounce of platina. By an hour's calcination in a crucible, the metal is converted into a blackiſh maſs reſembling ſilver, weighing upwards of an ounce, and of which the lower part conſiſts of cubical cryſtals. Notwithſtanding this change, however, the quantity of phoſphorus united with the platina is very inconſiderable; for from 12 ounces of the metal, and as much phoſphoric glaſs, only 12 ounces and five grains of the phoſphorated metallic maſs was obtained. It was very brittle, but of conſiderable hardneſs; was not attracted by the magnet, and by expoſure to a ſtrong fire parted with the phoſphorus it had been combined with. He obſerves, that all the metals loſe their malleability by combination with phoſphorus, excepting tin and lead; and the reſiduum of the matter which has once phoſphorated a metal, will ſerve again for the ſame purpoſe.

Though the acid of tartar has been commonly ſuppoſed a product of the vinous fermentation, yet late experiments have ſhown that this is not the caſe. It has been found not only in the juice of the grape, but in that of tamarinds, the berries of the *rhus coriaria*, and the leaves of the *rumex acetoſa*. In theſe it is generally combined with the vegetable fixed alkali, or with calcareous earth. Hermbſtadt has found it combined with calcareous earth in the juice of the roots of the *triticum repens*, the *leontodon-taxaracum*, and *China-bark*. By the aſſiſtance of nitrous acid he obtained it alſo from the juice of grapes, mulberries, apples, pears, oranges, ſtrawberries, and plums; alſo from honey, ſugar, gum arabic, manna, ſpirit of wine, beech-wood, and the root of black hellebore. In theſe caſes, where the nitrous acid is made uſe of, however, it may juſtly be ſuppoſed that the acid of tartar is partly at leaſt produced from it. In Scheele's proceſs for procuring the pure acid of tartar by means of calcareous earth, it is adviſable to make uſe of quicklime rather than chalk, as by this double the quantity of tartar will be decompoſed. An hundred parts of pure tartar contain about 23 of vegetable alkali, 43 parts of acid employed to ſaturate that alkali, and 34 of ſuperabundant acid. By uſing oyſter-ſhells well prepared by boiling and powdering, the cryſtals of the acid may be obtained very white and pure. Some chemiſts have imagined that the vegetable alkali, does not exiſt ready formed in tartar, but that it is produced by fire or mineral acids. In proof of this M. Machi offers the following experiments. On an ounce of cream of tartar were poured 10 ounces of boiling water, and the mixture allowed to remain in a jar covered with paper and parchment in which a ſmall hole was made with a pin. At the end of three months it was conſiderably diminiſhed; and contained a quantity of thick, tough, yellow, mucilaginous matter, which neither efferveſced with acids nor alkalies, and, when burnt, the aſhes were found to contain only a very ſmall quantity of alkali. The experiment was repeated by Mr Corvinus with ſome variation. He kept a ſolution of cream of tartar in a heat between 10° and 30° of Reaumur's ſcale; removing the ſaline pellicles which formed on the ſurface as faſt as they appeared, and rediſſolving them in water By continuing the digeſtion for ſeveral months, the liquor became at laſt evidently alkaline: and he thus obtained 216 grains of a brown alkali from two ounces of cream of tartar. Mr Berthollet expoſed for nine months, to the heat of his laboratory, a ſolution of two ounces of cream of tartar in eight ounces of water; taking care to replace the water which evaporated, but without removing the cruſts which formed upon the ſurface. At the end of this time he found that the liquor was no longer acid, but began to turn the ſyrup of violets green. In 18 months it became ſtrongly alkaline; and left, when evaporated, an oily reſiduum which efferveſced with acids, and weighed 468 grains. On treating in the ſame manner a ſolution of terra foliata tartari, the liquor began to change the ſyrup of violets green in two months, and in four the decompoſition ſeemed to be complete. At the end of a year he filtered and evaporated the liquor to dryneſs, by which proceſs he obtained 432 grains of fixed alkali. The ſame quantity of terra foliata tartari decompoſed immediately by diſtillation, yielded only 36 grains more of alkali. Solution of ſalt of wood ſorrel ſuffered no decompoſition by a ſimilar treatment for two years. The latter he obſerved to be a much more powerful antiſceptic than tartar; for which reaſon it ſeems to reſiſt decompoſition in a proportionable degree. He ſuppoſes oil to be the principal cauſe of the deſtruction of theſe acids; and the obvious deficiency of oil in the ſaccharine acid, in compariſon with tartar, ſeems to be the cauſe of the want of capacity in it to undergo the decompoſition juſt mentioned. A remarkable circumſtance attends this ſpontaneous decompoſition, viz. that no air is either abſorbed or emitted during the whole proceſs. It is alſo worth notice, that in combining acid of tartar with fixed alkalies, the ſalt ſuperſaturated with acid or cream of tartar is always formed in preference to the other called *ſoluble tartar*. Thus if to a ſaturated ſolution of alkali with cream of tartar we add another of pure tartareous acid, a white ſpongy matter will be precipitated to the bottom; which, on examination, is found to be a true tartar. Any other acid added to the ſolution of tartariſed tartar will in like manner produce a precipitation of tartar, by engaging a part of the alkali with which it was combined; and if the acid of tartar be added to a ſolution of any neutral ſalt containing the vegetable fixed alkali, as vitriolated tartar, ſalt of Sylvius, and nitre, a ſimilar precipitation of tartar will enſue. Hence the acid of tartar may be employed as a teſt to diſcover the preſence of the vegetable fixed alkali, and to diſtinguiſh it from the mineral, which has not that effect. Bergman indeed obſerves, that Rochelle ſalt will do the ſame thing; but it muſt be remembered that this is prepared with crude tartar, which contains a portion of vegetable alkali, and not with the pure acid.

The following is a liſt of the Vegetables from which the induſtry of the modern chemiſts has procured different acids, with the names of the diſcoverers.

1 *Agave Americana.* The juice exſuding from the calyx of this plant yields acid of tartar and apples. Mr *Hoffman of Weimar.*

2 *Aloes.* Acid of ſugar and apples. Mr *Scheele.*

3 *Apples.* A peculiar acid called by the name of the fruit. By nitrous acid that of tartar is procured. Mr *Scheele* and Mr *Hermbſtadt.*

4 *Barberry.* Acid of apples, and of tartar. By treatment with nitrous acid it yields acid of ſugar. *Scheele* and *Hermbſtadt.*—Hoffman denies that it contains any native acid of tartar. By treating it with ſpirit of wine and manganeſe he obtained an ether.

5 *Bilberry* (*Vaccinium myrtillus*). Equal parts of the acids of citrons and apples. *Scheele.*

6 *Bramble* (*Rubus chamæmorus*). The ſame with the foregoing. *Scheele.*

7 *Camphor.* A peculiar kind of cryſtallizable acid. *M. Koſegarten.*

8 *Cherries*, Equal parts of acids of citrons and apples. Saccharine acid by treatment with ſpirit of nitre. *Scheele, Hermbſtadt*, and *Weſtrumb*—Hermbſtadt ſays that he found acid of tartar alſo.

9 *Citrons* and *lemons.* A particular kind of cryſtallizable acid. *Scheele*

10 *Coffee.* The infuſion evaporated and treated with ſpirit of nitre. Acids of ſugar and apples. *Scheele.*

11 *Corks.* A yellow acid by repeated abſtractions of ſpirit of nitre. With ſome of the alkalies and earths this acid forms cryſtallizable ſalts which do not deliquate, though others do. That with fixed vegetable alkali forms needle-like cryſtals, ſoluble in water, vitriolic, nitrous, or marine acids, but not in vinegar or ſpirit of wine. Like the ſaccharine acid it has a ſtrong affinity to calcareous earth, which it ſeparates from lime-water, and forms a greyiſh ſaline powder, ſoluble in marine acid, but not in water, nor even in its own acid. It exhibits ſome appearances with metals, which deſerve farther examination. *Brugnatelli.*

12 *Cranberry.* (*Vaccinium oxycoccos*). Acid of citrons. *Scheele.*

13 *Currants, red* and *white.* Acids of citrons and apples. *Weſtrumb.* Hermbſtadt ſays that they contain acid of tartar.

14 *Elder berries.* Acid of apples. *Scheele.*

15 *Galls.* A peculiar kind of acid. *Scheele*—Mr Kier obſerves, that from other aſtringent matters, eſpecially thoſe uſed in dyeing, it is probable that ſimilar acids might be obtained. Mr Morveau has obtained from galls a reſin which he ſuppoſes to be their acidifiable baſe; and which, along with pure air, forms the acid of galls. When purified, this acid is ſaid to make a fine and durable ink.

16 *Geraninum acidum.* Small acid cryſtals *Cartheuſer.* Said by Hermbſtadt to be the acid of ſugar.

17 *Gooſeberries.* Acid of apples. *Scheele.*—Hermbſtadt ſays that they contain the acid of tartar alſo.

18 *Grapes.* Their juice well known to contain the acid of tartar partially combined with fixed alkali.

19 *Graſs-roots.* Saline cryſtals from the extract of the juice after three months ſtanding. Theſe were ſoluble in water, and gave an earthy precipitate on mixture with fixed alkali. On abſtracting the nitrous acid from them, and adding a ſolution of calcareous earth in vinegar, a precipitate fell, which was found to conſiſt of acid of tartar ſaturated with lime. *Hermbſtadt.*

20 *Gum Arabic.* Acid of ſugar and apples. *Scheele.*

21 *Gum tragacanth.* Acids of ſugar of milk, apples, and ſugar.

22 *Haw* (*Cratægus aria*). Equal parts of acids of citrons and apples.

23 *Honey.* An acid liquor by diſtillation; and with ſpirit of nitre, the acid of ſugar. The diſtilled acid has been ſaid to diſſolve gold.

24 *Lemons.* An acid the ſame with that of citrons.

25 *Leontodon taraxacum.* Acid of tartar by treatment with ſpirit of nitre.

26 *Manna.* Acid of ſugar by treatment with ſpirit of nitre.

27 *Mulberries.* Acid of tartar. *Hermbſtadt.* A cryſtallizable acid ſalt by evaporating the juice. *Angelus Sala.*

28 *Oil of olives.* A ſalt which ſublimed and cryſtallized, by repeated and copious abſtractions of the nitrous acid. *Weſtrumb.*

29 *Peruvian bark.* Acid of apples and ſugar, by treating the extract with nitrous acid. *Scheele.*

30 *Prunus ſpinoſa et domeſtica.* Acid of apples. *Scheele.*

31 *Prunus padus.* Acid of citrons. *Scheele.*

32 *Poppy.* Acids of ſugar and apples, by treating the juice with nitrous acid. *Scheele.*

33 *Raſpberries.* Acids of apples and citrons. *Scheele.* Acid of tartar by ſaturating the juice with chalk, and then ſeparating the earthy baſis by means of vitriolic acid. *Hermbſtadt.*

34 *Rhapontic.* Acid of tartar by cryſtallizing the juice; of ſugar by treating it with nitrous acid. *Bindheim.*

35 *Rhubarb.* Acids of ſugar and apples by treating the infuſion with nitrous acid. If a pound of Indian rhubarb be infuſed in hot water, a powder ſubſides, which by waſhing becomes white, weighing then about nine drachms, and is found to conſiſt of calcareous earth united with the acid of ſugar. *Scheele.*

36 *Ribes cynoſbati.* Acid of citrons or lemons. *Scheele.*

37 *Salep.* Acids of ſugar and apples by treatment with nitrous acid. *Scheele.*

38 *Service* (*Sorbus aucuparia*). Acid of apples. *Scheele.*

39 *Solanum dulcamara.* Acid of citrons. *Scheele.*

40 *Sorrel* (*Rumex acetoſa*). Cryſtals of tartar by evaporating and cryſtallizing the juice; and pure acid of tartar by ſaturating the acid with chalk, and then expelling it by means of the vitriolic. *Hermbſtadt.* Other chemiſts, however, have certainly found it to contain the acid of ſugar partly neutralized with álkali, and which is capable of being cryſtallized. This is generally known under the name of *ſalt of wood-ſorrel*, and is manufactured in conſiderable quantities in Thuringia, Suabia, Switzerland, and the Hartz. It is prepared from this plant as well as the *oxalis acetoſella.* The plants are bruiſed in ſtone or wooden mortars; the juice is ſqueezed through linen; and when cleared by ſettling, is to be boiled to a proper conſiſtence, and clarified with the whites of eggs, or with blood. It is to be ſtrained whilſt hot, and then kept in a cold cellar. In a few weeks cryſtals will be formed, from which the remaining liquor muſt be poured off, and by further evaporation will yield more ſalt. Savary obtained only two ounces, and a half of ſalt from 25 pounds of the juice.

41 *Strawberries.* Equal parts of the acids of apples and citrons. *Scheele.*

42 *Sugar.* See the article.

43 *Sumach* (*Rhus coriaria*). Cryſtals of tartar. Profeſſor *Tromſdorf* and *Son.*

44 *Tamarinds.* Acid of tartar, tartar itſelf, with a mucilaginous and ſaccharine matter. *Weſtrumb.*

45 *Vaccinium vitis idæa.* Acid of citrons. *Scheele.*

46 *Wood and bark of the birch tree.* From 55 ounces of the wood were obtained 17 ounces of rectified acid, which when freed from an amber-coloured oil was to the ſpecific gravity of water as 49 to 48, and of ſuch ſtrength that one ounce of it required 23 of lime-water for its ſaturation. *Chemiſts of Dijon.*—By allowing the acid diſtilled from the bark to remain at reſt for three months, much of its oil was ſeparated; by ſaturation with fixed alkali a dark-coloured neutral ſalt was obtained, which was purified by fuſion and ſubſequent filtration and evaporation. On ſubjecting

CHEMNITZ, (Martin) a famous Lutheran divine, the diſciple of Melancthon, was born at Britzen in Brandenburgh, in 1522. He was employed in ſeveral important negociations by the princes of the ſame communion; and died in 1589. His principal work is the Examen of the Council of Trent, in Latin.

CHEMOSH. See CHAMOS.

CHEMOSIS, a diſeaſe of the eyes, proceeding from an inflammation; wherein the white of the eye ſwells above the black, and overtops it to ſuch a degree, that there appears a ſort of gap between them. Others define it to be an elevation of the membrane which ſurrounds the eye, and is called the *white;* being an affection of the eye, like white-fleſh.

CHENOPODIUM, GOOSE-FOOT, or *Wild Orach:* A genus of the digynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 20th order *Holoraceæ*. The calyx is pentaphyllous and pentagonal; no corolla; one ſeed lenticular, ſuperior. There are 18 ſpecies, 13 of which are natives of Britain. The moſt remarkable are the following: 1. The bonus henricus, or common Engliſh mercury, found growing naturally in ſhady lanes in many places in Britain. It has large triangular, arrow-pointed, entire leaves; upright, thick, ſtriated ſtalks garniſhed with triangular leaves, and terminated by cloſe ſpikes of apetalous yellowiſh-green flowers in June and July, which are ſucceeded by ripe ſeeds in Auguſt. 2. The ſcoparia, belvidere, or annual mock-cypreſs, which is of a beautiful pyramidal form reſembling a young cypreſs tree. 3. The botrys, or oak of Jeruſalem. 4. The ambroſoides, or oak of Cappadocia. All theſe are very eaſily propagated from ſeeds; and will thrive beſt in a rich light earth. Moſt of the ſpecies have an aromatic ſmell. A ſpecies which grows near the Mediterranean is uſed by the Egyptians in ſallads, on account of its ſaltiſh aromatic taſte. From the ſame plant kelp is made in other countries.—The firſt ſpecies, or Engliſh mercury, was formerly uſed as ſpinach; but is now diſuſed, as being greatly inferior to that herb. As an article of the materia medica, it is ranked among the emollient herbs, but rarely made uſe of in practice. The leaves are applied by the common people for healing ſlight wounds, cleanſing old ulcers, and other like purpoſes. The roots are given to ſheep that have a cough. Goats and ſheep are not fond of the herb; cows, horſes, and ſwine, refuſe it.—The ſecond ſpecies, or belvidere, is a plant much eſteemed in China. The following are the properties attributed to it in the Chineſe Herbal. After having ſaid that it is about the end of March or beginning of April that the belvidere ſprings up from the earth; that its ſuckers or ſhoots riſe to the height of eight or nine inches, in ſhape of a child's fiſt half ſhut; that it afterwards extends itſelf, and ſends forth a number of branches loaded with leaves like thoſe of flax; and that, as it grows, its branches arrange themſelves naturally in the form of a beautiful pyramid; it adds, that its leaves, yet tender, abound with juice, and have a very agreeable taſte; that it may be eaten as a ſallad with vinegar, to which a little ginger has been added; that being prepared like other leguminous plants, and baked with meat, it gives it an agreeable and pleaſing flavour: that, when in its full beauty, its leaves become hard and unfit for the table; but that nouriſhment is then found in its root, which ſerves as a reſource in times of famine and ſcarcity. When the belvidere has attained to its natural ſize, the Chineſe ſeparate its principal ſtalk from the reſt, and put it into a ley of aſhes, which cleans and ſoftens it, and frees it from all impurities of the bark. After this bath, it is expoſed to the ſun; and when dry it is baked and ſeaſoned. With regard to the root, which has ſomething of a violet-colour, they ſtrip off the ſkin by filaments, which may be boiled and eaten: but what is particularly ſought after, is the root itſelf; of which, when reduced to powder, they collect only what remains in the bottom of the veſſel, and form it into ſmall loaves that are baked by being held over the ſteam of boiling water. People of a delicate taſte will ſcarcely be tempted to admit this diſh at their tables; but is it not uſeful to point out to the poor peaſants, that in caſes of neceſſity, they may always have recourſe, without danger, to this ruſtic food? In ſuch caſes, they will be indebted to the Chineſe for having made the firſt trial, which, for the moſt part is, dangerous. The Chineſe Herbal cites the example of four mountaineers, who having lived on nothing but the leaves, roots, and ſtalks, of the belvidere, with which their country abounded, had nevertheleſs enjoyed perfect health to a very great age.

CHEPELIO, an iſland in the bay of Panama and province of Darien, in South America, ſituated about three leagues from the city of Panama, which it ſupplies with proviſions. W. Long. 81. N. Lat. 9.

CHEPSTOW, a market town of Monmouthſhire in England, ſeated on the river Wye near its mouth, in W. Long. 2. 40. N. Lat. 51. 40.

CHEQ, or CHERIF, the prince of Mecca, who is, as it were, high prieſt of the law, and ſovereign pontiff of all the Mahometans of whatever ſect or country they be. See CALIPH.

The grand ſignior, ſophis, moguls, khans of Tartary, &c. ſend him yearly preſents, eſpecially tapeſtry to cover Mahomet's tomb withal, together with a ſumptuous tent for himſelf, and vaſt ſums of money to provide for all the pilgrims during the 17 days of their devotion.

CHERASCO, a ſtrong and conſiderable town of Italy, in Piedmont, and capital of a territory of the ſame name, with a ſtrong citadel, belonging to the king of Sardinia, where he retired in 1706, during the ſiege of Turin. It is ſeated at the confluence of the rivers Sturia and Tanaro, upon a mountain. E. Long. 7. 55. N. Lat. 44. 35.

CHERBURG, a ſea-port town of France, in Normandy, with a harbour and Auguſtine abbey. It is remarkable for the ſea-fight between the Engliſh and French fleets in 1692, when the latter were beat, and upwards of twenty of their men of war burnt near Cape la Hogue. The Britiſh landed here in Auguſt 1758, and took the town, with the ſhips in the baſon, demoliſhed the fortifications, and ruined the other works which had been long carried on for enlarging the harbour and rendering it more ſafe and convenient. Within theſe few years it has been attempted again to improve the harbour, and rebuild the works; but after conſiderable progreſs had been made, a great part of them ſuddenly gave way, and the enterpriſe it is thought will not be again reſumed. E. Long 1. 38. N. Lat. 49. 38.

CHEREM, among the Jews, is uſed to ſignify a ſpecies of annihilation. See ANNIHILATION.

The Hebrew word *cherem*, ſignifies properly to *deſtroy, exterminate, devote*, or *anathematiſe.*

CHEREM is likewiſe ſometimes taken for that which is conſecrated, vowed, or offered to the Lord, ſo that it may no longer be employed in common or profane uſes. No devoted thing that a man ſhall devote unto the Lord, of all that he hath of man and beaſt, and of the field of his poſſeſſion, ſhould be ſold or redeemed; every devoted thing is moſt holy to the Lord: none devoted, which ſhall be devoted of men, ſhall be redeemed, but ſhall ſurely be put to death. There are ſome who aſſert that the perſons thus devoted were put to death; whereof Jephtha's daughter is a memorable example. Judges xi. 29. &c.

CHEREM is alſo uſed for a kind of excommunication in uſe among the Jews. See NIDDUI.

CHERESOUL, or CHAHRZUL, a town of Turkey in Aſia, capital of Curdiſtan, and the ſeat of a beglerbeg. E. Long. 45. 15. N. Lat. 36. 0.

CHERILUS, of Samos, a Greek poet, flouriſhed 479 years before Chriſt. He ſung the victory gained by the Athenians over Xerxes, and was rewarded with a piece of gold for every verſe. His poem had afterwards the honour of being rehearſed yearly with the works of Homer.

CHERLERIA, in botany: a genus of the trigynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 22d order, *Caryophylleæ.* The calyx is pentaphyllous; there are five nectaria, bifid, and petal-like; the antheræ alternately barren; the capſule is trilocular and three-valved.

Plate cxxxviii. CHERLESQUIOR, in Turkiſh affairs, denotes a lieutenant-general of the grand ſignior's armies.

CHERMES, in zoology, a genus of inſects belonging to the order of inſecta hemiptera. The roſtrum is ſituated on the breaſt; the feelers are longer than the thorax; the four wings are deflected; the thorax is gibbous; and the feet are of the jumping kind. There are 17 ſpecies; and the trivial names are taken from the plants which they frequent, as the Chermes graminis, or graſs-bug; the chermes ulmi, or elm-bug, &c. The chermes ficus, or fig-tree bug, one of the largeſt of the genus, is brown above and greeniſh beneath. The antennæ, likewiſe brown, are large, hairy, and one third longer than the thorax. The feet are yellowiſh; the wings large, twice the length of the abdomen. They are placed ſo as to form together an acute roof. The membrane of which they conſiſt is thin and very tranſparent; but they have brown veins, ſtrongly marked, eſpecially towards the extremity. The roſtrum of this chermes is black, and takes its riſe from the lower part of the thorax, between the firſt and ſecond pair of feet. It is an inſect to be met with in great numbers upon the fig-tree. The larva has ſix feet. It is like the inſect, when provided with wings. Its form is oblong, and its motion ſlow.

The chryſalis differs from it by two flat buds that ſpring from the thorax and incloſe the wings, afterwards ſeen in the perfect inſect. Theſe chryſalids are frequently met with on plants; and the two plates of their thorax give them a broad uncouth appearance and a heavy look. When the little chryſalids are going to be metamorphoſed, they remain motionleſs under ſome leaves which they fix themſelves upon. Their ſkin then divides upon the head and thorax, and the perfect inſect comes forth with his wings, leaving the ſpoil of his chryſalis open and rent anteriorly upon the leaf. Theſe kind of ſloughs are often found beneath the leaves of the fig-tree. The perfect inſect is furniſhed with four wings, large in proportion to its body, veined, and placed in the form of a roof; and with them it flies. It has, moreover, the faculty of leaping pretty briſkly, by means of its hinder-legs, which play like a ſpring. When it is attempted to catch the chermes, it makes its eſcape rather by leaping than flying. Some of thoſe inſects have a manœuvre worthy of notice. Several ſpecies are provided at the extremity of their body with a ſmall ſharp-pointed implement, but which lies concealed, and that they draw out in order to depoſit their eggs, by making a puncture in the plant that ſuits them. By this method the fir-tree chermes produces that enormous ſcaly protuberance that is to be found at the ſummit of the branches of that tree, and which is formed by the extravaſation of the juices occaſioned by the punctures. The young larvæ ſhelter themſelves in cells contained in the tumor. The white down, under which the larva of the pine-chermes is found, ſeems to be produced much in the ſame manner. That of the box-tree chermes produces no tubercula like thoſe; but its punctures make the leaves of that tree bend and grow hollow in the ſhape of a cap, which by the union of thoſe inflected leaves produces at the extremity of the branches a kind of knobs, in which the larvæ of that inſect find ſhelter. The box-chermes, as well as ſome others, has yet another peculiarity, which is, that the larva and its chryſalis eject at the anus a white ſweet-taſted matter, that ſoftens under the touch, and is not unlike manna. This ſubſtance is found in ſmall white grains within the balls formed by the box-leaves, and a ſtring of the ſame matter is often ſeen depending from the anus of the inſect.

CHERMES Mineral. See KERMES.

CHERRY-ISLAND, an iſland in the northern ocean, lying between Norway and Greenland, in E. Long. 20. 5. N. Lat. 75. 0.

CHERRY-Tree, in botany. See PRUNUS.

CHERSO, an iſland in the gulph of Venice, with a town of the ſame name near Croatia, belonging to the Venetians. The air is good, but the ſoil ſtony; however, it abounds in wine, cattle, oil, and excellent honey. E. Long. 15. 5. N. Lat. 45. 8.

CHERSONESUS, among modern geographers, the ſame with a peninſula; or a continent almoſt encompaſſed round with the ſea, only joining to the main land by a narrow neck or iſthmus. The words is Greek, χερσονησος; of χερσος, *land*, and νησος, *iſland;* which ſignifies the ſame. In ancient geography, it was applied to ſeveral peninſulas; as the Cherſoneſus Aurea, Cimbrica, Taurica, and Thracia, now thought to be Malacca, Jutland, Crim Tartary, and Romania.

CHERT, PETROSILEX, *Lapis Corneus*, the *Hornſtein* of the Germans; a ſpecies of ſtone claſſed by Cronſtedt among the ſiliceous earths. It is of a coarſer texture than the common flint, as well as ſofter; for which reaſons it is not capable of ſuch a fine poliſh. It is ſemitranſparent at the edges, or when broken into very thin pieces. It is found of different colours, *viz.* white, whitiſh yellow, fleſh-coloured, and greeniſh. According to Mr Kirwan, it runs in veins through rocks, from whence its name is derived; its ſpecific gravity being from 2590 to 2700. In the fire it whitens and decrepitates like ſilex, but is generally fuſible *per ſe.* Mineral alkali does not totally diſſolve it in the dry way, but borax and microcoſmic ſalt do ſo without efferveſcence. Its appearance is duller and leſs tranſparent than common flint. The reddiſh petroſilex, uſed in the count de Lauragais's porcelain manufactory, and there called *feld-ſpat,* contained 72 *per cent.* of ſilex, 22 of argill, and 6 of calcareous earth.

Cronſtedt obſerves that there are not as yet any certain characters known by which the cherts and jaſpers may be diſtinguiſhed from one another, though they can eaſily be ſo by ſight; the cherts appearing of a fine ſparkling texture when broken; but the jaſper being grained, dull, and opaque, and having the appearance of a dry clay. The chert is alſo found forming larger or ſmaller veins, or in nodules like kernels in rocks; whereas the jaſper, on the contrary, ſometimes conſtitutes the principal part of the higheſt and moſt extended mountains. The chert is likewiſe found plentifully in the neighbourhood of ſcaly limeſtone, as flints are in the ſtrata of chalk.

The connection between theſe bodies is not yet diſcovered; but it is impoſſible to eſtabliſh any eſſential difference between them, from the circumſtance of flints and agates being generally found in ſingle, looſe, and irregular nodules, and hardly in rocks like the chert: for near Conſtantinople the agate ſtone runs in a vein acroſs the rock, of the ſame hardneſs, and as fine and tranſparent, as thoſe agates found in round nodules at Deux Ponts

CHERTZEY, a market town of Surrey in England, about ſeven miles weſt from Kingſton upon Thames. W. Long. 30′. N. Lat. 51. 25.

CHERUB, (plural, CHERUBIM); a celeſtial ſpirit, which in the hierarchy is placed next to the ſeraphim. See HIERARCHY.

The term *cherub,* in Hebrew, is ſometimes taken for a calf or ox. Ezekiel ſets down the face of a cherub as ſynonymous to the face of an ox. The word *cherub,* in Syriac and Chaldee, ſignifies to *till* or *plow,* which is the proper work of oxen. Cherub alſo ſignifies *ſtrong* and *powerful.* Grotius ſays, that the Cherubim were figures much like that of a calf. Bochart thinks likewiſe, that the cherubim were more like to the figure of an ox than to any thing beſides; and Spencer is of the ſame opinion. Laſtly, St John, in the Revelations, calls cherubim *beaſts.* Joſephus ſays the cherubim were extraordinary creatures of a figure unknown to mankind. Clemens of Alexandria believes, that the Egyptians imitated the cherubim of the Hebrews in the repreſentations of their ſphinxes and their hieroglyphical animals. All the ſeveral deſcriptions which the ſcripture gives us of cherubim differ from one another; but all agree in repreſenting them as a figure compoſed of various creatures, as a man, an ox, an eagle, and a lion. Such were the cherubim deſcribed by Ezekiel. Thoſe which Iſaiah ſaw, and are called *ſeraphim* by him, had the figure of a man with ſix wings; with two whereof they covered their faces, with two more they covered their feet, and with the two others they flew. Thoſe which Solomon placed in the temple of Jeruſalem are ſuppoſed to have been nearly of the ſame form. Thoſe which St John deſcribes in the Revelations were all eyes before and behind, and had each ſix wings. The firſt was in the form of a lion, the ſecond in that of a calf, the third of a man, and the fourth of an eagle. The figure of the cherubim was not always uniform, ſince they are differently deſcribed in the ſhapes of men, eagles, oxen, lions, and in a compoſition of all theſe figures put together. Moſes likewiſe calls theſe ſymbolical or hieroglyphical repreſentations, which were embroidered on the veils of the tabernacle, *cherubim* of coſtly work. Such were the ſymbolical figures which the Egyptians placed at the gates of their temples and the images of the generality of their gods, which were commonly nothing but ſtatues compoſed of men and animals.

CHERVIL, in botany. See CHÆROPHYLLUM.

CHESAPEAK, in America, one of the largeſt bays in the known world. Its entrance is between Cape Charles and Cape Henry in Virginia, 12 miles wide; and it extends 270 miles to the northward, dividing Virginia and Maryland. Through this extent it is from 7 to 18 miles broad, and generally about 9 fathoms deep; affording many commodious harbours, and a ſafe and eaſy navigation. It receives the waters of the Suſquehannah, Patomack, Rappahannock, York, and James rivers, which are all large and navigable.

CHESELDEN (William), an eminent anatomiſt and ſurgeon, was born at Burrow on the Hill, in the county of Leiceſter, England, deſcended from an ancient family in the county of Rutland, whoſe arms and pedigree are in Wright's "Hiſtory of Rutland." He received the rudiments of his profeſſional ſkill at Leiceſter; and married Deborah Knight, a citizen's daughter, by whom he had one daughter, Williamina Deborah. In 1713 he publiſhed his Anatomy of the Human Body, one volume, 8vo; and in 1723, A Treatiſe on the High Operation for the Stone. He was one of the earlieſt of his profeſſion who contributed by his writings to raiſe it to its preſent eminence. In the beginning of 1736, he was thus honourably mentioned by Mr Pope: "As ſoon as I had ſent my laſt letter, I received a moſt kind one from you, expreſſing great pain for my late illneſs at Mr Cheſelden's. I conclude you was eaſed of that friendly apprehenſion in a few days after you had diſpatched your's, for mine muſt have reached you then. I wondered a little at your quære, Who Cheſelden was? It ſhows that the trueſt merit does not travel ſo far any way as on the wings of poetry: he is the moſt noted and moſt deſerving man in the whole profeſſion of chirurgery; and has ſaved the lives of thouſands by his manner of cutting for the ſtone." He appears to have been on terms of the moſt intimate friendſhip with Mr Pope, who frequently in his Letters to Mr Richardſon, talks of dining with Mr Cheſelden, who then lived in or near Queen Square. In February 1737, Mr Cheſelden was appointed ſurgeon to Chelſea hoſpital. As a governor of the Foundling Hoſſpital, he ſent a benefaction of 50 l. to that charity, May 7, 1751, incloſed in a paper with the following lines:

> 'Tis what the happy to th' unhappy owe;
> For what man gives, the gods by him beſtow. Pope.

He died at Bath, April 11, 1752, of a diſorder ariſing from drinking ale after eating hot buns. Finding himſelf uneaſy, he ſent for a phyſician, who adviſed vomiting immediately; and if the advice had been taken, it was thought his life might have been ſaved. By his direction, he was buried at Chelſea.

CHESHIRE, a maritime county of England, bounded by Lancaſhire on the north; Shropſhire and part of Flintſhire, on the ſouth; Derbyſhire and Staffordſhire, on the eaſt and ſouth-eaſt; and Denbighſhire and part of Flintſhire, on the weſt and north-weſt. It extends in length about 44 miles, in breadth 25; and is ſuppoſed to contain 125,000 inhabitants. Both the air and ſoil in general are good. In many places of the country are peat-moſſes, in which are often found trunks of fir-trees, ſometimes ſeveral feet under ground, that are uſed by the inhabitants both for fuel and candles. Here alſo are many lakes and pools well ſtored with fiſh: beſides the rivers Merſee, Weaver, and Dee, which laſt falls into a creek of the Iriſh ſea near Cheſter. This county alſo abounds with wood: but what it is chiefly remarkable for, is its cheeſe, which has a peculiar flavour, generally thought not to be inferior to any in Europe; (ſee Cheese). The principal towns are, Cheſter the capital, Cholmondely, Namptwitch, &c.

William the Conqueror erected this county into a palatinate, or county-palatine, in favour of his nephew Hugh Lupus, to whom he granted the ſame ſovereignty and juriſdiction in it that he himſelf had in the reſt of the iſland. By virtue of this grant, the town of Cheſter enjoyed ſovereign juriſdiction within its own precincts; and that in ſo high a degree, that the earls held parliaments, conſiſting of their barons and tenants, which were not bound by the acts of the Engliſh parliament: but this exorbitant power of the palatinates was at laſt reduced by Henry VIII.; however, all caſes and crimes, except thoſe of error, foreign-plea, foreign-voucher, and high-treaſon, are ſtill heard and determined within the ſhire. The earls were anciently ſuperiors of the whole county, and all the landholders were mediately or immediately their vaſſals, and under the like ſovereign allegiance to them as they were to the kings of England; but the earldom was united to the crown by Edward III. ſince which time, the eldeſt ſons of kings of England have always been earls of Cheſter, as well as princes of Wales. Cheſhire ſends four members to parliament; two for the county, and two for the capital.

CHESNE (Andrew du), ſtyled the father of French hiſtory, was born in 1584. He wrote, 1. A hiſtory of the popes. 2. An hiſtory of England. 3. An inquiry into the antiquities of the towns of France. 4. An hiſtory of the cardinals. 5. A bibliotheca of the authors who have written the hiſtory and topography of France, &c. He was cruſhed to death by a cart, in going from Paris to his country-houſe at Verriere, in 1640.

CHESNUT-tree. See Fagus.

CHESS, an ingenious game performed with different pieces of wood, on a board divided into 64 ſquares or houſes; in which chance has ſo ſmall a ſhare, that it may be doubted whether a perſon ever loſt a game but by his own fault.

Each gameſter has eight dignified pieces, *viz.* a king, a queen, two biſhops, two knights, and two rooks, alſo eight pawns: all which, for diſtinction's ſake, are painted of two different colours, as white and black.

As to their diſpoſition on the board, the white king is to be placed on the fourth black houſe from the corner of the board, in the firſt and lower rank; and the black king is to be placed on the fourth white houſe on the oppoſite, or adverſary's end of the board. The queens are to be placed next to the kings, on houſes of their own colour. Next to the king and queen, on each hand, place the two biſhops; next to them, the two knights; and laſt of all, on the corners of the board, the two rooks. As to the pawns, they are placed, without diſtinction, on the ſecond rank of the houſe, one before each of the dignified pieces.

Having thus diſpoſed the men, the onſet is commonly begun by the pawns, which march ſtraight forward in their own file, one houſe at a time, except the firſt move, when it can advance two houſes, but never moves backwards: the manner of their taking the adverſary's men is ſide-ways, in the next houſe forwards; where having captivated the enemy, they move forward as before. The rook goes forward or croſs-ways through the whole file, and back again. The knight ſkips backward and forward to the next houſe, ſave one, of a different colour, with a ſidling march, or a ſlope, and thus kills his enemies that fall in his way, or guards his friends that may be expoſed on that ſide. The biſhop walks always in the ſame colour of the field that he is placed in at firſt, forward and backward, aſlope, or diagonally, as far as he liſts. The queen's walk is more univerſal, as ſhe takes all the ſteps of the before mentioned pieces, excepting that of the knight; and as to the king's motion, it is one houſe at a time, and that, either forward, backward, ſloping, or ſide-ways.

As to the value of the different pieces, next to the king is the queen, after her the rooks, then the biſhops, and laſt of the dignified pieces comes the knight. The difference of the worth of pawns, is not ſo great as that of noblemen; only, it muſt be obſerved, that the king's biſhop's pawn is the beſt in the field, and therefore the ſkilful gameſter will be careful of him. It ought alſo to be obſerved, that whereas any man may be taken, when he falls within the reach of any of the adverſary's pieces, it is otherwiſe with the king, who, in ſuch a caſe, is only to be ſaluted with the word *check*, warning him of his danger, out of which it is abſolutely neceſſary that he move; and, if it ſo happen that he cannot move without expoſing himſelf to the like inconveniency, it is check-mate, and the game is loſt. The rules of the game are,

1. In order to begin the game, the pawns muſt be moved before the pieces, and afterwards the pieces muſt be brought out to ſupport them. The king's, queen's and biſhop's pawns, ſhould be moved firſt, that the game may be well opened; the pieces muſt not be played out early in the game, becauſe the player may thereby

loſe his moves: but above all, the game ſhould be well arranged before the queen is played out. Uſeleſs checks ſhould alſo be avoided, unleſs ſome advantage is to be gained by them, becauſe the move may be loſt, if the adverſary can either take or drive the piece away.

2. If the game is crowded, the player will meet with obſtructions in moving his pieces; for which reaſon he ſhould exchange pieces or pawns, and caſtle (A) his king as ſoon as it is convenient, endeavouring at the ſame time to crowd the adverſary's game, which may be done by attacking his pieces with the pawns, if the adverſary ſhould move his pieces out too ſoon.

3. The men ſhould be ſo guarded by one another, that if a man ſhould be loſt, the player may have it in his power to take one of the adverſary's in return; and if he can take a ſuperior piece in lieu of that which he loſt, it would be an advantage, and diſtreſs the adverſary.

4. The adverſary's king ſhould never be attacked without a force ſufficient; and if the player's king ſhould be attacked without having it in his power to attack the adverſary's, he ſhould offer to make an exchange of pieces, which may cauſe the adverſary to loſe a move.

5. The board ſhould be looked over with attention, and the men reconnoitred, ſo as to be aware of any ſtroke that the adverſary might attempt in conſequence of his laſt move. If, by counting as many moves forward as poſſible, the player has a proſpect of ſucceſs, he ſhould not fail doing it, and even ſacrifice a piece or two to accompliſh his end.

6. No man ſhould be played till the board is thoroughly examined, that the player might defend himſelf againſt any move the adverſary has in view; neither ſhould any attack be made till the conſequences of the adverſary's next move are conſidered; and when an attack may with ſafety be made, it ſhould be purſued without catching at any bait that might be thrown out in order for the adverſary to gain a move, and thereby cauſe the deſign to miſcarry.

7. The queen ſhould never ſtand in ſuch a manner before the king, that the adverſary, by bringing a rook or biſhop, could check the king if ſhe were not there; as it might be the loſs of the queen.

8. The adverſary's knight ſhould never be ſuffered to check the king and queen, or king and rook, or queen and rook, or the two rooks at the ſame time; eſpecially if the knight is properly guarded: becauſe, in the two firſt caſes, the king being forced to go out of check, the queen or the rook muſt be loſt; and in the two laſt caſes a rook muſt be loſt at leaſt for a worſe piece.

9. The player ſhould take care that no guarded pawn of the adverſary's fork two of his pieces.

10. As ſoon as the kings have caſtled on different ſides of the board, the pawns on that ſide of the board ſhould be advanced upon the adverſary's king, and the pieces, eſpecially the queen and rook, ſhould be brought to ſupport them; and the three pawns belonging to the king that is caſtled muſt not be moved.

11. The more moves a player can have as it were in ambuſcade, the better; that is to ſay, the queen, biſhop, or rook, is to be placed behind a pawn or a piece, in ſuch a poſition as that upon playing that pawn or piece a check is diſcovered upon the adverſary's king, by which means a piece or ſome advantage is often gained.

12. An inferior piece ſhould never be guarded with a ſuperior, when a pawn would anſwer the ſame purpoſe; for this reaſon, the ſuperior piece may remain out of play; neither ſhould a pawn be guarded with a piece when a pawn would do as well.

13. A well ſupported pawn that is paſſed often coſts the adverſary a piece; and when a pawn or any other advantage is gained without endangering the loſs of the move, the player ſhould make as frequent exchanges of pieces as he can. The advantage of a paſſed pawn is this: for example, if the player and his adverſary have each three pawns upon the board, and no piece, and the player has one of his pawns on one ſide of the board, and the other two on the other ſide, and the adverſary's three pawns are oppoſite to the player's two pawns, he ſhould march with his king as ſoon as he can, and take the adverſary's pawns: If the adverſary goes with his king to ſupport them, the player ſhould go on to queen with his ſingle pawns; and then if the adverſary goes to hinder him, he ſhould take the adverſary's pawns, and move the others to queen (B).

14. When the game is near finiſhed, each party having only three or four pawns on each ſide of the board, the kings muſt endeavour to gain the move in order to win the game. For inſtance, when the player brings his king oppoſite to the adverſary's with only one ſquare between, he will gain the move.

15. If the adverſary has his king and one pawn on the board, and the player has only his king, he cannot loſe the game, provided he brings his king oppoſite to the adverſary's, when the adverſary is directly before or on one ſide of his pawn, and there is only one ſquare between the kings.

16. If the adverſary has a biſhop and one pawn on the rook's line, and this biſhop is not of the colour that commands the corner ſquare the pawn is going to, and the player has only his king, if he can get into that corner, he cannot loſe; but, on the contrary, may win by a ſtale (C).

17. If the player has greatly the diſadvantage of the game, having only his queen left in play, and his king happens to be in a poſition to win, as abovementioned, he ſhould keep giving check to the adverſary's king, always taking care not to check him where he can interpoſe any of his pieces that make the ſtale; by ſo doing he will at laſt force the adverſary to take his queen, and then he will win the game by being in a ſtale-mate.

18. The

(A) *Caſtle his king*, is to cover the king with a caſtle; which is done by a certain move which each player has a right to whenever he thinks proper.

(B) *To queen*, is to make a queen; that is, to move a pawn into the adverſary's back row, which is the rule at this game when the original one is loſt.

(C) When the king is blocked up ſo as to have no move at all.

18. The player ſhould never cover a check with a piece that a pawn puſhed upon it may take, for fear of getting only the pawn in exchange for the piece.

19. A player ſhould never crowd his adverſary up with peices, for fear of giving a ſtale-mate inadvertently, but always ſhould leave room for his king to move.

By way of corroborating what has been already ſaid with reſpect to this game, it is neceſſary to warn a player againſt playing a timid game. He ſhould never be too much afraid of loſing a rook for an inferior piece; becauſe although a rook is a better piece than any other except the queen, it ſeldom comes into play to be of any great uſe till at the end of the game; for which reaſon it is often better to have an inferior piece in play, than a ſuperior one to ſtand ſtill, or moving to no great purpoſe. If a piece is moved, and is immediately drove away by a pawn, it may be reckoned a bad move, becauſe the adverſary gains a double advantage over the player, in advancing at the ſame time the other is made to retire; although the firſt move may not ſeem of conſequence between equal players, yet a move or two more loſt after the firſt makes the game ſcarcely to be recovered.

There never wants for a variety at this game, provided the pieces have been brought out regular; but if otherwiſe, it often happens that a player has ſcarce any thing to play.

Many indifferent players think nothing of the pawns, whereas three pawns together are ſtrong; but four, which conſtitute a ſquare, with the aſſiſtance of other pieces, well managed, make an invincible ſtrength, and in all probability may produce a queen when very much wanted. It is true, that two pawns with a ſpace between are no better than one; and if there ſhould be three over each other in a line, the game cannot be in a worſe way. This ſhows that the pawns are of great conſequence, provided they are kept cloſe together.

Some middling players are very apt to riſk loſing the game in order to recover a piece: this is a miſtake; for it is much better to give up a piece and attack the enemy in another quarter; by ſo doing, the player has a chance of ſnatching a pawn or two from, or gaining ſome advantage over, the adverſary, whilſt his attention is taken up in purſuing this piece.

If the queen and another piece are attacked at the ſame time, and that by removing the queen the piece muſt be loſt; provided two pieces can be gained in exchange for the queen, the queen ſhould be given up, it being the difference of three pieces, and conſequently more than the value of the queen. By loſing the queen, the game is not thrown into that diſorder which it would otherwiſe have been: in this caſe it would be judicious to give the queen for even a piece, or a pawn or two; it being well known among good players, that he who begins the attack, and cannot maintain it, being obliged to retire, generally loſes the game.

A player ſhould never be fond of changing without reaſon, becauſe the adverſary, if he is a good player, will ruin his ſituation, and gain a conſiderable advantage over him. But rather than loſe a move, when a player is ſtronger than the adverſary, it is good play to change, for he thereby increaſes his ſtrength.

When the game is almoſt drawn to a concluſion, the player ſhould recollect that his king is a capital piece, and conſequently ſhould keep him in motion; by ſo doing he generally gets the move, and often the game.

As the queen, rook, and biſhop, operate at a diſtance, it is not always neceſſary in the attack to have them near the adverſary's king.

If a man can be taken with different pieces, the player ſhould take his time, and conſider which of thoſe pieces is the beſt to take it with.

If a piece can be taken almoſt at any time, the player ſhould not be in a hurry about it, but try to make a good move elſewhere before he takes it.

A player ſhould be cautious how he takes his adverſary's pawn with his king, as it often happens to be a ſafe-guard to it.

After all that has been ſaid, it is ſtill neceſſary for us to adviſe thoſe who would play well at this game, to be very cool and attentive to the matter in queſtion: for it is impoſſible that any perſon in the univerſe can be capable of playing at cheſs if their thoughts are employed elſewhere. The laws at this game are,

1. If a player touches his man, he muſt play it, and if he quits it, he cannot recal it.

2. If by miſtake or otherwiſe a falſe move is played, and the adverſary takes no notice of it till he hath played his next move, it cannot be recalled by either of the parties.

3. If a player miſplaces the men, and he plays two moves, it is at the option of the adverſary to permit him to begin the game or not.

4. If the adverſary plays or diſcovers a check to a player's king, and gives no notice of it, the player may let him ſtand ſtill till he does.

5. After the king is moved, a player cannot caſtle.

Saraſin has an expreſs treatiſe on the different opinions of the original of the Latin *ſchacchi*, whence the French *ethecs*, and our *cheſs*, is formed. Menage is alſo very full on the ſame head. Leunclavius take it to come from *Uſcoches*, famous Turkiſh robbers: P. Sirmond, from the German *ſcachhe*, "theft;" and that from *calculus*. He takes *cheſs* to be the ſame with the *ludus latrunculorum* of the Romans, but miſtakenly. This opinion is countenanced by Voſſius and Salmaſius, who derive the word from *calculus*, as uſed for *latrunculus*. G. Toloſanus derives it from the Hebrew *ſcach, vallavit et mat mortuus*; whence *check* and *check-mate*. Fabricius ſays, a celebrated Perſian aſtronomer, one Schatrenſcha, invented the game of *cheſs*; and gave it his own name, which it ſtill bears in that country. Nicod derives it from *ſcheeque*, or *xeque*, a Mooriſh word for lord, king, and prince. Bochart adds, that *ſcach* is originally Perſian; and that *ſcach-mat*, in that language, ſignifies the king is dead.—The opinion of Nicod and Bochart, which is likewiſe that of Scriverius, appears the moſt probable.

Mr Twiſs mentions a ſmall treatiſe on cheſs, written, as he ſuppoſes, about 400 years ago; at the end of which is a repreſentation of a round cheſs-board, with directions for placing the men upon it. In this the knight can cover the 64 ſquares on the board at as many moves. The board is divided into theſe 64 parts by four concentric circles, having an empty ſpace in the middle; and each of theſe is divided into 16 parts. Number 1 is placed in the outermoſt circle; number 2 in the third circle counting inwards, in the diviſion to the right hand of the former; number 3 is placed in the outermoſt circle, in the diviſion to the right hand of 2; 4 in the third circle counting inwards to the right hand of three; and thus alternately from the firſt to the third, and from the third to the firſt circle, till the round is completed by 16 on the third circle to the left hand of 1. Number 17 is then placed on the diviſion of the innermoſt circle to the right hand of 1; 18 on the ſecond circle counting inwards, to the right hand of 17; and thus alternately from the fourth to the ſecond, and from the ſecond to the fourth circles, until the round is completed by 32, directly below number 1. Number 33 then is placed on the third circle directly to the right hand of number 2; 34 on the fourth circle, to the right hand of 4; and thus alternately between the third and fourth circles, until the round is again completed by 48 on the fourth circle, directly below number 33. The numbers are now placed in a retrograde faſhion; 50 on the outer circle in that diviſion immediately to the right hand of 1; 51 on the third circle, to the left hand of 2, and directly below number 32; 52 is then placed on the outer circle, immediately on the left hand of 1: 53 on the third circle directly to the left hand of 16; and thus alternately on the firſt and third circles, until the laſt round is completed by 64 between the numbers 3 and 5. On this round cheſs-board, ſuppoſing the black king to be placed in number 48 on the fourth circle, the queen ſtands on number 17 at his left hand; the biſhops in 33 and 2; the knights 18 and 47; the caſtles in 3 and 50; the pawns on 19, 4, 49, 64, and 46, 51 32, 1. The white king will then ſtand in 25, oppoſite the black queen; the white queen in 40 oppoſite to the black king, and ſo on. In playing on a board of this kind, it will be found that the power of the caſtle is double to that in the common game, and that of the biſhop only one half; the former having 16 ſquares to range in, and the laſt only four. The king can caſtle only one way; and it is very difficult to bring the game to a concluſion.

With regard to the origin of the game at cheſs, we are much in the dark. Though it came to us from the Saracens, it is by no means probable that they were the original inventors of it. According to ſome it was invented by the celebrated Grecian hero Diomedes. Others ſay, that two Grecian brothers, Ledo and Tyrrheno, were the inventors; and that being much preſſed with hunger, they ſough to alleviate the pain by this amuſement. It is certain, however, that it is a game of very ancient ſtanding, and in former ages has been very faſhionable in every part of Europe; though in this country it is not very common, probably on account of the intenſe application of thought required to play at it. It has long been a favourite of the Icelanders and other northern people. There is little difference between their game and ours.

The game of cheſs has been generally practiſed by the greateſt warriors and generals; and ſome have even ſuppoſed that it was neceſſary for a military man to be well ſkilled in this game. It is a game which has ſomething in it peculiarly intereſting. We read that Tamerlane was a great cheſs-player, and was engaged in a game during the very time of the deciſive battle with Bajazet the Turkiſh emperor, who was defeated and taken priſoner. It is alſo related of Al Amin the khalif of Bagdad, that he was engaged at cheſs with his freedman Kuthar at the time when Al Mamun's forces were carrying on the ſiege of that city with ſo much vigour that it was on the point of being carried by aſſault. Dr Hyde quotes an Arabic hiſtory of the Saracens, in which the khalif is ſaid to have cried out when warned of his danger, Let me alone, for I ſee check-mate againſt Kuthar! We are told that Charles I. was at cheſs when news were brought of the final intention of the Scots to ſell him to the Engliſh; but ſo little was he diſcompoſed by this alarming intelligence, that he continued his game with the utmoſt compoſure; ſo that no perſon could have known that the letter he received had given him information of any thing remarkable. King John was playing at cheſs when the deputies from Rouen came to acquaint him that their city was beſieged by Philip Auguſtus; but he would not hear them until he had finiſhed his game.

The following remarkable anecdote we have from Dr Robertſon in his Hiſtory of Charles V. John Frederic, elector of Saxony, having been taken priſoner by Charles, was condemned to death. The decree was intimated to him while at cheſs with Erneſt of Brunſwic, his fellow-priſoner. After a ſhort pauſe, and making ſome reflections on the irregularity and injuſtice of the emperor's proceedings, he turned to his antagoniſt, whom he challenged to finiſh the game. He played with his uſual ingenuity and attention; and having beat Erneſt, expreſſed all the ſatisfaction that is commonly felt on gaining ſuch victories. He was not, however, put to death, but ſet at liberty after five years confinement.

In the Chronicle of the Mooriſh kings of Granada we find it related, that in 1396, Mehemed Balba ſeized upon the crown in prejudice of his elder brother, and paſſed his life in one continual round of diſaſters. His wars with Caſtile were invariably unſucceſsful; and his death was occaſioned by a poiſoned veſt. Finding his caſe deſperate, he diſpached an officer to the fort of Salobrena to put his brother Juzaf to death, leſt that prince's adherents ſhould form any obſtacle to his ſon's ſucceſſion. The alcayde found the prince playing at cheſs with an *alfaqui* or prieſt. Juzaf begged hard for two hours reſpite, which was denied him; at laſt with great reluctance the officer permitted him to finiſh the game; but before it was finiſhed a meſſenger arrived with the news of the death of Mehemed, and the unanimous election of Juzaf to the crown.

We have a curious anecdote of Ferrand count of Flanders; who having been accuſtomed to amuſe himſelf at cheſs with his wife, and being conſtantly beaten by her, a mutual hatred took place; which came to ſuch an height, that when the count was taken priſoner at the battle of Bovines, ſhe ſuffered him to remain a long time in priſon though ſhe could eaſily have procured his releaſe.

The game of cheſs has undergone conſiderable variations ſince it was firſt invented. We have it on good authority, that among the eaſtern nations, the piece now called the *queen* was formerly called the *vizir* or king's miniſter, and that the powers of the queen herſelf were but very ſmall. The cheſs-boards uſed by Tamerlane were larger, and contained many more ſquares, than thoſe at preſent in uſe. Carrera invented two new pieces to be added to the eight commonly in uſe. One of theſe, which he calls *campione*, is placed between the king's knight and caſtle; the other, named *Centaur*, between the queen's knight and caſtle, has the move of the biſhop and knight united. This invention, however, did not ſurvive its author. In another of this kind, the two additional pieces are called the *centurion* and *decurion*; the former, ſituated between the king and his biſhop, in its move the ſame with that of the queen, but only for two ſquares; the latter moves as the biſhop, but only one ſquare at a time. This, like the former, died with its inventor. The cheſs-board of Tamerlane was a parallelogram, having eleven ſquares one way and twelve the other. In the Memoirs of the late Marſhal Keith, we find it related, that he invented an amuſement ſomething ſimilar to that of cheſs, with which the king of Pruſſia was highly entertained. Several thouſand ſmall ſtatues were caſt by a founder; and theſe were ranged oppoſite to each other as if they had been drawn up in an army; making the different movements with them as in real ſervice in the field.

A very complicated kind of game at cheſs was invented by the late duke of Rutland. At this the board has 14 ſquares in breadth and 10 in height, which make in all 140 houſes: and there are 14 pawns on each ſide, which may move either one, two, or three ſquares the firſt time. The other pieces were the king, queen, two biſhops, two knights, a crowned caſtle uniting the move of the king and caſtle, and a common caſtle. On the other ſide of the king was a *concubine*, whoſe move united that of the caſtle and knight, two biſhops, a ſingle knight, a crowned caſtle, and a common one. In this game the pawns are of very little uſe; and by the extent of the board, the knights loſe much of their value, which conſequently renders the game more defective and leſs intereſting than the common one.

There is an amuſing variety at the game of cheſs, in which the king with eight pawns engages the whole ſet, by being allowed to make two moves for every one of his adverſary. In this he is almoſt certain of coming off victorious; as he can make his firſt move into check, and the ſecond out of it. Thus he can take the queen when ſhe ſtands immediately before her king, and then retreat; for he cannot remain in check. He cannot be check-mated unleſs his adverſary has preſerved his queen and both caſtles.

CHESS-Trees, taquets d'amure; two pieces of wood bolted perpendicularly, one on the ſtarboard, and another on the larboard, ſide of the ſhip. They are uſed to confine the *clue*, or lower corners of the main-ſail; for which purpoſe there is a hole in the upper part, through which the rope paſſes that uſually extends the clue of the ſail to windward. See TACK.

The cheſs-trees are commonly placed as far before the main-maſt as the length of the main-beam.

CHEST, in commerce, a kind of meaſure, containing an uncertain quantity of ſeveral commodities.

A cheſt of ſugar, *v. g.* contains from ten to fifteen hundred weight; a cheſt of glaſs, from two hundred to three hundred feet: of Caſtile ſoap, from two and an half to three hundred weight; of indigo, from one and an half to two hundred weight, five ſcore to the hundred.

CHEST, or *Thorax*. See ANATOMY, Part IV.

CHESTER, commonly called *Weſt-Cheſter*, to diſtinguiſh it from many other Cheſters in the kingdom; the capital of Cheſhire, in England. It is a very ancient city, ſuppoſed to have been founded by the Romans; and plainly appears to have been a Roman ſtation by the many antiquities which have been and are ſtill diſcovered in and about the town. It was among the laſt places the Romans quitted; and here the Britons maintained their liberty long after the Saxons had got poſſeſſion of the reſt of their country. At preſent it is a large well-built wealthy city, and carries on a conſiderable trade. Mr Pennant calls it *a city without parallel*, on account of the ſingular ſtructure of the four principal ſtreets. They are as if excavated out of the earth, and ſunk many feet beneath the ſurface; the carriages drive far beneath the level of the kitchens on a line with ranges of ſhops. The houſes are moſtly of wood, with galleries, piazzas, and covered walls before them; by which not only the ſhops, but thoſe who are walking about the town, are ſo hid, that one would imagine there were ſcarce any inhabitants in it, though it is very populous. But though by this contrivance ſuch as walk the ſtreets are ſcreened from rain, &c. yet the ſhops are thereby rendered dark and inconvenient. The back courts of all the houſes are on a level with the ground; but to go into any of the four principal ſtreets, it is neceſſary to deſcend a flight of ſeveral ſteps.

Cheſter is a biſhop's ſee. It was anciently part of the dioceſe of Litchfield; one of whoſe biſhops removing the ſeat of his ſee hither in the year 1075, occaſioned his ſucceſſors to be frequently ſtyled *biſhops of Cheſter*. But it was not erected into a diſtinct biſhopric until the general diſſolution of monaſteries, when king Henery VIII. in the year 1541, raiſed it to this dignity, and allotted the church of the abbey of St Werburgh for the cathedral, ſtyling it the *cathedral church of Chriſt and the bleſſed Virgin;* adding the biſhopric to the province of Canterbury: but ſoon after he disjoined it from Canterbury, and added it to the province of York. When this abbey was diſſolved, its revenues were valued at L. 1003 : 5 : 11. This dioceſe contains the entire counties of Cheſter and Lancaſter, part of the counties of Weſtmoreland, Cumberland, and Yorkſhire, two chapelries in Denbyſhire, and five pariſhes in Flintſhire; amounting in all to 256 pariſhes, of which 101 are impropriations. This biſhopric is valued in the king's books at L.420 : 1 ; 8, and is computed to be worth annually L.2700; the clergy's tenth amounting to L435 : 12 : 0. To this cathedral belong a dean, two archdeacons, a chancellor, a treaſurer, ſix prebendaries, and other inferior officers and ſervants. W. Long. 3. 0. N. Lat. 53. 12.

CHESTER-le-Street, the *Cuneaceſtre* of the Saxons: a ſmall thoroughfare town between Newcaſtle and Durham, with a good church and fine ſpire. In the Saxon times this place was greatly reſpected on account of the relics of St Cuthbert, depoſited here by biſhop Eardulf, for fear of the Danes, who at that time (about 884) ravaged the country. His ſhrine became afterwards an object of great devotion. King Athelſton, on his expedition to Scotland, paid it a viſit, to obtain, by enterceſſion of the ſaint, ſucceſs on his arms; beſtowed a multitude of gifts on the church; and directed, in caſe he died in his enterprize, that his body ſhould be enterred there. At the time that this place was honoured with the remains of St Cuthbert, the biſhoprie of Lindesfarn was removed here, and endowed with all the lands between the Tyne and the Were, the preſent county of Durham. It was ſtyled *St Cuthbert's patrimony*. The inhabitants had great privileges, and always thought themſelves exempt from all military duty, except that of defending the body of their ſaint. Cheſter-le-ſtreet may be conſidered as the parent of the ſee of Durham; for when the relics were removed there, the ſee in 995 followed them. Tanner ſays, that probably a chapter of monks, or rather ſecular canons, attended the body at this place from its firſt arrival; but biſhop Beke, in 1286, in honour of the ſaint, made the church collegiate, and eſtabliſhed here a dean and ſuitable eccleſiaſtics; and, among other privileges, gives the dean a right of fiſhing on the Were, and the tythe of fiſh.

New CHESTER, a town in the ſtate of Pennſylvania, and capital of a county of that name. It is ſeated on the Delaware; and has a fine capacious harbour, admitting veſſels of any burden. W. Long. 74. 7. N. Lat. 40. 15.

CHESTERFIELD, a market town of Derbyſhire in England, pleaſantly ſituated on a hill between two ſmall rivers. It has the title of an earldom; and a conſiderable market for corn, lead, and other country commodities. The houſes are, for the moſt part, built of rough ſtone, and covered with ſlate. W. Long. 1.25. N. Lat. 53. 20.

CHESTERFIELD (Earl of). See STANHOPE.

CHEVAL *de* FRISE, a large piece of timber pierced, and traverſed with wooden ſpikes, armed or pointed with iron, five or ſix feet long. See Plate CXXXVI.

The term is French and properly ſignifies a *Frieſland horſe*; as having been firſt invented in that country.—It is alſo called a *Turnpike* or *Turniquet*.

Its uſe is to defend a paſſage, ſtop a breach, or make a retrenchment to ſtop the cavalry. It is ſometimes alſo mounted on wheels, with artificial fires, to roll down in an aſſault. Errard obſerves, that the prince of Orange uſed to incloſe his camp with *chevaux de Friſe*, placing them one over another.

CHEVALER, in the manege, is ſaid of a horſe, when, in paſſaging upon a walk or trot, his off fore-leg croſſes or overlaps the near fore-leg every ſecond motion.

CHEVALIER, a French term, ordinarily ſignifying a KNIGHT. The word is formed of the French *cheval*, "horſe;" and the barbarous Latin *cavallus*.

It is uſed, in heraldry, to ſignify any *cavalier*, or horſeman armed at all points; by the Romans called *cataphractus eques*: now out of uſe, and only to be ſeen in coat-armour.

CHEVAUX *de* FRISE. See CHEVAL *de Friſe*.

CHEVIN, a name uſed in ſome parts of England for the CHUB.

CHEVIOT (or TIVIOT) HILLS, run from north to ſouth through Cumberland; and were formerly the borders or boundaries between England and Scotland, where many a bloody battle has been fought between the two nations; one of which is recorded in the ballad of Chevy-chaſe. Theſe hills are the firſt land diſcovered by ſailors in coming from the eaſt into Scotland.

CHEVISANCE, in law, denotes an agreement or compoſition, as an end or order ſet down between a creditor and his debtor, &c. In the ſtatutes, this word is moſt commonly uſed for an unlawful bargain or contract.

CHEVREAU (Urban), a learned writer, born at Lundun in 1613. He diſtinguiſhed himſelf in his youth by his knowledge of the belles lettres; and became ſecretary of ſtate to queen Chriſtina of Sweden. Several German princes invited him to their courts; and Charles-Lewis, the elector palatine, retained him under the title of counſellor. After the death of that prince, he returned to France, and became preceptor to the duke of Maine. At length retiring to Lundun, he died there in 1701, aged 88. He was the author of ſeveral books; and amongſt others, of an Univeſal Hiſtory, which has been often reprinted.

CHEVRON, or CHEVERON, in heraldry. See HERALDRY.

CHEWING-BALLS, a kind of balls made of aſafoetida, liver of antimony, bay-wood, juniper-wood, and pellitory of Spain; which being dried in the ſun, and wrapped in a linen cloth, are tied to the bit of the bridle for the horſe to chew; they create an appetite; and it is ſaid, that balls of Venice-treacle may be uſed in the ſame manner with good ſucceſs.

CHEYKS. See BENGAL, nº 17.

CHEYNE (Dr George), a phyſician of great learning and abilities, born in Scotland in 1671, and educated at Edinburgh under the great Dr Pitcairn. He paſſed his youth in cloſe ſtudy, and with great temperance: but coming to ſettle at London, when about 30, and finding the younger gentry and free-livers to be the moſt eaſy of acceſs and moſt ſuſceptible of friendſhip, he changed on a ſudden his former manner of living in order to force a trade, having obſerved this method to ſucceed with ſome others. The conſequence was, that he grew daily in bulk, and in intimacy with his gay acquaintance; ſwelling to ſuch an enormous ſize, that he exceeded 32 ſtone weight; and he was forced to have the whole ſide of his chariot made open to receive him into it; he grew ſhort-breathed, lethargic, nervous, and ſcorbutic; ſo that his life became an intolerable burden. In this deplorable condition, after having tried all the power of medicine in vain, he reſolved to try a milk and vegetable diet; the good effects of which quickly appeared. His ſize was reduced almoſt a third; and he recovered his ſtrength, activity, and cheerfulneſs, with the perfect uſe of all his faculties. In ſhort, by a regular adherence to this regimen, he lived to a mature period, dying at Bath in 1742, aged 72. He wrote ſeveral treatiſes that were well received; particularly, "An Eſſay on Health and Long Life;" and "The Engliſh Malady, or a Treatiſe of Nervous Diſeaſes;" both the reſult of his own experience. In ſhort, he had great reputation in his own time, both as a practitioner and as a writer; and moſt of his pieces paſſed thro' ſeveral editions. He is to be ranked among thoſe phyſicians

phyſicians who have accounted for the operations of medicines and the morbid alterations which take place in the human body upon mechanical principles. A ſpirit of piety and of benevolence, and an ardent zeal for the intereſts of virtue, are predominant throughout his writings. An amiable candour and ingenuouſneſs are alſo diſcernible, and which led him to retract with readineſs whatever appeared to him to be cenſurable in what he had formerly advanced. Some of the metaphyſical notions which he has introduced into his books, may, perhaps, juſtly be thought fanciful and ill-grounded; but there is an agreeable vivacity in his productions, together with much openneſs and frankneſs, and in general great perſpicuity.

CHIABRERA (Gabriel), eſteemed the Pindar of Italy, was born at Savona in 1552, and went to ſtudy at Rome. The Italian princes, and Urban VIII. gave him public marks of their eſteem. He wrote a great number of poems; but his lyric verſes are moſt admired. He died at Savona in 1638, aged 86.

CHIAN EARTH, in pharmacy, one of the medicinal earths of the ancients, the name of which is preſerved in the catalogues of the materia medica, but of which nothing more than the name has been known for many ages in the ſhops.

It is a very denſe and compact earth; and is ſent hither in ſmall flat pieces from the iſland of Chios, in which it is found in great plenty at this time. It ſtands recommended to us as an aſtringent. They tell us, it is the greateſt of all coſmetics; and that it gives a whiteneſs and ſmoothneſs to the ſkin, and prevents wrinkles, beyond any of the other ſubſtances that have been celebrated for the ſame purpoſes.

CHIAOUS, a word in the original Turkiſh, ſignifying "envoys," are officers to the number of five or ſix hundred in the grand ſignior's court, under the command of a chiaous baſchi. They frequently meet in the grand viſir's palace, that they may be in readineſs to execute his orders, and carry his diſpatches into all the provinces of the empire. The chiaous baſchi aſſiſts at the divan, and introduces thoſe who have buſineſs there.

CHIAPA, the capital of a province of the ſame name in Mexico, ſituated about 300 miles eaſt of Acapulco. W. Long. 98. 0. N. Lat. 16. 30.

CHIAPA el Real, a town of Mexico, in a province of the ſame name, with a biſhop's ſee. Its principal trade conſiſts in chocolate-nuts, cotton, and ſugar. W. Long. 98. 35. N. Lat. 16. 20.

CHIAPAS de los Indos, a large and rich town of North America, in Mexico, and in a province of the ſame name. The governor and moſt of the inhabitants are originally Americans. W. Long. 98. 5. N. Lat. 15. 6.

CHIARI (Joſeph), a celebrated Italian painter, was the diſciple of Carlo Maratti; and adorned the churches and palaces of Rome with a great number of fine paintings. He died of an apoplexy in 1727, aged 73.

CHIARI, a town of Italy, in the province of Breſcia, and territory of Venice, 7 miles weſt of Breſcia, and 27 eaſt of Milan. Here the Imperialiſts gained a victory over the French in 1701. E. Long. 18. 18. N. Lat. 45. 30.

CHIARO-SCURO. See *CLARO-Obſcuro*.

CHIAVENNA, a handſome, populous, and large town of Swiſſerland, in the country of the Griſons. It is a trading place, eſpecially in wine and delicate fruits. The governor's palace and the churches are very magnificent, and the inhabitants are Roman Catholics. It is ſeated near the lake Como. E. Long. 9. 29. N. Lat. 46. 15.

CHIAUSI, among the Turks, officers employed in executing the vizirs, baſhaws, and other great men: the orders for doing this, the grand ſignior ſends them wrapped up in a black cloth; on the reception of which, they immediately perform their office.

CHICANE, or CHICANERY, in law, an abuſe of judiciary proceeding, tending to delay the cauſe, to puzzle the judge, or impoſe upon the parties.

CHICANE, in the ſchools, is applied to vain ſophiſms, diſtinctions, and ſubtleties, which protract diſputes, and obſcure the truth.

CHICHESTER, the capital city of the county of Suſſex in England, was built by Ciſſa, the 2d king of the South Saxons, and by him called *Ciſſan Caeſter*. It is ſurrounded with a wall, which has four gates, anſwering to the four cardinal points; from which run two ſtreets, that croſs one another in the middle and form a ſquare, where the market is kept, and where there is a fine ſtone piazza built by biſhop Read. The ſpace between the weſt and ſouth gates is taken up with the cathedral church and the biſhop's palace. It has five pariſh-churches; and is ſeated on the little river Lavant, which waſhes it on all ſides except the north. This city would have been in a much more flouriſhing condition if it had been built by the ſea-ſide; however, the inhabitants have endeavoured to ſupply this defect in ſome meaſure, by cutting a canal from the city down into the bay. The principal manufactures of the town are malt and needles. The market of Chicheſter is noted for fiſh, wheat, barley, malt, and oats; the fineſt lobſters in England are bred in the Lavant; and it is obſervable, that this river, unlike moſt others, is very low in winter, but in ſummer often overflows its banks. Chicheſter is a city and county of itſelf; it is governed by a mayor, recorder, aldermen, common-council without limitation, and four juſtices of the peace choſen out of the aldermen; and it ſends two members to parliament. It is a biſhop's ſee. The cathedral church was anciently dedicated to St Peter. It was new built by Radulph, the twenty-fifth biſhop; but being deſtroyed by fire, it was again built by Seffridus II. the twenty-ninth biſhop. This ſee hath yielded to the church two ſaints, and to the nation three lord chancellors, two almoners, and one chancellor to the univerſity of Oxford. Anciently the biſhops of Chicheſter were confeſſors to the queens of England. This dioceſe contains the whole of the county of Suſſex (excepting 22 pariſhes, peculiars of the archbiſhop of Canterbury), wherein are 250 pariſhes, whereof 112 are impropriated. It hath two archdeacons, viz. of Chicheſter and Lewes; is valued in the king's books at L.677 : 1 : 3, and is computed to be worth annually L.2600. The tenths of the whole clergy is L.287 : 2 : 0¾. To the cathedral belong a biſhop, a dean, two archdeacons, a treaſurer, a chancellor, thirty-two prebendaries, a chanter, twelve vicars-coral, and other officers. W. Long. 50. N. Lat. 50. 50.

CHICK, or CHICKEN, in zoology, denotes the young

young of the gallinaceous order of birds, eſpecially the common hen. See PHASIANUS.

CHICK-*Weed*, in botany. See ALSINE.

CHICKEN-*Pox*. See *(Index ſubjoined to)* MEDICINE.

CHICKLING-PEA, in botany, a name given to the LATHYRUS.

CHICUITOS, a province of South America, in the government of Santo-Cruz de la Sierra. The chief riches conſiſt of honey and wax; and the original inhabitants are very voluptuous, yet very warlike. They maintained bloody wars with the Spaniards till 1690; ſince which, ſome of them have become Chriſtians. It is bounded by la Plata on the N. E. and by Chili on the W.

CHIDLEY, or CHIMLEY, a market-town of Devonſhire, ſituated in W. Long. 4. 0. N. Lat. 51. 0.

CHIEF, a term ſignifying the head or principal part of a thing or perſon. Thus we ſay, the chief of a party, the chief of a family, *&c.* The word is formed of the French *chef*, "head;" of the Greek κεφαλη, *caput*, "head;" though Menage derives it from the Italian *capo*, formed of the Latin *caput*.

CHIEF, in heraldry, is that which takes up all the upper part of the eſcutcheon from ſide to ſide, and repreſents a man's head. *In chief*, imports ſomething borne in the chief part or top of the eſcutcheon.

CHIEFTAIN, denotes the captain or chief of any claſs, family, or body of men. Thus the chieftains or chiefs of the Highland clans, were the principal noblemen or gentlemen of their reſpective clans. See CLANS.

CHIELEFA, a ſtrong town of Turkey in Europe, in the Morea. It was taken by the Venetians in 1685; but after that the Turks retook it, with all the Morea. E. Long. 22. 21. N. Lat. 26. 50.

CHIGI (Fabio), or Pope Alexander VII. was born at Sienna in 1599. His family finding him a hopeful youth, ſent him early to Rome, where he ſoon engaged in a friendſhip with the marquis Pallavicini, who recommended him ſo effectually to Pope Urban VIII. that he procured him the poſt of Inquiſitor at Malta. He was ſent vice-legate to Ferrara, and afterward nuncio into Germany: there he had an opportunity of diſplaying his intriguing genius; for he was mediator at Munſter, in the long conference held to conclude a peace with Spain. Cardinal Mazarin had ſome reſentment againſt Chigi, who was ſoon after made a cardinal and ſecretary of ſtate by Innocent X. but his reſentment was ſacrificed to political views. In 1655, when a pope was to be choſen, Cardinal Sacchetti, Mazarin's great friend, finding it was impoſſible for him to be raiſed into St Peter's chair becauſe of the powerful oppoſition made by the Spaniſh faction, deſired Cardinal Mazarin to conſent to Chigi's exaltation. His requeſt was granted, and he was elected pope by the votes of all the 64 cardinals who were in the conclave: an unanimity of which there are but few inſtances in the election of popes. He ſhowed uncommon humility at his election, and at firſt forbade all his relations to come to Rome without his leave; but he ſoon became more favourable to his nephews, and loaded them with favours. It is aſſerted that he had once a mind to turn Proteſtant. The news-papers in Holland beſtowed great encomiums upon him; and acquainted the world, that he did not approve of the cruel perſecutions of the Waldenſes in Piedmont. There is a volume of his poems extant. He loved the *Belles-Lettres*, and the converſation of learned men. He was extremely fond of ſtately buildings: the grand plan of the college *Della Sapienza*, which he finiſhed, and adorned with a fine library, remains a proof of his taſte in architecture. He died in 1667.

CHILBLAIN, *(pernio)*, in medicine, a tumour affecting the feet and hands; accompanied with an inflammation, pains, and ſometimes an ulcer or ſolution of continuity: in which caſe it takes the denomination of *chaps* on the hands, and of *kibes* on the heels. Chilblain is compounded of *chill* and *blain*; *q. d.* a blain or ſore contracted by cold. *Pernio* is the Latin name adopted by phyſicians; and is derived by Voſſius from *perna* "a gammon of bacon," on account of ſome reſemblance. *Chap* alludes to *gape*, both in ſound and appearance. *Kibes*, in welch *kibws*, may be derived from the German *kerben*, "to cut;" the ſkin, when broke, appearing like a cut.

Chilblains are occaſioned by exceſſive cold ſtopping the motion of the blood in the capillary arteries. See the article PERNIO.

CHILD, a term of relation to *parent*. See PARENT and CHILDREN.

Bartholine, Paré, Licetus, and many other writers, give an account of a petrified child, which has ſeemed wholly incredible to ſome people. The child, however, which they deſcribe, is ſtill in being; and is kept as a great rarity in the king of Denmark's muſeum at Copenhagen. The woman who was big with this, lived at Sens in Champaign in the year 1582; it was cut out of her belly, and was univerſally ſuppoſed to have lain there about 20 years. That it is a real human fœtus, and not artificial, is evident to the eyes of any obſerver; and the upper part of it, when examined, is found to be of a ſubſtance reſembling the gypſum, or ſtone whereof they make the plaſter of Paris: the lower part is much harder; the thighs and buttocks being a perfect ſtone of a reddiſh colour, and as hard as common quary-ſtone: the grain and ſurface of this part appears exactly like that of the calculi, or ſtones taken out of human bladders: and the whole ſubſtance examined ever ſo nearly, and felt ever ſo carefully, appears to be abſolute ſtone. It was carried from Sens to Paris, and there purchaſed by a goldſmith of Venice; and Frederic III. king of Denmark, purchaſed it of this man at Venice for a very large ſum, and added it to his collection of rarities.

CHILD-*Bed*, } See MIDWIFERY.
CHILD-*Birth*.

CHILD-*Wit*, a power to take a fine of a bond-woman unlawfully gotten with child, that is, without conſent of her lord. Every reputed father of a baſe child got within the manor of Writtel in Eſſex, in England, pays to the lord a fine of 3s. 4d.; where, it ſeems, child-wit extends to free as well as bond-women.

CHILDERMAS-DAY, or INNOCENT'S *Day*, an anniverſary held by the church of England on the 28th of December, in commemoration of the children of Bethlehem maſſacred by order of Herod.

CHILDREN, the plural of CHILD.

Mr Derham computes, that marriages, one with another, produce four children, not only in England, but in other parts alſo.

In the genealogical hiſtory of Tuſcany, wrote by Gamarini, mention is made of a nobleman of Sienna, named Pichi, who of three wives had 150 *children*; and that, being ſent ambaſſador to the pope and the emperor, he had 48 of his ſons in his retinue. In a monument in the church yard of St Innocent, at Paris, erected to a woman who died at 88 years of age, it is recorded, that ſhe might have ſeen 288 *children* directly iſſued from her. This exceeds what Hakewell relates of Mrs Honeywood, a gentlewoman of Kent, in England born in the year 1527, and married at 16 to her only huſband R. Honeywood, of Charing, Eſq.; and died in her 93d year. She had 16 *children* of her own body; of which three died young, and a fourth had no iſſue: yet her *grandchildren*, in the ſecond generation, amounted to 114; in the third, to 228; though in the fourth, they fell to 9. The whole number ſhe might have ſeen in her life-time, being 367. $16+114+228+9=367$. So that ſhe could ſay the ſame as the diſtich does of one of the Dalburg's family at Baſil:

1 2 3 4
Mater ait natæ dic natæ filia natam,
5 6
Ut moneat, natæ, plangere, filiolam.

Management of CHILDREN See INFANT.

Overlaying of CHILDREN, is a misfortune that frequently happens; to prevent which, the Florentines have contrived an inſtrument called *arcuccio*. See ARCUCCIO.

CHILDREN are, in law, a man's iſſue begotten on his wife. As to *illegitimate children*, ſee BASTARD.

For the legal duties of parents to their children, ſee the articles PARENT and BASTARD.

As to the duties of children to their parents, they ariſe from a principle of natural juſtice and retribution. For to thoſe who gave us exiſtence, we naturally owe ſubjection and obedience during our minority, and honour and reverence ever after: they who protected the weakneſs of our infancy, are intitled to our protection in the infirmity of their age; they who by ſuſtenance and education have enabled their offspring to proſper, ought, in return, to be ſupported by that offspring, in caſe they ſtand in need of aſſiſtance. Upon this principle proceed all the duties of children to their parents, which are enjoined by poſitive laws. And the Athenian laws carried this principle into practice with a ſcrupulous kind of nicety: obliging all children to provide for their father when fallen into poverty; with an exception to ſpurious children, to thoſe whoſe chaſtity had been proſtituted with conſent of their father, and to thoſe whom he had not put in any way of gaining a livelihood. The legiſlature, ſays baron Monteſquieu, conſidered, that, in the firſt caſe, the father, being uncertain, had rendered the natural obligation precarious; that, in the ſecond caſe, he had ſullied the life he had given, and done his children the greateſt of injuries, in depriving them of their reputation; and that, in the third caſe, he had rendered their life (ſo far as in him lay) an inſupportable burden, by furniſhing them with no means of ſubſiſtence.

Our laws agree with thoſe of Athens, with regard to the firſt only of theſe particulars, the caſe of ſpurious iſſue. In the other caſes, the law does not hold the tie of nature to be diſſolved by any miſbehaviour of the parent; and therefore a child is equally juſtifiable in defending the perſon, or maintaining the the cauſe or ſuit, of a bad parent as of a good one; and is equally compellable, if of ſufficient ability, to maintain and provide for a wicked and unnatural progenitor, as for one who has ſhown the greateſt tenderneſs and paternal piety. See further the article *FILIAL Affection*.

CHILI, a province of South America, bounded by Peru on the north, by the province of La Plata on the eaſt, by Patagonia on the ſouth, and by the Pacific ocean on the weſt, lying between 75 and 85 degrees of weſt longitude, and between 25 and 45 degrees of ſouth latitude; though ſome comprehend in this province Patagonia and Terra del Fuego.

The firſt attempt of the Spaniards upon this country was made by Almagro in the year 1535, after he and Pizaro had completed the conqueſt of Peru. He ſet out on his expedition to Chili with a conſiderable body of Spaniards and auxiliary Indians. For 200 leagues he was well accommodated with every neceſſary by the Indians, who had been ſubjects of the emperors of Peru: but reaching the barren country of Charcas, his troops became diſcontented through the hardſhips they ſuffered; which determined Almagro to climb the mountains called Cordilleras, in order to get the ſooner into Chili; being ignorant of the invaluable mines of Potoſi, contained in the province of Charcas where he then was. At that time the Cordilleras were covered with ſnow, the depth of which obliged him to dig his way through it. The cold made ſuch an impreſſion on his naked Indians, that it is computed no leſs than 10,000 of them periſhed on theſe dreadful mountains, 150 of the Spaniards ſharing the ſame fate; while many of the ſurvivors loſt their fingers and toes through the exceſs of cold. At laſt, after encountering incredible difficulties, Almagro reached a fine, temperate, and fertile plain on the oppoſite ſide of the Cordilleras, where he was received with the greateſt kindneſs by the natives. Theſe poor ſavages, taking the Spaniards for deputies of their god Virachoca, immediately collected for them an offering of gold and ſilver worth 200,000 ducats: and ſoon after brought a preſent to Almagro worth 300,000 more. Theſe offerings only determined him to conquer the whole country as ſoon as poſſible. The Indians among whom he now was, had acknowledged the authority of the Peruvian incas, or emperors, and conſequently gave Almagro no trouble. He therefore marched immediately againſt thoſe who had never been conquered by the Peruvians, and inhabited the ſouthern parts of Chili. Theſe ſavages fought with great reſolution, and diſputed every inch of ground: but in five months time the Spaniards had made ſuch progreſs, that they muſt infallibly have reduced the whole province in a very little time, had not Almagro returned to Peru, in conſequence of a commiſſion ſent him from Spain.

In 1540, Pizaro having overcome and put Almagro to death, ſent into Chili, Baldivia, or Valdivia, who had learned the rudiments of war in Italy, and was reckoned one of the beſt officers in the Spaniſh ſervice. As he penetrated ſouthwards, however, he met with much oppoſition; the confederated caziques frequently gave him battle, and diſplayed great courage and reſolution; but could not prevent him from penetrating to the valley of Maſiocho, which he found incredibly fertile and populous. Here he founded the city of St Jago; and finding gold mines in the neighbourhood, forced the Indians to work in them; at the ſame time building a caſtle for the ſafety and protection of his new colony. The natives, exaſperated at this ſlavery, immediately took up arms; attacked the fort; and, though defeated and repulſed, ſet fire to the outworks, which contained all the proviſions of the Spaniards. Nor were they diſcouraged by this and many other defeats, but ſtill continued to carry on the war with vigour. At laſt, Valdivia, having overcome them in many battles, forced the inhabitants of the vale to ſubmit; upon which he immediately ſet them to work in the mines of Quilotta. This indignity offered to their countrymen redoubled the fury of thoſe who remained at liberty. Their utmoſt efforts, however, were as yet unable to ſtop Valdivia's progreſs. Having croſſed the large rivers Maulle and Hata, he traverſed a vaſt tract of country, and founded the city of La Conception on the South-ſea-coaſt. He erected fortreſſes in ſeveral parts of the country, in order to keep the natives in awe; and built the city called *Imperial*, about 40 leagues to the ſouthward of Conception. The Spaniſh writers ſay that the neighbouring valley contained 80,000 inhabitants of a peaceable diſpoſition; and who were even ſo tame as to ſuffer Valdivia to parcel out their lands among his followers, while they themſelves remained in a ſtate of inactivity. About 16 leagues to the eaſtward of Imperial, the Spaniſh general laid the foundations of the city *Villa Rica*, ſo called on account of the rich gold mines he found there. But his ambition and avarice had now involved him in difficulties from which he could never be extricated: He had extended his conqueſts beyond what his ſtrength was capable of maintaining. The Chileſians were ſtill as deſirous as ever of recovering their liberties. The horſes, fire-arms, and armour of the Spaniards, indeed, appeared dreadful to them; but thoughts of endleſs ſlavery were ſtill more ſo. In the courſe of the war they had diſcovered that the Spaniards were vulnerable and mortal men like themſelves; they hoped, therefore, by dint of their ſuperiority in numbers, to be able to expel the tyrannical uſurpers. Had all the nations joined in this reſolution, the Spaniards had certainly been exterminated; but ſome of them were of a pacific and fearful diſpoſition, while others conſidered ſervitude as the greateſt of all poſſible calamities. Of this laſt opinion were the Araceans, the moſt intrepid people in Chili, and who had given Valdivia the greateſt trouble. They all roſe to a man, and choſe Capaulican, a renowned hero among them, for their leader. Valdivia, however, received notice of their revolt ſooner than they intended he ſhould, and returned with all expedition to the vale of Araccea; but before he arrived, 14,000 of the Chileſians were there aſſembled under the conduct of Capaulican. He attacked them with his cavalry, and forced them to retreat into the woods; but could not obtain a complete victory, as they kept continually ſallying out and haraſſing his men. At laſt Capaulican, having obſerved that fighting with ſuch a number of undiſciplined troops only ſerved to contribute to the defeat and confuſion of the whole, divided his forces into bodies of 1000 each. Theſe he directed to attack the enemy by turns; and, though he did not expect that a ſingle thouſand would put them to flight, he directed them to make as long a ſtand as they could; when they were to be relieved and ſupported by another body; and thus the Spaniards would be at laſt wearied out and overcome. The event fully anſwered his expectations. The Chileſians maintained a fight for ſeven or eight hours, until the Spaniards, growing faint for want of refreſhment, retired precipitately. Valdivia ordered them to poſſeſs a paſs at ſome diſtance from the field, to ſtop the purſuit; but this deſign being diſcovered to the Chileſians by the treachery of his page, who was a native of that country, the Spaniards were ſurrounded on all ſides, and cut in pieces by the Indians. The general was taken and put to death: ſome ſay with the tortures uſually inflicted by thoſe ſavages on their priſoners; others, that he had melted gold poured down his throat; but all agree, that the Indians made flutes and other inſtruments of his bones, and preſerved his ſkull as a monument of their victory, which they celebrated by an annual feſtival. After this victory the Chileſians had another engagement with their enemies; in which alſo they proved victorious, defeating the Spaniards with the loſs of near 3000 men; and upon this they bent their whole force againſt the colonies. The city of Conception, being abandoned by the Spaniards, was taken and deſtroyed: but the Indians were forced to raiſe the ſiege of Imperial; and their progreſs was at laſt ſtopped by Garcia de Mendoza, who defeated Capaulican, took him priſoner, and put him to death. No defeats, however, could diſpirit the Chileſians. They continued the war for 50 years; and to this day they remain unconquered, and give the Spaniards more trouble than any other American nation. Their moſt irreconcileable enemies are the inhabitants or Araccea and Tucapel, thoſe to the ſouth of the river Bobio, or whoſe country extends towards the Cordilleras — The manners of theſe people greatly reſemble thoſe of North America, which we have already deſcribed under the article AMERICA; but ſeem to have a more warlike diſpoſition. It is a conſtant rule with the Chileſians never to ſue for peace. The Spaniards are obliged not only to make the firſt overtures, but to purchaſe it by preſents. They have at laſt been obliged to abandon all thoughts of extending their conqueſts, and reduced to cover their frontiers by erecting forts at proper diſtances.

The Spaniſh colonies in Chili are diſperſed on the borders of the South-ſea. They are parted from Peru by a deſart 80 leagues in breadth; and bounded by the iſland of Chiloe, at the extremity next the ſtraits of Magellan. There are no ſettlements on the coaſts except that of Baldivia, Conception iſland, Valparaiſo, and Coquimbo or La Serena, which are all ſea-ports. In the inland country is St Jago, the capital of the colony. There is no culture nor habitation at any diſtance from theſe towns. The buildings in the whole province are low, made of unburnt brick, and moſtly thatched. This practice is obſerved on account of the frequent earthquakes; and is properly adapted to the nature of the climate, as well as the indolence of the inhabitants.

The climate of Chili is one of the moſt wholeſome

in

in the whole world. The vicinity of the Cordilleras gives it ſuch a delightful temperature as could not otherwiſe be expected in that latitude. Though gold mines are found in it, their richneſs has been too much extolled; their produce never exceeds L. 218,750. The ſoil is prodigiouſly fertile. All the European fruits have improved in that happy climate. The wine would be excellent if nature were properly aſſiſted by art: and the corn-harveſt is reckoned a bad one when it does not yield a hundred fold. With all theſe advantages, Chili has no direct intercourſe with the mother-country. Their trade is confined to Peru, Paraguay, and the ſavages on their frontiers. With theſe laſt they exchange their leſs valuable commodities, for oxen, horſes, and their own children, whom they are ready to part with for the moſt trifling things. This province ſupplies Peru with great plenty of hides, dried fruit, copper, ſalt-meat, horſes, hemp, lard, wheat, and gold. In exchange, it receives tobacco, ſugar, cocoa, earthen-ware, woollen cloth, linen, hats, made at Quito, and every article of luxury brought from Europe. The ſhips ſent from Callao on this traffic were formerly bound to Conception Bay, but now come to Valparaiſo. The commerce between this province and Paraguay is carried on by land, though it is a journey of 300 leagues, 40 of which lie through the ſnows and precipices of Cordilleras; but if it was carried on by ſea, they muſt either paſs the ſtraits of Magellan or double Cape Horn, which the Spaniards always avoid as much as poſſible. To Paraguay are ſent ſome woollen ſtuffs called *ponchos*, which are uſed for cloaks; alſo wines, brandy, oil, and chiefly gold. In return they receive wax, a kind of tallow fit to make ſoap, European goods, and negroes.

Chili is governed by a chief, who is abſolute in all civil, political, and military affairs, and is alſo independent of the viceroy. The latter has no authority except when a governor dies; in which caſe he may appoint one in his room for a time, till the mother-country names a ſucceſſor. If, on ſome occaſions, the viceroy has interfered in the government of Chili, it was when he has been either authoriſed by a particular truſt repoſed in him by the court, or by the deference paid to the eminence of his office; or when he has been actuated by his own ambition to extend his authority. In the whole province of Chili there are not 20,000 white men, and not more than 60,000 negroes, or Indians, able to bear arms. The military eſtabliſhment amounted formerly to 2000 men; but the maintaining of them being found too expenſive, they were reduced to 500 at the beginning of this century.

CHILIAD, an aſſemblage of ſeveral things ranged by thouſands. The word is formed of the Greek *χιλιας*, *mille*, a thouſand.

CHILIAGON, in geometry, a regular plain figure of 1000 ſides and angles. Though the imagination cannot form the idea of ſuch a figure, yet we may have a very clear notion of it in the mind, and can eaſily demonſtrate that the ſum of all its angles is equal to 1996 right ones: for the internal angles of every plane figure are equal to twice as many right ones as the figure hath ſides, except thoſe four which are about the centre of the figure, from whence it may be reſolved into as many triangles as it has ſides. The author of *l'Art de Penſer*, p. 44. has brought this inſtance to ſhow the diſtinction between imagination and conceiving.

CHILIARCHA, or CHILIARCHUS, an officer in the armies of the ancients, who had the command of a thouſand men.

CHILIASTS, in church-hiſtory. See MILLENARIANS.

CHILLINGWORTH (William), an eminent divine of the church of England, was born at Oxford in 1602, and bred there. He made early great proficiency in his ſtudies, being of a very quick genius. He was an expert mathematician, as well as an able divine, and a very good poet. Study and converſation at the univerſity turning upon the controverſy between the church of England and that of Rome, on account of the king's marriage with Henrietta daughter to Henry IV. king of France, Mr Chillingworth forſook the church of England, and embraced the Romiſh religion. Dr Laud, then biſhop of London, hearing of this, and being greatly concerned at it, wrote Mr Chillingworth; who expreſſing a great deal of candour and impartiality, that prelate continued to correſpond with him. This ſet Mr Chillingworth on a new inquiry; and at laſt determined him to return to his former religion. In 1634 he wrote a confutation of the arguments which had induced him to go over to the church of Rome. He ſpoke freely to his friends of all the difficulties that occurred to him; which gave occaſion to a groundleſs report, that he had turned Papiſt a ſecond time, and then Proteſtant again. His return to the communion of the church of England made a great noiſe, and engaged him in ſeveral diſputes with thoſe of the Romiſh perſuaſion. But in 1635 he engaged in a work which gave him a far greater opportunity to confute the principles of the church of Rome, and to vindicate the Proteſtant religion, under the title of "The Religion of Proteſtants a ſafe way to Salvation." Sir Thomas Coventry, lord keeper of the great ſeal, offering him preferment, Mr Chillingworth refuſed to accept it on account of his ſcruples with regard to the ſubſcription of the 39 articles. However, he at laſt ſurmounted theſe ſcruples; and being promoted to the chancellorſhip of the church of Sarum, with the prebend of Brixworth in Northamptonſhire annexed to it, he complied with the uſual ſubſcription. Mr Chillingworth was zealouſly attached to the royal party; and, in Auguſt 1643, was preſent in king Charles I.'s army at the ſiege of Glouceſter, where he adviſed and directed the making certain engines for aſſaulting the town. Soon after, having accompanied the Lord Hopton, general of the king's forces in the weſt, to Arundel caſtle in Suſſex, he was there taken priſoner by the parliamentary forces under the command of Sir William Waller, who obliged the caſtle to ſurrender. But his illneſs increaſing, he obtained leave to be conveyed to Chicheſter, where he was lodged at the biſhop's palace; and, after a ſhort ſickneſs, died in 1644. He hath left ſeveral excellent works behind him.

CHILMINAR. See PERSEPOLIS.

CHILO, one of the ſeven ſages of Greece, and of the ephori of Sparta the place of his birth, flouriſhed about 556 years before Chriſt. He was accuſtomed to ſay, that there were three things very difficult: "To keep a ſecret; to know how beſt to employ our time; and to ſuffer injuries without murmuring." According to Pliny, it was he who cauſed the ſhort ſentence, *Know thyſelf*, to be written in letters of gold in the temple of Delphos. It is ſaid that he died with joy, while embracing his ſon, who had been crowned at the Olympic games.

CHILOE, an iſland lying near the coaſt of Chili, in South America, under the 43d degree of ſouth latitude. It is the chief of an archipelago of 40 iſlands, and its principal town is Caſtro. It rains here almoſt all the year, inſomuch that nothing but Indian corn, or ſome ſuch grain, that requires but little heat to ripen it, can ever come to perfection. They have excellent ſhell-fiſh, very good wild-fowl, hogs, ſheep, and beeves; as alſo a great deal of honey and wax. They carry on a trade with Peru and Chili; whither they ſend boards of cedar, of which they have vaſt foreſts.

CHILTENHAM, a town in Glouceſterſhire, England, ſix miles from Glouceſter; noted for its purgative chalybeat ſpring, which has rendered it of late years a place of faſhionable reſort. This water, which operates with great eaſe, is deemed excellent in ſcorbutic complaints, and has been uſed with ſucceſs in the gravel.

CHILTERN, a chain of chalky hills forming the ſouthern part of Buckinghamſhire, England, the northern part of the county being diſtinguiſhed by the name of the *Vale*. The air on theſe heights is extremely healthful: The ſoil, though ſtoney, produces good crops of wheat and barley; and in many places it is covered with thick woods, among which are great quantities of beach.—*Chiltern* is alſo applied to the hilly parts of Berkſhire, and it is believed has the ſame meaning in ſome other counties. Hence the HUNDREDS lying in thoſe parts are called the *Chiltern Hundreds*.

CHILTERN *Hundreds (Stewards of.)* Of the Hundreds into which many of the Engliſh counties were divided by King Alfred, for the better government, the juriſdiction was originally veſted in peculiar courts, but came afterwards to be devolved to the county courts; and ſo remains at preſent, excepting with regard to ſome, as the *chilterns*, which have been by privilege annexed to the crown. Theſe having ſtill their own courts, a *Steward* of thoſe courts is appointed by the chancellor of the exchequer, with a ſalary of 20s. and all fees, &c. belonging to the office: And this is deemed an appointment of ſuch profit, as to vacate a ſeat in parliament.

CHIMÆRA, a port-town of Turkey in Europe, ſituated at the entrance of the gulph of Venice, in the province of Epirus, about 32 miles north of the city Corfu, near which are the mountains of Chimæra, which divide Epirus from Theſſaly. E. Long. 20. 40. N. Lat. 40. 20.

CHIMÆRA, in fabulous hiſtory, a celebrated monſter, ſprung from Echidna and Typhon. It had three heads; that of a lion, a goat, and a dragon; and continually vomited flames. The foreparts of its body were thoſe of a lion, the middle was that of a goat, and the hinder parts were thoſe of a dragon. It generally lived in Lycia, about the reign of Jobates, by whoſe orders Bellerophon, mounted on the horſe Pegaſus, overcame it. This fabulous tradition is explained by the recollection that there was a burning mountain in Lycia, whoſe top was the reſort of lions on account of its deſolate wilderneſs; the middle, which was fruitful, was covered with goats; and at the bottom the marſhy ground abounded with ſerpents. Bellerophon is ſaid to have conquered the Chimæra, becauſe he deſtroyed the wild beaſts on that mountain, and rendered it habitable. Plutarch ſays that it was the captain of ſome pirates who adorned their ſhip with the images of a lion, a goat, and a dragon.

By a *chimæra*, among the philoſophers, is underſtood a mere creature of the imagination, compoſed of ſuch contradictions and abſurdities as cannot poſſibly any where exiſt but in thought.

CHIMES of a CLOCK, a kind of periodical muſic, produced at equal intervals of time, by means of a particular apparatus added to a clock.

In order to calculate numbers for the chimes, and adapt the chime-barrel, it muſt be obſerved, that the barrel muſt turn round in the ſame time that the tune it is to play requires in ſinging. As for the chime-barrel, it may be made up of certain bars that run athwart it, with a convenient number of holes punched in them to put in the pins that are to draw each hammer: and theſe pins, in order, to play the time of the tune rightly, muſt ſtand upright, or hang down from the bar, ſome more, ſome leſs. To place the pins rightly, you may proceed by the way of changes on bells, viz. 1, 2, 3, 4; or rather make uſe of the muſical notes. Obſerve what is the compaſs of your tune, and divide the barrel accordingly from end to end.

Thus, in the examples on Plate CXXXVII. each of the tunes is eight notes in compaſs, and accordingly the barrel is divided into eight parts. Theſe diviſions are ſtruck round the barrel; oppoſite to which are the hammer-tails.

We ſpeak here as if there were only one hammer to each bell, that it may be more clearly apprehended; but when two notes of the ſame ſound come together in a tune, there muſt be two hammers to the bell to ſtrike it: ſo that if in all the tunes you intend to chime of eight notes compaſs, there ſhould happen to be ſuch double notes on every bell, inſtead of eight you muſt have ſixteen hammers; and accordingly you muſt divide the barrel, and ſtrike ſixteen ſtrokes round it, oppoſite to each hammer-tail: then you are to divide it round about into as many diviſions as there are muſical bars, ſemibreves, minims, &c. in the tune.

Thus the hundredth-pſalm tune has 20 ſemibreves, and each diviſion of it is a ſemibreve: the firſt note of it alſo is a ſemibreve: and, therefore, on the chime-barrel muſt be a whole diviſion, from five to five, as your may underſtand plainly, if you conceive the ſurface of a chime-barrel to be repreſented by the above figures, as if the cylindrical ſuperficies of the barrel were ſtretched out at length, or extended on a plane; and then ſuch a table, ſo divided, if it were to be wrapped round the barrel, would ſhow the places where all the pins are to ſtand in the barrel; for the dots running about the table are the places of the pins that play the tune.

Indeed, if the chimes are to be complete, you ought to have a ſet of bells to the gamut notes; ſo as that each bell having the true ſound of *ſol, la, mi, fa,* you may play any tune with its flats and ſharps: nay, you may by this means play both the baſs and treble with one barrel: and by ſetting the names of your bells at the head of any tune, that tune may eaſily be transferred to the chime-barrel, without any ſkill in muſic; but it muſt be obſerved, that each line in the muſic is three notes diſtant; that is, there is a note between each line, as well as upon it.

CHIMNEY, in architecture, a particular part of a houſe, where the fire is made, having a tube or funnel to carry off the ſmoke. The word *chimney* comes from the French *cheminee*; and that from the Latin *caminata*, "a chamber wherein is a chimney:" *caminata*, again, comes from *caminous*; and that from the Greek καμινος, "a chimney;" of καιω, *uro* "I burn."

Chimneys are uſually ſuppoſed a modern invention; the ancients only making uſe of ſtoves: but Octavio Ferrari endeavours to prove chimneys in uſe among the ancients. To this end, he cites the authority of Virgil,

Et jam ſumma procul villarum culmina fumant:

and that of Appian, who ſays, "That of thoſe perſons proſcribed by the triumvirate, ſome hid themſelves in wells and common ſewers, and ſome on the tops of houſes and chimneys;" for ſo he underſtands καπνωδεις υπωροφιας, *fumaria ſub tecto poſita*. Add, that Ariſtophanes, in one of his comedies, introduces his old man, Polycleon, ſhut up in a chamber, whence he endeavours to make his eſcape by the *chimney*. However, the few inſtances remaining among the ancients, together with the obſcurity of the rules of Vitruvius on this head, make us rather conclude the uſe of ſtoves, whereof the ancients had entire apartments, induced them to neglect this part of building which the coldneſs of our climates obliges us to have a principal regard to.

Method of Building CHIMNEYS *that will not ſmoke.* Workmen have different methods of drawing up the funnels of chimneys, generally according to their own fancies and judgements, and ſometimes according to the cuſtoms of places. They are ſeldom directed by ſound and rational principles. It will be found for the moſt part, that the ſmoking of chimneys is owing to their being carried up narrower near the top than below, or zig-zag, all in angles: in ſome caſes, indeed, it is owing to accidental cauſes; but, for the moſt part, to thoſe two abovementioned. Where they are carried up in pyramid or tapering form, eſpecially if the houſe be of a conſiderable height, it is ten to one but they ſometimes ſmoke. The air in the rooms, being rarified, is forced into the funnel of the chimney, and receives from the fire an additional force to carry up the ſmoke. Now, it is evident, that the further up the ſmoke flies, the leſs is the force that drives it, the ſlower it muſt move, and conſequently the more room in proportion it ſhould have to move in; whereas in the uſual way it has leſs, by the ſides of the chimney being gathered cloſer and cloſer together.

The method here propoſed of carrying up chimneys will be objected to by ſome thus: The wider a chimney is at the top, ſay they, the more liberty has the wind to blow down. Very true; but is it not reſiſted in going down, both by the form of the chimney and other evident cauſes, ſo that it muſt return again? In the other way, when the wind blows down, the reſiſtance being leſs, the wind and ſmoke are, if we may uſe the expreſſion, impriſoned, and make the ſmoke puff out below. This method has proved effectual after all others had failed: and that in a houſe placed in the worſt ſituation poſſible, namely, under a high mountain to the ſouthward, from which ſtrong blaſts blow down upon it. A vent was carried up without angles, as perpendicular as poſſible; and was made about three or four inches wider at top than at the bottom: the funnel was gathered in a throat directly above the fire-place, and ſo widening upwards. Since that time the houſe has not only ceaſed to ſmoke, but when the doors ſtand open, the draught is ſo ſtrong that it will carry a piece of paper out at the chimney-head. See more on this ſubject under the article SMOKE.

CHIMNEY-Money, otherwiſe called *Hearth-money*, a duty in England on houſes. By ſtat. 14. Char. II. cap. 2. every fire-hearth, and ſtove of every dwelling or other houſe, within England and Wales (except ſuch as pay not to church and poor), was chargeable with 2 s. *per annum*, payable at Michaelmas and Lady-day to the king and his heirs and ſucceſſors *&c.*; which payment was commonly called *chimney-money*. This tax, being much complained of as burdenſome to the people, has been ſince taken off, and others impoſed in its ſtead; among which that on windows has by ſome been eſteemed almoſt equally grievous.

CHIMPANZEE, in natural hiſtory. See SIMIA.

1 Boundaries Extent, &c.

CHINA, a country of Aſia, ſituated on the moſt eaſterly part of that continent. It is bounded on the north by Tartary; from which it is divided, partly by a prodigious wall of 1500 miles in length, and partly by high, craggy, and inacceſſible mountains. On the eaſt, it is bounded by the ocean; on the weſt, by part of the Mogul's empire, and India beyond the Ganges, from which it is parted by other ridges of high mountains and ſandy deſerts. On the ſouth, it is bounded partly by the kingdoms of Lao, Tonquin, Ava, and Cochin-China, and partly by the ſouthern or Indian ſea, which flows between it and the Philippine iſlands. There are ſeveral ways of computing its length and breadth. According to ſome of theſe, it is reckoned 1268, 1600, or 1800 miles in length, and as much in breadth; however, by the beſt and lateſt accounts, this vaſt country is ſomewhat of an oval form, the breadth being leſs than the length by little more than a fourth-part.

2 Diviſion into provinces.

It contains 15 provinces, excluſive of that of Lyau-tong, which is ſituated without the great wall, though under the ſame dominion. Their names are, 1. Shenſi; 2. Shanſi; 3. Pecheli; which are ſituated on the north ſide, along the wall. 4. Shantong; 5. Kyan-nang; 6. Che-Kyang; 7. Fo-keyn: which are ſituated along the eaſtern ocean. 8. Quangtong: 9. Quangſi; 10. Yu-nan; 11. Se-chuen; which ſtretch themſelves towards the ſouth and ſouth-weſt. And, 12. Ho-nan; 13. Hu-quand; 14. Quey-chew; 15 Kyang-ſi; which take up the middle part. For a particular deſcription of all theſe, ſee their proper articles.

3 Chineſe pretenſions to antiquity.

The origin of all nations is involved in obſcurity and fable; but that of the Chineſe much more ſo than any other. Every nation is inclined to aſſume too high an antiquity to itſelf, but the Chineſe carry theirs beyond all bounds. Indeed, though no people on earth are more exact in keeping records of every memorable

4 Why their hiſtory is ſo uncertain.

morable tranſaction, yet ſuch is the genius of the Chineſe for ſuperſtition and fable, that the firſt part of their hiſtory is deſervedly contemned by every rational perſon. What contributes more to the uncertainty of the Chineſe hiſtory is, that neither we, nor they themſelves, have any thing but fragments of their ancient hiſtorical books; for about 213 years before Chriſt, the reigning emperor of Si-whang-ti cauſed all the books in the empire to be burned, except thoſe written by laywers and phyſicians. Nay, the more effectually to deſtroy the memory of every thing contained in them, he commanded a great number of learned men to be buried alive, leſt, from their memories, they ſhould commit to writing ſomething of the true memoirs of the empire. The inaccuracy of the Chineſe annals is complained of even by their moſt reſpected author, Confucius himſelf; who alſo affirms, that, before his time, many of the oldeſt materials for writing ſuch annals had been deſtroyed.

5 Fabulous hiſtory of China.

According to the Chineſe hiſtories, the firſt monarch of the whole univerſe (that is, of China), was called *Puon-ku*, or *Puen-cu*, This, according to ſome, was the firſt man; but according to Bayer and Menzelius, two of the greateſt critics in Chineſe literature that have hitherto appeared, the word ſignifies *the higheſt antiquity*. Puon-ku was ſucceeded by *Tiene-hoang*, which ſignifies *the emperor of heaven*. They call him alſo the intelligent heaven, the ſupreme king of the middle heaven, *&c.* According to ſome of their hiſtorians, he was the inventor of letters, and of the Cyclic characters by which they determine the place of the year, *&c.* Tiene-hoang was ſucceeded by Ti-hoang (the emperor of the earth), who divided the day and night, appointing 30 days to make one moon, and fixed the winter ſolſtice to the 11th moon. Ti-hoang was ſucceeded by Gine-hoang (ſovereign of men), who with his nine brothers ſhared the government among them. They built cities, and ſurrounded them with walls; made a diſtinction between the ſovereign and ſubjects; inſtituted marriage, *&c.*

The reigns of theſe four emperors make up one of what the Chineſe called *ki*, "ages," or "periods," of which there were nine before Fo-hi, whom their moſt ſenſible people acknowledge as the founder of their empire.

The hiſtory of the ſecond *ki* contradicts almoſt every thing ſaid of the firſt; for though we have but juſt now been told that Gine-hoang and his brethren built cities ſurrounded with walls; yet, in the ſucceeding age, the people dwelt in caves, or perched upon trees as it were in neſts. Of the third *ki* we hear nothing; and in the fourth, it ſeems matters had been ſtill worſe, as we are told that men were then only taught to retire into the hollows of rocks. Of the fifth and ſixth we have no account. Theſe ſix periods, according to ſome writers, contained 90,000 years; according to others, 1,100,750.

In the ſeventh and eighth *ki*, they tell us over again what they had ſaid of the firſt; namely, that men began to leave their caves and dwell in houſes, and were taught to prepare cloths, *&c.* Tchine-fang, the firſt monarch of the eighth *ki*, tought his ſubject to take off the hair from ſkins with rollers of wood, and cover themſelves with the ſkins ſo prepared. He taught them alſo to make a kind of web of their hair, to ſerve as a covering to their heads againſt rain. They obeyed his orders with joy, and he called his ſubjects *people clothed with ſkins*. His reign laſted 350 years; that of one of his ſucceſſors, alſo, named Yeou-tſao-chi, laſted more than 300; and his family continued for 12 or 18,000 years. But what is very ſurpriſing, all theſe thouſands and millions of years had elapſed without mankind's having any knowledge of fire. This was not diſcovered till towards the cloſe of this period, by one Souigine. After ſo uſeful a diſcovery, he taught the people to dreſs their victuals; whereas before, they had devoured the fleſh of animals quite raw, drank their blood, and ſwallowed even their hair and feathers. He is alſo ſaid to have been the inventor of fiſhing, letters, *&c.*

In the ninth period we find the invention, or at leaſt the origin of letters, attributed to one Tſang-hie, who received them from a divine tortoiſe that carried them on his ſhell, and delivered them into the hands of Tſang-hie. During this period alſo, muſic, money, carriages, merchandize, and commerce, *&c.* were invented. There are various calculations of the length of theſe *ki* or periods. Some make the time from Puon-ku to Confucius, who flouriſhed about 479 years before Chriſt, to contain 279,000 years; others, 2,276,000; ſome, 2,759,860 years; others, 3,276,000; and ſome no leſs than 96,961,740 years.

6 Fabulous hiſtory explained.

Theſe extravagant accounts are by ſome thought to contain obſcure and imperfect hints concerning the coſmogony and creation of the world, *&c.* Puon-ku, the firſt emperor, they think, repreſents eternity preceding the duration of the world. The ſucceeding ones, Tiene-hoang, Ti-hoang, and Gine-hoang, they imagine, ſignify the creation of the heavens and earth, and the formation of man. The ten *ki*, or ages, nine of which preceded Fo-hi, mean the ten generations preceding Noah. This may very poſſibly be the caſe; for about 300 years before Chriſt, ſome Jews travelled into China, who might have made the Moſaic writings known there.

7 Reign of Fo-hi.

What we have now related, contains the ſubſtance of that part of the Chineſe hiſtory which is entirely fabulous. After the nine *ki* or "ages" already taken notice of, the tenth commenced with Fo-hi; and the hiſtory, though ſtill very dark, obſcrue, and fabulous, begins to grow ſomewhat more conſiſtent and intelligible. Fo-hi was born in the province of Shenſi. His mother walking upon the banks of a lake in that province, ſaw a very large print of a man's foot in the ſand there; and, being ſurrounded by an iris or rainbow, became impregnated. The child was named *Fo-hi*; and, when he grew up, was by his countrymen elected king on account of his ſuperior merit, and ſtyled *Tyent-tſe*, that is "the ſon of heaven." He invented the eight *qua*, or ſymbols, conſiſting of three lines each, which, differently combined, formed 64 characters that were made uſe of to expreſs every thing. To give theſe the greater credit, he pretended that he had ſeen them inſcribed on the back of a dragon-horſe (an animal ſhaped like a horſe, with the wings and ſcales of a dragon), which aroſe from the bottom of a lake. Having gained great reputation among his countrymen by this prodigy, he is ſaid to have created manda-

mandarins or officers, under the name of *dragons.* Hence we may aſſign a reaſon why the emperors of China always carry a dragon in their banners. He alſo inſtituted marriage, invented muſic, *&c.* Having eſtabliſhed a prime miniſter, he divided the government of his dominions among four mandarins, and died after a reign of 115 years.

8 Miraculous ſolſtice.

After Fo-hi followed a ſucceſſion of emperors, of whom nothing remarkable is recorded, except that in the reign of *Yau*, the ſeventh after Fo-hi, the ſun did not ſet for ten days, ſo that the Chineſe were afraid of a general conflagration. This event the compilers of the Univerſal Hiſtory take to be the ſame with that mentioned in the book of Joſhua, when the ſun and moon ſtood ſtill for about the ſpace of a day. Fo-hi, they will have to be the ſame with Noah. They imagine, that after the deluge, this patriarch remained ſome time with his deſcendents; but on their wicked combination to build the tower of Babel, he ſeparated himſelf from them with as many as he could perſuade to go along with him; and that, ſtill travelling eaſtward, he at laſt entered the fertile country of China, and laid the foundation of that vaſt empire—But, leaving theſe fabulous and conjectured times, we ſhall proceed to give ſome account of that part of the Chineſe hiſtory, which may be more certainly depended on.

9 Hypotheſis concerning this ſolſtice and Fo-hi.

As the Chineſe, contrary to the practice of almoſt all nations, have never ſought to conquer other countries, but rather to improve and content themſelves with their own, their hiſtory for many ages furniſhes nothing remarkable. The whole of their emperors, abſtracting from thoſe who are ſaid to have reigned in the fabulous times, are comprehended in 22 dynaſties, mentioned in the following table.

	Emperors.	Before Chriſt.
1. *Hya*, containing	16	2207.
2. *Shang*, or *Ing*,	28	1766.
3. *Chew*,	35	1122.
4. *Tſin*,	4	248.
5. *Han*,	25	206.
		After Chriſt.
6. *Hew-han*,	2	220.
7. *Tſin*,	15	465.
8. *Song*,	8	220.
9. *Tſi*,	5	479.
10- *Lyang*,	4	502.
11. *Chin*,	4	557.
12. *Swi*,	3	
13. *Twand*,	20	618.
14. *Hew-lyang*,	2	907.
15. *Hew-tang*,	4	903.
16. *Hewtſin*,	2	936.
17. *Hew-han*,	4	947.
18. *Hew-chew*,	3	951.
19. *Song*,	18	960.
20. *Iwen*,	9	1280.
21. *Ming*,	16	1368.
22. *Tſing*,		1645.

This table is formed according to the account of the Jeſuit Du Halde, and is commonly reckoned to be the moſt authentic; but according to the abovementioned hypotheſis of the compilers of the Univerſal Hiſtory, who make *Yau* contemporary with Joſhua, the dynaſty of *Hya* did not commerce till the year before Chriſt 1057; and to accommodate the hiſtory to their hypotheſis, great alterations muſt be made in the duration of the dynaſties.

10 Incurſions of the tartars.

The moſt intereſting particulars of the Chineſe hiſtory relate only to the incurſions of the Tartars, who at laſt conquered the whole empire, and who ſtill continue to hold the ſovereignty; though by transferring the ſeat of the empire to Peking, and adopting the Chineſe language, manners, *&c.* Tartary would ſeem rather to have been conquered by China, than China by Tartary. Theſe incurſions are ſaid to have begun very early; even in the time of the emperor Shun, ſucceſſor to Yau abovementioned, in whoſe reign the miraculous ſolſtice happenned. At this time, the Tartars were repulſed, and obliged to retire into their own territories. From time to time, however, they continued to threaten the empire with invaſions, and the northern provinces were often actually ravaged by the Tartars in the neighbourhood. About the year before Chriſt 213, Shi-whang-ti, having fully ſubdued all the princes, or kings, as they were called, of the different provinces, became emperor of China with unlimited power. He divided the whole empire into 36 provinces; and finding the northern part of his dominions much incommoded by the invaſions of the neighbouring barbarians, he ſent a formidable army againſt them, which drove them far beyond the boundaries of China. To prevent their return, he built the famous wall already mentioned, which ſeparates China from Tartary. After this, being elated with his own exploits, he formed a deſign of making poſterity believe that he himſelf had been the firſt Chineſe emperor that ever ſat on the throne. For this purpoſe, he ordered all the hiſtorical writings to be burnt, and cauſed many of the learned to be put to death, as already mentioned.

11 Great wall built.

12 Kitan Tartars ſettle in China.

What effect the great wall for ſome time had in preventing the invaſions of the Tartars, we are not told; but in the tenth century of the Chriſtian aera, thoſe of Kitan or Lyau got a footing in China. The Kitan were a people of eaſtern Tartary, who dwelt to the north and north-eaſt of the province of Pecheli in China, particularly in that of Layu-tong lying without the great wall. Theſe people having ſubdued the country between Korea and Kaſhgar, became much more troubleſome to the Chineſe than all the other Tartars. Their empire commenced about the year 916, in the fourth year of Mo-ti-kyan-ti, ſecond emperor of the 14th Chineſe dynaſty called *Hew-lyang*. In 946, Mingt-ſong, ſecond emperor of the 15th dynaſty, being dead, Sheking-tang, his ſon-in-law, rebelled againſt Mingt-ſong, his ſon and ſucceſſor, whom he deprived of his crown and life. This he accompliſhed by means of an army of 50,000 men furniſhed by the Kitan. Fi-ti, the ſon of Mingt-Song, being unable to reſiſt the uſurper, fled to the city Ghey-chew; where ſhutting himſelf up with his family and all his valuable effects, he ſet fire to the palace, and was burnt to aſhes. On his death, Sheking-tang aſſumed the title of emperor; founded the 16th dynaſty; and changed his name to that of *Kaut-ſu*. But the Kitan general refuſing to acknowledge him, he was obliged to purchaſe

chaſe a peace by yielding up to the Tartars 16 cities in the province of Pecheli, beſides a yearly preſent of 300,000 pieces of ſilk.

This ſubmiſſion ſerved only to inflame the avarice and ambition of the Kitan. In 959, they broke the treaty when leaſt expected, and invaded the empire afreſh. Tſi-vang, the emperor at that time, opppoſed them with a formidable army : but through the treachery of his general Lyew-chi-ywen, the Tartars were allowed to take him priſoner. On this, Tſi-vang was glad to recover his liberty by accepting of a ſmall principality ; while the traitor became emperor of all China, and, changing his name to *Kaut-ſu*, founded the 17th dynaſty. The Tartars, in the mean time, ravaged all the northern provinces without oppoſition, and then marched into the ſouthern. But being here ſtopped by ſome bodies of Chineſe troops, the general thought proper to retire with his booty into Tartary. In 962, Kaut-ſu, dying, was ſucceeded by his ſon In-ti. The youth of this prince gave an opportunity to the eunuchs to raiſe commotions ; eſpecially as the army was employed at a diſtance in repelling the invaſions of the Tartars. This army was commanded by Ko-ghey, who defeated the enemy in ſeveral battles, and thus reſtored peace to the northern provinces. In the mean time, In-ti was ſlain by his eunuchs, and the empreſs placed his brother on the throne : but Ko-ghey, returning in triumph, was ſaluted emperor by his victorious army, and the empreſs being unable to ſupport the rights of her ſon, was obliged to ſubmit, while Ko-ghey, aſſuming the name of *Tay-tſu*, founded the 18th dynaſty. Nine years after this, however, the grandees of the empire, ſetting aſide Kong-ti, the third in ſucceſſion from Tay-tſu, on account of his non-age, proclamed his guardian, named *Chau-quang-yu*, emperor; who aſſuming the name of Kau-tſu, founded the 19th dynaſty, called *Song*, or *Tſong*.

Under this monarch the empire began to recover itſelf ; but the Kitan ſtill continued their incurſions. The ſucceſſors of Kau-tſu, oppoſed them with various ſucceſs ; but at laſt, in 978, the barbarians became ſo ſtrong as to lay ſiege to a conſiderable city. Tay-tſong, ſucceſſor to Kau-tſu, detached 3000 ſoldiers, each carrying a light in his hand, againſt them in the night-time, with orders to approach as near as poſſible to the Tartar camp. The barbarians imagining by the number of lights, that the whole Chineſe army was at hand, immediately fled, and falling into the ambuſcades laid for them by the Chineſe general, were almoſt all cut to pieces.

This check, however, did not long put a ſtop to the ravages of the Kitan. In the year 999, they laid ſiege to a city in the province of Peche-li : but Ching-tſong, ſucceſſor to Tay-tſong, came upon them with his army ſo ſuddenly, that they betook themſelves to flight. The emperor was adviſed to take advantage of their conſternation, and recover their country which had been yielded to them : but inſtead of purſuing his victory, he bought a peace, by conſenting to pay annually 100,000 tael (about L.34,000), and 200,000 pieces of ſilk. The youth and pacific diſpoſition of Jin-tſong, ſucceſſor to Ching-tſong, revived the courage of the Kitan ; and, in 1035, war would have been renewed, had not the emperor condeſcended to as ſhameful a treaty as that concluded by his father. Two years after, the Tartars demanded reſtitution of ten cities in the province of Peche-li, which had been taken by Ko-ghey founder of the 18th dynaſty ; upon which Jin-tſong engaged to pay them an annual tribute of 200,000 taels of ſilver, and 300,000 pieces of ſilk in lieu of theſe cities.

13
Kitan driven out by the eaſtern Tartars.

From this time the Kitan remained in peaceable poſſeſſion of their Chineſe dominions till the year 1117. Whey-tſong, at that time emperor, being able neither to bear their ravages, nor by himſelf to put a ſtop to them, reſolved upon a remedy which at laſt proved worſe than the diſeaſe . This was to call in the Nu-che, Nyu-che, or Eaſtern Tartars, to deſtroy the kingdom of the Kitan. From this he was diſſuaded by the king of Korea, and moſt of his own miniſters ; but, diſregarding their ſalutary advice, he joined his forces to thoſe of the Nu-che. The Kitan were then every where defeated ; and at laſt reduced to ſuch extremity, that thoſe who remained were forced to leave their country, and fly to the mountains of the weſt.

14
Who aſſume the name of *Kin*, and invade China.

Thus the empire of the Kitan was totally deſtroyed, but nothing to the advantage of the Chineſe; for the Tartar general, elated with his conqueſt, gave the name of *Kin* to his new dominion, aſſumed the title of emperor, and began to think of aggrandizing himſelf and enlarging his empire. For this purpoſe, he immediately broke the treaties concluded with the Chineſe emperor; and invading the provinces of Peche-li and Shen-ſi, made himſelf maſter of the greater part of them. Whey-tſong, finding himſelf in danger of loſing his dominions, made ſeveral advantageous propoſals to the Tartar ; who, ſeeming to comply with them, invited him to come and ſettle matters by a perſonal conference. The Chineſe monarch complied : but, on his return, the terms agreed on ſeemed intolerable to his miniſters ; ſo that they told him the treaty could not ſubſiſt, and that the moſt cruel war was preferable to ſuch an ignominious peace. The Kin monarch, being informed of all that paſſed, had recourſe to arms, and took ſeveral cities. Whey-tſong was weak enough to go in perſon to hold a ſecond conference ; but, on his arrival, was immediately ſeized by the Tartar. He was kept priſoner under a ſtrong guard during the remaining part of his life ; and ended his days in 1126, in the deſert of Shamo, having nominated his eldeſt ſon Kin-tſong to ſucceed him.

15
They take the emperor priſoner.

16
Imperial city and another emperor taken.

Kin-tſong began his reign with putting to death ſix miniſters of ſtate, who had betrayed his father into the hands of the Kin Tartars. The barbarians in the mean time purſued their conqueſts without oppoſition. They croſſed the Whang-ho, or Yellow River, which an handful of troops might have prevented ; and marching directly towards the imperial city, took and plundered it. Then ſeizing the emperor and his conſort, they carried them away captives : but many of the principal lords, and ſeveral of the miniſters, preferring death to ſuch an ignominious bondage, killed themſelves. The Kin being informed by the empreſs *Meng* that ſhe had been divorced, they left her behind. This proved the means of ſaving the empire: for

for by her wiſdom and prudence ſhe got the crown placed on the head of Kau-tſong, ninth ſon of the emperor Whey-tſong by his divorced empreſs.

Kau-tſong fixed his court at Nanking the capital of Kyang-nan; but ſoon after was obliged to remove it to Kang-chew in Che-kyang. He made ſeveral efforts to recover ſome of his provinces from the Kin, but without effect. Ili-tſong the Kin monarch, in the mean time, endeavoured to gain the eſteem of his Chineſe-ſubjects by paying a regard to their learning and learned men, and honouring the memory of Confucius. Some time after, he advanced to Nanking, from whence Kau-tſong had retired, and took it: but, receiving advice that Yo-ſi, general of the Song, or ſouthern Chineſe, was advancing by long marches to the relief of that city, they ſet fire to the palace, and retired northward.

17 Progreſs the Kin checked.

However, Yo-ſi arrived time enough to fall upon their rear-guard; which ſuffered very much; and from this time the Kin never dared to croſs the river Kyang. In a few years afterwards the Chineſe emperor ſubmitted to become tributary to the Kin, and concluded a peace with them upon very diſhonourable terms. This ſubmiſſion, however, was of little avail: for, in 1163, the Tartars broke the peace; and, invading the ſouthern province with a formidable army, took the city of Yang-chew. The king, having approached the river Kyang, near its mouth, where it is wideſt as well as moſt rapid, commanded his troops to croſs it, threatening with his drawn ſword to kill thoſe who refuſed. On receiving ſuch an unreaſonable command, the whole army mutinied; and the king being killed in the beginning of the tumult, the army immediately retired.

18 They are attacked by Jenghiz-khan and the king of Hya.

From this time to the year 1210, nothing remarkable occurs in the Chineſe hiſtory; but this year, Jenghiz-khan, chief of the weſtern Tartars, *Moguls*, or *Mungls*, quarrelled with Yong-tſi emperor of the Kin; and at the ſame time the king of Hya, diſguſted at being refuſed aſſiſtance againſt Jenghiz-khan, threatened him with an invaſion on the weſt ſide. Yong-tſi prepared for his defence; but in 1211, receiving news that Jenghiz-khan was advancing ſouthward with his whole army, he was ſeized with fear, and made propoſals of peace, which were rejected.

19 Great wall forced by Jenghiz-khan.

In 1212, the Mogul generals forced the great wall; or, according to ſome writers, had one of the gates treacherouſly opened to them, to the north of Shanſi; and made incurſions as far as Peking the capital of the Kin empire. At the ſame time the province of Lyau-tong was almoſt totally reduced by ſeveral Kitan lords who had joined Jenghiz-khan; ſeveral ſtrong places were taken, and an army of 300,000 Kin defeated by the Moguls. In autumn they laid ſiege to the city of Tay-tong-fu; where, although the governor Hujaku fled, yet Jenghiz-khan met with a conſiderable reſiſtance. Having loſt a vaſt number of men, and being himſelf wounded by an arrow, he was obliged to raiſe the ſiege and retire into Tartary; after which the Kin retook ſeveral cities. The next year, however, Jenghiz-khan re-entered China; retook the cities which the Kin had reduced the year before; and overthrew their armies in two bloody battles, in one of which the ground was ſtrewed with dead bodies for upwards of four leagues.

The ſame year Yong-tſi was ſlain by his general Hujaku; and Sun, a prince of the blood, advanced in his room. After this the Moguls, attacking the empire with four armies at once, laid waſte the provinces of Shanſi, Honan, Pecheli, and Shantong. In 1214 Jenghiz-khan ſat down before Peking; but inſtead of aſſaulting the city, offered terms of peace, which were accepted, and the Moguls retired into Tartary. After their departure, the emperor, leaving his ſon at Peking, removed his court to Pyen-lyang near Kay-ſong-fu, the capital of Honan. At this Jenghiz-khan being offended, immediately ſent troops to beſiege Peking.

20 Peking taken.

The city held out to the fifth month of the year 1215, and then ſurrendered. At the ſame time the Moguls finiſhed the conqueſt of Lyau-tong; and the Song refuſed to pay the uſual tribute to the Kin.

21 Southern Chineſe declared war againſt the Kin.

In 1216, Jenghiz-khan returned to purſue his conqueſts in the weſt of Aſia, where he ſtaid ſeven years; during which time his general Muhuli made great progreſs in China againſt the Kin emperor. He was greatly aſſiſted by the motions of Ning-tſong emperor of the Song, or ſouthern China; who, incenſed by the frequent perfidies of the Kin, had declared war againſt them, and would hearken to no terms of peace, though very advantageous propoſals were made. Notwithſtanding this, however, in 1220, the Kin, exerting themſelves raiſed two great armies, one in Shenſi, and the other in Shang-ton. The former baffled the attempts of the Song and king of Hya, who had united againſt them; but the latter, though no fewer than 200,000, were entirely defeated by Muhuli. In 1221, that officer paſſed the Whang-ho, and died after conquering ſeveral cities.

22 Jenghiz-khan deſtroys the kingdom of Hya;

In 1224, the Kin emperor died; and was ſucceeded by his ſon Shew, who made peace with the king of Hya: but next year, that kingdom was entirely deſtroyed by Jenghiz-khan. In 1226, Oktay ſon to Jenghiz-khan marched into Honan, and beſieged Kay-Song-fu, capital of the Kin empire; but was obliged to withdraw into Shenſi, where he took ſeveral cities, and cut in pieces an army of 30,000 men.

23 And dies.

In 1227 Jenghiz-khan died, after having deſired his ſons to demand a paſſage for their army through the dominions of the Song, without which he ſaid they could not eaſily vanquiſh the Kin.

After the death of that great conqueror, the war was carried on with various ſucceſs; but though the Moguls took above 60 important poſts in the province of Shenſi, they found it impoſſible to force Tong-quan, which it behoved them to do in order to penetrate effectually into Honan. In April 1231 they took the capital of Shenſi, and defeated the Kin army which came to its relief. Here one of the officers deſired prince Toley to demand a paſſage from the Song through the country of Han-chong-fu. This propoſal Toley communicated to his brother Oktay, who approved of it as being conformable to the dying advice of Jenghiz-khan. Hereupon Toley, having aſſembled all his forces, ſent a meſſenger to the Song generals to demand paſſage through their territories.

24 Moguls quarrel with the Song.

This, however, they not only refuſed, but put the meſſenger to death; which ſo enraged Toley that he ſwore to make them repent of it, and was ſoon as good as his word.

25 Exploits of Toley.

He decamped in Auguſt 1231; and having forced the paſſages, put to the ſword the inhabitants of Wha-

Wha-yang and Fong-chew, two cities in the diſtrict of Han-chong-fu. Then having cut down rocks to fill up deep abyſſes, and made roads through places almoſt inacceſſible, he came and beſieged the city of Han-chong-fu itſelf. The miſerable inhabitants fled to the mountains on his approach, and more than 100,000 of them periſhed. After this, Toley divided his forces, conſiſting of 30,000 horſe, into two bodies. One of theſe went weſtward to Myen-chew: from thence, after opening the paſſages of the mountains, they arrived at the river Kyaling, which runs into the great Kyang. This they croſſed on rafts made of the wood of demoliſhed houſes; and then, marching along its banks, ſeized many important poſts. At laſt, having deſtroyed more than 140 cities, towns, or fortreſſes, they returned to the army. The ſecond detachment ſeized an important poſt in the mountains, called *Tautong*, ſix or ſeven leagues to the eaſtward of Han-chong-fu. On the other ſide Oktay advanced, in October, towards Pu-chew a city of Shan-ſi; which being taken after a vigorous defence, he prepared to paſs the Whang-ho. Toley, after ſurmounting incredible difficulties, arrived in December on the borders of Honan, and made a ſhew as if he deſigned to attack the capital of the Kin empire. On his firſt appearance in Honan through a paſſage ſo little ſuſpected, every body was filled with terror and aſtoniſhment, ſo that he proceeded for ſome time without oppoſition. At laſt the emperor ordered his generals, Hota, Ilapua, and others, to march againſt the enemy. Toley boldly attacked them; but was obliged to retire, which he did in good order. Hota was for purſuing him, ſaying that the Mogul army did not exceed 30,000 men, and that they ſeemed not to have eaten any thing for two or three days. Ilapua, however, was of opinion that there was no occaſion for being ſo haſty, as the Moguls were incloſed between the rivers Han and Whang-ho, ſo that they could not eſcape. This negligence they ſoon had occaſion to repent of: for Toley, by a ſtratagem, made himſelf maſter of their heavy baggage; which accident obliged them to retire to Tang-chew. From thence they ſent a meſſenger to acquaint the emperor that they had gained the battle, but concealed the loſs of their baggage. This good news filled the court with joy; and the people who had retired into the capital for its defence, left it again, and went into the country; but, in a few days after, the vanguard of the Moguls, who had been ſent by the emperor Oktay, appeared in the field, and carried off a great number of thoſe that had quitted the city.

26 Capital of the Kin empire beſieged.

In January 1232, Oktay paſſing the Whang-ho, encamped in the diſtrict of Kay-fong-fu, capital of the Kin empire, and ſent his general Suputay to beſiege the city. At that time the place was near 30 miles in circumference: but having only 40,000 ſoldiers to defend it, as many more from the neighbouring cities, and 20,000 peaſants, were ordered into it; while the emperor publiſhed an affecting declaration, animating the people to defend it to the laſt extremity. Oktay, having heard with joy of Toley's entrance into Honan, ordered him to ſend ſuccours to Suputay. On the other hand, the Kin generals advanced with 150,000 men to relieve the city; but being obliged to divide their forces in order to avoid in part the great road which Toley had obſtructed with trees, they were attacked by that prince at a diſadvantage, and, after a faint reſiſtance, defeated with great ſlaughter, and the loſs of both their generals, one killed and the other taken. The emperor now ordered the army at Tong-quan and other fortified places to march to the relief of Kay-fong-fu. They aſſembled accordingly, to the number of 110,000 foot and 15,000 horſe; and were followed by vaſt numbers of people who expected by their means to be protected from the enemy. But many of theſe troops having deſerted, and the reſt being enfeebled by the fatigues of their march, they diſperſed on the approach of their purſuers, who killed all they found in the highways. After this the Moguls took Tong-quan and ſome other conſiderable poſts; but were obliged to raiſe the ſieges of Quey-te-fu and Loyang, by the bravery of the governors. Kyang-ſhin, governor of Loyang, had only 3 or 4000 ſoldiers under him, while his enemies were 30,000 ſtrong. He placed his worſt ſoldiers on the walls, putting himſelf at the head of 400 brave men; whom he ordered to go naked, and whom he led to all dangerous attacks. He invented engines to caſt large ſtones, which required but few hands to play them, and aimed ſo true as to hit at 100 paces diſtance. When their arrows failed, he cut thoſe ſhot by the enemy into four pieces; pointed them with pieces of braſs coin; and diſcharged them from wooden tubes with as much force as bullets are from a muſket. Thus he haraſſed the Moguls for three months ſo grievouſly, that they were obliged, notwithſtanding their numbers, to abandon the enterprize.

27 Bravery of the beſieged.

Oktay, at laſt, notwithſtanding his ſucceſſes, reſolved to return to Tartary; and offered the Kin emperor peace, provided he became tributary, and delivered up to him 27 families which he named. Theſe offers were very agreeable to the emperor; but Suputay, taking no notice of the treaty, puſhed on the ſiege of the capital with more vigour than ever. By the help of the Chineſe ſlaves in his army, the Mogul general ſoon filled the ditch; but all his efforts ſeemed only to inſpire the beſieged with new vigour. The Moguls at that time made uſe of artillery, but were unable to make the leaſt impreſſion upon the city walls. They raiſed walls round thoſe they beſieged, which they fortified with ditches, towers, and battlements. They proceeded alſo to ſap the walls of the city; but were very much annoyed by the artillery of the beſieged, eſpecially by their bombs, which ſinking into the galleries, and burſting under ground, made great havock among the miners. For 16 days and nights the attack continued without intermiſſion; during which time an incredible number of men periſhed on both ſides: at length, Suputay, finding that he could not take the city, withdrew his troops, under pretence of conferences being on foot. Soon after, the plague began in Kay-fong-fu; and raged with ſuch violence, that in 50 days, 900,000 biers were carried out, beſides a vaſt multitude of the poorer ſort who could not afford any.

28 Peace concluded;

29 And broken.

In a ſhort time, two unlucky accidents occaſioned a renewal of the war; which now put an end to the empire of the Kin. Gan-yong, a young Mogul lord, having aſſumed the government of ſome cities in Kyang-nan, and killed the officer ſent to take poſſeſſion

ſion of them, declared for the Kin. The emperor unwarily took Gan-yong into his ſervice, and gave him the title of Prince. Upon this Oktay ſent an envoy, attended by 30 other perſons, to inquire into the affair; but the Kin officers killed them all, without being puniſhed by the emperor. Suputay, having informed his maſter of all theſe proceedings, was ordered to continue the war in Honan. Shew-fu now commanded his officers to unite their troops for the defence of the capital; but before his orders could be obeyed, they were attacked and defeated, one after another, by the Moguls. This obliged him to raiſe ſoldiers from among the peaſants, for whoſe ſubſiſtence the people were taxed $\frac{3}{10}$ of the rice they poſſeſſed. The city began now to be diſtreſſed for want of proviſions; and as it was but in a bad poſture of defence, the emperor marched with an army againſt the Moguls. His expedition proved unfortunate; for, ſending part of his army to beſiege a city called Why-chew, it was totally cut in pieces, and Suputay a ſecond time ſat down before the capital.

30 Capital again beſieged,

31 And taken.

On hearing this bad news, the emperor repaſſed the Whang-ho, and retired to Quey-te-fu. Here he had not been long before the capital was delivered up by treachery, and Suputay put all the males of the imperial race to death; but, by the expreſs command of Oktay, ſpared the inhabitants, who are ſaid to have amounted to 1,400,000 families. After this diſaſter the unhappy monarch left his troops at Quey-te-fu, and retired to Juning-fu, a city in the ſouthern part of Honan, attended only by 400 perſons. Here the diſtance of the Moguls made him think of living at eaſe; but while he flattered himſelf with theſe vain hopes; the enemy's army arrived before the city and inveſted it. The garriſon were terrified at their approach; but were encouraged by the emperor, and his brave general Hu-ſye-hu, to hold out to the laſt. As there were not in the city a ſufficient number of men, the women, dreſſed in mens clothes, were employed to carry wood, ſtones, and other neceſſary materials to the walls. All their efforts, however, were ineffectual. They were reduced to ſuch extremities, that for three months they fed on human fleſh; killing the old and feeble, as well as many priſoners, for food. This being known to the Moguls, they made a general aſſault in January 1234. The attack continued from morning till night: but at laſt the aſſailants were repulſed. In this action, however, the Kin loſt all their beſt officers; upon which the emperor reſigned the crown to Cheng-lin a prince of the blood. Next morning, while the ceremony of inveſting the new emperor was performing, the enemy mounted the ſouth walls, which were defended only by 200 men; and the ſouth gate being at the ſame time abandoned, the whole army broke in. They were oppoſed, however, by Hu-ſye-hu; who, with 1000 ſoldiers, continued to fight with amazing intrepidity. In the mean time Shew-fu, ſeeing every thing irreparably loſt, lodged the ſeal of the empire in a houſe; and then cauſing ſheaves of ſtraw to be ſet round it, ordered it to be ſet on fire as ſoon as he was dead. After giving this order he hanged himſelf, and his commands were executed by his domeſtics. Hu-ſye-hu, who ſtill continued fighting with great bravery, no ſooner heard of the tragical death of the emperor than he drowned himſelf in the river Ju; as did alſo 500 of his moſt reſolute ſoldiers. The ſame day the new emperor, Cheng-lin, was ſlain in a tumult; and thus an end was put to the dominion of the Kin Tartars in China.

32 Siege of Juning-fu.

33 Unhappy fate of the emperor.

34 Diſſolution of the Kin empire.

The empire of China was now to be ſhared between the Song, or Southern Chineſe, and the Moguls. It had been agreed upon, that the province of Honan ſhould be delivered up to the Song as ſoon as the war was finiſhed. But they, without waiting for the expiration of the term, or giving Oktay notice of their proceedings, introduced their troops into Kay-fong-fu, Lo-yang, and other conſiderable cities. On this the Mogul general reſolved to attack them; and repaſſing the Whang-ho, cut in pieces part of the garriſon of Lo-yang, while they were out in ſearch of proviſions. The garriſon of Kay-fong-fu likewiſe abandoned that place; and the Song emperor degraded the officers who had been guilty of thoſe irregularities, ſending ambaſſadors to Otkay, at the ſame time, to deſire a continuance of the peace. What Oktay's anſwer was we are not told, but the event ſhowed that he was not well pleaſed; for, in 1235, he ordered his ſecond ſon prince Kotovan, and his general Chahay, to attack the Song in Se-chwen, while others marched towards the borders of Kyang-nan.

35 War between the Song and the Moguls.

In 1236, the Moguls made great progreſs in the province of Hu-quang, where they took ſeveral cities, and put vaſt numbers to the ſword. This year they introduced paper or ſilk money, which had formerly been uſed by Chang-tſong ſixth emperor of the Kin. Prince Kotovan forced the paſſages into the diſtrict of Hang-chong-fu in the province of Shenſi, which he entered with an army of 500,000 men. Here a terrible battle was fought between the vaſt army of the Moguls and the Chineſe troops, who had been driven from the paſſages they defended. The latter conſiſted only of 10,000 horſe and foot, who were almoſt entirely cut off; and the Moguls loſt ſuch a number of men, that the blood is ſaid to have run for two leagues together. After this victory the Moguls entered Sechwen, which they almoſt entirely reduced, committing ſuch barbarities, that, in one city, 40,000 people choſe rather to put an end to their own lives than ſubmit to ſuch cruel conquerors.

36 Dreadful engagement.

In 1237, the Moguls received a conſiderable check before the city of Gan-tong in Kyang-nan, the ſiege of which they were obliged to raiſe with loſs. In 1238 they beſieged Lu-chew, another city in the ſame province. They ſurrounded it with a rampart of earth and a double ditch; but the Chineſe general ordered their intrenchments to be filled with immenſe quantities of herbs ſteeped in oil, and then ſet on fire, while he ſhot ſtones upon them from a tower ſeven ſtories high. At the ſame time a vigorous ſally was made; and the Mogul army being thrown into the utmoſt diſorder, were obliged finally to abandon the ſiege and retire northwards.

In 1239, theſe barbarians were oppoſed by a general called Meng-kong, with great ſucceſs; who, this and the following year, gained great honour by his exploits. While he lived, the Moguls were never able to make any conſiderable progreſs; but his death, in 1246, proved of the greateſt detriment to the Chineſe affairs; and ſoon after, the Tartars renewed the war with more vigour and ſucceſs than ever. In

37 Siege of Ho-chew.

38 Moguls defeated and their emperor killed.

1225, they re-entered the province of Se-chwen; but ſtill met with vigorous oppoſition in this quarter, becauſe the Chineſe took care to have Se-chwen furniſhed with good troops and generals. Though they were always beaten, being greatly inferior in number to their enemies, yet they generally retook the cities the Moguls had reduced, as the latter were commonly obliged to withdraw for want of proviſions and forage. In 1259 they undertook the ſiege of Ho-chew, a ſtrong city to the weſt of Peking, defended by Vang-kyen, a very able officer, who commanded a numerous garriſon. The ſiege continued from the month of February till Auguſt; during which time the Moguls loſt an immenſe number of men. On the 10th of Auguſt they made a general aſſault in the night. They mounted the walls before the governor had intelligence; but were ſoon attacked by him with the utmoſt fury. The Mogul emperor, Meng-ko, himſelf came to the ſcalade; but his preſence was not ſufficient to overcome the valour of Vang-kyen. At the ſame time the ſcaling-ladders of the Moguls were blown down by a ſtorm; upon which a terrible ſlaughter enſued, and among the reſt fell the emperor himſelf. Upon this diſaſter the Mogul generals agreed to raiſe the ſiege, and retire towards Shen-ſi.

On the death of Meng-ko, Hupilay, or Kublay Khan, who ſucceeded him, laid ſiege to Vu-chang-fu, a city not far diſtant from the capital of the Song empire.

At this the emperor being greatly alarmed, diſtributed immenſe ſums among his troops; and, having raiſed a formidable army, marched to the relief of Vu-chang-fu. Unfortunately the command of this army was committed to the care of Kya-tſe-tau, a man without either courage or experience in war. He was beſides very vain and vindictive in his temper; often uſing the beſt officers ill, and entirely overlooking their merit, which cauſed many of them to go over to the Moguls. The ſiege of Vu-chang-fu was commenced, and had continued a conſiderable time, when Kya-tſe-tau, afraid of its being loſt, and at the ſame time not daring to take any effectual ſtep for its relief, made propoſals of peace. A treaty was accordingly concluded, by which Kya-tſe-tau engaged to pay an annual tribute of about L.50,000 in ſilver, and as much in ſilk; acknowledging likewiſe the ſovereignty of the Moguls over the Song empire. In conſequence of this treaty, the Moguls retreated after the boundaries of the two empires had been fixed, and repaſſed the Kyang; but 170 of them having ſtaid on the other ſide of the river, were put to death by Kya-tſe-tau.

39 Treachery of a Chineſe miniſter.

This wicked miniſter totally concealed from the emperor his having made ſuch a ſhameful treaty with the Moguls; and the 170 ſoldiers maſſacred by his order, gave occaſion to report that the enemy had been defeated; ſo that the Song court believed that they had been compelled to retreat by the ſuperior valour and wiſdom of Kya-tſe-tau. This proved the ruin of the empire; for, in 1260, the Mogul emperor ſent Hauking to the Chineſe court to execute the treaty according to the terms agreed on with Kya-tſe-tau. The miniſter, dreading the arrival of this envoy, impriſoned him near Nanking; and took all poſſible care that neither Hupilay, nor Li-tſong the Chineſe emperor, ſhould ever hear any thing of him.

40 Deſperate conflict.

It was impoſſible ſuch unparalleled conduct could fail to produce a new war. Hupilay's courtiers inceſſantly preſſed him to revenge himſelf on the Song for their treacherous behaviour; and he ſoon publiſhed a manifeſto againſt them, which was followed by a renewal of hoſtilities in 1268. The Mogul army amounted to 300,000 men; but notwithſtanding their numbers, little progreſs was made till the year 1271. Syan-yang and Fan-ching, cities in the province of Se-chew had been beſieged for a long time ineffectually; but this year, an *Igur* lord adviſed Hupilay to ſend for ſeveral of thoſe engineers out of the weſt, who knew how to caſt ſtones of 150 pounds weight out of their engines, which made holes of ſeven or eight feet wide in the ſtrongeſt walls. Two of theſe engineers were accordingly ſent for; and after giving a ſpecimen of their art before Hupilay, were ſent to the army in 1272. In the beginning of 1273 they planted their engines againſt the city of Fan-ching, and preſently made a breach in the walls. After a bloody conflict the ſuburbs were taken; and ſoon after the Moguls made themſelves maſters of the walls and gates of the city. Nevertheleſs, a Chineſe officer, with only 100 ſoldiers, reſolved to fight from ſtreet to ſtreet. This he did for a long time with the greateſt obſtinacy, killing vaſt numbers of the Moguls; and both parties are ſaid to have been ſo much overcome with thirſt, that they drank human blood to quench it. The Chineſe ſet fire to the houſes, that the great beams, falling down, might embarraſs the way of their purſuers; but at laſt being quite wearied out, and filled with deſpair, they put an end to their own lives. After the taking of Fan-ching, all the materials which had ſerved at the ſiege were tranſported to Seyen-yang. The two engineers poſted themſelves againſt a wooden entrenchment raiſed on the ramparts. This they quickly demoliſhed: and the beſieged were ſo intimidated by the noiſe and havock made by the ſtones caſt from theſe terrible engines, that they immediately ſurrendered.

41 Chineſe empreſs ſubmits.

In 1274, Pe-yen, an officer of great valour, and endowed with many other good qualities, was promoted to the command of the Mogul army. His firſt exploits were the taking of two ſtrong cities; after which he paſſed the great river Ky-ang, defeated the Song army, and laid ſiege to Vu-chang-fu. This city was ſoon intimidated into a ſurrender; and Pe-yen, by reſtraining the barbarity of his ſoldiers, whom he would not allow to hurt any body, ſoon gained the hearts of the Chineſe ſo much, that ſeveral cities ſurrendered to him on the firſt ſummons. In the mean time the treacherous Kya-tſe-tau, who was ſent to oppoſe Pe-yen, was not aſhamed to propoſe peace on the terms he had formerly concluded with Hupilay; but theſe being rejected, he was obliged at length to come to an engagement. In this he was defeated, and Pe-yen continued his conqueſts with great rapidity. Having taken the city of Nanking, and ſome others, he marched towards Hang-chew-fu, the capital of the Song empire. Peace was now again propoſed, but rejected by the Mogul general; and at laſt the empreſs was conſtrained to put herſelf, with her ſon, then an infant, into the hands of Pe-yen, who immediately ſent them to Hupilay.

The ſubmiſſion of the empreſs did not yet put an end to the war. Many of the chief officers ſwore to do their utmoſt to reſcue her from the hands of her enemies. In conſequence of this reſolution they diſtributed their money among the ſoldiers, and ſoon got together an army of 40,000 men. This army attacked the city where the young emperor Kong-tſong was lodged, but without ſucceſs; after which, and ſeveral other vain attempts, they raiſed one of his brothers to the throne, who then took upon him the name of Twon-tſong. He was but nine years of age when he was raiſed to the imperial dignity, and enjoyed it but a very ſhort time. In 1277 he was in great danger of periſhing, by reaſon of the ſhip on board which he then was being caſt away. The poor prince fell into the water, and was taken up half dead with the fright. A great part of his troops periſhed at that time, and he ſoon after made offers of ſubmiſſion to Hupilay. Theſe, however, were not accepted; for, in 1278, the unhappy Twon-tſong was obliged to retire into a little deſert iſland on the coaſt of Quang-tong, where he died in the 11th year of his age.

42
Diſſolution of the Song empire.

Notwithſtanding the progreſs of the Moguls, vaſt territories ſtill remained to be ſubdued before they could become maſters of all the Chineſe empire. On the death of Twon-tſong, therefore, the mandarins raiſed to the throne his brother, named Te-ping, at that time but eight years of age. His army conſiſted of no fewer than 200,000 men; but being utterly void of diſcipline, and entirely ignorant of the art of war, they were defeated by 20,000 Mogul troops. Nor was the fleet more ſucceſsful; for being put in confuſion by that of the Moguls, and the emperor in danger of falling into their hands, one of the officers taking him on his ſhoulders, jumped with him into the ſea, where they were both drowned. Moſt of the mandarins followed this example, as did alſo the empreſs and miniſter, all the ladies and maids of honour, and multitudes of others, inſomuch that 100,000 people are thought to have periſhed on that day. Thus ended the Chineſe race of emperors; and the Mogul dynaſty, known by the name of *Ywen*, commenced.

43
Reign of Hupilay.

Though no race of men that ever exiſted were more remarkable for cruelty and barbarity than the Moguls; yet it doth not appear that the emperors of the Ywen dynaſty were in any reſpect worſe than their predeceſſors. On the contrary, Hupilay, by the Chineſe called *Shi-tſu*, found the way of reconciling the people to his government, and even of endearing himſelf to them ſo much, that the reign of his family is to this day ſtyled by the Chineſe *the wiſe government*. This he accompliſhed by keeping as cloſe as poſſible to their ancient laws and cuſtoms, by his mild and juſt government, and by his regard for their learned men. He was indeed aſhamed of the ignorance and barbarity of his Mogul ſubjects, when compared with the Chineſe. The whole knowledge of the former was ſummed up in their ſkill in managing their arms and horſes, being perfectly deſtitute of every art or ſcience, or even of the knowledge of letters. In 1269, he had cauſed the Mogul characters to be contrived. In 1280, he cauſed ſome mathematicians ſearch for the ſource of the river Whang-ho, which at that time was unknown to the Chineſe themſelves. In four months time they arrived in the country where it riſes, and made a map of it, which they preſented to his majeſty. The ſame year a treatiſe on aſtronomy was publiſhed by his order; and, in 1282, he ordered the learned men to repair from all parts of the empire to examine the ſtate of literature, and take meaſures for its advancement.

At his firſt acceſſion to the crown he fixed his reſidence at Tay-ywen-fu, the capital of Shen-ſi; but thought proper afterwards to remove it to Peking. Here, being informed that the barks, which brought to court the tribute of the ſouthern provinces, or carried on the trade of the empire, were obliged to come by ſea, and often ſuffered ſhipwreck, he cauſed that celebrated canal to be made, which is at preſent one of the wonders of the Chineſe empire, being 300 leagues in length. By this canal above 9000 imperial barks tranſport with eaſe, and at ſmall expence, the tribute of grain, rice, ſilks, *&c.* which is annually paid to the court. In the third year of his reign Shi-tſu formed a deſign of reducing the iſlands of Japan, and the kingdoms of Tonkquin and Cochin-china. Both theſe enterpriſes ended unfortunately, but the firſt remarkably ſo; for of 100,000 perſons employed in it, only four or five eſcaped with the melancholy news of the deſtruction of the reſt, who all periſhed by ſhipwreck. Shi-tſu reigned 15 years, died in the 80th year of his age, and was ſucceeded by his grandſon.

42
Moguls driven out.

The throne continued in the Ywen family till the year 1367, when Shun-ti, the laſt of that dynaſty, was driven out by a Chineſe named Chu. During this period the Tartars had become enervated by long proſperity; and the Chineſe had been rouſed into valour by their ſubjection. Shun-ti, the reigning prince, was quite ſunk in ſloth and debauchery; and the empire, beſides, was oppreſſed by a wicked miniſter named Ama.

45
Exploits of Chu.

In June 1355, Chu, a Chineſe of mean extraction, and head of a ſmall party, ſet out from How-chew, paſſed the Kyang, and took Tay-ping. He then aſſociated himſelf with ſome other malcontents, at the head of whom he reduced the town of Tu-chew, in Kyang-nan. Soon after he made himſelf maſter of Nanking, having defeated the Moguls who come to its relief. In December 1356, he was able to raiſe 100,000 men, at the head of whom he took the city of U-chew, in the eaſt borders of Quang-ſi; and here, aſſembling his generals, it was reſolved neither to commit ſlaughters nor to plunder. The moſt formidable enemy he had to deal with was *Chen-yew-lyang*, ſtyled "emperor of the Han." This man being grieved at the progreſs made by Chu, equipped a fleet, and raiſed a formidable army, in order to reduce Nan-chang-fu, a city of Kyang-ſi, which his antagoniſt had made himſelf maſter of. The governor, however, found means to inform Chu of his danger; upon which that chief cauſed a fleet to be fitted out at Nanking, in which he embarked 200,000 ſoldiers. As ſoon as Chen-yew-lyang was informed of his enemy's approach, he raiſed the ſiege of Nan-chang-fu, and gave orders for attacking Chu's naval force. An engagement enſued between a part of the fleets, in which Chu proved victorious; and next day, all the ſquadrons having joined in order to come to a general engagement, Chu gained a ſecond victory, and burnt 100 of the enemy's veſſels. A third and fourth engagement happened, in both which Chu gained the victory; and in the laſt, Chen-yew-lyang himſelf was killed, his ſon taken priſoner, and his generals obliged to ſurrender themſelves, with all their forces and veſſels.

46
He is proclaimed king of U.

In January 1364, Chu's generals propoſed to have him proclaimed emperor; but this he declined, and at firſt contented himſelf with the title of king of *U*. In February he made himſelf maſter of Vu-chang-fu, capital of Hu-quang; where, with his uſual humanity, he relieved thoſe in diſtreſs, encouraged the literati, and would allow his troops neither to plunder nor deſtroy. This wiſe conduct procured him an eaſy conqueſt both of Kyang-ſi and Hu-quang. The Chineſe ſubmitted to him in crowds, and profeſſed the greateſt veneration and reſpect for his perſon and government.

47
Becomes emperor of China.

48
Moguls driven beyond the deſert.

All this time Shun-ti, with an unaccountable negligence, never thought of exerting himſelf againſt Chu, but continued to employ his forces againſt the rebels who had taken up arms in various parts of the empire; ſo that Chu found himſelf in a condition to aſſume the title of emperor. This he choſe to do at Nanking on the firſt day of the year 1368. After this his troops entered the province of Honan, which they preſently reduced. In the third month, Chu, who had now taken the title of *Hong-vu*, or *Tay-tſu*, reduced the fortreſs of Tong-quan; after which his troops entered Pecheli from Honan on the one ſide, and Shan-tong on the other. Here his generals defeated and killed one of Shun-ti's officers; after which they took the city of Tong-chew, and then prepared to attack the capital, from which they were now but 12 miles diſtant. On their approach the emperor fled with all his family beyond the great wall, and thus put an end to the dynaſty of Ywen. In 1370 he died, and was ſucceeded by his ſon, whom the ſucceſſor of Hong-vu drove beyond the Kobi or Great Deſert, which ſeparates China from Tartary. They continued their incurſions, however, for many years; nor did they ceaſe their attempts till 1583, when vaſt numbers of them were cut in pieces by the Chineſe troops.

49
China again conquered by the Tartars.

The 21ſt dynaſty of Chineſe emperors, founded in 1368 by Chu, continued till the year 1644, when they were again expelled by the Tartars. The laſt Chineſe emperor was named Whay-tſong, and aſcended the throne in 1628. He was a great lover of the ſciences, and a favourer of the Chriſtians; though much addicted to the ſuperſtitions of the Bonzes. He found himſelf engaged in a war with the Tartars, and a number of rebels in different provinces. That he might more effectually ſuppreſs the latter, he reſolved to make peace with the former; and for that end ſent one of his generals, named *Ywen*, into Tartary, at the head of an army, with full power to negociate a peace; but that traitor made one upon ſuch ſhameful terms, that the emperor refuſed to ratify it. Ywen, in order to oblige his maſter to comply with the terms made by himſelf, poiſoned his beſt and moſt faithful general, named *Mau-ven-long*; and then deſired the Tartars to march directly to Peking, by a road different from that which he took with his army. This they accordingly did, and laid ſiege to the capital. Ywen was ordered to come to its relief: but, on his arrival, was put to the torture and ſtrangled; of which the Tartars were no ſooner informed, than they raiſed the ſiege, and returned to their own country. In 1636, the rebels abovementioned compoſed four great armies, commanded by as many generals; which, however, were ſoon reduced to two, commanded by Li and Chang. Theſe agreed to divide the empire between them; Chang taking the weſtern provinces, and Li the eaſtern ones. The latter ſeized on part of Shen-ſi, and then of Honan, whoſe capital, named Kay-fong-fu, he laid ſiege to, but was repulſed with loſs. He renewed it ſix months after, but without ſucceſs; the beſieged chooſing rather to feed on human fleſh than ſurrender. The imperial forces coming ſoon after to its aſſiſtance, the general made no doubt of being able to deſtroy the rebels at once, by breaking down the banks of the Yellow River; but unfortunately the rebels eſcaped to the mountains, while the city was quite overflowed, and 300,000 of the inhabitants periſhed.

50
Unhappy fate of the emperor and his family.

After this diſaſter, Li marched into the provinces of Shen-ſi and Honan; where he put to death all the mandarins, exacted great ſums from the officers in place, and ſhowed no favour to any but the populace, whom he freed from all taxes: by this means he drew ſo many to his intereſt, that he thought himſelf ſtrong enough to aſſume the title of emperor. He next advanced towards the capital, which, though well garriſoned, was divided into factions. Li had taken care to introduce before-hand a number of his men in diſguiſe; and by theſe the gates were opened to him the third day after his arrival. He entered the city in triumph at the head of 300,000 men; whilſt the emperor kept himſelf ſhut up in his palace, buſied only with his ſuperſtitions. It was not long, however, before he found himſelf betrayed: and, under the greateſt conſternation, made an effort to get out of the palace, attended by about 600 of his guards. He was ſtill more ſurpriſed to ſee himſelf treacherouſly abandoned by them, and deprived of all hopes of eſcaping the inſults of his ſubjects. Upon this, preferring death to the diſgrace of falling alive into their hands, he immediately retired with his empreſs, whom he tenderly loved, and the princeſs her daughter, into a private part of the garden. His grief was ſo great that he was not able to utter a word; but ſhe ſoon underſtood his meaning, and, after a few ſilent embraces, hanged herſelf on a tree in a ſilking ſtring. Her huſband ſtaid only to write theſe words on the border of his veſt; "I have been baſely deſerted by my ſubjects; do what you will with me, but ſpare my people." He then cut off the young princeſs's head with one ſtroke of his ſcymitar, and hanged himſelf on another tree, in the 17th year of his reign, and 36th of his age. His prime miniſter, queens, and eunuchs, followed his example; and thus ended the Chineſe monarchy, to give place to that of the Tartars, which hath continued ever ſince.

It was ſome time before the body of the unfortunate monarch was found. At laſt it was brought before the rebel Li, and by him uſed with the utmoſt indignity; after which he cauſed two of Whey-tſong's ſons, and all his miniſters, to be beheaded; but his eldeſt ſon happily eſcaped by flight. The whole empire ſubmitted peaceably to the uſurper, except prince U-ſan-ghey, who commanded the imperial forces in the province of Lyau-tong. This brave prince, finding himſelf unable to cope with the uſurper, invited the Tartars

Tartars to his aſſiſtance, and Tſong-te their king immediately joined him with an army of 80,000 men. Upon this the uſurper marched directly to Peking; but not thinking himſelf ſafe there, plundered and burnt the palace, and then fled with the immenſe treaſure he had got. What became of him afterwards we are not told; but the young Tartar monarch was immediately declared emperor of China, his father Tſong-te having died almoſt as ſoon as he ſet his foot in that empire.

The new emperor, named *Shun-chi*, or *Xun-chi*, began his reign with rewarding U-ſan-ghey, by conferring upon him the title of King; and aſſigned him the city of Si-gnan-fu, capital of Shen-ſi, for his reſidence. This, however, did not hinder U-ſan-ghey from repenting of his error in calling in the Tartars, or, as he himſelf uſed to phraſe it, in ſending for lions to drive away dogs.” In 1674, he formed a very ſtrong alliance againſt them, and had probably prevailed if his allies had been faithful; but they treacherouſly deſerted him one after another: which ſo affected him, that he died ſoon after. In 1681 Hong-wha, ſon to U-ſan-ghey, who continued his efforts againſt the Tartars, was reduced to ſuch ſtraits that he put an end to his own life.

51
Empire totally reduced.

52
Chriſtianity firſt encouraged and then perſecuted.

During this ſpace, there had been ſome reſiſtance made to the Tartars in many of the provinces. Two princes of Chineſe extraction had at different times been proclaimed emperors; but both of them were overcome and put to death. In 1682, the whole 15 provinces were ſo effectually ſubdued, that the emperor Kang-hi, ſucceſſor to Shunc-hi, determined to viſit his native dominions of Tartary. He was accompanied by an army of 70,000 men, and continued for ſome months taking the diverſion of hunting. This he continued to do for ſome years; and in his journeys took father Verbeiſt along with him; by which means we have a better deſcription of theſe countries than could poſſibly have been otherwiſe obtained. This prince was a great encourager of learning and of the Chriſtian religion; in favour of which laſt he publiſhed a decree, dated in 1692. In 1716, however, he revived ſome obſolete laws againſt the Chriſtians; nor could the Jeſuits with all their art preſerve the footing they had got in China. The cauſes of this alteration in his reſolution are, by the miſſionaries, ſaid to have been the ſlanders of the mandarins: but, from the known character of the Jeſuits, it will be readily believed, that there was ſomething more at bottom. This emperor died in 1722, and was ſucceeded by his ſon Yon-ching; who not only gave no encouragement to the miſſionaries, but perſecuted all Chriſtians of whatever denomination, not excepting even thoſe of the imperial race. At the beginning of his reign he baniſhed all the Jeſuits into the city of Canton, and in 1732 they were baniſhed from thence into Ma-kau, a little iſland inhabited by the Portugueſe, but ſubject to China. He died in 1736; but though the Jeſuits entertained great hopes from his ſucceſſor, we have not heard that they have yet met with any ſucceſs.

Thus we have given an account of the moſt memorable tranſactions recorded in the Chineſe hiſtory. It now remains only to deſcribe the preſent ſtate of the empire and its inhabitants, according to the beſt and lateſt accounts.

53
Climate, ſoil, and produce.

The climate as well as the ſoil of this extenſive empire is very different in different parts; ſevere cold being often felt in the northern provinces, while the inhabitants of the ſouthern ones are ſcarce able to bear the heat. In general, however, the air is accounted wholeſome, and the inhabitants live to a great age.—The northern and weſtern provinces have many mountains, which in the latter are cultivated, but in the north are barren, rocky, and incapable of improvement. On the mountains of Chenſi, Honan, Canton, and Fokien, are many foreſts, abounding with tall, ſtraight trees, of different kinds, fit for building, and particularly adapted for maſts and ſhip-timber. Theſe are uſed by the emperor in his private buildings; and from theſe foreſts enormous trunks are ſometimes tranſported to the diſtance of more than 300 leagues. Other mountains contain quickſilver, iron, tin, copper, gold, and ſilver. Formerly theſe laſt were not allowed to be opened, leſt the people ſhould thereby be induced to neglect the natural riches of the ſoil; and it is certain, that, in the 15th century, the emperor cauſed a mine of precious ſtones to be ſhut, which had been opened by a private perſon. Of late, however, the Chineſe are leſs ſcrupulous, and a great trade in gold is carried on by them. Many extravagant fables are told by the Chineſe of their mountains, particularly of one in Chen-ſi which throws out flames, and produces violent tempeſts, whenever any one beats a drum or plays on a muſical inſtrument near it. In the province of Folkien is a mountain, the whole of which is an idol, or ſtatue of the god Fo. This natural coloſſus, for it appears not to have been the work of art, is of ſuch an enormous ſize, that each of its eyes is ſeveral miles in circumference, and its noſe extends ſome leagues.

54
Lakes and rivers.

China has ſeveral large lakes; the principal one is that named Poyang-hou, in the province of Kiang-ſi. It is formed by the confluence of four large rivers, extends near 100 leagues in length; and, like the ſea, its waters are raiſed into tempeſtuous waves. The empire is watered by an immenſe number of rivers of different ſizes, of which two are particularly celebrated, *viz.* the *Yang-tſe kiang*, or *ſon of the ſea*, and *Hoang-ho*, or the *Yellow river*. The former riſes in the province of Yun-nan, and paſſing through Hou-quang and Kiang-nan, falls into the eaſtern ocean, after a courſe of 1200 miles, oppoſite to the iſland of Tſon-ming, which is formed by the ſand accumulated at its mouth. This river is of immenſe ſize, being half a league broad at Nanking, which is near 100 miles from its mouth. The navigation is dangerous, ſo that great numbers of veſſels are loſt on it. It runs with a rapid current, forming ſeveral iſlands in its courſe, which are again carried off and new ones formed in different places, when the river is ſwelled by the torrents from the mountains. Theſe iſlands, while they remain, are very uſeful; producing great quantities of reeds ten or twelve feet high, which are uſed in all the neighbouring countries for fuel. The Hoang-ho, or yellow river, has its name from the yellow colour given it by the clay and ſand waſhed down in the time of of rain. It riſes in the mountains which border the province of Te-tchuen on the weſt, and after a courſe of near 600 leagues, diſcharges itſelf into the eaſtern ſea not far from the mouth of the Kiang. It is very broad and rapid, but ſo ſhallow that it is ſcarce navigable. It is very liable to inundations, often overflowing its banks, and deſtroying whole villages. For this reaſon it has been found neceſſary to confine it in ſeveral places by long and ſtrong dykes; which yet do not entirely anſwer the purpoſe. The people of Honan, therefore, whoſe land is exceedingly low, have ſurrounded moſt of their cities with ſtrong ramparts of earth faced with turf, at the diſtance of three furlongs.

55
Canals.

The Chineſe have been at great pains to turn their lakes and rivers to the advantage of commerce, by promoting an inland navigation. One of their principal works for this purpoſe, is the celebrated canal reaching from Canton to Peking, and forming a communication between the ſouthern and northern provinces. This canal extends through no leſs a ſpace than 600 leagues; but its navigation is interrupted in one place by a mountain, where paſſengers are obliged to travel 10 or 12 leagues over land. A number of other canals are met with in this and other provinces; moſt of which have been executed by the induſtry of the inhabitants of different cities and towns, in order to promote their communication with the various parts of the empire. M. Groſier remarks, that, in theſe works, the Chineſe have "ſurmounted obſtacles that perhaps would have diſcouraged any other people; ſuch, for example, is a part of a canal which conducts from *Chao-king* to *Ning-po*." Near theſe cities there are two canals, the waters of which do not communicate, and which differ ten or twelve feet in their level. To render this place paſſable for boats, the Chineſe have conſtructed a double glacis of large ſtones, or rather two inclined planes, which unite in an acute angle at their upper extremity, and extend on each ſide to the ſurface of the water. If the bark is in the lower canal, they puſh it up the plane of the firſt glacis by means of ſeveral capſtans, until it is raiſed to the angle, when by its own weight it glides down the ſecond glacis, and precipitates itſelf into the water of the higher canal with the velocity of an arrow. It is aſtoniſhing that theſe barks, which are generally very long and heavily loaden, never burſt aſunder when they are balanced on this acute angle; however, we never hear of any accident of this kind happening in the paſſage. It is true, they take the precaution of uſing for their keels a kind of wood which is exceedingly hard, and proper for reſiſting the violence of ſuch an effort.

56
Remarkable river, which partly ſinks under ground.

The following remarkable phenomenon in a Chineſe river is related by Father *le Couteux*, a French miſſionary. "Some leagues above the village Che-pai (ſays he), the river becomes conſiderably ſmaller, although none of its waters flow into any other channel; and, eight or nine leagues below, it reſumes its former breadth, without receiving any additional ſupply, excepting what it gets from a few ſmall rivulets, which are almoſt dry during the greater part of the year. Oppoſite to Che-pai it is ſo much diminiſhed, that, excepting one channel, which is not very broad, I have paſſed and repaſſed it ſeveral times by the help of a common pole. I was always ſurpriſed to find this river ſo narrow and ſhallow in that place; but I never thought of inquiring into the cauſe of it, until the loſs of a bark belonging to a Chriſtian family afforded me an opportunity. In that place where the river diminiſhes almoſt of a ſudden, it flows with great impetuoſity; and where it reſumes its former breadth it is equally rapid. At the ſixth moon, when the water was high and the wind ſtrong, the bark I have mentioned arriving above Che-pai, was driven on a ſand-bank; for between theſe two places the river is full of moveable ſands, which are continually ſhifting their ſituation. The maſter of the boat dropped his anchor until the wind ſhould abate, and permit him to continue his voyage; but a violent vortex of moveable ſand, which was caſt up from the bottom of the river, laid the bark on its ſide; a ſecond vortex ſucceeded; then a third; and afterwards a fourth, which ſhattered the bark to pieces. When I arrived at the place where this bark had been loſt, the weather was mild and ſerene; I perceived eddies in the current every where around; which abſorbed, and carried to the bottom of the river whatever floated on the ſurface; and I obſerved, at the ſame time, that the ſand was thrown violently up with a vortical motion. Above theſe eddies the water was rapid, but without any fall; and in the place below, where the river reſumes its uſual courſe, no eddies are to be ſeen, but the ſand is thrown up in the ſame violent manner; and in ſome places there are water-falls, and a kind of ſmall iſlands ſcattered at ſome diſtance from one another. Theſe iſlands which appear above the ſurface of the water, are not ſolid earth, but conſiſt of branches of trees, roots, and herbs collected together. I was told that theſe boughs roſe up from the water, and that no one knew the place from whence they came. I was informed, that theſe maſſes, which were 40 or 50 feet in extent on that ſide on which we paſſed, were immoveable, and fixed in the bottom of the river; that it was dangerous to approach them, becauſe the water formed whirlpools every where around them; that, however, when the river was very low, the fiſhermen ſometimes ventured to collect the buſhes that floated on its ſurface, and which they uſed for fuel. I am of opinion, that, at the place of the river which is above Che-pai, the water falls into deep pits, from whence it forces up the ſand with that vertical motion; and that it flows underground to the other place, eight or nine leagues below, where it carries with it all the boughs, weeds, and roots, which it waſhes down in its courſe, and thus forms thoſe iſlands which appear above its ſurface. We know there are ſome rivers that loſe themſelves entirely, or in part, in the bowels of the earth, and which afterwards ariſe in ſome other place; but I believe there never was one known to loſe part of its water below its own channel, and again to recover it at the diſtance of ſome leagues."

57
Why China is ſubject to famines, notwithſtanding its fertility.

It has already been ſaid, that China is, in general, a fertile country; and indeed all travellers agree in this reſpect, and make encomiums on the extent and beauty of its plains. So careful are the huſbandmen of this empire to loſe none of their ground, that neither incloſure, hedge, nor ditch, nay, ſcarce a ſingle tree, are ever to be met with. In ſeveral places the land yields two crops a year; and even in the interval between the harveſts, the people ſow ſeveral kinds of pulſe and ſmall grain. The plains of the northern provinces yield wheat; thoſe of the ſouthern, rice, becauſe the country is low and covered with water. Notwithſtanding all this fertility, however, the inhabitants are much more frequently afflicted with famine than thoſe of the European nations, though the countries of Europe produce much leſs than China. For this

this two cauſes are aſſigned. 1. The deſtruction of the riſing corps by drought, hail, inundations, locuſts, *&c.* in which caſe China cannot like the European countries be ſupplied by importation. This is evident by conſidering how it is ſituated with regard to other nations. On the north are the Mogul Tartars, a lazy and indolent race, who ſubſiſt principally on the fleſh of their flocks; ſowing only a little millet for their own uſe. The province of Leatong, which lies to the north-eaſt, is indeed extremely fertile, but too far diſtant from the capital and centre of the empire to ſupply it with proviſions; and beſides, all carriage is impracticable but in the winter, when great quantities of game, and fiſh, preſerved in ice, are ſent thither. No corn is brought from Corea to China; and, though the Japan iſlands are only three or four days ſailing from the Chineſe provinces of Kiang-nan and Che-kyang, yet no attempt was ever made to obtain proviſions from thence, whether it be, that the Japaneſe have nothing to ſpare, or on account of the inſults offered by theſe iſlanders to foreign merchants. Formoſa lies oppoſite to the province of Fo-kien; but ſo far is that iſland from being able to ſupply any thing, that in a time of ſcarcity it requires a ſupply from China itſelf. The province of Canton is alſo bounded by the ſea, and has nothing on the ſouth but iſlands and remote countries. One year, when rice was exceedingly ſcarce there, the emperor ſent for F. Parranin, a Jeſuit miſſionary, and aſked him if the city of Macao could not furniſh Canton with rice until the ſupply he had ordered from other provinces ſhould arrive; but was informed that Macao had neither rice, corn, fruits, herbs, nor flocks; and that it generally got from China what was neceſſary for its ſubſiſtence.—The only method, therefore, the Chineſe can take to guard againſt famines ariſing from theſe cauſes is to erect granaries and public magazines in every province and moſt of the principal cities of the empire. This has at all times been a principal object of care to the public miniſters; but though this mode of relief ſtill takes place in theory, ſo many ceremonies are to be gone through before any ſupply can be drawn from thoſe public repoſitories, that it ſeldom arrives ſeaſonably at the places where it is wanted; and thus numbers of unhappy wretches periſh for want. 2. Another cauſe of the ſcarcity of grain in this empire, is the prodigious conſumpt of it in the compoſition of wines, and a ſpirituous liquor called *rack*. But though government is well appriſed that this is one of the principal ſources of famine throughout the empire, it never employed means ſufficient to prevent it. Proclamations indeed have frequently been iſſued, prohibiting the diſtillation of rack; and the appointed officers will viſit the ſtill-houſes and deſtroy the furnaces if nothing is given them; but on ſlipping ſome money into their hands, they ſhut their eyes, and go ſomewhere elſe to receive another bribe. When the mandarin himſelf goes about, however, theſe diſtillers do not eſcape quite ſo eaſily, the workmen being whipped and impriſoned, after which they are obliged to carry a kind of collar called the *Cangue**; the maſters are likewiſe obliged to change their habitations and conceal themſelves for a ſhort time, after which they generally reſume their operations. It is impoſſible, however, that any method of this kind can prove effectual in ſuppreſſing theſe manufactories while the liquors themſelves are allowed to be ſold publicly; and againſt this there is no law throughout the empire. Our author, however, juſtly obſerves, that in caſe of a prohibition of this kind, the grandees would be obliged to deny themſelves the uſe of theſe luxuries, which would be too great a ſacrifice for the good of the empire.

*See below No. 74.

58 Immenſe population.

The population of China is ſo great, in compariſon with that of the European countries, that the accounts of it have generally been treated as fabulous by the weſtern nations; but by an accurate inveſtigation of ſome Chineſe records concerning the number of perſons liable to taxation throughout the empire, M. Groſier has ſhowed that it cannot be leſs than 200 millions. For this extraordinary population he aſſigns the following cauſes. 1. The ſtrict obſevance of filial duty throughout the empire, and the prerogatives of fraternity, which make a ſon the moſt valuable property of a father. 2. The infamy attached to the memory of thoſe who die without children. 3. The univerſal cuſtom by which the marriage of children becomes the principal concern of the parents. 4. The honours beſtowed by the ſtate on thoſe widows who do not marry a ſecond time. 5. Frequent adoptions, which prevent families from becoming extinct. 6. The return of wealth to its original ſtock by the diſinheriting of daughters. 7. The retirement of wives, which renders them more complaiſant to their huſbands, ſaves them from a number of accidents when big with child, and conſtrains them to employ themſelves in the care of their children. 8. The marriage of ſoldiers. 9. The fixed ſtate of taxes; which being always laid upon lands, never fall but indirectly on the trader and mechanic. 10. The ſmall number of ſailors and travellers. 11. To theſe may be added the great number of people who reſide in China only by intervals; the profound peace which the empire enjoys; the frugal and laborious manner in which the great live; the little attention that is paid to the vain and ridiculous prejudice of marrying below one's rank; the ancient policy of giving diſtinction to men and not to families; by attaching nobility only to employments and talents, without ſuffering it to become hereditary. And, 12. laſtly, A decency of public manners, and a total ignorance of ſcandalous intrigues and gallantry.

59 Unlimited authority of the emperor.

The government of China, according to the Abbe Groſier, is purely patriarchal. The emperor is more unlimited in his authority than any other potentate on earth; no ſentence of death, pronounced by any of the tribunals can be executed without his conſent, and every verdict in civil affairs is ſubject to be reviſed by him; nor can any determination be of force until it has been confirmed by the emperor: and, on the contrary, whatever ſentence he paſſes is executed without delay; his edicts are reſpected throughout the empire as if they came from a divinity; he alone has the diſpoſal of all offices, nor is there any ſuch thing as the purchaſe of places in China; merit, real or ſuppoſed, raiſes to an office, and rank is attached to it only. Even the ſucceſſion to the throne is not altogether hereditary. The emperor of China has a power of chooſing his own ſucceſſor without conſulting any of his nobility; and can ſelect one not only from among his own children, but even from the body of his people; and there have been ſeveral inſtances of his making uſe of this right: and he has even a power of altering the ſucceſſion after it has once been fixed, in caſe the perſon pitched upon does not behave towards him with proper reſpect. The emperor can alſo prevent the princes of the blood from exerciſing the title, with which, according to the conſtitution of the empire, they are inveſted. They may indeed, notwithſtanding this poſſeſs their hereditary dignity; in which caſe they are allowed a revenue proportioned to their high birth, as well as a palace, officers, and a court; but they have neither influence nor power, and their authority is lower than that of the meaneſt mandarin.

60 Mandarins of different claſſes.

The mandarins are of two claſſes, *viz.* thoſe of letters, and the inferior ſort, ſtyled mandarins of arms. The latter by no means enjoy the ſame conſideration with the former ſort; indeed in China the literati are highly honoured, and to their influence M. Groſier ſuppoſes that we may in a great meaſure aſcribe the mildneſs and equity of the government; though he thinks that the balance may incline rather too much in their favour. Several degrees, anſwering to thoſe of bachelor, licentiate, and doctor, muſt be paſſed through before one can attain to the dignity of a mandarin of letters; though ſometimes, by the favour of the emperor, it is conferred on thoſe who have attained only the two firſt degrees: but even the perſons who have gone through all the three, enjoy at firſt only the government of a city of the ſecond or third claſs. When ſeveral vacancies happen in the government of cities, the emperor invites to court a correſponding number of the literati, whoſe names are written down in a liſt. The names of the vacant governments are then put into a box, raiſed ſo high that the candidates are able only to reach it with their hands; after which they draw in their turns, and each is appointed governor of the city whoſe name he has drawn.

There are eight orders of theſe mandarins in China. 1. The *calao*, from whom are choſen the miniſters of ſtate, the preſidents of the ſupreme courts, and all the ſuperior officers among the militia. The chief of this order preſides alſo in the emperor's council, and enjoys a great ſhare of his confidence. 2. The *te-kioſe*, or man of acknowledged ability, is a title beſtowed upon every mandarin of the ſecond rank; and from theſe are ſelected the viceroys and preſidents of the ſupreme council in the different provinces. 3. The *tchong-tchueo*, or ſchool of mandarins, act as ſecretaries to the emperor. 4. *Y-tchuen,-tao.* Theſe keep in repair the harbours, royal lodging-houſes, and barks, which belong to the emperor, unleſs particularly engaged in ſome other office by his order. 5. The *ping-pi-tao* have the inſpection of the troops. 6. The *tun-tien-hao* have the care of the high-ways. 7. The *ho-tao* ſuperintend the rivers. 8. The *hai-tao* inſpect the ſea-coaſts.

Thus the whole adminiſtration of the Chineſe empire is intruſted to the mandarins of letters; and the homage paid by the common people to every mandarin in office, almoſt equals that paid to the emperor himſelf. This indeed flows from the nature of their government. In China it is a received opinion that the emperor is the father of the whole empire; that the governor of a province is the father of that province; and that the Mandarin who is governor of a city is alſo the father of that city. This idea is productive of the higheſt reſpect and ſubmiſſion, which is not at all leſſened by their great number; for though the mandarins of letters amount to more than 14,000, the ſame reſpect is paid to every one of them.

The mandarins of arms are never indulged with any ſhare in the government of the ſtate; however, to attain to this dignity, it is alſo neceſſary to paſs through the degrees of bachelor, licentiate, and doctor of arms. The accompliſhments neceſſary for a mandarin of arms are, ſtrength of body, with ability and readineſs in performing the various military exerciſes, and comprehending the orders requiſite for the profeſſion of arms: an examination on theſe ſubjects muſt be undergone before the candidate can obtain the wiſhed for dignity.

61 Tribunal of the mandarins of arms.

The mandarins of arms have tribunals, the members of which are ſelected from among their chiefs; and among theſe they reckon princes, counts, and dukes; for all theſe dignities, or ſomething equivalent to them, are met with in China. The principal of theſe tribunals is held at Peking, and conſiſts of five claſſes. 1. The mandarins of the rear-guard, called *heou-fou*. 2. Of the left wing, or *tſa-fou*. 3. Of the right wing, or *yeou-feou*. 4. Of the advanced main-guard, or *te-hong-fou*. 5. Of the advanced guard, or *tſien-fou*. Theſe five tribunals are ſubordinate to one named *iong-tching-fou*; the preſident of which is one of the great lords of the empire, whoſe authority extends over all the military men in the empire. By his high dignity he could render himſelf formidable even to the emperor; but to prevent this inconvenience, he has for his aſſeſſor a mandarin of letters, who enjoys the title and exerciſes the function of ſuperintendant of arms. He muſt alſo take the advice of two inſpectors who are named by the emperor; and when theſe four have agreed upon any meaſure, their reſolution muſt ſtill be ſubmitted to the reviſal of an higher court named *Ping-pou*, which is entirely of a civil nature. The chief of theſe mandarins is a general of courſe, whoſe powers are equivalent to thoſe of our commanders in chief; and below him are other mandarins who act as ſubordinate officers.

Theſe two claſſes of mandarins compoſe what is called the nobility of China; but as we have already hinted, their office is not hereditary; the emperor alone continues or confers it. They have the privilege of remonſtrating to the emperor, either as individuals or in a body, upon any part of his conduct which appears contrary to the intereſts of the empire. Theſe remonſtrances are ſeldom ill received, though the ſovereign complies with them only when he himſelf thinks proper. The number of literary mandarins in China is computed at upwards of 14,000; and thoſe of arms at 18,000; the former, however, are conſidered as the principal body in the empire; and this preference is thought to damp the military ardour of the nation in general, and to be one cauſe of that weakneſs in war for which the Chineſe are remarkable.

62 Military force.

The armies of this empire are proportioned to its vaſt extent and population; being computed in time of of peace at more than 700,000. Their pay amounts to about twopence half-penny and a meaſure of rice per day, though ſome of them have double pay, and the pay of a horſeman is double that of a foot-ſoldier; the emperor furniſhes a horſe, and the horſeman receives two meaſures of ſmall beans for his daily ſubſiſtence; the arrears of the army being punctually paid up every three months.

The arms of a horſeman are, a helmet, cuiraſs, lance, and ſabre; thoſe of a foot-ſoldier are a pike and ſabre; ſome have fuſees, and others bows and arrows. All theſe are carefully inſpected at every review; and if any of them are found in the leaſt ruſted, or otherwiſe in bad condition, the poſſeſſor is inſtantly puniſhed; if a Chineſe, with 30 or 40 blows of a ſtick; or, if a Tartar, with as many laſhes.

63 Uſe of fire-arms loſt and revived.

Though the uſe of gun-powder is certainly very ancient in China, it appears to have been afterwards totally loſt, at leaſt fire-arms ſeem to have been almoſt entirely unknown ſome centuries ago. Three or four cannon were to be ſeen at that time about the gates of Nanking; but not a ſingle perſon in China knew how to make uſe of them; ſo that, in 1621, when the city of Macao made a preſent of three pieces of artillery to the emperor, it was found neceſſary alſo to ſend three men to load them. The utility of theſe weapons was quickly perceived by the execution which the three cannon did againſt the Tartars, at that time advanced as far as the great wall. When the invaders threatened to return, the mandarins of arms gave it as their opinion, that cannons were the beſt arms they could make uſe of againſt them. They were then taught the art of caſting cannon by F. Adam Schaal and Verbieſt, two Jeſuit miſſionaries, and their artillery was increaſed to the number of 320 pieces; at the ſame time that they were inſtructed in the method of fortifying towns, and conſtructing fortreſſes and other buildings according to the rules of modern architecture.

The beſt ſoldiers in China are procured from the three northern provinces, the others being ſeldom called forth, but allowed to remain at peace with their families: indeed there is not often occaſion for exerting their military talents, unleſs it be in the quelling of an inſurrection, when a mandarin or governor uſually accompanies them. They march in a very tumultuous manner, but want neither ſkill nor agility in performing their different evolutions. They, in general, handle a ſabre well, and ſhoot very dexterouſly with bows and arrows. There are in China more than 2000 places of arms; and through the different provinces there are diſperſed about 3000 towers or caſtles, all of them defended by garriſons. Soldiers continually mount guard there; and on the firſt appearance of tumult, the neareſt centinel makes a ſignal from the top of the tower, by hoiſting a flag in the day time, or lighting a torch in the night; when the neighbouring garriſons immediately repair to the place where their preſence is neceſſary.

64 Account of the great wall.

The principal defence of the empire againſt a foreign enemy is the great wall which ſeparates China from Tartary, extending more than 1500 miles in length, and of ſuch thickneſs that ſix horſeman may eaſily ride abreaſt upon it. It is flanked with towers two bow-ſhots diſtant from one another; and it is ſaid that a third of the able bodied men in the empire were employed in conſtructing it. The workmen were ordered, under pain of death, to place the materials ſo cloſely, that not the leaſt entrance might be afforded for any inſtrument of iron; and thus the work was conſtructed with ſuch ſolidity, that it is ſtill almoſt entire, though 2000 years have elapſed ſince it was conſtructed. This extraordinary work is carried on not only through the low lands and valleys, but over hills and mountains; the height of one of which was computed by F. Verbieſt at 1236 feet above the level of the ſpot where he ſtood. According to F. Martini it begins at the gulf of Lea-tong, and reaches to the mountains near the city of Kin on the yellow river; between which places it meets with no interruption except to the north of the city of Suen in the province of Pecheli, where it is interrupted by a ridge of hedious and inacceſſible mountains, to which it is cloſely united. It is likewiſe interrupted by the river Hoang-ho; but for others of an inferior ſize, arches have been conſtructed, through which the water paſſes freely. Mr Bell informs us, that it is caracid acroſs rivers, and over the tops of the higheſt hills, without the leaſt interruption, keeping nearly along that circular range of barren rocks which incloſes the country; and, after running about 1200 miles, ends in impaſſable mountains and ſandy deſerts. The foundation conſiſts of large blocks of ſtone laid in mortar; but all the reſt is of brick. The whole is ſo ſtrong and well built, that it ſcarcely needs any repairs; and, in the dry climate in which it ſtands, may remain in the ſame condition for many ages. When carried over ſteep rocks, where no horſe can paſs, it is about 15 or 20 feet high: but when running through a valley, or croſſing a river, it is about 30 feet high, with ſquare towers and embraſures at equal diſtances. The top is flat, and paved with cut ſtone; and where it riſes over a rock or eminence, there is an aſcent made by an eaſy ſtone-ſtair. "This wall (our author adds) was begun and completely finiſhed in the ſhort ſpace of five years; and it is reported, that the labourers ſtood ſo cloſe for many miles, that they could hand the materials from one to another. This ſeems the more probable, as the rugged rocks among which it is built muſt have prevented all uſe of carriages; and neither clay for making bricks, nor any kind of cement, are to be found among them."

65 Courts by which the civil government is managed.

The whole civil government of China is managed by the following courts. 1. The emperor's grand council, compoſed of all the miniſters of ſtate, preſidents and aſſeſſors of the ſix ſovereign courts, and of three others, to be afterwards mentioned. This is never aſſembled but on affairs of the greateſt importance; the emperor's private council being ſubſtituted to it in all caſes of ſmaller moment. 2. The chief of the other courts furniſhes mandarins for the different provinces, watches over their conduct, and keeps a journal of their tranſactions, and informs the emperor of them, who rewards or puniſhes according to the report he gets.

This ſecond tribunal, which may be called a kind of civil inquiſition, is ſubdivided into four others; the firſt entruſted with the care of ſelecting thoſe who, on account of their learning or other good properties, are capable of filling the offices of government; the ſecond appointed to take care of the conduct of the mandarins; the third affixing the ſeals to the different public acts, giving the ſeals to mandarins, and examining thoſe of the different diſpatches; while the fourth enquires into the merit of the grandees of the empire, not excepting the princes of the imperial blood themſelves. The principal ſovereign court to which theſe four laſt are ſubordinate is called *Lii-pou*.

2. *Hou-pou*, or the grand treaſurer, ſuperintends all the finances of the ſtate; is the guardian and protector of the treaſures and dominions of the emperor, keeping an account of his revenues, *&c.* ſuperintending the management and coining of money; the public magazines, cuſtom-houſes; and, laſtly, keeping an exact regiſter of all the families in the empire. To aſſiſt this court, 14 others are appointed throughout the different provinces of the empire.

3. *Li-pou*, or the court of ceremonies. "It is an undoubted fact (ſays M. Groſier), that ceremonies form, in part, the baſe of the Chineſe government. This tribunal therefore takes care to ſupport them, and enforce their obſervance; it inſpects alſo the arts and ſciences. It is conſulted by the emperor when he deſigns to confer particular honours; takes care of the annual ſacrifices offered up by him, and even regulates the entertainments which he gives either to ſtrangers or his own ſubjects. It alſo receives and entertains foreign ambaſſadors, and preſerves tranquillity among the different religious ſects in the empire. It is aſſiſted by four inferior tribunals.

4. *Ping-pou*, or the tribunal of arms, comprehends in its juriſdiction the whole militia of the empire; inſpecting alſo the fortreſſes, magazines, arſenals, and ſtore-houſes of every kind, as well as the manufactories of arms both offenſive and defenſive; examining and appointing officers of every rank. It is compoſed entirely of mandarins of letters; and the four tribunals depending upon it conſiſt alſo of literati."

5. The *hong-pou* is the criminal bench for the whole empire, and is aſſiſted by 14 ſubordinate tribunals.

6. The *cong-pou*, or tribunal of public works, ſurveys and keeps in repair the emperor's palaces, as well as thoſe of the princes and viceroys, and the buildings where the tribunals are held, with the temples, tombs of the ſovereigns, and all public monuments. It has beſides the ſuperintendence of the ſtreets, public highways, bridges, lakes, rivers, and every thing relating either to internal or foreign navigation. Four inferior tribunals aſſiſt in the diſcharge of theſe duties; the firſt drawing the plans of public works: the ſecond directing the work-ſhops in the different cities of the empire; the third ſurveying the cauſeways, roads, bridges, canals, &c.; and the fourth taking care of the emperor's palaces, gardens, and orchards, and receiving their produce.

66 Partiality of government towards the Chineſe.

All thoſe tribunals are compoſed, one half of Chineſe, and the other of Tartars; and one of the preſidents of each ſuperior tribunal is always a Tartar born. None of the courts above deſcribed, however, has abſolute authority even in its own juriſdiction; nor can its deciſions be carried into execution without the concurrence of another tribunal, and ſometimes of ſeveral others. The fourth tribunal, for inſtance, has indeed under its juriſdiction the whole troops of the empire; but the payment of them is entruſted with the ſecond, while the ſixth has the care of the arms, tents, chariots, barks, and ſtores neceſſary for military operations; ſo that nothing relative to theſe can be put in execution without the concurrence of all the three tribunals.

67 Cenſors.

To prevent any lawful combination among the tribunals, each has its *cenſor* appointed. This is an officer whoſe duty is merely to watch over the proceedings of the court, without deciding upon any thing himſelf. He aſſiſts therefore at all aſſemblies, reviſes all their acts, and without acquainting the court in the leaſt with either his ſentiments or intentions, immediately informs the emperor of what he judges to be amiſs. He likewiſe gives information of the behaviour of the mandarins, either in the public adminiſtration of affairs, or in their private conduct; nay, ſometimes he will not ſcruple to reprimand the emperor for what he ſuppoſes to be erroneous in his conduct.

Theſe cenſors are never removed from their places but in order to be promoted; and thus, holding their offices for life, they have the greater courage to ſpeak out when they obſerve any impropriety or abuſe. Their accuſation is ſufficient to ſet on foot an inquiry, which generally leads to a proof; in which caſe the accuſed is diſcharged from his office, and never held in any eſtimation afterwards. The complaints of the cenſors, however, are referred to the very tribunals againſt whoſe members they complain; though, being afraid of an accuſation themſelves, they very ſeldom paſs ſentence againſt the accuſers.

Beſides all this, the cenſors alſo form a tribunal of their own, named *tou-tche-yven*. Its members have a right of remonſtrating with the emperor, whenever his own intereſt or that of the public renders it neceſſary. They inſpect all lawyers and military men in public employments. "In ſhort (ſays M. Groſier), they are, morally ſpeaking, placed between the prince and the mandarins; between the mandarines and the people; between the people and families; between families and individuals; and they generally unite to the importance of their office incorruptible probity and invincible courage. The ſovereign may, if he proceeds to rigour, take away their lives; but many of them have patiently ſuffered death, rather than betray the cauſe of truth, or wink at abuſes. It is not ſufficient therefore to have got rid of one, they muſt all be treated in the ſame manner; the laſt that might be ſpared would tread in the ſame ſteps with no leſs reſolution than thoſe who went before him. In the annals of no nation do we find an example of ſuch a tribunal, yet it appears to be neceſſary in all, without exception. We muſt not, however, imagine, that the privileges of a cenſor gave him a right to forget his duty to his ſovereign, or to communicate to the public thoſe remarks which he takes the liberty of making to him: were he only to give the leaſt hint of them to his colleagues, he would be puniſhed with death; and he would ſhare the ſame fate did he, in any of his repreſentations, ſuffer a ſingle word, inconſiſtent with moderation or reſpect, to eſcape him."

68 Two courts peculiar to China.

There are ſtill two other courts in China, both of them peculiar to the empire, which deſerve to be mentioned. The firſt is that of princes; and which, in conformity with its title, is compoſed of princes only.

In the regiſters of this tribunal are inſcribed the names of all the children of the imperial family as ſoon as they are born; and to theſe are alſo conſigned the dignities and titles which the emperor confers upon them. This is the only tribunal where the princes can be tried; and here they are abſolved or puniſhed according to the pleaſure of the judges.

The other tribunal is that of hiſtory, called by the Chineſe *han-lin-yvan*. It is compoſed of the greateſt geniuſes of the empire, and of men of the moſt profound erudition. Theſe are entruſted with the education of the heir apparent to the throne, and the compilation and arrangement of the general hiſtory of the empire; which laſt part of their office renders them formidable even to the emperor himſelf. From this body the mandarins of the firſt claſs, and the preſidents of the ſupreme claſs, are generally choſen.

69
Filial piety the baſis of all their laws:

The baſis of all the civil laws of the Chineſe is filial piety. Every mandarin, who is a governor either of a province or city, muſt inſtruct the people aſſembled round him twice a month, and recommend to them the obſervance of certain ſalutary rules, which are ſummed up in a few ſhort ſentences, and ſuch as no perſon can ever be ſuppoſed capable of forgetting.

70
Of their marriages.

The Chineſe are allowed only to have one wife, whoſe rank and age muſt be nearly equal to that of their huſbands; but they are allowed to have ſeveral concubines, whom they may admit into their houſes without any formality, after paying the parents a ſum of money, and entering into a written engagement to uſe their daughters well. Theſe concubines, however, are all in ſubjection to the lawful wife; their children are conſidered as heirs; they addreſs her as mother, and can give this title to her only. A perſon that has once been married, whether man or woman, may lawfully marry again, but it is then no longer neceſſary to ſtudy equality of age or condition. A man may chooſe his ſecond wife from among his concubines; and, in all caſes, this new marriage requires very few formalities. A widow is abſolute miſtreſs of herſelf, and can neither be compelled by her parents to marry again, nor to continue in a ſtate of widowhood, contrary to her own inclination. Thoſe of moderate rank, however, who have no children, do not enjoy the ſame privilege, as the parents of the former huſband can diſpoſe of her in marriage, not only without her conſent, but without her knowledge. The law authoriſes the diſpoſal of them in this manner, in order to indemnify the relations of the deceaſed huſband for the money they may have coſt him. If the wife is left big with child, this cannot take place, until ſhe is delivered; nor can it be done at all if ſhe brings forth a ſon. There are likewiſe two exceptions; 1. when the parents of the widow aſſign her a proper maintenance; and, 2. if the widow embraces a religious life, and becomes a bonzeſſe.

71
Divorces, unlawful marriages, &c.

Divorces are allowed in China in caſes of adultery, mutual diſlike, incompatibility of tempers, jealouſy, &c. No huſband, however, can put away or ſell his wife until a divorce is legally obtained; and if this regulation be not ſtrictly obſerved, the buyer and ſeller become equally culpable. If a wife, lawfully married, privately withdraws herſelf from her huſband, he may immediately commence an action at law; by the ſentence of which ſhe becomes his ſlave, and he is at liberty to ſell her to whom he pleaſes. On the other hand, if an huſband leaves his wife for three years, ſhe is at liberty, after laying her caſe before the mandarins, to take another huſband; but if ſhe were to anticipate their conſent, ſhe would be liable to a ſevere puniſhment.

Marriage is deemed illegal in China in the following caſes. 1. If a young woman has been betrothed to a young man, and preſents have been given and received by the parents of the intended huſband and wife. 2. If in the room of a beautiful young woman another be ſubſtituted of a diſagreeable figure; or if the daughter of a free man marry his ſlave; or if any one give his ſlave to a free woman, pretending to her parents that he is his ſon or relation. In all theſe caſes the marriage is null and void; and all thoſe who have had any ſhare in making up the match are ſeverely puniſhed.

3. Any mandarin of letters is forbidden to form an alliance with any family reſiding in the province or city of which he is governor.

4. No Chineſe youth can enter into a ſtate of marriage during the time of mourning for his father or mother; and if promiſes have been made before, they ceaſe immediately on that event taking place. After the uſual time of mourning is expired, however, the parents of the intended bride are obliged to write to thoſe of the young man, putting him in mind of his engagement.

5. Marriage is alſo ſuſpended when a family experiences any ſevere misfortune, and even if a near relation were thrown into priſon; though this may be ſet aſide, provided the unfortunate perſon give his conſent.

6. Two brothers cannot marry two ſiſters; nor is a widower at liberty to marry his ſon to the daughter of a widow whom he chooſes for his own wife. A man is alſo forbidden to marry any of his own relations, however diſtant the degree of conſanguinity may be between them.

In China every father of a family is reſponſible for the conduct of his children, and even of his domeſtics; all thoſe faults being imputed to him which it was his duty to have prevented. Every father has the power of ſelling his ſon, “provided (ſays the law) the ſon has a right of ſelling himſelf.” This cuſtom, however, is barely tolerated among the middling and inferior ranks; and all are forbidden to ſell them to comedians, or people of infamous character, or very mean ſtations.

In China a ſon remains a minor during the whole lifetime, and is even liable for the debts contracted by his father, thoſe from gaming only excepted. Adoption is authoriſed by law, and the adopted child immediately enters into all the rights of a lawful ſon; only the law gives a right to the father of making a few diſpoſitions in favour of his real children. The children, however, whether adopted or not, cannot ſucceed to the dignity or titles of their father, though they may to his eſtate. The emperor alone can confer honours; and even then they muſt be reſigned when the perſon attains the age of 70; though this reſignation is conſidered as an advice rather than a law.

law. The will of a father cannot be ſet aſide in China on account of any informality; nor can any mother in this empire make a will.

Though the Chineſe laws authoriſe ſlavery, yet the power of the maſter extends only to thoſe matters which concern his own ſervice; and he would be puniſhed with death for taking advantage of his power to debauch the wife of his ſlave.

By the laws of China huſbandmen are exempt from the payment of taxes after they have begun to till the earth to the beginning of harveſt.

72 Criminal laws in China.

In criminal matters every perſon accuſed muſt be examined before five or ſix tribunals; and whoſe enquiries are directed not only againſt him, but againſt his accuſer, and the witneſſes that appear in the cauſe. He is, however, obliged to remain in priſon during the proceſs: "but (ſays M. Groſier) the Chineſe priſons are not horrible dungeons like thoſe of ſo many other nations; they are ſpacious, and have even a degree of convenience. One of the mandarins is obliged to inſpect them frequently; and this he does with the greater punctuality, as he muſt anſwer for thoſe who are ſick. He is obliged to ſee them properly treated, to ſend for phyſicians, and to ſupply them with medicines at the emperor's expence. If any of them dies, he muſt inform the emperor, who perhaps will order ſome of the higher mandarins to examine whether the former has diſcharged his duty faithfully or not.

73 Method of inflicting the baſtinado.

The ſlighteſt puniſhment in China is the baſtinado; and the number of blows is to be determined by the degree of the offender's guilt. Twenty is the loweſt number; and in this caſe the puniſhment is conſidered as having nothing infamous in it, but being only a ſimple paternal correction. In this way the emperor ſometimes orders it to be inflicted on his courtiers; which does not prevent them from being afterwards received into favour, and as much reſpected as before. Every mandarin may inflict the baſtinado when any one forgets to ſalute him, or when he ſits in judgment in public. The inſtrument of correction is called *pan-tſee*, and is a piece of bamboo a little flatted, broad at the bottom, and poliſhed at the upper extremity, in order to manage it more eaſily with the hand. When the puniſhment is to be inflicted, the magiſtrate ſits gravely behind a table, having on it a bag filled with ſmall ſticks, while a number of petty officers ſtand around him, each furniſhed with theſe *pan-tſees*, and waiting only for his ſignal to make uſe of them. The mandarin then takes out one of the little ſticks contained in the bag, and throws it into the hall of audience. On this the culprit is ſeized and ſtretched out with his belly towards the ground; his breeches are pulled down to his heels, and an athletic domeſtic applies five ſmart blows with his *pan-tſee*. If the judge draws another ſmall ſtick from the bag, another officer ſucceeds, and beſtows five more blows; and ſo on until the judge makes no more ſignals. When the puniſhment is over, the criminal muſt throw himſelf on his knees, incline his body three times to the earth, and thank the judge for the care he takes of his education.

74 The *cangue*, or wooden collar.

For faults of a higher nature, the carrying of a wooden collar, called by the Portugueſe the *cangue*, is inflicted. This machine is compoſed of two pieces of wood hollowed out in the middle, which, when put together, leave ſufficient room for the neck. Theſe are laid upon the ſhoulders of the criminal, and joined together in ſuch a manner, that he can neither ſee his feet nor put his hands to his mouth; ſo that he is incapable of eating without the aſſiſtance of another. This diſagreeable burden he is obliged to carry day and night; its weight is from 50 to 200 pounds, according to the enormity of the crime, to which the time of carrying it is alſo proportioned. For robbery, breaking the peace, or diſturbing a family, or being a notorious gambler, it is generally carried three months. During all this time the criminal is not allowed to take ſhelter in his own houſe, but is ſtationed for a certain ſpace of time, either in ſome public ſquare, the gate of a city or temple, or perhaps even of the tribunal where he was condemned. On the expiration of his term of puniſhment, he is again brought before the judge, who exhorts him in a friendly manner to amend; and after giving him 20 ſound blows diſcharges him.

75 Baniſhment, &c.

Baniſhment is infliction for crimes of a nature inferior to homicide, and the duration is often for life, if the criminals be ſent into Tartary. Some culprits are condemned to drag the royal barks for three years, or to be branded in the cheeks with a hot iron, indicating the nature of their tranſgreſſions. Robbery between relations is more ſeverely puniſhed than any other; and that is accounted the moſt atrocious where younger brothers or nephews appropriate to themſelves beforehand any part of the ſucceſſion in which they have a right to ſhare with their elder brothers or nephews.

76 Puniſhment of informers againſt parents, &c.

Information againſt a father or mother, grandfather or grandmother, uncle or eldeſt brother, even though the accuſation be juſt, is puniſhed with 100 blows of the pan-tſee, and three years baniſhment. If the accuſation be falſe, it is puniſhed with death. Deficiency in proper filial reſpect to a father, mother, grandfather, or grandmother, is puniſhed with 100 blows of the pan-tſee; abuſive language to theſe relations is death by ſtrangling; to ſtrike them is puniſhed by beheading; and if any one preſumes to hurt or maim them, his fleſh is torn from his bones with red hot pincers, and he is cut into 1000 pieces. Abuſing an elder brother is puniſhed with 100 blows of the pan-tſee; ſtriking him, with the puniſhment of exile.

77 Capital puniſhments, how inflicted.

Homicide, even though accidental, is puniſhed with death in China. A rope about ſix or ſeven feet in length, with a running nooſe, is thrown over the criminal's head; and a couple of domeſtics belonging to the tribunal pull it ſtrongly in different directions. They then ſuddenly quit it, and in a few moments give a ſecond pull; a third is ſeldom neceſſary to finiſh the buſineſs. Beheading is accounted in China the moſt diſhonourable of all puniſhments, and is reſerved only for deſperate aſſaſſins, or thoſe who commit ſome crime equally atrocious with murder. To be cut in a thouſand pieces is a puniſhment inflicted only upon ſtate criminals or rebellious ſubjects. It is performed by tying the criminal to a poſt, ſcalping the ſkin from the head, and pulling it over the eyes. The executioner then tears the fleſh from different parts of the unhappy wretch's body; and never quits this horrible employment till mere fatigue obliges him to give over: the remains of the body are then left to the barbarous ſpectators, who finiſh what he has begun. Though this puniſhment, however, has been inflicted by ſome emperors with all the dreadful circumſtances juſt mentioned, the law orders only the criminal's belly to be opened, his body to be cut into ſeveral peices, and then thrown into a ditch or river.

The torture, both ordinary and extraordinary, is uſed in China. The former is applied to the hands or feet: for the hands, ſmall pieces of wood are applied diagonally between the fingers of the criminal; his fingers are then tied cloſe with cords, and he is left for ſome time in that painful ſituation. The torture for the feet is ſtill worſe. An inſtrument, conſiſting of three croſs pieces of wood, is provided, that in the middle being fixed, the others moveable. The feet of the criminal are then put into this machine, which ſqueezes them ſo cloſe that the ancle bones become flat. The extraordinary torture conſiſts in making ſmall gaſhes in the body, and then tearing off the ſkin like thongs. It is never applied but for ſome great crime, ſuch as treaſon, or where the criminal's guilt has been clearly proved, and it is neceſſary to make him diſcover his accomplices.

78
M. Groſier's general view of the Chineſe laws.

Notwithſtanding thoſe dreadful puniſhments, M. Groſier is at great pains to prove that the laws of the Chineſe, with regard to criminal matters, are extremely mild. "One law (ſays he) will no doubt appear exceedingly ſevere and rigorous; it inflicts the puniſhment of death on thoſe who uſe pearls. Thoſe who read the hiſtory of China will be apt to fall into certain miſtakes reſpecting the penal laws of that nation. Some of its ſovereigns have indulged themſelves in gratifying ſanguinary caprices which were not authoriſed by the laws, and which have often been confounded with them: but theſe princes are even yet ranked among the number of tyrants, and their names are ſtill abhorred and deteſted throughout the whole empire. The Chineſe, in their criminal procedure, have a great advantage over all other nations: it is almoſt impoſſible that an innocent man ſhould ever become a victim to a falſe accuſation: in ſuch caſes the accuſer and witneſs are expoſed to too much danger. The ſlowneſs of the proceſs, and the numberleſs reviſions it undergoes, are another ſafeguard for the accuſed. In ſhort, no ſentence of death is ever carried into execution until it has been approved and confirmed by the emperor. A fair copy of the whole proceſs is laid before him; a number of other copies are alſo made out, both in the Chineſe and Tartar languages, which the emperor ſubmits to the examination of a like number of doctors, either Tartars or Chineſe. When the crime is of great enormity, and clearly proved, the emperor writes with his own hand at the bottom of the ſentence, "When you receive this order, let it be executed without delay." In caſes where the crime, though puniſhable by death according to law, is ranked in the ordinary claſs, the emperor writes at the bottom of the ſentence, "Let the criminal be detained in priſon, and executed in autumn;" that being the ſeaſon in which they are generally executed, and all on the ſame day.

79
Caſes in which crimes may be pardoned.

The emperor of China never ſigns an order for the execution of a criminal till he has prepared himſelf by faſting. Like other monarchs he has the power of giving pardons; but in this reſpect is much more limited than any other. The only caſes in which the Chineſe monarch can remit the puniſhment inflicted by law, are, 1. To the ſon of a widow who has not married again; 2. To the heir of an ancient family; 3. The deſcendents of great men or citizens who have deſerved well of their country; and, 4. laſtly, the ſons, or grandſons of a mandarin, who has become illuſtrious, and diſtinguiſhed himſelf by faithfully diſcharging the duties of his office. Neither a child, nor a man of very advanced age, can be cited before a tribunal. The ſon of a very aged father and mother is pardoned, if private property or the public peace be not hurt by giving him a pardon; and if the ſons of ſuch a father and mother be all guilty, or accomplices in the ſame crime, the youngeſt is pardoned in order to comfort his parents.

In China the accuſed are always treated with tenderneſs and lenity, being accounted innocent until their guilt be clearly proved; and even then, liberty excepted, they are ſcarce allowed to want for any thing. A jailor is puniſhed who behaves rigorouſly towards his priſoners; and the judges muſt likewiſe anſwer at their peril for any additions to the ſeverity of the law: depoſition being the ſlighteſt puniſhment inflicted upon them.

Subſtitution is ſometimes allowed by the laws of China; ſo that the near relation of a guilty perſon may put himſelf into the criminal's place, provided, however, that the chaſtiſement be ſlight, and the accuſed his ancient friend. The ſons, grandſons, wife, and brothers of a baniſhed Chineſe, are allowed to follow him into exile; and the relations of all perſons are permitted to viſit them in priſon, and to give them every aſſiſtance in their power; to do which good offices they are even encouraged, inſtead of being prevented.

80
Of the cities and their government.

Every city in China is divided into different quarters, each of which is ſubjected to the inſpection of a certain officer, who is anſwerable for whatever paſſes in the place under his juriſdiction. Fathers of families, as we have already obſerved, are anſwerable for the conduct of their children and domeſtics. Neighbours are even obliged to anſwer for one another, and are bound to give every help and aſſiſtance in caſes of robery, fire, or any accident, eſpecially in the night-time. All the cities are furniſhed with gates, which are barricaded on the commencement of night. Centinels are alſo poſted at certain diſtances throughout the ſtreets, who ſtop all who walk in the night, and a number of horſemen go round the ramparts for the ſame purpoſe; ſo that it is almoſt impoſſible to elude their vigilance by favour of the darkneſs. A ſtrict watch is alſo kept during the day time; and all thoſe who give any ſuſpicion by their looks, accent, or behaviour, are immediately carried before a madarin, and ſometimes even detained until the pleaſure of the governor be known.

Private quarrels do not often happen in China, and it is rare that they are attended with a fatal iſſue. The champions ſometime decide the quarrel with their fiſts, but moſt frequently refer the caſe to a mandarin, who very often orders them both a ſound drubbing. None but military people are permitted to wear arms in public; and this privilege is extended even to them only during the time of war, or when they accompany a mandarin, mount guard, or attend a review. Proſtitutes are not allowed to remain within the walls of a city, or to keep a houſe of their own even in the ſuburbs. They may, however, lodge in the houſe of another: but that other is accountable for every diſturbance which may happen on their account.

81
Borrowing of money.

In all the Chineſe cities, and even in ſome of their ordinary towns, there is an office where money may be borrowed upon pledges at the common rate of the country; which, however, is no leſs than 30 *per cent.* Every pledge is marked with a number when left at the office, and muſt be produced when demanded: but it becomes the property of the office if left there a ſingle day longer than the term agreed upon for the payment of the money. The whole tranſaction remains an inviolable ſecret; not even the name of the perſon who leaves the pledge being inquired after.

82
Of the Chineſe roads.

Great attention is paid by the adminiſtration of China to the conveniency of travellers. The roads are generally very broad, all of them paved in the ſouthern provinces, and ſome in the northern; but neither horſes nor carriages are allowed to paſs along theſe. In many places valleys have been filled up, and rocks and mountains cut through, for the purpoſe of making commodious high ways, and to preſerve them as nearly as poſſible on a level. They are generally bordered with very lofty trees, and in ſome places with walls eight or ten feet high, to prevent travellers from going into the fields; but openings are left in proper places, which give a paſſage into croſs roads that lead to different villages. Covered ſeats are erected on all the great roads, where travellers may ſhelter themſelves from the inclemency of the weather; temples and pagods are alſo frequent, into which travellers are admitted without ſcruple in the day-time, but often meet with a refuſal in the night. In theſe mandarins only have a right to reſt themſelves as long as they think proper. There is, however, no want of inns on the great roads, or even the croſs ones in China; but they are ill ſupplied with proviſions: and thoſe who frequent them are even obliged to carry beds along with them to ſleep on, or elſe take up with a plain mat.

Towers are erected on all the roads of this great empire, with watch-boxes on the top, with flag-ſtaffs, for the convenience of ſignals, in caſe of any alarm. Theſe towers are ſquare, and generally conſtructed of brick, but ſeldom exceed twelve feet in height. They are built, however, in ſight of one another, and are guarded by ſoldiers, who run with great ſpeed from one to another, carrying letters which concern the emperor. Intelligence of any remarkable event is alſo conveyed by ſignals; and thus the court is informed with ſurpriſing quickneſs of any important matter. Thoſe which are built on any of the roads conducting to court, are furniſhed with battlements, and have alſo very large bells of caſt iron. According to law theſe towers ſhould be only five *lys*, about half a French league, diſtant from one another.

83
Method of conveyance.

There is no public poſt-office in China, though ſeveral private ones have been eſtabliſhed; but the couriers and offices charged with diſpatches for the empire have only a right to make uſe of them. This inconvenience, however excepted, travellers find conveyance very eaſy from one part of China to another. Great numbers of porters are employed in every city, all of whom are aſſociated under the conduct of a chief, who regulates all their engagements, fixes the price of their labour, receives their hire, and is reſponſible for every thing they carry. When porters are wanted, he furniſhes as many as may be neceſſary, and gives the ſame number of tickets to the traveller; who returns one to each porter when they have conveyed their loads to an appointed place. Theſe tickets are carried back to the chief, who immediately pays them from the money he received in advance. On all the great roads in China there are ſeveral offices of this kind, which have a ſettled correſpondence with others; the travellers therefore have only to carry to one of theſe offices a liſt of ſuch things as they wiſh to have tranſported: this is immediately written down in a book; and though there ſhould be occaſion for two, three, or four hundred porters, they are inſtantly furniſhed. Every thing is weighed before the eyes of their chief, and the hire is five pence per hundred weight for one day's carriage. An exact regiſter of every thing is kept in the office; the traveller pays the money in advance, after which he has no occaſion to give himſelf any farther trouble: on his arrival at the city he deſigns, his baggage is found at the correſponding office, and every thing is delivered to him with the moſt ſcrupulous exactneſs.

84
Cuſtom-houſes.

The cuſtom-houſes are here regulated by the general police of the country; and according to M. Groſier's account, theſe cuſtom-houſe officers are the moſt civil in the world. They have no concern with any claſs of people but the merchants, whom they take care not to diſtreſs by any rigorous exactions; neither, though they have authority to do ſo, do they ſtop travellers till their baggage is examined, nor do they even require the ſmalleſt fee from them. Duties are paid either by the piece or the load; and in the former caſe credit is given to the merchant's book without aſking any queſtions. A mandarin is appointed by the viceroy of each province to inſpect the cuſtom-houſes of the whole diſtrict; and the mandarins have alſo the care of the poſt-offices.

85
Money of the empire.

In former times the only money uſed in China was made of ſmall ſhells, but now both ſilver and copper coin are met with. The latter conſiſts of round pieces about nine-tenths of an inch (A) in diameter, with a ſmall ſquare hole in the middle, inſcribed with two Chineſe words on one ſide, and two Tartar ones on the other. The ſilver pieces are valued only by their weight. For the convenience of commerce, the metal is therefore caſt into plates of different ſizes; and for want of ſmall coin, a Chineſe always carries about

---

(A) The Chineſe foot is longer by one hundredth part than the French, and the inch is divided into ten parts.

about him his ſcales, weights, and a pair of ſciſſars to cut the metal. This operation is performed by putting the ſilver between the ſciſſars, and then knocking them againſt a ſtone till the pieces drop off. In giving of change, however, people have no right to value ſilver by the numerical value of copper, this being entirely regulated by the intrinſic value of the metals. Thus, an ounce of ſilver will ſometimes be worth 1000 copper pieces, and ſometimes only 800; and thus the copper money of China may frequently be ſold for more than it would paſs for in commerce. The emperor would loſe much by this recoinage, were he not the ſole proprietor of all the copper mines in China. It is, however, expreſsly forbidden to employ copper coin in any manufacture where it might be employed as plain copper, and it is alſo forbidden to be ſold for the purpoſe of melting: but, if the price of the metal has not fallen, the infraction of this law is not very ſeverely puniſhed. On the other hand, if the value of unwrought copper exceeds that of the coin, a quantity of the latter is iſſued out to reſtore the equilibrium.

To keep up a conſtant circulation of all the coin in the empire, the Chineſe government are attentive to preſerve an equilibrium between the proportional value of the gold and ſilver; that is, to regulate the intrinſic value of each in ſuch a manner that the poſſeſſor of ſilver may not be afraid to exchange it for copper, nor the poſſeſſor of copper for ſilver. The method uſed for this purpoſe is, when ſilver becomes ſcarce, to make all the payments for ſome time in ſilver; but if copper, to make them all for ſome time in that metal only.

86 Of the Chineſe commerce.

The commerce of China is under the inſpection of the tribunal of finances; but on this ſubject the Chineſe entertain an opinion quite different from that of the Europeans. Commerce, according to them, is only uſeful as far as it eaſes the people of their ſuperfluities, and procures them neceſſaries. For this reaſon they conſider even that which is carried on at Canton as prejudicial to the intereſt of the empire. "They take from us (ſay the Chineſe) our ſilks, teas, and porcelain: the price of theſe articles is raiſed through all the provinces: ſuch a trade therefore cannot be beneficial. The money brought us by Europeans, and the high-priced baubles that accompany it, are mere ſuperfluities to ſuch a ſtate as ours. We have no occaſion for more bullion than what may be neceſſary to anſwer the exigencies of government, and to ſupply the relative wants of individuals. It was ſaid by Kouan-tſe, two thouſand years ago, That the money introduced does not enrich a kingdom in any other way than as it is introduced by commerce. No commerce can be advantageous long, but that which conſiſts in a mutual exchange of things neceſſary or uſeful. That trade, whether carried on by barter or money, which has for its object the importing of articles that tend to the gratification of pride, luxury, or curioſity, always ſuppoſes the exiſtence of luxury: but luxury, which is an abundance of ſuperfluities among certain claſſes of people, ſuppoſes the want of neceſſaries among a great many others. The more horſes the rich put to their carriages, the greater will be the number of thoſe who are obliged to walk on foot; the larger and more magnificent their houſes are, ſo much the more confined and wretched muſt thoſe of the poor be; and the more their tables are covered with a variety of diſhes, the more muſt the number of thoſe increaſe who are reduced to the neceſſity of feeding upon plain rice. Men, united by ſociety in a large and populous kingdom, can employ their induſtry, talents, and economy, to no better purpoſe than to provide neceſſaries for all, and procure convenience for ſome."

87 Hiſtory of the trade with Ruſſia.

The only commerce conſidered by the Chineſe as advantageous to their empire, is that with Ruſſia and Tartary; by which they are ſupplied with thoſe furs ſo neceſſary in the northern provinces. The diſputes concerning the limits of the reſpective empires of Ruſſia and China ſeem to have paved the way to this commerce. Theſe diſputes were ſettled by treaty on the 27th of Auguſt 1689, under the reign of Ivan and Peter Alexiowitz. The chief of the embaſſy on the part of Ruſſia was Golovin governor of Siberia; and two Jeſuits were deputed on the part of the emperor of China; and the conferences were held in Latin, with a German in the Ruſſian ambaſſador's train, who was acquainted with that language. By this treaty the Ruſſians obtained a regular and permanent trade with China, which they had long deſired; but in return they yielded up a large territory, beſides the navigation of the river Amour. The firſt intercourſe had taken place in the beginning of the 17th century; at which time a ſmall quantity of Chineſe merchandize was procured by ſome Ruſſian merchants from the Kalmuck Tartars. The rapid and profitable ſale of theſe commodities encouraged certain Siberian Wayvodes to attempt a direct and open communication with China. For this purpoſe ſeveral deputations were ſent to the emperor; and though they failed of obtaining the grant of a regular commerce, their attempts were attended with ſome conſequences of importance. Thus the Ruſſian merchants were tempted to ſend traders occaſionally to Peking; by which means a faint connection was preſerved with that metropolis. This commerce, however, was at laſt interrupted by the commencement of hoſtilities on the river Amour; but after the concluſion of the treaty in 1689, was reſumed with uncommon alacrity on the part of the Ruſſians: and the advantages thence ariſing were found to be ſo conſiderable, that a deſign of enlarging it was formed by Peter the Great. Iſbrand Ides, a native of the duchy of Holſtein, then in the Ruſſian ſervice, was therefore diſpatched to Peking in 1692; by whoſe means the liberty of trade, before confined to individuals, was now extended to caravans. In the mean time, private merchants continued to trade as before, not only with the Chineſe, but alſo at the head quarters of the Mogul Tartars. The camp of theſe roving Tartars, which was generally ſtationed near the confluence of the Orhon and Toula rivers between the ſouthern frontiers of Siberia and the Mogul deſert, thus became the ſeat of an annual fair. Complaints, however, were ſoon made of the diſorderly behaviour of the Ruſſians; on which the Chineſe monarch threatened to expel them from his dominions entirely, and to allow them neither to trade with the Chineſe nor Moguls. This produced another embaſſy to Peking in 1719, when matters were again adjuſted to the

the ſatisfaction of both parties. The reconciliation, was of no long duration; for the Ruſſians having ſoon renewed their diſorderly behaviour, an order for their expulſion was iſſued in 1722, and all intercourſe between the two nations forbidden. The differences were once more made up in 1727, and a caravan allowed to go to Peking once in three years, provided it conſiſted of no more than 100 perſons; and that during their ſtay their expences ſhould not, as formerly, be defrayed by the emperor of China. The Ruſſians at the ſame time obtained permiſſion to build a church within the precincts of the caravanſary; and that four prieſts were allowed to reſide at Peking for the celebration of divine ſervice; the ſame indulgence being granted to ſome Ruſſian ſcholars, for the purpoſe of learning the Chineſe language, and qualifying themſelves for being interpreters between the two nations. This intercourſe continued till the year 1755; ſince which time no more caravans have been ſent to China. It was firſt interrupted by a miſunderſtanding betwixt the two courts; and though that difference was afterwards made up, no caravans have been ſent ever ſince. The empreſs of Ruſſia, ſenſible that the monopoly of the fur trade (which was entirely confined to the caravans belonging to the crown, and prohibited to individuals) was prejudicial to commerce, gave it up in favour of her ſubjects in 1762; and the centre of commerce betwixt the two nations is now at Kiatka. Here the trade is entirely carried on by barter. The Ruſſians are prohibited from exporting their own coin; finding it more advantageous to take goods in exchange than to receive bullion at the Chineſe ſtandard. The principal exports from Ruſſia are furs of different kinds; the moſt valuable of which are thoſe of ſea-otters, beavers, wolves, foxes, martins, ſables, and ermines; the greater part of which are brought from Siberia and the newly diſcovered iſlands; but as they cannot ſupply the demand, there is a neceſſity for importing foreign furs to Peterſburgh, which are afterwards ſent to Kiatka. Various kinds of cloth are likewiſe ſent to China, as well as hardware, and live cattle, ſuch as horſes, camels, &c. The exports from China are, raw and manufactured ſilk, cotton, porcelain, rhubarb, muſk, &c. The government of Ruſſia likewiſe reſerves to itſelf the excluſive privilege of purchaſing rhubarb. It is brought to Kiatka by ſome Bukharian merchants, who have entered into a contract to ſupply the crown with it in exchange for furs: the exportation of the beſt rhubarb is forbidden under ſevere penalties, but yet is procured in ſufficient quantities, ſometimes by clandeſtinely mixing it with inferior roots, and ſometimes by ſmuggling it directly. Great part of Europe is ſupplied with rhubarb from Ruſſia.

88
Emperor's revenue.

The revenue of the emperor of China amounts to more than 41 millions ſterling; and might eaſily be increaſed, did the ſovereign incline to burden his ſubjects with new impoſitions. The annual expences of government are indeed immenſe, but they are regulated in ſuch a manner as never to be augmented but in caſes of the utmoſt neceſſity; it even happens very often that adminiſtration makes greater ſavings every year. When this happens to be the caſe, the ſurplus ſerves to increaſe the general treaſure of the empire, and prevents the neceſſity of new impoſitions in time of war, or other public calamities. The greater part of the taxes are paid in kind; thoſe, for inſtance, who breed ſilk worms, pay their taxes in ſilk, the huſbandmen in grain, the gardeners in fruits, &c. This method, at the ſame time that it is exceedingly convenient for the ſubject, is no way detrimental to the public intereſt. There are numbers of people every where in the ſervice of government, who are thus furniſhed with food and clothing; ſo that the commodities collected as taxes are almoſt conſumed in the provinces where they are levied; what remains is ſold for the behoof of the emperor, and the money depoſited in the imperial treaſury. The taxes paid in money ariſe principally from the cuſtoms and ſale of ſalt (which belongs entirely to the emperor), from the duties paid by veſſels entering any port, and from other impoſts on various branches of manufactures. Excepting theſe, the trader ſcarcely contributes any thing to the exigencies of the ſtate, and the mechanic nothing at all; the whole burden of taxation thus falling upon the huſbandman. This burden is regulated in proportion to the extent and fertility of his lands; and the greateſt care has been taken to manage matters ſo, that he may neither be overcharged in the impoſition nor haraſſed in the levying of the duties. "The regiſtering of lands (ſays M. Groſier), ſo often and to no purpoſe projected in France, has been long practiſed in this empire, notwithſtanding its prodigious extent."

89
Of the taxes in China.

The levying of taxes in China is as ſimple as the nature of the thing will admit of. The duties levied from towns and villages are carried to cities of the third claſs; then they are conducted to thoſe of the ſecond; then to thoſe of the firſt; and at laſt to the capital. The levying and impoſition of taxes is ſubmitted to the tribunal of finances; and matters are ſo managed, that beſides the conſumption in each diſtrict for diſcharging the ordinary expences of government, ſomething is left by way of reſerve for anſwering accidental demands, and to be ready in caſes of neceſſity. This ſum becomes gradually leſs from the capital to cities of the firſt, ſecond, and third claſs. A proper ſtatement of what is paid in the provinces, of what is reſerved in the different cities, or contained in the different treaſuries of the empire, is ſubjected to the examination of the grand tribunal of finances. This reviſes the whole, and keeps an exact account of what is conſumed, and of whatever ſurplus may be left.

90
Of lending money, and deficiencies in paying intereſt.

Lending money upon intereſt has been in uſe in China for about 2000 years. It has often been aboliſhed, and as often eſtabliſhed. The intereſt, as has been already hinted, is no leſs than 30 *per cent.* and the year is only lunar. A tenth part of this intereſt is paid monthly; and concerning neglects of payment, the following laws have been enacted. "However much the debt may have accumulated by months or years, the principal and intereſt ſhall remain always the ſame. Whoever infringes this law ſhall receive 40 blows of a *pan-tſee*; or an hundred, if he uſes any artifice to add the principal and intereſt together." This law is explained by the following. "Whoever ſhall be convicted before a mandrain of not having paid a month's intereſt, ſhall receive ten blows; twenty for two months, and thirty for three; and in this manner as far as ſixty; that is to ſay, to the ſixth month. The debtor is then obliged to pay principal and intereſt; but thoſe who obtain payment by uſing violence and force, are condemned to receive 24 blows.

Many Chineſe writers have endeavoured unſucceſsfully to ſhow why government ſhould allow ſuch exorbitant intereſt to be taken for money; but the moſt ſatisfactory and rational account ſeems to be, that the great intereſt of money prevents the rich from purchaſing much land; as landed eſtates would only embarraſs and impoveriſh them, their produce being ſo much inferior to that of money. The patrimony of a family in China is ſeldom divided; and it never happens there, as in almoſt every other country, that wealth and riches are engroſſed by one part of the nation, while the other poſſeſſes nothing.

91 Agriculture greatly encouraged.

92 Ceremony of the emperor tilling the earth with his own hands.

Agriculture is by the Chineſe conſidered as the firſt and moſt honourable of all profeſſions; ſo that in this empire the huſbandman enjoys many and great privileges, while the merchant and mechanic are much leſs eſteemed. Part of the crop is allowed to be uſed in diſtillation; but if the harveſt happens to be bad, this operation is prohibited. In China, the tillage of the earth is not only encouraged by law, but alſo by the example of the emperor, who annually tills the earth with his own hands. The beginning of ſpring in China is always reckoned to be in the mouth of February; but it belongs to the tribunal of mathematics to determine the preciſe day. The tribunal of ceremonies announces it to the emperor by a memorial; in which every thing requiſite to be done by him is mentioned with the moſt ſcrupulous exactneſs. The ſovereign then names 12 of the moſt illuſtrious perſons in his court to accompany him, and to hold the plough after he has performed his part of the ceremony. Among theſe there are always three princes of the blood, and nine preſidents of ſupreme courts; and if any of them are too old and infirm to undergo the fatigue, the ſubſtitutes muſt be authoriſed by the emperor. The feſtival is preceded by a ſacrifice, which the emperor offers up to *Chang-ti* (the ſupreme God); after which he and his attendants prepare themſelves by three days faſting and continence. Others are appointed by the emperor, on the evening before the ceremony, to go and proſtrate themſelves at the ſepulchre of his anceſtors, and to acquaint them, that, on the day following, he intends to celebrate a grand ſacrifice. This is offered up on a ſmall mount a few furlongs diſtant from the city, which, by the indiſpenſable rules of the ceremony, muſt be 50 feet in height. The Chang-ti is invoked by the emperor, who ſacrifices under the title of ſovereign pontiff, and prays for an abundant harveſt in favour of his people. He then deſcends, accompanied by the three princes and nine preſidents who are to put their hands to the plough along with him; the field ſet apart for this purpoſe being at a ſmall diſtance from the mount. Forty labourers are ſelected to yoke the oxen, and to prepare the ſeeds which the emperor is to ſow; and which are of five different kinds, viz. wheat, rice, two kinds of millet, and beans. They are brought to the ſpot in magnificent boxes, carried by perſons of the moſt diſtinguiſhed rank. The emperor then lays hold of the plough, and turns up ſeveral furrows; the princes of the blood do the ſame, and then the preſidents; after which the emperor throws into the furrows the five kinds of ſeeds already mentioned: laſtly, four pieces of cotton-cloth, proper for making dreſſes, are diſtributed to each of the labourers, who aſſiſt in yoking the oxen and preparing the ſeeds; and the ſame preſents are made to 40 other perſons who have only been ſpectators of the ceremony.

93 Of the peaſants.

“We muſt not (ſays M. Groſier) judge of the Chineſe peaſants from thoſe of Europe, eſpecially in what relates to the lights acquired by education. Free ſchools are very numerous in every province of China, and even ſome of the villages are not deſtitute of this advantage. The ſons of the poor are there received as readily as thoſe of the rich; their duties and their ſtudies are the ſame; the attention of the maſters is equally divided between them; and from this obſcure ſource talents often ſpring, which afterwards make a conſpicuous figure on the grand ſtage of life. Nothing is more common in China than to ſee the ſon of a peaſant governor of that province in which his father had long toiled in cultivating only a few acres. The father himſelf, if taken from his plough, and elevated to a ſuperior ſphere, might, by reviving the inſtruction he received in his youth, and eſpecially if he be endowed with genius, find himſelf fully competent for his new employment.”

94 Groſier's defence of the Chineſe from the charge of murdering and expoſing their children.

The Chineſe have been greatly reproached with the inhuman practice of murdering their children; but though our author cannot deny that they are guilty of this practice, he excuſes them by ſaying, that “the crime when committed in China is commonly owing to the fanaticiſm of idolatry; a fanaticiſm which prevails only among the loweſt of the people. It is either in obedience to the oracle of a bonze, to deliver themſelves from the power of magic ſpells, or to diſcharge a vow, that theſe infatuated wretches precipitate their children into the river: they imagine that, by doing ſo, they make an expiatory ſacrifice to the ſpirit of the river. All nations of antiquity almoſt have diſgraced themſelves by the like horrid practices; but the Chineſe are far from countenancing this barbarity on that account. Beſides, theſe criminal ſacrifices are never practiſed but in certain cantons of China, where the people, blinded by idolatry, are the dupes of prejudice, fanaticiſm, and ſuperſtition.—It often happens alſo, that the bodies of thoſe children which are ſeen floating on the water have not been thrown into it till after their death; and this is likewiſe the caſe with thoſe which are found in the ſtreets, or lying near the public roads. The poverty of the parents ſuggeſts this diſmal reſource, becauſe their children are then buried at the expence of the public. Expoſing of children in public places is a cuſtom tolerated in China; and government employs as much vigilance to have them carried away in the morning, as it beſtows care on their education. This is certainly giving people intimation to expoſe their children in the night-time, and no doubt encourages the practice; but the dictates of humanity are here united to thoſe of ſound policy. No law in China authoriſes mutilation: there are indeed eunuchs in the empire, but their number is much leſs than what it is generally ſuppoſed to be by Europeans. The greater part of the eunuchs belonging to the emperor and empreſſes have no higher employment than that of ſweeping the courts of juſtice.”

95 Gazette of Peking.

Like the capital cities of European kingdoms, Peking, the metropolis of the Chineſe empire, is furniſhed with a gazette, which circulates into the remoteſt provinces, and which is even conſidered by adminiſtration as an eſſential part of the political conſtitution. It is printed daily at Peking, and contains an account of all thoſe objects to which the attention of adminiſtration is directed. In this gazette may be ſeen the names of all thoſe mandarins who are ſtripped of their employments, and the cauſes of their diſgrace; it mentions alſo the names of all thoſe delinquents who are puniſhed with death; of the officers appointed to fill the places of the diſgraced mandarins; the calamities which have afflicted any of the provinces; the relief given by government; and the expences incurred by adminiſtration for the ſubſiſtence of the troops, ſupplying the wants of the people, repairing or erecting public works; and, laſtly, the remonſtrances made to the ſovereign by the ſuperior tribunals, either with regard to his public deciſions or private conduct, and ſometimes even with regard to both. Nothing, however, is contained in this gazette that has not immediately come from the emperor, or been ſubmitted to his inſpection; and immediate death would be the conſequence of inſerting a falſehood in this miniſterial paper.

96 Seals of the emperor, mandarins, &c.

No law or ſentence, as has already been ſaid, is of any force, until the emperor's ſeal has been affixed to it. This is about 8 inches ſquare, and is made of fine jaſper, a kind of precious ſtone much eſteemed in China; of which only the emperor is allowed to have a ſeal. Thoſe given to princes as marks of honour are compoſed of gold; the ſeals of the viceroys and great mandarins, of ſilver; while thoſe of inferior mandarins and magiſtrates are made only of lead or copper. The ſize of thoſe ſeals is greater or ſmaller according to the rank their poſſeſſors hold in the tribunals or as mandarins; and when any of them happens to be worn out, intimation muſt be ſent to the next ſuperior tribunal; on which a new one is ſent, and the old one muſt then be delivered up. The commiſſion of every inſpector ſent into the provinces muſt alſo be confirmed by the emperor's ſeal. The duty of theſe officers is to examine into the conduct of governors, magiſtrates, and private individuals; and inſtances are recorded of emperors themſelves aſſuming the office of inſpectors in ſome of the provinces. Theſe officers are not only ſuperior to all the magiſtrates, but even to the viceroys of the provinces themſelves. When a ſuperior magiſtrate behaves ill to an inferior one, the former inſtantly becomes the priſoner of the inſpector, and is ſuſpended from his office until he has cleared himſelf from every imputation laid to his charge. The viceroy, however, is allowed to enjoy his office until the report of the inſpector has been tranſmitted to the emperor.

97 Power of the viceroys of provinces.

Theſe viceroys are diſtinguiſhed by the title of *Tſong-tou*, and are always mandarins of the firſt claſs, poſſeſſing an almoſt unlimited power within their diſtricts. They march abroad with all the pomp of royal magnificence, never quitting their palaces, on the moſt trifling occaſion, without a guard of 100 men. A viceroy is the receiver-general of all the taxes collected in the province, tranſmitting them to the capital, after having reſerved what he judges neceſſary for the demands of his diſtrict. All law-ſuits muſt be brought before his tribunal; and he has the power of paſſing ſentence of death, but it cannot be put in execution without being firſt carried to the emperor. Every three years he ſends to court a report of the conduct of the mandarins ſubordinate to him; and according to the contents they are either continued or diſgraced. Thoſe of whom he makes an unfavourable report are puniſhed in proportion to their delinquency; while, on the other hand, thoſe who have the good fortune to be well reported, are rewarded in a ſimilar proportion.

98 Degradation of mandarins.

The principal mandarins are ſometimes broke and diſmiſſed from all their employments, while others are only removed ſome degrees lower. Thoſe who have been degraded ten ſteps, run a great riſk of never being employed again. Theſe degraded mandarins are kept in perpetual remembrance of their misfortune, by being obliged to mention it in every public order they iſſue forth in their inferior ſtation; thus, "I, ſuch a mandarin, degraded one, two, three, *&c.* ſteps, command and order," *&c.* Over theſe inferior mandarins the inſpector of the province has a very unlimited authority, and can, by his own power, deprive them of their employments for a great offence; nor does he conſult the court, excepting where the immediate puniſhment of the criminal is not neceſſary. Every one of the mandarins, of whatever rank or denomination, is obliged, once in three years, to give in writing an exact account of the faults he has committed in the execution of his office. If he is a mandarin belonging to any of the four firſt claſſes, this confeſſion is examined at court; but if it is made by any of the inferior ones, it muſt be laid before the provincial tribunal of the governor. Government, however, is not ſatisfied even with this confeſſion; inquiry is made into the truth of it, and the conduct of the mandarin is ſcrutinized with the utmoſt ſeverity, the informations being ſubjected to the tribunal of mandarins; where they are carefully examined, the merits and demerits of thoſe ſubjected to this political inquiſition carefully balanced, and their names afterwards divided into three claſſes. The firſt conſiſts of thoſe for whom rewards and preferment are intended; the ſecond, for whom gentle reproof and admonition are thought neceſſary; and the third, of thoſe who are to be ſuſpended for ſome time, or removed altogether, from their offices. Of theſe laſt ſome are allowed to continue; but they receive no ſalary, and are not only deprived of all their emoluments, but even of their honours. If they have been guilty of any action tending to oppreſs the people, or to occaſion a famine or ſcarcity among the lower ranks, their puniſhment is not confined to diſmiſſion from their offices, but they are alſo criminally impeached. The family burying-place of every Chineſe is accounted ſacred; none dares cut down the trees with which it is overſhadowed until they become decayed with age; and even then, not until their condition has been atteſted by a mandarin: but for certain crimes againſt government or the people, the burying-place of a mandarin is raſed to the foundation. No kind of puniſhment, however, inflicted on a father, is ſuppoſed in the leaſt to affect the character of his ſon; and therefore, when the latter is aſked by the emperor concerning his family, he will perhaps

coolly

cooly anſwer, “ My father was diſgraced for ſuch a crime, my grandfather was beheaded for ſuch another,” without the acknowledgement being in the leaſt detrimental. On the contrary, by great and important ſervices, it is poſſible for him to wipe out theſe ſtains from the memory of his anceſtors.

Though the empire of China is governed by Tartar princes, the latter ſeem to beſtow much more care and attention on the Chineſe than their own natural ſubjects. Should any diſpute ariſe between a Chineſe and a Tartar, the former muſt have greatly deviated from the rules of juſtice, if he is not acquitted even by thoſe tribunals which are compoſed of half Chineſe and half Tartars. The ſlighteſt fault committed by a Tartar mandarin is always ſeverely puniſhed; but the puniſhment of the greateſt is often mitigated if the delinquent be a Chineſe; and the ſame ſeverity is exerciſed towards thoſe of the military department. Thoſe faults, however, are puniſhed with the greateſt ſeverity which hurt the intereſts of the people: for which reaſon they ſeldom fall a ſacrifice to that claſs of petty tyrants who in other countries prey upon and devour them. Every ſuperior mandarin is obliged to inform himſelf of the faults of his inferiors, and expoſe them; nay, he would be puniſhed for them himſelf if he did not.

99
Privileges of princes, &c. in China.

Very little regard, as we have already had occaſion to obſerve, is paid to hereditary right in China. Even the princes of the blood enjoy no other privilege by birth but that of wearing a yellow girdle; and the names of their children, with the exact time of their birth, are inſcribed in a yellow book appropriated to that purpoſe. Collateral princes are diſtinguiſhed by an orange girdle, and their children are marked in a book of a red colour. The ſurnames of the princes of the reigning family are determined by the emperor alone; the reſt not being allowed to aſſume any name that too much reſembles thoſe of the Moguls or Chineſe. The rank even of the emperor's ſons diminiſhes one degree every generation; ſo that, at the ſeventh, only the eldeſt branch has a title to wear the yellow girdle, the reſt being ſunk into the rank of plain citizens. An hereditary ſovereignty, however, paſſes from one eldeſt ſon to another; and this title cannot be forfeited, unleſs the poſſeſſor be guilty of ſome crime. In this caſe the emperor appoints to the ſucceſſion either one of his younger brothers or a couſin; but theſe muſt be always choſen from the ſame branch, as the lawful branch cannot be deprived of its right without the condemnation of all who compoſe it. The only hereditary authority of the other princes exiſts among thoſe troops called the *Tartar bands*. There they enjoy, without oppoſition, that rank which they derive from their birth, but in every thing elſe are on a level with others. They are ſubjected to a military examination at ſtated periods, and are always promoted or degraded according to the degree of ſkill they exhibit. The ſame trial is undergone by the heir apparent and his ſons; the only indulgence ſhown them being, that ſchools are appointed for their particular uſe. The princes are likewiſe indulged with a tribunal appropriated on purpoſe for them, and before which alone they can be tried. An inſult offered to a prince decorated with the yellow girdle is puniſhed with death; but if he has omitted to put it on, the aggreſſor eſcapes with a baſtinading. A prince may be put to death by the emperor's conſent; but he eſcapes every ſlighter corporal puniſhment by paying a fine. Untitled princes have very few privileges ſuperior to thoſe of common citizens; and are generally very poor, unleſs poſſeſſed of ſome lucrative office. Thus they are ſometimes reduced to the neceſſity of accepting the higheſt pay of a common ſoldier in the Tartar bands. When they, or any of their children, however, enter into the marriage ſtate, the emperor uſually makes them a preſent of 100 ounces of ſilver. He will alſo relieve them on other occaſions, aſſiſt their widows and orphans, *&c.* but in all this never departs from the moſt exact rules of economy; ſo that the mandarins in this reſpect are much better than the relations of the ſovereign himſelf.

100
F. Amiot's account of the ancient religion of China.

With regard to the ancient religion of China, F. Amiot informs us, that, after making every poſſible reſearch, comparing and reaſoning upon his obſervations, he at laſt concluded, that “ the Chineſe are a diſtinct people, who have ſtill preſerved the characteriſtic marks of their firſt origin; a people whoſe primitive doctrine will be found, by thoſe who take the trouble of inveſtigating it thoroughly, to agree in its eſſential parts with the doctrine of the choſen people, before Moſes, by the comand of God himſelf, had conſigned the explanation of it to the ſacred records; a people, in a word, whoſe traditional knowledge, when freed from whatever the ignorance or ſuperſtition of later ages has added to it, may be traced back from age to age, and from epocha to epocha, without interruption, for the ſpace of 4000 years, even to the renewal of the human race by the grandſon of Noah.” The *king*, or canonical books of the Chineſe, every where inculcate the belief of a Supreme Being, the author and preſerver of all things. Under him they mention the names of *Tien*, or Heaven; *Chang-tien*, or Supreme Heaven; *Chang-ti*, or Supreme Lord; and of *Hoang-chan-ti*, Sovereign and Supreme Lord: “ Names (ſays M. Groſier) correſponding to thoſe which we uſe when we ſpeak of God, the Lord, the Almighty, the Moſt High.”

According to the Chineſe books, the Supreme Being is the principle of every thing that exiſts, and the father of all living; he is eternal, immoveable, and independent; his power knows no bounds; his ſight equally comprehends the paſt, preſent, and the future, penetrating even into the inmoſt receſſes of the heart. Heaven and earth are under his government; all events, all revolutions, are the conſequences of his will; he is pure, holy, and impartial; wickedneſs offends his ſight; but he beholds with an eye of complacency the virtuous actions of men. Severe, yet juſt, he puniſhes vice in a ſtriking manner even on the throne, and often precipitates from thence the guilty, to place upon it the man who walks after his own heart, whom he hath raiſed from obſcurity. Good, merciful, and full of pity, he relents on the repentance of the wicked: public calamities, and the irregularities of the ſeaſons, are only ſalutary warnings, which his fatherly goodneſs gives to men to induce them to reform and amend.

The performance of religious worſhip at the proper and appointed times, has given occaſion to the great exact-

exactneſs with reſpect to the kalendar, which is remarkable throughout the empire of China; and all the celebrated emperors have begun their reigns with a reformation of it. Our hiſtorians, however, not contented with diſcovering in the Chineſe religion the fundamental principles of the ancient patriarchal religion, have alſo found in it evident ſymptoms of a knowledge of the Trinity as believed among Chriſtians. "Among the ancient Chineſe characters (ſays M. Groſier), which have eſcaped the ravages of time, we find the following △. According to the dictionary of *Kang-hi*, this ſignifies union; according to the *Choue-ouen* (that book ſo highly eſteemed in China) △ is three united in one; it derives it from the characters *jou* (to enter or penetrate), and *ye*, one; whence it concludes, that △ means three united, penetrated, or incorporated into one. According to another book, accounted a learned and accurate explanation of the ancient characters, '△ ſignifies ſtrict union, harmony, the chief good of man, of heaven, and of earth; it is the union of the three *tſai* (powers, principles, or intelligencies); for, united, they direct, create, and nouriſh together. The image 王 (three united in one figure) is not ſo obſcure in itſelf; however it is difficult to reaſon upon it without being deceived: on this ſubject it is difficult to ſpeak.'

"Father Amiot, ſpite of all the objections which the critics of Europe may make, ſeems to conjecture, that the character △ might have been, among the ancient Chineſe, the ſymbol of the moſt holy Trinity; 'and the more ſo (he adds), as the ancient books furniſh a number of texts, which give us reaſon to ſuppoſe them to have been poſſeſſed of ſome knowledge of this ſublime myſtery.' The book *See-ki* ſays, 'The emperor formerly offered up a ſolemn ſacrifice every three years to the Spirit Trinity and Unity, *Chin-ſan-ye*.' The following celebrated text of *Lao-tſe* has long been known in Europe. '*Tao* is one by nature: the firſt begot the ſecond; two produced the third; the three created all things.'

"F. Amiot quotes another paſſage, which appears to be no leſs ſingular. 'He who is, as it were, viſible, and cannot be ſeen, is named *Khi*; he who may be heard, yet ſpeaketh not to the ears, is called *Hi*; he whom, in a manner, we feel, yet cannot touch, is named *Ouei*. In vain do we interrogate our ſenſes reſpecting theſe three: our reaſon, which alone can give us any ſatisfaction, will tell us that they make only one. Above there is no light; below there is no darkneſs. He is eternal; there is no name which can be given him. He reſembles nothing that exiſts; he is an image without figure; a figure without matter: his light is ſurrounded by darkneſs. If we look up to him above, we behold no beginning; if we follow him, we diſcover no end. From what the *Tao* hath been at all times, conclude what he is, viz. that he is eternal: he is the beginning of wiſdom.' The commentaries which explain this paſſage ſpeak in ſuch ſtrong and preciſe terms, that F. Amiot forbears to quote them, leſt he might incur the cenſure of too many incredulous readers."

101
Sacrifices.

The ſacrifices of the Chineſe were firſt offered up in the open fields, or on ſome mountain, upon what they call the *Tan*, which ſignifies a quantity of ſtones thrown together in a round form, or ſimply a round heap of earth. A double fence, called *Kiao*, compoſed of turf and branches of trees, was raiſed around this; and, in the ſpace left between the two fences, two leſſer altars were erected on the right and left; upon which, immediately after the ſacrifice offered up to the *Tien*, they ſacrificed alſo to the *Cheng*, or good ſpirits of every rank, and to their virtuous anceſtors. The ſovereign alone had a right of ſacrificing upon this *Tan*; and the cuſtom of ſacrificing to inferior ſpirits, according to the Chineſe commentators, may be traced even to the days of *Fo-hi* himſelf. The ſame writers add, that, in addreſſing themſelves to the Chang-ti, they conſidered him as the ſovereign lord of the univerſe, clothed with all that power which was neceſſary to ſatisfy them with regard to the different objects of their requeſts; but that, in offering up their prayers to the inferior objects of worſhip, they only implored their protection and mediation with the Chang-ti.

While the empire was confined within narrow bounds, one mountain was ſufficient for the ſacrifices; but in proceſs of time it became neceſſary to conſecrate four others. Theſe were ſituated at the extremities of the empire, and were ſuppoſed to correſpond with the four quarters of the world; and the prince went ſucceſſively every year to one of theſe mountains to offer up ſacrifices; taking occaſion at the ſame time to ſhow himſelf to his people, and to inform himſelf of their wants. This cuſtom ſubſiſted for a long time; but at length it was found convenient to add a fifth mountain in the centre of the empire; and ever ſince theſe have been called the five *Yo*, or the five mountains of ſacrifice. This method of ſubjecting the emperor to regular annual journies could not but be attended with many inconveniences. It was found neceſſary on this account to conſecrate ſome ſpot in the neighbourhood of his palace, which might be ſubſtituted for the *Yo* upon all occaſions when the emperor could not repair to them. An edifice was therefore erected, which at once repreſented the *Kiao*, *Tan*, and the *Hall of Anceſtors*. This laſt was a neceſſary part of the edifice; becauſe it was incumbent on thoſe who offered up ſacrifices, firſt to repair to this hall, and acquaint their anceſtors with what they were about to perform; and thither alſo they returned after ſacrificing, to thank the ſame anceſtors for the protection they had received from the Chang-ti; after which they offered up a ſacrifice of thankſgiving in honour of them, and performed certain other ceremonies to ſhow their reſpect. The building contained five ſeparate halls, appropriated to different purpoſes: originally it had neither paintings nor ornaments of any kind, and a ſtair-caſe of nine ſteps conducted to the principal entrance. Afterwards, however, it was much more richly ornamented, each of the five halls being decorated with columns, over which others were placed that ſupported the ſecond roof. In ſucceeding times it was ſtripped of all its ornaments, with a view to bring back religion to its primitive ſimplicity. Its four gates were covered with fine moſs, repreſenting the branches of which the double fence of the ancient *Kiao* were formed. The ridge of the roof was covered with the ſame, and the whole was encompaſſed by a canal filled with water at the time of offering up the ſacrifices. To this a ſecond building was added, which they called the

the *temple of neatneſs*, and which was uſed only for purifications and ceremonies, the former being entirely conſecrated to the worſhip of the Chang-ti.

At preſent there are only two temples in Peking, named the *Tien-tan* and the *Ti-tan*; in the conſtruction of which all the elegance of Chineſe architecture is diſplayed. Theſe are both dedicated to the Chang-ti, but under different titles; in the one he is adored as the *eternal ſpirit*; in the other, as the creator and preſerver of the world. The ceremonies of the modern ſacrifices are greatly multiplied; and nothing can exceed the ſplendor and magnificence with which theſe ſolemnities are performed. Some time before the day appointed for the grand ceremony, the monarch, the grandees of the court, and all thoſe whom their employments qualify to aſſiſt at the ſolemnity, prepare themſelves by retirement, faſting, and continence; no audience is given by the emperor, and the tribunals are entirely ſhut; marriages, funerals, rejoicings, and entertainments of every kind, are then forbidden. At laſt, on the day appointed, the emperor appears attended by an innumerable multitude, and, his perſon ſurrounded by a vaſt number of princes, lords, and officers, while every part of the temple ſeems to correſpond with the magnificence of the ſovereign; all the vaſes and utenſils employed in the ſacrifices are of gold, and cannot be employed to any other purpoſe; even the inſtruments of muſic are of enormous magnitude, and never uſed any where elſe. All this grandeur, however, ſerves only to diſplay in a more eminent manner the humility and abaſement of the monarch during his devotion; at which time he rolls in the duſt, and ſpeaks of himſelf before the *Chang-ti* in terms of the moſt abject ſubmiſſion and humiliation.

102 Sect of Tao-ſſe.

The purity of the ancient Chineſe religion has, however, been long contaminated by many idolatrous and fanatical ſects. Among theſe, one named *Tao-ſse* was founded by a philoſopher called *Lao-kiun* or *Lao-tſe*, who was born 603 B. C. He died in an advanced age, leaving to his diſciples a book intitled *Tao-te*, being a collection of 5000 ſentences. His morality has a great reſemblance to that of Epicurus. It conſiſts principally in baniſhing all vehement deſires and paſſions capable of diſturbing the peace and tranquillity of the ſoul. According to him, the care of every wiſe man ought to be only to endeavour to live free from grief and pain, and to glide gently down the ſtream of life devoid of anxiety and care. To arrive at this happy ſtate, he adviſes his followers to baniſh all thoughts of the paſt, and to abſtain from every vain and uſeleſs inquiry concerning futurity, as well as all tormenting thoughts of ambition, avarice, &c. It was found by the diſciples of this philoſopher, however, that all theſe endeavours to obtain a perfect tranquillity of mind were vain, as long as the thoughts of death intervened; they therefore declared it poſſible to diſcover a compoſition from which drink might be made that would render mankind immortal. Hence they were led to the ſtudy of chemiſtry; and, like the weſtern alchemiſts, wearied themſeves in ſearch of the philoſopher's ſtone, until at laſt they gave themſelves up to all the extravagancies of magic.

The deſire of avoiding death, together with the credulity natural to unenlightened minds, quickly produced a number of converts to the ſect of *Tao-ſse*. Magical practices, the invocation of ſpirits, and the art of foretelling events by divination, quickly diffuſed themſelves over the empire, and the imbecillity of the emperors contributed to propagate the deception. Temples conſecrated to ſpirits quickly reared their heads in every corner of the empire; and two of the moſt celebrated of the ſect were authoriſed to maintain public worſhip there after the form which had been preſcribed by their maſter. At the ſame time they diſtributed, and ſold at a dear rate, images of the imaginary ſpirits with which they had peopled the heavens and the earth. Theſe were, by their command, worſhipped as ſo many deities independent of the Supreme Being; and, in like manner, ſeveral of the ancient emperors were invoked as gods.

Being patroniſed by the emperors of ſeveral dynaſties, this ſect became more and more powerful. At laſt they had the impudence to affix, during the night-time, to one of the gates of the imperial city, a book filled with myſtic characters and magical figures. At break of day they informed the emperor of the ſudden appearance of this book, and publicly declared that it was fallen from heaven. This trick eaſily impoſed upon the weak prince. He immediately repaired, with a numerous train, to the ſpot where the ſacred volume appeared; and having taken it into his hands in a reſpectful manner, carried it in triumph to his palace, where he ſhut it up in a golden box. Another emperor carried his reverence for the ſect to ſuch an height of impiety and extravagance, as to order a celebrated *Tao-ſse* to be publicly worſhipped under the name of *Chang-ti*. The ſect thus patroniſed by the princes, and accommodated to the credulity of the vulgar, continued to gain ground in ſpite of every oppoſition from the wiſer part of the people, and is ſtill very powerful in China. At preſent they offer up three different victims, a hog, a fowl, and a fiſh, to a ſpirit whom they invoke. Various ceremonies, ſuch as howling, drawing fantaſtical figures upon paper, making an hideous noiſe with kettles and drums, are uſed in their incantations; and though it may readily be believed that they are for the moſt part unſucceſsful, yet their credit is ſtill kept up by thoſe caſes in which they ſucceed by accident.

The chief of the *Tao-ſse* is inveſted by government with the dignity of grand mandarin, which is enjoyed by his ſucceſſors; he reſides in a ſumptuous palace in a town of Kiang-ſi; and the ſuperſtitious confidence of the people attracts an immenſe number thither from all parts of the empire. Some arrive in order to be cured of diſeaſes, others to get an inſight into futurity. The impoſtor diſtributes to them ſmall bits of paper filled with magical characters; and the ignorant wretches depart well ſatisfied, without grudging the expence of their journey, though ever ſo long.

103 Of the worſhippers of Fo.

A ſtill more pernicious and more widely diffuſed ſect is that of the idol *Fo*, which came orignally from India. The *Tao-ſse*, had promiſed to the brother of one of the emperors of China to introduce him to a communication with ſpirits. The credulous prince having heard of a great ſpirit named *Fo*, who reſided in India, prevailed on his brother to ſend an embaſſy thither. On the arrival of the ambaſſadors, however, they could find only two worſhippers of this diety, both of whom they brought to China. Several images of Fo were alſo collected at the ſame time; and theſe, together with ſome canonical books of the Indians, were placed on a white horſe, and carried in proceſſion to the imperial city.

This ſuperſtition was introduced into China about the 65th year of the Chriſtian æra, and ſoon made vaſt progreſs. One of its principal doctrines is that of the metempſychoſis, or tranſmigration of ſouls, of which M. Groſier thinks he was the inventor, and that Pythagoras, who travelled into ſeveral parts of India, had borrowed the doctrine from him. The account given of him by the bonzes is, that finding himſelf, at the age of 70, oppreſſed with infirmities, he called his diſciples together, and told them he was unwilling to leave the world without communicating the ſecret and hidden myſteries of his doctrine; which were, in ſhort, that all things had proceeded from a vacuum and nothing, and to that they muſt return. This doctrine produced a correſponding mode of action, or rather of inaction, in thoſe who believed it: for thus the great happineſs of man was made to conſiſt in abſolute annihilation; and therefore the nearer he could bring himſelf to this ſtate during life, the happier he was ſuppoſed to be.

The common doctrine, however, which admits of a diſtinction between good and evil, finds more proſelytes among the vulgar, whoſe ſituation in life will not allow them to ſpend their time in perpetual idleneſs. According to this, the righteous will be rewarded and the wicked puniſhed after death. They ſay alſo, that the god Fo came to ſave mankind, and to expiate their ſins; and that he alone can procure them a happy regeneration in the life to come. Five precepts are likewiſe inculcated on thoſe who adopt this doctrine: 1. Not to kill any living creature. 2. Not to take away the goods of another. 3. Not to pollute themſelves by uncleanneſs. 4. Not to lie; and, 5. Not to drink wine. Above all, they recommend to them to perform acts of mercy, to treat their bonzes well, build temples, &c.

The doctrine of metempſychoſis has introduced into China an infinite number of idols, who are all worſhipped on the ſuppoſition that the ſpirit of Fo has tranſmigrated into the animals they repreſent. Theſe idols, however, ſeem not to be worſhipped with great ſincerity; but, like the images of ſaints in the more ſuperſtitious countries of Europe, are beaten and thrown in the dirt when their votaries happen not to obtain their deſires, which they impute to the obſtinacy or weakneſs of the idol. Nay, M. Groſier gives an account of one man, who having ineffectually paid a ſum of money to the bonzes of a certain idol for the cure of his daughter, brought a formal accuſation againſt the idol itſelf; and in ſpite of all that the bonzes could ſay in its behalf, got its worſhip ſuppreſſed throughout the province.

104
Bad character of the bonzes.

The bonzes of China are repreſented as a moſt avaricious and hypocritical race of men, ready to practiſe every kind of villany, and even to ſubject themſelves to the moſt intolerable tortures, in order to obtain money from the compaſſion of the public when they cannot get it in any other way; and an edict of one of the emperors is cited by M. Groſier, by which great numbers of their religious houſes were ſuppreſſed. In order to perpetuate their ſect, they purchaſe young children, whom they take care to inſtruct in all the myſteries and tricks of their profeſſion; but excepting this, they are in general very ignorant, and few of them would be able to give any tolerable account of the tenets of their own ſect. They are not ſubject to a regular hierarchy, but acknowledge ſuperiors among them whom they call grand bonzes, who have the firſt place in all religious aſſemblies at which they happen to be preſent; and great profit is derived from certain religious clubs, both of men and women, at which the bonzes are always called to aſſiſt. Their wealth is likewiſe augmented by pilgrimages to certain places where there are temples more or leſs reverenced, and where a multitude of abſurd ceremonies are performed. Theſe bonzes, as may be eaſily imagined, are inveterate enemies to the progreſs of Chriſtianity, telling the moſt abſurd ſtories concerning the miſſionaries: as that they pluck out the eyes of their converts to conſtruct teleſcopes with, &c. The literati, however, and the more ſenſible part of the nation, hold them in the greateſt contempt.

105
Ridiculous ſuperſtition of the *fong-choui*.

We ſhall conclude this detail of the Chineſe religion with giving an account of one other ſuperſtition which ſeems peculiar to the nation. It is named *fong-choui*, which ſignifies wind and water. By this they mean the lucky or unlucky ſituation of a houſe, burying-place, &c. If any imprudent perſon has built a houſe cloſe to that of a Chineſe, in ſuch a manner that the angle formed by its roof flanks the wall or roof of the former houſe, the proprietor ever after lives in terror of utter ruin and deſtruction from the malignant influence of that angle. An implacable hatred inſtantly commences betwixt the two families, and often gives riſe to a law-ſuit, which furniſhes matter of diſcuſſion for ſome of the ſuperior tribunals. If no redreſs can be had at law, however, the Chineſe is then reduced to the neceſſity of erecting, on the top of his houſe, an enormous image of a dragon, or ſome other monſter, with its mouth gaping towards the angle, and, as it were, threatening to ſwallow it up; after which the apprehenſions of the proprietor begin to ſubſide, and tranquillity is reſtored to the family. In this manner the governor of *Kien-tchang* ſecured himſelf from the influence of the church of the Jeſuits, which, being built on an eminence, overlooked his palace. Not depending, however, entirely on the good offices of his tutelary dragon, he alſo took the wiſe precaution of altering his principal apartments, and raiſing, at the diſtance of 200 paces from the church, a kind of large facade three ſtories high. But unluckily the death of his ſucceſſor was attributed to this facade; for the mandarin being attacked with a diſorder in his breaſt, which made him ſpit up a white phlegm, this ſymptom was thought to be owing to the walls of the facade, which were very white, and which were forthwith painted black. The ſalutary precaution, however, happened to be taken too late; for the governor died notwithſtanding the black colour of the walls.

“ We ſhould never have done (ſays M. Groſier), were we to relate all the ſuperſtitious ideas of the Chineſe, reſpecting the lucky and unlucky ſituation of houſes, the quarter which doors ought to front, and the plan and day proper for conſtructing the ſtoves in which they cook their rice." But the object on which they employ their greateſt care is the choice of the ground and ſituation for a burying-place. Some quacks follow no other profeſſion than that of pointing out hills and mountains which have an aſpect favourable for works of that kind. When a Chineſe is perſuaded of the truth of ſuch information, there is no ſum which he would not give to be in poſſeſſion of the fortunate ſpot. The greater part of the Chineſe are of opinion that all the happineſs and misfortunes of life depend upon the *fong-choui*.

106 Jews and Mahometans in China.

A colony of Jews was eſtabliſhed in China about the year 206 B. C.; but they are now reduced to a ſmall number of families at Cai-fong, the capital of the province of Honan. The Mahometans have multiplied much more than the Jews. It is above 600 years ſince they firſt entered the empire, where they have formed different eſtabliſhments. At firſt their number was augmented only by marriages; but for ſome time paſt they have been more particularly attentive to the extending of their ſect and propogating their doctrine. The principal means employed for this purpoſe are, to purchaſe a great number of children brought up in idolatry, whom their poor parents are glad to part with; and theſe they circumciſe, and afterwards inſtruct in the principles of their religion. During the time of a famine which deſolated the province of Chang-tong, they purchaſed more than 10,000 of theſe children; for whom, when grown up, they procured wives, built houſes, and even formed whole villages of them. They are now become ſo numerous, that in the places where they reſide they entirely exclude every inhabitant who does not believe in their prophet, and frequent a moſque.

107 Ceremonies of marriage.

With regard to the manners of the Chineſe, they bear no reſemblance to thoſe of any other nation; and, if we may believe their hiſtorians, they are the ſame at this day that they were 4000 years ago. The women are condemned almoſt to perpetual impriſonment within the precincts of their own houſes, and are never ſeen even by their intended huſbands before marriage. He knows nothing of her looks or perſon but from the account of ſome female relation or confident, who in ſuch caſes acts the part of match-maker; though, if impoſed upon either with regard to her age or figure, he can have recourſe to a divorce. The ſame matrons who negociate the marriage, alſo determine the ſum which the intended huſband muſt pay to the parents of the bride: for in China a father does not give a dowry to his daughter; it is the huſband who gives a dowry to the wife. When the day appointed for the marriage is arrived, the bridge is placed in a chair or cloſe palanquin, the key of which is committed to the care of a truſty domeſtic, who muſt deliver it to none but the huſband. The latter richly dreſſed, waits at his gate for the arrival of the proceſſion. As ſoon as it approaches the key is put into his hands; he eagerly opens the chair, and for the firſt time perceives his good or bad fortune. If he is contented with his new ſpouſe, the bride deſcends and enters the houſe, where the marriage is concluded by feaſting and merriment as in other countries; but if the bridegroom is very much diſappointed, he ſuddenly ſhuts the chair, and ſends the bride home to her relations. To get rid of her in this manner, however coſts a ſum equal to what he originally gave in dowry to obtain her.

The Chineſe women, even of the firſt rank, ſeldom quit their apartment, which is ſituated in the moſt retired part of the houſe, and in which they are ſecluded from all ſociety but that of their domeſtics. The book of ceremonies requires that there ſhould be two apartments in every houſe; the exterior one for the huſband, the interior for the wife. They muſt even be ſeparated by a wall or wooden partition, the door of which is carefully guarded; nor is the huſband at liberty to enter the wife's apartment, or ſhe to quit it, without ſufficient reaſon. According to the ſame book, the prattling and loquacity of a woman are reckoned ſufficient grounds for a divorce. A woman, however, cannot be divorced on any account, if ſhe loſes her parents after marriage, or if ſhe has worn three years mourning for the loſs of her huſband, father, or mother.

A widow of any rank above the common, who has children, ſeldom enters a ſecond time into the marriage ſtate, though thoſe of the ordinary rank generally do. The poorer ſort are not at liberty to follow their own inclination; but are ſold for the behoof of the parents of the deceaſed. As ſoon as the bargain is concluded, a couple of porters bring a chair, which is guarded by a number of truſty people. In this the widow is ſhut up, and thus conducted to her new huſband.

"Maſters (ſays Mr Groſier), for the moſt part are very deſirous of promoting marriage among their ſlaves, whatever Mr *Paw* may ſay; who, without any foundation, has ventured boldly to aſſert the contrary. They have even very ſtrong motives to induce them to encourage theſe marriages; the children produced by them are ſtill their ſlaves; and beſides their becoming new property to them, the fathers and mothers are thus more ſtrongly attached to their ſervice."

108 Concubinage tolerated.

Concubinage is tolerated in China, though not authoriſed by any law. This privilege is granted only to the emperor, the princes of the blood, and mandarins; and none but the emperor is permitted to have more than one. The common people generally avail themſelves of the toleration granted them in this reſpect, and will have two or three concubines if they can afford it. They are, however, careful to excuſe themſelves as well as they can to their wives in this reſpect, pretending only a deſire of having many children, and a number of women to attend their wives. Others, deſirous of having a male child, which perhaps their lawful wife cannot have, take a concubine for this reaſon only, and diſmiſs her as ſoon as their wiſhes are accompliſhed: they then permit her to marry whom ſhe pleaſes, and frequently even provide a huſband for her themſelves. Theſe concubines are almoſt all procured from two cities named *Yang-tcheou* and *Sou-tcheou*, where they are educated, and taught ſinging, dancing, muſic, and every accompliſhment ſuitable to women of quality, or which can render them agreeable and pleaſing. The greater part of them are purchaſed in other places, to be again diſpoſed of; and this is the principal branch of trade carried on by theſe two cities. Unlawful intrigues are ſeldom heard of in China. Whoever ſeduces the wife of another is puniſhed with death: and the ſame puniſhment is generally inflicted on the perſon who debauches a young woman.

109 Education of children. From the accounts we have of the education of children in China, one might be apt to conclude, that, inſtead of being the ignorant ſuperſtitious race already deſcribed, they ought to be the moſt intelligent people in the world. The book of ceremonies directs the education of a child to commence as ſoon as it is born, and deſcribes exactly the qualities which its nurſe ought to have. She muſt ſpeak little, adhere ſtrictly to truth, have a mild temper, behave with affability to her equals, and with reſpect to her ſuperiors. The child is taught to uſe the right hand as ſoon as it can put its hand to its mouth, and then it is weaned. At ſix years of age, if a male, he is taught the numbers moſt in uſe, and made acquainted with the names of the principal parts of the world; at ſeven, he is ſeparated from his ſiſters, and no longer allowed to eat with them, nor to ſit down in their preſence; at eight, he is inſtructed in the rules of good breeding and politeneſs; at nine, he ſtudies the kalendar; at ten he is ſent to a public ſchool, where he learns to read, write, and caſt accounts; from 13 to 15 he is taught muſic, and every thing that he ſings conſiſts of moral precepts. It was formerly the cuſtom, that all the leſſons deſigned for the Chineſe youth were in verſe: and it is to this day lamented, that the ſame cuſtom is not followed, as their education has ſince been rendered much more difficult and laborious.

At the age of 15, the Chineſe boys are taught to handle the bow and arrow, and to mount on horſeback; at 20 they receive the firſt cap, if they are thought to deſerve it, and they are permitted to wear ſilk dreſſes ornamented with furs; but before that period they are not allowed to wear any other thing than cotton.

Another method of initiating children into the principles of knowledge in this empire is, by ſelecting a number of characters expreſſive of the moſt common objects, engraving or painting them ſeparately on ſome kind of ſubſtance, and, under the thing repreſented, putting the name, which points out to the children the meaning of the word.

As the Chineſe have no proper alphabet, they repreſent almoſt every thing by different characters. The labour of their youth, therefore, is intolerable; being obliged to ſtudy many thouſand characters, each of which has a diſtinct and proper ſignification. Some idea of their difficulties may be obtained from what we are told by F. Martini, who aſſures us, that he was under the neceſſity of learning 60,000 different characters before he could read the Chineſe authors with tolerable eaſe.

The book firſt put into the hands of the Chineſe children is an abridgment, which points out what a child ought to learn, and the manner in which he ſhould be taught. This volume is a collection of ſhort ſentences, conſiſting of three or four verſes each, all of which rhyme; and they are obliged to give an account in the evening of what they have learned in the day. After this elementary treatiſe, they put into their hands the four books which contain the doctrines of Confucius and Mencius. The ſenſe and meaning of the work is never explained to them until they have got by heart all the characters, that is to ſay, the *words* in the book: a method no doubt inconceivably diſguſting, and calculated utterly to deſtroy the genius of a boy, if he has any. While they are getting theſe characters by heart, indeed, they are likewiſe employed in learning to form them with a pencil. For this purpoſe they are furniſhed with large leaves of paper, on which are written or printed with red ink very big characters; and all they are required to do is to cover thoſe red characters with black ink, and to follow exactly their ſhape and figure: which inſenſibly accuſtoms them to form the different ſtrokes. After this they are made to trace other characters, placed under the paper on which they write. Theſe are black, and much ſmaller than the other. It is a great advantage to the Chineſe literati to be able to paint characters well; and on this account they beſtow great pains in forming the hands of young people. This is of the utmoſt conſequence to literary ſtudents in the examinations which they are obliged to undergo before they can be admitted to the firſt degree. Du Halde gives a remarkable inſtance, *viz.* that "a candidate for degrees having, contrary to order, made uſe of an abbrevation in writing the character *ma*, which ſignifies an horſe, had the mortification of ſeeing his compoſition, though in other reſpects excellent, rejected merely on that account; beſides being ſeverely rallied by the mandarin, who told him that a horſe could not walk unleſs he had all his legs."

After the ſcholar has made himſelf maſter of the characters, he is then allowed to compoſe; but the ſubject of his compoſition is pointed out to him only by one word. Competitions are likewiſe eſtabliſhed in China, but moſt of them are of a private nature. Twenty or thirty families, who are all of the ſame name, and who conſequently have only one hall for the names of their anceſtors, agree among themſelves to ſend their children twice a month to this hall in order to compoſe. Each head of a family in turn gives the ſubject of this literary conteſt, and adjudges the prize; but this coſts him a dinner, which he muſt cauſe to be carried to the hall of competition. A fine of about ten pence is impoſed on the parent of each ſcholar who abſents himſelf from this exerciſe.

Beſides theſe private competitions, every ſtudent is obliged to compete at leaſt twice a-year under the inſpection of an inferior mandarin of letters, ſtyled *Hio-kouan*. It frequently happens alſo, that the mandarins of letters order theſe ſtudents to be brought before them, to examine the progreſs they have made in their ſtudies, to excite a ſpirit of emulation among them, and make them give ſuch application as may qualify them for any employment in the ſtate. Even the governors of cities do not think it below their dignity to take this care upon themſelves; ordering all thoſe ſtudents who reſide near them to appear before their tribunal once a month: the author of the beſt compoſition is honoured with a prize, and the governor treats all the candidates on the day of competion at his own expence. In every city, town, and village in China, there are ſchoolmaſters who teach ſuch ſciences as are known in that country. Parents poſſeſſed of a certain fortune provide maſters for their children, to attend and inſtruct them, to form their minds to virtue, and to initiate them in the rules of good breeding and the accuſtomed ceremonies, as well as to make them acquainted

quainted with the laws and hiſtory, if their age will admit. Theſe maſters have for the moſt part attained to one or two degrees among the literati, and not unfrequently arrive at the firſt employments of the ſtate.

The education of the Chineſe women is confined to giving them a taſte for ſolitude, and accuſtoming them to modeſty and ſilence; and, if their parents are rich, they are likewiſe inſtructed in ſuch accompliſhments as may render them agreeable to the other ſex.

110
Dreſs.

There is little diſtinction in China between the ordinary dreſs of men and women. Rank and dignity are diſtinguiſhed by certain acceſſary ornaments: and the perſon would be ſeverely chaſtiſed who ſhould preſume to aſſume them without being properly authoriſed. The dreſs in general conſiſts of a long veſt which reaches to the ground. One part of this veſt, *viz.* that on the left ſide, folds over the other, and is faſtened to the right by four or five ſmall gold or ſilver buttons, placed at a little diſtance from one another The ſleeves are wide towards the ſhoulder, growing narrower as they approach the wriſt, where they terminate in the form of a horſe ſhoe, covering the hands entirely, and leaving nothing but the ends of the fingers to be ſeen. Round their middle they wear a large gridle of ſilk, the ends of which hang down to their knees. From this griddle is ſuſpended a ſheath, containing a knife and two of thoſe ſmall ſticks which they uſe as forks. Below this robe they wear a pair of drawers, in ſummer made of linen, and in winter of ſatin lined with fur, ſometimes of cotton, and in ſome of the northern provinces of ſkins. Theſe are ſometimes covered with another pair of white taffety. Their ſhirts are always very ſhort and wide, of different kinds of cloth, according to the ſeaſon. Under theſe they wear a ſilk net to prevent it from adhering to the ſkin. In warm weather they have their necks always bare; when it is cold, they wear a collar made of ſilk, ſable, or fox's ſkin, joined to their robe, which in winter is trimmed with ſheep's ſkin, or quilted with ſilk and cotton. That of people of quality is entirely lined with beautiful ſable ſkins brought from Tartary, or with the fineſt fox's ſkin, trimmed with ſable; and in the ſpring it is lined with ermine. Above their robe they wear alſo a kind of ſur-tout with wide ſleeves, but very ſhort, which is lined in the ſame manner. The emperor and princes of the blood only have a right to wear yellow; certain mandarins have liberty to wear ſatin of a red ground, but only upon days of ceremony; in general they are clothed in black, blue, or violet. The common people are allowed to wear no other colours but blue or black; and their dreſs is always compoſed of plain cotton cloth.

111
Chineſe obliged by the Tartars to cut off their hair.

Formerly the Chineſe were at great pains to preſerve their hair; but the Tartars, who ſubdued them, compelled them to cut off the greater part of it, and to alter the form of their clothes after the Tartar faſhion. This revolution in dreſs was not effected without bloodſhed, though the conqueror at the ſame time adopted in other reſpects the laws, manners, and cuſtoms of the conquered people. Thus the Chineſe are painted as if bald, but they are not ſo naturally; that ſmall portion of hair which they preſerve behind, or on the tops of their heads, is all that is now allowed them. This they wear very long, and plait like a tail. In ſummer they wear a kind of cap ſhaped like an inverted cone, lined with ſatin, and covered with ratan or cane very prettily wrought. The top terminates in a point, to which they fix a tuft of red hair, which ſpreads over it, and covers it to the brims. This hair grows between the legs of a kind of cow, and is capable of taking any colour, eſpecially a deep red. This ornament is much uſed, and any perſon who chooſes may wear it.

The mandarins and literati wear a cap of the ſame form as the foregoing, only it is lined with red ſatin, and covered on the outſide with white. A large tuft of the fineſt red ſilk is fixed over it, which is ſuffered to hang down or wave with the wind. People of diſtinction generally uſe the common cap when they mount on horſeback or during bad weather; being better calculated to keep off rain, and ſhelter thoſe who wear it from the rays of the ſun. For winter they have another cap bordered with ſable, ermine, or fox's ſkin, and ornamented with a tuft of ſilk like the former. In theſe fur-trimmings they are very curious, ſometimes expending 40 or 50 ounces of ſilver upon them.

The Chineſe people of rank never go abroad without boots made of ſatin, or ſome other ſilk, and ſometimes of cotton, but always dyed. They have neither heel nor top, and are made to fit the foot with the greateſt exactneſs. When they travel on horſeback, however, they have others made of the ſkin of a cow or horſe made very pliable. Their boot-ſtockings are of ſilk ſtuff, quilted and lined with cotton, reaching above the top of their boot, and ornamented with a border of velvet or cloth. In ſummer they wear a cooler kind, and in their houſes a ſort of ſlippers made of ſilk ſtuff. The common people are contented with black ſlippers made of cotton cloth. The fan is alſo a neceſſary appendage of the Chineſe dreſs, and is reckoned equally neceſſary with the boots.

The dreſs of the women conſiſts of a long robe quite cloſe at top, and long enough to cover even their toes, with ſleeves ſo long that they would hang down upon the ground, did they not take care to tuck them up; but their hands are ſeldom ſeen. The colour of their dreſſes is entirely arbitrary, but black and violet are generally choſen by thoſe advenced in life. The young ladies, like thoſe of Europe, make uſe of paint to give a bloom to their complections; but this, though not the ſame with the kind uſed in Europe, agrees with it in the effect of ſoon wrinkling the ſkin. Their general head-dreſs conſiſts in arranging their hair in ſeveral curls, among which are interſperſed ſmall tufts of gold or ſilver flowers. According to Du Halde, ſome of them ornament their heads with the image of a fabulous bird, concerning which many ſtories are told. This is made of copper or ſilver gilt, its wings extended and lying pretty cloſe to the head-dreſs, embracing the upper part of their temples, while the long ſpreading tail forms a kind of plume on the top of the head. Its body is directly over the head, and the neck and bill hang down, the former being joined to the body by a concealed hinge, in order that it may play freely, and move about on the leaſt motion of the head. The whole bird adheres to the head by means of the claws, which are fixed in the hair.

Ladies of quality ſometimes wear ſeveral of theſe birds made up into a ſingle ornament, the workmanſhip of which is very expenſive. Young ladies wear alſo a crown made of paſteboard, the fore-part of which riſes in a point above the forehead, and is covered with jewels. The reſt of the head is decorated with natural or artificial flowers, among which ſmall diamond pins are interſperſed. The head-dreſs of the ordinary claſs of women, eſpecially when they are advanced in years, conſiſts only of a piece of very fine ſilk wrapped round their heads.

112 Abſurd cuſtom of preventing the feet of female infants from growing.

All authors agree, that an abſurd cuſtom prevails throughout China of confining the feet of female infants in ſuch a manner that they are never allowed to grow to near their full ſize. The ſmallneſs of their feet is accounted ſuch a valuable beauty, that the Chineſe women never think they can pay too dear for it. As ſoon therefore as a female infant is born, the nurſe wraps up its feet in very tight bandages; and this torture muſt be endured until their feet have ceaſed to grow. So prevalent is the force of cuſtom, however, that as the child grows up ſhe voluntarily ſubmits to new tortures in order to accompliſh the purpoſe more effectually. Thus the Chineſe women are deprived almoſt entirely of the uſe of their feet; and are ſcarce able to walk, in the moſt aukward hobbling manner, for the ſhorteſt ſpace. The ſhoe of a full grown Chineſe woman will frequently not exceed ſix inches.

The Chineſe uſe white as the colour proper for mourning; and though a ſon cannot wear this while his father and mother are alive, he can uſe no other for three years after their death; and ever afterwards his clothes muſt be of one colour. The law has forbidden the uſe of ſilks and furs to children; and has even preſcribed the time when they are firſt to wear a cap. This is put upon their heads by the maſter of ceremonies himſelf, who addreſſes them in the following manner: "Conſider that you now receive the dreſs of thoſe who have attained to maturity, and that you ceaſe to be children; renounce therefore all childiſh thoughts and inclinations, aſſume a grave and ſerious deportment, apply with reſolution to the ſtudy of virtue and wiſdom, and endeavour to merit a long and happy life." "This ceremony (ſays M. Groſier), which may appear trifling, is attended with the happieſt effects. The Chineſe give a kind of importance to every thing which can inſpire youth with a taſte for morality and a love of good order. It might be uſeful to mankind at every fixed epocha of their lives, to remind them of thoſe new duties impoſed by each ſucceſſive change; but, by uniting the ſolemnity of a public ceremony to this inſtruction, it will make a deeper impreſſion, and remain much longer imprinted on their memories."

115 Exceſſive ceremoniouſneſs of the Chineſe.

Nothing can appear more irkſome to an European than the multitude of ceremonies uſed on all occaſions by the Chineſe. An invitation to an entertainment is not ſuppoſed to be given with ſincerity until it has been renewed three or four times in writing. A card is ſent on the evening before the entertainment, another on the morning of the appointed day, and a third when every thing is prepared and the gueſts ready to ſit down to the table. The maſter of the houſe always introduces his gueſts into the hall, where he ſalutes them one after another. He then orders wine to be brought him in a ſmall cup made of ſilver, porcelain, or precious wood, and placed upon a ſmall varniſhed ſalver. He lays hold of it with both his hands, makes a bow to all the ſurrounding gueſts, and advances towards the fore-part of the hall, which generally looks into a large court. He there raiſes his eyes and the cup towards heaven; after which he pours the wine on the ground. He afterwards pours ſome wine into a ſilver or porcelain cup, makes a bow to the moſt conſiderable perſon in company, and then goes to place the cup on the table before him; for in China every gueſt has a table for himſelf. The perſon for whom he intends this honour, however, generally ſaves him the trouble of placing the cup; calls for wine in his turn, and offers to place the cup on the maſter's table, who endeavours to prevent him; with a thouſand apologies and compliments according to the rules of Chineſe politeneſs. A ſuperior domeſtic conducts the principal gueſt to an elbow chair covered with rich flowered ſilk, where the ſtranger again begins his compliments, and begs to be excuſed from ſitting in ſuch an honourable ſeat, which neverthelefs he accepts of; and all the reſt of the gueſts do the ſame, otherwiſe the ceremonial would be gone through with each of them. The entertainment is concluded by ſome theatrical repreſentations, accompanied with the muſic of the country; which, however, would give but little pleaſure to an European. Beſides the gueſts, a certain number of people are admitted into the court in order to behold theſe theatrical repreſentations; and even the women are allowed to view them through a wicket, contrived ſo that they may behold them without being ſeen themſelves.

The entertainments of the Chineſe are begun, not by eating, but by drinking; and the liquor they drink muſt always be pure wine. The intendant, or *maître de hotel*, falling down on one knee, firſt invites the gueſts to take a glaſs; on which each of them lays hold, with both hands, of that which is placed before him, raiſing it as high as his forehead, then bringing it lower down than the table, and at laſt putting it to his mouth; they all drink together, and very ſlowly, taking three or four draughts. While they are drinking, the diſhes on each of the tables are removed, and others brought in. Each of the gueſts has twenty-four ſet before him in ſucceſſion: all of them fat, and in the form of ragouts. They never uſe knives in their repaſts; and two ſmall-pointed ſticks, ornamented with ivory or ſilver, ſerve them inſtead of forks. They never begin to eat, however, until they are invited by the *maître de hotel*; and the ſame ceremony muſt be gone through every time they are going to take a cup of wine or begin to a new diſh. Towards the middle of the entertainment the ſoup is brought in, accompanied with ſmall loaves or meat-pies. Theſe they take up with their ſmall ſticks, ſteep them in the ſoup, and eat them without waiting for any ſignal or being obliged to keep time with the reſt of the gueſts. The entertainment, however, continues in other reſpects with the utmoſt formality until tea is brought in; after which they retire from table and amuſe themſelves in another hall, or in the garden for a ſhort time, until the deſert be brought in. This, like the entertainment itſelf, conſts of 24 diſhes, which are made up of ſweatmeats, fruits differently prepared, hams and ſalted ducks which have been backed or dried in the ſun, with ſhell and other kinds of fiſh. The ſame ceremonies which preceded the repaſt are now renewed,

renewed, and every one ſits down at the ſame place he occupied before. Larger cups are then brought in, and the maſter invites the gueſts to drink more freely.

Theſe entertainments begin towards evening, and never end till midnight. A ſmall ſum of money is given to the domeſtics; when every one of the gueſts goes home in a chair preceded by ſeveral ſervants, who carry large lanthorns of oiled paper, on which are inſcribed the quality, and ſometimes the name, of the maſter. Without ſuch an attendance they would be taken up by the guard; and the day following they never fail to return a card of thanks to the officer.

Their method of drinking tea is not like that of other nations. A ſmall quantity of bohea, ſufficient to tinge the water and render it palatable (for they drink no green), is taken in the morning, and thrown into a veſſel adapted to the number in family. This ſtands till milk warm; in which ſtate it is kept the whole day, and a cup drank now and then without ſugar or milk, in order to exhilerate the ſpirits when exhauſted by fatigue: and if a ſtranger call by accident, or a viſitor by appointment, the firſt thing preſented, after the uſual ceremonies of meeting, is a very ſmall pipe filled with tobacco of their own growth and a cup of the tea already mentioned, or of ſome freſh made of better quality, together with ſweetmeats, &c. Tea is the daily beverage in China, and is drank by all ranks of people.

Some change has been made in the ceremonial of the Chineſe by the Tartar conqueſt, and ſome new diſhes alſo introduced by the ſame means; and here M. Groſier obſerves, that the Tartars are much better cooks than the Chineſe. All their diſhes are highly ſeaſoned; and by a variation in the proportions of their ſpiceries, they are able to form a variety of diſhes out of the ſame materials. None of their viands, however, are more eſteemed than ſtags ſinews, and the neſts of a particular ſpecies of birds, which have the property of giving a moſt agreeable reliſh to whatever is mixed with them. Other diſhes are introduced at theſe repaſts, which would be accounted very diſagreeable with us; ſuch as the fleſh of wild horſes, the paws of a bear, and the feet of ſeveral wild animals. The greater part of theſe proviſions are brought preſerved in ſalt from Siam, Camboya, and Tartary.

114 Chineſe wines. The wines of China have no reſemblance to ours either in taſte or quality, being procured from rice and not from the vine. A particular kind of rice is employed for making them, and the grain is ſteeped for 20 or 30 days in water, into which ingredients of a different nature are ſucceſſively thrown: they afterwards boil it; and as ſoon as it becomes diſſolved by the heat, it immediately ferments, and throws up a vaporous ſcum not unlike new wine. A very pure liquor is found under this ſcum, which is drawn off and put into veſſels well glazed; From the remaining lyes an inflammable ſpirit is made, little inferior, and ſometimes even ſuperior to the European. Another kind of wine is uſed by the Chineſe, or rather Tartars, called *lamb-wine*. It is very ſtrong, and has a diſagreeable ſmell; and the ſame may be believed of a kind of ſpirit diſtilled from the fleſh of ſheep; though this laſt is ſometimes uſed by the emperors.

Theſe entertainments exceed the bounds of ordinary repaſts; the Chineſe being naturally ſober, and thoſe in eaſy circumſtances living chiefly on pork, for which reaſon a great number of hogs are bred in the country. Their fleſh is much eaſier of digeſtion, and more agreeable to the taſte, than thoſe of Europe. The Chineſe hams are in high eſtimation. The common people live very poorly; being ſatisfied, in time of ſcarcity, with the fleſh of dogs, horſes, cats, and rats, which laſt are ſold publicly in the ſtreets.

115 Public feſtivals. There are ſeveral public feſtivals annually celebrated in China. One is that already mentioned, in which the emperor tills the ground with his own hands. This is alſo celebrated on the ſame day throughout the empire. In the morning the governor of every city comes forth from his palace crowned with flowers, and enters his chair amidſt the noiſe of different inſtruments which precede it; a great number of people attending, as is uſual on all ſuch occaſions. The chair is ſurrounded by litters covered with ſilk carpets, on which are repreſented either ſome illuſtrious perſons who have ſupported and encouraged agriculture, or ſome hiſtorical painting on the ſame ſubject. The ſtreets are hung with carpets, triumphal arches are erected at certain diſtances, lanthorns every where diſplayed, and all the houſes illuminated. During the ceremony a figure reſembling a cow, made of baked earth, with gilt horns, is carried in proceſſion, and of ſuch enormous magnitude that 40 men are ſcarce ſufficient to ſupport it. A child follows with one foot naked and the other ſhod, who is called the *ſpirit of labour and diligence*, and keeps continually beating the image with a rod to make it advance. Labourers, with their implements of huſbandry, march behind; and the proceſſion is cloſed by a number of comedians and people in maſks. The governor advances towards the eaſtern gate, and returns in the ſame manner. The cow is then ſtripped of its ornaments, a prodigious number of earthen calves taken from its belly and diſtributed among the people; after which the large figure is broken in pieces and diſtributed in the ſame manner. The ceremony is ended by an oration in praiſe of agriculture, in which the governor endeavours to excite his hearers to the practice of that uſeful art.

Other two feſtivals are celebrated in China with ſtill more magnificence than that above deſcribed. One of them is at the commencement of the year; the other is called the *feaſt of lanthorns*. During the celebration the former, all buſineſs, whether private or public, is ſuſpended, the tribunals are ſhut, the poſts ſtopped, preſents are given and received, and viſits paid. All the family aſſemble in the evening, and partake of a feaſt to which no ſtranger is admitted; though they become a little more ſociable on the following day.

The feaſt of lanthorns ought to take place on the 15th day of the firſt month, but uſually commences on the evening of the 13th, and does not end till that of the 16th. At that time every city and village, the ſhores of the ſea, and the banks of all the rivers, are hung with lanthorns of various ſhapes and ſizes; ſome of them being ſeen in the courts and windows of the pooreſt houſes. No expence is ſpared on this occaſion; and ſome of the rich people will lay out eight or nine pounds ſterling on one lanthron. Some of theſe are very large compoſed of ſix wooden frames either neatly painted or gilt, and filled up with pieces of fine tranſparent ſilk, upon which are painted flowers, animals, and human figures; others are blue, and made of a tranſparent kind of horn. Several lamps, and a great

great number of wax candles, are placed in the inſide: to the corners of each are fixed ſtreamers of ſilk and ſatin of different colours, with a curious piece of carved work on the top. They are likewiſe acquainted with our magic lanthorn, which they ſometimes introduce in this feſtival. Beſides this they have the art of forming a ſnake 60 or 80 feet in length, filled with lights from one end to the other; which they cauſe twiſt itſelf into different forms, and move about as if it was a real ſerpent. During the ſame feſtival all the varieties of the Chineſe fire-works, ſo juſtly admired, and which, ſome time ago at leaſt, ſurpaſſed every thing of the kind that could be done in Europe, are exhibited.

116
Magnificence of the viceroys.

Every public ceremony in China is carefully rendered as ſtriking as poſſible. A viceroy never quits his palace but with a royal train, dreſſed in his robes of ceremony, and carried in a chair elegantly gilt, which is born upon the ſhoulders of eight domeſtics; two drummers marching before the guards, and beating upon copper baſons to give notice of his approach. Eight other attendants carry ſtandards of wood varniſhed, upon which are inſcribed in large characters all his titles of honour. After theſe come 14 flags with the ſymbols of his office; ſuch as the dragon, tyger, phoenix, flying tortoiſe, &c. Six officers follow, each bearing a piece of board in ſhape like a large ſhovel, on which are written in large golden characters the qualities of the mandarin himſelf: two others carry, the one a large umbrella of yellow ſilk, and the other the cover in which the umbrella is kept. The firſt guards are preceded by two archers on horſeback; the latter are followed by others armed with a kind of weapons compoſed of hooked blades, fixed perpendicularly to long poles ornamented with four tufts of ſilk, placed at a ſmall diſtance above one another. Behind theſe are two other files of ſoldiers, ſome of whom carry large maces with long handles; others iron maces in the ſhape of a ſnake; others are armed with huge hammers; while thoſe behind them carry long battle-axes in the form of a creſcent: others follow, who have battle-axes of another kind; and behind theſe are ſome with the hooked weapons already deſcribed.

Behind theſe come ſoldiers armed with triple-pointed ſpears, arrows, or battle-axes; having in front two men who carry a kind of box containing the viceroy's ſeal. Then come two other drummers to give notice of his approach. Two officers follow, having on their heads felt-hats, adorned with plumes of feathers, and each armed with a cane to recommend regularity and good order to the ſurrounding multitude. Two others bear maces in the form of gilt dragons. Theſe again are followed by a number of magiſtrates and officers of juſtice; ſome of whom carry whips or flat ſticks, while others have chains, hangers, and ſilk ſcarfs. Two ſtandard-bearers and a captain command this company, which immmediately precedes the governor. His chair is ſurrounded by pages and footmen, and an officer attends him who carries a large fan in form of a ſcreen: he is followed by ſeveral guards differently armed, together with enſigns and other officers, who are alſo followed by a great number of domeſtics all on horſeback, carrying various neceſſaries for the uſe of the mandarin. If he marches in the night-time, inſtead of flambeaux, as are cuſtomary in Europe, large lanthorns, exceedingly pretty, are carried before him; on the tranſparent part of which are written, in very conſpicuous characters, his quality, titles, and rank, as mandarin. Theſe are alſo intended to give notice to the paſſengers to ſtop, and to thoſe who are ſitting to riſe up with reſpect; for whoever neglects either the one or the other is ſure to receive a ſevere baſtinading.

The emperor marches with ſtill more magnificence, in proportion to his ſuperior quality. The trumpets uſed in his proceſſion are about three feet long, eight inches in diameter at the lower extremity, and pretty much reſembling a bell in ſhape: their ſound is peculiarly adapted to that of the drums. His cavalcade is cloſed by 2000 mandarins of letters and as many of arms. Sometimes the great mandarins, as well as the emperor, travel in barks. Their attendance is then ſomewhat different, but the magnificence almoſt the ſame. The honours paid to a viceroy who has governed a province with equity are exceedingly great on his departure from it. He has ſcarcely left the capital of the province when he finds on the highway, for the ſpace of two or three leaugues, tables ranged at certain diſtances, each of which is ſurrounded with a long piece of ſilk that hangs down to the earth. On theſe wax candles are placed even in the open day; perfumes are burnt upon them; and they are loaded with a profuſion of victuals and various kinds of fruit, while tea and wine are prepared for him on others. The people throw themſelves on their knees as he paſſes, and bow their heads even to the earth; ſome ſhed tears, or pretend to do ſo; ſome preſent him wine and ſweetmeats; others frequently pull off his boots and give him new ones. Theſe boots, which he has perhaps uſed only for a moment, are conſidered as a valuable monument: thoſe firſt taken off are preſerved in a cage over the gate of the city; the reſt are carefully kept by his friends.

117
Knaviſh diſpoſition of the Chineſe.

Hitherto our author, M. Groſier, has ſeemed inclined to give a favourable idea of the Chineſe, and to cauſe us look upon them as many degrees ſuperior to ourſelves in the practice of virtue and morality; but when he comes to give an account of their dealings in trade, he is then obliged to confeſs that they are as diſhoneſt and knaviſh a race as any that exiſt. “The moſt frequented fairs of Europe (ſays he) afford but a faint idea of that immenſe numbers of buyers and ſellers with which the large cities of China are continually crowded. We may almoſt ſay, that the one half are employed in over-reaching the other. It is, above all, againſt ſtrangers that the Chineſe merchants exerciſe, without any ſenſe of ſhame, their inſatiable rapacity. Of this F. du Halde gives a ſtriking example, which might be ſupported by many others: ‘The captain of an Engliſh veſſel bargained with a Chineſe merchant at Canton for ſeveral bales of ſilk, which the latter was to provide againſt a certain time. When they were ready, the captain went with his interpreter to the houſe of the Chineſe merchant to examine whether they were ſound an in good condition. On opening the firſt bale, he found it according to his wiſh, but all the reſt were damaged and good for nothing. The captain on this fell into a great paſſion, and reproached the merchant in the ſevereſt terms for his diſhoneſty. The Chineſe, after having heard him for ſome time with great coolneſs, replied, ‘Blame, Sir, your knave of an interpreter: he aſſured me that you would not inſpect the bales.’

“The lower claſs of people are, above all, very dexterous

terous in counterfeiting and adulterating every thing they ſell. Sometimes you think you have bought a capon, and you receive nothing but ſkin; all the reſt has been ſcooped out, and the place ſo ingeniouſly filled, that the deception cannot be diſcovered till the moment you begin to eat it. The counterfeit hams of China have been often mentioned. They are made of a peice of wood cut in the form of a ham, and coated over with a certain kind of earth which is covered with hog's ſkin. The whole is ſo curiouſly painted and prepared, that a knife is neceſſary to detect the fraud. Mr Oſbeck relates, that having one day obſerved a blind man carrying about for ſale ſome of thoſe trees called by the Chineſe *Fo-kei*, he purchaſed one, which to appearance had fine double red and white flowers; but in a cloſer examination, he found that the flowers were taken from another tree, and that one calyx was ſo neatly fitted into the other, with nails made of bamboo, that he ſhould ſcarcely have diſcovered the deceit, had not the flowers begun to wither. The tree itſelf had buds, but not one open flower.

“ The robbers in China ſignalize themſelves alſo by their dexterity and ingenuity, which they diſplay in their profeſſion. They ſeldom have recourſe to acts of violence, but introduce themſelves into a houſe either privately or by forming ſome connection with the family. It is as difficult in China to avoid robbery as it is to apprehend the criminal in the fact. If we are deſirous of finding among the Chineſe openneſs of temper, benevolence, friendſhip, and, laſtly virtue, we muſt not ſeek for it in cities, but in the boſom of the country, among that claſs of men who have devoted themſelves to labour and agriculture. A Chineſe ruſtic often diſcovers moral qualities which would add a luſtre to the character of men of the moſt exalted rank. It appears that rural life naturally inſpires ſentiments of benevolence; by continually receiving the gifts of nature, the mind is enlarged, and men are inſenſibly accuſtomed to diffuſe them to thoſe around them.”

The internal commerce of China is much greater than that of all Europe; but its foreign trade is by no means equal to that of any of the grand European powers. Its internal commerce is greatly facilitated by the vaſt number of canals and rivers with which the country is interſected. The Chineſe, however, are not at all fitted for maritime commerce: Few of their veſſels go beyond the ſtraits of Sunda: their longeſt voyages to Malacca extend only as far as Acheen, towards the ſtraits of Batavia, and northward to Japan.

Their commerce with the laſt mentioned iſland, conſidering the articles of exchange which they procure at Camboya or Siam, produces them *cent. per cent.* Their trade with the Manillas brings only about 50 *per cent.* Their profit is more conſiderable about Batavia; and the Dutch ſpare no pains to invite them to traffic at their ſettlemeut. The Chineſe traders go alſo, tho' not very frequently, to Acheen, Malacca, Thor, Patan and Ligor, belonging to Siam and Cochin-china; from whence they bring gold and tin, together with ſome objects of luxury for the table. A great obſtacle to the foreign commerce of the Chineſe is their indifference about marine affairs, and the bad conſtruction of their veſſels. This they themſelves ackowledge: but ſay, that any attempt to remove it would be derogating from the laws, and ſubverting the conſtitution of the empire.

118 Burying-places deſcribed.

The burying-places in China are always ſituated at a ſmall diſtance from a city or town, and generally upon ſome eminence, having pines or cypreſſes uſually planted around them. The form of the tombs is various, according to the different provinces, and the ſituation of thoſe for whom they are intended. The coffins of the poor are placed under a ſhade covered with thatch, or incloſed in a ſmall building of brick in the form of a tomb. The tombs of the rich are ſhaped like a horſe-ſhoe, well whitened, and finiſhed with great taſte; but thoſe of the mandarins and people of quality are much more ſumptuous and elegant. A vault is firſt conſtructed, in which the coffin is ſhut up; over this vault is raiſed a pyramid of earth well beat together, about 12 feet in height and 10 in diameter. A layer of lime and ſand laid over this earth makes a kind of plaſter, which renders the whole very durable and ſolid; various kinds of trees being planted around it in regular order. Before it is placed a large and long table of white marble, on the middle of which are ſet a cenſer accompanied with two vaſes, and the ſame number of candleſticks of exquiſite workmanſhip. Beſides this, a great number of figures, repreſenting officers, eunuchs, ſoldiers, ſaddled horſes, camels, lions, tortoiſes, &c. are ranged round the tombs in different rows; which, F. du Halde aſſures us, produce a very ſtriking effect.

When a Chineſe dies in a province in which he was not born, his children have a right, nay it is their indiſpenſable duty, to tranſport the body to the burying place of their anceſtors. A ſon who ſhould be wanting in this reſpect, would be diſgraced, and his name never placed in the hall of his anceſtors. This is a vaſt building, conſidered as common to all the branches of the ſame family; and to which they all repair at a certain ſeaſon of the year. Sometimes they amount to ſeven or eight thouſand perſons, whoſe fortune, dignity, and rank in ſociety, are all very different; but there no diſtinction of rank is known; age only gives precedence, and the oldeſt always takes place of all the reſt, though he ſhould be the pooreſt in the company. The diſtinguiſhing ornament of this hall is a long table ſet againſt the wall, upon which is generally ſeen the image of one of their anceſtors, who has filled ſome office of diſtinction in the empire with honour to himſelf, or who has been rendered illuſtrious by his talents and abilities. Sometimes it only contains the names of men, women, and children belonging to the family inſcribed upon tablets, together with their age, the day of their death, and the dignities they enjoyed at that time. Theſe tablets are ranged in two rows upon ſteps, and are only about a foot high each. In the ſpring, and and ſometimes in the autumn, the relations of the deceaſed repair to this hall, where the only privilege enjoyed by the richeſt is that of preparing an entertainment, and treating the whole family at their own expences: but they never allow themſelves to taſte a bit of any thing until an offering has been firſt made to their anceſtors. This does not, however, excuſe them from viſiting the real tomb of their anceſtors once or twice a year, generally in the month of April. At this time they pluck the weeds and buſhes from around the tomb, renew their expreſſions of of grief, and conclude by placing upon it wine and proviſions, which ſerve to dine their aſſiſtants.

119 Funeral ceremonies.

The funeral ceremonies are conſidered by the Chineſe as the moſt important of any. A few moments after a perſon has expired, he is dreſſed out in his richeſt attire, and adorned with every badge of his dignity; after which he is placed in the coffin. The preparation of a coffin, in which his body may be incloſed after death, is one of the chief objects of attention to a Chineſe during his life, and great expence is often thrown out upon it; inſomuch that the poor will give all they are worth, and the rich expend a thouſand crowns, nay, a ſon will ſell himſelf for a ſlave in order to purchaſe a coffin for his father. Sometimes the coffin, when purchaſed with all this labour and expence, will remain twenty years uſeleſs in the family, and is conſidered as the moſt valuable piece of furniture in his poſſeſſion.

The manner of interment is as follows; Firſt they ſprinkle ſome lime in the bottom of the coffin; then they lay the body in it, taking care to place the head on a pillow, and to add a great deal of cotton that it may remain more ſteady, and be prevented from ſhaking. In this manner the body remains expoſed ſeven days; but the time may be reduced to three, if any weighty reaſon makes it neceſſary; and, during this interval, all the relations and friends, who are purpoſely invited, come and pay their reſpects to the deceaſed, the neareſt relations remaining in the houſe. The coffin is expoſed in the hall of ceremony, which is then hung with white, but ſome pieces of black or violet coloured ſilk are here and there interſperſed, as well as ſome other ornaments of mourning. Before the coffin is placed a table, on which ſtands the image of the deceaſed, or a carved ornament inſcribed with his name: and theſe are always accompanied with flowers, perfumes, and lighted wax candles.

In the mean time thoſe who enter the hall are accuſtomed to ſalute the deceaſed as if he were ſtill in life. They proſtrate themſelves before the table, and knock their foreheads ſeveral times againſt the earth; after which they place on the table ſome perfumes and wax candles provided for the purpoſe. The ſalutation which they have made to the deceaſed is returned by the eldeſt ſon accompanied by his brothers. The latter come forth from behind a curtain, which hangs on one ſide of the coffin, creeping along the ground until they reach the ſpot where thoſe ſtand whom they are going to ſalute; after which, without riſing up, they return to the place from whence they came. The women are alſo concealed behind the ſame curtain, from whence they every now and then ſend forth diſmal cries.

After a number of ceremonies and invitations, the funeral proceſſion at laſt commences. A troop of men march in a file, carrying different figures made of paſte-board, and repreſenting ſlaves, lions, tigers, horſes, &c. Others follow, marching in two files; ſome of which carry ſtandards, ſome flags or cenſers filled with perfumes; while melancholy and plaintive airs are played by others on different muſical inſtruments. Theſe muſicians immediately precede the coffin, which is covered with a canopy, in form of a dome, of violet-coloured ſilk: its four corners are ornamented with tufts of white ſilk very neatly embroidered, and covered at the top with net-work. The coffin is placed on the bottom of this machine, and is carried by 64 men. The eldeſt ſon, clothed in a frock of canvas, having his body bent and leaning on a ſtaff, follows near the coffin; and behind him his brothers and nephews, but none of them clothed in canvas. Then come the relations and friends, all clad in mourning, and followed by a great number of chairs covered with white ſtuff, which contain the wives and female ſlaves of the deceaſed. Theſe make great ſhow of ſorrow by their doleful cries; but M. Groſier obſerves, that in ſpite of all they can do, the lamentations of the Chineſe are ſo methodical, that an European would be apt to conclude that they were the effects of art rather than the natural effuſions of a mind agitated and oppreſſed with grief. When they arrive at the burying place, the coffin is depoſited in a tomb appropriated for it, not far from which there are tables arranged in different halls, and on which the aſſiſtants are entertained with great ſplendour. The entertainment is ſometimes followed by freſh marks of homage to the corpſe; but theſe are often changed into thanks to the eldeſt ſon; who, however, anſwers only by ſigns. But if the deceaſed was a grandee of the empire, a certain number of his relations never leave the tomb for a month or two. There they reſide in apartments purpoſely provided for them, and every day renew their marks of grief in company with the children of the deceaſed. The magnificence of theſe funeral ceremonies is proportioned to the wealth or dignity of the deceaſed. That of one of the brothers of the emperor was attended by 16,000 people, each of whom had a particular office aſſigned him relating to the ceremony.

120 Mourning.

Mourning continues in China for three years; and during all this time they are obliged to abſtain from the uſe of fleſh and wine; nor can they aſſiſt at any entertainment of ceremony, or attend any public aſſembly. At firſt they are not even permitted to go abroad; and when they do ſo, they are carried in a chair covered with a white cloth. Sometimes the filial piety of the Chineſe is carried to ſuch a length, that they preſerve the bodies of their deceaſed fathers in their houſes for three or four years; and thoſe who do ſo impoſe alſo upon themſelves a great number of other duties, uſing no other ſeat during the day but a ſtool covered with white ſerge, and no other bed but a plain mat made of reeds, which is placed near the coffin.

121 Diverſions of hunting and fiſhing.

According to M Groſier, the only diverſions of the Chineſe are thoſe of hunting and fiſhing, dancing not being practiſed, and gaming forbidden by law. Fiſhing is conſidered by them rather as an object of commerce and induſtry than amuſement. They catch fiſh by various methods; uſing nets in their great fiſheries, but lines in the private. In certain provinces alſo they uſe a certain kind of bird, whoſe plumage greatly reſembles that of a raven, but with a much longer bill, very ſharp and hooked. This method of fiſhing is practiſed in boats, of which great numbers may be ſeen on the river about ſun-riſing, with the fiſhing-birds perched on their prows. Theſe birds are taught to catch fiſh almoſt in the ſame manner that dogs purſue game. The fiſhermen, after making ſeveral turns with their boats, beat the water ſtrongly with one of their oars. This ſerves as a ſignal to the birds, who inſtantly plunge into the water, and diving, ſwallow as many

ſmall

ſmall fiſh as they can, repairing immediately afterwards to the boat, and carrying a large one by the middle in their bill. The ſmall ones are prevented from paſſing into the ſtomach by a ring placed on purpoſe to confine its gullet: and thus the fiſherman by ſtroaking its neck with the head downwards, makes the bird diſgorge all thoſe ſmall fiſh it has ſwallowed. When they have done fiſhing, the rings are taken off, and the birds allowed to feed. When the fiſh happens to be too large for a ſingle bird, the others have ſagacity enough to aſſiſt it; one taking it by the tail, another by the head, &c. and thus they tranſport it to their maſter.

Another method of fiſhing, practiſed only in China, is as follows: They nail a board, about two feet in breadth, which is covered with a white ſhining kind of varniſh, upon the edges of a long narrow boat, from one end to the other. This board is placed in ſuch a manner as to ſlope almoſt imperceptibly to the water. It is uſed only in the night-time, and is always turned towards the moon, that the reflection of light from the luminary may increaſe the ſplendor of the varniſh. The fiſh, in ſporting, often miſtake this varniſhed board for water; and endeavouring to throw themſelves into it, fall into the boat.

The ſoldiers have a particular method of fiſhing with a bow and an arrow; the latter of which is fixed to the bow by a ſtring, both to prevent it from being loſt, and to enable them to draw out the fiſh which the arrow has pierced: others make uſe of tridents to catch large fiſh which are ſometimes found in the mud.

Beſides theſe diverſions, the Chineſe have ſome ſtrolling players, but no regular theatres; they have likewiſe muſicians and ſingers, but no operas, or indeed any public ſpectacle worthy of notice.

122 Of the Chineſe language. The language of the Chineſe is not only very ancient, but, in M. Groſier's opinion, is ſtill ſpoken as in the moſt early ages without any variation. His reaſons for this opinion are, 1. We do not perceive in hiſtory, nor even in the moſt fabulous traditions, a ſingle fact tending to occaſion any doubt of the language ſpoken by the ancient Chineſe being different from that uſed at preſent. 2. China has never changed its inhabitants; and if revolutions have occaſioned any mixture of new languages, it appears that the ancient language has always been predominant, and that the new ſettlers have learned and ſpoken it, as the Marchew Tartars after their conqueſt. 3. The moſt intelligent and diſcerning of the literati agree, that the firſt chapters of the *Chou-king* were written under the reign of Yao 2300 years before Chriſt; and in theſe, ſeveral ſpeeches of the firſt emperors are related word for word; and it is not probable that the language of theſe princes was different from that of the hiſtorian. 4. A compliment paid to Yao by one of his ſubjects, with the anſwer of that prince, are ſtill preſerved, as well as two ſongs compoſed under the ſame reign. 5. The moſt ancient inſcriptions in China are all in the language ſpoken throughout the empire at this day. 7. The Chineſe have borrowed nothing from other nations; and their attachment to their own cuſtoms, and to antiquity, muſt undoubtedly be very unfavourable to any innovation. The language ſpoken by the vulgar, indeed, muſt have undergone ſome changes; but theſe may be accounted trivial, affecting only the pronunciation; which indeed appears to be varied in ſome few inſtances. It is certain, however, that the Chineſe players act theatrical pieces which were written 1000 years ago, and that theſe are ſtill underſtood throughout the empire.

The language of China has no alphabet; all the words which compoſe it conſiſt of one ſyllable only, and are very few in number. Theſe always remain the ſame, and continue monoſyllables even when two are joined together, being united in the ſame manner as the French words *bon* and *jour* are united to form *bon-jour*. Theſe monoſyllables never form but one ſound. When written by an European, they begin with the letters *ch*, *tch*, *f*, *g*, or *j*, *i*, *h*, *l*, *m*, *n*, *g*, *ng*, *p*, *ſ*, *ts*, *v*, *ou*; the final letters being *a*, *e*, *i*, *o*, *oi*, *ou*, *u*, *l*, *n*, *gn*. The middle of Chineſe words conſiſts of vowels and conſonants produceing only one ſound, and pronounced always as monoſyllables. The whole primary words of the language are in number only about 330, though ſome dictionaries make them 484. The ſenſe of theſe words, however, is varied by the accents and changes of the voice in pronouncing them almoſt *ad infinitum*. Two principal accents are known in China; the *ping*, that is *even*, without elevating or depreſſing the voice. This is divided into *tſing*, *clear*, and *tcho*, *obſcure*; or rather *open* and *mute*. The accent *tſe* is ſubdivided into *tchang*, ſharp, *kiu*, grave, and *jou* re-entering. The tone is *chang* when one raiſes the voice at the end of a word, as when the negative *no* is pronounced with great emphaſis and force; it is *kiu* when one depreſſes the voice with an air of timidity. When the accent is *jou*, the voice is drawn back as it were into the throat; and the aſpiration which takes place on certain words beginning with the letters *c*, *k*, *p*, *t*, ſtill adds to theſe varieties.

By theſe differences in pronunciation the ſignification of the words is totally changed: thus the word *tchu* pronounced by lengthening the *u*, and with a clear tone of voice, ſignifies maſter or lord: if it is pronounced in an uniform tone by lengthening the *u*, it ſignifies *hog*: when pronounced lightly, and with rapidity, it ſignifies *kitchen*; and when articulated with a ſtrong voice depreſſed towards the end, it ſignifies a *pillar*.

By the conjunction and modification of theſe different monoſyllables, a Chineſe can expreſs every thing he has occaſion for; and it may be eaſily ſeen what variety muſt reſult from this art of multiplying words. The Chineſe language therefore has words expreſſive of the ſmalleſt variation of circumſtance, and which cannot be expreſſed in the European languages without a circumlocution. Thus, inſtead of the five words, calf, bull, ox, heifer, cow, every time that a cow has a calf ſhe acquires a new name in the language of this empire; and ſtill another when ſhe becomes barren. An ox fed for ſacrifice has a particular name, which is changed when he goes to the altar. In like manner, a whole dictionary might be compoſed of the words that are employed to expreſs the different parts of the emperor's palace, and thoſe that are in a manner conſecrated to it; others being employed when the palaces of princes or mandarins are ſpoken of. Thus the number of their characters are augmented beyond all bounds, ſo that the greater part of their literati ſpend all their lives in ſtudying them.

In the Chineſe there are four different languages. 1. The *Kou-ouen*, or claſſical language. This is not ſpoken at preſent, though it is generally believed to have been the language of the early ages. It is ſo laconic, and the ideas are ſo crowded, that it is very difficult to be underſtood; however, the literati, who can read and underſtand it, are much delighted with it. 2. The *Ouen-tchang* is the language uſed in compoſitions where a noble and elevated ſtyle is requiſite. It is never ſpoken, but certain ſentences and complimentary expreſſions are ſometimes borrowed from it. It approaches near to the laconic brevity and majeſtic ſublimity of the *Kou-ouen*, and is equally proper for every kind of ſubject, excepting only the ambiguities of metaphyſics, and the formal rugged diction uſed in treating of the abſtract ſciences.

3. The *Kouan-ha* is the language of the court, of people in office, and of the literati. It admits of ſynonymous expreſſions to moderate the brevity of monoſyllables; of pronouns and relatives; prepoſitions, adverbs, and particles; to ſupply the want of caſes, moods, tenſes, and numbers, which have place in other languages.

4. *Hiang-tan* is a kind of corrupted language, or provincial dialect, ſpoken by the lower claſſes in China; and of which every province, city, and almoſt every village, has its own. Beſides the ſenſe of the words, which is changed in a great variety of places, they are ſo altered by diverſity of pronunciation as to be almoſt unintelligible.

123 Chineſe writing. There are five kinds of writing mentioned by the Chineſe literati; the moſt modern of which is a method of tracing out the characters with a pencil. This is difficult, and requires much experience; at any rate, it disfigures the characters greatly, and is therefore only uſed in the preſcriptions of phyſicians, prefaces to books, and inſcriptions of fancy. The tracing of characters with neatneſs and accuracy, however, as we have already had occaſion to obſerve, is greatly admired in China. They are often preferred to the moſt elegant painting; and ſome will give a moſt exorbitant price for a page of an old book, if it happens to be neatly written. They pay particular attention to well-formed characters even in the moſt common books; and if any of the leaves happen to fall off, will replace them with the greateſt attention. To apply them to any vile purpoſe, tread them under foot, &c. would be reckoned an unpardonable violation of decency and politeneſs; nay, it often happens, that workmen, ſuch as maſons and joiners, dare not tear a printed leaf of paper fixed to the wall.

124 Of their poetry. Punctuation was not formerly uſed in China, nor are points as yet employed in works of an elevated ſtyle, or ſuch as are to be preſented to the emperor. Poetry is ſeldom any object of attention, though the taſte for it ſeems to be pretty general in China. Their verſification has its rules, and is no leſs difficult than that of other nations. Only the moſt harmonious, energetic, and pictureſque words, are to be employed, and they muſt always be uſed in the ſame ſenſe in which they were uſed by the ancients. Each verſe can contain only a certain number of words; all of which muſt be ranged according to the rules of quantity, and terminate in rhyme. The number of verſes in a ſtrophe is not determined; but they muſt be uniform, and preſent the ſame diſtribution of rhymes. The ſmall number of poetical expreſſions contained in the Chineſe language has rendered it neceſſary to extend the poetical licence to a great length in this reſpect. The Chineſe poets are allowed to employ a blank verſe in every four. They are acquainted with moſt kinds of poetry in uſe among us. They have ſtanzas, odes, elegies, idylls, eclogues, epigrams, ſatires, and even *bouts rimes*. The common people have alſo ballads and ſongs peculiar to themſelves. Some of the moſt diſtinguiſhed of the literati have even thought it of importance enough to turn the moſt celebrated maxims of morality, with the rules of civility, into verſe. Their poetry is ſeldom diſgraced by any kind of obſcenity; and indeed any ſuch thing would be ſeverely puniſhed by government. That ſevere attention with which every thing tending to corrupt the morals is watched in China, prohibits not only poems of this kind, but likewiſe romances of all ſorts. The police, however, permits ſuch novels as have an uſeful tendency, and in which nothing is introduced prejudicial to ſound morality. Every author who writes againſt government is puniſhed with death, as well as all thoſe who have had any hand in the printing or diſtribution of his works.

125 Chineſe paper. The art of making paper and printing have been long known among the Chineſe. That kind of paper now in uſe was firſt manufactured about 105 years before the Chriſtian æra. Before that period they uſed cloth, and various kinds of ſilk ſtuff, inſtead of paper; and to this day they ſtill preſerve a cuſtom of writing the praiſes of the dead upon large pieces of ſilk, which are ſuſpended on one ſide of the coffin, and carried in funeral proceſſions; and of ornamenting their apartments with maxims and moral ſentences written in the ſame manner. In ages ſtill more early, they wrote with a kind of ſtyle upon pieces of bamboo, or even upon plates of metal. The firſt paper was invented by a mandarin. He took the bark of trees, hemp, and old pieces of ſilk-ſtuff, boiling them together until they were reduced to a kind of paſte, of which he formed his paper; which by degrees was brought to perfection, and the art of whitening and giving it a luſtre found out. A great number of different ſubſtances are now uſed in this empire for making paper; ſuch as the bamboo, reed, the cotton ſhrub, the bark of the plant called *kou-chu*, and of the mulberry tree; hemp, the ſtraw of wheat and rice, parchment, the cods of the ſilk worm, and ſeveral other ſubſtances unknown in Europe. In this manufacture the bark of trees and ſhrubs is uſed, and the woody ſubſtance of the bamboo and cotton tree, after it has been macerated and reduced to a thin paſte. Moſt of the Chineſe paper, however, is attended with the diſadvantage of being very ſuſceptible of moiſture, readily attracts the duſt, and worms inſenſibly get into it: to prevent which inconveniences, it is neceſſary to beat the books often, and expoſe them to the ſun. That made of cotton is the prettieſt, and moſt uſed of any. All of them, however, are much ſofter and ſmoother than ours; which is abſolutely neceſſary for their method of writing with a pencil, in order that it may run with freedom, which it could not do upon ours. It is formed into ſheets of an enormous ſize; ſo that it would be no difficult matter to procure from the manufactories of this empire ſheets of paper 30 or 40 feet long.

126 Ink. The Chineſe ink came originally from Corea; and it was not until the year 900, that they hit upon the me-

thod of making it to perfection. The beſt is made in *Hoei-tcheou* in the province of *Kiangnan*; but its compoſition is a ſecret, which the workmen conceal not only from ſtrangers, but from their fellow-citizens. When a Chineſe has occaſion to write, he places upon his table a piece of poliſhed marble, having a cavity at one of its extremities to contain a little water. In this he dips the end of his cake of ink, and rubs it upon the ſmooth part of the marble; and as he preſſes more or leſs ſtrongly, the liquor acquires a deeper or lighter tinge of black. When he has done writing, the ſtone is carefully waſhed; for it would be diſhonoured by allowing the leaſt ſpot to remain. The pencils uſed in writing are commonly made of the fur of a rabbit, and conſequently very ſoft.

127 Their method of printing. The Chineſe method of printing is exceedingly different from ours; and indeed it would be in a manner impoſſible to have moveable types for ſuch a number of characters as their language requires. The whole work which they intend to print is therefore engraved upon blocks of wood; and their method of proceeding is as follows. They firſt employ an excellent writer, who tranſcribes the whole upon very thin paper. The engraver glues each of the leaves of the manuſcript upon a piece of plank made of any hard wood; he then traces over with a graver the ſtrokes of the writing, carves out the characters in relief, and cuts down the intermediate part of the wood. Thus each page of a book requires a ſeparate plank; and the exceſſive multiplication of theſe is no doubt a very great inconvenience, one chamber being ſcarce ſufficient to preſerve thoſe employed for a ſingle book. The advantages are, that the work is thus free from typographical errors, and the author has no occaſion to correct the proofs. Thus alſo the bookſellers in China have a decided advantage over thoſe of Europe, as they are able by this method of printing to throw off copies according to their ſale, without running the riſk of being ruined by too large an addition. In this method the beauty of the work depends entirely upon the ſkill of the writer previouſly employed. The engravers are exceedingly dexterous, and imitate every ſtroke ſo exactly, that it is ſometimes difficult to diſtinguiſh a printed work from one that is only written.

The method of printing in China is not by a preſs as in Europe, as neither their wooden planks nor their ſoft paper could ſuſtain ſo much preſſure. They firſt place the plank level, and then fix it in that poſition. The printer is provided with two bruſhes, and, with the hardeſt, daubs the plank with ink; and one daubing is ſufficient for four or five leaves. After a leaf has been adjuſted upon the plank, the workman takes the ſecond bruſh, which is ſofter than the former, and of an oblong figure, and draws it gently over the paper, preſſing it down a little, that it may receive the ink. The degree of preſſure is to be regulated by the quantity of ink upon the plank: and in this manner one man is able to throw off almoſt 10,000 copies a-day. The ink uſed for printing is different from that formerly deſcribed, and which is uſed in writing. The leaves, on account of the thinneſs of the paper, are printed only upon one ſide; on which account each leaf of a book is double, ſo that the fold ſtands uppermoſt, and the opening is towards the back, where it is ſtitched. Hence the Chineſe books are not cut on the edges, but on the back. They are generally bound in grey paſteboard, which is very neat; and thoſe who wiſh to have them more elegantly done, get the paſteboard covered with ſatin, flowered taffety, and ſometimes with gold and ſilver brocade. Their books are neither gilt nor coloured on the edges like ours.

128 Vaſt quantity of ſilk produced. The art of manufacturing ſilk, according to the beſt authorities, was communicated by the Chineſe to the Perſians, and from them to the Greeks. The art has been known in this empire from the remoteſt antiquity; and the breeding of ſilk-worms and making of ſilk was one of the employments even of the empreſſes in very early ages.

The moſt beautiful ſilk in the whole empire is that of *Tche-kiang*, which is wrought by the manufactories of Nankin. From theſe are brought all the ſtuffs uſed by the emperor, and ſuch as he diſtributes in preſents to his nobility. A great number of excellent workmen are alſo drawn to the manufactories of Canton by the commerce with Europe and other parts of Aſia. Here are manufactured ribbons, ſtockings, and buttons. A pair of ſilk ſtockings here coſt little more than 6s. ſterling.

The quantity of ſilk produced in China ſeems to be almoſt inexhauſtible; the internal conſumption alone being incredibly great, beſides that which is exported in the commerce with Europe and the reſt of Aſia. In this empire all who poſſeſs a moderate fortune wear ſilk clothes; none but the lower claſs of people wearing cotton ſtuffs, which are commonly dyed blue. The principal ſtuffs manufactured by them are plain and flowered gauzes, of which they make ſummer dreſſes, damaſk of all colours; ſtripped and black ſatins; napped, flowered, ſtriped, clouded, and pinked taffeties; crapes, brocades, pluſh, different kinds of velvet, and a multitude of other ſtuffs unknown in Europe. They make particular uſe of two kinds; one named *touan-tſe*, a kind of ſatin much ſtronger, but, which has leſs luſtre, than that of Europe; the other a kind of taffety, of which they make drawers and linings. It is woven exceedingly cloſe, and is yet ſo pliable that it may be rumpled and rubbed between the hands without any creaſe; and even when waſhed like cotton-cloth, it loſes very little of its luſtre. They manufacture alſo a kind of gold brocades, but of ſuch a ſlight nature, that they cannot be worn in clothes: they are fabricated by wrapping fine ſlips of gilt paper round the threads of ſilk.

129 Porcelain. Porcelain is another great branch of Chineſe manufacture, and employs a vaſt number of workmen. The fineſt is made in a village called *King-te-ching* in the province of *Kiang-ſi*. Manufactories have alſo been erected in the provinces of Fo kien and Canton, but their produce is not eſteemed, and one which the emperor cauſed to be erected at Peking, in order to be under his own inſpection, miſcarried entirely.

The Chineſe divide their porcelain into ſeveral claſſes, according to its different degrees of fineneſs and beauty. The whole of the firſt is reſerved for the uſe of the emperor, ſo that none of it ever comes into the hands of other perſons, unleſs it happen to be cracked or otherwiſe damaged in ſuch a manner as to be unworthy of being preſented to the ſovereign. Among that ſent to the emperor, however, there is ſome porcelain of an in-

inferior quality, which he diſpoſes of in preſents. There is ſome doubt, therefore, whether any of the fineſt Chineſe porcelain was ever ſeen in Europe. Some value, however, is now put upon the European porcelain by the Chineſe themſelves.

130
Glaſs of little eſtimation.

The uſe of glaſs is very ancient in China, though it does not appear that great value was ever put upon this kind of ware, the art of manufacturing it having been frequently loſt and revived again in this empire. They greatly admire the workmanſhip of the European cryſtal, but prefer their own porcelain, which ſtands hot liquors, and is much leſs liable to be broken. The little eſtimation in which this ſubſtance was held, is even mentioned by their own writers in ſpeaking of the falſe pearls, mirrors and other toys which were made in former ages. The remembrance of a very large glaſs veſſel, however, which was made in 627, is ſtill preſerved; and of which it was ſaid that a mule could as eaſily enter it as a gnat could enter a pitcher. In order to tranſport this monſtrous veſſel from the place where it was manufactured to the emperor's palace, it was neceſſary to incloſe it in a net, the four corners of which were fixed to four carriages. The ſame indifference with regard to glaſs is ſtill entertained by the preſent emperors; however, a glaſs-houſe is eſtabliſhed at Peking, where a number of vaſes and other works are made; and theſe are ſo much the more difficult in the execution, as none of them are blown. This manufactory, as well as many others, is conſidered only as an appendage of the court, deſtined for the purpoſes of pomp and magnificence.

131
Medicine.

132
Method of diſcovering if a man has died a voluntary death.

Moſt of the Chineſe medicine is abſolute quackery; their ſkill in anatomy is not only very limited, but mixed with ſuch a number of falſehoods, as render it in a manner abſolutely uſeleſs. Their materia medica conſiſts moſtly of herbs, of which tea is one. To this they aſcribe great and wonderful virtues, eſpecially if it has been gathered on any of the ſummits of a mountain called *Mong-chan*. The only thing regarding this ſcience, which merits any attention, is the method they are ſaid to poſſeſs of diſcovering whether a man has hanged or drowned himſelf, or had that violence committed upon him by others. In order to diſcover this, the body is firſt taken from the earth, and waſhed in vinegar. After this a large fire is kindled in a pit dug on purpoſe, ſix feet long, three wide, and the ſame depth. This fire is continually augmented, until the ſurrounding earth becomes as hot as an oven; the remaining fire is then taken out, a large quantity of wine is poured into it, and it is covered with a hurdle made of oſier twigs, upon which the body is ſtretched out at full length. A cloth is thrown over both in the form of an arch, in order that the ſteam of the wine may act upon it in every direction. At the end of two hours the cloth is taken off; and if any blows have been given, they then appear upon the body in whatever ſtate it may be. The Chineſe likewiſe aſſert, that if the blows given have been ſo ſevere as to occaſion death, this trial makes the marks appear upon the bones, though none of them ſhould be broken or apparently injured. The wine uſed in theſe trials is only a kind of beer made from rice and honey.

133
Of their muſic.

With regard to the muſic of the Chineſe, we have the ſame ſtories related as of the Greeks and Egyptians, viz. that in former ages the muſicians could make brute animals leap at the ſound of their inſtruments. Our author, M. Groſier, indeed, does not quote any Chineſe author who aſſerts that the ancient muſic could make trees dance, or ſtones arrange themſelves into a city; but he quotes them, aſſerting, "that the muſicians could call down ſuperior ſpirits of every age from the etherial regions; raiſe up the manes of departed beings; inſpire men with a love of virtue; and lead them to the practice of their duty." Effects of this ſupernatural kind are attributed to the ſacred muſic by the inſpired writers; as in the caſe of Saul, out of whom an evil ſpirit departed at the ſound of David's harp; and of Eliſha, who was inſpired with the ſpirit of prophecy at the ſound of a muſical inſtrument. It is probable therefore, that the relations both of the Greeks and Chineſe are founded upon facts of this kind; and we cannot from thence infer, that the muſic of early ages was at all ſuperior to that which followed. According to thoſe who have employed much time in theſe reſearches, the ancient Chineſe were acquainted with the diviſion of the octave into twelve ſemitones; and that before the time of Pythagoras, or even Mercury himſelf; that the lyre of Pythagoras, his invention of the diatonic tetrachords, and the formation of his grand ſyſtem, were merely borrowed from the ancient Chineſe. In ſhort, it is maintained, that the Greeks, even Pythagoras himſelf, did nothing but apply to ſtrings that theory which the Chineſe had before formed, and applied to pipes.

At preſent the Chineſe are not acquainted with the uſe of our muſical notes; they have not that diverſity of ſigns which diſtinguiſh the different tones, and the gradual elevation or depreſſion of the voice, nor any thing to point out the various modifications of ſound to produce harmony. They have only a few characters to mark the principal notes; and all the airs they learn are repeated merely by rote. The emperor Kang-hi was therefore greatly aſtoniſhed at the facility with which an European could catch and remember an air the firſt time he heard it. In 1679 he ſent for Fathers Grimaldi and Pereira, to play ſome tunes on the harpſichord, of which they had before made him a preſent. He was greatly entertained with their muſic, but altogether aſtoniſhed when he found that F. Pereira could take down a Chineſe air while the muſicians were playing it, and then repeat the whole without omitting a ſingle note. Having made ſeveral trials of this kind in order to ſatisfy himſelf, he beſtowed the higheſt encomiums upon the European muſic, and the means furniſhed by it to facilitate and leſſen the labour of the memory. "I muſt confeſs (ſays he) that the European muſic is incomparable, and that the like of this F. Pereiri is not to be found in my whole kingdom."

134
Muſical inſtruments.

The Chineſe have always diſtinguiſhed eight different ſounds; and they believe that nature, in order to produce theſe, formed eight different kinds of ſonorous bodies. The order in which they diſtribute theſe ſounds, and the inſtruments they have contrived to produce them, are, 1. The ſound of ſkin produced by drums. 2. That of ſtone produced by the *king*. 3. The ſound of metal by bells. 4. That of baked earth by the *huien*. 5. Of ſilk by the *kin* and *che*. 6. Of

wood

wood by the *yu*, and *tchou*. 7. Of the bamboo by the *koan*, and different flutes. 8. That of a gourd by the *cheng*.

The drums were originally compoſed of a box made of baked earth, and covered at the extremities with the ſkin of ſome animal; but on account of the brittleneſs of baked earth, wood was ſoon ſubſtituted in its ſtead. Greater part of theſe inſtruments are ſhaped like our barrels, but ſome are cylindric.

The inſtruments formed of the ſonorous ſtones are called *king*, diſtinguiſhed into *tſe-king* and *pien-king*. The *tſe-king* conſiſts only of one ſtone, and therefore produces only one note. The *pien-king* conſiſts of 16 ſtones ſuſpended together, and thus forming an inſtrument capable of producing all the tones admitted into the muſic of the ancient Chineſe. They are cut into the form of a carpenter's ſquare; their tone is flattened by diminiſhing their thickneſs, and is made ſharper by abridging their length.

135 Bells of immenſe ſize. The bells in China have always been made of a mixture of tin and copper. They are of different ſhapes, and thoſe of the ancients were not round, but flatted, and in the lower part reſembling a creſcent. An inſtrument, correſponding to the *king* already mentioned, is compoſed of 16 bells of different ſizes. Some of their bells uſed on public occaſions are of enormous magnitudes. One at Peking is deſcribed as 13½ feet in diameter, 12½ in height, and 42 in circumference; the weight being upwards of 120,000 pounds. It is uſed for announcing the hours or watches of the night; and its ſound, which is prodigiouſly loud and ſtrong, has a moſt awful effect in the night-time, by reverberating round the walls and the echo of the ſurrounding country. There are ſeveral others likewiſe of a vaſt ſize in the ſame city; one of which deſerves greatly to be admired on account of the beautiful characters with which it is covered: and which are as neat and perfect as if traced out by the hand of the fineſt writer, or formed by means of a ſtamp upon wax. F. le Comte tells us, that in all the cities of China there are bells for marking the hours and watches of the night. They generally divide the night into five watches, beginning at ſeven or eight in the evening. On the commencement of the firſt they give one ſtroke, which is repeated a moment after; and thus they continue for two hours till the beginning of the ſecond: they then give two ſtrokes, which are repeated at equal intervals till the beginning of the third watch; and thus they proceed to the fourth and fifth, always increaſing the number of the ſtrokes. For the ſame purpoſe alſo they uſe enormous drums, which they beat in a ſimilar manner. F. Magaillans mentions one at Peking upwards of 40 feet in circumference.

The inſtrument called *huien*, which is made of baked earth is highly eſteemed by the Chineſe on account of its antiquity. It is diſtinguiſhed into two kinds, the great and ſmall; the former being of the ſize of a gooſe's egg; the latter of that of a hen's. It has ſix holes, and a ſeventh for the mouth

The *kin* and *tche* have been known from the remoteſt antiquity. The kin has ſeven ſtrings made of ſilk, and is diſtinguiſhed into three kinds, differing only in ſize. The body is formed of a kind of wood varniſhed black, and its whole length about five feet five inches. The *che* is about nine feet in length, has 25 ſtrings, and is divided into 25 kinds. F. Amiot aſſures us, that we have no inſtrument in Europe which deſerves to be preferred to it.

The inſtruments which emit the ſound of wood are the *tchou*, the *yu*, and the *tchoung-tou*. The firſt is ſhaped like a buſhel, and is beat on the inſide with a hammer; the ſecond, which repreſents a tyger ſquatting, is made to ſound by ſcraping its back gently with a rod; the third is a collection of twelve pieces of boards tied together, which are uſed for beating time, by holding them in the right hand, and knocking them gently againſt the palm of the left.

Many inſtruments are conſtructed of the bamboo. Theſe conſiſt of pipes joined together, or ſeparate, and pierced with more or fewer holes. The principal of all theſe wind inſtruments is the *cheng*, which emits the ſound of a gourd. This is formed by cutting off the neck of a gourd, and reſerving only the lower part. To this a cover is fitted, having as many holes as are equal to the number of ſounds required. In each of theſe holes a pipe made of bamboo is fixed, and ſhorter or longer according to the tone intended. The mouth of the inſtrument is formed of another pipe ſhaped like the neck of a gooſe; which is fixed to the gourd on one ſide, and ſerves to convey the air to all the pipes it contains. The ancient *cheng* varied in the number of their pipes; thoſe uſed at preſent have only 13.

136 Chineſe painting. The painting of the Chineſe is undoubtedly inferior to that of the Europeans, though we are not by any means to judge of the abilities of the painters of this empire by the performances which are brought to Europe. M. Groſier remarks, that the works of the eminent Chineſe painters are never brought to Canton, becauſe they cannot find purchaſers among the European merchants. The latter delight only in obſcene pictures, which are not permitted by government, nor indeed will any artiſt of character execute them, though they prevail upon ſome of the inferior daubers to gratify them in this reſpect. It ſeems, however, to be univerſally agreed, that the Chineſe have no notion of correctneſs or perſpective, and little knowledge of the proportions of the human body, though it cannot be denied that they excel in painting flowers and animals. In theſe they pride themſelves in a ſcrupulouſly exact imitation of nature, inſomuch that it is no uncommon thing to hear a painter aſk his pupil how many ſcales there are between the head and tail of a carp.

Painting was formerly much eſteemed in China, but has now fallen into diſrepute on account of its political inutility. The cabinets and galleries of the emperor, however, are filled with European paintings, and the celebrated artiſts Caſtiglioni and Attiret were both employed; but their offer of erecting a ſchool of painting was rejected, leſt they ſhould by this means revive the taſte for that art which it had been formerly thought prudent to ſuppreſs.

Painting in freſco was known in China long before the Chriſtian aera; and, like the Grecians, the Chineſe boaſt much of their celebrated painters of antiquity. Thus we are told of a door painted by Fan-hien, which was ſo perfect an imitation, that the people who entered the temple where it was attempted to go out by it, unleſs prevented by thoſe who had ſeen it before.

The preſent emperor has in his park an European village painted in freſco, which produces the moſt agreeable deception. The remaining part of the wall repreſents a landſcape and little hills, which are ſo happily blended with the diſtant mountains, that nothing can be conceived more agreeable. This was the production of Chineſe painters, and executed from deſigns ſketched out for them.

137 Engraving. Engraving in three, four, or five colours, is very ancient among the Chineſe, and was known in this empire long before its diſcovery in Europe.

138 Sculpture. Sculpture is very little known in this empire; nor is there a ſingle ſtatue in any of the ſquares or public edifices of Peking, not even in the emperor's palace. The only real ſtatues to be met with in the empire are thoſe which, for the ſake of ceremonious diſtinction, are uſed to ornament the avenues leading to the tombs of princes and men of great rank; or thoſe that are placed near the emperor's coffin, and that of his ſons and daughters in the interior part of the vault, where their remains are depoſited.

139 Architecture. The Chineſe architecture is entirely different from that of the Greeks or Romans: but nevertheleſs has certain proportions of its own, and a beauty peculiar to itſelf. The habitations of the emperor are real palaces, and announce in a ſtriking manner the majeſty and grandeur of the maſter who inhabits them. All the miſſionaries who had acceſs to the inſide of the emperor's palace at Peking, agreed, that if each of its parts, taken ſeparately, does not afford ſo much delight to the eye as ſome pieces of the grand architecture of Europe, the whole preſents a ſight ſuperior to any thing they had ever ſeen before. In the Chineſe architecture, when a pillar is two feet diameter at the baſe, its height muſt be 14 feet: and by meaſures of this kind the height of every building is determined.

Almoſt all the houſes and buildings in China are conſtructed of wood. One reaſon of this may be the dread of earthquakes; but, beſides this, ſuch buildings are rendered eligible by the heat and dampneſs of the ſouthern provinces, and the exceſſive cold in the northern, which would render ſtone houſes almoſt uninhabitable. Even at Peking, where the rains are but of ſhort duration, it is found neceſſary to cover the ſmall marble ſtair-caſes belonging to the imperial palace with pieces of felt: the humidity of the air moiſtens and ſoaks into every thing. During winter the cold is ſo exceedingly ſevere, that no window can be opened to the north; and water continues conſtantly frozen to the depth of a foot and a half for more than three months. For the ſame reaſons a variety of ſtories are not uſed in the Chineſe buildings; as neither a ſecond nor third ſtory would be habitable during the great heats of ſummer or the rigorous cold of winter. Though Peking is ſituated in the northern part of the empire, the heat there, during the dog-days, is ſo intolerably ſcorching, that the police obliges tradeſmen and ſhopkeepers to ſleep in the open air in the piazzas of their houſes, leſt they ſhould be ſtifled by retiring into their inner apartments. The habitations of people of rank, or of thoſe of eaſy circumſtances, generally conſiſt of five large courts, incloſed with buildings on every ſide. The method of building with ſeveral ſtories was, however, followed for ſeveral centuries, when the court reſided in the ſouthern provinces; and the taſte for this kind of building was carried to ſuch an height, that immenſe edifices were erected from 150 to 200 feet in height, and the pavilions or towers at the extremities roſe upwards of 300 feet. This kind of building, however, at length became diſguſting; though, either to preſerve the remembrance of it, or for the ſake of variety, there are ſtill ſome buildings to be ſeen ſeveral ſtories high in the palaces belonging to the emperor.

140 Bridges. A multiplicity of bridges are rendered neceſſary in China by the vaſt number of canals and rivers which interſect the empire. Anciently, however, the Chineſe bridges were much more ingenious as well as magnificent than they are at preſent. Some of them were ſo contrived that they could be erected in one day to ſupply the place of others which might happen to be broken down, or for other purpoſes. At that time they had bridges which derived their name from their figure; as *reſembling the rainbow; draw-bridges, bridges to move with pullies, compaſs-bridge*, &c. with many others entirely unknown at preſent. The building of bridges indeed was once a luxurious folly of the emperors; ſo that they were multiplied from whim or caprice, without any neceſſity, and without uſe. Still, however, many of them are extremely beautiful and magnificent. The arches of ſome are very lofty and acute, with eaſy ſtairs on each ſide, the ſteps of which are not quite three inches in thickneſs, for the greater facility of aſcending and deſcending: others have no arches, but are compoſed of large ſtones, ſometimes 18 feet in length, placed tranſverſely upon piles like planks. Some of theſe bridges are conſtructed of ſtone, marble, or brick; others of wood; and ſome are formed of a certain number of barks joined together by very ſtrong iron chains. Theſe are known by the name of floating bridges, and ſeveral of them are to be ſeen on the large rivers Kiang and Hoang-ho.

141 Ship-building. For ſeveral centuries the Chineſe have made no progreſs in ſhip-building. Their veſſels have neither mizen, bowſprit, nor top maſt. They have only a main and fore-maſt, to which is ſometimes added a ſmall top gallant-maſt. The main-maſt is placed almoſt in the ſame part of the deck as ours; but the fore-maſt ſtands much farther forward. The latter is to the former in the proportion of two to three; and the main-maſt is generally two-thirds of the length of the veſſel. They uſe mats for ſails, ſtrengthening them with whole bamboos equal in length to the breadth of the ſail, and extended acroſs it at the diſtance of a foot from one another. Two pieces of wood are fixed to the top and bottom of the ſail; the upper ſerves as a ſail-yard; and the lower, which is about five or ſix inches in thickneſs, keeps the ſail ſtretched when it is neceſſary to hoiſt or lower it. This kind of ſail may be folded or unfolded like a ſcreen. For caulking their veſſels they do not uſe pitch, but a particular kind of gum mixed with lime, which forms a compoſition of ſuch excellent quality, that one or two wells in the hold are ſufficient to keep the veſſel dry. They have not yet adopted the uſe of pumps, and therefore draw up the water with buckets. Their anchors are made of the hard wood called *iron-wood*, which they ſay is much

ſuperior

ſuperior to the metal, becauſe the latter ſometimes bend, but the former never do.

The Chineſe pretend to have been the firſt inventors of the mariner's compaſs, but ſeem to have little inclination to improve ſuch an important machine: however, they are well acquainted with the art of manœuvring a veſſel, and make excellent coaſting pilots, though they are bad ſailors in an open ſea.

China-Root, in the materia medica, the root of a ſpecies of SMILAX, brought both from the Eaſt and Weſt Indies; and thence diſtinguiſhed into oriental and occidental. Both ſorts are longiſh, full of joints, of a pale-reddiſh colour, with no ſmell, and very little taſte. The oriental, which is the moſt eſteemed, is conſiderably harder and paler-coloured than the other. Such ſhould be choſen as is freſh, cloſe, heavy, and upon being chewed appears full of a fat unctuous juice. It is generally ſuppoſed to promote inſenſible perſpiration and the urinary diſcharge, and by its unctuous quality to obtund acrimonious juices. China-root was firſt brought into Europe in the year 1535, and uſed as a ſpecific againſt venereal and cutaneous diſorders. With this view it was made uſe of for ſome time; but has long ſince given place to more powerful medicines.

China-Ware. See PORCELAIN.

CHINCA, a ſea-port town of Peru in South America, ſituated in an extenſive valley of the ſame name, in W. Long. 76. 0. S. Lat. 13. 0.

CHINCOUGH, a convulſive kind of cough to which children are generally ſubject. See MEDICINE-*Index*.

CHINESE, in general denotes any thing belonging to China, or its inhabitants.

Chinese Swanpan. See SWANPAN.

CHINKAPIN. See FAGUS.

CHINNOR, a muſical inſtrument among the Hebrews, conſiſting of 32 chords. Kircher has given a figure of it, which is copied on Plate CXXXV.

CHINON, an ancient town of Tourain in France, remarkable for the death of Henry II. king of England, and for the birth of the famous Rabelais. It is ſeated on the river Vienne, in a fertile and pleaſant country, in E. Long. 0. 18. N. Lat. 47. 2.

CHIO, or CHIOS, an Aſiatic iſland lying near the coaſt of Natolia, oppoſite to the peninſula of Ionia. It was known to the ancients by the name of Æthalia, Macris, Pithynſa, &c. as well as that of Chios. According to Herodotus, the iſland of Chios was peopled originally from Ionia. It was at firſt governed by kings; but afterwards the government aſſumed a republican form, which by the direction of Iſocrates was modelled after that of Athens. They were, however, ſoon enſlaved by tyrants, and afterwards conquered by Cyrus king of Perſia. They joined the other Grecians in the Ionian revolt; but were ſhamefully abandoned by the Samians, Leſbians, and others of their allies; ſo that they were again reduced under the yoke of the Perſians, who treated them with the utmoſt ſeverity. They continued ſubject to them till the battle of Mycale, when they were reſtored to their ancient liberty: this they enjoyed till the downfal of the Perſian empire, when they became ſubject to the Macedonian princes. In the time of the emperor Veſpaſian the iſland was reduced to the form of a Roman province; but the inhabitants were allowed to live according to their own laws under the ſuperintendance of a praetor. It is now ſubject to the Turks, and is called *Scio*. See that article.

CHIOCOCCA, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 48th order, *Aggregatae*. The corolla is funnel-ſhaped and equal; the berry unilocular, diſpermous, inferior.

CHIONANTHUS, the SNOW-DROP or FRINGE TREE: A genus of the monogynia order, belonging to the diandria claſs of plants; and in the natural method ranking under the 44th order, *Sepiariae*. The corolla is quadrifid, with the ſegments very long; the fruit is a plum. There is but one ſpecies particularly deſcribed by botaniſts, viz. the *Virginica*. It is common in Virginia and South Carolina, where it grows by the ſides of rivulets. It riſes to the height of ten feet; the leaves are as large as thoſe of the laurel, but much thinner. The flowers come out in May, and are of a pure white; from whence it has the name of the *ſnow-drop tree*. They hang down in large branches, and are cut into narrow ſegments; from which it has got its other name of the *fringe-tree*. After the flowers are fallen off, the fruit appears, which grows to the ſize of a ſloe, having a ſtone in the middle. The plants are propagated, in Britain, from ſeeds ſown on a hot-bed, and kept in a ſtove. Some have been raiſed from layers; but this method is very precarious, and therefore the other is to be preferred. The ſeeds are procured from America, for they never come to perfection in Britain.

CHIONE, in fabulous hiſtory, was daughter of Daedalion, of whom Apollo and Mercury became enamoured. To enjoy her company, Mercury lulled her to ſleep with his caduceus; and Apollo, in the night, under the form of an old woman, obtained the ſame favours as Mercury. From this embrace Chione became mother of Philammon and Autolycus; the former of whom, as being ſon of Apollo, became an excellent muſician; and the latter was equally notorious for his robberies, of which his father Mercury was the patron. Chione grew ſo proud of her commerce with the gods, that ſhe even preferred her beauty to that of Juno; for which impiety ſhe was killed by the goddeſs and changed into a hawk.——Another of the ſame name was daughter of Boreas and Orithyia, who had Eumolphus by Neptune. She threw her ſon into the ſea; but he was preſerved by his father.

CHIOS. See CHIO and SCIO

CHIOURLIC, an ancient town of Turkey in Europe, and in Romania, with a ſee of a Greek biſhop. It is ſeated on a river of the ſame name, in E. Long. 7. 47. N. Lat. 41. 18.

CHIOZZO, an ancient and handſome town of Italy, in the territory of Venice, and in a ſmall Iſland, near the Lagunes, with a podeſta, a biſhop's ſee, and a harbour defended by a fort. E. Long. 12. 23. N. Lat. 45. 17.

CHIPPENHAM, a town of Wiltſhire, ſeated on the river Avon. It is a good thoroughfare town; has a handſome ſtone-bridge over the river, conſiſting of 16 arches; and ſends two members to parliament. There

There is here a manufacture of the beſt ſuperfine woollen cloth in England. W. Long. 2. 12. N. Lat. 51. 25.

CHIPPING, a phraſe uſed by the potters and china-men to expreſs that common accident both of our own ſtone and earthen ware, and the porcelain of China, the flying off of ſmall pieces, or breaking at the edges. Our earthen wares are particularly ſubject to this, and are always ſpoiled by it before any other flaw appears in them. Our ſtone-wares eſcape it better than theſe; but not ſo well as the porcelain of China, which is leſs ſubject to it than any other manufacture in the world. The method by which the Chineſe defend their ware from this accident, is this: They carefully burn ſome ſmall bamboo canes to a ſort of charcoal, which is very light, and very black; this they reduce to a fine powder, and then mix it into a thin paſte, with ſome of the varniſh which they uſe for their ware: they next take the veſſels when dried, and not yet baked, to the wheel; and turning them ſoftly round, they, with a pencil dipt in this paſte, cover the whole circumference with a thin coat of it; after this, the veſſel is again dried; and the border made with this paſte appears of a pale greyiſh colour when it is thoroughly dry. They work on it afterwards in the common way, covering both this edge and the reſt of the veſſel with the common varniſh. When the whole is baked on, the colour given by the aſhes diſappears, and the edges are as white as any other part; only when the baking has not been ſufficient, or the edges have not been covered with the ſecond varniſhing, we ſometimes find a duſky edge, as in ſome of the ordinary thick tea-cups. It may be a great advantage to the Engliſh manufactures to attempt ſomething of this kind. The willow is known to make a very light and black charcoal; but the elder, though a thing ſeldom uſed, greatly exceeds it. The young green ſhoots of this ſhrub, which are almoſt all pith, make the lighteſt and the blackeſt of all charcoal; this readily mixes with any liquid, and might be eaſily uſed in the ſame way that the Chineſe uſe the charcoal of the bamboo cane, which is a light hollow vegetable, more reſembling the elder ſhoots than any other Engliſh plant. It is no wonder that the fixed ſalt and oil contained in this charcoal ſhould be able to penetrate the yet raw edges of the ware, and to give them in the ſubſequent baking a ſomewhat different degree of vitrification from the other parts of the veſſel; which, though, if given to the whole, it might take off from the true ſemivitrified ſtate of that ware, yet at the edges is not to be regarded, and only ſerves to defend them from common accidents, and keep them entire. The Chineſe uſe two cautions in this application: the firſt in the preparation; the ſecond in the laying it on. They prepare the bamboo canes for burning into charcoal, by peeling off the rind. This might eaſily be done with the elder ſhoots, which are ſo ſucculent, that the bark ſtrips off with a touch. The Chineſe ſay, that if this is not done with their bamboo, the edges touched with the paſte will burſt in the baking: this does not ſeem indeed very probable; but the charcoal will certainly be lighter made from the peeled ſticks, and this is a known advantage. The other caution is, never to touch the veſſel with hands that have any greaſy or fatty ſubſtance about them; for if this is done, they always find the veſſel crack in that place.

CHIROGRAPH, was anciently a deed which, requiring a counterpart, was engroſſed twice on the ſame piece of parchment, counterwiſe; leaving a ſpace between, wherein was written CHIROGRAPH; through the middle whereof the parchment was cut, ſometimes ſtraight, ſometimes indentedly; and a moiety given to each of the parties. This was afterwards called *dividenda*, and *chartæ diviſæ*; and was the ſame with what we now call *charter-party*. See CHARTER-*Party*. The firſt uſe of theſe chirographs, in Britain, was in the time of Henry III.

CHIROGRAPH was alſo anciently uſed for a fine; and the manner of engroſſing the fines, and cutting the parchment in two pieces, is ſtill retained in England, in the office called the *chirographer's office*.

CHIROGRAPHER *of* FINES, an officer in the common pleas, in England, who engroſſes FINES acknowledged in that court into a perpetual record (after they have been examined, and paſſed by other officers), and writes and delivers the indentures thereof to the party. He makes two indentures; one for the buyer, the other for the ſeller; and a third indented piece, containing the effect of the fine, and called *the foot of the fine*; and delivers it to the *cuſtos brevium*.—The ſame officer alſo, or his deputy, proclaims all fines in court every term, and indorſes the proclamations on the backſide of the foot; keeping, withal, the writ of covenant, and the note of the fine.

CHIROMANCY, a ſpecies of divination drawn from the lines and lineaments of a perſon's hand; by which means, it is pretended, the diſpoſitions may be diſcovered. See DIVINATION, nº 9.

CHIRON, a famous perſonage of antiquity; ſtyled by Plutarch, in his dialogue on muſic, "*The wiſe Centaur.*" Sir Iſaac Newton places his birth in the firſt age after Deucalion's deluge, commonly called the *Golden Age*; and adds, that he formed the conſtellations for the uſe of the Argonauts, when he was 88 years old; for he was a practical aſtronomer, as well as his daughter Hippo: he may, therefore, be ſaid to have flouriſhed in the earlieſt ages of Greece, as he preceded the conqueſt of the Golden Fleece, and the Trojan war. He is generally called the ſon of Saturn and Phillyra; and is ſaid to have been born in Theſſaly among the CENTAURS, who were the firſt Greeks that had acquired the art of breaking and riding horſes: whence the poets, painters, and ſculptors, have repreſented them as a compound of man and horſe; and perhaps it was at firſt imagined by the Greeks, as well as the Americans, when they firſt ſaw cavalry, that the horſe and the rider conſtituted the ſame animal.

Burney's Hiſt. of Muſic.

Chiron was repreſented by the ancients as one of the firſt inventors of medicine, botany, and *chirurgery*; a word which ſome etymologiſts have derived from his name. He inhabited a grotto or cave in the foot of Mount Pelion, which, from his wiſdom and great knowledge of all kinds, became the moſt famous and frequented ſchool throughout Greece. Almoſt all the heroes of his time were fond of receiving his inſtructions; and Xenophon, who enumerates them, names the following illuſtrious perſonages among his diſciples: Cephalus, Æſculapius, Melanion, Neſtor, Amphiaraus,

phiaraus, Peleus, Telamon, Meleager, Theſeus, Hippolitus, Palamedes, Ulyſſes, Mneſthens, Diomedes, Caſtor and Pollux, Machaon and Podalirius, Antilochus, Æneas, and Achilles. From this catalogue it appears, that Chiron frequently inſtructed both fathers and ſons; and Xenophon has given a ſhort eulogium on each, which may be read in his works, and which redounds to the honour of the preceptor. The Greek hiſtorian, however, has omitted naming ſeveral of his ſcholars, ſuch as Bacchus, Phœnix, Cocytus, Aryſtæus, Jaſon, and his ſon Medeus, Ajax, and Proteſilaus. Of theſe we ſhall only take notice of ſuch as intereſt Chiron more particularly. It is pretended that the Grecian Bacchus was the favourite ſcholar of the Centaur; and that he learned of this maſter the revels, orgies, bacchanalia, and other ceremonies of his worſhip. According to Plutarch, it was likewiſe at the ſchool of Chiron that Hercules ſtudied muſic, medicine, and juſtice; though Diodorus Siculus tells us, that Linus was the muſic-maſter of this hero. But among all the heroes, who have been diſciples of this Centaur, no one reflected ſo much honour upon him as Achilles, whoſe renown he in ſome meaſure ſhared; and to whoſe education he in a particular manner attended, being his grandfather by the mother's ſide. Apollodorus tells us, that the ſtudy of muſic employed a conſiderable part of the time which he beſtowed upon his young pupil, as an incitement to virtuous actions, and a bridle to the impetuoſity of his temper. One of the beſt remains of antique painting now exiſting, is a picture upon this ſubject, dug out of the ruins of Herculaneum, in which Chiron is teaching the young Achilles to play on the lyre. The death of this philoſophic muſician was occaſioned, at an extreme old age, by an accidental wound in the knee with a poiſoned arrow, ſhot by his ſcholar Hercules, at another. He was placed after his death by Muſæus among the conſtellations, through reſpect for his virtues, and in gratitude for the great ſervices which he had rendered the people of Greece. Sir Iſaac Newton ſays*, in proof of the conſtellations being formed by Chiron and Muſæus for the uſe and honour of the Argonauts, that nothing later than the expedition was delineated on the ſphere; according to the ſame author, Chiron lived till after the Argonautic expedition, in which he had two grandſons. The ancients have not failed to attribute to him ſeveral writings; among which, according to Suidas, are *precepts*, υποθηκας, in verſe, compoſed for the uſe of Achilles, and a medicinal treatiſe on the *diſeaſes incident to horſes* and other quadrupeds, ἱππατριχον; the lexicographer even pretends, that it is from this work the Centaur derived his name. Fabricius gives a liſt of the works attributed to Chiron, and diſcuſſes the claims which have been made for others to the ſame writings; and in vol. xiii. he gives him a diſtinguiſhed place in his catalogue of ancient phyſicians.

CHIRONIA, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 20th order, *Rotaceæ*. The corolla is wheel-ſhaped; the piſtil declining downwards; the ſtamina placed in the tube of the corolla; the antheræ in their laſt ſtage ſpiral; the ſeed-caſe bilocular. There are eight ſpecies, of which the *fruteſcens* is the moſt remarkable. It is a native of the cape of Good Hope. The root is fibrous, and ſpreads near the ſurface of the ground. The ſtalks are round, and inclining to be ligneous, but are of a very ſoft texture; theſe riſe from two to three feet high, ſending out ſeveral branches which grow erect, and are garniſhed with ſucculent leaves an inch or more in length, and about an eighth of an inch in breadth. At the end of each ſhoot the flowers are produced, which are tubulous, and ſpread open at the top; they are of a bright red colour; and when there are a large number of flowers open on the ſame plant, they make a fine appearance. The flowers are produced from June to autumn; and the ſeeds ripen in October. The plants are propagated by ſeeds, which muſt be ſown in pots filled with light ſandy earth, and plunged in a moderate hot-bed. In ſummer they may be inured to the open air; but muſt always be ſheltered in winter.

CHIRONOMY, in antiquity, the art of repreſenting any paſt tranſaction by the geſtures of the body, more eſpecially by the motions of the hands: this made a part of liberal education; it had the approbation of Socrates, and was ranked by Plato among the political virtues.

CHIROTONY, among eccleſiaſtical writers, denotes the impoſition of hands uſed in conferring prieſtly orders. However, it is proper to remark, that chirotony was a method of electing magiſtrates by holdin up the hands.

CHIRURGEON, or SURGEON. See SURGEON.

CHIRURGERY. See SURGERY.

CHISLEY-LAND, in agriculture, a ſoil of a middle nature between ſandy and clayey land, with a large admixture of pebbles.

CHISON, KISON, or KISSON, (Judges iv. and v.), a river of Galilee; ſaid to riſe in mount Tabor, to run by the town of Naim, and to fall into the Mediterranean between mount Carmel and Ptolemais, 1 Kings xviii. 40.

CHISSEL, or CHISEL, an inſtrument much uſed in ſculpture, maſonry, joinery, carpentry, &c.

There are chiſſels of different kinds; though their chief difference lies in their different ſize and ſtrength, as being all made of ſteel well ſharpened and tempered: but they have different names, according to the different uſes to which they are applied.—The chiſſels uſed in carpentry and joinery are, 1. The former; which is uſed firſt of all before the paring-chiſſel, and juſt after the work is ſcribed. 2. The paring-chiſſel; which has a fine ſmooth edge, and is uſed to pare off or ſmooth the irregularities which the former makes. This is not ſtruck with a mallet as the former is, but is preſſed with the ſhoulder of the workman. 3. Skew-former: this is uſed for cleanſing acute angles with the point or corner of its narrow edge. 4. The mortiſe-chiſſel; which is narrow, but very thick and ſtrong, to endure hard blows, and it is cut to a very broad baſil. Its uſe is to cut deep ſquare holes in the wood for mortiſes. 5. The gouge, which is a chiſſel with a round edge; one ſide whereof ſerves to prepare the way for an augre, and the other to cut ſuch wood as is to be rounded, hollowed, &c. 6. Socket-chiſſels, which are chiefly uſed by carpenters, &c. have their

* *Chronol.* p. 151.

ſhank made with a hollow ſocket at top, to receive a ſtrong wooden ſprig, fitted into it with a ſhoulder. Theſe chiſſels are diſtinguiſhed, according to the breadth of the blade, into half-inch chiſſels, three quarters of an inch chiſſels, &c. 7. Ripping-chiſſels; which is a ſocket-chiſſel of an inch broad, having a blunt edge, with no baſil to it. Its uſe is to rip or tear two pieces of wood aſunder, by forcing in the blunt edge between them.

CHITON, in zoology, a genus of the order of vermes teſtaceæ. The name *chiton* is from χιτων, *Lorica*, a coat of mail. The ſhell is plated, and conſiſts of many parts lying upon each other tranſverſely: the inhabitant is a ſpecies of the DORIS. They are common on the ſhores of Scarborough, Aberdeen, and Lochbroom. See ſeveral ſpecies repreſented of their natural ſize on Plate CXXXVIII.

CHITTIM (anc. geog.), according to Le Clerc, Calmet, and others, was the ſame with Macedonia, peopled by Kittim the ſon of Javan and grandſon of Noah.

CHITTRICK's MEDICINE FOR THE STONE. This medicine was ſome years ago kept as a ſecret, and had great reputation as a lithontriptic, which indeed in many caſes it ſeems to deſerve. It was diſcovered by Dr Blackrie, to be no other than ſoap-lye; and the following receipt for uſing it was procured by General Dunbar: "Take one tea-ſpoonful of the ſtrongeſt ſoap-lye, mixed in two table-ſpoonfuls of ſweet milk, an hour before breakfaſt and at going to bed. Before you take the medicine, take a ſup of pure milk, and immediately after you have ſwallowed the medicine take another. If you find this agrees with you for two or three days, you may add half as much more to the doſe."

1 Definition.

CHIVALRY, (from *cheval*, "a horſe);" an abſtract term, uſed to expreſs the peculiar privileges, obligations, and turn of mind, with all the other diſtinguiſhing characteriſtics of that order of men who flouriſhed in Europe in the dark ages, during the vigour of the feudal ſyſtems of government, under the name of *Knights*, or *Knights Errant*.

2 Difficulty of tracing the origin of chivalry.

To aſcertain the period at which the order ſprung up, and the circumſtances to which its origin was owing, is no eaſy taſk. In the hiſtory of ſociety, ſuch a multiplicity of collateral facts appear interwoven together, and cauſes and effects run into each other by a gradation ſo imperceptible; that it is exceedingly difficult, even for the niceſt eye, to diſcern cauſes from their immediate effects, or to diſtinguiſh to which among a number of collateral circumſtances the origin of any particular event is to be referred. The age to which we muſt look for the origin of chivalry was ſingularly rude and illiterate. Even the principal events of that period, emigrations, wars, and the eſtabliſhment of ſyſtems of laws and forms of government, have been but imperfectly, and in many inſtances unfaithfully, recorded. But the tranſactions which took place in the ordinary courſe of civil and domeſtic life, and which, though leſs ſtriking, muſt have always prepared the way for the more remarkable events, have been generally thought unworthy of tranſmiſſion to poſterity, and have very ſeldom found an hiſtorian. Add to theſe difficulties which oppoſe our reſearches on this ſubject, that the nations of Europe were in that age a mixed multitude, conſiſting of the aboriginal inhabitants, who, though either ſubdued by the Roman arms, or at leaſt compelled to retire to the woods and mountains, ſtill obſtinately retained their primitive manners and cuſtoms; Roman colonies, and ſuch of the original inhabitants of the countries in which theſe were eſtabliſhed, as had yielded not only to the arms of the Romans, but alſo to the influence of their laws, arts, and manners; and the barbarians, who proceeding from the northern regions of Aſia and Europe, the wilds of Scythia and Germany, diſſolved the fabric of the Roman empire, and made themſelves lords of Europe. Amid this confuſion of nations, inſtitutions and cuſtoms, it becomes almoſt impoſſible to trace any regular ſeries of cauſes and effects.

Yet as the hiſtory of that period is not entirely unknown to us, and the obſcure and imperfect records in which it is preſerved, while they commemorate the more remarkable events, throw a faint light on the cuſtoms, manners, and ordinary tranſactions of the age; we can at leaſt collect ſome circumſtances, which, if they did not of themſelves give riſe to the inſtitution of chivalry, muſt certainly have co-operated with others to that end. We may even be allowed, if we proceed with due diffidence and caution, to deduce, from a conſideration of the effect, ſome inferences concerning the cauſe; from thoſe particulars of its hiſtory which are known to us, we may venture to carry imagination backwards, under a proper reſtraint, to thoſe, which are hid under the darkneſs of a rude and illiterate age.

3 Diſtinction of ranks an eſſential part of the mechaniſm of ſociety.

Diſtinction of ranks appear to be eſſentially neceſſary to the exiſtence of civil order. Even in the ſimpleſt and rudeſt ſocial eſtabliſhments, we find not merely the natural diſtinctions of weak and ſtrong, young and old, parent and child, huſband and wife; theſe are always accompanied with others which owe their inſtitution to the invention of man, and the conſent, either tacit or formal, of the ſociety among whom they prevail. In peace and in war, ſuch diſtinctions are equally neceſſary: they conſtitute an eſſential and important part of the mechaniſm of ſociety.

4 The early pre-eminence of the military character.

One of the earlieſt artificial diſtinctions introduced among mankind, is that which ſeparates the bold and ſkilful warrior from thoſe whoſe feebleneſs of body and mind renders them unable to excel in dexterity, ſtratagem, or valour. Among rude nations, who are but imperfectly acquainted with the advantages of ſocial order, this diſtinction is more remarkably eminent than in any other ſtate of ſociety. The ferocity of the human character in ſuch a period produces almoſt continual hoſtilities among neighbouring tribes: the elements of nature, and the brute inhabitants of the foreſt, are not yet reduced to be ſubſervient to the will of man; and theſe, with other concomitant circumſtance, render the warrior, who is equally diſtinguiſhed by cunning and valour, more uſeful and reſpectable than any other character.

5 Subordinate diſtinctions of rank introduced into ſociety.

On the ſame principles, as the boundaries of ſociety are enlarged, and its form becomes more complex, the claſſes into which it is already diſtinguiſhed are again ſubdivided. The invention of arts, and the acquiſition of property, are the chief cauſes of theſe new diſtinctions which now ariſe among the orders of ſociety;

and they extend their influence equally through the whole ſyſtem. Difference of armour, and different modes of military diſcipline, produce diſtinction of orders among thoſe who practiſe the arts of war; while other circumſtances, originating from the ſame general cauſes, occaſion ſimilar changes to take place amid the ſcenes of peace.

6
The diſtinction introduced into the military order by the uſe of cavalry.

None of the new diſtinctions which are introduced among men, with reſpect to the diſcipline and conduct of war, in conſequence of the acquiſition of property and the invention of arts, is more remarkable than that occaſioned by the uſe of horſes in military expeditions, and the training of them to the evolutions of the military art. Fire-arms, it is true, give to thoſe who are acquainted with them a greater ſuperiority over thoſe to whom their uſe is unknown than what the horſeman poſſeſſes over him who fights on foot. But the uſe of fire-arms is of ſuch importance in war, and the expence attending it ſo inconſiderable, that wherever theſe have been introduced, they have ſeldom been confined to one particular order in an army; and therefore they produce indeed a remarkable, though tranſient, diſtinction among different nations; but eſtabliſh no permanent diſtinctions in the armies of any one nation. But to maintain a horſe, to equip him with coſtly furniture, to manage him with dexterity and vigour, are circumſtances which have invariably produced a ſtanding and conſpicuous diſtinction among the military order, wherever bodies of cavalry have been formed. The Roman *equites*, who, though they became at length a body of uſurers and farmers-general, were originally the only body of cavalry employed by the ſtate, occupied a reſpectable rank between the ſenators and the plebeians; and the elegance and humanity of their manners were ſuitable to their rank. In ancient Greece, and in the celebrated monarchies of Aſia, the ſame diſtinction prevailed at a ſimilar period.

7
Military diſtinctions among the ancient Germans.

Since the circumſtances and principles on which this diſtinction depends are not ſuch as muſt be confined in their influence to one particular nation, or one region of the globe, we may hope to trace their effects among the ſavage warriors of Scythia and Germany, as well as among the Greeks or Romans. From the valuable treatiſe of Tacitus *de moribus Germanorum*, we learn, that among the German warriors a diſtinction ſomewhat of this nature *did* actually ſubſiſt; not ſo much indeed a diſtinction between the warrior who fought on horſeback and thoſe who fought on foot, as between thoſe whom vigour of body and energy of mind enabled to brave all the dangers of war, and ſuch as, from the imbecility of youth, the infirmities of age, or the natural inferiority of their mental and bodily powers, were unequal to ſcenes of hardſhip and deeds of valour. The youth was not permitted to take arms and join his warlike countrymen in their military expeditions whenever he himſelf thought proper. There was a certain age before which he could not be inveſted with armour. When he had attained that period, if not found deficient in ſtrength, activity, or courage, he was formally honoured with the ſhield and the lance, called to the duties, and admitted to all the privileges, of a warrior.

8
Reſpectability of the women among the Germans.

Another fact worthy of notice reſpecting the manners of the barbarians of Germany before they eſtabliſhed themſelves in the cultivated provinces of the Roman empire is, that their women, contrary to what we find among many other rude nations, were treated with an high degree of reſpect. They did not generally vie with the men in deeds of valour, but they animated them by their exhortations to diſtinguiſh themſelves in the field; and virgins eſpecially were conſidered with a ſacred veneration, as endowed with prophetic powers, capable to foreſee events hid in the womb of futurity, and even to influence the will of the deities. Hence, though domeſtic duties were their peculiar province, yet they were not harſhly treated nor confined to a ſtate of ſlavery. There appears indeed a ſtriking analogy between the condition of the women among the rude ſoldiers of Sparta and the rank which they occupied among the warlike cantons of Germany. Perhaps, indeed, the German were ſtill more honourable than the Spartan women; as they were taught to wield the magic weapons of ſuperſtition, which in Greece were appropriated to the prieſts.

It appears, therefore, that, in the foreſts of Germany at leaſt, if not in the more northern regions of Aſia and Europe, the conquerors of the Roman empire, before they penetrated into its provinces, treated their women with a degree of reſpect unknown to moſt of the nations of antiquity; that the character of the warrior was likewiſe highly honourable, being underſtood to unite all thoſe qualities which were in the higheſt eſtimation; and that it was only at a particular age, and with certain forms, that the youth were admitted to bear arms.

9
Changes in the manners of the barbarians after they ſettled in the Roman empire, which gave riſe to chivalry.

When thoſe nations ſallied from their deſerts and foreſts, over-ran the Roman empire, and eſtabliſhed themſelves in its provinces, the change which took place on their circumſtances was remarkable; and by a natural influence, it could not but produce an equally remarkable change on their habits, cuſtoms, and manners. The great outlines might ſtill remain; but they could not now fail to be filled up in a different manner. Here, however, the records of hiſtory are peculiarly imperfect. We have no Cæſar or Tacitus to ſupply facts or direct our reaſonings; the Gothic nations had not yet learned to read and write; and the Romans were ſo depreſſed under the ſenſe of their own miſeries, as to be negligent of the changes which happened around them. But as ſoon as the light of hiſtory begins again to dawn, we find that the leading features of the barbarian character were not effaced, but only modified in a particular manner, in conſequence of their mixing among a more poliſhed people, becoming acquainted with the luxuries of life, and acquiring extenſive power and property.

Thoſe who fought on horſeback now began to be diſtinguiſhed with peculiar honours. The manners of the warrior too were become more cultivated, and his ſpirit more humane. Leiſure and opulence, with the influence of a poliſhed people, even though in a ſtate of ſlavery, taught thoſe barbarians to aſpire after more refined pleaſures and more ſplendid amuſements than thoſe which they had been before ſatisfied with. The influence of chriſtianity too, which, though groſsly corrupted, was ſtill favourable to the ſocial happineſs of mankind, concurred to poliſh their manners and exalt their character. Hence, in the end of the tenth and in the beginning of the eleventh century, we ſee knight-errantry, with that romantic gallantry, piety, and humanity, by which it was principally diſtinguiſhed, make its appearance. At the court of every prince, count, or baron, jouſts and tournaments became the favourite amuſements. At thoſe entertainments, ſkill in arms, devotion to the fair, and generous courteſy, were all at once cultivated. About this period began the cruſades; and theſe, to which alone ſome have referred the origin of chivalry, though they could not give riſe to what was already in exiſtence, yet moulded the form and directed the ſpirit of the inſtitution in ſuch a manner, as to raiſe it, by a rapid progreſs from infancy, as it were, to full vigour and maturity. Its character, as it appeared when fully formed, is well deſcribed by an eloquent hiſtorian in the following manner:

Gibbon, vol. vi. p. 26.

“ Between the age of Charlemagne and that of the cruſades, a revolution had taken place among the Spaniards, the Normans, and the French, which was gradually extended to the reſt of Europe. The ſervice of the infantry was degraded to the plebeians; the cavalry formed the ſtrength of the armies, and the honourable name of *miles*, or ſoldier, was confined to the gentlemen who ſerved on horſeback, and were inveſted with the character of knighthood. The dukes and counts, who had uſurped the rights of ſovereignty, divided the provinces among their faithful barons: the barons diſtributed among their vaſſals the fiefs or benefices of their juriſdiction; and theſe military tenants, the peers of each other and of their lord, compoſed the noble or equeſtrian order, which diſdained to conceive the peaſant or burgher as of the ſame ſpecies with themſelves. The dignity of their birth was preſerved by pure and equal alliances; their ſons alone who could produce four quarters or lines of anceſtry, without ſpot or reproach, might legally pretend to the honour of knighthood; but a valiant plebeian was ſometimes enriched and ennobled by the ſword, and became the father of a new race. A ſingle knight could impart, according to his judgment, the character which he received; and the warlike ſovereigns of Europe derived more glory from this perſonal diſtinction than from the luſtre of their diadem. This ceremony was in its origin ſimple and profane; the candidate, after ſome previous trial, was inveſted with his ſword and ſpurs; and his cheek and ſhoulder were touched with a ſlight blow as the emblem of the laſt affront which it was lawful for him to endure. But ſuperſtition mingled in every public and private action of life: In the holy wars, it ſanctified the profeſſion of arms; and the order of chivalry was aſſimilated in its rights and privileges to the ſacred orders of prieſthood. The bath and white garment of the novice, were an indecent copy of the regeneration of baptiſm: his ſword, which he offered on the altar, was bleſſed by the miniſters of religion; his ſolemn reception was preceded by faſts and vigils; and he was created a knight in the name of God, of St George, and of St Michael the archangel. He ſwore to accompliſh the duties of his profeſſion; and education, example, and the public opinion, were the inviolable guardians of his oath. As the champion of God and the ladies, he devoted himſelf to ſpeak the truth; to maintain the right; to protect the diſtreſſed; to practiſe *courteſy*, a virtue leſs familiar to the ancients; to purſue the infidels; to deſpiſe the allurements of eaſe and ſafety; and to vindicate in every perilous adventure the honour of his character. The abuſe of the ſame ſpirit provoked the illiterate knight to diſdain the arts of induſtry and peace; to eſteem himſelf the ſole judge and avenger of his own injuries; and proudly to neglect the laws of civil ſociety and military diſcipline. Yet the benefits of this inſtitution, to refine the temper of barbarians, and to infuſe ſome principles, of faith, juſtice, and humanity, were ſtrongly felt, and have been often obſerved. The aſperity of national prejudice was ſoftened; and the community of religion and arms ſpread a ſimilar colour and generous emulation over the face of Chriſtendom. Abroad, in enterpriſe and pilgrimage; at home, in martial exerciſe, the warriors of every country were perpetually aſſociated; and impartial taſte muſt prefer a Gothic tournament to the Olympic games of claſſic antiquity. Inſtead of the naked ſpectacles which corrupted the manners of the Greeks, and baniſhed from the ſtadium the virgins and matrons, the pompous decoration of the liſts was crowned with the preſence of chaſte and high-born beauty, from whoſe hands the conqueror received the prize of his dexterity and courage. The ſkill and ſtrength that were exerted in wreſtling and boxing, bear a diſtant and doubtful relation to the merit of a ſoldier; but the tournaments, as they were invented in France, and eagerly adopted both in the eaſt and weſt, preſented a lively image of the buſineſs of the field. The ſingle combats, the general ſkirmiſh, the defence of a paſs or caſtle, were rehearſed as in actual ſervice; and the conteſt, both in real and mimic war, was decided by the ſuperior management of the horſe and lance. The lance was the proper and peculiar weapon of the knight: his horſe was of a large and heavy breed; but his charger, till he was rouſed by the approaching danger, was uſually led by an attendant, and he quietly rode a pad or palfrey of a more eaſy peace. His helmet and ſword, his greaves and buckler, it would be ſuperfluous to deſcribe; bnt I may remark, that at the period of the cruſades, the armour was leſs ponderous than in latter times; and that, inſtead of a maſſy cuiraſs, his breaſt was defended by an hauberk or coat of mail. When their long lances were fixed in the reſt, the warriors furiouſly ſpurred their horſes againſt the foe; and the light cavalry of the Turks and Arabs could ſeldom ſtand againſt the direct and impetuous weight of their charge. Each knight was attended to the field by his faithful ſquire, a youth of equal birth and ſimilar hopes; he was followed by his archers and men at arms; and four, or five, or ſix ſoldiers, were computed as the furniture of a complete *lance*. In the expeditions to the neighbouring kingdoms or the Holy Land, the duties of the feudal tenure no longer ſubſiſted; the voluntary ſervice of the knights and their followers was either prompted by zeal or attachment, or purchaſed with rewards and promiſes; and the numbers of each ſquadron were meaſured by the power, the wealth, and the fame of each independent chieftain. They were diſtinguiſhed by his banner, his armorial coat, and his cry of war; and the moſt ancient families of Europe muſt ſeek in theſe atchievements the origin and proof of their nobility.”

The reſpectable author of the Letters on Chivalry and Romance, traces, with great ingenuity and erudition, a ſtrong reſemblance between the manners of the age of chivalry and thoſe of the old heroic ages delineated by Homer.

10 The reſemblance between heroic and Gothic manners.

There is, ſays he, a remarkable correſpondence between the manners of the old heroic times, as painted by their great romancer Homer, and thoſe which are repreſented to us in the modern books of knight-errantry. A fact of which no good account can be given, but by another not leſs certain; that the political ſtates of Greece, in the earlieſt periods of its ſtory, was ſimilar in many reſpects to that of Europe, as broken by the feudal ſyſtem into an infinite number of petty independent governments.

Some obvious circumſtances of agreement between the heroic and Gothic manners may be worth putting down.

1. The military enthuſiaſm of the barons is but of a piece with the fanaticiſm of the heroes. Hence the ſame particularity of deſcription in the accounts of battles, wounds, deaths, in the Greek poet as in the Gothic romancers. Hence that minute curioſity in the diſplay of their dreſſes, arms, accoutrements. The minds of all men being occupied with warlike images and ideas, were much gratified by thoſe details, which appear cold and unaffecting to modern readers.

We hear much of knights-errant encountering giants and quelling ſavages in books of chivalry. Theſe giants were oppreſſive feudal lords; and every lord was to be met with, like the giant, in his ſtrong-hold or caſtle. Their dependents of a lower form, who imitated the violence of their ſuperiors, and had not their caſtles but lurking places, were the ſavages of romance. The greater lord was called a giant for his power; the leſs, a ſavage for his brutality.

2. Another terror of the Gothic ages was monſters, dragons, and ſerpents. Their ſtories were received in thoſe days for ſeveral reaſons: 1. From the vulgar belief of enchantments: 2. From their being reported on the faith of eaſtern tradition, by adventurers from the Holy Land: 3. In ſtill later times from the ſtrange things told and believed on the diſcovery of the new world.

In all theſe reſpects, Greek antiquity reſembles the Gothic. For what are Homer's Læſtrigon's and Cyclops, but bands of lawleſs ſavages, with each of them a giant of enormous ſize at their head? And what are the Grecian Bacchus, Hercules, and Theſeus, but knights-errant, the exact counterparts of Sir Launcelot and Amadis de Gaul?

3. The oppreſſion with which it was the glory of the knights to avenge, were frequently carried on, as we are told, by the *charms and enchantments of women*. Theſe charms, we may ſuppoſe, are often metaphorical; as expreſſing only the blandiſhments of the ſex. Sometimes they are taken to be real, the ignorance of thoſe ages acquieſcing in ſuch conceits. And are not theſe ſtories matched by thoſe of Calypſo and Circe, the enchantreſſes of the Greek poet?

4. Robbery and piracy were honourable in both: ſo far were they from reflecting any diſcredit on the ancient and modern *redreſſers of wrongs*. What account can be given of this, but that, in the feudal times, and in the early days of Greece, when government was weak, and unable to redreſs the injuries of petty ſovereigns, it would be glorious for private adventurers to undertake this work; and, if they could accompliſh it in no other way, to pay them in kind by downright plunder and rapine?

5. Baſtardy was in credit with both. They were extremely watchful over the chaſtity of their own women; but ſuch as they could ſeize upon in the enemies quarter, were lawful prize. Or if, at any time, they tranſgreſſed in this ſort at home, the fault was covered by an ingenious fiction. The offspring was reputed divine. Their greateſt heroes were the fruit of goddeſſes approached by mortals; juſt as we hear of the doughtieſt knights being born of fairies.

6. With the greateſt fierceneſs and ſavageneſs of character, the utmoſt generoſity, hoſpitality, and courteſy, were imputed to the heroic ages. Achilles was at once the moſt relentleſs, vindictive, implacable, and the friendlieſt of men. We have the very ſame repreſentation in the Gothic romances. As in thoſe lawleſs times, dangers and diſtreſſes of all kinds abounded, there would be the ſame demand for compaſſion, gentleneſs, and generous attachment to the unfortunate, thoſe eſpecially of their own clan, as of reſentment, rage, and animoſity againſt their enemies.

7. Again, the martial games celebrated in ancient Greece, on great and ſolemn occaſions, had the ſame origin and the ſame purpoſe as the tournaments of the Gothic warriors.

8. Laſtly, the paſſions for adventures ſo natural in their ſituation, would be as naturally attended with the love of praiſe and glory. Hence the ſame encouragement, in the old Greek and Gothic times, to panegyriſts and poets. In the affairs of religion and gallantry, indeed, the reſemblance between the hero and the knight is not ſo ſtriking. But the religious character of the knight was an accident of the times and no proper effect of his civil condition. And that his devotion for the fair ſex ſhould ſo far ſurpaſs that of the hero, is a confirmation of the ſyſtem here advanced. For the conſideration had of the females in the feudal conſtitution, will of itſelf account for this deference. It made them capable of ſucceeding to fiefs, as well as the men. And does not one ſee, on the inſtant, what reſpect and dependence this privilege would draw upon them?

It was of mighty conſequence who ſhould obtain the favour of a rich heireſs. And though, in the ſtrict feudal times, ſhe was ſuppoſed to be in the power and at the diſpoſal of her ſuperior lord, yet this rigid ſtate of things did not laſt long. Hence we find ſome diſtreſſed damſel was the ſpring and mover of every knight's adventure. She was to be reſcued by his arms, or won by the fame and admiration of his proweſs. The plain meaning of all which was this: That as, in theſe turbulent times, a protector was neceſſary to the weakneſs of the ſex, ſo the courteous and valorous knight was to approve himſelf qualified for that purpoſe.

It may be obſerved, that the two poems of Homer were intended to expoſe the miſchiefs and inconveniences ariſing from the political ſtate of Old Greece: the *Iliad*, the diſſentions that naturally ſpring up among independent chiefs; and the *Odyſſey* the inſolence of their greater ſubjects, more eſpecially when unreſtrained by the preſence of their ſovereign. And can any thing more exactly reſemble the condition of the

the feudal times, when, on occaſion of any great enterpriſe, as that of the cruſades, the deſigns of the confederate Chriſtian ſtates were perpetually fruſtrated, or interrupted at leaſt, by the diſſentions of their leaders; and their affairs at home, as perpetually diſtreſſed and diſordered by the rebellious uſurpations of their greater vaſſals? Jeruſalem was to the European what Troy had been to the Grecian princes. See the article KNIGHT.

CHIVALRY, in law, is uſed for a tenure of lands by knight's ſervice; whereby the knight was bound to perform ſervice in war unto the king, or the meſne lord of whom he held by that tenure. And chivalry was either general or ſpecial: *general*, when it was only in the feoffment that the tenant held *per ſervitium militare*, without any ſpecification of ſergeantry, eſcuage; &c.; *ſpecial*, when it was declared particularly by what kind of knight ſervice the land was held.

For the better underſtanding of this tenure it hath been obſerved, that there is no land but is holden mediately or immediately of the crown by ſome ſervice; and therefore all freeholds that are to us and our heirs, are called *feuda* or *feoda*, "fees;" as proceeding from the king for ſome ſmall yearly rent, and the performance of ſuch ſervices as were originally laid upon the land at the donation thereof. For as the king gave to the great nobles his immediate tenants, large poſſeſſions for ever, to hold of him for this or that ſervice or rent; ſo they in time parcelled out to ſuch others as they liked the ſame lands for rents and ſervices as they thought good: and theſe ſervices were by Littleton divided into two kinds, *chivalry* and *ſocage*; the firſt whereof was martial and military, the other ruſtical. Chivalry, therefore, was a tenure of ſervice, whereby the tenant was obliged to perform ſome noble or military office unto his lord: and it was of two kinds, either *regal*, that is, held only by the king; or *common*, where held of a common perſon. That which might be held only of the king was called *ſervitium*, or *ſergeantia*; and was again divided into *grand* and *petit* ſerjeanty. The grand ſerjeanty was where one held lands of the king by ſervice, which he ought to do in his own perſon; as to bear the king's banner or ſpear, to lead his hoſt, to find men at arms to fight, &c. Petit ſerjeanty was when a man held lands of the king, to yield him annually ſome ſmall thing towards his wars, as a ſword, dagger, bow, &c. Chivalry that might be holden of a common perſon was termed *ſcutagium*, "eſcuage;" that is, ſervice of the ſhield; which was either uncertain or certain.

Eſcuage uncertain, was likewiſe two-fold: firſt, where the tenant was bound to follow his lord, going in perſon to the king's wars, either himſelf, or ſending a ſufficient man in his place, there to be maintained at his expence, ſo long as was agreed upon between the lord and his firſt tenant at the granting of the fee; and the days of ſuch ſervice ſeem to have been rated by the quantity of land ſo holden: as if it extended to a whole knight's fee, then the tenant was to follow his lord 40 days; and if but to half a knight's fee, then 20 days; if a fourth part, then 10 days, &c. The other kind of this eſcuage was called *caſtle-ward*, where the tenant was obliged, by himſelf or ſome other, to defend a caſtle as often as it ſhould come to his turn. And theſe were called *eſcuage uncertain*; becauſe it was uncertain how often a man ſhould be called to follow his lord to the wars, or to defend a caſtle, and what his charge would be therein.

Eſcuage certain, was where the tenure was ſet at a certain ſum of money to be paid in lieu of ſuch ſervice; as that a man ſhould pay yearly for every knight's fee 20s. for half a knight's fee 10s. or ſome like rate; and this ſervice, becauſe it is drawn to a certain rent, groweth to be of a mixed nature, not merely ſocage, and yet ſocage in effect, being now neither perſonal ſervice nor uncertain. The tenure called chivalry had other conditions annexed to it: but there is a great alteration made in theſe things by the ſtat. 12. Car. 2. c. 24. whereby tenures by knight's ſervice of the king, or any other perſon *in capite*, &c. and the fruits and conſequences thereof, are taken away and diſcharged; and all tenures are to be conſtrued and adjudged to be free and common ſocage, &c.

Court of CHIVALRY, a court formerly held before the lord high conſtable and earl marſhal of England jointly, and having both civil and criminal juriſdiction: but ſince the attainder of Stafford Duke of Buckingham under Henry VIII. and the conſequent extinguiſhment of the office of lord high conſtable, it hath uſually, with reſpect to civil matters, been heard before the earl marſhal only. This court, by ſtat. 13. Rich. II. c. 2. hath cognizance of contracts and other matters touching deeds of arms and war, as well out of the realm as in it. And from its ſentences lies an immediate appeal to the king in perſon. This court was in great reputation in the times of pure chivalry; and afterwards during the Engliſh connections with the continent, by the territories which their princes held in France: but it is now grown almoſt entirely out of uſe, on account of the feebleneſs of its juriſdiction, and want of power to enforce its judgments; as it can neither fine nor impriſon, not being a court of record.

1. The *civil* juriſdiction of this court of chivalry is principally in two points; the redreſſing injuries of honour, and correcting encroachments in matters of coat armour, precedency, and other diſtinctions, of families. As a court of honour, it is to give ſatisfaction to all ſuch as are aggrieved in that point; a point of a nature ſo nice and delicate, that its wrongs and injuries eſcape the notice of the common law, and yet are fit to be redreſſed ſomewhere. Such, for inſtance, as calling a man a *coward*, or giving him the lie; for which, as they are productive of no immediate damage to his perſon or property, no action will lie in the courts at Weſtminſter: and yet they are ſuch injuries as will prompt every man of ſpirit to demand ſome honourable amends; which by the ancient law of the land, was given in the court of chivalry. But modern reſolutions have determined, that how much ſoever a juriſdiction may be expedient, yet no action for words will at preſent lie therein. And it hath always been moſt clearly holden, that as this court cannot meddle with any thing determinable by common law, it therefore can give no pecuniary ſatisfaction or damages; in as much as the quantity and determination thereof is ever of common law cognizance. And therefore this court of chivalry can at moſt order reparation in point of honour; as, to

compel

compel the defendant *mendacium ſibi ipſi imponere*, or to take the lie that he has given upon himſelf, or to make ſuch other ſubmiſſion as the laws of honour may require. As to the other point of its civil juriſdiction, the redreſſing of uſurpations and encroachments in matters of heraldry and coat-armour; it is the buſineſs of this court, according to Sir Matthew Hale, to adjuſt the rights and armorial enſigns, bearings, creſts, ſupporters, pennons, &c.; and alſo rights of places, precedence, where the king's patent or act of parliament, which cannot be over-ruled, by this court, have not already determined it. The proceedings of this court are by petition in a ſummary way: and the trial not by a jury of twelve men, but by witneſſes, or by combat. But as it cannot impriſon, not being a court of record; and as, by the reſolutions of the ſuperior courts, it is now confined to ſo narrow and reſtrained a juriſdiction; it has fallen into contempt. The marſhalling of coat-armour, which was formerly the pride and ſtudy of all the beſt families in the kingdom, is now greatly diſregarded; and has fallen into the hands of certain officers and attendants upon this court, called *heralds*, who conſider it only as a matter of lucre, and not of juſtice: whereby ſuch falſity and confuſion have crept into their records (which ought to be the ſtanding evidence of families, deſcents, and coat armour), that though formerly ſome credit has been paid to their teſtimony, now, even their common ſeal will not be received as evidence in any court of juſtice in the kingdom. But their original viſitation books, compiled when progreſſes were ſolemnly and regularly made into every part of the kingdom, to inquire into the ſtate of families, and to regiſter ſuch marriages and deſcents as were verified to them upon oath, are allowed to be good evidence of pedigrees.

2. As a *criminal* court, when held before the lord high conſtable of England jointly with the earl marſhal, it had juriſdiction over pleas of life and member, ariſing in matters of arms and deeds of war, as well out of the realm as within it. But the criminal as well as civil part of its authority is fallen into entire diſuſe: there having been no permanent high conſtable of England (but only *pro hac vice*, at coronations and the like), ſince the attainder and execution of Stafford Duke of Buckingham, in the 13th year of Henry VIII.; the authority and charge, both in war and peace being deemed too ample for a ſubject; ſo ample, that when the chief juſtice Fineux was aſked by King Henry VIII. how far they extended? he declined anſwering; and ſaid, the deciſion of that queſtion belonged to the law of arms, and not to the law of England.

CHIVES, in botany, are ſlender thread-like ſubſtances, generally placed within the bloſſom, and ſurrounding the POINTALS. They are formed of the woody ſubſtance of the plant.

CHIUM MARMOR, in the natural hiſtory of the ancients, the name of a black marble, called alſo the *lapis opſidianus*. It is very hard, and of a fine black; and, beſide the many uſes which the ancients put it to, is well known among our goldſmiths by the name of the *touchſtone*; moſt of them being furniſhed with nothing better for this purpoſe than a piece of this: though the baſaltes, which might be had plentifully enough, is greatly preferable for thoſe uſes; any black marble, however, that is tolerably hard, will do. There is a very fine and elegantly ſmooth marble, of a compact texture, and fine gloſſy black, but ſhowing no glittering particles when freſh broken, as moſt of the black marbles do. It is extremely hard, and cuts with difficulty, but is capable of the higheſt poliſh of any marble. The ancients had it from Ethiopia and the iſland of Chios; we have it from Italy.

CHIUM Vinum, *Chian Wine*, or wine of the growth of the iſland of Chios, now Scio, is commended by Dioſcorides as affording good nouriſhment, fit to drink, leſs diſpoſed to intoxicate, endued with the virtue of reſtraining defluxions, and a proper ingredient in ophthalmic medicines. Hence Scribonius Largus directs the dry ingredients in collyria for the eyes to be made up with Chian wine.

CHIUN, or CHEVAN, in Hebrew antiquity. We meet with this word in the prophet Amos, cited in the Acts of the Apoſtles. St Luke reads the paſſage thus: "Ye took up the tabernacle of Moloch, and the ſtar of your god Remphan, figures which ye made to worſhip them." The import of the Hebrew is as follows: "Ye have borne the tabernacle of your kings, and the pedeſtal (the *chiun*) of your images, the ſtar of your gods, which ye made to yourſelves." The Septuagint in all probability read *Repham* or *Revan*, inſtead of *Chiun* or *Chevan*, and took the pedeſtal for a god.

Some ſay that the Septuagint, who made their tranſlation in Egypt, changed the word *Chiun* into that of *Remphan* becauſe they had the ſame ſignification. M. Baſnage, in his book intitled *Jewiſh Antiquities*, after having diſcourſed a good deal upon *Chion* or *Remphan*, concludes that Moloch was the ſun, and *Chion*, *Chiun*, or *Remphan*, the moon.

CHLAMYS, in antiquity, a military habit worn by the ancients over the tunica. It belonged to the patricians, and was the ſame in the time of war that the toga was in the time of peace. This ſort of gown was called *picta*, from the rich embroidery with figures in Phrygian work; and *purpurea*, becauſe the groundwork was purple. The chlamydes of the emperors were all purple, adorned with a golden and embroidered border.

CHLOEIA, in antiquity, a feſtival celebrated at Athens in honour of Ceres, to whom, under the name Χλοη, *i. e. Graſs*, they ſacrificed a ram.

CHLORA, in botany, a genus of the monogynia order, belonging to the octandria claſs of plants. The calyx is octophyllous, the corolla monopetalous and octofid; the capſule unilocular, bivalved, and polyſpermous.

CHLOROSIS, in medicine, a diſeaſe, commonly called the *green-ſickneſs*, incident to young girls. See (the Index ſubjoined to) MEDICINE.

CHOCOLATE, in commerce, a kind of paſte or cake prepared of certain ingredients, the baſis of which is cacao. See CACAO.

The Indians, in their firſt making of chocolate, uſed to roaſt the cacao in earthen pots; and having afterwards cleared it of the huſks, and bruiſed it between two ſtones, they made it into cakes with their hands. The Spaniards improved this method: when the cacao is properly roaſted and well cleaned, they pound it in a mortar, to reduce it into a coarſe maſs, which they afterwards grind on a ſtone till it be of the utmoſt fineneſs: the paſte being ſufficiently ground, is put quite hot into tin moulds, in which it congeals in a very little time. The form of theſe moulds is arbitrary: the cylindrical ones, holding two or three pounds, are the moſt proper; becauſe the bigger the cakes are, the longer they will keep. Obſerve, that theſe cakes are very liable to take any good or bad ſcent, and therefore they muſt be carefully wrapt up in paper, and kept in a dry place. Complaints are made, that the Spaniards mix with the cacao nuts too great a quantity of cloves and cinnamon, beſides other drugs without number, as muſk, ambergreaſe, &c. The grocers of Paris uſe few or none of theſe ingredients: they only chooſe the beſt nuts, which are called *caracca*, from the place from whence they are brought; and with theſe they mix a very ſmall quantity of cinnamon, the freſheſt vanilla, and the fineſt ſugar, but very ſeldom any cloves. In England, the chocolate is made of the ſimple cacao, excepting that ſometimes ſugar and ſometimes vanilla is added.

Chocolate ready made, and cacao paſte, are prohibited to be imported into Britain from beyond the ſeas. If made and ſold in Great Britain, it pays inland duty 1s. 6d. *per lb.* avoirdupoiſe: it muſt be incloſed in papers containing one pound each, and produced at the exciſe-office to be ſtamped. Upon three days notice given to the officer of exciſe, private families may make chocolate for their own uſe, provided no leſs than half an hundred weight of nuts be made at one time.

The chocolate made in Portugal and Spain is not near ſo well prepared as the Engliſh, depending perhaps on the machine employed there, *viz.* the double cylinder, which ſeems very well calculated for exact triture. If perfectly prepared, no oil appears on the ſolution. London chocolate gives up no oil like the foreign; and it alſo may, in ſome meaſure, depend on the thickneſs of the preparation. The ſolution requires more care than is commonly imagined. It is proper to break it down, and diſſolve it thoroughly in cold water by milling it with the chocolate ſtick. If heat is applied, it ſhould be done ſlowly: for, if ſuddenly, the heat will not only coagulate it, but ſeparate the oil; and therefore much boiling after it is diſſolved, is hurtful. Chocolate is commonly required by people of weak ſtomachs; but often rejected for want of proper preparation. When properly prepared, it is eaſily diſſolved; and an excellent food where a liquid nutrient vegetable one is required, and is leſs flatulent than any of the farinacea.

Mr Henly, an ingenious electrician, has lately diſcovered that chocolate, freſh from the mill, as it cools in the tin-pans into which it is received, becomes ſtrongly electrical; and that it retains this property for ſome time after it has been turned out of the pans, but ſoon loſes it by handling. The power may be once or twice renewed by melting it again in an iron ladle, and pouring it into the tin pans as at firſt; but when it becomes dry and powdery, the power is not capable of being revived by ſimple melting: but if a ſmall quantity of olive oil be added, and well mixed with the chocolate in the ladle, its electricity will be completely reſtored by cooling it in the tin-pan as before. From this experiment he conjectures, that there is a great affinity between phlogiſton and the electric fluid, if indeed they be not the ſame thing.

Chocolate-Nut Tree. See Cacao.

CHOENIX, χοινιξ, an ancient dry meaſure, containing the 48th part of a *medimnus*, or ſix buſhels.

CHOERILUS, a tragic poet of Athens about the 64th Olympiad. He wrote 150 tragedies, of which 13 had obtained the prize.—An hiſtorian of Samos.—Two other poets, one of whom was very intimate with Herodotus. He wrote a poem on the victory which the Athenians had obtained over Xerxes; and on account of the excellence of the compoſition he received a piece of gold for each verſe from the Athenians. The other was one of Alexander's flatterers and friends.

CHOERINÆ, in antiquity, a kind of ſea-ſhells, with which the ancient Greeks uſed to give their ſuffrage or vote.

CHOIR, that part of the church or cathedral where choiriſters ſing divine ſervice; it is ſeparated from the chancel where the communion is celebrated, and alſo from the nave of the church where the people are placed: the patron is ſaid to be obliged to repair to the choir of the church. It was in the time of Conſtantine that the choir was ſeparated from the nave. In the twelfth century they began to incloſe it with walls; but the ancient baluſtrades have ſince been reſtored, out of a view to the beauty of architecture.

Choir in nunneries, is a large hall adjoining to the body of the church, ſeparated by a grate, where the nuns ſing the office.

CHOISI (Francis Timoleon de), dean of the cathedral of Bayeux, and one of the forty of the French academy, was born at Paris in 1644. In 1685, he was ſent with the chevalier de Chamont to the king of Siam, and was ordained prieſt in the Indies by the apoſtolical vicar. He wrote a great number of works, in a polite, florid, and eaſy ſtile; the principal of which are, 1. Four dialogues on the Immortality of the Soul, *&c.* 2. Account of a voyage to Siam. 3. An Eccleſiaſtical Hiſtory, in 11 vols. 4to. 4. Life of David, with an interpretation of the Pſalms. 5. Life of Solomon, *&c.* he died at Paris, in 1724.

CHOLEDOCHUS, in anatomy, a term applied to a canal or duct, called alſo *ductus communis;* formed of the union of the porus bilarius and ductus cyſticus. The word comes from χολη, *choler;* and δεχομαι, *I receive*, or *contain*.

The choledochus ductus paſſing obliquely to the lower-end of the duodenum, ſerves to convey the bile from the liver to the inteſtines. See Anat. nº 97.

CHOLER. See Bile.

CHOLERA morbus, a ſudden eruption or overflowing of the bile or bilious matters both upwards and downwards. See (the *Index* ſubjoined to) Medicine.

CHOMER, or Omer. See Corus.

CHONDRILLA, in botany, a genus of the polygamia equalis order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ.* The receptacle is naked; the calyx calyculated; the pappus ſimple and ſtalked; the florets in a manifold ſeries.

CHONDROPTERYGII, in ichthyology, a term

formerly applied to the order of fiſhes now called *amphibia nantes* by Linnæus. See AMPHIBIA.

CHOP-CHURCH, or CHURCH-CHOPPER, a name, or rather nick-name, given to parſons who make a practice of exchanging benefices. See PERMUTATION.

Chop-church occurs in an ancient ſtatute as a lawful trade or occupation; and ſome of the judges ſay it was a good addition. Brook holds that it was no occupation, but a thing permiſſible by law.

CHOPIN, or CHOPINE, a liquid meaſure uſed both in Scotland and France, and equal to half their pint. See PINT and MEASURE.

CHOPIN (Rene), a famous civilian born at Bailleul in Anjou in 1537. He was advocate in the parliament of Paris, where he pleaded for a long time with great reputation. He at laſt ſhut himſelf up in his cloſet; and compoſed many works, which have been collected together, and printed in 6 vols, folio. He died at Paris in 1606.

CHORAL, ſignifies any perſon that, by virtue of any of the orders of the clergy, was in ancient times admitted to ſit and ſerve God in the choir.

Dugdale, in his hiſtory of St Paul's Church, ſays, that there were with the chorus formerly ſix vicars choral belonging to that church.

CHORASSAN, or KHORASSAN, a province of Perſia adjoining to Uſbec Tartary. This was the ancient Bactria, and the birth-place of Kouli Khan.

CHORAX, or CHARAX. See CHARACENE.

CHORAZIM, or CHORAZIN, (Luke, Mathew), a town of Galilee: whoſe wretched incredulity Chriſt deplores: now deſolate, at two miles diſtance from Capernaum.

CHORD, or CORD, primarily denotes a ſlender rope or cordage *. The word is formed of the Latin, *chorda*, and that from the Greek, χορδη, *a gut*, whereof ſtrings may be made.

CHORD, in geometry, a right line drawn from one part of an arch of a circle to another. Hence,

CHORD of an Arch, is a right line joining the extremities of that arch.

CHORD, in muſic, the union of two or more ſounds uttered at the ſame time, and forming together an entire harmony.

The natural harmony produced by the reſonance of a ſounding body, is compoſed of three different ſounds, without reckoning their octaves; which form among themſelves the moſt agreeable and perfect chord that can poſſibly be heard: for which reaſon they are called, on account of their excellence, *perfect chords*. Hence, in order to render this harmony complete, it is neceſſary that each cord ſhould at leaſt conſiſt of three ſounds. The trio is likewiſe found by muſicians to include the perfection of harmony; whether becauſe in this all the cords, and each in its full perfection, are uſed; or, becauſe upon ſuch occaſions as render it improper to uſe them all, and each in its integrity, arts have been ſucceſsfully practiſed to deceive the ear, and to give it contrary perſuaſion, by deluding it with the principal ſounds of each *chord*, in ſuch a manner as to render it forgetful of the other ſounds neceſſary to their completion. Yet the octave of the principal ſound produces new relations, and new conſonances, by the completion of the intervals: they commonly add this octave, to have the aſſemblage of all the conſonances in one and the ſame *chord*; (See CONSONANCE.) Moreover, the addition of the diſſonance (ſee DISCORD), producing a fourth ſound ſuperadded to the perfect chord, it becomes indiſpenſibly neceſſary, if we would render the cord full, that we ſhould include a fourth part to expreſs this diſſonance. Thus the ſeries of chords can neither be complete nor connected but by means of four parts.

Chords are divided into perfect and imperfect. The *perfect chord* is that which we have lately deſcribed; which is compoſed of the fundamental ſound below, of its third, is fifth, and its octave: they are likewiſe ſubdivided into major and minor, according as the thirds which enter into their compoſition are flat or ſharp: (See INTERVAL.) Some authors likewiſe give the name of *perfect* to all chords, even to diſſonances, whoſe fundamental ſounds are below. Imperfect *chords* are thoſe in which the ſixth, inſtead of the fifth, prevails, and in general all thoſe whoſe loweſt are not their fundamental ſounds. Theſe denominations, which had been given before the fundamental baſs was known, are now moſt unhappily applied: thoſe of chords *direct* and *reverſed*, are much more ſuitable in the ſame ſenſe.

Chords are once more divided into conſonances and diſſonances. The chords denominated *conſonances*, are the perfect chord, and its derivatives: every other chord is a *diſſonance*.

A table of both, according to the ſyſtem of M. Rameau, may be ſeen in Rouſſeau's Muſical Dictionary, vol. I. p. 27.

After the table to which our readers have been remitted, Rouſſeau adds the following obſervations, which are at the ſame time ſo juſt and ſo important, that we ſhould be very ſorry if they eſcape the reader's attention.

At the words *harmony, fundamental baſs, compoſition*, &c. he promiſes to treat concerning the manner of uſing all the chords to form regular harmony; and only adds, in this place, the ſubſequent reflections.

1. It is a capital error to imagine, that the methods of inverting the ſame chord are in all caſes equally eligible for the harmony and for the expreſſion. There is not one of theſe different arrangements but had its proper character. Every one feels the contraſt between the ſoftneſs of the falſe fifth, and the grating ſound of the tritone, though the one of theſe intervals is produced by a method of inverting the other. With the ſeventh diminiſhed, and the ſecond redundant, the caſe is the ſame with the interval of the ſecond in general uſe, and the ſeventh. Who does not feel how much more vocal and ſonorous the fifth appears when compared with the fourth? The *chord* of the great ſixth, and that of the leſſer ſixth minor, are two forms of the ſame fundamental *chord*: but how much leſs is the one harmonious than the other? On the contrary, the *chord* of the leſſer ſixth major is much more pleaſing and cheerful than that of the falſe fifth. And only to mention the moſt ſimple of all *chords*, reflect on the majeſty of the perfect chord, the ſweetneſs of that which is called the chord of the ſixth, and the inſipidity of that which is compoſed of

* See *Cordage*.

a ſixth and a fourth; all of them, however, compoſed of the ſame ſounds. In general, the redundant intervals, the ſharps in the higher part, are proper by their ſeverity to expreſs violent emotions of mind, ſuch as anger and the rougher paſſions. On the contrary, flats in the higher parts, and diminiſhed intervals, form a plaintive harmony, which melts the heart. There are a multitude of ſimilar obſervations, of which when a muſician knows how to avail himſelf, he may command at will the affections of thoſe who hear him.

2. The choice of ſimple intervals is ſcarcely of leſs importance than that of the *chords*, with regard to the ſtations in which they ought to be placed. It is, for inſtance, in the lower parts that the fifth and octave ſhould be uſed in preference; in the upper parts, the third and ſixth are more proper. If you tranſpoſe this order, the harmony will be ruined even tho' the ſame *chords* are preſerved.

3. In a word, the *chords* are rendered ſtill more harmonious, by being approximated and only divided by the ſmalleſt practicable intervals, which are more ſuitable to the capacity of the ear than ſuch as are remote. This is what we call *contracting* the harmony, an art which few compoſers have ſkill and abilities enough to put in practice. The limits in the natural compaſs of voices, afford an additional reaſon for leſſening the diſtance of the intervals, which compoſe the harmony of the chorus, as much as poſſible. We may affirm, that a chorus, is improperly compoſed, when the diſtance between the *chords* increaſes; when thoſe who perform the different parts are obliged to ſcream; when the voices riſe above their natural extent, and are ſo remotely diſtant one from the other that the perception of harmonical relations between them is loſt.

We ſay likewiſe, that an inſtrument is in *concord* when the intervals between its fixed ſounds are what they ought to be; we ſay in this ſenſe, that the *chords* of an inſtrument are true or falſe, that it preſerves or does not preſerve its *chords*. The ſame form of ſpeaking is uſed for two voices which ſing together, or for two ſounds which are heard at the ſame time, whether in uniſon or in parts.

Chords, or *Cords, of Muſical inſtruments*, are ſtrings, by the vibration of which the ſenſation of ſound is excited, and by the diviſions of which the ſeveral degrees of tone are determined.

CHORDEE, in medicine and ſurgery, a ſymptom attending a gonorrhœa, conſiſting in a violent pain under the frenum, and along the duct of the urethra during the erection of the penis, which is incurvated downwards. Theſe erections are frequent and involuntary.

CHOREA Sancti Viti. See *Vitus's Dance*.

CHOREPISCOPUS, an officer in the ancient church, about whoſe function the learned are extremely divided, The word comes from χωρος, a *region, little country*, and επισκοπος, *a biſhop*, or *overſeer*.

The chorepiſcopi were ſuffragan or local biſhops, holding a middle rank between biſhops and preſbyters, and delegated to exerciſe epiſcopal juriſdiction within certain diſtricts, when the boundaries of particular churches, over with ſeparate biſhops preſided, were conſiderably enlarged. It is not certain when this office was firſt introduced: ſome trace it to the cloſe of the firſt century; others tell us, that chorepiſcopi were not known in the eaſt till the beginning of the fourth century: and in the weſt about the year 439. They ceaſed both in the eaſt and weſt in the tenth century.

Chorepiscopus is alſo the name of a dignity ſtill ſubſiſting in ſome cathedrals, particularly in Germany; ſignifying the ſame with *chori epiſcopus*, or "biſhop of the choir." The word, in this ſenſe, does not come from χωρος, *place*, but χορος, *quoir*, &c. In the church of Cologne, &c. the firſt chanter is called *chorepiſcopus*.

CHOREUS, Χορειος, a foot in the ancient poetry, more commonly called *trochæus*. See Trochee.

CHORIAMBUS, in ancient poetry, a foot conſiſting of four ſyllables, whereof the firſt and laſt are long, and the two middle ones are ſhort; or, which is the ſame thing, it is made up of a trochæus and iambus; ſuch is the word *nobilitas*.

CHORION, in anatomy, the exterior membrane which inveſts the foetus in the uterus. See Foetus.

CHOROBATA, or Chorobates, a kind of water level among the ancients, of the figure of the letter T, according to Vitruvius's deſcription.

CHOROGRAPHY, the art of making a map of ſome country or province.

Chorography differs from geography, as the deſcription of a particular country is different from that of the whole earth; and from topography, as the deſcription of a country is different from that of a town or diſtrict. See the articles Geography, Topography, and Map.

CHOROIDES, or Choroeides, in anatomy, a term applied to ſeveral parts of the body; bearing ſome reſemblance to the chorion. The word is formed from χοριον, *chorion*, and ειδος, *likeneſs*.

Choroides is particularly uſed for the inner membrane which immediately inveſts the brain; ſo called as being intermingled with a great number of blood-veſſels, like the *chorion*: but more uſually denominated the *pia mater*, or *meninx tenuis*.

Plexus or *Lacis Choroides*, is a knot of veins and arteries in the anterior ventricle of the brain, woven out of the branches of the carotid.

Choroides is alſo applied to the inner and poſterior tunic of the eye, immediately under the ſclerotica. It is ſoft, thin, and black; and its inner or concave ſurface is very ſmooth and poliſhed. It has its name from its being interſperſed with veſſels.

CHORUS, in dramatic poetry, one or more perſons preſent on the ſtage during the repreſentation, and ſuppoſed to be by-ſtanders without any ſhare in the action.

Tragedy in its origin was no more than a ſingle chorus, who trod the ſtage alone, and without any actors, ſinging dithyrambics or hymns in honour of Bacchus. Theſpis, to relieve the chorus, added an actor, who rehearſed the adventures of ſome of their heroes; and Æſchylus, finding a ſingle perſon too dry an entertainment, added a ſecond, at the ſame time reducing the ſinging of the chorus, to make more room for the recitation. But when once tragedy began to be formed, the recitative, which at firſt was intended only as an acceſſory part to give the chorus a breathing time, became a principal part of the tragedy. At length, however, the chorus became inſerted and incorporated into the action: ſometimes it was to ſpeak; and then their chief, whom they called *coryphæus*, ſpoke in behalf of the reſt: the ſinging was performed by the whole company; ſo that when the coryphæus ſtruck into a ſong, the chorus immediately joined him.

The chorus ſometimes alſo joined the actors in the courſe of the repreſentation, with their plaints and lamentations on account of any unhappy accidents that befel them: but the proper function, and that for which it ſeemed chiefly retained, was to ſhow the intervals of the acts: while the actors were behind the ſcenes, the chorus engaged the ſpectators; their ſongs uſually turned on what was exhibited, and were not to contain any thing but what was ſuited to the ſubject, and had a natural connection with it; ſo that the chorus concurred with the actors for advancing the action. In the modern tragedies the chorus is laid aſide, and the fiddles ſupply its place M. Dacier looks on this retrenchment as of ill conſequence, and thinks it robs tragedy of a great part of its luſtre; he therefore judges it neceſſary to re-eſtabliſh it, not only on account of the regularity of the piece, but alſo to correct, by prudent and virtuous reflections, any extravagances that might fall from the mouths of the actors when under any violent paſſion.

M. Dacier obſerved alſo, that there was a chorus, or grex, in the ancient comedy: but this is ſuppreſſed in the new comedy, becauſe it was uſed to reprove vices by attacking particular perſons; as the chorus of the tragedy was laid aſide to give the greater probability to thoſe kinds of intrigue which require ſecrecy.

Chorus, in muſic, is when, at certain periods of a ſong, the whole company are to join the ſinger in repeating certain couplets or verſes.

CHOSE, *(Fr.)* "a thing;" uſed in the common law with divers epithets; as *choſe local, choſe tranſitory*, and *choſe in action*. Choſe local is ſuch a thing as is annexed to a place, as a mill and the like; choſe tranſitory, is that thing which is moveable, and may be taken away, or carried from place to place; and choſe in action is a thing incorporeal, and only a *right*, as an obligation for debt, annuity, &c. And generally all cauſes of ſuit for any debt, duty, or wrong, are to be accounted choſes in action: and it ſeems, choſe in action may be alſo called *choſe in ſuſpence*; becauſe it hath no real exiſtence, or being, nor can properly be ſaid to be in our poſſeſſion.

CHOSROES I. the Great, king of Perſia, after his father Cabades, A. D. 532. He made peace with the Romans; but broke it the third year, and forced Juſtinian to a diſadvantageous peace. Afterward, he was ſo ſwelled with his victories, as to bid the emperor's ambaſſador follow him for audience to Cæſarea: but Tiberius ſent an army under Juſtinian; who made himſelf maſter of the country, and put Choſroes to death in 586.

Chosroes II. His ſubjects put his father Hormiſdas in priſon, and the ſon upon the throne of Perſia. He uſed his father tenderly at firſt; but afterwards cauſed him to be put to death. This, together with his killing ſome of the nobility, obliged him to fly: he gave his horſe the bridle, which carried him into a town of the Romans, where Mauricius the emperor received him kindly, and ſent an army under Narſes, which ſet him again upon the throne. He took Jeruſalem; after this he made himſelf maſter of Libya and Egypt, and carried Carthage. Heraclius ſued for peace; which was offered him on condition, *That he and his ſubjects ſhould deny Jeſus Chriſt*: Hereupon Heraclius attacked him with ſucceſs, and put him to flight. His own ſon purſued him, and he was ſtarved in priſon in 627.

CHOUCH, in ornithology, the trivial name of a ſpecies of Corvus.

CHOUS, in the eaſtern military orders, the title of the meſſengers of the divan of Janiſaries. There are ſeveral degrees of honour in this poſt. When a perſon is firſt advanced to it, he is called a *cuchuk*, or little *chous*; after this he is advanced to be the *alloy chous*; that is, the meſſenger of ceremonies; and from this, having paſſed through the office of *petelma*, or procurator of the effects of the body, he is advanced to be the *bas chous*.

CHOWDER-beer, a provincial phraſe of Devonſhire, in England, denoting a cheap and eaſily prepared drink, highly commended for preventing the ſcurvy in long voyages, or for the cure of it where it may have been contracted. It is prepared in the following manner: Take twelve gallons of water, in which put three pounds and a half of black ſpruce: boil it for three hours, and having taken out the fir or ſpruce, mix with the liquor ſeven pounds of melaſſes, and juſt boil it up; ſtrain it through a ſieve, and when milk warm put to it about four ſpoonfuls of yeſt to work it. In two or three days ſtop the bung of the caſk; and in five or ſix days, when fine, bottle it for drinking. Two gallons of melaſſes are ſufficient for an hogſhead of liquor; but if melaſſes cannot be procurod, treacle or coarſe ſugar will anſwer the purpoſe.

CHREMNITZ, the principal of the nine-towns in Upper Hungary, ſituated about 68 miles north-eaſt of Preſburg, and ſubject to the houſe of Auſtria. E. Long. 19. N. Lat. 48. 45.

CHRENECRUDA, a term occurring in writers of the middle age, and expreſſing a cuſtom of thoſe times; but its ſignification is doubtful. It is mentioned in *Lege Salica*, Tit. 61. which ſays, he who kills a man, and hath not wherewithal to ſatisfy the law or pay the fine, makes oath that he has delivered up every thing he was poſſeſſed of; the truth of which muſt be confirmed by the oaths of 12 other perſons. Then he invites his next relations by the father's ſide to pay off the remainder of the fine, having firſt made over to them all his effects by the following ceremony. He goes into his houſe, and taking in his hand a ſmall quantity of duſt from each of the four corners, he returns to the door, and with his face inwards throws the duſt with his left hand over his ſhoulders upon his neareſt of kin. Which done, he ſtrips to his ſhirt; and coming out with a pole in his hand, jumps over the hedge. His relations, whether one or ſeveral, are upon this obliged to pay off the compoſition for the murder. And if theſe (or any one of them) are not able to pay, *iterum ſuper illum chrenecruda, qui pauperior eſt, jactat, et ille totam legem componat.* Whence it appears, that *chrenecruda jactare,* is the ſame with throwing the duſt, gathered from the four corners of the houſe. Goldaſtus and Spelman tranſlate it *viridem herbam,* "green graſs," from the German *gruen kraut,* or from the Dutch *groen,* "green," and *gruid,* "graſs." Wendelinus is of a contrary opinion, who thinks that by this word *denotari purificationis approbationem,* from *chrein,* "pure, chaſte, clean;" and *keuren,* "to prove;" ſo that it muſt refer to the oaths of the twelve jurors. Be this as it will, king Childebert reformed this law by a decree, chap. 15. both becauſe it favoured of pagan ceremonies, and becauſe ſeveral perſons were thereby obliged to make over all their effects: *De chrenecruda lex quam paganorum tempore obſervabant, deinceps nunquam valeat, quia per ipſam cecidit multorum poteſtas.*

CHRISM (from χριω, *I anoint*), oil conſecrated by the biſhop, and uſed in the Romiſh and Greek churches, in the adminiſtration of baptiſm, confirmation, ordination, and extreme unction, which is prepared on holy Thurſday with much ceremony. In Spain it was anciently the cuſtom for the biſhop to take one third of a ſol for the chriſm diſtributed to each church, on account of the balſam that entered its compoſition.

Du Cange obſerves, that there are two kinds of chriſm; the one prepared of oil and balſam, uſed in baptiſm, confirmation, and ordination; the other of oil alone, conſecrated by the biſhop, uſed anciently for the catechumens, and ſtill in extreme unction. The Maronites, before their reconciliation with Rome, beſides oil and balſam, uſed muſk, ſaffron, cinnamon, roſes, white frankincenſe, and ſeveral other drugs mentioned by Rynaldus, in 1541, with the doſes of each. The Jeſuit Dandini, who went to mount Libanus in quality of the pope's nuncio, ordained, in a ſynod held there in 1596, that chriſm for the future ſhould be made only of two ingredients, oil and balſam; the one repreſenting the human nature of Jeſus Chriſt, the other his divine nature. The action of impoſing the chriſm is called *chriſmation*: this the generality of the Romiſh divines hold to be the next matter of the ſacrament of confirmation.

The chriſmation in baptiſm is performed by the prieſt; that in confirmation by the biſhop; that in ordination, &c. is more uſually ſtyled *unction.*

Chrism Pence, Chrismatis Denarii, or *Chrismales Denarii,* a tribute anciently paid to the biſhop by the pariſh-clergy, for their chriſm, conſecrated at Eaſter for the enſuing year: this was afterwards condemned as ſimoniacal.

CHRISOM, Chrismale, was anciently the face-cloth or piece of linen laid over the child's head when it was baptized. Whence, in the bills of mortality, children who die in the mouth are called *chriſoms.* The time between the child's birth and baptiſm was alſo called *chriſomus.*

CHRIST, an appellation ſynonymous with *Meſſiah,* uſually added to Jeſus: and, together therewith, denominating the Saviour of the world. See Christianity and Messiah.

The word χριςος ſignifies *anointed,* from χριω, *inungo,* "I anoint." Sometimes the word *Chriſt* is uſed ſingly, by way of *antonomaſis,* to denote a perſon ſent from God, as an anointed prophet, king, or prieſt.

Order of Christ, a military order, founded by Dionyſius I. king of Portugal, to animate his nobles againſt the Moors.—The arms of this order are gules, patriarchal croſs, charged with another croſs argent: they had their reſidence at firſt at Caſtromarin; afterwards they removed to the city of Thomar, as being nearer to the Moors of Andaluſia, and Eſtremadura.

Christ is alſo the name of a military order in Livonia, inſtituted in 1205 by Albert biſhop of Riga. The end of this inſtitution was to defend the new Chriſtians, who were converted every day in Livonia, but were perſecuted by the heathens. They wore on their cloaks a ſword with a croſs over it, whence they were alſo denominated *brothers of the ſword.*

Christ-Burgh, a town of Poland, near the lake Drauſen, and about three Poliſh miles from Marienburgh.

Christ-Church, a borough-town of Hampſhire, in England, 30 miles ſouth-weſt of Wincheſter, near the ſea-coaſt. W. Long. 2. N. Lat. 50. 40. It ſends two members to parliament.

Christ-Thorn, in botany. See Rhamnus.

CHRISTIAN. See Christianity and Christians.

Moſt Christian King, one of the titles of the king of France.

The French antiquaries trace the origin of this appellation up to Gregory the Great, who, writing a letter to Charles Martel, occaſionally gave him that title, which his ſucceſſors have ſince retained.

Christian Religion, that inſtituted by Jeſus Chriſt. See Christianity.

1 Origin of the word.

CHRISTIANITY, the religion of Chriſtians. The word is analogically derived, as other abſtracts from their concretes, from the adjective *Chriſtian.* This again is derived from the name Χριςος, *Chriſtus,* from the word χριω, *I anoint.* Chriſt is called *the anointed,* from a cuſtom which extenſively prevailed in antiquity, and was originally ſaid to be of divine inſtitution, of anointing perſons in the ſacerdotal or regal character, as a public ſignal of their conſecration to their important offices, and as a teſtimony that heaven itſelf was the guarantee of that relation which then commenced between the perſons thus conſecrated and their ſubordinates.

2 By what name the apoſtles were firſt diſtinguiſhed.

The diſciples of Jeſus, after the death of their teacher, had for ſome time been called *Nazarenes,* from Nazareth in Galilee where he dwelt; which afterwards became the deſignation of a particular ſect. They, who adopted the principles and profeſſed the religion which he taught, were firſt diſtinguiſhed by the name of *Chriſtians* at Antioch. That profeſſion, and thoſe doctrines, we now proceed to delineate with as much perſpicuity as the limits of our plan will admit, yet with the conciſeneſs which a work ſo multiform and extenſive requires.

3 Delineation of Chriſtianity.

When a Chriſtian is interrogated concerning the nature and foundation of his faith and practice, his ultimate reference, his laſt appeal, is to the facts, the doctrines, and the injunctions, contained in the books of the Old and New Teſtament. From theſe, therefore, and from theſe alone, muſt every fair account, or the materials of which it is compoſed, be extracted or deduced. Other formularies, or confeſſions of faith, may, according to the Chriſtian, deſerve more or leſs attention, as they are more or leſs immediately contained or implied in the ſcriptures. But whatever is not actually expreſſed in, or deduced by fair and neceſſary conſequence from, theſe writings, muſt be regarded as merely human; and can have no other title to our aſſent and obſervation than what they derive from their conformity with the ſcriptures, with the dictates and feelings of a reformed and cultivated mind, or with thoſe meaſures which are found expedient and uſeful in human life. But as thoſe books, from whence the Chriſtian inveſtigates his principles of belief and rules of conduct, have been variouſly interpreted by different profeſſors and commentators, theſe diverſities have given birth to a multiplicity of different ſects. It cannot, therefore, be expected, that any one who undertakes to give an account of Chriſtianity, ſhould comprehend all the writings and opinions which have been propagated and exhibited by hiſtorical, ſyſtematical, or polemical authors. Theſe, if at all contained in ſuch a work as this, ſhould be ranged under their proper articles, whether ſcientifical, controverſial, or biographical. It is our preſent buſineſs, if poſſible, to confine ourſelves to a detail of ſuch facts and doctrines as in the ſtrict and primitive ſenſe of the word, are *catholic*, or in other expreſſions, to ſuch as uniformly have been, and ſtill are, recogniſed and admitted by the whole body of Chriſtians.

4
Account of Chriſtianity, whence deducible.

We have already ſaid that theſe, or at leaſt the greateſt number of them, appeal to the ſcriptures of the Old and New teſtament as the ultimate ſtandard, the only infallible rule of faith and manners. If you aſk them, by what authority theſe books claim an abſolute right to determine the conſciences and underſtandings of men with regard to what they ſhould believe and what they ſhould do? they will anſwer you, that all ſcripture, whether for doctrine, correction, or reproof, was given by immediate inſpiration from God.

5
The nature of its evidences.

If again you interrogate them how thoſe books, which they call *Scripture*, are authenticated? they reply, that the evidences by which the Old and New Teſtament are proved to be the Word of God, are either external or internal. The *external* may again be divided into direct or collateral. The direct evidences are ſuch as ariſe from the nature, conſiſtency, and probability, of the facts; and from the ſimplicity, uniformity, competency, and fidelity, of the teſtimonies by which they are ſupported. The collateral evidences, are either the ſame occurences ſupported by Heathen teſtimonies, or others which concur with and corroborate the hiſtory of Chriſtianity. Its *internal* evidences ariſe either from its exact conformity with the character of God, from its aptitude to the frame and circumſtances of man, or from thoſe ſupernatural convictions and aſſiſtances which are impreſſed on the mind by the immediate operation of the divine Spirit. Theſe can only be mentioned in a curſory manner in a detail ſo conciſe as the preſent.

6
How Chriſtianity is ſupported by facts.

Such facts as are related in the hiſtory of his religion, the Chriſtian aſſert to be not only conſiſtent each with itſelf, but likewiſe one with another. Hence it is, that, by a ſeries of antecedents and conſequences, they corroborate each other, and form a chain which cannot be broken but by an abſolute ſubverſion of all hiſtorical authenticity. Nor is this all: for, according to him, the facts on which Chriſtianity is founded, not only conſtitute a ſeries of themſelves, but are likewiſe in ſeveral periods the beſt reſources for ſupplying the chaſms in the hiſtory of our nature, and preſerving the tenor of its annals entire. The facts themſelves are either natural or ſupernatural. By natural facts we mean ſuch occurrences as happen or may happen from the various operations of mechanical powers, or from the interpoſition of natural agents without higher aſſiſtants. Such are all the common occurrences of hiſtory, whether natural, biographical, or civil. By ſupernatural facts, we mean ſuch as could not have been produced without the interpoſition of Deity, or at leaſt of powers ſuperior to the laws of mechaniſm or the agency of embodied ſpirits. Among theſe may be reckoned the immediate change of water into wine, the inſtantaneous cure of diſeaſes without the intervention of medicine, the reſuſcitation of the dead, and others of the ſame kind. In this order of occurrences may likewiſe be numbered the exertions and exhibitions of prophetic power, where the perſons by whom theſe extraordinary talents were diſplayed could neither by penetration nor conjecture unravel the mazes of futurity, and trace the events of which they ſpoke from their primary cauſes to their remote completions. So that they muſt have been the paſſive organs of ſome ſuperior Being, to whom the whole concatenation of cauſes and effects which operate from the origin to the conſummation of nature, was obvious at a glance of thought.

7
Natural facts, what, and how conducive to the elucidation of hiſtory.

It has already been hinted, that the facts which we have called *natural*, not only agree with the analogy of human events, and corroborate each other, but in a great many emergencies nobly illuſtrate the hiſtory of nature in general. For this a Chriſtian might offer one inſtance, of which philoſophy will not perhaps be able to produce any tolerable ſolution, without having recourſe to the facts upon which Chriſtianity is founded. For if mankind were originally deſcended from one pair alone, how ſhould it have happened that long before the date of authentic hiſtory every nation had its own diſtinct language? Or if it be ſuppoſed, as ſome late philoſophers have maintained, that man is an indigenous animal in every country; or, that he was originally produced in, and created for, each particular ſoil and climate which he inhabits; ſtill it may be demanded, whence the prodigious multiplicity, the immenſe diverſity, of languages? Is the language of every nation intuitive, or were they dictated by exigencies, and eſtabliſhed by convention? If the laſt of theſe ſuppoſitions be true, what an immenſe period of time muſt have paſſed? How many revolutions of material and intellectual nature muſt have happened? What acceſſions of knowledge, refinement, civilization, muſt human intercourſe have gained before the formation and eſtabliſhment even of the moſt ſimple, imperfect, and barbarous language? Why is a period ſo vaſt, obliterated ſo entirely as to eſcape the retroſpect of hiſtory, of tradition, and even of fable itſelf; Why was the acquiſition and improvement of other arts ſo infinitely diſtant from that of language, that the aera of the latter is entirely loſt, whilſt we can trace the former from their origin through the various gradations of their progreſs.

8
This obſcurity inexplicable but by the Moſaic account.

Theſe difficulties, inextricable by all the lights of hiſtory or philoſophy, this more than Cimmerian darkneſs, is immediately diſſipated by the Moſaic account of the confuſion of tongues: wiſely intended to ſeparate the tribes of men one from another, to repleniſh the ſurface of the globe, and to give its multiplied inhabitants thoſe opportunities of improvement which might be derived from experiment and induſtry, variouſly exerted, according to the different ſituations in which they were placed, and the different employments which theſe ſituations dictated. Thus the time of nature's exiſtence is limited to a period within the ken of human intellect. Thus whatever has happened might have happened during the preſent mode of things; whereas, if we deduce the orign and diverſity of language from a period ſo remotely diſtant as to be abſolutely loſt, and entirely detached from all the known occurences and viciſſitudes of time, we muſt admit the preſent forms and arrangments of things to have ſubſiſted perhaps for a much longer duration than any mechanical philoſopher will allow to be poſſible. Other inſtances equally pregnant with conviction might be multiplied; but, precluded by the limits of our plan, we proceed to a ſingle obſervation upon the facts which have been termed *ſupernatural*.

9
Miracles how conducive to prove the truth of Chriſtianity.

Of thoſe changes which happen in ſenſible objects, ſenſation alone can be judge. Reaſon has nothing to do in the matter. She may draw concluſions from the teſtimonies of ſenſe, but can never refute them. If, therefore, our ſenſes inform us that ſnow is white, in vain would the moſt learned and ſubtile philoſopher endeavour to convince us that it was of a contrary colour. He might confound us, but never could perſuade us. Such changes, therefore, as appear to happen in ſenſible objects, muſt either be real or fallacious. If real, the miracle is admitted; if falacious, there muſt be a cauſe of deception equally unaccountable from the powers of nature, and therefore equally miraculous. If the veracity or competency of the witneſſes be queſtioned, the Chriſtian anſwers, that they muſt be competent, becauſe the facts which they relate are not beyond their capacity to determine. They muſt likewiſe be faithful, becauſe they had no ſecular motives for maintaining, but many for ſuppreſſing or diſguiſing, what they teſtified. Now the Chriſtian appeals to the whole ſeries of hiſtory and experience, whether ſuch a man is or can be found, as will offer a voluntary, ſolemn, and deliberate ſacrifice of truth at the ſhrine of caprice.

10
Prophecy evident by its own nature independent of its vehicles.

But ſuch facts as after a long continuance of time have been found exactly agreeable to predictions formerly emitted, muſt ſuperſede the fidelity of teſtimony, and infallibly prove that the event was known to the Being by whom it was foretold. In vain has it been urged, that prophecies are ambiguous and equivocal. For though they may prefigure ſubordinate events, yet if the grand occurrences to which they ultimately relate, can alone fulfil them in their various circumſtances, and in their utmoſt extent, it is plain, that the Being by whom they were revealed muſt have been actually preſcient of thoſe events, and muſt have had them in view when the predictions were uttered. For this ſee a learned and ingenious Diſſertation on the Credibility of Goſpel-hiſtory, by Dr M'Knight; where the evidences urged by the Chriſtian in defence of his tenets, which appear detached and ſcattered through innumerable volumes, are aſſembled and arranged in ſuch a manner as to derive ſtrength and luſtre from the method in which they are diſpoſed, without diminiſhing the force of each in particular. See alſo the works of Dr Hurd: conſult likewiſe thoſe of Newton, Sherlock Chandler, &c. For the evidences of thoſe preternatural facts which have been termed *miracles*, the reader may peruſe a ſhort but elegant and concluſive defence of theſe aſtoniſhing phenomena, in anſwer to Mr Hume, by the Rev. George Campbell, D. D.

11
Properties common to all religions.

It muſt be obvious to every reflecting mind, that whether we attempt to form the idea of any religion *a priori*, or contemplate thoſe which have been already exhibited, certain facts, principles, or *data*, muſt be pre-eſtabliſhed, from whence will reſult a particular frame of mind and courſe of action ſuitable to the character and dignity of that Being by whom the religion is enjoined, and adapted to the nature and ſituation of thoſe agents who are commanded to obſerve it. Hence *Chriſtianity* may be divided into *credenda* or doctrines, and *agenda* or precepts.

12
Chriſtian theology.

As the great foundation of his religion, therefore, the Chriſtian believes the exiſtence and government of one eternal and infinite God, who, for ever retains in himſelf the cauſe of his own exiſtence, and inherently poſſeſſes all thoſe perfections which are compatible with his nature: ſuch are, his almighty power, omniſcient wiſdom, infinite juſtice, boundleſs goodneſs, perfect holineſs, and univerſal preſence. That Jeſus Chriſt is the Son of God, in whom the fulneſs of the Godhead dwells, by whom he created and governs the univerſe, exerciſing in his univerſal government the energy of the Holy Spirit, and conducting all his diſpenſations to accompliſh the deſigns of infinite wiſdom and benevolence.

The Supreme Being, though abſolutely independent and for ever ſufficient for his own beatitude, was graciouſly pleaſed to create an univerſe replete with inferior intelligences, who might for ever contemplate and enjoy his glory, participate his happineſs, and imitate his perfections. But as freedom of will is eſſential to the nature of moral agents, that they may co-operate with God in their own improvement and happineſs, ſo their natures and powers are neceſſarily limited, and by that conſtitution rendered peccable. This degeneracy firſt took place in a rank of intelligence ſuperior to man. But guilt is never ſtationary. Impatient of itſelf, and curſed with its own feelings, it proceeds from bad to worſe, whilſt the poignancy of its torments increaſes with the number of its perpetrations. Such was the ſituation of Satan, and his apoſtate angels. They attempted to transfer their turpitude and miſery to man; and were, alas! but too ſucceſsful. Hence the heterogeneous and irreconcileable principles which operate in his nature. Hence that inexplicable medley of wiſdom and folly, of rectitude and error, of benevolence and malignity, of ſincerity and fraud, exhibited through his whole conduct.

duct. Hence the darkneſs of his underſtanding, the depravity of his will, the pollution of his heart, the irregularity of his affections, and the abſolute ſubverſion of his whole internal economy. Theſe ſeeds of perdition ſoon ripened into overt acts of guilt and horror. All the hoſtilities of nature were confronted, and the whole ſublunary creation became a theatre of diſorder and miſchief.

Here the Chriſtian once more appeals to fact and experience. If theſe things are ſo; if *man* is the veſſel of guilt and the victim of miſery; he demands how this conſtitution of things can be accounted for? how can it be ſuppoſed, that a being ſo wicked and unhappy ſhould be the production of an infinitely perfect Creator? He therefore inſiſts, that human nature muſt have been diſarranged and contaminated by ſome violent ſhock; and that, of conſequence, without the light diffuſed over the face of things by Chriſtianity, all nature muſt remain an inſcrutable and inexplicable myſtery.

To redreſs theſe evils, to re-eſtabliſh the empire of virtue and happineſs, to reſtore fallen nature to its primitive rectitude, to purify from every ſtain, to remove the guilt and deſtroy the power of vice, the Son of God, the Logos or Word, the Redeemer or Saviour of the world, the Immanuel or God with us, from whom Chriſtianity takes its name, and to whom it owes its origin, deſcended from the boſom of his Father; was made fleſh; took upon him the form of a ſervant; ; endured a ſevere probation in that character; exhibited a pattern of perfect righteouſneſs; and at laſt ratified his doctrine, and fully accompliſhed all the ends of his miſſion, by a cruel, unmerited, and ignominious death. Before he left this world, he delivered the doctrine of human ſalvation, and the rules of human conduct, to his apoſtles, whom he empowered to inſtruct the world in all that concerned their eternal felicity, and whom he inveſted with miraculous gifts to aſcertain the reality of what they taught. To them he likewiſe promiſed another comforter, even the Divine Spirit, who ſhould relume the darkneſs, conſole the woes, and purify the ſtains, of human nature. Having remained for a part of three days under the power of death, he aroſe again from the grave, diſcovered himſelf to his diſciples, converſed with them for ſome time, then reaſcended to heaven; from whence the Chriſtian expects him, according to his promiſe, to appear as the Sovereign Judge of the living and the dead, from whoſe award there is no appeal, and by whoſe ſentence the pious and the wicked ſhall receive according to their deeds.

Soon after his departure to the right hand of his Father, where he ſits ſupreme of all created beings, and inveſted with the abſolute adminiſtration of heaven and earth, the Spirit of grace and conſolation deſcended on his apoſtles with viſible ſignatures of divine power and preſence. Nor were his ſalutary operations confined to them, but extended to all the rational world, who did not by obſtinate guilt repel his influences, and provoke him to withdraw them. Theſe, indeed, were leſs conſpicuous than at the glorious æra when they were viſibly exhibited in the perſons of the apoſtles. But though his energy is leſs obſervable, it is by no means leſs effectual to all the purpoſes of grace and mercy.

The Chriſtian is convinced, that there is and ſhall continue to be a ſociety upon earth, who worſhip God as revealed in Jeſus Chriſt; who believe his doctrines; who obſerve his percepts; and who ſhall be ſaved by his death, and by the uſe of theſe external means of ſalvation which he hath appointed.

13
The external means of Chriſtianity, what, and how promotive of their end.

Theſe are few and ſimple. The ſacraments of baptiſm and the euchariſt, the interpretation and application of ſcripture, the habitual exerciſe of public and private devotion, are obviouſly calculated to diffuſe and promote the intereſts of truth and virtue, by ſuperinducing the ſalutary habits of faith, love, and repentance.

The Chriſtian is firmly perſuaded, that at the period which God hath appointed, and to which the purpoſes of providence in the various revolutions of progreſſive nature tend, the whole human race ſhall once more iſſue from their graves; ſome to ſupreme felicity, in the actual perception and enjoyment of their Creator's preſence; others to that conſummate ſhame and miſery, which are the native conſequences of their wickedneſs.

14
Chriſtian morality.

The two grand principles of action, according to the Chriſtian, are, The love of God, which is the ſovereign paſſion in every perfect mind: and the love of man, which regulates our actions according to the various relations in which we ſtand, whether to communities or individuals. This ſacred connection can never be totally extinguiſhed by any temporary injury. It ought to ſubſiſt in ſome degree even amongſt enemies. It requires that we ſhould pardon the offences of others, as we expect pardon for our own; and that we ſhould no farther reſiſt evil than is neceſſary for the preſervation of perſonal rights and ſocial happineſs. It dictates every relative and reciprocal duty between parents and children, maſters and ſervants, governors and ſubjects, friends and friends, men and men. Nor does it merely enjoin the obſervation of equity, but likewiſe inſpires the moſt ſublime and extenſive charity, a boundleſs and diſintereſted effuſion of tenderneſs for the whole ſpecies, which feels their diſtreſs and operates for their relief and improvement. Theſe celeſtial diſpoſitions, and the different duties which are their natural exertions, are the various gradations by which the Chriſtian hopes to attain the perfection of his nature and the moſt exquiſite happineſs of which it is ſuſceptible.

15
This ſyſtem aſſerted by the Chriſtian, ſuperior in the excellence of its nature, and the evidence of its reality, to all others.

Such are the ſpeculative, and ſuch the practical principles of Chriſtianity. From the former, its votaries contend, that the origin, economy, and revolutions of intelligent nature alone can be rationally explained. From the latter, they aſſert, that the nature of man, whether conſidered in its individual or ſocial capacity, can alone be conducted to its higheſt perfection and happineſs. With the determined Atheiſts they ſcarcely deign to expoſtulate. For, according to them, philoſophers who can deduce the origin and conſtitution of things from caſual rencounters or mechanical neceſſity, are capable of deducing any concluſion from any premiſes. Nor can a more glaring inſtance of abſurdity be produced, than the idea of a contingent or ſelf-originated univerſe. When

Deiſts and other ſceptics upbraid them with myſterious or incompatible principles, they without heſitation deny the charge. They demand of any reaſoner who admits that a being may be omnipreſent without extenſion; or that he can impreſs motion upon other things, whilſt he himſelf is neceſſarily immoveable, upon what ground he charges Chriſtianity with incompatible principles. They aſk the ſage, why it ſhould be thought more extraordinary, that the Son of God ſhould be ſent to this world, that he ſhould be a man of like paſſions with other men, that he ſhould ſuffer and die for the relief of his degnerate creatures, than that an exiſtence whoſe felicity is eternal, inherent, and infinite, ſhould have any motive for creating beings exterior to himſelf? Is it not, ſays the Chriſtian, equally worthy of the divine interpoſition to reſtore order and happineſs where they are loſt, as to communicate them where they never have been? Is not infinite goodneſs equally conſpicious in relieving miſery as in diffuſing happineſs? Is not the exiſtence of what we call evil in the world, under the tuition of an infinitely perfect Being, as inſcrutable as the mean exhibited by Chriſtianity for its abolition? The death and reſurrection of the Son of God, and pardon and life through him, are certainly not leſs reconcileable to human reaſon, *a priori*, than the exiſtence of vice and puniſhment in the productions of infinite wiſdom, power, and goodneſs: particularly when it is conſidered, that the virtues exerted and diſplayed by a perfect Being in a ſtate of humiliation and ſuffering, ſhall ultimately be productive of the reſtored felicity of inferior creatures, in proportion to their glory and excellence; and that ſuch goodneſs may apply the bleſſings which it has obtained, in whatever manner, in whatever degree, and to whomſoever it pleaſes, without being under any neceſſity to violate the freedom of moral agents, by recalling them to the paths of virtue and happineſs by a mechanical and irreſiſtible force.

16
Miraculous as poſſible, and perhaps as neceſſary, as natural events.

It will be granted to philoſophy by the Chriſtian, that as no theory of mechanical nature can be formed without preſuppoſing ſacred and eſtabliſhed laws from which ſhe ought rarely or never to deviate, ſo in fact ſhe tenaciouſly purſues theſe general inſtitutions, and from their conſtant obſervance reſult the order and regularity of things. But he cannot admit, that the important ends of moral and intellectual improvement may be uniformly obtained by the ſame means. He affirms, that if the hand of God ſhould either remain always entirely inviſible, or at leaſt only perceptible in the operation of ſecond cauſes, intelligent beings would be apt in the courſe of time to reſolve the interpoſitions of Deity into the general laws of mechaniſm; to forget their connection with nature, and conſequently their dependence upon him. Hence, according to the dictates of common ſenſe, and to the unanimous voice of every religion in every age or clime, for the purpoſes of wiſdom and benevolence, God may not only control, but has actually controlled, the common courſe and general operations of nature. So that, as in the material, world the law of *cauſe* and *effect* is generally and ſcrupulouſly obſerved for the purpoſes of natural ſubſiſtence and accommodation; thus ſuſpenſes and changes of that univerſal law are equally neceſſary for the advancement of moral and intellectual perfection.

17
Chriſtianity not only explains the phenomena, but conſolesthe miſeries, of human nature.

But the diſciple of Jeſus not only contends, that no ſyſtem of religion has ever yet been exhibited ſo conſiſtent with itſelf, ſo congruous to philoſophy and the common ſenſe of mankind, as Chriſtianity; he likewiſe avers, that it is infinitely more productive of real and ſenſible conſolation than any other religious or philoſophical tenets, which have ever entered into the ſoul, or been applied to the heart of man. For what is death to that mind which conſiders eternity as the career of its exiſtence? What are the frowns of fortune to him who claims an eternal world as his inheritance? What is the loſs of friends to that heart which feels, with more than natural conviction, that it ſhall quickly rejoin them in a more tender, intimate, and permanent intercourſe than any of which the preſent life is ſuſceptible? What are the fluctuations and viciſſitudes of external things to a mind which ſtrongly and uniformly anticipates a ſtate of endleſs and immutable felicity? What are mortifications, diſappointments, and inſults, to a ſpirit which is conſcious of being the original offspring and adopted child of God; which knows that its omnipotent Father will, in proper time, effectually aſſert the dignity and privileges of its nature? In a word, as earth is but a ſpeck of creation, as time is not an inſtant in proportion to eternity, ſuch are the hopes and proſpects of the Chriſtian in compariſon of every ſublunary misfortune or difficulty. It is therefore, in his judgment, the eternal wonder of angels, and indelible opprobrium of man, that a religion ſo worthy of God, ſo ſuitable to the frame and circumſtances of our nature, ſo conſonant to all the dictates of reaſon, ſo friendly to the dignity and improvement of intelligent beings, pregnant with genuine comfort and delight, ſhould be rejected and deſpiſed. Were there a poſſibility of ſuſpence or heſitation between this and any other religion extant, he could freely truſt the determination of a queſtion ſo important to the candid deciſion of real virtue and impartial philoſophy.

18
Mr Gibbon attempts to prove, that the propagation of Chriſtianity was owing to cauſes from the operation of which no arguments can be deduced in proof of its authenticity.

Mr Gibbon, in his Hiſtory of the Decline and Fall of the Roman Empire, mentions five ſecondary cauſes to which he thinks the propagation of Chriſtianity, and all the remarkable circumſtances which attended it, may be with good reaſon aſcribed. He ſeems to inſinuate, that Divine Providence did not act in a ſingular or extraordinary manner in diſſeminating the religion of Jeſus through the world; and that, if every other argument which has been adduced to prove the ſacred authority of this religion can be parried or refuted, nothing can be deduced from this ſource to prevent it from ſharing the ſame fate with other ſyſtems of ſuperſtition. The cauſes of its propagation were in his opinion founded on the principles of human nature and the circumſtances of ſociety. If we aſcribe not the propagation of Mahometiſm, or of the doctrines of Zerduſt, to an extraordinary interpoſition of divine providence, operating by an unperceived influence on the diſpoſitions of the human heart, and controlling and confounding the ordinary laws of nature; neither can we, upon any reaſonable grounds, refer the promulgation of Chriſtianity to ſuch an interpoſition.

The

19 The cauſes. The ſecondary cauſes to which he aſcribes theſe effects are, 1. The inflexible and intolerant zeal of the Chriſtians; derived from the Jewiſh religion, but purified from the narrow and unſocial ſpirit which, inſtead of inviting, deterred the Gentiles from embracing the law of Moſes. 2. The doctrine of a future life, improved by every additional circumſtance which could give weight and efficacy to that important truth. 3. The miraculous powers aſcribed to the primitive church. 4. The pure and auſtere morals of the Chriſtians. 5. The union and diſcipline of the Chriſtian republic, which gradually formed an independant and increaſing ſtate in the heart of the Roman empire.

20 Cauſe I. In pointing out the connection between the *firſt* of theſe cauſes and the effects which he repreſents as ariſing from it, this learned and ingenious writer obſerves, that the religion of the Jews does not ſeem to have been intended to be propagated among the Heathens, and that the converſion of proſelytes was rather accidental than conſiſtent with the purport and the general ſpirit of the inſtitutions of Judaiſm. The Jews were, of conſequence, ſtudious to preſerve themſelves a peculiar people. Their zeal for their own religion was intolerant, narrow, and unſocial.

In Chriſtianity, when it made its appearance in the world, all the better part of the predominant ſpirit of Judaiſm was retained; but whatever might have a tendency to confine its influence within narrow limits was laid aſide. Chriſtians were to maintain the doctrines and adhere to the inſtitutions of their religion with ſacred fidelity. They were not to violate their allegiance to Jeſus by entertaining or profeſſing any reverence for Jupiter or any other of the Heathen deities; it was not even neceſſary for them to comply with the poſitive and ceremonial inſtitutions of the law of Moſes,—although theſe were acknowledged to have been of divine origin. The zeal, therefore, which their religion inculcated, was inflexible. It was even intolerant: for they were not to content themſelves with profeſſing Chriſtianity and conforming to its laws; they were to labour with unremitting aſſiduity, and to expoſe themſelves to every difficulty and every danger, in converting others to the ſame faith.

But the ſame circumſtances which rendered it thus intolerant, communicated to it a more liberal and a leſs unſocial ſpirit than that of Judaiſm. The religion of the Jews was intended only for a few tribes: Chriſtianity was to become a catholic religion; its advantages were to be offered to all mankind.

All the different ſects which aroſe among the primitive Chriſtians uniformly maintained the ſame zeal for the propagation of their own religion, and the ſame abhorrence for every other. The Orthodox, the Ebionites, the Gnoſtics, were all equally animated with the ſame excluſive zeal, and the ſame abhorrence of idolatry, which had diſtinguiſhed the Jews from other nations.

21 Obſervations in anſwer. Such is the general purport of what Mr Gibbon advances concerning the influence of the firſt of thoſe ſecondary cauſes in the propagation of Chriſtianity. It would be uncandid to deny, that his ſtatement of facts appears to be, in this inſtance, almoſt fair, and his deductions tolerably logical. The firſt Chriſtians *were* remarkable for their deteſtation of idolatry, and for the generous diſintereſted zeal with which they laboured to convert others to the ſame faith. The firſt of theſe principles, no doubt, contributed to maintain the dignity and the purity of Chriſtianity; and the ſecond to diſſeminate it through the world. But the facts which he relates are ſcarce conſiſtent throughout. He ſeems to repreſent the zeal of the firſt Chriſtians as ſo hot and intolerant, that they could have no ſocial intercourſe with thoſe who ſtill adhered to the worſhip of Heathen deities. In this caſe, how could they propagate their religion? Nay, we may even aſk, How could they live? If they could not mingle with the Heathens in the tranſactions either of peace or war; nor witneſs the marriage or the funeral of the deareſt friend, if a Heathen; nor practiſe the elegant arts of muſic, painting, eloquence, or poetry; nor venture to uſe freely in converſation the language of Greece or of Rome;—it is not eaſy to ſee what opportunities they could have of diſſeminating their religious ſentiments. If, in ſuch circumſtances, and obſerving rigidly ſuch a tenor of conduct, they were yet able to propagate their religion with ſuch amazing ſucceſs as they are ſaid to have done; they muſt ſurely either have practiſed ſome wondrous arts unknown to us, or have been aſſiſted by the ſupernatural operation of divine power.

But all the hiſtorical records of that period, whether ſacred or profane, concur to prove, that the primitive Chriſtians in general did not retire with ſuch religious horror from all intercourſe with the Heathens. They refuſed not to ſerve in the armies of the Roman empire: They appealed to Heathen magiſtrates, and ſubmitted reſpectfully to their deciſions: the Huſband was often a Heathen, and the wife a Chriſtian; or, again, the huſband a Chriſtian, and the wife a Heathen. Theſe are facts ſo univerſally known and believed, that we need not quote authorities in proof of them.

This reſpectable writer appears therefore not to have ſtated the facts which he produces under this head with ſufficient ingenuouſneſs; and he has taken care to exaggerate and improve thoſe which he thinks uſeful to his purpoſe with all the dazzling, deluſive colours of eloquence. But had the zeal of the firſt Chriſtians been ſo intolerant as he repreſents it, it muſt have been highly unfavourable to the propagation of their religion: all their wiſhes to make converts would, in that caſe, have been counteracted by their unwillingneſs to mix, in the ordinary intercourſe of life, with thoſe who were to be converted. Their zeal, and the liberal ſpirit of their religion, were indeed ſecondary cauſes which contributed to its propagation: but their zeal was by no means ſo ridiculouſly intolerant as this writer would have us believe; if it had, it muſt have produced effects directly oppoſite to thoſe which he aſcribes to it.

22 Cauſe II. In illuſtrating the influence of the *Second* of theſe ſecondary cauſes to which he aſcribes the propagation of Chriſtianity, Mr Gibbon diſplays no leſs ingenuity than in tracing the nature and the effects of the firſt. The doctrine of a future life, improved by every additional circumſtance which can give weight and efficacy to that important truth, makes a conſpicuous figure in the Chriſtian ſyſtem; and it is a doctrine highly flattering to the natural hopes and wiſhes of the human heart.

Though the Heathen philoſophers were not unacquainted with this doctrine; yet to them the ſpirituality of the human ſoul, its capacity of exiſtence in a ſeparate ſtate from the body, its immortality, and its proſpect of laſting happineſs in a future life, rather appeared things poſſible and deſirable, than truths fully eſtabliſhed upon ſolid grounds. Theſe doctrines, Mr Gibbon would perſuade us, had no influence on the moral ſentiments and general conduct of the Heathens. Even the philoſophers, who amuſed themſelves with diſplaying their eloquence and ingenuity on thoſe ſplendid themes, did not allow them to influence the tenor of their lives. The great body of the people, who were occupied in purſuits very different from the ſpeculations of philoſophy, and were unacquainted with the queſtions diſcuſſed in the ſchools, were ſcarce ever at pains to reflect whether they conſiſted of a material and a ſpiritual part, or whether their exiſtence was to be prolonged beyond the term of the preſent life; and they could not regulate their lives by principles which they did not know.

In the popular ſuperſtition of the Greeks and Romans, the doctrine of a future ſtate was not omitted. Mankind were not only flattered with the hopes of continuing to exiſt beyond the term of the preſent life; but different conditions of exiſtence were promiſed or threatened, in which retributions for their conduct in human life were to be enjoyed or ſuffered. Some were exalted to heaven, and aſſociated with the gods; others were rewarded with leſs illuſtrious honours, and a more moderate ſtate of happineſs, in Elyſium; and thoſe, again, who by their conduct in life had not merited rewards, but puniſhments, were conſigned to Tartarus. Such were the ideas of a future ſtate which made a part of the popular ſuperſtition of the Greeks and Romans. But they produced only a very faint impreſſion on the minds of thoſe among whom they prevailed. They were not truths ſupported by evidence; they were not even plauſible; they were a tiſſue of abſurdities. They had not therefore a more powerful influence on the morals, than the more refined ſpeculations of the philoſophers.

Even the Jews, whoſe religion and legiſlature were communicated from heaven, were in general, till within a very ſhort time before the propagation of the goſpel, as imperfectly acquainted with the doctrine of a future ſtate as the Greeks and Romans. This doctrine made no part of the law of Moſes. It is but darkly and doubtfully inſinuated through the other parts of the Old Teſtament. Thoſe among the Jews who treated the ſacred ſcriptures with the higheſt reverence, always denied that ſuch a doctrine could be deduced from any thing which theſe taught; and maintained that death is the final diſſolution of man.

The rude tribes who inhabited ancient Gaul, and ſome other nations not more civilized than they, entertained ideas of a future life, much clearer than thoſe of the Greeks, the Romans, or the Jews.

Chriſtianity, however, explained and inculcated the truth of this doctrine in all its ſplendor and all its dignity. It exhibited an alluring, yet not abſurd, view of the happineſs of a future life. It conferred new horrors on the place of puniſhment, and added new ſeverity to the tortures to be inflicted, in another world. The authority on which it taught theſe doctrines, and diſplayed theſe views, was ſuch as to ſilence inquiry and doubt, and to command implicit belief. What added to the influence of the doctrine of a future ſtate of exiſtence, thus explained and inculcated, was, that the firſt Chriſtians confidently propheſied and ſincerely believed that the end of the world, the conſummation of all things, was faſt approaching, and that the generation then preſent ſhould live to witneſs that awful event. Another circumſtance which contributed to render the ſame doctrine ſo favourable to the propagation of Chriſtianity was, that the firſt Chriſtians dealt damnation without remorſe, and almoſt without making any exceptions, on all who died in the belief of the abſurdities of Heathen ſuperſtition. Thus taught and improved with theſe additional and heightening circumſtances, this doctrine, partly by preſenting alluring proſpects and exciting pleaſing hopes, partly by working upon the fears of the human heart with repreſentations of terror, operated in the moſt powerful manner in extending the influence of the Chriſtian faith.

23 Obſervations in anſwer.

Here, too, facts are rather exaggerated, and the inferences ſcarce fairly deduced. It muſt be confeſſed, that the ſpeculations of the Heathen philoſophers did not fully and undeniably eſtabliſh the doctrine of the immortality of the human ſoul; nor can we preſume to aſſert, in contradiction to Mr Gibbon, that their arguments could impreſs ſuch a conviction of this truth as might influence in a very ſtrong degree the moral ſentiments and conduct. They muſt, however, have produced ſome influence on theſe. Some of the moſt illuſtrious among the Heathen philoſophers appear to have been ſo ſtrongly impreſſed with the belief of the ſoul's immortality, and of a future ſtate of retribution, that their general conduct was conſtantly and in a high degree influenced by that belief. Plato and Socrates are eminent and well known inſtances. And if, in ſuch inſtances as theſe, the belief of theſe truths produced ſuch conſpicuous effects; it might be fairly inferred, though we had no farther evidence, that thoſe characters were far from being ſingular in this reſpect. It is a truth acknowledged as unqueſtionable in the hiſtory of the arts and ſciences, that wherever any one perſon has cultivated theſe with extraordinary ſucceſs, ſome among his contemporaries will always be found to have rivalled his excellence, and a number of them to have been engaged in the ſame purſuits. On this occaſion we may venture, without heſitation, to reaſon upon the ſame principles. When the belief of the immortality of the human ſoul produced ſuch illuſtrious patterns of virtue as a Plato and a Socrates; it muſt certainly have influenced the moral ſentiments and conduct of many others,—although in an inferior degree. We ſpeculate, we doubt, concerning the truth of many doctrines of Chriſtianity; many who profeſs that they believe them, make this profeſſion only becauſe they have never conſidered ſeriouſly whether they be true or falſe. But, notwithſtanding this, theſe truths ſtill exert a powerful influence on the ſentiments and manners of ſociety in general. Thus, alſo, it appears, that the doctrines of ancient philoſophy concerning a future life, and even the notions concerning Olympus, Elyſium, and Tartarus, which made a part of the popular ſuperſtition, *did* produce a certain influence on the ſentiments and manners of the heathens in general. That influence was often indeed inconſiderable, and not always happy; but ſtill it was ſomewhat greater than Mr Gibbon ſeems willing to allow. Chriſtians have been ſometimes at pains to exaggerate the abſurdities of Pagan ſuperſtition, in order that the advantages of Chriſtianity might acquire new value from being contraſted with it. Here we find one who is rather diſpoſed to be the enemy of Chriſtianity, diſplaying, and even exaggerating, thoſe abſurdities for a very different purpoſe. But the truth may be ſafely admitted: it is only when exaggerated that it can ſerve any purpoſe inimical to the ſacred authority of our holy religion. Mr Gibbon certainly repreſents the religious doctrine of the ancient Gauls, in reſpect to the immortality of the human ſoul and a future ſtate, in too favourable a light. It is only becauſe the whole ſyſtem of ſuperſtition which prevailed among thoſe barbarians is ſo imperfectly known, that it has been imagined to conſiſt of more ſublime doctrines than thoſe of the popular ſuperſtition of the Greeks and Romans. The evidence which Mr Gibbon adduces in proof of what he aſſerts concerning theſe opinions of the ancient Gauls, is partial, and far from ſatisfactory. They *did* indeed aſſert and believe the ſoul to be immortal; but this doctrine was blended among a number of abſurdities much groſſer than thoſe which characteriſe the popular religion of the Greeks and Romans. The latter was the ſuperſtition of a civilized people, among whom reaſon was unfolded and improved by cultivation, and whoſe manners were poliſhed and liberal; the former was that of barbarians, among whom reaſon was, as it were, in its infancy, and who were ſtrangers to the improvements of civilization. When haſty obſervers found that thoſe barbarians were not abſolutely ſtrangers to the idea of immortality, they were moved to undue admiration; their ſurpriſe at finding what they had not expected, confounded their underſtanding, and led them to miſconceive and miſrepreſent. What we ought to aſcribe to the ſavage ferocity of the character of theſe rude tribes, has been attributed by miſtake to the influence of their belief of a future ſtate.

In the law of Moſes, it muſt be allowed, that this doctrine is not particularly explained nor earneſtly inculcated. The author of the Divine Legation of Moſes, &c. has founded upon this fact an ingenious theory, which we ſhall elſewhere have occaſion to examine. The reaſons why this doctrine was not more fully explained to the Jews, we cannot pretend to aſſign, at leaſt in this place; yet we cannot help thinking, that it was more generally known among the Jews than Mr Gibbon and the author of the Divine Legation are willing to allow. Though it be not ſtrongly inculcated in their *code of laws*, yet there is ſome reaſon to think that it was known and generally prevalent among them long before the Babyloniſh captivity; even in different paſſages in the writings of Moſes, it is mentioned or alluded to in an unequivocal manner. In the hiſtory of the patriarchs, it appears that this doctrine was known to *them;* it appears to have had a ſtrong influence on the mind of Moſes himſelf. Was David, was Soloman, a ſtranger to this doctrine? We cannot here deſcend to very minute particulars; but ſurely all the efforts of ingenuity muſt be inſufficient to torture the ſacred ſcriptures of the Old Teſtament, ſo as to prove that they contain nothing concerning the doctrine of a future ſtate any where but in the writings of the latter prophets, and that even in theſe it is only darkly inſinuated. Were the Jews, in the earlier part of their hiſtory, ſo totally ſecluded from all intercourſe with other nations, that a doctrine of ſo much importance, more or leſs known to all around, could not be communicated to them? The Phariſees *did* admit traditions, and ſet upon them an undue value; yet they appear to have been conſidered as the moſt orthodox of the different ſects which prevailed among the Jews: the Sadducees were rather regarded as innovators.

But though we are of opinion, that this ingenious writer allows to the doctrine of the Greek and Roman philoſophers, concerning the immortality of the human ſoul, as well as to the notions concerning a future ſtate which made a part of the popular ſuperſtitions of thoſe nations, leſs influence on the moral ſentiments and conduct of mankind than what they really exerted; though we cannot agree with him in allowing the ideas of the immortality of the ſoul and of a future ſtate, which were entertained by the Gauls and ſome other rude nations, to have been much ſuperior in their nature, or much happier in their influence, than thoſe of the Greeks and Romans; and though, in conſequence of reading the Old teſtament, we are diſpoſed to think that the Jews knew ſomewhat more concerning the immortality of the human ſoul, and concerning the future ſtate in which human beings are diſtined to exiſt, than Mr Gibbon repreſents them to have known; yet ſtill we are very ſenſible, and very well pleaſed to admit, that "life and immortality were brought to light through the goſpel."

The doctrine of a future life, as it was preached by the firſt Chriſtians, was eſtabliſhed on a more ſolid baſis than that on which it had been before maintained; was freed from every abſurdity; and was, in ſhort, ſo much improved, that its influence, which, as it was explained by Heathen poets and philoſophers, muſt be confeſſed to have been in many inſtances doubtful, now became favourable only to the intereſts of piety and virtue, and to them in a very high degree. It undoubtedly contributed to the ſucceſsful propagation of Chriſtianity; for it was calculated to attract and pleaſe both the ſpeculating philoſopher and the ſimple unenlightened votary of the vulgar ſuperſtition. The views which it exhibited were diſtinct; and all was plauſible and rational, and demonſtrated by the fulleſt evidence. But the happineſs which it promiſed was of a leſs ſenſual nature than the enjoyments which the Heathens expected on Olympus or in Elyſium; and would therefore appear leſs alluring to thoſe who were not very capable of refined ideas, or preferred the gratification of the ſenſes in the preſent life to every other ſpecies of good. If the firſt Chriſtians rejoiced in the hope of beholding all the votaries of Pagan idolatry afflicted with the torments of hell in a future ſtate, and boaſted of theſe hopes with inhuman exultation, they would in all probability rather irritate than alarm thoſe whom they ſought to convert from that ſuperſtition: the Heathens would be moved to regard with indignant ſcorn the preacher who pretended, that thoſe whom they venerated as gods, heroes, and wiſe men, were condemned to a ſtate of unſpeakable and laſting torment. Would not every feeling of the heart revolt againſt the idea, that a parent, a child, a huſband, a wife, a friend, a lover, or a miſtreſs, but lately loſt, and ſtill lamented, was conſigned to eternal torments for actions and opinions which they had deemed highly agreeable to ſuperior powers?

We may conclude, then, with reſpect to the influence of this ſecondary cauſe in promoting the propagation of Chriſtianity, that the circumſtances of the Heathen world was leſs favourable to that influence than Mr Gibbon pretends; that the means by which he repreſents the primitive Chriſtians, as improving its efficacy, were ſome of them not employed, and others rather likely to weaken than to ſtrengthen it; and that therefore more is attributed to the operation of this cauſe than it could poſſibly produce.

Cauſe III.

The *third cauſe*, the miraculous powers of the primitive church, is with good reaſon repreſented as having conduced very often to the conviction of infidels. Mr Gibbon's reaſonings under this head are, That numerous miraculous works of the moſt extraordinary kind were oſtentatiouſly performed by the firſt Chriſtians: that, however, from the difficulty of fixing the period at which miraculous powers ceaſed to be communicated to the Chriſtian church, and from ſome other circumſtances, there is reaſon to ſuſpect them to have been merely the pretences of impoſture; but this (to uſe a phraſe of his own) is only darkly inſinuated: and laſtly, that the Heathens having been happily prepared to receive them as real by the many wonders nearly of a ſimilar nature to which they were accuſtomed in their former ſuperſtition, the miracles which the firſt Chriſtians employed to give a ſanction to their doctrines, contributed in the moſt effectual manner to the propagation of Chriſtianity.

Obſervations in reply.

In reply to what is here advanced, it may be ſuggeſted, that the miracles recorded in the New Teſtament, as having been performed by the firſt Chriſtians when engaged in propagating their religion, as well as a number of others recorded by the Fathers, are eſtabliſhed as true, upon the moſt indubitable evidence which human teſtimony can afford for any fact. An ingenious Scotch writer *, who was to fond of employing his ingenuity in undermining truths generally received, has endeavoured to prove that no human teſtimony, however ſtrong and unexceptionable, can afford ſufficient evidence of the reality of a miracle. But his reaſonings on this head, which once excited doubt and wonder, have been ſince completely refuted; and mankind ſtill continue to acknowledge, that though we are all liable to miſtakes and capable of deceit, yet human teſtimony *may* afford the moſt convincing evidence of the moſt extraordinary and even ſupernatural facts. The reader will not expect us to enter, in this place, into a particular examination of the miracles of our Saviour, and his apoſtles, and the primitive church. An enquiry into theſe will be a capital object in another part of this work (THEOLOGY). We may here conſider it as an undeniable and a generally acknowledged fact, that a certain part of thoſe miracles were real. Such as were real, undoubtedly contributed, in a very eminent manner, to the propagation of Chriſtianity; but they are not to be ranked among the natural and *ſecondary* cauſes.

It is difficult to diſtinguiſh at what period miraculous gifts ceaſed to be conferred on the members of the primitive church; yet we *may* diſtinguiſh, if we take pains to inquire with minute attention, at what period the evidence ceaſes to be ſatisfactory. We can alſo by conſidering the circumſtances of the church through the ſeveral ſtages of its hiſtory, form ſome judgment concerning the period during which the gifts of propheſying, and ſpeaking with tongues, and working miracles, were moſt neceſſary to Chriſtians to enable them to aſſert the truth and dignity of their religion.

The Heathens were no ſtrangers to pretended miracles and prophecies, and other ſeeming interpoſitions of ſuperior beings, diſturbing the ordinary courſe of nature and of human affairs: but the miracles to which they were familiariſed had been ſo often detected to be tricks of impoſture or pretences of mad enthuſiaſm, that, inſtead of being prepared to witneſs or to receive accounts of new miracles with eaſy credulity, they muſt have been in general diſpoſed to view them with jealouſy and ſuſpicion. Beſides, the miracles to which they had been accuſtomed, and thoſe performed by the apoſtles and the firſt preachers of Chriſtianity, were directly contradictory; and therefore the one could receive no aſſiſtance from the other.

Yet we muſt acknowledge, notwithſtanding what we have above advanced, that as diſagreements with reſpect to the principles and inſtitutions of their religion very early aroſe among Chriſtians; ſo they likewiſe ſought to extend its influence, at a very early period, by the uſe of *pious frauds*. Pious frauds, too, appear to have ſometimes ſerved the immediate purpoſes for which they were employed, though eventually they have been highly injurious to the cauſe of Chriſtianity.

We conclude, then, that Chriſtianity *was* indebted to the influence of miracles in a conſiderable degree for its propagation: but that the real miracles of our Saviour and his apoſtles, &c. were not among the *ſecondary* cauſes of its ſucceſs: that the Heathens who were to be converted were not very happily prepared for receiving the miracles of the goſpel with blind credulity: that, as it is poſſible to diſcern between ſufficient and inſufficient evidence, ſo it is not more difficult to diſtinguiſh between true and falſe miracles: and, laſtly, that falſe miracles were ſoon employed by Chriſtians as engines to ſupport and propagate their religion, and perhaps not unſucceſsfully; but were, upon the whole, more injurious than ſerviceable to the cauſe which they were called in to maintain.

Cauſe IV.

The *fourth of this ſeries of ſecondary cauſes*, which this author thinks to have been adequate to the propagation of Chriſtianity, is the virtues of the primitive Chriſtians. Theſe he is willing to attribute to other and leſs generous motives, rather than to the pure influence of the doctrines and precepts of their religion.

The firſt converts to Chriſtianity were moſt of them from among the loweſt and moſt worthleſs characters. The wiſe, the mighty, and thoſe who were diſtinguiſhed by ſpecious virtues, were in general perfectly ſatisfied with theeir preſent circumſtances and future proſpects. People whoſe minds were naturally weak, unenlightened, or oppreſſed with the ſenſe of atrocious guilt, and who were infamous or outcaſts from ſociety, were eager to graſp at the hopes which the goſpel held out to them.

When, after enliſting under the banner of Chriſt, they began to conſider themſelves as " born again to newneſs of life; remorſe and fear, which eaſily prevail over weak minds; ſelfiſh hopes of regaining their reputation, and attaining to the honours and happineſs of thoſe manſions which Jeſus was ſaid to have gone to

---

* Mr *Hume*.

prepare; with a deſire to raiſe the honour and extend the influence of the ſociety of which they were become members; all together operated ſo powerfully as to enable them to diſplay both active and paſſive virtue in a very extraordinary degree. Their virtues did not flow from the pureſt and nobleſt ſource; yet they attracted the notice and moved the admiration of mankind. Of thoſe who admired, ſome were eager to imitate; and, in order to that, thought it neceſſary to adopt the ſame principles of action.

Their virtues too, were rather of that ſpecies which excite wonder, becauſe uncommon, and not of eſſential utility in the ordinary intercourſe of ſociety; than of thoſe which are indiſpenſably neceſſary to the exiſtence of ſocial order, and contribute to the eaſe and convenience of life. Such virtues were well calculated to engage the imitation of thoſe who had failed egregiouſly in the practice of the more ſocial virtues.

Thus they practiſed extraordinary, but uſeleſs and unſocial, virtues, upon no very generous motives; and thoſe virtues drew upon them the eyes of the world, and induced numbers to embrace their faith.

Obſervations, in anſwer.

We muſt, however unwillingly, declare, that this is plainly an uncandid account of the virtues of the primitive Chriſtians, and the motives from which they originated. The ſocial virtues are ſtrongly recommended through the goſpel. No degree of mortification or ſelf-denial, or ſecluſion from the ordinary buſineſs and amuſements of ſocial life, was required of the early converts to Chriſtianity; ſave what was indiſpenſably neceſſary to wean them from the irregular habits in which they had before indulged, and which had rendered them nuiſances in ſociety, and to form them to new habits equally neceſſary to their happineſs and their uſefulneſs in life. We allow that they practiſed virtues which in other circumſtances would, however ſplendid, have been unneceſſary. But in the difficult circumſtances in which the firſt Chriſtians were placed, the virtues which they practiſed were in the higheſt degree ſocial. The moſt prominent feature in their character was, "their continuing to entertain ſentiments of generous benevolence, and to diſcharge ſcrupulouſly all the ſocial duties," towards thoſe who exerciſed neither charity nor humanity, and frequently not even bare integrity and juſtice, in their conduct towards them.

It cannot be ſaid with truth, that ſuch a proportion of the primitive Chriſtian were people whoſe characters had been infamous and their circumſtances deſperate, as that the character of the religion which they embraced can ſuffer from this circumſtance. Nor were they *only* the weak and illiterate whom the apoſtles and their immediate ſucceſſors converted by their preaching. The criminal, to be ſure, rejoiced to hear that he might obtain abſolution of his crimes; the mourner was willing to receive comfort; minds of refined and generous feelings were deeply affected with that goodneſs which had induced the Son of God to ſubmit to ſuffer and die for ſinners: but the ſimplicity, the rationality, and the beauty of the Chriſtian ſyſtem, likewiſe prevailed in numerous inſtances over the pride and prejudices of the great and the wiſe; in ſo many inſtances, as are ſufficient to vindicate the Chriſtian church from the aſperſion by which it has been repreſented, as being in the firſt period of its exiſtence merely a body of *criminals and idiots*.

The principles, too, from which the virtues of the firſt Chriſtians originated, were not peculiarly mean and ſelfiſh; nay, they ſeem to have been uncommonly ſublime and diſintereſted. Remorſe in the guilty mind is a natural and reaſonable ſentiment; the deſire of happineſs in every human breaſt is equally ſo. It is uncandid to cavil againſt the firſt Chriſtians for being, like the reſt of mankind, influenced by theſe ſentiments: And when we behold them overlooking temporary poſſeſſions and enjoyments, extending their views to futurity, and "living by faith;" when we obſerve them "doing good to thoſe who hated them, bleſſing thoſe who curſed them, and praying for thoſe by whom they were deſpitefully uſed;" can we deny their virtues to have been of the moſt generous and diſintereſted kind?

We allow, then, that the virtues of the firſt Chriſtians muſt have contributed to the propagation of their religion: but it is with pain that we obſerve this reſpectable writer ſtudiouſly labouring to miſrepreſent the principles from which thoſe virtues aroſe; and not only the principles from which they aroſe, but alſo their importance in ſociety.

Cauſe V. with obſervations.

The *fifth cauſe* was the mode of church government adopted by the firſt Chriſtians, by which they were knit together in one ſociety; who preferred the church and its intereſts to their country and civil concerns. We wiſh not to deny, that the mutual attachment of the primitive Chriſtians contributed to ſpread the influence of their religion; and the order which they maintained, in conſequence of being animated with this ſpirit of brotherly love, and with ſuch ardent zeal for the glory of God, muſt no doubt have produced no leſs happy effects among them than order and regularity produce on every other occaſion on which they are ſtrictly obſerved. But whether the form of church-government, which was gradually eſtabliſhed in the Chriſtian church, was actually the happieſt that could poſſibly have been adopted; or whether, by eſtabliſhing a diſtinct ſociety, with ſeparate intereſts, within the Roman empire, it contributed to the diſſolution of that mighty fabric, we cannot here pretend to inquire. Theſe are ſubjects of diſcuſſion, with reſpect to which we may with more propriety endeavour to ſatisfy our readers elſewhere.

General concluſion concerning the influence of the five cauſes.

From the whole of this review of what Mr Gibbon has ſo ſpeciouſly advanced concerning the influence of theſe five ſecondary cauſes in the propagation of the goſpel, we think ourſelves warranted to conclude, That the zeal of the firſt Chriſtians was not, as he repreſents it, intolerant: That the doctrine of the immortality of the human ſoul was ſomewhat better underſtood in the heathen world, particularly among the Greeks and Romans and the Jews, than he repreſents it to have been; and had an influence ſomewhat happier than what he aſcribes to it: That the additional circumſtances by which, he tells us, the firſt preachers of Chriſtianity improved the effects of this doctrine, were far from being calculated to allure converts: That the heathens, therefore, were not quite ſo well prepared for an eager reception of this doctrine as he would perſuade us they were; and, of conſequence, could not be influenced by it in ſo conſiderable a degree, in their converſion: That real, unqueſtionable miracles, performed by our Saviour, by his apoſtles, and

by

by their ſucceſſors, *did* contribute ſignally to the propagation of Chriſtianity; but are not to be ranked among the *ſecondary* cauſes: That weakneſs and blind zeal did at times employ pretended miracles for the ſame purpoſe not altogether ineffectually: That though theſe deſpicable and wicked means might be in ſome inſtances ſucceſsful; yet they were, upon the whole, much more injurious than beneficial: That the virtues of the primitive Chriſtians aroſe from the moſt generous and noble motives, and were in their nature and tendency highly favourable to ſocial order, and to the comfort of mankind in the ſocial ſtate: And, laſtly, That the order and regularity of church-government, which were gradually eſtabliſhed among the firſt Chriſtians, contributed greatly to maintain the dignity and ſpread the influence of their religion; but do not appear to have disjoined them from their fellow-ſubjects or to have rendered them inimical to the welfare of the ſtate of which they were members.

Upon the whole, then, we do not ſee that theſe ſecondary cauſes were equal to the effects that have been aſcribed to them; and it ſeems undeniable, that others of a ſuperior kind co-operated with them. We earneſtly recommend to the peruſal of the reader a valuable performance of Lord Hailes's, in which he enquires into Mr Gibbon's aſſertions and reaſonings, concerning the influence of theſe five cauſes, with the utmoſt accuracy of information, ſtrength and clearneſs of reaſoning, and elegant ſimplicity of ſtyle, and without virulence or paſſion.

CHRISTIANS, thoſe who profeſs the religion of Chriſt: See CHRISTIANITY and MESSIAH.—The name *Chriſtian* was firſt given at Antioch in the year 42 to ſuch as believed in Chriſt, as we read in the Acts: till that time they were called *diſciples*.

The firſt Chriſtians diſtinguiſhed themſelves in the moſt remarkable manner by their conduct and their virtues. The faithful, whom the preaching of St Peter had converted, hearkened attentively to the exhortations of the Apoſtles, who failed not carefully to inſtruct them, as perſons who were entering upon an entirely new life. They went every day to the temple with one heart and one mind, and continued in prayers; doing nothing different from the other Jews, becauſe it was yet not time to ſeparate from them. But they made a ſtill greater progreſs in virtue; for they ſold all that they poſſeſſed, and diſtributed their goods in proportion to the wants of their brethren. They *eat their meat with gladneſs and ſingleneſs of heart, praiſing God, and having favour with all the people.* St Chryſoſtom, examining from what ſource the eminent virtue of the firſt Chriſtians flowed, aſcribes it principally to their diveſting themſelves of their poſſeſſions; "For (ſays that father) perſons from whom all that they have is taken away, are not ſubject to ſin: whereas, whoever has large poſſeſſions, wants not a devil or a tempter to draw him into hell by a thouſand ways."

The Jews were the firſt and the moſt inveterate enemies the Chriſtians had. They put them to death as often as they had it in their power: and when they revolted againſt the Romans in the time of the emperor Adrian, Barchochebas, the head of that revolt, employed againſt the Chriſtians the moſt rigorous puniſhments to compel them to blaſpheme and renounce Jeſus Chriſt. And we find that, even in the third century, they endeavoured to get into their hands Chriſtian women, in order to ſcourge and ſtone them in their ſynagogues. They curſed the Chriſtians ſolemnly three times a-day in their ſynagogues, and their rabbins would not ſuffer them to converſe with Chriſtians upon any occaſion. Nor were they contented to hate and deteſt them; but they diſpatched emiſſaries all over the world to defame the Chriſtians, and ſpread all ſorts of calumnies againſt them. They accuſed them, among other things, of worſhipping the ſun and the head of an aſs. They reproached them with idleneſs, and being an uſeleſs race of people. They charged them with treaſon, and endeavouring to erect a new monarchy againſt that of the Romans. They affirmed, that, in celebrating their myſteries, they uſed to kill a child and eat its fleſh. They accuſed them of the moſt ſhocking inceſts, and of intemperance in their feaſts of charity. But the lives and behaviour of the firſt Chriſtians were ſufficient to refute all that was ſaid againſt them, and evidently demonſtrated that theſe accuſations were mere calumny and the effect of inveterate malice.

Pliny the younger, who was governor of Pontus and Bithynia between the years 103 and 105, gives a very particular account of the Chriſtians in that province, in a letter which he wrote to the emperor Trajan, of which the following is an extract: "I take the liberty, Sir, to give you an account of every difficulty which ariſes to me. I have never been preſent at the examination of the Chriſtians; for which reaſon I know not what queſtions have been put to them, nor in what manner they have been puniſhed. My behaviour towards thoſe who have been accuſed to me has been this: I have interrogated them, in order to know whether they were really Chriſtians. When they have confeſſed it, I have repeated the ſame queſtion two or three times, threatening them with death if they did not renounce this religion. Thoſe who have perſiſted in their confeſſion, have been, by my order, led to puniſhment. I have even met with ſome Roman citizens guilty of this phrenſy, whom, in regard to their quality, I have ſet apart from the reſt, in order to ſend them to Rome. Theſe perſons declare, that their whole crime, if they are guilty, conſiſts in this; that, on certain days, they aſſemble before ſun-riſe, to ſing alternately the praiſes of Chriſt, as of a God, and to oblige themſelves, by the performance of their religious rites, not to be guilty of theft, or adultery, to obſerve inviolably their word, and to be true to their truſt. This depoſition has obliged me to endeavour to inform myſelf ſtill farther of this matter, by putting to the torture two of their women-ſervants, whom they call *deaconeſſes*: but I could learn nothing more from them, than that the ſuperſtition of theſe people is as ridiculous as their attachment to it is aſtoniſhing."

There is extant a juſtification, or rather panegyric, of the Chriſtians, pronounced by the mouth of a Pagan prince. It is a letter of the emperor Antoninus, written in the year 152, in anſwer to the States of Aſia, who had accuſed the Chriſtians of being the cauſe of ſome earthquakes which had happened in that part of the world. The emperor adviſes them to "take care, leſt, in torturing and puniſhing thoſe whom they accuſed of Atheiſm (meaning the Chriſtians), they ſhould render them more obſtinate, inſtead of prevailing upon them to change their opinion; ſince their religion taught them to ſuffer with pleaſure for the ſake of God." As to the earthquakes which had happened, he puts them in mind," that they themſelves are always diſcouraged, and ſink under ſuch misfortunes; whereas the Chriſtians never diſcovered more cheerfulneſs and confidence in God than upon ſuch occaſions." He tells them, that "they pay no regard to religion, neglect the worſhip of the Eternal; and, becauſe the Chriſtians honour and adore Him, therefore they are jealous of them, and perſecute them even to death." He concludes: "Many of the governors of provinces have formerly written to my father concerning them; and his anſwer always was, that they ſhould not be moleſted or diſturbed, provided they quietly ſubmitted to the authority of the government. Many perſons have likewiſe conſulted me upon this affair, and I have returned the ſame anſwer to them all; namely, that if any one accuſes a Chriſtian merely on account of his religion, the accuſed perſon ſhall be acquitted, and the accuſer himſelf puniſhed." This ordinance, according to Euſebius, was publicly fixed up at Epheſus in an aſſembly of the ſtates.

It is no difficult matter to diſcover the cauſes of the many perſecutions, to which the Chriſtians were expoſed during the three firſt centuries. The purity of the Chriſtian morality, directly oppoſite to the corruption of the Pagans, was doubtleſs one of the moſt powerful motives of the public averſion. To this may be added, the many calumnies unjuſtly ſpread about concerning them by their enemies, particularly the Jews. And this occaſioned ſo ſtrong a prejudice againſt them, that the Pagans condemned them without inquiring into their doctrine, or permitting them to defend themſelves. Beſides, their worſhipping Jeſus Chriſt, as God, was contrary to one of the moſt ancient laws of the Roman empire, which expreſsly forbad the acknowledging of any God which had not been approved by the ſenate.

But notwithſtanding the violent oppoſition made to the eſtabliſhment of the Chriſtian religion, it gained ground daily, and very ſoon made a ſurpriſing progreſs in the Roman empire. In the third century, there were Chriſtians in the camp, in the ſenate, in the palace; in ſhort every where, but in the temples and the theatres: they filled the towns, the country, the iſlands. Men and women, of all ages and conditions, and even thoſe of the firſt dignities, embraced the faith; inſomuch that the Pagans complained that the revenues of their temples were ruined. They were in ſuch great numbers in the empire, that (as Tertullian expreſſes it) were they to have retired into another country, they would have left the Romans only a frightful ſolitude.

The primitive Chriſtians were not only remarkable for the practice of every virtue; they were alſo very eminently diſtinguiſhed by the many miraculous gifts and graces beſtowed by God upon them. "Some of the Chriſtians (ſays Irenæus) drive out devils, not in appearance only, but ſo as that they never return; whence it often happens, that thoſe who are diſpoſſeſſed of evil ſpirits embrace the faith and are received into the church. Others know what is to come, ſee viſions, and deliver oracles as prophets. Others heal the ſick by laying their hands on them, and reſtore them to perfect health: and we find ſome who even raiſe the dead.——It is impoſſible to reckon up the gifts and graces which the church has received from God—what they have freely received they as freely beſtow. They obtain theſe gifts by prayer alone, and invocation, of the name of Jeſus Chriſt, without any mixture of enchantment or ſuperſtition."

We ſhall here ſubjoin the remarkable ſtory, atteſted by Pagan authors themſelves, concerning the *Chriſtian Legion* in the army of the emperor Marcus Aurelius. That prince having led his forces againſt the Quadi, a people on the other ſide of the Danube, was ſurrounded and hemmed in by the enemy in a diſadvantageous place, and where they could find no water. The Romans were greatly embarraſſed, and, being preſſed by the enemy, were obliged to continue under arms, expoſed to the violent heat of the ſun, and almoſt dead with thirſt; when, on a ſudden, the clouds gathered, and the rain fell in great abundance. The ſoldiers received the water in their bucklers and helmets, and ſatisfied both their own thirſt and that of their horſes. The enemy, preſently after, attacked them; and ſo great was the advantage they had over them, that the Romans muſt have been overthrown, had not heaven again interpoſed by a violent ſtorm of hail, mixed with lightning, which fell on the enemy, and obliged them to retreat. It was found afterwards, that one of the legions, which conſiſted of Chriſtians, had by their prayers, which they offered up on their knees before the battle, obtained this favour from heaven: and from this event that legion was ſirnamed *The thundering Legion*. See, however, the criticiſm of Mr *Moyle* on this ſtory in his *Works*, vol. ii. p. 81—390. See alſo *Moſheim's Church Hiſtory*, vol. i. p. 124.

Such were the primitive Chriſtians, whoſe religion has by degrees ſpread itſelf over all parts of the world, though not with equal purity in all. And though, by the providence of God, Mahometans and Idolaters have been ſuffered to poſſeſs themſelves of thoſe places in Greece, Aſia, and Africa, where the Chriſtian religion formerly moſt flouriſhed; yet there are ſtill ſuch remains of the Chriſtian religion among them as to give them opportunity ſufficient to be converted. For, in the dominions of the Turk in Europe, the Chriſtians make two third parts at leaſt of the inhabitants: and in Conſtantinople itſelf there are above twenty Chriſtian churches, and above thirty in Theſſalonica. Philadelphia, now called *Ala-ſhahir*, has no fewer than twelve Chriſtian churches. The whole iſland of Chio is governed by Chriſtians; and ſome iſlands of the Archipelago are inhabited by Chriſtians only. In Africa, beſides the Chriſtians living in Egypt, and in the kingdom of Congo and Angola, the iſlands upon the weſtern coaſts are inhabited by Chriſtians; and the vaſt kingdom of Abyſſinia, ſuppoſed to be as big as Germany, France, Spain, and Italy, put together, is poſſeſſed by Chriſtians. In Aſia, moſt part of the empire of Ruſſia, the countries of Circaſſia and Mingrelia, Georgia, and Mount Libanus, are inhabited only by Chriſtians. In America, it is notorious that the Chriſtians are very numerous, and ſpread over moſt parts of that vaſt continent.

Christians of St John, a ſect of Chriſtians very numerous in Balſara and the neighbouring towns: they formerly inhabited along the river Jordan, where St John baptized, and it was from thence they had their name. They hold an anniverſary feaſt of five days; during which they all go to the biſhop, who baptizes them with the baptiſm of St John. Their baptiſm is alſo performed in rivers, and that only on Sundays: they have no notion of the third Perſon in the Trinity; nor have they any canonical books, but abundance full of charms, &c. Their biſhoprics deſcend by inheritance, as our eſtates do, though they have the ceremony of an election.

Christians of St Thomas, a ſort of Chriſtians in a peninſula of India on this ſide of the Gulf: they inhabit chiefly at Cranganor, and the neighbouring country: theſe admit of no images; and receive only the croſs, to which they pay a great veneration: they affirm, that the ſouls of the ſaints do not ſee God till after the day of judgement: they acknowledge but three ſacraments, *viz.* baptiſm, orders, and the euchariſt: they make no uſe of holy oils in the adminiſtration of baptiſm; but, after the ceremony, anoint the infant with an unction compoſed of oil and walnuts, without any benediction. In the euchariſt, they conſecrate with little cakes made of oil and ſalt, and inſtead of wine make uſe of water in which raiſins have been infuſed.

CHRISTIANA, a town of Norway, in the province of Aggerhuys, ſituated on a bay of the ſea. E. Long. 10. 15. N. Lat. 59. 30.

CHRISTIANOPLE, a port-town of Sweden, ſituated on the Baltic Sea, in the territory of Blecking, and province of South Gothland. E. Long. 15. 40 N. Lat. 57°.

CHRISTIANSTADT, a ſtrong fortified town of Sweden; ſituated in the territory of Blecking and province of South Gothland. It was built in 1614 by Chriſtian IV. king of Denmark, when this province belonged to the Danes; and finally ceded to the Swedes by the peace of Roſkild in 1658. The town is ſmall but neatly built, and is eſteemed the ſtrongeſt fortreſs in Sweden. The houſes are all of brick, and moſtly ſtuccoed white. It ſtands in a marſhy plain cloſe to the river Helge-a, which flows into the Baltic at Ahus about the diſtance of 20 miles, and is navigable only for ſmall craft of ſeven tons burden. Engliſh veſſels annually reſort to this port for alum, pitch, and tar. The inhabitants have manufactures of cloth and ſilken ſtuffs, and carry an a ſmall degree of commerce. E. Long. 14. 40. N Lat. 56. 30.

CHRISTINA, daughter of Guſtavus Adolphus king of Sweden, born in in 1626; and ſucceeded to the crown in 1633, when only ſeven years of age. This princeſs diſcovered even in her infancy, what ſhe afterwards expreſſed in her memoirs, an invincible antipathy for the employments and converſation of women; and ſhe had the natural aukwardneſs of a man with reſpect to all the little works which generally fall to their ſhare. She was on the contrary, fond of violent exerciſes, and ſuch amuſements as conſiſt in feats of ſtrength and activity. She had alſo both ability and taſte for abſtracted ſpeculations; and amuſed herſelf with language and the ſciences, particularly that of legiſlature and government. She derived her knowledge of ancient hiſtory from its ſource: and Polybius and Thucydides were her favourite authors. As ſhe was the ſovereign of a powerful kingdom, it is not ſtrange that almoſt all the princes in Europe aſpired to her bed. Among others, were the Prince of Denmark, the Elector Palatine, the Elector of Brandenburg, the King of Spain, the king of the Romans, Don John of Auſtria; Sigiſmund of Rockocci, count and general of Caſſovia; Staniſlaus king of Poland; John Caſſimir his brother; and Charles Guſtavus duke of Deux Ponts, of the Bavarian Palatinate family, ſon of her father the great Guſtavus's ſiſter, and conſequently her firſt couſin. To this nobleman, as well as to all his competitors, ſhe conſtantly refuſed her hand; but ſhe cauſed him to be appointed her ſucceſſor by the ſtates. Political intereſts, differences of religion, and contrariety of manners, furniſhed Chriſtina with pretences for rejecting all her ſuitors; but her true motives were the love of independence, and a ſtrong averſion ſhe had conceived, even in her infancy, from the marriage yoke. "Do not force me to marry (ſaid ſhe to the ſtates); for if I ſhould have a ſon, it is not more probable that he ſhould be an Auguſtus than a Nero."

An accident happened in the beginning of her reign which gave her a remarkable opportunity of diſplaying the ſtrength and equanimity of her mind. As ſhe was at the chapel of the caſtle of Stockholm, aſſiſting at divine ſervice with the principal lords of her court, a poor wretch, who was diſordered in his mind, came to the place with a deſign to aſſaſſinate her. This man, who was preceptor of the college, and in the full vigour of his age, choſe, for the execution of his deſign, the moment in which the aſſembly was performing what in the Swediſh church is called an *act of recollection*; a ſilent and ſeparate act of devotion, performed by each individual kneeling and hiding the face with the hand. Taking this opportunity; he ruſhed through the crowd, and mounted a balluſtrade within which the queen was upon her knees. The Baron Braki, chief juſtice of Sweden, was alarmed, and cried out; and the guards croſſed their partiſans, to prevent his coming further: but he ſtruck them furiouſly on one ſide; leaped over the barrier; and, being then cloſe to the queen, made a blow at her with a knife which he had concealed without a ſheath in his ſleeve. The queen avoided the blow, and puſhed the captain of her guards, who inſtantly threw himſelf upon the aſſaſſin, and ſeized him by the hair. All this happened in leſs than a moment of time. The man was known to be mad, and therefore nobody ſuppoſed he had any accomplices: they therefore contented themſelves with locking him up; and the queen returned to her devotion without the leaſt emotion that could be perceived by the people, who were much more frightened than herſelf.

One of the great affairs that employed Chriſtina while ſhe was upon the throne, was the peace of Weſtphalia, in which many claſhing intereſts were to be reconciled, and many claims to be aſcertained. It was concluded in the month of October 1648. The ſucceſs of the Swediſh arms rendered Chriſtina the arbitreſs of this treaty; at leaſt as to the affairs of Sweden, to which this peace confirmed the poſſeſſion of many important countries. No public event of importance took place during the reſt of Chriſtina's reign; for there were neither wars abroad, nor troubles at home. This quiet might be the effect of chance; but it might alſo be the effect of a good adminiſtration,

miniſtration, and the great reputation of the queen; and the love her people had for her ought to lead us to this determination. Her reign was that of learning and genius. She drew about her, wherever ſhe was, all the diſtinguiſhed characters of her time: Grotius, Paſcal, Bochart, Deſcartes, Gaſſendi, Saumaiſe, Naude, Voſſius, Heinſius, Meibom, Scudery, Menage, Lucas, Holſtenius, Lambecius, Bayle, madam Dacier, Filicaia, and many others. The arts never fail to immortalize the prince who protects them; and almoſt all theſe illuſtrious perſons have celebrated Chriſtina, either in poems, letters, or literary productions of ſome other kind, the greater part of which are now forgotten. They form, however, a general cry of praiſe, and a maſs of teſtimonials which may be conſidered as a ſolid baſis of reputation. Chriſtina, however, may be juſtly reproached with want of taſte, in not properly aſſigning the rank of all theſe perſons, whoſe merits, though acknowledged, were yet unequal; particularly for not having been ſufficiently ſenſible of the ſuperiority of Deſcartes, whom ſhe diſguſted, and at laſt wholly neglected. The rapid fortune which the adventurer Michon, known by the name of *Bourdelot*, acquired by her countenance and liberality, was alſo a great ſcandal to literature. He had no pretenſions to learning; and though ſprightly, was yet indecent. He was brought to court by the learned Saumaiſe; and, for a time drove literary merit entirely out of it, making learning the object of his ridicule, and exacting from Chriſtina an exorbitant tribute to the weakneſs and inconſtancy of her ſex; for even Chriſtina, with reſpect to this man, ſhowed herſelf to be weak and inconſtant. At laſt ſhe was compelled, by the public indignation, to baniſh this unworthy minion; and he was no ſooner gone, than her regard for him was at an end. She was aſhamed of the favour ſhe had ſhown him; and in a ſhort time, thought of him with hatred or contempt. This Bourdelot, during his aſcendency over the queen, had ſupplanted count Magnus de la Gardie, ſon of the conſtable of Sweden, who was a relation, a favourite, and perhaps the lover of Chriſtina. M. de Motteville, who had ſeen him ambaſſador in France, ſays, in his memoirs, that he ſpoke of his queen in terms ſo paſſionate and reſpectful, that every one concluded his attachment to her to be more ardent and tender, than a mere ſenſe of duty can produce. This nobleman fell into diſgrace becauſe he ſhowed an inclination to govern; while M. Bourdelot ſeemed to aim at nothing more than to amuſe; and concealed, under the unſuſpected character of a droll, the real aſcendency which he exerciſed over the queen's mind.

About this time, an accident happened to Chriſtina which brought her into ſtill greater danger, than that which has been related already. Having given orders for ſome ſhips of war to be built at the port of Stockholm, ſhe went to ſee them when they were finiſhed; and as ſhe was going on board of them, croſs a narrow plank, with admiral Fleming, his foot ſlipping, he fell, and drew the queen with him into the ſea, which in that place was near 90 feet deep. Anthony Steinberg, the queen's firſt equerry, inſtantly threw himſelf into the water, laid hold of her robe, and, with ſuch aſſiſtance as was given him, got the queen aſhore: during this accident, her recollection was ſuch, that the moment her lips were above water, ſhe cried, out, "Take care of the Admiral." When ſhe was got out of the water, ſhe diſcovered no emotion either by her geſture or countenance; and ſhe dined the ſame day in public, where ſhe gave a humorous account of her adventure.

But, though at firſt ſhe was fond of the power and ſplendor of royalty, yet ſhe began at length to feel that it embarraſſed her; and the ſame love of independence and liberty which had determined her againſt marriage, at laſt made her weary of her crown. As, after her firſt diſguſt, it grew more and more irkſome to her, ſhe reſolved to abdicate; and, in 1652, communicated her reſolution to the ſenate. The ſenate zealouſly remonſtrated againſt it; and was joined by the people; and even by Charles Guſtavus himſelf, who was to ſucceed her: ſhe yielded to their importunities, and continued to ſacrifice her own pleaſure to the will of the public till the year 1654, and then ſhe carried her deſign into execution. It appears by one of her letters to M. Canut, in whom ſhe put great confidence, that ſhe had meditated this project for more than eight years; and that ſhe had communicated it to him five years before it took place.

The ceremony of her abdication was a mournful ſolemnity, a mixture of pomp and ſadneſs, in which ſcarce any eyes but her own were dry. She continued firm and compoſed through the whole; and, as ſoon as it was over, prepared to remove into a country more favourable to ſcience than Sweden was. Concerning the merit of this action, the world has always been divided in opinion; it has been condemned alike both by the ignorant and the learned, the trifler and the ſage. It was admired, however, by the great Condé: "How great was the magnanimity of this princeſs (ſaid he), who could ſo eaſily give up that for which the reſt of mankind are continually deſtroying each other, and which ſo many throughout their whole lives, purſue without attaining!" It appears by the works of St Evermond, that the abdication of Chriſtina was at that time the univerſal topic of ſpeculation and debate in France. Chriſtina, beſides abdicating her crown, abjured her religion: but this act was univerſally approved by one party and cenſured by another; the Papiſts triumphed, and the Proteſtants were offended. No prince, after a long impriſonment, ever ſhowed ſo much joy upon being reſtored to his kingdom, as Chriſtina did in quitting hers. When ſhe came to a little brook, which ſeparates Sweden from Denmark, ſhe got out of her carriage; and leaping to the other ſide, cried out in a tranſport of joy, "At laſt I am free, and out of Sweden, whither I hope I ſhall never return." She diſmiſſed her women, and laid by the habit of her ſex: "I would become a man (ſaid ſhe); yet I do not love men becauſe they are men, but becauſe they are not women." She made her abjuration at Bruſſels; where ſhe ſaw the great Condé, who, after his defection, made that city his aſylum. "Couſin (ſaid ſhe), who would have thought ten years ago, that we ſhould have met at this diſtance from our countries?"

The inconſtancy of Chriſtina's temper appeared in her going continually from place to place: from Bruſſels ſhe went to Rome; from Rome to France, and from France ſhe returned to Rome again; after this ſhe went to Sweden, where ſhe was not very well received; from Sweden ſhe went to Hamburgh, where ſhe continued a year, and then went again to Rome; from Rome ſhe returned to Hamburgh; and again to Sweden, where ſhe was ſtill worſe received than before; upon which ſhe went back to Hamburgh, and from Hamburgh again to Rome. She intended another journey to Sweden; but it did not take place, any more than an expedition to England, where Cromwell did not ſeem well diſpoſed to receive her; and after many wanderings, and many purpoſes of wandering ſtill more, ſhe at laſt died at Rome in 1689.

It muſt be acknowledged, that her journeys to Sweden had a motive of neceſſity; for her appointments were very ill paid, though the ſtates often confirmed them after her abdication: but to other places ſhe was led merely by a roving diſpoſition; and, what is more to her diſcredit, ſhe always diſturbed the quiet of every place ſhe came into, by exacting greater deference to her rank as queen than ſhe had a right to expect, by her total non-conformity to the cuſtoms of the place, and by continually exciting and fomenting intrigues of ſtate. She was indeed always too buſy, even when ſhe was upon the throne; for there was no event in Europe in which ſhe was not ambitious of acting a principal part. During the troubles in France by the faction called the *Fronde*, ſhe wrote with great eagerneſs to all the intereſted parties, officiouſly offering her mediation to reconcile their intereſts, and calm their paſſions, the ſecret ſprings of which it was impoſſible ſhe ſhould know. This was firſt thought a dangerous, and afterwards a ridiculous, behaviour. During her reſidence in France ſhe gave univerſal diſguſt, not only by violating all the cuſtoms of the country, but by practiſing others directly oppoſite. She treated the ladies of the court with the greateſt rudeneſs and contempt: when they came to embrace her, ſhe, being in man's habit, cried out, "What a ſtrange eagerneſs have theſe women to kiſs me! is it becauſe I look like a man?"

But though ſhe ridiculed the manners of the French court, ſhe was very ſolicitous to enter into its intrigues. Louis XIV. then very young, was enamoured of Mademoiſelle de Mancini niece to Cardinal Mazarine; Chriſtina flattered their paſſion, and offered her ſervice. "I would fain be your confident (ſaid ſhe); if you love, you muſt marry."

The murder of Monaldeſchi is, to this hour, an inſcrutable myſtery. It is, however, of a piece with the expreſſions conſtantly uſed by Chriſtina in her letters, with reſpect to thoſe with whom ſhe was offended; for ſhe ſcarce ever ſignified her diſpleaſure without threatening the life of the offender. "If you fail in your duty, (ſaid ſhe to her ſecretary, whom ſhe ſent to Stockholm after her abdication), not all the power of the king of Sweden ſhall ſave your life, though you ſhould take ſhelter in his arms." A muſician having quitted her ſervice for that of the duke of Savoy, ſhe was ſo tranſported with rage as to diſgrace herſelf by theſe words, in a letter written with her own hand: "He lives only for me; and if he does not ſing for me, he ſhall not long ſing for any body."

Bayle was alſo threatened for having ſaid that the letter which Chriſtina wrote, upon the revocation of the edict of Nantes, was "a remain of Proteſtantiſm;" but he made his peace by apologies and ſubmiſſion. See the article Bayle.

Upon the whole, ſhe appears to have been an uncommon mixture of faults and great qualities; which, however it might excite fear and reſpect, was by no means amiable. She had wit, taſte, parts, and learning: ſhe was indefatigable upon the throne; great in private life; firm in misfortunes; impatient of contradiction; and, except in her love of letters, inconſtant in her inclinations. The moſt remarkable inſtance of this fickleneſs is, That after ſhe had abdicated the crown of Sweden, ſhe intrigued for that of Poland. She was, in every action and purſuit, violent and ardent in the higheſt degree; impetuous in her deſires, dreadful in her reſentment, and fickle in her conduct.

She ſays of herſelf, "that ſhe was miſtruſtful, ambitious, paſſionate, haughty, impatient, contemptuous, ſatyrical, incredulous, undevout, of an ardent and violent temper, and extremely amorous;" a diſpoſition, however, to which, if ſhe may be believed, her pride and her virtue were always ſuperior. In general, her failings were thoſe of her ſex, and her virtues the virtues of ours.

Santa-Christina, one of the Marquesas *Iſlands*.

CHRISTMAS-day, a feſtival of the Chriſtian church; obſerved on the 25th of December, in memory of the *nativity* or birth of Jeſus Chriſt. As to the antiquity of this feſtival, the firſt footſteps we find of it are in the ſecond century, about the time of the emperor Commodus. The decretal epiſtles indeed carry it up a little higher; and ſay that Teleſphorus, who lived in the reign of Antoninus Pius, ordered divine ſervice to be celebrated, and an angelical hymn to be ſung, the night before the nativity of our Saviour. However, that it was kept before the times of Conſtantine we have a melancholy proof: for whilſt the perſecution raged under Diocleſian, who then kept his court at Nicomedia, that prince, among other acts of cruelty, finding multitudes of Chriſtians aſſembled together to celebrate Chriſt's nativity, commanded the church-doors where they were met to be ſhut, and fire to be put to it, which, in a ſhort time, reduced them and it to aſhes.

CHRISTOPHER'S, St. one of the Caribbee Iſlands, in America, lying to the north-weſt of Nevis, and about 60 miles weſt of Antigua. It was formerly inhabited by the French and Engliſh; but, in 1713, it was ceded entirely to the latter. In 1782, it was taken by the French, but reſtored to Britain at the peace. It is about 20 miles in breadth and ſeven in length; and has high mountains in the middle, whence rivulets run down. Between the mountains are dreadful rocks, horrid precipices, and thick woods; and in the ſouth-weſt part of the iſland, hot ſulphureous ſprings at the foot of them. The air is good; the ſoil, light, ſandy, and fruitful; but the iſland is ſubject to hurricanes. The produce is chiefly ſugar, cotton, ginger, indigo, and the tropical fruits. W. Long. 62. 32. N. Lat. 17. 30.

CHROASTACES, in natural hiſtory, a genus of pellucid gems, comprehending all thoſe of variable colours, as viewed in different lights; of which kinds are the *opal* and the *aſteria* or *oculus cati*. See OPAL and ASTERIA.

CHROMATIC, a kind of muſic which proceeds by ſeveral ſemitones in ſucceſſion. The word is derived from the Greek χρωμα, which ſignifies *colour*. For this denomination ſeveral cauſes are aſſigned, of which none appear certain, and all equally unſatisfactory. Inſtead, therefore, of fixing upon any, we ſhall offer a conjecture of our own; which, however, we do not impoſe upon the reader as more worthy of his attention than any of the former. Χρωμα may perhaps not only ſignify a *colour*, but that ſhade of a colour by which it melts into another, or what the French call *nuance*. If this interpretation be admitted, it will be highly applicable to ſemitones; which being the ſmalleſt interval allowed in the diatonic ſcale, will moſt eaſily run one into another. To find the reaſons aſſigned by the ancients for this denomination, and their various diviſions of the chromatic ſpecies, the reader may have recourſe to the ſame article in Roſſeau's Muſical Dictionary. At preſent, that ſpecies conſiſts in giving ſuch a procedure to the fundamental baſs, that the parts in the harmony, or at leaſt ſome of them may proceed by ſemitones, as well in riſing as deſcending; which is moſt frequently found in the minor mode, from the alterations to which the ſixth and ſeventh note are ſubjected, by the nature of the mode itſelf.

The ſucceſſive ſemitones uſed in the *chromatic* ſpecies are rarely of the ſame kind; but alternately major and minor, that is to ſay, *chromatic* and *diatonic:* for the interval of a minor tone contains a major or chromatic ſemitone, and another which is major or diatonic; a meaſure which temperament renders common to all tones: ſo that we cannot proceed by two minor ſemitones which are conjunctive in ſucceſſion, without entering into the enharmonic ſpecies; but two major ſemitones twice follow each other in the *chromatic* order of the ſcale.

The moſt certain procedure of the fundamental baſs to generate the chromatic elements in aſcent, is alternately to deſcend by thirds, and riſe by fourths, whilſt all the chords carry the third major. If the fundamental baſs proceeds from dominant to dominant by perfect cadences avoided, it produces the *chromatic* in deſcending. To produce both at once, you interweave the perfect and broken cadences, but at the ſame time avoid them.

As at every note in the *chromatic* ſpecies one muſt change the tone, that ſucceſſion ought to be regulated and limited for fear of deviation. For this purpoſe, it will be proper to recollect, that the ſpace moſt ſuitable to *chromatic* movements, is between the extremes of the dominant and the tonic in aſcending, and between the tonic and the dominant in deſcending. In the major mode, one may alſo chromatically deſcend from the dominant upon the ſecond note. This tranſition is very common in Italy; and, notwithſtanding its beauty, begins to be a little too common amongſt us.

The chromatic ſpecies is admirably fitted to expreſs grief and affliction: theſe ſounds boldly ſtruck in aſcending tear the ſoul. Their power is no leſs magical in deſcending; it is then that the ear ſeems to be pierced with real groans. Attended with its proper harmony, this ſpecies appears proper to expreſs every thing: but its completion, by concealing the melody, ſacrifices a part of its expreſſion: and for this diſadvantage, ariſing from the fullneſs of the harmony, it can only be compenſated by the nature and genius of the movement. We may add, that in proportion to the energy of this ſpecies, the compoſer ought to uſe it with greater caution and parſimony. Like thoſe delicate viands, which when profuſely adminiſtered, immediately ſurfeit us with their abundance: as much as they delight us when enjoyed with temperance, ſo much do they diſguſt when devoured with prodigality.

CHROMATIC, *Enharmonic*. See ENHARMONIC.

CHROMATICS;

THAT part of optics which explains the ſeveral properties of the colours of light, and of natural bodies.

1
Different hypotheſes concerning colours.

Before the time of Sir Iſaac Newton, we find no hypotheſis concerning colours of any conſequence. The opinions of the old philoſophers, however, we ſhall briefly mention, in order to gratify the curioſity of our readers. The Pythagoreans called colour the ſuperficies of body. Plato ſaid that it was a flame iſſuing from them. According to Zeno, it is the firſt configuration of matter; and Ariſtotle ſaid it was that which moved bodies actually tranſparent. Deſcartes aſſerted, that colour is a modification of light; but he imagined, that the difference of colour proceeds from the prevalence of the direct or rotatory motion of the particles of light. Father Grimaldi, Dechales, and many others, thought the differences of colour depended upon the quick or ſlow vibrations of a certain elaſtic medium filling the whole univerſe. Rohault imagined, that the different colours were made by the rays of light entering the eye at different angles with reſpect to the optic axis; and from the phænomenon of the rainbow, he pretended to calculate the preciſe quantity of the angle that conſtituted each particular colour. Laſtly, Dr Hooke, the rival of Newton, imagined that colour is cauſed by the ſenſation of the oblique or uneven pulſe of light; and this being capable of no more than two varieties, he concluded there could be no more than two primary colours.

2
This ſubject inveſtigated by Sir Iſaac Newton.

In the year 1666, Sir Iſaac Newton began to inveſtigate this ſubject; and finding the coloured image of the ſun, formed by a glaſs priſm, to be of an oblong, and not of a circular form, as, according to the laws of refraction, it ought to be, he began to conjecture that light is not *homogeneal*; but that it conſiſts of rays, ſome of which are much more refrangible than others. See this diſcovery fully explained and aſcertained under the article OPTICS.

This method of accounting for the different colours of bodies, from their reflecting this or that kind of rays moſt copiouſly, is ſo eaſy and natural, that Sir Iſaac's ſyſtem quickly overcame all objections, and to this day continues to be almoſt univerſally believed. It is now acknowledged, that the light of the ſun, which to us ſeems perfectly homogeneal and white, is compoſed of no fewer than ſeven different colours, *viz.* red, orange, yellow, green, blue, purple, and violet or indigo. A body which appears of a red colour, hath the property of reflecting the red rays more powerfully than any of the others; and ſo of the orange, yellow, green, &c. A body which is of a black colour, inſtead of reflecting, *abſorbs* all or the greateſt part of the rays that fall upon it; and, on the contrary, a body which appears white, reflects the greateſt part of the rays indiſcriminately, without ſeparating the one from the other.

3
Colours appearing between two glaſs plates.

The foundation of a rational theory of colours being thus laid, it next became natural to inquire, by what peculiar mechaniſm in the ſtructure of each particular body it was fitted to reflect one kind of rays more than another? This Sir Iſaac Newton attributes to the denſity of theſe bodies. Dr Hooke had remarked, that thin tranſparent ſubſtances, particularly water and ſoap blown into bubbles, exhibited various colours according to their thinneſs, though, when they have a conſiderable degree of thickneſs, they appear colourleſs; and Sir Iſaac himſelf had obſerved, that as he was compreſſing two priſms hard together, in order to make their ſides (which happened to be a little convex) to touch one another, in the place of contact they were both perfectly tranſparent, as if they had been but one continued piece of glaſs. Round the point of contact, where the glaſſes were a little ſeparate from each other, rings of different colours appeared. To obſerve more nicely the order of the colours produced in this manner, he took two object-glaſſes; one of them a plano-convex one belonging to a 14 feet refracting teleſcope, and the other a large double convex one for a teleſcope of about 50 feet; and laying the former of them upon the latter, with its plain ſide downwards, he preſſed them ſlowly together; by which means the colours very ſoon emerged, and appeared diſtinct to a conſiderable diſtance. Next to the pellucid central ſpot, made by the contact of the glaſſes, ſucceeded blue, white, yellow, and red. The blue was very little in quantity, nor could he diſcern any violet in it; but the yellow and red were very copious, extending about as far as the white, and four or five times as far as the blue. The next circuit immediately ſurrounding theſe, conſiſted of violet, blue, green, yellow, and red: all theſe were copious and vivid, except the green, which was very little in quantity, and ſeemed more faint and dilute than the other colours. Of the other four, the violet was the leaſt in extent; and the blue leſs than the yellow or red. The third circle of colours was purple, blue, green, yellow, and red. In this the purple ſeemed more reddiſh than the violet in the former circuit and the green was more conſpicuous; being as briſk and copious as any of the other colours, except the yellow; but the red began to be a little faded, inclining much to purple. The fourth circle conſiſted of green and red; and of theſe the green was very copious and lively, inclining on the one ſide to blue, and on the other to yellow; but in this fourth circle there was neither violet, blue, nor yellow, and the red was very imperfect and dirty. All the ſucceeding colours grew more and more imperfect and dilute, till after three or four revolutions they ended in perfect whiteneſs.

4
Suppoſed ariſe from denſity.

As the colours were thus found to vary according to the different diſtances of the glaſs-plates from each other, our author thought that they proceeded from the different thickneſs of the plate of air intercepted between the glaſſes; this plate of air being, by the mere circumſtance of thinneſs or thickneſs, diſpoſed to reflect or tranſmit this or that particular colour. From this he concluded, as already obſerved, that the colours of all natural bodies depended on their denſity, or the bigneſs of their component particles. He alſo conſtructed a table, wherein the thickneſs of a plate neceſſary to reflect any particular colour was expreſſed in parts of an inch divided into 1,000,000 parts.

5
Colours by reflection.

Sir Iſaac Newton purſuing his diſcoveries concerning the colours of thin ſubſtances, found that the ſame were alſo produced by plates of a conſiderable thickneſs. There is no glaſs or ſpeculum, he obſerves, how well poliſhed ſoever, but, beſides the light which it refracts or reflects regularly, ſcatters every way irregularly a faint light; by means of which the poliſhed ſurface, when illuminated in a dark room by a beam of the ſun's light, may eaſily be ſeen in all poſitions of the eye. It was with this ſcattered light that the colours in the following experiments were produced.

The ſun ſhining into his darkened chamber through a hole in the ſhutter one inch wide, he let the beam of light fall perpendicularly upon a glaſs ſpeculum, concave on one ſide and convex on the other, ground to a ſphere of five feet eleven inches radius, and quickſilvered over on the convex ſide. Then, holding a quire of white paper at the centre of the ſphere, to which the ſpeculums were ground, in ſuch a manner as that the beam of light might paſs through a little hole made in the middle of the paper, to the ſpeculum, and thence be reflected back to the ſame hole, he obſerved on the paper four or five concentric rings of colours, like rainbows ſurrounding the hole, very much like thoſe which appeared in the thin plates abovementioned, but larger and fainter. Theſe rings, as they grew larger and larger, became more dilute, ſo that the fifth was hardly viſible; and yet ſometimes, when the ſun ſhone very clear, there appeared faint traces of a ſixth and ſeventh.

6
Colours by refraction and reflection enumerated.

We have already taken notice, that the thin plates made uſe of in the former experiments reflected ſome kinds of rays in particular parts, and tranſmitted others in the ſame parts. Hence the coloured rings appeared variouſly diſpoſed, according as they were viewed by tranſmitted or reflected light; that is, according as the plates were held up between the light and the eye, or not. For the better underſtanding of which we ſubjoin the following table, wherein on one ſide are mentioned the colours appearing on the plates by reflected light, and on the other thoſe which were oppoſite to them, and which became viſible when the glaſſes were held up between the eye and the window. We have already obſerved, that the centre, when the glaſſes were in full contact, was perfectly tranſparent. This ſpot, therefore, when viewed by reflected light, appeared

appeared black, becauſe it tranſmitted all the rays: and for the ſame reaſon it appeared white when viewed by tranſmitted light.

Colours by reflected Light.	*Colours by Tranſmitted Light.*
Black	White
Blue	Yellowiſh-red
White	Black
Yellow	Violet
Red	Blue
Violet	White
Blue	Yellow
Green	Red
Yellow	Violet
Red	Blue
Purple	Green
Blue	Yellow
Green	Red
Yellow Red	Bluiſh-green
Green	Red
Red	Bluiſh-green
Greeniſh-blue	Red.
Red.	

The colours of the rings produced from reflection by the thick plates, followed the order of thoſe produced by tranſmiſſion through the thin ones: and by the analogy of their phenomena with thoſe produced from the thin plates, Sir Iſaac Newton concluded that they were produced in a ſimilar manner. For he found, that if the quickſilver was rubbed off from the back of the ſpeculum, the glaſs alone would produce the ſame rings, but much more faint than before; ſo that the phenomenon did not depend upon the quickſilver, except in as far as, by increaſing the reflection at the back of the glaſs, it increaſed the light of the coloured rings. He alſo found that a ſpeculum of metal only, produced none of thoſe rings; which made him conclude, that they did not ariſe from one ſurface only, but depended on the two ſurfaces of the plate of glaſs of which the ſpeculum was made, and upon the thickneſs of the glaſs between them.

7 General theory of colours by Sir Iſaac Newton.

From theſe experiments and obſervations, it will be eaſy to underſtand the Newtonian theory of colours. Every ſubſtance in nature ſeems to be tranſparent, provided it is made ſufficiently thin. Gold, the moſt denſe ſubſtance we know, when reduced into thin leaves, tranſmits a bluiſh-green light through it. If, therefore, we ſuppoſe any body, gold, for inſtance, to be divided into a vaſt number of plates ſo thin as to be almoſt perfectly tranſparent, it is evident that all or greateſt part of the rays will paſs through the upper plates, and when they loſe their force will be reflected from the under ones. They will then have the ſame number of plates to paſs through which they had penetrated before; and thus, according to the number of thoſe plates through which they are obliged to paſs, the object appears of this or that colour, juſt as the rings of colours appeared different in the experiment of the two plates, according to their diſtance from one another, or the thickneſs of the plate of air between them.

8 Mr Delaval's experiments in confirmation of it.

This theory is adopted by Edward Huſſey Delaval, in his Experimental Inquiry into the cauſe of the changes of colours in opaque and coloured bodies. He endeavours to confirm it by a number of experiments on the infuſions of flowers of different colours; but his ſtrongeſt arguments ſeem to be thoſe derived from the different tinges given to glaſs by metallic ſubſtances. Here he obſerves, that each metal gives a tinge according to its ſpecific denſity; the more denſe metals producing the leſs refrangible colours, and the lighter ones thoſe colours which are more eaſily refrangible. Gold, which is the denſeſt of all metals, imparts a red colour to glaſs, whenever it can be divided into particles ſo minute, that it is capable of being mixed with the materials of which glaſs is made. It ſeems indifferent by what means it is reduced to this ſtate, nor can it by any means be made to produce another colour. If it is mixed in large maſſes without being minutely divided, it imparts no colour to the glaſs, but remains in its metallic form. Lead, the metal whoſe denſity is next in order to that of gold, affords a glaſs of the colour of the hyacinth; a gem whoſe diſtinguiſhing characteriſtic is, that it is red with an admixture of yellow, the ſame colour which is uſually called *orange*. Glaſs of lead is mentioned by ſeveral authors as a compoſition proper, without the addition of any other ingredient, for imitating the hyacinth. Silver, next in denſity to lead, can only be made to communicate a yellow colour to glaſs. If the metal is calcined with ſulphur, it readily communicates this colour. Leaf-ſilver laid upon red-hot glaſs likewiſe tinges it yellow. When we meet with authors who mention a blue or greeniſh colour communicated by ſilver, the cauſe, muſt have been, that the ſilver uſed in ſuch proceſſes was mixed with copper. Mr Delaval aſſures us, from his own experience, that ſilver purified by the teſt retains ſo much copper, that, when melted ſeveral times with nitre and borax, it always imparted a green colour at the firſt and ſecond melting; though afterwards no ſuch colour was obtainable from it. The only colour produced by copper is green. It is indifferent in what manner the copper is prepared in order to tinge the glaſs, provided it is expoſed without any other ingredient to a ſufficient degree of heat. If a quantity of ſalts are added in the preparation, they will, by attenuating the mixture, make the glaſs incline to blue, the colour next in order: but this happens only when the fire is moderate; for, in a greater degree of heat, the redundant ſalts, even thoſe of the moſt fixed nature, are expelled. It is true, that copper is mentioned by ſome writers as an ingredient in red glaſs and enamel: but the *red*, which is the colour of the metal not diſſolved or mixed with the glaſs, remains only while the compoſition is expoſed to ſuch a degree of heat as is too ſmall to melt and incorporate it; for, if it be ſuffered to remain in the furnace a few minutes after the copper is added, the maſs will turn out green inſtead of red. Iron, the metal next in denſity to copper, is apt to be calcined, or reduced to a ruddy crocus, ſimilar to that ruſt which it contracts ſpontaneouſly in the air. In this ſtate, it requires a conſiderable degree of heat to diſſolve and incorporate it with glaſs: till that heat is applied, it retains its ruddy colour: by increaſing the heat, it paſſes through the intermediate colours, till it arrives at its permanent one, which is blue; this being effected in the greateſt degree of heat the glaſs will bear, without loſing all colour whatever. Iron vitrified *per ſe* is converted into a blue glaſs. In ſhort, it is indubitable, that iron is the only metal which will, without any addition, impart to the glaſs a blue colour: for copper will not communicate that colour without the addition of a conſiderable quantity of ſalts; or ſome other matter that attenuates it; and the other metals cannot by any means be made to produce it at all.

9
Sir Iſaac's theory defended by Dr Prieſtley.

10
His experiments.

11
Mr Canton's experiments.

Theſe are the principal of Mr Delaval's arguments in favour of Sir Iſaac Newton's theory of colours being formed by denſity. Dr Prieſtley too hath mentioned ſome which deſerve attention. "It was a diſcovery of Sir Iſaac Newton (ſays he), that the colours of bodies depend upon the thickneſs of the fine plates which compoſe their ſurfaces. He hath ſhown, that a change of the thickneſs of theſe plates occaſions a change in the colours of the body; rays of a different colour being thereby diſpoſed to be tranſmitted through it; and conſequently rays of a different colour reflected at the ſame place, ſo as to preſent an image of a different colour to the eye. A variation in the denſity occaſions a variation in the colour; but ſtill a medium of any denſity will exhibit all the colours, according to the thickneſs of it. Theſe obſervations he confirmed by experiments on plates of air, water, and glaſs. He likewiſe mentions the colours which ariſe on poliſhed ſteel by heating it, as likewiſe on bell-metal, and ſome other metalline ſubſtances, when melted and poured on the ground, where they may cool in the open air; and he aſcribes them to the ſcoriae or vitrified parts of the metal, which, he ſays, moſt metals, when heated or melted, do continually protrude and ſend out to their ſurfaces, covering them in the form of a thin glaſſy ſkin. This great diſcovery concerning the colours of bodies depending on the thickneſs of the fine plates which compoſe their ſurfaces, of whatever denſity theſe plates may be, I have been ſo happy as to hit upon a method of illuſtrating and confirming by means of electrical exploſions. A number of theſe being received on the ſurface of any piece of metal, change the colour of it to a conſiderable diſtance from the ſpot on which they were diſcharged; ſo that the whole circular ſpace is divided into a number of concentric rings, each of which conſiſts of all the priſmatic colours, and perhaps as vivid as they can be produced in any method whatever. Upon ſhowing theſe coloured rings to Mr Canton, I was agreeably ſurpriſed to find, that he had likewiſe produced all the priſmatic colours from all the metals, but by a different operation. He extended fine wires of all the different metals along the ſurfaces of pieces of glaſs, ivory, wood, &c.; and when the wire was exploded, he always found them tinged with all the colours. They are not diſpoſed in ſo regular and beautiful a manner as in the rings I produced, but they equally demonſtrate that none of the metals thus exploded diſcovers the leaſt preference to one colour more than to another. In what manner theſe colours are formed it may not be eaſy to conjecture. In Mr Canton's method of producing them, the metal, or the calcined and vitrified parts of it, ſeem to be diſperſed, in all directions from the plate of exploſion, in the form of ſpheres of a very great variety of ſizes, tinged with all the variety of colours, and ſome of them ſmaller than can be diſtinctly ſeen by any magnifier. In my method of making theſe colours, they ſeem to be produced in a manner ſimilar to the production of colours on ſteel and other metals by heat; *i. e.* the ſurface is affected without the parts of it being removed from their places, certain plates or laminae being formed of a thickneſs proper to exhibit the reſpective colours."

12
Newtonian theory impugned by Dr Prieſtley.

13
Curious experiments by the Abbe Mazeas.

But, however well ſupported this doctrine of the formation of colours by denſity may be, we find the ſame author (Dr Prieſtley), whom we have juſt now ſeen arguing for it in his hiſtory of electricity, arguing againſt it in his hiſtory of viſion. "There are (ſays he) no optical experiments with which Sir Iſaac Newton ſeems to have taken more pains than thoſe relating to the rings of colours which appear in thin plates; and in all his obſervations and inveſtigations concerning them, he diſcovers the greateſt ſagacity both as a philoſopher and mathematician; and yet in no ſubject to which he gave his attention, does he ſeem to have overlooked more important circumſtances in the appearances he obſerved, or to have been more miſtaken with regard to their cauſes. The former will be evident from the obſervations of thoſe who ſucceeded him in theſe inquiries, particularly thoſe of the Abbe Mazeas. This gentleman, endeavouring to give a very high poliſh to the flat ſide of an object-glaſs, happened to be rubbing it againſt another piece of flat and ſmooth glaſs; when he was ſurpriſed to find, that after this friction, they adhered very firmly together, till at laſt he could not move the one upon the other. But he was much more ſurpriſed to obſerve the ſame colours between theſe plane glaſſes that Newton obſerved between the convex object-glaſs of a teleſcope and another that was plane. Theſe colours between the plane glaſſes, the Abbe obſerves, were in proportion to their adheſion. The reſemblance between them and the colours produced by Newton, induced him to give a very particular attention to them; and his obſervations and experiments are as follow:

"If the ſurfaces of the pieces of glaſs are tranſparent, and well poliſhed, ſuch as are uſed for mirrors, and the preſſure be as equal as poſſible on every part of the two ſurfaces, a reſiſtance, he ſays, will ſoon be perceived when one of them is made to ſlide over the other; ſometimes towards the middle, and ſometimes towards the edges; but wherever the reſiſtance is felt, two or three very fine curve lines will be perceived, ſome of a pale red, and others of a faint green. Continuing the friction, theſe red and green lines increaſe in number at the place of contact, the colours being ſometimes mixed without any order, and ſometimes diſpoſed in a regular manner. In the laſt caſe, the coloured lines are generally concentric circles, or ellipſes, or rather ovals, more or leſs elongated as the ſurfaces are more or leſs united. Theſe figures will not fail to appear, if the glaſſes are well wiped and warmed before the friction.

"When the colours are formed, the glaſſes adhere with conſiderable force, and would always continue ſo without any change in the colours. In the centre of all thoſe ovals, the longer diameter of which generally exceeds ten lines, there appears a ſmall plate of the ſame figure, exactly like a plate of gold interpoſed between the glaſſes; and in the centre of it there is often

often a dark ſpot, which abſorbs all the rays of light except the violet; for this colour appears very vivid through a priſm.

"If the glaſſes are ſeparated ſuddenly, either by ſliding them horizontally over one another, or by the action of fire, as will be explained hereafter, the colours will appear immediately upon their being put together again, without the leaſt friction.

"Beginning by the ſlighteſt touch, and increaſing the preſſure by inſenſible degrees, there firſt appears an oval plate of a faint red, and in the midſt of it a ſpot of light green, which enlarges by the preſſure, and becomes a green oval, with a red ſpot in the centre; and this, enlarging in its turn, diſcovers a green ſpot in its centre. Thus the red and the green ſucceed one another in turns, aſſuming different ſhades, and having other colours mixed with them, which will be diſtinguiſhed preſently.

"The greateſt difference between theſe colours exhibited between plane ſurfaces and thoſe formed by curve ones is, that in the former caſe preſſure alone will not produce them, except in the caſe abovementioned. With whatever force he compreſſed them, his attempts to produce the colours were in vain without previous friction. But the reaſon of this plainly was, that without ſliding one of the glaſſes over the other, they could not be brought to approach near enough for the purpoſe.

"Having made theſe obſervations with plates of glaſs whoſe ſides were nearly parallel, he got two priſms with very ſmall refracting angles; and rubbing them together, when they were ſo joined as to form a parallelopiped, the colours appeared with a ſurpriſing luſtre at the places of contact, owing, he did not doubt, to the ſeparation of the rays of light by the priſm. In this caſe, differently coloured ovals appeared, but the plate of gold in them was much whiter, and only appeared yellow about its edges. This plate having a black ſpot in its centre, was bordered by a deep purple. He could not perceive any violet by his naked eye, but it might be perceived by the help of a lens with a weak light. It appeared in a very ſmall quantity at the confines of the purple and the blue, and ſeemed to him to be only a mixture of theſe two colours. It was very viſible in each of the coloured rings by inclining the glaſſes to the light of the moon. Next to the purple and violet appeared blue, orange, red tinged with purple, light green, and faint purple. The other rings appeared to the naked eye to conſiſt of nothing but faint reds and greens; and they were ſo ſhaded that it was not eaſy to mark their terminations. That the order of theſe may be compared with Newton's, he gives a view of both in the following table:

Order of the Colours in the Plane Glaſſes.		*Order of the Colours in Newt. Object Glaſſes.*
Order I.	Black ſpot	Black
	Whitiſh oval	Blue
	Yellow border	White
	Deep purple	Yellow
		Red
Order II.	Blue	Violet.
	Orange	Blue
	Purple	Green
		Yellow
		Red.
Order III.	Greeniſh blue	Purple
	Yellowiſh green	Blue
	Purpled red	Green
		Yellow
		Red
Order IV.	Green	Green
	Red	Red
Order V.	Faint green	Greeniſh blue
	Faint red	Red
Order VI.	Weak green	Greeniſh blue
	Light red	Red
Order VII	Very faint green	Greeniſh blue
	Very faint red.	Pale red.

"When theſe coloured glaſſes were ſuſpended over the flame of a candle, the colours diſappeared ſuddenly, though the glaſſes ſtill continued to adhere to one another when they were parallel to the horizon. When they were ſuffered to cool, the colours returned by degrees to their former places, in the order of the preceding table.

"After this the Abbe took two plates much thicker than the former, in order to obſerve at his leiſure the action of fire upon the matter which he ſuppoſed to produce the colours and obſerved, that as they grew warm, the colours retired to the edges of the glaſſes, and there became narrower and narrower till they were reduced to imperceptible lines. Withdrawing the flame, they returned to their place. This experiment he continued till the glaſſes were bent by the violence of the heat. It was pleaſant, he ſays, to obſerve theſe colours glide over the ſurface of the glaſs as they were purſued by the flame.

"At the firſt, our author had no doubt but that theſe colours were owing to a thin plate of air between the glaſſes, to which Newton has aſcribed them; but the remarkable difference in the circumſtances attending thoſe produced by the flat plates, and thoſe produced by the object-glaſſes of Newton, convinced him that the air was not the cauſe of this appearance. The colours of the flat plates vaniſhed at the approach of flame, but thoſe of the object-glaſſes did not. He even heated the latter till that which was next the flame was cracked by the heat, before he could obſerve the leaſt dilatation of the coloured rings. This difference was not owing to the plane glaſſes being leſs compreſſed than the convex ones; for though the former were compreſſed ever ſo much by a pair of forceps it did not in the leaſt hinder the effect of the flame.

"Afterwards he put both the plane glaſſes and the convex ones into the receiver of an air-pump, ſuſpending the former by a thread, and keeping the latter compreſſed by two ſtrings; but he obſerved no change in the colours of either of them in the moſt perfect vacuum he could make.

"Notwithſtanding theſe experiments ſeemed to be concluſive againſt the hypotheſis of theſe colours being formed by a plate of air, the Abbe frankly acknowledges, that the air may adhere ſo obſtinately to the ſurface of the glaſſes as not to be ſeparated from them by the force of the pump; which, indeed, is agreeable to other appearances: but the following experiments of our author make it ſtill more improbable that the air ſhould be the cauſe of theſe colours.

"To try the utmoſt effect of heat upon theſe coloured plates, after warming them gradually, he laid them upon burning coals; but though they were nearly red, yet when he rubbed them together by means of an iron rod, he obſerved the ſame coloured circles and ovals as before. When he ceaſed to preſs upon them, the colours ſeemed to vaniſh; but when he repeated the friction, they returned, and continued till the pieces of glaſs began to be red-hot, and their ſurfaces to be united by fuſion.

"When the outward ſurface of one of his plates of glaſs was quickſilvered, none of thoſe colours were viſible, though the glaſſes continued to adhere with the ſame force. This he aſcribed to the ſtronger impreſſion made on the eye by the greater quantity of light reflected from the quickſilver.

"Judging from the reſemblance between his experiments and thoſe of Sir Iſaac Newton, that the colours were owing to the thickneſs of ſome matter, whatever that was, interpoſed between the glaſſes, the Abbe, in order to verify his hypotheſis, tried the experiment on thicker ſubſtances. He put between his glaſſes a little ball of ſuet, about a fourth of a line in diameter, and preſſed it between the two ſurfaces, warming them at the ſame time, in order to diſperſe the ſuet; but, though he rubbed them together as before, and uſed other ſoft ſubſtances beſides ſuet, his endeavours to produce the colours had no effect. But, rubbing them with more violence in a circular manner, he was ſurpriſed, on looking at a candle through them, to ſee it ſurrounded with two or three concentric rings, very broad, and with very lively delicate colours; namely, a red inclining to a yellow, and a green inclining to that of an emerald. At that time he obſerved only theſe two colours; but continuing the friction, the rings aſſumed the colours of blue, yellow, and violet, eſpecially when he looked through the glaſſes on bodies directly oppoſed to the ſun. If, after having rubbed the glaſſes, the thickneſs was conſiderably diminiſhed, the colours grew weaker by tranſmitted light, but they ſeemed to be much ſtronger by reflection, and to gain on one ſide what they loſt on the other.

14 Newtonian hypotheſis oppoſed.

"Our author was confirmed in his opinion, that there muſt be ſome error in Newton's hypotheſis, by conſidering, that, according to his meaſures, the colours of the plates varied with the difference of a millionth part of an inch; whereas he was ſatisfied that there muſt have been much greater differences in the diſtance between his glaſſes, when the colours remained unchanged.

"If the colour depended upon the thickneſs only, he thought that the matter interpoſed between the glaſſes ought to have given the ſame colour when it was reduced to a thin plate by ſimple fuſion as well as by friction, and that, in rubbing two plates together, warming them at different times, and compreſſing them with a conſiderable force, other colours would have appeared beſides thoſe abovementioned.

"Theſe circumſtances made him ſuſpect, that the different thickneſſes of the ſubſtance interpoſed between the glaſſes ſerved only to make them more or leſs tranſparent, which was an eſſential condition in the experiment; and he imagined that the friction diffuſed over the ſurface of the thin ſubſtance a kind of matter on which the colours are formed by reflected light: for when he held the plates (which gave the colours when the ſuet was between them) over the flame of a ſmall candle, the colours fled with great precipitation, and returned to their place without his being able to perceive the leaſt alteration in the ſuet.

"He was confirmed in his conjectures, by frequently obſerving, that when the glaſſes were ſeparated, at the moment the colours diſappeared, they were covered with the ſame greaſy matter, and that it ſeemed to be in the very ſame ſtate as when they were ſeparated without warming. Beſides, having often repeated the ſame experiment with different kinds of matter, he found that the degree of heat that diſperſed the colours was not always ſufficient to melt it; which difference was more ſenſible in proportion as the matter interpoſed was made thinner.

"Inſtead of the ſuet, he ſometimes made uſe of Spaniſh wax, reſin, common wax, and the ſediment of urine. He began with Spaniſh wax, on account of its remarkable tranſparency in Mr Haukſbee's electrical experiments; but he had much difficulty in making it ſufficiently thin by friction, being often obliged to warm his glaſſes, to ſeize the moment of fuſion, which continued but a ſhort time, and to hazard the burning of his fingers.

"The experiment at length ſucceeding, the Spaniſh wax appeared with its opacity and natural colour when it reflected the light, but they both diſappeared in the tranſmitted light. He obſerved the ſame rings in it as in the ſuet; and indeed he could perceive but little difference between the colours of ſuet, Spaniſh wax, common wax, or reſin; except that this laſt ſubſtance did not make the colours ſo vivid, on account of the too great tranſparency of its particles.

"The ſediment of urine had ſomething more particular in its appearance, as its colours were more lively. Holding it above the flame, its colours diſappeared; and, keeping it in that ſituation, there were formed, upon its ſurface, ramifications, like thoſe of the hoar-froſt, which diſappeared as the glaſſes grew cold. There were the ſame ramifications both upon the ſuet and the wax, but they were not ſo conſiderable. The glaſſes which had Spaniſh wax and reſin between them adhered with ſo much force, that they could not be ſeparated without the help of fire; and when they began to grow warm, they ſeparated with a noiſe like that of a glaſs breaking in the fire, though the glaſſes were not broken, and the matter between them was not melted.

"Separating the glaſſes which he firſt uſed very ſuddenly, he obſerved upon their ſurface very thin vapours, which formed different colours, but preſently vaniſhed altogether.

"To try the effect of vapour, he breathed upon one of his plates of glaſs, and obſerved that the vapours which adhered to the glaſſes ſometimes formed, before they were entirely diſperſed, a ſurpriſing variety of colours. This experiment, he obſerves, does not always ſucceed at the firſt trial. The glaſs muſt be breathed upon ſeveral times, and care muſt be taken to wipe it every time with one's hand, both to take off the moiſture, and alſo to make upon the glaſs a kind of furrows, which contribute very much to the variety of colours, by making inequalities in the thickneſſes of the vapours. It is neceſſary, alſo, that the glaſſes on which theſe experiments are made have no quickſilver upon them.

“ When the particles of water which formed this vapour were too thick to exhibit theſe colours, he ſtruck them ſeveral times with his pencil, in order to attenuate them; and then he ſaw an infinity of ſmall coloured threads which ſucceeded one another with great rapidity.

“ Putting a drop of water between two pieces of common glaſs, he obſerved that the compreſſion of them produced no colour; but if, while they were compreſſed, the water was made to paſs from one place to another, it left behind it large ſpots, red, yellow, green, purple, *&c.* and the ſpots aſſumed different colours with a ſurpriſing rapidity, and preſented to the eye a moſt beautiful variety of ſhades.

“ In order to determine with greater certainty whether they were vapours that cauſed the colours in his firſt obſervations, he firſt breathed upon one of his plates of glaſs, and then rubbed them againſt one another, when the colours appeared in the ſame order as before, but darker, and diſperſed in confuſion in the places occupied by the vapours; but when he made uſe of fire to diſſipate the watery particles, the colours reſumed their luſtre.

“ Newton, having introduced a drop of water between his two object-glaſſes, obſerved, that in proportion as the water inſinuated itſelf between the glaſſes, the colours grew fainter, and the rings were contracted; and aſcribing theſe colours to the thickneſs of the plate of water, as he aſcribed the former to that of the plate of air, he meaſured the diameters of the coloured rings made by the plate of water, and concluded that the intervals between the glaſſes at the ſimilar rings of theſe two mediums were nearly as three to four; and thence he inferred, that, in all caſes, theſe intervals would be as the ſines of the refractions of theſe mediums.

“ The Abbé Mazeas, in order to aſſure himſelf whether, agreeable to this rule, the coloured rings of his glaſſes depended upon the thickneſs of the water only, dipped one of the edges of his coloured glaſſes in a veſſel of water, having taken care to wipe and warm them well before he produced his colours by friction. The water was a conſiderable time in riſing as high as the glaſſes; and in proportion as it aſcended, he perceived a very thin plate of water, which ſeemed to paſs over the matter which he thought produced the colours, without mixing with it; for beyond this plate of water, he ſtill perceived the colours in the ſame place and order, but deeper and darker; and holding the glaſſes above the flame of a candle, he ſaw the colours go and come ſeveral times as he moved them nearer to or farther from the flame. He then moiſtened both the glaſſes more than before; and rubbing them as uſual, he always ſaw the ſame appearance; and ſeizing the moment when the colours had diſappeared to ſeparate the glaſſes, he always found that they were wet. On this account, he thought that it could not be the water on which the colour depended, but ſome ſubſtance much more ſenſible to heat. He alſo thought that theſe coloured rings could not be owing to the compreſſion of the glaſſes; or that, if this circumſtance did contribute any thing to them, it ſerved rather to modify than to generate them.

15
M. du Tour's obſervations.

“ M. du Tour gave particular attention to the preceding obſervations of the Abbé Mazeas. He repeated the experiments with ſome variation of circumſtances, particularly comparing them with thoſe of Sir Iſaac Newton. He is ſo far from ſuppoſing a plate of air to be neceſſary to the formation of theſe coloured rings, that he thinks the reaſon of their not appearing between the flat plates of glaſs is the adhering of the air to their ſurfaces; and that mere preſſure is not ſufficient to expel it; except, as the Abbé Mazeas obſerved, the rings had before been made in the ſame place; in which caſe, ſimple appoſition without friction is ſufficient; the air, probably, not having had time to apply itſelf ſo cloſely to the ſurface of the glaſs. The contact of ſome other ſubſtances, M. du Tour obſerves, is not ſo prejudicial in this experiment as that of air; for he found, that, if he only gave the plates a ſlight coating of any kind of greaſe, the rings would appear without friction. Alſo dipping them ſlightly in water, or wiping them with his finger, would anſwer the ſame purpoſe. He verified his conjectures by means of the air-pump: for, dipping two pieces of glaſs in water, one of which had been wiped, and the other not, the former appeared to have no bubbles adhering to it when the air was exhauſted, whereas the other had.

“ When one of the glaſſes is convex, our author obſerves, that the particles of air may more eaſily make their eſcape by preſſure only; whereas their retreat is in a manner cut off when they are compreſſed between two flat ſurfaces. The air-pump, he found, was not able to detach theſe particles of air from the ſurfaces to which they adhere; leaving theſe flat plates for a conſiderable time in an exhauſted receiver, was not ſufficient to prepare them ſo well for the experiment, as wiping them.

16
Experiments on colours by reflection.

“ Beſides the obſervations on the colours of thin plates, it has been ſeen that Sir Iſaac Newton imagined he could account for the colours exhibited by thick ones in ſome caſes in a ſimilar manner; particularly in thoſe curious experiments in which he admitted a beam of light through a hole in a piece of paſteboard, and obſerved the rings of colours reflected back upon it by a concave glaſs mirror of equal thickneſs in all places. Theſe experiments were reſumed, and happily purſued, by the Duke de Chaulnes, who aſcribed theſe colours to the inflection of light*. Chance led the duke to obſerve, that when the nearer ſurface of the glaſs mirror was clouded by breathing upon it, ſo as lightly to tarniſh it, a white diffuſed and vivid light was ſeen upon the paſteboard, and all the colours of the rings became much ſtronger, and more diſtinct. This appearance he made conſtant by moiſtening the ſurface of the mirror with a little milk and water, and ſuffering it to dry upon it.

“ In all his experiments upon this ſubject, he found, than when the rays fell converging on the ſurface of the mirror, the rings were hardly viſible; when they fell parallel upon it, as they muſt have done in all the experiments of Newton, they appeared ſufficiently diſtinct; but when, by means of a convex lens placed in the hole of the window, they were made to diverge

---

* See *Optics.*

from the centre of the ſphere to which the mirror was ground, ſo that they fell perpendicularly on the ſurface of the mirror, the colours were as vivid as he could make them. In this caſe he could remove the reflected image to a great diſtance from the hole, without making the rings diſappear; and he could plainly perceive them to ariſe from their central ſpots, which changed their colours ſeveral times.

"The effect of tarniſhing the mirror convinced him, that theſe coloured rings depended on the firſt ſurface of the mirror, and that the ſecond ſurface, or that which reflected them after they had paſſed the firſt, only ſerved to collect them and throw them upon the paſteboard in a quantity ſufficient to make them viſible, and he was confirmed in his ſuppoſition by the following experiments.

"He took a plano-convex object-glaſs, of ſix feet focus, and placed it ſix feet from the paſteboard with its convex ſide towards it. By this means the rays which fell upon that ſurface, after being refracted there, were tranſmitted through the thickneſs of the glaſs, parallel to one another, and fell perpendicularly on the plane ſurface that reflected them, and, in their return, would be collected upon the paſteboard. In theſe circumſtances the rings appeared very diſtinct after he had tarniſhed the convex ſurface, which in this poſition was next to the light.

"Turning the ſame glaſs the contrary way, ſo that the plane ſurface was towards the paſteboard, he could perceive none of the rings at the diſtance of ſix feet; but they were viſible at the diſtance of three feet: becauſe at that diſtance the ſecond ſurface reflected the rays by its concavity directly towards the paſteboard.

"Theſe two experiments demonſtrate the uſe of the ſecond ſurface of the mirror, and ſhow the manner of placing it to moſt advantage. Thoſe that follow ſhow the uſe of the firſt ſurface with reſpect to theſe rings; and he was led to make them by the caſual obſervation abovementioned.

"Newton, he obſerves, had remarked, that when he made uſe of a mirror of the ſame focus with the firſt he had uſed, but of twice the thickneſs, he found the diameter of the rings much ſmaller than before. This obſervation the duke thought favourable to his own concluſions; for if theſe rings depend upon the firſt ſurface, the nearer it is to the ſecond, which only reflects the ray tranſmitted from it, the larger they ought to appear upon the paſteboard.

"To aſcertain this fact, he thought of making uſe of two moveable ſurfaces; and to make uſe of a micrometer to meaſure the diſtance between them with exactneſs. For this purpoſe he took a metallic mirror belonging to a reflecting teleſcope, being part of a ſphere of ten feet radius; and he fixed it firm upon a foot in which was a groove that carried a light frame, to which was faſtened a thin piece of talc tarniſhed with milk and water. The frame that ſupported the piece of talc could neither be brought into contact with the mirror, or be removed to the diſtance of eight or nine inches from it, and the micrometer ſhowed to the utmoſt exactneſs the leaſt motion of the frame.

"Having placed this mirror ten feet from the paſteboard, that is, at the diſtance of the radius of its own ſphere, he obſerved the rings to appear very diſtinct, the form of his mirror being very true: but the diameter of the rings upon the paſteboard varied with the diſtance of the talc from the mirror; ſo that they were very large when the talc was near the mirror, and very ſmall when it was placed at the diſtance of ſeven or eight inches.

"Theſe experiments proved, that the rings were formed by the firſt ſurface, and reflected by the ſecond; but it ſtill remained to be determined in what manner they were formed. He imagined, that the ſmall pencils of rays that were tranſmitted through the pores of the glaſs, or any other tranſparent ſubſtance, might ſuffer a kind of inflection, which might change the cylinder which they formed into a truncated cone, either by means of their different degrees of inflexibility, or by the different diſtances at which they paſs by the edges of the ſmall hole through which they are tranſmitted. Purſuing this idea, he thought of making uſe of ſome body, the pores of which were of a known and determined ſhape. Inſtead, therefore, of the piece of talc, he placed a piece of fine linen in the abovementioned frame, ſtretching it as even as poſſible, to make the pores formed by the threads more exact and more permeable by the light; and he ſoon found, with great pleaſure, that his conjecture was verified: for, inſtead of the circular rings which he had before, they were now manifeſtly ſquare, though their angles were a little rounded; and they were coloured as the others, though the light was not very vivid, on account of the quantity that was ſtopped by the muſlin.

"When, inſtead of the muſlin, he ſtretched acroſs his frame fine ſilver wires exactly parallel, at the diſtance of about three quarters of a line, or a whole line from one another, without any other wires acroſs them; inſtead of the rings which he had ſeen before, there was nothing upon the paſteboard but a gleam of white light divided by many ſmall ſtreaks, coloured in a very vivid manner, and in the ſame manner as the rings."

17
Another theory of colours.

Thus we have another hypotheſis of the formation of colours, namely, by the inflection of light in its paſſage out from between the ſolid and impenetrable particles of which bodies are compoſed. It is, however, very difficult, upon the hypotheſis either of Sir Iſaac Newton, or that of the Duke de Chaulnes, to give a reaſon why bodies that are not entirely white, ſhould not appear variouſly coloured. For, it appears from Sir Iſaac Newton's experiments, that plates of different denſity are capable of exhibiting the ſame colours; and that where a plate is continually varying in denſity, it will produce all the colours. Now it is evident, that the plates of which we ſuppoſe all natural bodies to be compoſed, muſt be ſimilar to one that is perpetually varying in its thickneſs; for ſuppoſing the plates of which any ſubſtance is compoſed to be of any determinate thickneſs, 9 millionth parts of an inch for inſtance; ſuch of the rays as are reflected from this plate will be red. But if any of them penetrate to the depth of $11\frac{1}{6}$ of theſe parts, they will be reflected of a violet colour, *&c.* and thus muſt alloy and obſcure the red; and ſo of others. If we ſuppoſe the colours to be produced by inflection, it will be equally difficult to account for ſome particular rays being inflected and others not; ſeeing we obſerve that all of them are capable of being inflected by every ſubſtance whatever, when they paſs very near it. In ſome caſes too, colours are produced when the light is neither refracted nor inflected, as far as we can judge; and this ſeems to obſcure the theory of chromatics more than any thing we have yet mentioned.

As the experiments we are now about to mention are of the greateſt importance, and in direct terms contradict one of Sir Iſaac Newton's, we ſhall give a full account of them, from Prieſtley's hiſtory of Viſion, *&c.* with his remarks thereon.

18 One of Sir Iſaac Newton's experiments found to be erroneous

The experiment in queſtion is the eight of Newton's ſecond book of Optics: "He (Sir Iſaac Newton) found, he ſays, that when light goes out of air through ſeveral contiguous refracting mediums, as through water and glaſs, and thence goes out again into air, whether the refracting ſurfaces be parallel or inclined to one another, that light, as often as, by contrary refractions, it is ſo corrected, that it emerges in lines parallel to thoſe in which it was incident, continues ever after to be white: but if the emergent rays be inclined to the incident, the whiteneſs of the emerging light will, by degrees, in paſſing on from the place of emergence, become tinged, at its edges with colours. This he tried by refracting light with priſms of glaſs, placed within a priſmatic veſſel of water.

" By theorems deduced from this experiment, he infers, that the refraction of the rays of every ſort, made out of any medium into air, are known by having the refraction of the rays of any one ſort; and alſo, that the refraction out of one medium into another is found as often as we have the refractions out of them both into any third medium.

" On the contrary, a Swediſh philoſopher (M. Klingenſtierna) obſerves*, that, in this experiment, the rays of light, after paſſing through the water and the glaſs, though they come out parallel to the incident rays, will be coloured; but that the ſmaller the glaſs priſm is, the nearer will the reſult of it approach to Newton's deſcription.

" This paper of M. Klingenſtierna, being communicated to Mr Dollond by M. Mallet, made him entertain doubts concerning Newton's report of the reſult of his experiment; and determined him to have recourſe to experiments of his own.

" He therefore cemented together two plates of parallel glaſs, at their edges, ſo as to form a priſmatic veſſel when ſtopped at the ends or baſes; and the edge being turned downwards, he placed in it a glaſs priſm with one of its edges upwards, and filled up the vacancy with clear water: ſo that the refraction of the priſm was contrived to be contrary to that of the water, in order that a ray of light, tranſmitted through both theſe refracting mediums, might be affected by the difference only between the two refractions. As he found the water to refract more or leſs than the glaſs priſm, he diminiſhed or increaſed the angle between the glaſs plates, till he found the two contrary refractions to be equal, which he diſcovered by viewing an object through this double priſm. For when it appeared neither raiſed nor depreſſed, he was ſatisfied that the refractions were equal, and that the emergent rays were parallel to the incident.

19 Colours produced without refraction or reflection.

" Now, according to the prevailing opinion, he obſerves, that the object ſhould have appeared through this double priſm in its natural colour; for if the difference of refrangibility had been in all reſpects equal, in the two equal refractions, they would have rectified each other. But this experiment fully proved the fallacy of the received opinion, by ſhowing the divergency of the light by the glaſs priſm to be almoſt double of that by the water; for the image of the object, though not at all refracted, was yet as much infected with priſmatic colours, as though it had been ſeen through a glaſs wedge only whoſe angle was near 30 degrees.

" This experiment is the very ſame with that of Sir Iſaac Newton abovementioned, notwithſtanding the reſult was ſo remarkably different: but Mr Dollond aſſures us, that he uſed all poſſible precaution and care in his proceſs; and he kept his apparatus by him, that he might evince the truth of what he wrote, whenever he ſhould be properly required to do it.

" He plainly ſaw, however, that if the refracting angle of the water-veſſel could have admitted of a ſufficient increaſe, the divergency of the coloured rays would have been greatly diminiſhed, or entirely rectified; and that there would have been a very great refraction without colour, as he had already produced a great diſcolouring without refraction: but the inconveniency of ſo large an angle as that of the priſmatic veſſel muſt have been, to bring the light to an equal divergency with that of the glaſs priſm, whoſe angle was about 60°, made it neceſſary to try ſome experiments of the ſame kind with ſmaller angles.

" Accordingly he got a wedge of plate-glaſs, the angle of which was only nine degrees: and, uſing it in the ſame circumſtances, he increaſed the angle of the water-wedge, in which it was placed, till the divergency of the light by the water was equal to that by the glaſs; that is, till the image of the object, though conſiderably refracted by the exceſs of the refraction of the water, appeared nevertheleſs quite free from any colours proceeding from the different refrangibility of the light.

20 Defences of Sir Iſaac.

" Notwithſtanding it evidently appeared, I may ſay to almoſt all philoſophers, that Mr Dollond had made a real diſcovery of ſomething not comprehended in the optical principles of Sir Iſaac Newton, it did not appear to ſo ſenſible a man, and ſo good a mathematician, as Mr Murdoch is univerſally acknowledged to be. Upon this occaſion he interpoſed in the defence, as he imagined, of Sir Iſaac Newton; maintaining, that Mr Dollond's poſitions, which he ſays, he knows not by what miſhap have been deemed paradoxes in Sir Iſaac's theory of light, are really the neceſſary conſequences of it. He alſo endeavours to ſhow, that Sir Iſaac might not be miſtaken in his account of the experiment abovementioned. But admitting all that he advances in this part of his defence, Newton muſt have made uſe of a priſm with a much ſmaller refracting angle than, from his own account of his experiments, we have any reaſon to believe he ever did make uſe of.

" The fact probably was, that Sir Iſaac deceived himſelf in this caſe, by attending to what he imagined to be the clear conſequences of his other experiments; and though the light he ſaw was certainly tinged with

---

* *Swed. Abhand.* vol. 16. p. 300.

colours, and he muſt have ſeen it to be ſo, yet he might imagine that this circumſtance aroſe from ſome imperfection in his priſms, or in the diſpoſition of them, which he did not think it worth his while to examine. It is alſo obſervable, that Sir Iſaac is not ſo particular in his deſcription of his priſms, and other parts of his apparatus, in his account of this experiment, as he generally is in other caſes, and therefore probably wrote his account of it from his memory only.

P. 804. “ Much has been ſaid on this experiment; and it is thought very extraordinary that a man of Sir Iſaac's accurate attention ſhould overlook a circumſtance, the effect of which now appears to be ſo conſiderable. But it has happily occurred to Mr Michell, that, as Sir Iſaac Newton obſerves he uſed to put ſaccharum ſaturni into his water to increaſe its refractive power, the lead, even in this form, might increaſe the diſſipative refraction, as it does in the compoſition of glaſs; and if ſo, that this would account for Newton's not finding the diſſipative power of water leſs than that of his glaſs priſms, which he otherwiſe ought to have done, if he had tried the experiment as he ſaid he did.

“ Accordingly he included a priſm of glaſs in water, as highly impregnated with ſaccharum ſaturni as it would bear, the proportion of ſaccharum to water being about as 5 to 11. When the image, ſeen through the water (ſo impregnated) and a glaſs priſm, was in its natural place, it ſtill was coloured, though very little: he thought not more than a fourth part as much as when ſeen through plain water, and the priſm in its natural place; ſo that he had no doubt, but that, if his priſm had had a little leſs of the diſperſing power, its errors would have been perfectly corrected.”

21
Mr Delaval's experiments on the colours of opaque bodies.

Beſides the experiments of Mr Delaval above related, and which were made on the colours of tranſparent bodies, he has lately publiſhed an account of ſome made upon the permanent colours of opaque ſubſtances; the diſcovery of which muſt be of the utmoſt conſequence in the arts of colour-making and dyeing. Theſe arts, he obſerves, were in very remote ages carried to the utmoſt height of perfection in the countries of Phoenicia, Egypt, Paleſtine, India, &c. and that the inhabitants of theſe countries alſo excelled in the art of imitating gems, and tinging glaſs and enamel of various colours. The colours uſed in very ancient paintings were as various as thoſe now in uſe, and greatly ſuperior both in beauty and durability. The paints uſed by Apelles were ſo bright, that he was obliged to glaze his pictures with a dark-coloured varniſh, leſt the eye ſhould be offended by their exceſſive brightneſs; and even theſe were inferior to what had been uſed among the ancient Egyptians. Pliny complains that the art of painting was greatly decayed in his time; and the moderns were not furniſhed with any means of retrieving the art until they began to avail themſelves of experimental obſervations.

22
Theſe colours depend chiefly on the diviſion of the colouring particles.

The changes of colour in permanently coloured bodies, our author obſerves, are produced by the ſame laws which take place in tranſparent colourleſs ſubſtances; and the experiments by which they can be inveſtigated conſiſt chiefly of various methods of uniting the colouring particles into larger, or dividing them into ſmaller maſſes. Sir Iſaac Newton made his experiments chiefly on tranſparent ſubſtances; and in the few places where he treats of others, acknowledges his deficiency of experiments. He makes the following remark, however, on thoſe bodies which reflect one kind of light and tranſmit another, viz. that “ if theſe glaſſes or liquors were ſo thick and maſſy that no light could get through them, he queſtioned whether they would not, like other opaque bodies, appear of one and the ſame colour in all poſitions of the eye; though he could not yet affirm it from experience.” It was the opinion of this great philoſopher, that all coloured matter reflects the rays of light, ſome reflecting the more refrangible and others the leſs refrangible rays more copiouſly; and that this is not only a true reaſon of theſe colours, but likewiſe the only reaſon. He was likewiſe of opinion that opaque bodies reflect the light from their anterior ſurface by ſome power of the body evenly diffuſed over and external to it. With regard to tranſparent coloured liquors, he expreſſes himſelf in the following manner: “ A tranſparent body which looks of any colour by tranſmitted light, may alſo look of the ſame colour by reflected light; the light of that colour being reflected by the farther ſurface of that body, or by the air beyond it: and then the reflected colour will be diminiſhed, and perhaps ceaſe, by making the body very thick, and pitching it on the back-ſide to diminiſh the reflection of its farther ſurface, ſo that the light reflected from the tinging particles may predominate. In ſuch caſes the colour of the reflected light will be apt to vary from that of the light tranſmitted.”

To inveſtigate the truth of theſe opinions Mr Delaval entered upon a courſe of experiments with tranſparent coloured liquors and glaſſes, as well as with opaque and ſemitranſparent bodies. From theſe he diſcovered ſeveral remarkable properties of the colouring matter; particularly, that in tranſparent coloured ſubſtances, it does not reflect any light; and when, by intercepting the light which was tranſmitted, it is hindered from paſſing through ſuch ſubſtances, they do not vary from their former colour to any other, but become entirely black (A).

23
No light reflected by the colouring particles.

This incapacity of the colouring particles of tranſparent bodies to reflect light, being deduced from very numerous experiments, may therefore be held as a general law. It will appear the more extenſive, if we conſider that, for the moſt part, the tinging particles of liquors or other tranſparent ſubſtances are extracted from opaque bodies; that the opaque bodies owe their colours to thoſe particles, in like manner as the tranſparent ſubſtances do: and that by the loſs of them they are deprived of their colours.

For making his experiments, Mr Delaval uſed ſmall vials

(A) Here our author obſerves, that he makes uſe of the word *colour* only to expreſs thoſe called *primary*; ſuch a mixture of them as does not compoſe whiteneſs, or any of the gradations between white and black, ſuch as are called by Sir Iſaac Newton, grey, dun, or ruſſet brown.

24 Apparatus for making theſe experiments.

vials of flint glaſs, whoſe form was a parallelopiped, and their height, excluſive of the neck, about two inches, the baſe about an inch ſquare, and the neck two inches in length. The bottom and three ſides of each of theſe vials was covered with a black varniſh; the cylindrical neck, and the anterior ſide, except at its edges, being left uncovered. He was careful to avoid any crevices in the varniſh. That no light might be admitted except through the neck or anterior ſide of the vials.

In theſe experiments it is of importance to have the vials perfectly clean; and as many of the liquors are apt to depoſit a ſediment, they ought to be put into the vials only at the time the experiments are to be made. The uncovered ſide of the vials ſhould not be placed oppoſite to the window through which the light is admitted: becauſe in that ſituation the light would be reflected from the farther ſide of the vial; and our author obſerves that ſmooth black ſubſtances reflect light very powerfully. But as it is a principal object in the experiment that no light be tranſmitted through the liquor, this is beſt accompliſhed by placing the uncovered ſide of the vial in ſuch a ſituation that it may form a right angle with the window.

25 The colouring matter only ſhows itſelf by tranſmitted light.

With theſe precautions our author viewed a great numbers of ſolutions, both of coloured metallic ſalts and of the tinging matter of vegetables; univerſally obſerving, that the colour by reflection was black, whatever it might be when viewed by tranſmitted light. If theſe liquors, however, are ſpread thin upon any white ground, they appear of the ſame colour as when viewed by tranſmitted light: but on a black ground they afford no colour, unleſs the black body be poliſhed; in which caſe the reflection of the light through it produces the ſame effect as tranſmiſſion.

The experiments with tinged glaſſes were in many reſpects analogous to thoſe with tranſparent coloured liquors. For theſe he made ſeveral parcels of colourleſs glaſs, principally uſing one compoſed of equal parts of borax and white ſand. The glaſs was reduced to powder, and afterwards ground, together with the ingredients by which the colours were imparted. "This method (ſays he) of incorporating the tinging particles is greatly preferable to mixing them with the raw materials; and the glaſſes thus compoſed excel moſt others in hardneſs, being ſcarcely inferior in luſtre to real gems."

The reſult of all the experiments made in this manner was, that when matter is of ſuch thinneſs, and the tinge ſo dilute, that light can be tranſmitted through it, the glaſſes then appear vividly coloured; but when they are in larger maſſes, and the tinging matter is more denſely diffuſed through them, they appear black; for theſe, as well as the tranſparent coloured liquors, ſhow their colour only by a tranſmiſſion. The following experiments were made with a view to determine the proportion of tinging matter which produces colour or blackneſs.

26. Experiments to determine the proportion of tinging matter.

1. Glaſs was tinged green by adding to it $\frac{1}{60}$th of its weight of copper; and that whether the latter was uſed in its metallic or calcined ſtate.

2. A blue glaſs was made by the addition of zaffre, a purple one by maganeſe, a red glaſs by gold, and yellow glaſſes by ſilver and calcined iron. A yellow glaſs reſembling a topaz was likewiſe made by the addition of a ſmall quantity of charcoal in powder. The ſame colour was likewiſe procured by the addition of wheat-flour, roſin, and ſeveral other inflammable matters. Small pieces of each of theſe glaſſes being ground by a lapidary, reſembled gems of their different colours.

3. Having formed pieces of ſuch glaſſes about two inches thick, he incloſed them in black cloth on all ſides except their farther and anterior ſurfaces. In this ſituation each of them ſhowed a vivid colour when light was tranſmitted through them; but when the poſterior ſurface was likewiſe covered with the cloth to prevent this tranſmiſſion, no other colour than black was exhibited by any of them.

4. When plates of tranſparent coloured glaſs, ſomewhat thicker than common window-glaſs, were made uſe of, they always exhibited their colours by tranſmitted light.

5. On intercepting the light tranſmitted through theſe coloured plates, they as conſtantly appeared black when placed in ſuch a direction as to form a right angle with the window.

From theſe phenomena Mr Delaval deduced the following obſervations: 1. That the colouring particles do not reflect any light. 2. That a medium, ſuch as Sir Iſaac Newton has deſcribed, is diffuſed over both the anterior and farther ſurfaces of the plates, whereby objects are equally and regularly reflected as by a mirror. Hence, when it is ſaid that light is reflected by the ſurface of any ſubſtance, it ſhould be underſtood from this expreſſion, that the reflection is effected by the medium diffuſed over its ſurface.

27 On the reflection of the light of a candle by coloured glaſſes.

6. When a lighted candle is placed near one of thoſe coloured plates, the flame is reflected by the medium which is diffuſed over the anterior ſurface. The image thus reflected entirely reſembles the flame in ſize and colour; being ſcarcely diminiſhed, and not in the leaſt tinged by the coloured glaſs.

7. If the plate be not ſo intenſely coloured, or ſo maſſy, as to hinder the tranſmiſſion of the light of the candle, there appears a ſecondary image of the flame, which is reflected by the medium contiguous to the farther ſurface of the glaſs; and as the light thus reflected paſſes through the coloured glaſs, it is tinged very vividly.

8. When the glaſs uſed in this experiment is of a green colour, the image of the flame is always of a bright green; and when glaſſes of other colours are uſed, that of a ſecondary flame is always the ſame with that of the glaſs.

9. The ſecondary image is leſs than that reflected from the anterior ſurface. This diminution is occaſioned by the loſs of that part of the light which is abſorbed in paſſing through the coloured glaſs. For whenever any medium tranſmits one ſort of rays more copiouſly than the reſt, it ſtops a great part of the different coloured rays. Much more light alſo is loſt in paſſing through coloured than tranſparent ſubſtances. In making theſe obſervations, it is proper to chooſe coloured plates of glaſs which are not in every part of an equal thickneſs, that the ſecondary image may not coincide with that reflected from the anterior ſurface, and be intercepted by it.

10. When the plates are ſo thick, and ſo copiouſly coloured, that the light cannot penetrate to their far-

ther

ther ſurface, they appear intenſely black in whatever direction they are viewed, and afford no ſecondary image, but only reflect, from their anterior ſurface, the flame, or any other objects that are oppoſed to them. Theſe objects are repreſented in their own proper colours, and are as free from tinge as thoſe reflected from quickſilvered glaſs, or ſpecula made of white metals.

Hence again it is manifeſt, that the colouring particles do not poſſeſs any ſhare of reflective power; for if they had any ſhare in this reflection, they would certainly impart ſome ſhare of colour to the light they reflected. Hence alſo it appears, that tranſparent coloured bodies, in a ſolid ſtate, poſſeſs no more reflective power than thoſe in a fluid ſtate.

28 Experiments on the pure colouring particles.

Our author next conſiders the colouring particles themſelves, pure, and unmixed with other media. In order to procure maſſes made up of ſuch particles, ſeveral tranſparent coloured liquors were reduced to a ſolid conſiſtence by evaporation. By employing a gentle heat, the colouring matter may thus remain unimpaired; and is capable of having its particles again ſeparated by water or other liquids, and tinging them as before.

In this ſtate the colouring particles reflect no light, and therefore appear uniformly black, whatever ſubſtance they have been extracted from. In the courſe of his experiments, Mr Delaval made uſe of the infuſions of brazil wood, logwood, fuſtic, turmeric, red ſaunders, alkanet, ſap-green, kermes, and all the other tranſparent coloured liquors he had tried before, among which were infuſions of red and yellow flowers, without obſerving the leaſt variation in the reſult.

Some liquors are apt to become totally opaque by evaporation: the reaſon of which may be the cryſtallization of ſaline matters, or the coaleſcence of the particles into maſſes, differing conſiderably in denſity from the menſtrua in which they were diſſolved. When this opacity takes place, our author has conſtantly obſerved, that they become incapable of entering the pores of wool, ſilk, or other matters of that kind, or of adhering to their ſurface; and conſequently unfit for the purpoſes of dyeing. This he ſuppoſes to ariſe from their increaſed bulk; for the attractive force by which the particles cohere together is weakened in proportion as their bulk increaſes: ſo that the degree of magnitude of the colouring particles, which is eſſential to the opacity of liquors, is inconſiſtent with the minuteneſs requiſite for dyeing. An inſtance of this is given in an infuſion of fuſtic. Having infuſed ſome of this wood in ſuch a quantity of water, that the latter was ſaturated with the colouring particles, he evaporated the liquor to a ſolid conſiſtence with an uninterrupted, but very gentle heat. During every part of the proceſs the liquor continued tranſparent, and the ſolid extract yielded by it tranſmitted a yellow colour when ſpread thin, but appeared black when thicker maſſes were viewed. Having prepared another pint of this liquor, he evaporated half the water, and allowed the remainder to become cold. In this ſtate it became turbid and opaque; on filtering, a tranſparent tincture paſſed through an opaque fecula remaining on the paper. This fecula did not adhere to the paper, but was eaſily ſeparable from it: on being dried, it appeared white with a ſlight tinge of yellow; but was nevertheleſs ſoluble in water, and by ſolution gave a liquid in all reſpects ſimilar to the original infuſion. "From theſe circumſtances (ſays he) it appears that a given proportion of water, or a ſufficient degree of heat, is requiſite to the ſolution of the colouring particles of fuſtic. And experience evinces, that thoſe particles which are too groſs to paſs through filtering paper, are incapable of entering the pores or firmly cohering to the ſurface of bodies. Many ingredients, ſuch as the colouring particles of logwood, kermes, and various other matters, are ſoluble in water in every proportion; and therefore their infuſions are not ſubject to become opaque or turbid during their evaporation. The ſolid extracts obtained by evaporation reflect no colour, but are black.

Our author alſo formed ſolid maſſes by mixing a ſmall quantity of drying oil with pigments which conſiſt chiefly of colouring matter; as Pruſſian blue, indigo, and ſap-green. Theſe paints likewiſe exhibit their reſpective colours only by tranſmitted light; appearing entirely black when viewed by reflection. Inſtances of blackneſs ariſing from this denſity of the colouring matter may be obſerved in ſeveral kinds of fruits, as black currants, cherries, &c. for the juices of theſe appear red when ſpread thin on a white ground, or otherwiſe viewed by tranſmitted light.

Mr Delaval's next attempt was to conſider the action and properties of the colouring particles of opaque bodies themſelves, and the means by which theſe colours are produced. Here our author endeavours to prove, that theſe colours of opaque bodies appear on the ſame principles as thoſe already mentioned, which ſeem black when very denſe, but ſhow their proper tinge when ſpread thin upon a white ground. On this ſubject the following experiments were made.

1. Graſs, and other green leaves of plants, were digeſted in rectified ſpirit of wine; by which means a tranſparent green tincture was obtained. One of the vials formerly mentioned being filled with this liquid, it was obſerved to tranſmit a vivid green colour; but the other part of the tincture, which was contiguous to the uncovered ſide of the vial, reflected no light, and therefore appeared black.

2. Having poured ſome of the tincture into a China cup, the bottom was thereby made to look green, exactly reſembling the colour which had been extracted from the leaves.

3. After the colour had been totally abſtracted by the vinous ſpirit, the leaves remained apparently unaltered, either as to figure or texture; but were entirely white, or had their whiteneſs ſlightly tinged with brown.

4. Red, purple, and blue flowers, were alſo digeſted in ſpirit of wine; all of which yielded their colouring matter to the ſpirit, and became white by being deprived of it. From moſt of theſe flowers, however, the ſpirit acquired either no tinge at all, or only a very faint one; but when acidulated, it became red, and by the addition of an alkali appeared blue, purple, or green, according to the quantity of alkali and the nature of the infuſion. In theſe ſtates, all of them, when viewed

viewed by tranſmitted light, or poured upon a white ground, ſhowed their colours, but univerſally appeared black by reflection.

5. Red, purple, and blue flowers, were digeſted in water ſlightly acidulated with nitrous acid. Thus, red infuſions were obtained, which, by ſaturation with ſea ſalt, might be preſerved for many years.

6. The ſame liquors were changed, green, blue, or purple, by the addition of an alkali: but here the caſe was the ſame as before; all of them yielding vivid colours by tranſmiſſion, but none by reflection. In making this experiment, care muſt be taken to add the alkali very gradually; for if too much is put in at once to the red liquor, the intermediate colours between the red and the green will be wanting. To half an ounce of the red infuſion it is proper to add, at once, only the ſmalleſt quantity that can be taken up on the point of a pen; repeating this addition ſlowly, until each of the colours be produced.

7. The flowers, after having been repeatedly macerated in acidulated water, loſt their colouring matter, and became white.

8. Yellow flowers alſo communicated their colours to water and to ſpirit of wine. The infuſions and tinctures of theſe flowers were ſubjected to the ſame experiments as had been employed in the examination of the liquors already mentioned; and appeared yellow by tranſmitted light, but did not reflect any colour.

9. White paper, linen, &c. may be tinged of any of theſe colours, by dipping them in the infuſions; and the conſideration of the manner in which the colours are imparted to the linen, affords much inſight into the manner in which natural colours are produced. It has already been obſerved, that, when the colouring matter of plants is extracted from them, the ſolid fibrous parts, thus diveſted of their covering, diſplay their natural whiteneſs. White linen, paper, &c. are formed of ſuch fibrous vegetable matter; which is bleached by diſſolving and detaching the heterogeneous colouring particles. When theſe are dyed or painted with vegetable colours, it is evident that they do not differ in their manner of acting on the rays of light from natural vegetable bodies; both yielding their colours by tranſmitting, through the tranſparent coloured matter, the light which is reflected from the white ground. This white matter frequently exiſts, without any conſiderable mixture, in plants, while they are in a ſtate of vegetation; as cotton, white flowers, the pith, wood, ſeeds, roots, and other parts of ſeveral kinds of vegetables. When decayed trees, &c. have been long expoſed to the atmoſphere, their coloured juices are ſometimes ſo perfectly extracted, that the fibres appear white. This white matter is not diſtinct from the vegetable earth to which plants are reduced by burning†. Mr Delaval has rendered aſhes intenſely white, by carefully calcining them, and afterwards grinding with a ſmall proportion of nitre, and expoſing them to ſuch a degree of heat as would cauſe the nitre deflagrate with the remaining quantity of phlogiſton. Laſtly, the aſhes were digeſted with marine acid, in order to diſſolve the ferruginous matter diffuſed through them, and repeatedly waſhing the remainder in water. Mixing aſhes thus purified with borax, and applying a vitrifying heat, an opaque enamel is obtained, remarkable for its whiteneſs.

29
How aſhes may be made intenſely white.

30
White earth of plants, the only ſubſtance in them that reflects the light.

Hence it appears, that the earth which forms the ſubſtance of plants is white, and ſeparable from that ſubſtance which gives to each its peculiar colour; that whenever it is pure and unmixed, or diffuſed through colourleſs media, it ſhows its native whiteneſs; and is the only vegetable matter endowed with a reflective power. It may be diſcovered, however, by other means than that of burning: thus, roſes may be whitened by expoſing them to the vapour of burning ſulphur; an effect which cannot be attributed to the vitriolic acid, but to the phlogiſton contained in that vapour. This was proved to be the caſe, by expoſing ſeveral kinds of red and purple flowers to the phlogiſtic vapour iſſuing from hepar ſulphuris; and by this every one of them was whitened; their colour being afterwards reſtored by the addition of an acid either mineral or vegetable.

31
Colouring matter diſſolved by phlogiſton.

“ Thus (ſays Mr Delaval) it appears, that the colouring matter of the flowers is not diſcharged or removed, but only diſſolved by the phlogiſton; and thereby divided into particles too minute to exhibit any colour. In this ſtate, together with the vegetable juice in which they are diffuſed, they form a colourleſs tranſparent covering, through which the white matter of the flowers is ſeen untinged. The colouring particles of plants conſiſt principally of inflammable matter; and their ſolubility in phlogiſton, and union with it, are analogous to the action of other inflammable bodies upon each other. Thus, ether diſſolves all eſſential and expreſſed oils, animal empyreumatic oils, and reſins. Sulphur, camphor, and almoſt all ſubſtances abounding in phlogiſton, are ſoluble in oils, ardent ſpirits, or other inflammable menſtrua. The manner in which the red colour of vegetable flowers is reſtored, appears to be explicable from known chemical laws. When acids are applied to the whitened flowers, they unite with the phlogiſton which the ſulphur had communicated, and diſengage it from the colouring particles; which, being thus extricated, reſume their original magnitude and hue. A change of the ſame kind is alſo produced by fixed alkali, which, like the acids, has a ſtrong attraction for phlogiſton, always changes the whitened flowers to a blue, purple, or green colour.

32
Colours deſtroyed by the light of the ſun.

“ In like manner, the action of the rays of light operates upon coloured bodies. Thus, dyed ſilk, or other ſubſtances of that kind, when expoſed to the ſun's light, are deprived of their colour in every part on which the rays are allowed to act; whilſt thoſe preſerve their colour which are defended from the light by the folds of the cloth, or intervention of any opaque body. The colours, thus impared, may be reſtored if acids are applied while the injury is recent; but they are afterwards apt to fly off, on account of that volatility which is conſtantly imparted by inflammable matter to any other with which it is united.”

Our author now proceeds, at conſiderable length, to prove the identity of the ſolar light and phlogiſton: but as recent experiments have ſhown that theſe two are eſſentially diſtinct, we omit his argumentation upon his head. The error of his theory in this reſpect, however, does not in the leaſt affect the doctrine concerning colours above laid down: on the contrary, the

---

† See *Chemiſtry-Index.*

lateſt experiments have determined, that phlogiſton, in its groſſeſt form, *viz.* that of common charcoal, manifeſts a ſurpriſing power of whitening various ſubſtances; which, according to Mr Delaval's theory, proceeds from the power it has of diſſolving the colouring matter with which they are impregnated. This ſolvent power, according to our author, is manifeſt in many other inſtances beſides thoſe already mentioned. Silk is whitened by the phlogiſtic vapours of ſulphur: and this operation does not appear to differ from the change effected on flowers by the ſame vapour. The light of the ſun is found to be a neceſſary and eſſential agent in bleaching linen, wax, and various other ſubſtances; ſome part of the colouring matter which impairs the whiteneſs of theſe bodies not yielding to any other ſolvent. Red flowers are whitened by the electric ſpark, of whoſe inflammable nature we cannot entertain the leaſt doubt; for the ſpark itſelf is a bright flame, and yields the ſame ſmell which all other phlogiſtic matters impart. The electric ſpark, in like manner, changes the blue infuſion of turnſole to red (B). The effects which it produces on the turnſole, and on red flowers, do not differ from each other, except in degree only. For when vegetable matter is diſſolved, it is changed from blue to red; and, when farther diſſolved, it is divided into particles too minute to exhibit any colour.

33 How to diſtinguiſh the ſolutions made by phlogiſton from thoſe made by acids.

Solutions effected by means of phlogiſton frequently are wrongly attributed to the operation of ſuppoſed acid menſtrua, as ſeveral kinds of ſubſtances are capable of being diſſolved indiſcriminately both by acids and phlogiſton. For the purpoſe of diſtinguiſhing, therefore, in any caſe between the action of the acid ſolvents and that of the inflammable menſtrua, it is proper to examine the nature of the matter by which either of theſe principles are furniſhed. It appears from various chemical proceſſes, that alkalies are rendered mild, and capable of cryſtallization, in proportion as they are united to phlogiſton. The phlogiſticated alkaline lixivium, when ſaturated, is perfectly mild; and by a ſlight evaporation is reduced to a concrete cryſtalline maſs, which does not deliqueſce or imbibe the leaſt moiſture from the air, and no longer retains any alkaline property. M. Beaumé by an elegant and ingenious experiment, has proved the preſence of phlogiſton in mild alkalies, and has ſhown that their power of cryſtallizing depends upon their union with that principle. He heated in a ſilver veſſel a lixivium of mild alkali, which imparted to the ſilver a covering or coating of inflammable matter, by which its ſurface was tarniſhed and became black. The lixivium was ſeveral times poured out of the ſilver veſſel; and after the ſurface of the metal had been freed from the tarniſh, the lixivium was replaced in it, and again heated, by which the tarniſh was renewed; and this was repeated till the lixivium no longer communicated any ſtain to the ſilver. The cauſticity of the lixivium was increaſed in proportion as it imparted its phlogiſton to the ſilver; and at the end of the proceſs the alkali became perfectly cauſtic, and incapable of cryſtallizing.

Our author now goes on to prove, that fixed air is not an acid, nor a compound of air and phlogiſton, as is now generally believed, but rather entirely of a phlogiſtic nature. For an account of his arguments in favour of this opinion, ſee the article Fixed Air: here we ſhall only conſider his farther experiments on colours.

"From the preceding experiments (ſays he) it appears, that the colouring particles of flowers and leaves are ſoluble in acid, alkaline, and phlogiſtic menſtrua. The other parts of vegetables conſiſt of materials ſimilar to thoſe which are contained in their flowers and leaves, and undergo the ſame changes from the ſame cauſes. Having extracted from logwood its colouring particles by repeatedly boiling it in water, the wood was thus deprived of its yellow colour, and aſſumed a brown hue ſimilar to that of oak-wood. Some pieces of it thus deprived of its colour were then macerated in aquafortis; and after they had undergone the action of that acid, they were waſhed in a ſufficient quantity of water. The wood was thus reduced to whiteneſs."

34 Logwood affords only a yellow tincture with water.

Here our author obſerves, that though moſt authors who treat of colouring ſubſtances deſcribe logwood as of a red colour, he was never able to procure any other colour from it but yellow. It imparts yellow and orange colours to diſtilled water. Other waters extract a red tinge from it by means of the alkali which they contain. Theſe obſervations are alſo applicable to the other dyeing woods, kermes, and various other articles of the materia tinctoria. By a ſimilar treatment, fuſtic wood alſo loſt its colouring matter, and became white.

The reſults of all the experiments above related are, that the colouring matter of plants does not exhibit any colour by reflection, but by tranſmiſſion only; that their ſolid earthy ſubſtance is a white matter; and that it is the only part of vegetables which is endowed with a reflective power; that the colours of vegetables are produced by the light reflected from this white matter, and tranſmitted from thence through the coloured coat or covering which is formed on its ſurface by the colouring particles; that whenever the colouring matter is either diſcharged or divided by ſolution into particles too minute to exhibit any colour, the ſolid earthy ſubſtance is expoſed to view, and diſplays that whiteneſs which is its diſtinguiſhing characteriſtic.

34 Colouring matter of animal ſubſtances.

Mr Delaval next proceeds to examine the coloured parts of animal ſubſtances, and finds them exactly ſimilar, with regard to the manner in which the colour is produced, to the vegetable bodies already treated of. The tinctures and infuſions of cochineal and of kermes yield their colours when light is tranſmitted through them, but ſhow none by reflection. On diluting freſh ox-gall with water, and examining it in the phials already mentioned, that part of it which was in the neck of the phial, and viewed by tranſmitted light, was yellow; but the anterior ſurface was black, and reflected no colour. Fleſh derives its colour entirely from the blood, and when deprived of it the fibres and veſſels are perfectly white; as are likewiſe the membranes

---

(B) This effect of the electric ſpark is now known to be produced, not by its phlogiſtic nature, but by the generation of an acid.

branes, ſinews, and bones, when freed from their aqueous and volatile parts; in which caſe they are a mere earth, unalterable by fire, and capable of imparting an opaque whiteneſs to glaſs.

35 Of the colour of blood.

On examining blood diluted with water in one of the phials formerly deſcribed, it tranſmitted a red colour, and the anterior ſurface was almoſt, but not entirely, black; for it received a ſlight hue of brown from ſome coagulated particles that were ſuſpended in the liquor. In order to procure blood ſufficiently diluted, and at the ſame time equably and perfectly diſſolved, he mixed as much cruor with ſpirit of ſal ammoniac as imparted a bright colour to it. The liquor being then viewed in the phial, that part which was contained in the neck, and tranſmitted the light, appeared of a fine red; but the anterior part reflecting no light, was intenſely black. Hence it appears, that the florid red colour of the fleſh ariſes from the light which is reflected from the white fibrous ſubſtance, and tranſmitted back through the red tranſparent covering which the blood forms on every part of it.

Blood, when recently drawn, does not aſſume the appearance common to tranſparent coloured liquors; for theſe, when too maſſy to tranſmit light from their farther ſurfaces, always appear black; but blood, when recently drawn, always ſhows a fine red colour, in whatever way it be viewed. This is occaſioned by a white matter diffuſed through the blood; and which is eaſily ſeparated from the cruor, by dividing it after coagulation into a number of thin pieces, and waſhing in a ſufficient quantity of pure water. Thus the water acquires a red colour, and ought to be changed daily. In a few days it will acquire no more tinge; and the remaining maſſes of the cruor are no longer red, but white.

36 Of the ſhells of lobſters.

In like manner, the red colour of the ſhells of lobſters, after boiling, is no more than a mere ſuperficial covering ſpread over the white calcareous earth of which the ſhells are compoſed, and may be eaſily removed from the ſurface by ſcraping or filing. Before the application of heat, this ſuperficial covering is much denſer; inſomuch that, in ſome parts of the ſhell, it appears quite black, being too thick to admit the paſſage of the light to the ſhell and back again; but where this tranſparent blue colour of the unboiled lobſter is thinner, it conſtantly appears like a blue film. In like manner, the colours of the eggs of certain birds are entirely ſuperficial, and may be ſcraped off, leaving the white calcareous earth expoſed to view.

37 Of feathers.

The caſe is the ſame with feathers, which owe their colours entirely to a very thin layer of ſome tranſparent matter upon a white ground. Our author aſcertained this by ſcraping off the ſuperficial colours from certain feathers which were ſtrong enough to bear the operation; and thus ſeparated the coloured layers from the white ground on which they had been naturally ſpread. The lateral fibres of the feathers cannot indeed have their ſurfaces ſeparated in this manner; but their texture, when viewed by a microſcope, ſeems to indicate, that the colours are produced on them by no other means than thoſe already related. In the examination of ſome animal ſubjects where the colouring matter could not be ſeparated by chemical means, our author had recourſe to mechanical diviſion; but this can only be employed when the principal part of the white ſubſtance is unmixed with the coloured coat or covering which is ſpread upon its ſurface. All of them, however, by whatever means their colours could be ſeparated, ſhowed that they were produced in the ſame manner, namely, by the tranſmiſſion of light from a white ground through a tranſparent coloured medium.

38 Of the colours of mineral ſubſtances.

The coloured ſubſtances of the mineral kingdom are very numerous, and belong principally to two claſſes, *viz.* earths and metals. The former, when pure, are all perfectly white, and their colours ariſe from phlogiſtic or metallic mixtures. Calcareous earths, when indurated, conſtitute marble, and may be tinged with various colours by means of metallic ſolutions; all which are ſimilar in their nature to the dyes put upon ſilk, cotton, or linen, and invariably proceed from the ſame cauſe, *viz.* the tranſmiſſion of light through a very thin and tranſparent coloured medium. Flints are formed from ſiliceous earth, and owe their colour to phlogiſton. When ſufficiently heated, they are rendered white by the loſs of the inflammable matter which produced their colour. When impregnated with metals, they form agates, cornelians, jaſper, and coloured cryſtals. The coloured gems alſo receive their different hues from metals; and all of them may be imitated by glaſſes tinged with ſuch phlogiſtic or metallic matters as enter into the compoſition of the original ſubſtances.

39 Of metals.

Thus our author concludes, that the coloured earths, gems, &c. exhibit their various tints in the ſame manner with other ſubſtances; *viz.* by the tranſmiſſion of light reflected from a white ground. Our author, however, proceeds farther; and aſſerts, that even the colours of metals themſelves are produced in the ſame manner.

“ Gold (ſays he) exhibits a white light, which is tinged with yellow. I have uſed this expreſſion, becauſe it appears from experiment that gold reflects a white light, and that its yellow colour is a tinge ſuperadded to its whiteneſs. The experiment is thus ſet forth by Sir Iſaac Newton. Gold in this light (that is, a beam of white light) appears of the ſame yellow colour as in day light; but by intercepting at the lens a due quantity of the yellow-making rays, it will appear white like ſilver, as I have tried; which ſhows, that its yellowneſs ariſes from the exceſs of the intercepted rays, tinging that whiteneſs with their colour when they are let paſs.

“ I have already ſhown, by numerous experiments, in what manner coloured tinges are produced; and it uniformly appears, from all theſe experiments, that colours do not ariſe from reflection, but from tranſmiſſion only. A ſolution of ſilver is pellucid and colourleſs. A ſolution of gold tranſmits yellow, but reflects no colour. This metal alſo, when united with glaſs, yields no colour by reflection, but by tranſmiſſion only. All theſe circumſtances ſeem to indicate, that the yellow colour of gold ariſes from a yellow tranſparent matter, which is a conſtituent part of that metal; that it is equally mixed with the white particles of the gold, and tranſmits the light which is reflected by them, in like manner as when ſilver is gilt, or foils are made by covering white metals with tranſparent colours. But theſe factitious coverings are only ſuperficial; whereas the yellow matter of gold is diffuſed throughout the whole ſubſtance of the metal, and appears to envelope, and cover each of the white particles. In whatſoever manner the yellow matter of gold is united to its white ſubſtance, it exiſts in a rare ſtate; for it bears only the ſame proportion to the white particles of the gold as that of the yellow-making rays which were intercepted bears to all the other rays compriſed in the white light of the ſun.

"Sir Iſaac Newton has ſhown, that when ſpaces or interſtices of bodies are repleniſhed with media of different denſities, the bodies are opaque; that thoſe ſuperficies of tranſparent bodies reflect the greateſt quantity of light which intercede media that differ moſt in their refractive denſities; and that the reflections of very thin tranſparent ſubſtances are conſiderably ſtronger than thoſe made by the ſame ſubſtances of a greater thickneſs. Hence the minute portions of air, or of the rarer medium, which occupies ſpaces void of other matter, reflect a vivid white light whenever their ſurfaces are contiguous to media whoſe denſities differ conſiderably from their own; ſo that every ſmall maſs of air, or of the rarer medium, which fills the pores or interſtices of denſe bodies, is a minute white ſubſtance. This is manifeſt in the whiteneſs of froth, and of all pellucid colourleſs bodies; ſuch as glaſs, cryſtal, or ſalts, reduced to powder, or otherwiſe flawed; for in all theſe inſtances a white light is reflected from the air or rarer medium which intercede the particles of the denſer ſubſtances whoſe interſtices they occupy."

From theſe principles our author takes occaſion to explain the reaſon why the particles of metals which yield no colour by incident light when ſuſpended in their ſolvents, are diſpoſed to exhibit colours when ſeparated from them. Hence alſo we ſee why opaque white ſubſtances are rendered pellucid by being reduced to uniform maſſes whoſe component parts are every where nearly of the ſame denſity; for as all pellucid ſubſtances are rendered opaque and white by the admixture of pellucid colourleſs media of conſiderably different denſities, they are again deprived of their opacity by extricating theſe media which kept their particles at a diſtance from each other: thus froth or ſnow, when reſolved into water, loſe their whiteneſs, and aſſume their former pellucid appearance. In like manner, by proper fluxes, the opaque white earths are reduced to pellucid colourleſs glaſſes; becauſe all reflections are made at the ſurfaces of bodies differing in denſity from the ambient medium, and in the confines of equally denſe media there is no reflection.

As the calces of metals are enabled to reflect their colours by the intervention of the particles of air; ſo, when mixed with oil in the making of paints, they always aſſume a darker colour, becauſe the exceſs of the denſity of oil over that of air forms a ſenſible difference when comparatively conſidered with reſpect to the ſpecific gravity of the rarer metals. From this cauſe perceptibly leſs light is reflected from the moleculæ of oil than from thoſe of air, and conſequently the maſs appears darker. The caſe, however, is different with ſuch paints as are formed of the denſer metals; as vermilion, minium, &c.: for though oil differs very conſiderably from air in its ſpecific denſity, yet it alſo differs very much in this reſpect from the denſer metallic powders; and the moleculæ of oil which divide their particles act upon the light ſo ſtrongly, that the reflection occaſioned by them cannot be diſtinguiſhed from thoſe which are cauſed by rarer media. Hence, though we mix vermilion or minium with oil, the colour is not ſenſibly altered.

40 Objections to his theory of metallic colours.

This part of our author's theory, however, ſeems liable to objection: for though it be true that the calces of ſome metals are denſer than others, yet that is, comparatively ſpeaking, but in a very ſmall proportion; nor is even the difference of denſity between oil and the calces of the heavier metals at all comparable to that between the denſity of air and oil. Thus, tho' the calx of iron may be 10 or 11 times more denſe than oil; yet, as the latter is between 500 and 600 times denſer than air, the ſmall difference between the oil and metallic calx ought to be imperceptible. In this reſpect, indeed, there are conſiderable differences with regard to the oils employed, which cannot be ſuppoſed to ariſe from the mere circumſtance of denſity. Thus the colour of vermilion, when mixed with turpentine-varniſh, is much brighter than with linſeed-oil; and yet the difference between the denſities of linſeed-oil and turpentine-varniſh is very trifling. The mere action of heat likewiſe has a ſurpriſing effect in this caſe. Thus the red calx of iron, called *ſcarlet oker*, by being only heated a certain degree, appears of a very dark purple, reſuming its red colour when cold; and this variation may be induced as often as we pleaſe by only heating it over the fire in a ſhovel. In like manner, by gradually heating red lead, it may be made to aſſume a moſt beautiful crimſon colour; which growing gradually darker, becomes at laſt almoſt quite black. On cooling, if the heat has not been raiſed too high, it gradually returns through the ſame ſhades of colour, until at laſt it fixes in its original hue. Theſe immenſe differences in colour cannot by any means be attributed either to the expulſion of air or to an alteration in denſity. The fire indeed does certainly expand theſe calces as well as other bodies; but as the medium interſperſed between their particles is thus alſo expanded, the colour ought at leaſt to remain the ſame, if not to become lighter, on account of the ſuperior expanſion of air to that of metal by the ſame degree of heat. It would ſeem, therefore, that the action of the element of fire itſelf has a conſiderable ſhare in the production of colours; and indeed its ſhare in the operations of nature is ſo great, that we might well think it ſtrange if it ſhould be entirely excluded from this.

41 Of the colours of ſemipellucid ſubſtances.

With regard to ſemipellucid ſubſtances, which appear of one colour by incident and another by tranſmitted light, our author likewiſe endeavours to ſhow, that no reflection is made by the coloured matter, but only by the white or colourleſs particles. They conſiſt of pellucid media, throughout which white or colourleſs opaque particles are diſperſed. The latter are diſpoſed at ſuch diſtances from each other, that ſome of the incident rays of light are capable of paſſing through the intervals which intercede them, and thus are tranſmitted through the ſemipellucid maſs. Some ſorts of rays penetrate through ſuch maſſes, while others which differ from them in their refrangibility are reflected by the white or colourleſs particles; and from thence are tranſmitted through the pellucid part of the medium which intervenes between the reflecting particles and the anterior ſurface of the maſs. On the ſame principle our author explains the blue colour of the ſky, the green colour of the ſea, and other natural phenomena: and from his numerous experiments on this ſubject at laſt concludes, that the power by which the ſeveral rays of light are tranſmitted through different media is inherent in the particles themſelves, and therefore is not confined to the ſurfaces of ſuch media. For if the tranſmiſſive force was exerted at the ſurface only, the thinner plates of coloured ſubſtances would act upon the rays as powerfully as thicker maſſes. But it appears from experiment, that in proportion as the rays paſs through different thickneſſes of coloured media, they exhibit colours differing not only in degree, but frequently in ſpecies alſo.

42 How colours are ſhown by tranſmitted light

"The ſun's light, by which bodies are illuminated, conſiſts of all the rays by which a white light is compounded. Theſe rays, in their entire and undivided ſtate, are incident upon the opaque particles of ſemipellucid ſubſtances, and upon the colouring particles of tranſparent coloured ſubſtances, whenever theſe media are expoſed to the light. When the rays accede to the opaque particles of ſemipellucid ſubſtances, ſome ſorts of them are reflected back from the anterior ſurface of thoſe particles: the other ſorts of rays, which are not reflected back, are diverted from the direction which is opppoſite to the anterior ſurface of the opaque particles, and paſſing through the intervals between the particles, are tranſmitted through the maſs.

"When the rays are incident upon the particles of tranſparent coloured bodies, none of them are reflected back; becauſe the colouring particles are not endowed with any reflective power: but ſome of the rays are either ſtopped at the anterior ſurface of the particles, or are diverted into ſuch directions as render them incapable of paſſing towards the farther ſide of the maſs; and conſequently ſuch rays cannot be tranſmitted. The rays which are not thus intercepted or diſperſed, are tranſmitted in the ſame manner as thoſe which paſs through ſemipellucid media. Thus it is evident, that the coloured rays which are tranſmitted through ſemipellucid ſubſtances are *inflected* by the opaque particles: and thoſe which are tranſmitted through tranſparent-coloured ſubſtance are *inflected* by the colouring particles. From the preceding obſervations likewiſe it appears, that the particles of coloured media inflect the ſeveral ſorts of rays according to the ſeveral ſizes and denſities of the particles; alſo in proportion to the inflammability of the media which owe their colour to them; and it is manifeſt that the tranſmiſſion of coloured rays depends upon their inflection. All theſe obſervations are conformable to Sir Iſaac Newton's doctrine, that the rays of light are reflected, refracted, and inflected, by one and the ſame principle acting variouſly in various circumſtances."

43 Of the manner in which light is reflected from white bodies.

The moſt remarkable part of Mr Delaval's doctrine is that concerning the metals; for the better underſtanding of what we ſhall premiſe a ſhort abſtract of his general doctrine concerning white bodies, and the manner in which light is reflected by them. "All the earths (he obſerves), which in their natural ſtate are of a pure white, conſtitute tranſparent colourleſs media when vitrified with proper fluxes, or when diſſolved in colourleſs menſtrua; and the ſaline maſſes obtainable from their ſolutions are tranſparent and colourleſs while they retain the water which is eſſential to their cryſtallization, and are not flawed or reduced to powder; but after their pores and interſtices are opened in ſuch a manner as to admit the air, they become then white and opaque by the entrance of that rare medium. The earthy particles which form the ſolid parts of bodies generally exceed the others in denſity; conſequently theſe particles, when contiguous to the rare media already mentioned, muſt reflect the rays of light with a force proportionate to their denſity. The reflective power of bodies does not depend merely upon their exceſs of denſity, but upon their difference of denſity, with reſpect to the ſurrounding media. Tranſparent colourleſs particles, whoſe denſity is greatly inferior to that of the media they come between, alſo powerfully reflect all ſorts of rays, and thereby become white. Of this kind are the air or other rare fluids which occupy the interſtices of liquors; and in general of all denſer media into whoſe interſtices ſuch rare particles are admitted.

"Hence we may conclude, that white opaque bodies are conſtituted by the union or contiguity of two or more tranſparent colourleſs media differing conſiderably from each other in their reflective powers. Of theſe ſubſtances we have examples in froth, emulſions, or other imperfect combinations of pellucid liquors, milk ſnow, calcined or pulverized ſalts, glaſs or cryſtal reduced to powder, white earths, paper, linen, and even thoſe metals which are called white by mineralogiſts and chemiſts: for the metals juſt mentioned do not appear white unleſs theſe ſurfaces be rough? as in that caſe only there are interſtices on their ſurface ſufficient to admit the air, and thus make a reflection of a white and vivid light.

"But the poliſhed ſurfaces of metallic mirrors reflect the incident rays equably and regularly, according to their ſeveral angles of incidence; ſo that the reflected rays do not interfere with each other, but remain ſeparate and unmixed, and therefore diſtinctly exhibit their ſeveral colours. Hence it is evident, that white ſurfaces cannot act upon the light as mirrors; becauſe all the rays which are reflected from them are blended in a promiſcuous and diſorderly manner.

44 Of the cauſe of opacity.

"The abovementioned phenomena give much inſight into the nature and cauſe of opacity; as they clearly ſhow, that even the rareſt tranſparent colourleſs ſubſtances, when their ſurfaces are adjacent to media differing greatly from them in refractive power, may thereby acquire a perfect opacity, and may aſſume a reſplendency and hue ſo ſimilar to that of white metals, that the rarer pellucid ſubſtances cannot by the ſight be diſtinguiſhed from the denſe opaque metals. And this ſimilarity to the ſurface of metals occurs in the rare pellucid ſubſtances, not only when, from the roughneſs of their ſurfaces, they reſemble unpoliſhed metals in whiteneſs, but alſo when, from their ſmoothneſs, they reſemble the poliſhed ſurfaces of metals.

"Metals ſeem to conſiſt entirely of tranſparent matter, and to derive their apparent opacity and luſtre ſolely from the copious reflection of light from their ſurfaces. The analogy between the metals and tranſparent media, as far as reſpects their optical properties, will appear from the following conſiderations.

"1. All metals diſſolved in their proper menſtrua are tranſ-

tranſparent. 2. By the union of two or more tranſparent media, ſubſtances are conſtituted which are ſimilar to metals in their opacity and luſtre, as plumbago and marcaſites. 3. The tranſparent ſubſtances of metals, as well as thoſe of minerals, by their union with phlogiſton, acquire their ſtrong reflective powers from which their luſtre and opacity ariſe. 4. The ſurfaces of pellucid media, ſuch as glaſs or water, aſſume a metallic appearance, when by their ſmoothneſs, difference of denſity with reſpect to the contiguous media, or any other cauſe, they are diſpoſed copiouſly to reflect the light.

"From all theſe conſiderations it is evident that opaque ſubſtances are conſtituted by the union or contiguity of tranſparent colourleſs media, differing from one another in their reflective powers: and that, when the common ſurface, which comes between ſuch media, is plane, equal, and ſmooth, it reflects the incident rays equally and regularly as a mirror; but when the ſurface is rough and unequal, or divided into minute particles, it reflects the incident rays irregularly and promiſcuouſly in different directions, and conſequently appears white."

45 Theory of colours ſtill uncertain. From all thoſe experiments we can only conclude, that the theory of colours ſeems not yet to be determined with certainty; and very formidable, perhaps unanſwerable, objections, might be brought againſt every hypotheſis on this ſubject that hath been invented. The diſcoveries of Sir Iſaac Newton, however, are ſufficient to juſtify the following

APHORISMS.

1. All the colours in nature proceed from the rays of light.

2. There are ſeven primary colours: which are red, orange, yellow, green, blue, indigo, and violet.

3. Every ray of light may be ſeparated into the ſeven primary colours.

4. The rays of light in paſſing through the ſame medium have different degrees of refrangibility.

5. The difference in the colours of light ariſes from its different refrangibility: that which is the leaſt refrangible producing red; and that which is the moſt refrangible violet.

6. By compounding any two of the primary colours, as red and yellow, or yellow and blue, the intermediate colour, as orange or green, may be produced.

7. The colours of bodies ariſe from their diſpoſitions to reflect one ſort of rays, and to abſorb the other: thoſe that reflect the leaſt refrangible rays appearing red; and thoſe that reflect the moſt refrangible violet.

8. Such bodies as reflect two or more ſorts of rays appear of various colours.

9. The whiteneſs of bodies ariſes from their diſpoſition to reflect all the rays of light promiſcuouſly.

10. The blackneſs of bodies proceeds from their incapacity to reflect any of the rays of light (c).

Entertaining EXPERIMENTS, *founded on the preceding Principles.*

I. *Out of a ſingle colourleſs ray of light to produce ſeven other rays, which ſhall paint, on a white body, the ſeven primary colours of nature.*

Plate CXXXV. fig. 1. PROCURE of an optician a large glaſs priſm DEF, well poliſhed, two of whoſe ſides muſt contain an angle of about ſixty-four degrees. Make a room quite dark, and in the window ſhutter AB, cut a round hole, about one-third of an inch in diameter, at C, through which a ray of light LI paſſing, falls on the priſm DEF: by that it is refracted out of the direction IT, in which it would have proceeded into another GH; and, falling on the paper MNSX, will there form an oblong ſpectrum PQ, whoſe ends will be ſemicircular, and its ſides ſtraight; and if the diſtance of the priſm from the paper be about eighteen feet, it will be ten inches long, and two inches wide. This ſpectrum will exhibit all the primary colours: the rays between P and V, which are the moſt refracted, will paint a deep violet: thoſe between V and I, indigo; thoſe between I and B, blue; thoſe between B and G, green; thoſe between G and Y, yellow; thoſe between Y and O, orange; and thoſe between O and R, being the leaſt refracted, an intenſe red. The colours between theſe ſpaces will not be every where equally intenſe, but will incline to the neighbouring colour: thus the part of the orange next to R, will incline to a red; that next to Y, to a yellow: and ſo of the reſt.

II. *From two or more of the primary colours, to compoſe others that ſhall, in appearance, reſemble thoſe of the former.*

BY mixing the two homogeneal colours red and yellow, an orange will be produced ſimilar in appearance to that in the ſeries of primary colours; but the light of the one being homogeneal, and that of the other heterogeneal, if the former be viewed through a priſm it will remain unaltered, but the other will be reſolved into its component colours red and yellow. In like manner other contiguous homogeneal colours may compound new colours; as by mixing yellow and green, a colour between them is formed; and if blue be added, there will appear a green that is the middle colour of thoſe three. For the yellow and blue, if they are equal in quantity, will draw the intermediate green equally toward them, and keep it, at it were, in equilibrio, that it verge not more to the one than to the other. To this compound green there may be added ſome red and violet; and yet the green will not immediately ceaſe, but grow leſs vivid; till by adding more red and violet it will become more diluted; and at laſt by the prevalence of the added colours, it will be overcome, and turned into ſome anomalous colour.

If the ſun's white, compoſed of all kinds of rays, be added

(c) From hence it ariſes, that black bodies, when expoſed to the ſun, become ſooner heated than all others.

added to any homogeneal colour, that colour will not vaniſh, nor change its ſpecies, but be diluted; and by adding more white, it will become continually more diluted. Laſtly, if red and violet be mixed, there will be generated, according to their various proportions, various purples, ſuch as are not like, in appearance, to the colour of any homogeneal light; and of theſe purples, mixed with blue and yellow, other new colours may be compoſed.

III. *Out of three of the primary colours, red, yellow, and blue, to produce all the other priſmatic colours, and all that are intermediate to them.*

Fig. 2. Provide three panes of glaſs of about five inches ſquare; and divide each of them, by parallel lines, into five equal parts. Take three ſheets of very thin paper; which you muſt paint, lightly, one blue, another yellow, and the third red (D). Then paſte on one of the glaſſes five pieces of the red paper; one of which muſt cover the whole glaſs, the ſecond only the four lower diviſions, the third the three lower, the fourth the two loweſt, and the fifth the laſt diviſion only. On the other two glaſſes five pieces of the blue and yellow papers muſt be paſted in like manner. You muſt alſo have a box of about ſix inches long, and the ſame depth and width as the glaſſes; it muſt be black on the inſide: let one end be quite open, and in the oppoſite end there muſt be a hole large enough to ſee the glaſſes completely. It muſt alſo open at the top, that the glaſſes may be placed in it conveniently.

When you have put any one of theſe glaſſes in the box, and the open end is turned toward the ſun, you will ſee five diſtinct ſhades of the colour it contains. If you place the blue and yellow glaſſes together, in a ſimilar direction, you will ſee five ſhades of green diſtinctly formed. When the blue and red glaſſes are placed, a bright violet will be produced; and by the red and yellow, the ſeveral ſhades of orange.

Fig. 3. If, inſtead of placing theſe glaſſes in a ſimilar poſition, you place the ſide AB of the yellow glaſs againſt the ſide BD of the blue, you will ſee all the various greens that are produced by nature (E); if the blue and red glaſſes be placed in that manner, you will have all the poſſible varieties of purples, violets, &c.; and, laſtly, if the red and orange glaſſes be ſo placed, there will be all the intermediate colours, as the marygold, aurora, &c.

IV. *By means of the three primary colours, red, yellow, and blue, together with light and ſhade, to produce all the gradations of the priſmatic colours.*

On ſeven ſquare panes of glaſs, paſte papers that are painted with the ſeven priſmatic colours, in the ſame manner as in the laſt experiment. The colours for the orange, green, indigo, and violet, may be made by mixing the other three. Then with biſtre (F), well diluted, ſhade a ſheet of very thin paper, by laying it light on both its ſides. With pieces of this paper cover four-fifths of a glaſs, of the ſame ſize with the others, by laying one piece on the four loweſt diviſions, another on the three loweſt, a third on the two loweſt, and the fourth on the loweſt diviſion only, and leaving the top diviſion quite uncovered. When one of the coloured glaſſes is placed in the box, together with the glaſs of ſhades, ſo that the ſide AB of the one be applied to the ſide BC of the other, as in fig. 3. the ſeveral gradations of colours will appear ſhaded in the ſame manner as a drapery judiciouſly painted with that colour.

It is on this principle that certain French artiſts have proceeded in their endeavours to imitate, by deſigns printed in colours, paintings in oil: which they do by four plates of the ſame ſize, on each of which is engraved the ſame deſign. One of theſe contains all the ſhades that are to be repreſented, and which are painted either black or with a dark grey. One of the three other plates is coloured with blue, another with red, and the third with yellow; each of them being engraved in thoſe parts only which are to repreſent that colour (G); and the engraving is either ſtronger or weaker, in proportion to the tone of colour that is to be repreſented (H).

Theſe four plates are then paſſed alternately under the preſs, and the mixture of their colours produces a print that bears no ſmall reſemblance to a painting. It muſt be confeſſed, however, that what has been hitherto done of this kind falls far ſhort of that degree of perfection of which this art appears ſuſceptible. If they who engrave the beſt in the manner of the crayon were to apply themſelves to this art, there is reaſon to expect

---

(D) Water-colours muſt be uſed for this purpoſe: the blue may be that of Pruſſia, and very bright; the red, carmine; and the yellow, gambooge, mixed with a little ſaffron. Theſe colours muſt be laid very light and even, on both ſides of the paper.

(E) In the firſt poſition of the glaſſes, the quantity of blue and yellow being equal, the ſame ſort of green was conſtantly viſible: but by thus inverting the glaſſes, the quantity of the colours being conſtantly unequal, a very pleaſing variety of tints is produced.

(F) The biſtre here uſed muſt be made of ſoot, not that in ſtone.

(G) When a red drapery is required, it is engraved on the plate aſſigned to that colour; and ſo of yellow and blue: but if one of the other colours be wanting, ſuppoſe violet, it muſt be engraved on thoſe that print the red and blue: and ſo of the reſt. The plates of this kind have been hitherto engraved in the manner of mezzotinto; but theſe, unleſs they are ſkilfully managed, ſoon become ſmutty. Engravings in the manner of the crayon will perhaps anſwer better.

(H) The principal difficulty in this ſort of engraving ariſes from a want of a ſkilful management, in giving each plate that preciſe degree of engraving which will produce the tone of colour required. If a bright green is to be repreſented, there ſhould be an equal quantity of graving on the red and yellow plates: but if an olive green, the yellow plate ſhould be engraved much deeper than the red.

expect they would produce far more finiſhed pieces than we have hitherto ſeen.

V. *To make figures appear of different colours ſucceſſively.*

Fig. 4. MAKE a hole in the window-ſhutter of a dark room, through which a broad beam of light may paſs, that is to be refracted by the large glaſs priſm ABC, which may be made of pieces of mirrors cemented together, and filled with water. Provide another priſm DEF, made of three pieces of wood; through the middle of this there muſt paſs an axis on which it is to revolve. This priſm muſt be covered with white paper; and each of its ſides cut through in ſeveral places, ſo as to repreſent different figures, and thoſe of each ſide ſhould likewiſe be different. The inſide of this priſm is to be hollow, and made quite black, that it may not reflect any of the light that paſſes through the ſides into it. When this priſm is placed near to that of glaſs, as in the figure, with one of its ſides EF perpendicular to the ray of light, the figures on that ſide will appear perfectly white: but when it comes into the poſition *g h*, the figures will appear yellow and red; and when it is in the poſition *k l*, they will appear blue and violet. As the priſm is turned round its axis, the other ſides will have a ſimilar appearance. If inſtead of a priſm, a four or five ſided figure be here uſed, the appearances will be ſtill further diverſified.

This phenomenon ariſes from the different refrangibility of the rays of light. For when the ſide EF is in the poſition *g h*, it is more ſtrongly illuminated by the leaſt refrangible rays; and wherever they are predominant, the object will appear red or yellow. But when it is on the poſition *k l*, the more refrangible rays being then predominant, it will appear tinged with blue and violet.

VI. *The ſolar magic lantern.*

PROCURE a box, of about a foot high, and eighteen inches wide, or ſuch other ſimilar dimenſions as you ſhall think fit; and about three inches deep. Two of the oppoſite ſides of this box muſt be quite open; and in each of the other ſides let there be a groove, wide enough to paſs a ſtiff paper or paſteboard. This box muſt be faſtened againſt a window on which the ſun's rays fall direct. The reſt of the window ſhould be cloſed up, that no light may enter. Provide ſeveral ſheets of ſtiff paper, which muſt be blacked on one ſide. On theſe papers cut out ſuch figures as you ſhall think proper: and placing them alternately in the grooves of the box, with their blacked ſides towards you, look at them through a large and clear glaſs priſm; and if the light be ſtrong, they will appear to be painted with the moſt lively colours in nature. If you cut on one of theſe papers the form of the rainbow, about three quarters of an inch wide, you will have a lively repreſentation of that in the atmoſphere.

This experiment may be further diverſified, by paſting very thin papers, lightly painted with different colours, over ſome of the parts that are cut out: which will appear to change their colours when viewed through the priſm, and to ſtand out from the paper, at different diſtances, according to the different degrees of refrangibility of the colours with which they are painted. For greater convenience, the priſm may be placed in a ſtand on a table, at the height of your eye, and made to turn round on an axis, that when you have got an agreeable proſpect, you may fix it in that poſition.

VII. *The priſmatic camera obſcura.*

MAKE two holes F, *f*, in the ſhutter of a dark chamber, near to each other; and againſt each hole place a priſm ABC, and *a b c*, in a perpendicular direction, that their ſpectrums NM may be caſt on the paper in a horizontal line, and coincide with each other; the red and violet of the one being in the ſame part with thoſe of the other. The paper ſhould be placed at ſuch a diſtance from the priſms that the ſpectrum may be ſufficiently dilated. Provide ſeveral papers nearly of the ſame dimenſions with the ſpectrum, croſs theſe papers, and draw lines parallel to the diviſions of the colours. In theſe diviſions cut out ſuch figures as you ſhall find will have an agreeable effect, as flowers, trees, animals, &c. When you have placed one of theſe papers in its proper poſition, hang a black cloth or paper behind it, that none of the rays that paſs through may be reflected and confuſe the phenomenon. The figures cut on the paper will then appear ſtrongly illuminated with all the original colours of nature. If while one of the priſms remains at reſt, the other be revolved on its axis, the continual alteration of the colours will afford a pleaſing variety; which may be further increaſed by turning the priſm round in different directions. Fig. 5.

When the priſms are ſo placed that the two ſpectrums become coincident in an inverted order of their colours, the red end of one falling on the violet end of the other; if they be then viewed through a third priſm DH, held parallel to their length, they will no longer appear coincident, but in the form of two diſtinct ſpectrums, *pt* and *nm* (fig. 6.), croſſing one another in the middle, like the letter X: the red of one ſpectrum and the violet of the other, which were coincident at NM, being parted from each other by a greater refraction of the violet to *p* and *m*, than that of the red to *n* and *t*.

This experiment may be further diverſified by adding two other priſms, that ſhall form a ſpectrum in the ſame line, and contiguous in the other; by which not only the variety of figures, but the viciſſitude of colours, will be conſiderably augmented.

The diatonic ſcale of colours.

THE illuſtrious Newton, in the courſe of his inveſtigations of the properties of light, diſcovered that the length of the ſpaces which the ſeven primary colours poſſeſs in the ſpectrum, exactly correſponds to thoſe of chords that ſound the ſeven notes in the diatonic ſcale of muſic. As is evident by the following experiment.

On a paper in a dark chamber, let a ray of light be largely refracted into the ſpectrum AFTMGP, and mark the preciſe boundaries of the ſeveral colours, as *a*, *b*, *c*, *&c.* Draw lines from thoſe points perpendicular to the oppoſite ſide, and you will find that the ſpaces M *r f* F, by which the red is bounded: *r g e f*, by which the orange is bounded; *q p e d*, by which the yellow is bounded, *&c.* will be in exact proportion Fig. 7.

to

to the diviſions of a muſical chord for the notes of an octave; that is, as the intervals of theſe numbers 1, $\frac{8}{9}$, $\frac{5}{6}$, $\frac{3}{4}$, $\frac{2}{3}$, $\frac{3}{5}$, $\frac{9}{16}$, $\frac{1}{2}$.

IX. *Colorific muſic.*

Father Castel, a Frenchman, in a curius book he has publiſhed on chromatics, ſuppoſes the note *ut* to anſwer to blue in the priſmatic colours; the note *re* to yellow, and *mi* to red. The other tones he refers to the intermediate colours; from whence he conſtructs the following gamut of colorific muſic:

Ut	Blue
Ut ſharp	Sea-green
Re	Bright green
Re ſharp	Olive green
Mi	Yellow
Fa	Aurora
Fa ſharp	Orange
Sol	Red
Sol ſharp	Crimſon
La	Violet
La ſharp	Blue Violet
Si	Sky blue
Ut	Blue

This gamut, according to his plan, is to be continued in the ſame manner for the following octave; except that the colours are to be more vivid.

He ſuppoſes that theſe colours, by ſtriking the eye in the ſame ſucceſſion as the ſounds (to which he makes them analogous) do the ear, and in the ſame order of time, they will produce a correſpondent ſenſation of pleaſure in the mind. It is on theſe general principles, which F. Caſtel has dilucidated in his treatiſe, that he has endeavoured, though with little ſucceſs, to eſtabliſh his ocular harpſichord.

The conſtruction of this inſtrument, as here explained, will ſhow that the effects produced by colours by no means anſwer thoſe of ſounds, and that the principal relation there is between them conſiſts in the duration of the time that they reſpectively affect the ſenſes.

Fig. 8. Between two circles of paſteboard, of ten inches diameter, AB and CD, incloſe a hollow paſteboard cylinder E, 18 inches long. Divide this cylinder into ſpaces half an inch wide, by a ſpiral line that runs round it from top to bottom, and divide its ſurface into ſix equal parts by parallel lines drawn between its two extremities; as is expreſſed in the figure.

Let the circle AB, at top, be open; and let that at bottom, CD, be cloſed, and ſupported by an axis or ſcrew, of half an inch diameter, which muſt turn freely in a nut placed at the bottom of a box we ſhall preſently deſcribe. To the axis juſt mentioned adjuſt a wooden wheel G, of two inches and a half in diameter, and that has 12 or 15 teeth, which take the endleſs ſcrew H. Let this cylinder be incloſed in a box ILMN (fig. 9.) whoſe baſe is ſquare, and at whoſe bottom there is a nut in which the axis F turns. Obſerve that the endleſs ſcrew H ſhould come out of the box, that it may receive the handle O, by which the cylinder is to be turned.

This box being cloſed all round, place over it a tin covering A, which muſt be perforated in different parts; from this cover there muſt hang three or four lights, ſo placed that they may ſtrongly illumine the inſide of the cylinder. In one ſide of this box (which ſhould be covered with paſteboard) cut eight apertures, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, of half an inch wide, and $\frac{1}{3}$ of an inch high; they muſt be directly over each other, and the diſtance between them muſt be exactly two inches. It is by theſe openings, which here correſpond to the muſical notes, that the various colours analogous to them are to appear; and which being placed on the paſteboard cylinder, as we have ſhown, are reflected by means of the lights placed within it. Fig. 9.

It is eaſy to conceive, that when the handle O is turned, the cylinder in conſequence riſing half an inch, if it be turned five times round, it will ſucceſſively ſhow, at the openings made in the ſide of the box, all thoſe that are in the cylinder itſelf, and which are ranged according to the direction of the inclined lines drawn on it. It is therefore according to the duration of the notes which are to be expreſſed, that the apertures on the cylinder are to be cut. Obſerve, that the ſpace between two of the parallel lines drawn vertically on the cylinder, is equal to one meaſure of time; therefore, for every turn of the cylinder, there are ſix meaſures, and thirty meaſures for the air that is to be played by this inſtrument.

The ſeveral apertures being made in the ſide of the cylinder, in conformity to the notes of the tune that is to be expreſſed, they are to be covered with double pieces of very thin paper, painted on both ſides with the colours that are to repreſent the muſical notes.

This experiment might be executed in a different manner, and with a much greater extent; but as the entertainment would not equal the trouble and expence, we have thought it ſufficient to give the above piece, by which the reader will be enabled to judge how far the analogy ſuppoſed by F. Caſtel really exiſts.

Chronic, Chronicle.

CHRONIC, or chronical, among phyſicians, an appellation given to diſeaſes that continue a long time; in contradiſtinction to thoſe that ſoon terminate and are called *acute*.

CHRONICLE, in matters of literature, a ſpecies or kind of hiſtory diſpoſed according to the order of time, and agreeing in moſt reſpects with annals. See Annals.

Parian Chronicle. See *Arundelian Marbles*. Since that article was printed, in which an abſtract was given of Mr Robertſon's doubts and obſervations reſpecting the authenticity of the Parian Chronicle, one or two publications have ſince appeared in anſwer, but none of them calculated to remove the objections or materially to affect the arguments that had been ſtated with ſo much learning and ingenuity againſt it. The following ſtrictures, however, with which the Monthly Reviewers have concluded their critique of Mr Robertſon's performance, ſeem to merit conſideration.

Chronicle.

Monthly Review, Jan. 1787.

On Objection I. *That the characters have no certain or unequivocal marks of antiquity*, the Reviewers remark, that this ſeems rather to be an anſwer to a defender of the inſcription, than an objection. If a zealous partizan of the marble ſhould appeal to its characters and orthography, as deciſive proofs of its being genuine, it would be proper enough to anſwer, that theſe circumſtances afford no certain criterion of authenticity. But in this word *certain* ſculks an unlucky ambiguity. If it means demonſtrative, it muſt be allowed that no inſcription can be proved to be certainly genuine from theſe appearances; but if it means no more than highly probable, many inſcriptions poſſeſs ſufficient internal evidence to give their claims this degree of certainty. The true queſtion is, Has not the Parian Chronicle every mark of antiquity that can be expected in a monument claiming the age of 2000 years? The letters Γ and Ξ are, by Mr R's own confeſſion, ſuch as occur in genuine inſcriptions; and to ſay in anſwer, that an impoſtor might copy the forms of theſe letters from other inſcriptions, is already to ſuppoſe the inſcription forged, before it is rendered probable by argument. The learned author of the Diſſertation ſeems to betray ſome doubt of his own concluſion; for he adds, p. 56. "that the antiquity of an inſcription can never be proved by the mere form of the letters, becauſe the moſt ancient characters are as eaſily counterfeited as the modern." But this objection is equally applicable to all other ancient inſcriptions; and is not to the purpoſe, if the preſent inſcription has any peculiar marks of impoſture in its characters and orthography. "The characters do not reſemble the Sigean, the Nemean, or the Delian inſcriptions." Mr R. anſwers this objection himſelf, by adding, "which are ſuppoſed to be of a more ancient date." The oppoſite reaſon to this will be a ſufficient anſwer to the other objection, "that they do not reſemble the Farneſian pillars or the Alexandrian MS." If "they differ in many reſpects from the Marmor Sandvicenſe," they may be preſumed to agree in many. "They ſeem to reſemble, more than any other, the alphabet taken by Montfaucon from the Marmor Cyzicenum." Thus it appears that the Parian Chronicle moſt nearly reſembles the two inſcriptions, to whoſe age it moſt nearly approaches.

When Mr R. adds, that the letters "are ſuch as an ordinary ſtone-cutter would probably make, if he were employed to engrave a Greek inſcription, according to the alphabet now in uſe," he muſt be underſtood *cum grano ſalis*. The engraver of a fac ſimile generally omits ſome nice and minute touches in taking his copy; but, even with this abatement, we dare appeal to any adept in Greek calligraphy, whether the ſpecimen facing p. 56, will juſtify our author's obſervation? "The ſmall letters (ο, Θ, Ω) intermixed among the larger, have an air of affectation and artifice." Then has the greater part of ancient inſcriptions an air of affectation and artifice. For the ο is perpetually engraved in this diminutive ſize; and Ω being of a kindred ſound, and Θ of a kindred ſhape, how can we wonder that all three ſhould be repreſented of the ſame magnitude? In the inſcription which immediately follows the marble in Dr Chandler's edition, N° XXIV. theſe very three letters are never ſo large as the reſt, and often much ſmaller; of which there are inſtances in the three firſt lines. See alſo two medals in the ſecond part of Dorville's Siculà, Tab. XVI. Numb. 7, 9.

"From the archaiſms, ſuch as εγ Λυκαρειας, εγ Κυβελοις, εμ Παρωι, &c. &c. no concluſion can be drawn in favour of the authenticity of the inſcription." Yet ſurely every thing common to it with other inſcriptions, confeſſedly genuine, creates a reaſonable preſumption in its favour. "But what reaſon could there be for theſe archaiſms in the Parian Chronicle? We do not uſually find them in Greek writers of the ſame age, or even of a more early date." The reaſon is, according to our opinion, that ſuch archaiſms were then in uſe: this we know from other inſcriptions, in which ſuch archaiſms (or, as our author afterward calls them, barbariſms) are frequent. Nothing can be inferred from the Greek writers, unleſs we had their autographs. The preſent ſyſtem of orthography in our printed Greek books is out of the queſtion. Again, "The inſcription ſometimes adopts and ſometimes neglects theſe archaiſms, as in lines 4, 12, 27, 52, 63, 67." This inconſiſtency either is no valid objection, or if it be valid, will demoliſh not only almoſt every other inſcription, but almoſt every writing whatſoever. For example, in the inſcription juſt quoted, N° XXIV. we find τοΝ βασιλεα, l. 20. and οταΜ πεμπτηι, 34. A little farther, N° XXVI. l. 31. we have εΓ Μαγνησιας, 57. 73. 81. εΚ Μαγνησιας, and 106. 108. εΚΓ Μαγνησιας. The Corcyrean inſcription (Montfaucon, Diar. Ital. p. 420) promiſcuouſly uſes εΚδανειζομαι and εΓδανειζομαι. In Engliſh, who is ſurpriſed to find *has* and *hath*, *a hand* and *an hand*, *a uſeful* and *an uſeful*, in the works of the ſame author? We could produce inſtances of this inaccuracy from the ſame page, nay from the ſame ſentence.

"The authenticity of thoſe inſcriptions, in which theſe archaiſms appear, muſt be eſtabliſhed, before they can be produced in oppoſition to the preſent argument." This is, we cannot help thinking, rather too ſevere a reſtriction. If no inſcription may be quoted before it be proved genuine, the learned author of the Diſſertation need not be afraid of being confuted; for nobody will engage with him on ſuch conditions. Perhaps the reverſe of the rule will be thought more equitable; that every inſcription be allowed to be genuine, till its authenticity be rendered doubtful by probable arguments. We will conclude this head with two ſhort obſervations. In Selden's copy, l. 26. was written ΠΟΗΣΙΝ, which the later editors have altered to ΠΟΙΗΣΙΝ, but without reaſon, the other being the more ancient way of writing, common in MSS. and ſometimes found on inſcriptions. (See G. Koen's Notes on *Gregorius de Dialectis*, p. 30.) In l. 83. the marble has Καλλεου, for which Palmer wiſhed to ſubſtitute Καλλιου. Dr Taylor refutes him from the *Marmor Sandvicenſe*, obſerving at the ſame time, that this orthography occurs in no other place whatever except in theſe two monuments. Is it likely that two engravers ſhould by chance coincide in the ſame miſtake, or that the forger of the Parian Chronicle (if it be forged) ſhould have ſeen the *Marmor Sandvicenſe*, and taken notice of this peculiarity with the intention of afterward employing it in the fabrication of an impoſture?

The Reviewers next proceed to conſider, but more briefly, the other objections.

II. *It is not probable that the Chronicle was engraved for private uſe.* 1. *Becauſe it was ſuch an expence, as few learned Greeks were able to afford.* If only a *few* were able to afford it, ſome one of thoſe *few* might be willing to incur it. But let Mr R. conſider how likely it is that a modern, and probably a needy Greek, ſhould be more able to afford it in the laſt century, than a learned Greek 2000 years ago! 2. *A manuſcript is more readily circulated.* Do men never prefer cumbrous ſplendor to cheapneſs and convenience? And if this compoſition, inſtead of being engraved on marble, had been committed to parchment, would it have had a better chance of coming down to the preſent age? Such a flying ſheet would ſoon be loſt; or, if a copy had, by miracle, been preſerved to us, the objections to its being genuine would be more plauſible than any that have been urged againſt the inſcription. What Mr R. ſays about the errors to which an inſcription is liable, &c. will only prove that chronological inſcriptions ought not to be engraved; but not that they never were. We allow that the *common* method of writing in the reign of Ptolemy Philadelphus was NOT on STONES. But it was common enough to occur to the mind of any perſon who wiſhed to leave behind him a memorial at once of his learning and magnificence.

III. This objection, *that the marble does not appear to be engraved by public authority*, we ſhall readily admit, though Bentley (Diſſ. on Phalaris, p. 251.) leans to the contrary opinion. In explaining this objection, the learned diſſertator obſerves, that though the expreſſion, αρχοντος εμ Παρωι, would lead us to ſuppoſe that the inſcription related to Paros, not a ſingle circumſtance in the hiſtory of that iſland is mentioned. But this expreſſion only ſhows that the author was an inhabitant of Paros, and intended to give his readers a clue, or *parapegma*, by the aid of which they might adjuſt the general chronology of Greece to the dates of their own hiſtory. "It is as abſurd as would be a marble in Jamaica containing the revolutions of England." We ſee no abſurdity in ſuppoſing a book to be written in Jamaica containing the revolutions of England. The natives of Paros were not unintereſted in events relating to the general hiſtory of Greece, particularly of Athens; and how can we tell whither the author were an *inquilinus* or a native of the iſland; whether he thought it a place beneath his care; or whether he had devoted a ſeparate inſcription to the chronology of Paros?

IV. *It has been frequently obſerved, that the earlier periods of the Grecian hiſtory are involved in darkneſs and confuſion.* Granted. It follows then, that "an author who ſhould attempt to ſettle the dates of the earlier periods would frequently contradict preceding, and be contradicted by ſubſequent, writers: that he would naturally fall into miſtakes: and at beſt could only hope to adopt the moſt probable ſyſtem. But the difficulty of the taſk, or the impoſſibility of ſucceſs, are not ſufficient to prove that no man has been raſh or mad enough to make the attempt." On the contrary, we know that many have made it. What a number of diſcordant opinions has Mr R. himſelf given us from the ancients concerning the age of Homer? This conſideration will in part obviate another objection, that the Parian Chronicle does not agree with any ancient author. For if the ancients contradict one another, how could it follow more than one of them? and why might not the author, without any imputation of ignorance or raſhneſs, ſometimes depart from them all? If indeed he diſagrees with them when they are unanimous, it might furniſh matter for ſuſpicion; though even this would be far from a deciſive argument, unleſs the ancients were ſo extremely unlike the moderns, as never to be fond of ſingular and paradoxical poſitions.

V. *This Chronicle is not once mentioned by any writer of antiquity.* How many of thoſe inſcriptions, which are preſerved to the preſent day, are mentioned by claſſical authors? Verrius Flaccus compoſed a Roman kalendar, which, as a monument of his learning and induſtry, was engraved on marble, and fixed in the moſt public part of Preneſte. Fragments of this very kalendar were lately dug up at Preneſte, and have been publiſhed by a learned Italian. Now, if the paſſage of Suetonius, which informs us of this circumſtance, had been loſt, would the ſilence of the Latin writers prove that the fragments were not genuine remains of antiquity? It may be ſaid that the caſes are not parallel; for not a ſingle author mentions the Parian Chronicle, whereas Suetonius does mention Verrius's Roman kalendar. To this we anſwer, It is dangerous to deny the authenticity of any monument on the ſlender probability of its being caſually mentioned by a ſingle author. We ſhall alſo obſerve, that this fact of the Hemicyclium of Verrius will anſwer ſome part of the Diſſertator's ſecond objection: "The Parian Chronicle is not an inſcription that might have been concealed in a private library." Why not? it is of no extraordinary bulk; and might formerly have been concealed in a private library, or in a private room, with as much eaſe as many inſcriptions are now concealed in very narrow ſpace. But unleſs the monument were placed in ſome conſpicuous part of the iſland, and obtruded itſelf on the notice of every traveller, the wonder will in great meaſure ceaſe why it is never quoted by the ancients. Of the nine authors named in p. 109, had any one ever viſited Paros? If Pauſanias had travelled thither, and publiſhed his deſcription of the place, we might perhaps expect to find ſome mention of this marble in ſo curious and inquiſitive a writer. But though the inſcription exiſted, and were famous at Paros, there ſeems no neceſſity for any of the authors whoſe works are ſtill extant to have known or recorded it. If there be, let this learned antagoniſt point out the place where this mention ought to have been made. If any perſons were bound by a ſtronger obligation than others to ſpeak of the Parian inſcription, they muſt be the profeſſed chronologers; but alas! we have not the entire works of ſo much as a ſingle ancient chronologer: It is therefore impoſſible to determine whether this Chronicle were quoted by any ancient. And ſuppoſing it had been ſeen by ſome ancient, whoſe writings ſtill remain, why ſhould he make particular mention of it? Many authors, as we know from their remains, very freely copied their predeceſſors without naming them. Others, finding only a collection of bare events in the inſcription, without hiſtorical proofs or reaſons, might entirely neglect it, as deſerving no credit. Mr R. ſeems to lay much ſtreſs on the preciſe, exact, and particular ſpecification of the events, p. 109. But he ought to reflect, that this abrupt and poſitive method of ſpeaking is not only uſual, but neceſſary, in ſuch ſhort ſyſtems of chronology as the marble contains, where events only, and their dates, are ſet down, unaccompanied by any examination of evidences for and againſt, without ſtating any computation of probabilities, or deduction of reaſons. When therefore a chronological writer had undertaken to reduce the general hiſtory of Greece into a regular and conſiſtent ſyſtem, admitting that he was acquainted with this inſcription, what grounds have we to believe that he would ſay any thing about it? Either his ſyſtem coincided with the Chronicle or not: if it coincided, he would very probably diſdain to prop his own opinions with the unſupported aſſertions of another man, who, as far as he knew was not better informed than himſelf. On the other hand, if he differed from the authority of the marble, he might think it a ſuperfluous exertion of complaiſance, to refute, by formal demonſtration, a writer who had choſen to give no reaſons for his own opinion. We ſhall paſs hence to

Objection VII. With reſpect to the parachroniſms that Mr R. produces, we ſhall without heſitation grant, that the author of the inſcription may have committed ſome miſtakes in the chronology, as perhaps concerning Phidon, whom he ſeems to have confounded with another of the ſame name, &c. But theſe miſtakes will not conclude againſt the antiquity of the inſcription, unleſs we at the ſame time reject many of the principal Greek and Roman writers, who have been convicted of ſimilar errors. We return therefore to

Objection VI. *Some of the facts ſeem to have been taken from authors of a later date.* We have endeavoured impartially to examine and compare the paſſages quoted in proof of this objection; but we are obliged to confeſs, that we do not perceive the fainteſt traces of theft or imitation. One example only deſerves to be excepted; to which we ſhall therefore pay particular attention.

"The names of ſix; and, if the lacunæ are properly ſupplied, the names of twelve cities, appear to have been engraved on the marble, exactly as we find them in Ælian's Various Hiſtory. But there is not any imaginable reaſon for this particular arrangement. It does not correſpond with the time of their foundation, with their ſituation in Ionia, with their relative importance, or with the order in which they are placed by other eminent hiſtorians."

The chance of ſix names, ſays Mr R. being placed by two authors in the ſame order, is as 1 to 720; of 12, as 1 to 479,001,600. "It is therefore utterly improbable that theſe names would have been placed in this order on the marble, if the author of the inſcription had not tranſcribed them from the hiſtorian."

On this argument we ſhall obſerve, 1. That the very contrary concluſion might poſſibly be juſt, that the hiſtorian tranſcribed from the inſcription. Yet we ſhall grant that in the preſent caſe this is improbable, eſpecially if the author of the Various Hiſtory be the ſame Ælian, who, according to Philoſtratus, Vit. Sophiſt. II. 31. never quitted Italy in his life. But an intermediate writer might have copied the marble, and Ælian might have been indebted to him. 2dly, We ſee no reaſon to allow, that the *lacunæ* are properly ſupplied. Suppoſe we ſhould aſſert, that the names ſtood originally thus: Miletus, Epheſus, Erythræ, Clazomenæ, Lebedos, Chios, Phocæa, Colophon, Myus, Priene, Samos, Teos. In this arrangement, only four names would be together in the ſame order with Ælian; and from theſe Miletus muſt be excepted, becauſe there is an obvious reaſon for mentioning that city firſt. Three only will then remain; and ſurely that is too ſlight a reſemblance to be conſtrued into an imitation. For Pauſanias and Paterculus, quoted by our author, p. 154, have both enumerated the ſame twelve cities, and both agree in placing the five laſt in the ſame order; nay, the ſix laſt, if Voſſius's conjecture that TEUM ought to be inſerted in Paterculus after Myum TEM be as true as it is plauſible. But who imagines that Pauſanias had either opportunity or inclination to copy Paterculus? 3dly, Allowing that the names were engraved on the marble exactly in the order that Ælian has choſen, is there no way of ſolving the phenomenon but by ſuppoſing that one borrowed from the other? Seven authors at leaſt (Mr R ſeems to ſay more, p. 154, 5.) mention the colonization of the ſame cities: how many authors now loſt may we reaſonably conjecture to have done the ſame? If therefore the compoſer of the Chronicle and Ælian lighted on the ſame author, the former would probably preſerve the ſame arrangement that he found, becauſe in tranſcribing a liſt of names, he could have no temptation to deviate; and the latter would certainly adhere faithfully to his original, becauſe he is a notorious and ſervile plagiariſt. Mr R. indeed thinks, p. 158, that if a ſucceeding writer had borrowed the words of the inſcription, he would not have ſuppreſſed the name of the author. This opinion muſt fall to the ground, if it be ſhown that Ælian was accuſtomed to ſuppreſs the names of the authors to whom he was obliged. Ælian has given a liſt of fourteen celebrated gluttons; and, elſewhere, another of twenty-eight drunkards (from which, by the way, it appears, that people were apt to eat and drink rather too freely in ancient as well as modern times); and both theſe liſts contain exactly the ſame names in the ſame order with Atheneus. Now, it is obſervable, that fourteen names may be tranſpoſed 87,178,291,200 different ways, and that twenty-eight names admit of 304,888,344,611,713,860,501,504,000,000 different tranſpoſitions, &c. &c. Ælian therefore tranſcribed them from Atheneus? yet Ælian never mentions Atheneus in his Various Hiſtory. So that whether Ælian copied from the marble, or only drew from a common ſource, he might, and very probably would, conceal his authority.

VIII. *The hiſtory of the diſcovery of the Marbles is obſcure and unſatisfactory.*

In p. 169, it is ſaid to be "related with ſuſpicious circumſtances, and without any of thoſe clear and unequivocal evidences which always diſcriminate truth from falſehood." The queſtion then is finally decided. If the inſcription has not any of thoſe evidences which truth always poſſeſſes, and which falſehood always wants, it is moſt certainly forged. The learned diſſertator ſeems for a moment to have forgotten the modeſt character of a *doubter*, and to perſonate the dogmatiſt. But waving this, we ſhall add, that, as far as we can ſee, no no appearance of fraud is diſcoverable in any part of the tranſaction. The hiſtory of many inſcriptions is related in a manner equally unſatisfactory; and if it could be clearly proved that the marble was dug up at Paros, what would be eaſier for a critic, who is determined at any rate to object, than to ſay, that it was buried there in order to be afterward dug up? If the perſon who brought this treaſure to light had been charged on the ſpot with forging it, or concurring in the forgery, and had then refuſed to produce the external evidences of its authenticity, we ſhould have a right to queſtion, or perhaps to deny, that it was genuine. But no ſuch objection having been made or hinted, at the original time of its diſcovery, it is unreaſonable to require ſuch teſtimony as it is now impoſſible to obtain. "There is nothing ſaid of it in Sir T. Roe's negotiations." What is the inference? That Sir Thomas knew nothing of it, or believed it to be ſpurious, or forged it, or was privy to the forgery? Surely nothing of this kind can be pretended. But let our author account for the circumſtance if he can. To us it ſeems of no conſequence on either ſide. "Peireſc made no effort to recover this precious relic; and from his compoſure he ſeems to have entertained ſome ſecret ſuſpicious of its authenticity." Peireſc would have had no chance of recovering it after it was in the poſſeſſion of lord Arundel's agents. He was either a real or a pretended patron of letters; and it became him to affect to be pleaſed that the inſcription had come into England, and was illuſtrated by his learned friend Selden. John F. Gronovius had, with great labour and expence, collated Anna Comnena's Alexiades, and intended to publiſh them. While he was waiting for ſome other collations, they were intercepted, and the work was publiſhed by another. As ſoon as Gronovius heard this unpleaſant news, he anſwered, that learned men were engaged in a common cauſe; that if one prevented another in any publication, he ought rather to be thanked for lightening the burden; than blamed for interfering. But who would conclude from this anſwer, that Gronovius thought the Alexiades ſpurious, or not worthy of any regard?

Mr R. calculates, that the venders of the marble received 200 pieces. But here again we are left in the dark, unleſs we knew the preciſe value of theſe pieces. Perhaps they might be equal to an hundred of our pounds, perhaps only to fifty. Beſides, as they at firſt bargained with Samſon Piereſc's ſuppoſed Jew agent for fifty pieces only, they could not have forged the inſcription with the clear proſpect of receiving more; neither does it appear that they were paid by Samſon. It is fully as reaſonable to ſuppoſe fraud on the one ſide as on the other; and if Samſon, after having the marble in his poſſeſſion, refuſed or delayed to pay the ſum ſtipulated, he might, in conſequence of ſuch refuſal or delay, be thrown into priſon, and might, in revenge, damage the marble before the owners could recover it. We own this account of ours to be a romance; but it is lawful to combat romance with romance.

IX. *The world has been frequently impoſed upon by ſpurious books and inſcriptions; and therefore we ſhould be extremely cautious with regard to what we receive under the venerable name of antiquity.*

Much truth is obſervable in this remark. But the danger lies in applying ſuch general apophthegms to particular caſes. In the firſt place, it muſt be obſerved, that no forged books will exactly ſuit Mr R.'s purpoſe, but ſuch as pretend to be the author's own hand-writing; nor any inſcriptions, but ſuch as are ſtill extant on the original materials, or ſuch as were known to be extant at the time of their pretended diſcovery. Let the argument be bounded by theſe limits, and the number of forgeries will be very much reduced. We are not in poſſeſſion of Cyriacus Anconitanus's book; but if we were governed by authority, we ſhould think that the teſtimony of Reineſius in his favour greatly overbalances all that Auguſtinus has ſaid to his prejudice. The opinion of Reineſius is of the more weight, becauſe he ſuſpects Urſinus of publiſhing counterfeit monuments. We likewiſe find the moſt eminent critics of the preſent age quoting Cyriacus without ſuſpicion (*Vid.* Ruhnken. in Timæi Lex. Plat. p. 10. apud Ceon, ad Gregor. p. 140.) The doctrine advanced in the citation from Hardouin is exactly conformable to that writer's uſual paradoxes. He wanted to deſtroy the credit of all the Greek and Latin writers. But inſcriptions hung like a millſtone about the neck of his project. He therefore reſolved to make ſure work, and to deny the genuineneſs of as many as he ſaw convenient: to effect which purpoſe, he intrenches himſelf in a general accuſation. If the author of the diſſertation had quoted a few more paragraphs from Hardouin, in which he endeavours, after his manner, to ſhow the forgery of ſome inſcriptions, he would at once have adminiſtered the poiſon and the antidote. But to the reveries of that learned madman, reſpecting Greek ſuppoſititious compoſitions of this nature, we ſhall content ourſelves with oppoſing the ſentiments of a modern critic, whoſe judgment on the ſubject of ſpurious inſcriptions will not be diſputed. Maffei, in the introduction to the third book, c. 1. p. 51. of his admirable, though unfiniſhed, work *de Arte Critica Lapidaria*, uſes theſe words: *Inſcriptionum Græce loquentium commentitias, ſi cum Latinis comparemus, deprehendi paucas; neque enim ullum omnino eſt, in tanta debacchantium falſariorum libidine, monumenti genus, in quod ii ſibi minus licere putaverint. Argumenta eſt, pauciſſimas uſque in hanc diem ab eruditis viris, et in hoc literarum genere plurimum verſatis rejectas eſſe, falſique damnatas.*

Books of CHRONICLES, a canonical writing of the Old Teſtament. It is uncertain which were written firſt, *The Books of Kings*, or *The Chronicles*, ſince they each refer to the other. However it be, the latter is often more full and comprehenſive than the former. Whence the Greek interpreters call theſe two books Παραλειπομενα, *Supplements*, *Additions*, becauſe they contain ſome circumſtances which are omitted in the other hiſtorical books. The Jews make but one book of the Chronicles, under the title of *Dibre-Haiamim*, i. e. *Journals or Annals*. Ezra is generally believed to be the author of theſe books. It is certain they were written after the end of the Babyloniſh captivity and the firſt year of the reign of Cyrus, of whom mention is made in the laſt chapter of the ſecond book.

The *Chronicles*, or *Paraleipomena*, are an abridgement

ment of all the ſacred hiſtory, from the beginning of the Jewiſh nation to their firſt return from the captivity taken out of thoſe books of the Bible which we ſtill have, and out of other annals which the author had then by him. The deſign of the writer was to give the Jews a ſeries of their hiſtory. The firſt book relates to the riſe and propagation of the people of Iſrael from Adam, and gives a punctual and exact account of the reign of David. The ſecond book ſets down the progreſs and end of the kingdom of Judah, to the very year of their return from the Babyloniſh captivity.

CHRONOGRAM, a ſpecies of falſe wit, conſiſting in this, that a certain date or epocha is expreſſed by numeral letters of one or more verſes; ſuch is that which makes the motto of a medal ſtruck by Guſtavus Adolphus in 1632:

ChrIſtVs DVX; ergo trIVMphVs.

CHRONOLOGY,

1 How divided.

TREATS of time, the method of meaſuring its parts, and adapting theſe, when diſtinguiſhed by proper marks and characters, to paſt tranſactions, for the illuſtration of hiſtory. This ſcience therefore conſiſts of two parts. The firſt treats of the proper meaſurement of time, and the adjuſtment of its ſeveral diviſions; the ſecond of fixing the dates of the various events recorded in hiſtory, and ranging them, according to the ſeveral diviſions of time, in the order in which they happened.

2 Chronology unknown to the ancients.

3 Inaccurate methods of computing time at firſt made uſe of.

Chronology, comparatively ſpeaking, is but of modern date. The ancient poets appear to have been entirely unacquainted with it; and Homer, the moſt celebrated of them all, mentions nothing like a formal kalendar in any part of his writings. In the moſt early periods, the only meaſurement of time was by the ſeaſons, the revolutions of the ſun and moon; and many ages muſt have elapſed before the mode of computation by dating events came into general uſe. Several centuries intervened between the era of the olympic games and the firſt hiſtorians; and ſeveral more between theſe and the firſt authors of chronology. When time firſt began to be reckoned, we find its meaſures very indeterminate. The ſucceſſion of Juno's prieſteſſes at Argos ſerved Hellanicus for the regulation of his narrative; while Ephorus reckoned his matters by generations. Even in the hiſtory of Herodotus and Thucydides, we find no regular date for the events recorded; nor was there any attempt to eſtabliſh a fixed era, until the time of Ptolemy Philadelphus, who attempted it by comparing and correcting the dates of the olympiads, the kings of Sparta, and the ſucceſſion of the prieſteſſes of Juno at Argos. Eratoſthenes and Apollodorus digeſted the events recorded by them according to the ſucceſſion of the olympiads and of the Spartan kings.

4 Ancient hiſtorians not to be credited.

The uncertainty of the meaſures of time in the moſt early periods renders the hiſtories of thoſe times equally uncertain; and even after the invention of dates and eras, we find the ancient hiſtorians very inattentive to them, and inaccurate in their computations. Frequently their eras and years were reckoned differently without their being ſenſible of it, or at leaſt without giving the reader any information concerning it; a circumſtance which has rendered the fragments of their works now remaining of very little uſe to poſterity. The Chaldean and Egyptian writers are generally acknowledged to be fabulous; and Strabo acquaints us, that Diodorus Siculus, and the other early hiſtorians of Greece, were ill informed and credulous. Hence the diſagreement among the ancient hiſtorians, and the extreme confuſion and contradiction we meet with on comparing their works. Hellanicus and Aceſilaus diſagreed about their genealogies; the latter rejected the traditions of Heſiod. Timæus accuſed Ephorus of falſehood, and the reſt of the world accuſed Timæus. The moſt fabulous legends were impoſed on the world by Herodotus; and even Thucydides and Diodorus, generally accounted able hiſtorians, have been convicted of error. The chronology of the Latins is ſtill more uncertain. The records of the Romans were deſtroyed by the Gauls; and Fabius Pictor, the moſt ancient of their hiſtorians, was obliged to borrow the greateſt part of his information from the Greeks. In other European nations the chronology is ſtill more imperfect and of a later date; and even in modern times, a conſiderable degree of confuſion and inaccuracy has ariſen from want of attention in the hiſtorians to aſcertain the dates and epochs with preciſion.

5 Utility of chronology, liſt of chronologers, &c.

From theſe obſervations it is obvious how neceſſary a proper ſyſtem of chronology muſt be for the right underſtanding of hiſtory, and likewiſe how very difficult it muſt be to eſtabliſh ſuch a ſyſtem. In this, however, ſeveral learned men have excelled, particularly Julius Africanus, Euſebius of Cæſarea, George Cyncelle, John of Antioch, Dennis, Petau, Cluviar, Calviſius, Uſher, Simſon Marſham, Blair, and Playfair. It is founded, 1. On aſtronomical obſervations, particularly of the eclipſes of the ſun and moon, combined with the calculations of the eras and years of different nations. 2. The teſtimonies of credible authors. 3. Thoſe epochs in hiſtory which are ſo well atteſted and determined, that they have never been controverted. 4. Ancient medals, coins, monuments, and inſcriptions. None of theſe, however, can be ſufficiently intelligible without an explanation of the firſt part, which, we have already obſerved, conſiders the diviſions of time, and of which therefore we ſhall treat in the firſt place.

6 Of the diviſion of time into days.

The moſt obvious diviſion of time is derived from the apparent revolutions of the celeſtial bodies, particularly of the ſun, which by the viciſſitudes of day and night becomes evident to the moſt barbarous and ignorant nations. In ſtrict propriety of ſpeech the word *day* ſignifies only that portion of time during which the ſun diffuſes light on any part of the earth; but in the moſt comprehenſive ſenſe, it includes the night alſo, and is called by chronologers a *civil* day; by aſtronomers a *natural*, and ſometimes an *artificial*, day.

7 Civil, ſolar, &c. days defined.

By a civil day is meant the interval betwixt the ſun's departure from any given point in the heavens and next return to the ſame, with as much more as anſwers to its diurnal motion eaſtward, which is at the rate of 59 minutes and 8 ſeconds of a degree, or 3 minutes and 57 ſeconds of time. It is alſo called a *ſolar* day, and is longer than a *ſidereal* one, inſomuch that, if the former be divided into 24 equal parts or hours, the latter will conſiſt only of 23 hours 56 minutes. The apparent inequality of the ſun's motion, likewiſe, ariſing from the obliquity of the ecliptic, produces another inequality in the length of the days: and hence the difference betwixt real and apparent time, ſo that the apparent motion of the ſun cannot always be a true meaſure of duration. Thoſe inequalities, however, are capable of being reduced to a general ſtandard, which furniſhes an exact meaſure throughout the year; whence ariſes the difference between mean and apparent time, as is explained under the article ASTRONOMY.

8 Different ways of computing the beginning of the day.

There have been very conſiderable differences among nations with regard to the beginning and ending of their days. The beginning of the day was counted from ſunriſe by the Babylonians, Syrians, Perſians, and Indians. The civil day of the Jews was begun from ſunriſe, and their ſacred one from ſunſet; the latter mode of computation being followed by the Athenians, Arabs, ancient Gauls, and other European nations. According to ſome, the Egyptians began their day at ſunſet, while others are of opinion that they computed from noon or from ſunriſe; and Pliny informs us that they computed their civil day from one midnight to another. It is probable, however, that they had different modes of computation in different provinces or cities. The Auſonians, the moſt ancient inhabitants of Italy, computed the day from midnight; and the aſtronomers of Cathay and Oighur in the Eaſt Indies reckoned in the ſame manner. This mode of computation was adopted by Hipparchus, Copernicus, and other aſtronomers, and is now in common uſe among ourſelves. The *aſtronomical* day, however, as it is called, on account of its being uſed in aſtronomical calculations, commences at noon, and ends at the ſame time the following day. The Mahometans reckon from one twilight to another. 9 Strange method of computation in Italy. In Italy, the civil day commences at ſome indeterminate point after ſunſet: whence the time of noon varies with the ſeaſon of the year. At the ſummer ſolſtice, the clock ſtrikes 16 at noon, and 19 at the time of the winter ſolſtice. Thus alſo the length of each day differs by ſeveral minutes from that immediately preceding or following it. This variation requires a conſiderable difficulty in adjuſting their time by clocks. It is accompliſhed, however, by a ſudden movement which corrects the difference when it amounts to a quarter of an hour; and this it does ſometimes at the end of eight days, ſometimes at the end of 15, and ſometimes at the end of 40. Information of all this is given by a printed kalendar, which announces, that from the 16th of February, for inſtance, to the 24th, it will be noon at a quarter paſt 18; from the 24th of February to the 6th of March, it will be noon at 18 o'clock preciſely; from the firſt of June to the 13th of July, the hour of noon will be at 16 o'clock; on the 13th of July it will be at half an hour after 16; and ſo on throughout the different months of the year. This abſurd method of meaſuring the day continues, notwithſtanding ſeveral attempts to ſuppreſs it, throughout the whole of Italy, a few provinces only excepted.

10 Various ſubdiviſions of the day.

The ſubdiviſions of the day have not been leſs various than the computations of the day itſelf. The moſt obvious diviſion, and which could at no time, nor in no age, be miſtaken, was that of morning and evening. In proceſs of time the two intermediate points of noon and midnight were determined; and this diviſion into quarters was in uſe long before the invention of hours.

From this ſubdiviſion probably aroſe the method uſed by the Jews and Romans of dividing the day and night into four vigils or watches. The firſt began at ſun-riſing, or ſix in the morning; the ſecond at nine; the third at twelve; and the fourth at three in the afternoon. In like manner the night was divided into four parts; the firſt beginning at ſix in the evening, the ſecond at nine, the third at twelve, and the fourth at three in the morning. The firſt of theſe diviſions was called by the Jews the *third* hour of the day; the ſecond the *ſixth*; the third the *ninth*; and the fourth the *twelfth*, and ſometimes the *eleventh*. Another diviſion in uſe, not only among the nations abovementioned, but the Greeks alſo, was that which reckoned the firſt quarter from ſunſet to midnight; the ſecond from midnight to ſunriſe; the third, or morning watch, from morning to noon; and the fourth from noon to ſunſet.

11 Inventions of hours uncertain.

It is uncertain at what time the more minute ſubdiviſion of the day into hours firſt commenced. It does not appear from the writings of Moſes that he was acquainted with it, as he mentions only the morning, mid-day, evening, and ſunſet. Hence we may conclude, that the Egyptians at that time knew nothing of it, as Moſes was well ſkilled in their learning. According to Herodotus, the Greeks received the knowledge of the twelve hours of the day from the Babylonians. It is probable, however, that the diviſion was actually known and in uſe before the name *hour* was applied to it; as Cenſorinus informs us that the term was not made uſe of in Rome for 300 years after its foundation; nor was it known at the time the twelve tables were conſtructed.

The eaſtern nations divide the day and night in a very ſingular manner; the origin of which is not eaſily diſcovered. The Chineſe have five watches in the night, which are announced by a certain number of ſtrokes on a bell or drum. They begin by giving one ſtroke, which is anſwered by another; and this is repeated at the diſtance of a minute or two, until the ſecond watch begin, which is announced by two ſtrokes; and ſo on throughout the reſt of the watches. By the ancient Tartars, Indians, and Perſians, the day was divided into eight parts, each of which contained ſeven hours and a half. 12 Method of computation on the coaſt of Malabar. The Indians on the coaſt of Malabar divide the day into ſix parts, called *najika*: each of theſe ſix parts is ſubdivided into 60 others, called *venaigas*; the venaiga into 60 *birpes*, the birpe into 10 *kenikans*; the kenikan into four *mattires*; the mattire into eight *kannimas* or *caignodes*; which diviſions, according to our mode of computation, ſtand as follows.

Najika,

Najika,	Venaiga,	Birpe,	Kenikan,	Mattire,	Caignode.
24 min.	24 ſec.	4 ſec.	$\frac{2}{5}$ ſec.	$\frac{1}{10}$ ſec.	$\frac{1}{80}$ ſec.

The day of the Chineſe is begun at midnight, and ends with the midnight following. It is divided into twelve hours, each diſtinguiſhed by a particular name and figure. They alſo divide the natural day into 100 parts, and each of theſe into 100 minutes; ſo that the whole contains 10,000 minutes. In the northern parts of Europe, where only two ſeaſons are reckoned in the year, the diviſions of the day and night are conſiderably larger than with us. In Iceland the 24 hours are divided into eight parts; the firſt of which commences at three in the morning; the ſecond at five; the third at half an hour after eight; the fourth at eleven; the fifth at three in the afternoon; the ſixth at ſix in the evening; the ſeventh, at eight, and the laſt at midnight. In the eaſtern part of Turkeſtan, the day is divided into twelve equal parts, each of which is diſtinguiſhed by the name of ſome animal. Theſe are ſubdivided into eight *keh;* ſo that the whole 24 hours contain 96 *keh*.

13
Diviſions of the hour into minutes, &c.

The modern diviſions of the hour in uſe among us are into minutes, ſeconds, thirds, fourths, &c. each being a ſixtieth part of the former ſubdiviſion. By the Chaldæans, Jews, and Arabians, the hour is divided into 1080 ſcruples; ſo that one hour contains 60 minutes, and one minute 18 ſcruples. The ancient Perſians and Arabs were likewiſe acquainted with this diviſion; but the Jews are ſo fond of it, that they pretend to have received it in a ſupernatural manner. "Iſſachar (ſay they) aſcended into heaven, and brought from thence 1080 parts for the benefit of the nation."

14
Methods of announcing the hours.

The diviſion of the day being aſcertained, it ſoon became an object to indicate in a public manner the expiration of any particular hour or diviſion; as without ſome general knowledge of this kind, it would be in a great meaſure impoſſible to carry on buſineſs. The methods of announcing this have been likewiſe very different. Among the Egyptians it was cuſtomary for the prieſts to proclaim the hours like watchmen among us. The ſame method was followed at Rome; nor was there any other method of knowing the hours until the year 293 B. C. when Papirius Curſor firſt ſet up a ſun-dial in the Capitol. A ſimilar method is practiſed among the Turks, whoſe prieſts proclaim from the top of their moſques, the cock-crowing, day-break, mid-day, three o'clock in the afternoon, and twilight, being their appointed times of worſhip.

15
Invention of inſtruments for this purpoſe.

As this mode of proclaiming the hour could not but be very inconvenient as well as imperfect, the introduction of an inſtrument which every one could have in his poſſeſſion, and which might anſwer the ſame purpoſe, muſt have been conſidered as a valuable acquiſition. One of the firſt of theſe was the clepſydra or water clock*. Various kinds of theſe were in uſe among the Egyptians at a very early period. The invention of the inſtrument is attributed to Thoth or Mercury, and it was afterwards improved by Cteſibus of Alexandria. It was a common meaſure of time among the Greeks, Indians, and Chaldæans, as well as the Egyptians, but was not introduced into Rome till the time of Scipio Naſica. The Chineſe aſtronomers have long made uſe of it; and by its means divided the zodiac into twelves parts; but it is a very inaccurate meaſure of time, varying, not only according to the quantity of water in the veſſel, but according to the ſtate of the atmoſphere.

The clepſydra was ſucceeded by the gnomon or ſun-dial.—This, at firſt, was no more than a ſtile erected perpendicularly to the horizon; and it was a long time before the principles of it came to be thoroughly underſtood. The invention is with great probability attributed to the Babylonians, from whom the Jews received it before the time of Ahaz, when we know that a ſun-dial was already erected at Jeruſalem. The Chineſe and Egyptians alſo were acquainted with the uſe of the dial at a very early period, and it was conſiderably improved by Anaximander or Anaximenes; one of whom is for that reaſon looked upon to be the inventor. Various kinds of dials, however, were invented and made uſe of in different nations long before their introduction at Rome. The firſt erected in that city, as has been already mentioned, was that by Papirius Curſor; and 30 years after, Valerius Miſſala brought one from Sicily, which was uſed in Rome for no leſs than 99 years, though conſtructed for a Sicilian latitude, and conſequently incapable of ſhowing the hours exactly in any other place; but at laſt another was conſtructed by L. Philippus, capable of meaſuring time with greater accuracy.

It was long after the invention of dials before mankind began to form any idea of clocks; nor is it well known at what period they were firſt invented. A clock was ſent by Pope Paul I. to Pepin king of France, which at that time was ſuppoſed to be the only one in the world. A very curious one was alſo ſent to Charles the Great from the khalif Haroun Alraſchid, which the hiſtorians of the time ſpeak of with ſurpriſe and admiration: but the greateſt improvement was that of Mr Huygens, who added the pendulum to it. Still, however, the inſtruments for dividing time were found to be inaccurate for nice purpoſes. The expanſion of the materials by heat, and their contraction by cold, would cauſe a very perceptible alteration in the going of an inſtrument in the ſame place at different times of the year, and much more if carried from one climate to another. Various methods have been contrived to correct this; which indeed can be done very effectually at land by a certain conſtruction of the pendulum; but at ſea, where a pendulum cannot be uſed, the inaccuracy is of conſequence much greater: nor was it thought poſſible to correct the errors ariſing from theſe cauſes in any tolerable degree, until the late invention of Mr Harriſon's time-piece, which may be conſidered as making perhaps as near an approach to perfection as poſſible.

16
Of weeks.

Having thus given an account of the more minute diviſions of time, with the methods of meaſuring them, we muſt now proceed to the larger; which more properly belong to chronology, and which muſt be kept on record, as no inſtrument can be made to point them out. Of theſe the diviſion into weeks of ſeven days is one of the moſt ancient, and probably took place from the creation of the world. Some, indeed, are of opinion, that the week was invented ſome

* See *Clepſydra.*

ſome time after for the more convenient notation of time; but whatever may be in this, we are certain that it is of the higheſt antiquity, and even the moſt rude and barbarous nations have made uſe of it. It is ſingular indeed that the Greeks, notwithſtanding their learning ſhould have been ignorant of this diviſion; and M. Goguet informs us, that they were almoſt the only nation who were ſo. By them the month of 30 days was divided into three times 10, and the days of it named accordingly. Thus the 15th day of the month was called the *ſecond fifth*, or fifth of the ſecond tenth; the 24th was called the *third fourth*, or the fourth day of the third tenth. This method was in uſe in the days of Heſiod, and it was not until ſeveral ages had elapſed, that the uſe of weeks was received into Greece from the Egyptians. The inhabitants of Cathay, in the northern part of China, were likewiſe unacquainted with the week of ſeven days, but divided the year into ſix parts of 60 days each. They had alſo a cycle of 15 days, which they uſed as a week. The week was likewiſe unknown to the ancient Perſians and to the Mexicans; the former having a different name for every day of the month, and the latter making uſe of a cycle of 13 days. By almoſt all other nations the week of ſeven days was adopted.

17 Of holidays

It is remarkable, that one day in the week has always been accounted as ſacred by every nation. Thus Saturday was conſecrated to pious purpoſes among the Jews, Friday by the Turks, Tueſday by the Africans of Guinea, and Sunday by the Chriſtians. Hence alſo the origin of *Feriæ* or holidays, frequently made uſe of in ſyſtems of Chronology; and which aroſe from the following circumſtance. In the church of Rome the old eccleſiaſtical year began with Eaſter-week; all the days of which were called *Feriæ* or *Feriati*, that is, holy, or ſacred days; and in proceſs of time the days of other weeks came to be diſtinguiſhed by the ſame appellation, for the two following reaſons: 1. Becauſe every day ought to be holy in the eſtimation of a Chriſtian. 2. Becauſe all days are holy to eccleſiaſtics, whoſe time ought to be entirely devoted to religious worſhip.—The term *week* is ſometimes uſed to ſignify ſeven years, not only in the prophetical writings, but likewiſe by profane authors; thus Varro, in his book inſcribed *Hebdomades*, informs, that he had then entered the 12th week of his years.

18 Of months.

The next diviſion of time ſuperior to weeks, is that of *months*. This appears to have been, if not coeval with the creation, at leaſt in uſe before the flood. As this diviſion is naturally pointed out by the revolution of the moon, the months of all nations were originally lunar; until after ſome conſiderable advances had been made in ſcience, the revolutions of that luminary were compared with the ſun, and thus the limits of the month fixed with greater accuracy. The diviſion of the year into 12 months, as being founded on the number of full revolutions of the moon in that time, has alſo been very general; though Sir John Chardin informs us, that the Perſians divided the year into 24 months; and the Mexicans into 18 months of 20 days each. The months generally contained 30 days, or 29 and 30 days alternately; though this rule was far from being without exception. The months of the Latins conſiſted of 16, 18, 22, or 36 days; and Romulus gave his people a year of 10 months and 304 days. The Kamtſchadales divide the year into 10 months; reckoning the time proper for labour to be nine months, and the winter ſeaſon, when they are obliged to remain inactive, only as one month.

It has been a very ancient cuſtom to give names to the different months of the year, though this appears to have been more modern than the departure of the Iſraelites out of Egypt, as they would otherwiſe undoubtedly have carried it with them; but for a conſiderable time after their ſettlement in Canaan, they diſtinguiſhed the months only by the names of firſt, ſecond, *&c.* After their return from the Babyloniſh captivity, they adopted the names given to the months by the Chaldæans. Other nations adopted various names, and arranged the months themſelves according to their fancy. From this laſt circumſtance ariſes the variety in the dates of the months; for as the year has been reckoned from different ſigns in the ecliptic, neither the number nor the quantity of months have been the ſame, and their ſituation has likewiſe been altered by the intercalations neceſſary to be made.

Theſe intercalations became neceſſary on account of the exceſs of the ſolar above the lunar year; and the months compoſed of intercalary days are likewiſe called *emboliſmal*. Theſe emboliſmal months are either *natural* or *civil*. By the former, the ſolar and lunar years are adjuſted to one another; and the latter ariſes from the defect of the civil year itſelf. The *ador* of the Jews, which always conſiſts of 30 days, is an example of the natural emboliſmal month.

The Romans had a method of dividing their months into kalends, nones, and ides. The firſt was derived from an old word *calo*, "to call"; becauſe, at every new moon, one of the lower claſs of prieſts aſſembled the people, and called over, or announced, as many days as intervened betwixt that and the nones, in order to notify the difference of times and the return of feſtivals. The 2d, 3d, 4th, 5th, 6th, and 7th of March, May, July, and October, were the nones of theſe months; but in the other months were the 2d, 3d, 4th and 5th days only. Thus the 5th of January was its nones; the 4th was *pridie nonarum;* the third, *tertio nonarum*, &c. The ides contained eight days in every month, and were nine days diſtant from the nones. Thus the 15th day of the four months already mentioned was the ides of them; but in the others the 13th was accounted as ſuch; the 12th was *pridie iduum*, and the 11th *tertio iduum*. The ides were ſucceeded by the kalends; the 14th of January, for inſtance, being the 19th kalend of February; the 15th was the 18th kalend; and ſo on till the 31ſt of January, which was *pridie kalendarum;* and February 1ſt was the kalends.

19 Aſtronomical and civil months.

Among the European nations the month is either aſtronomical or civil. The former are meaſured by the motion of the heavenly bodies; the civil conſiſts of a certain number of days ſpecified by the laws, or by the civil inſtitutions of any nation or ſociety. The aſtronomical months, being for the moſt part regulated by the motions of the ſun and moon, are thus divided into ſolar and lunar, of which the former is ſometimes alſo called *civil*. The aſtronomical ſolar month is the time which the ſun takes up in paſſing through a ſign of the ecliptic. The lunar month is periodical, ſynodical, ſidereal, and civil. The ſynodical lunar month is the time that paſſes between any conjunction of the moon with the ſun and the conjunction following. It includes the motion of the ſun eaſtward during that time; ſo that a mean lunation conſiſts of 29d. 12h. 44′ 2″ 8921. The ſidereal lunar month is the time of the mean revolution of the moon with regard to the fixed ſtars. As the equinoctial points go backwards about 4″ in the ſpace of a lunar month, the moon muſt, in conſequence of this retroceſſion, arrive at the equinox ſooner than at any fixed ſtar, and conſequently the mean ſidereal revolution muſt be longer than the mean periodical one. The latter conſiſts of 27d. 7h. 43′ 4″ 6340. The civil lunar month is computed from the moon, to anſwer the ordinary purpoſes of life; and as it would have been inconvenient, in the computation of lunar months, to have reckoned odd parts of days, they have been compoſed of 30 days, or of 29 and 30 alternately, as the neareſt round numbers. When the month is reckoned from the firſt appearance of the moon after her conjunction, it is called the *month of illumination*. The Arabs, Turks, and other nations, who uſe the era of the Hegira, follow this method of computation. As twelve lunar months however, are 11 days leſs than a ſolar year, Julius Cæſar ordained that the month ſhould be reckoned from the courſe of the ſun, and not of the moon; and that they ſhould conſiſt of 30 and 31 days alternately, February only excepted, which was to conſiſt of 28 days commonly, and of 29 in leap-years.

19 Of years.

The higheſt natural diviſion of time is into years. At firſt, however, it is probable that the courſe of the ſun through the ecliptic would not be obſerved, but that all nations would meaſure their time by the revolutions of the moon. We are certain, at leaſt, that the Egyptian year conſiſted originally of a ſingle lunation; though at length it included two or three months, and was determined by the ſtated returns of the ſeaſons. As the eaſtern nations, however, particularly the Egyptians, Chaldeans, and Indians, applied themſelves in very early periods to aſtronomy, they found, by comparing the motions of the ſun and moon together, that one revolution of the former included nearly 12 of the latter. Hence a year of 12 lunations was formed, in every one of which were reckoned 30 days; and hence alſo the diviſion of the ecliptic into 360 degrees. The luniſolar year, conſiſting of 360 days, was in uſe long before any regular intercalations were made; and hiſtorians inform us, that the year of all ancient nations was luniſolar. Herodotus relates, that the Egyptians firſt divided the year into 12 parts by the aſſiſtance of the ſtars, and that every part conſiſted of 30 days. The Thebans corrected this year by adding 5 intercalary days to it. The old Chaldean year was alſo reformed by the Medes and Perſians; and ſome of the Chineſe miſſionaries have informed us, that the luniſolar year was alſo corrected in China: and that the ſolar year was aſcertained in that country to very conſiderable exactneſs. The Latin year, before Numa's correction of it, conſiſted of 360 days, of which 304 were divided into ten months; to which were added two private months not mentioned in the kalendar.

20 Explanation of a paſſage in Herodotus.

The imperfection of this method of computing time is now very evident. The luniſolar year was about 5¼ days ſhorter than the true ſolar year, and as much longer than the lunar. Hence the months could not long correſpond with the ſeaſons, and even in ſo ſhort a time as 34 years, the winter months would have changed places with thoſe of ſummer. From this rapid variation, Mr Playfair takes notice that a paſſage in Herodotus, by which the learned have been exceedingly puzzled, may receive a ſatisfactory ſolution, *viz.* that "in the time of the ancient Egyptian kings, the ſun had twice ariſen in the place where it had formerly ſet, and twice ſet where it had ariſen." By this he ſuppoſes it is meant, "that the beginning of the year had twice gone through all the ſigns of the ecliptic; and that the ſun had riſen and ſet twice in every day and month of the year." This, which ſome have taken for a proof of moſt extravagant antiquity, he further obſerves, might have happened in 138 years only; as in that period there would be a difference of nearly two years between the ſolar and lunar year. Such evident imperfections could not but produce a reformation every where; and accordingly we find that there was no nation which did not adopt the method of adding a few intercalary days at certain intervals. We are ignorant, however, of the perſon who was the firſt inventor of this method. The Theban prieſts attributed the invention to Mercury or Thoth; and it is certain that they were acquainted with the year of 365 days at a very early period. The length of the ſolar year was repreſented by the celebrated golden circle of Oſymandyas of 365 cubits circumference; and on every cubit of which was inſcribed a day of the year, together with the helaical riſings and ſettings of the ſtars. The monarch is ſuppoſed to have reigned in the 11th or 13th century before the Chriſtian era.

21 Great Egyptian year, or canicular cycle.

21 Of the time when it commenced.

The Egyptian ſolar year being almoſt ſix hours ſhorter than the true one, this inaccuracy, in proceſs of time produced another revolution; for ſome circumſtances attending which ſerve to fix the date of the diſcovery of the length of the year, and which from the above deſcription of the golden circle, we may ſuppoſe to have been made during the reign of Oſymandyas. The inundation of the Nile was annually announced by the heliacal riſing of Sirius, to which the reformers of the kalendar adjuſted the beginning of the year, ſuppoſing that it would have remained immoveable. In a number of years, however, it appeared that their ſuppoſitions in this were ill-founded. By reaſon of the inequality abovementioned, the heliacal riſings of Sirius gradually advanced nearly at the rate of one day in four years; ſo that in 1461 years it completed a revolution, by ariſing on every ſucceeding day of the year, and returning to the point originally fixed for the beginning of the year. This period, equal to 1460 Julian years, was termed the *great Egyptian year*, or *canicular cycle*. From the accounts we have of the time that the canicular cycle was renewed, the time of its original commencement may be gathered with tolerable certainty. This happened, according to Cenſorinus, in the 138th year of the Chriſtian æra. Reckoning backward therefore from this time for 1460 years, we come to the year B. C. 1322, when the ſun was in Cancer, about 14 or 15 days after the ſummer ſolſtice

ſolſtice, which happened on July 5th. The Egyptians uſed no intercalation till the time of Auguſtus, when the corrected Julian year was received at Alexandria by his order; but even this order was obeyed only by the Greeks and Romans who reſided in that city; the ſuperſtitious natives refuſing to make any addition to the length of a year which had been ſo long eſtabliſhed among them.

22 Uncertainty of the time when the true ſolar year was diſcovered.

We are not informed at what preciſe period the true year was obſerved to conſiſt of nearly ſix hours more than the 365 days. Though the prieſts of Thebes claim the merit of the diſcovery, Herodotus makes no mention of it; neither did Thales, who introduced the year of 365 days into Greece, ever uſe any intercalation. Plato and Eudoxus are ſaid to have obtained it as a ſecret from the Egyptians about 80 years after Herodotus, and to have carried it into Greece; which ſhowed, that the knowledge of this form of the year was at that time recent, and only known to a few learned men.

23 Years of the Jews, &c.

The year of the ancient Jews was luniſolar; and we are informed by tradition, that Abraham preſerved in his family, and tranſmitted to poſterity, the Chaldean form of the year, conſiſting of 360 days; which remained the ſame without any correction until the date of the era of Nabonaſſar. The ſolar year was adopted among them after their return from the Babyloniſh captivity; but when ſubjected to the ſucceſſors of Alexander in Syria, they were obliged to admit the lunar year into their kalendar. In order to adjuſt this year to the courſe of the ſun, they added at certain periods a month to Adar, formerly mentioned, and called it *Ve Adar*. They compoſed alſo a cycle of 19 years, in ſeven of which they inſerted the intercalary month. This correction was intended to regulate the months in ſuch a manner, as to bring the 15th of Niſan to the equinoctial point; and likewiſe the courſes of the ſeaſons and feaſts in ſuch a manner, that the corn might be ripe at the paſſover as the law required.

24 Reformation of the kalendar by Julius Cæſar and pope Gregory.

We ſhall not take up the reader's time with any further account of the years made uſe of by different nations, all of which are reſolved at laſt into the luniſolar, it will be ſufficient to mention the improvements in the kalendar made by the two great reformers of it, Julius Cæſar, and Pope Gregory XIII. The inſtitution of the Roman year by Romulus has been already taken notice of; but as this was evidently very imperfect, Numa, on his advancement to the throne, undertook to reform it. With a deſign to make a complete lunar year of it, he added 50 days to the 304 of Romulus; and from every one of his months, which conſiſted of 31 and 30 days, he borrowed one day. Of theſe additional days he compoſed two months; calling the one January, and the other February. Various other corrections and adjuſtments were made; but when Julius Cæſar obtained the ſovereignty of Rome, he found that the months had conſiderably receded from the ſeaſons to which Numa had adjuſted them. To bring them forward to their places, he formed a year of 15 months, or 445 days; which, on account of its length, and the deſign with which it was formed, has been called the *year of confuſion*. It terminated on the firſt of January 45 B. C. and from this period the civil year and months were regulated by the courſe of the ſun. The year of Numa being ten days ſhorter than the ſolar year, two days were added by Julius to every one of the months of January, Auguſt, and December; and one to April, June, September, and November. He ordained likewiſe, that an intercalary day ſhould be added every fourth year to the month of February, by reckoning the 24th day, or ſixth of the kalends of March, twice over. Hence this year was ſtyled *biſſextile*, and alſo *leap-year*, from its leaping a day more than a common year.

The Julian year has been uſed by modern chronologers, as being a meaſure of time extremely ſimple and ſufficiently accurate. It is ſtill, however, ſomewhat imperfect; for as the true ſolar year conſiſts of 365d. 5h. 48′ 45¼″, it appears that in 131 years after the Julian correction, the ſun muſt have arrived one day too ſoon at the equinoctial point. During Cæſar's reign the vernal equinox had been obſerved by Soſigenes on the 25th of March; but by the time of the Nicene council it had gone backward to the 21ſt. The cauſe of the error was not then known; but in 1582, when the equinox happened on the 11th of March it was thought proper to give the kalendar its laſt correction. Pope Gregory XIII. having invited to Rome a conſiderable number of mathematicians and aſtronomers, employed ten years in the examination of their ſeveral formulæ, and at laſt gave the preference to that of Aloſia and Antoninus Lelius, who were brothers. Ten days were now cut off in the month of October, and the 4th of that month was reckoned the 15th. To prevent the ſeaſons from receding in time to come, he ordained that one day ſhould be added every fourth or biſſextile year as before; and that the 1600th year of the Chriſtian era, and every fourth century thereafter, ſhould be a biſſextile or leap year. One day therefore is to be intercalated in the years 2000, 2400, 2800, &c. but in the other centuries, as 1700, 1800, 1900, 2100, &c. it is to be ſuppreſſed and theſe are to be reckoned as common years. Even this correction, however, is not abſolutely exact; but the error muſt be very inconſiderable, and ſcarce amounting to a day and a half in 5000 years.

25 Commencement of the year.

The commencement of the year has been determined by the date of ſome memorable event or occurrence, ſuch as the creation of the world, the univerſal deluge, a conjunction of planets, the incarnation of our Saviour, &c. and of courſe has been referred to different points in the ecliptic. The Chaldæan and the Egyptian years were dated from the autumnal equinox. The eccleſiaſtical year of the Jews began in the ſpring; but in civil affairs, they retained the epoch of the Egyptian year. The ancient Chineſe reckoned from the new moon neareſt to the middle of Aquarius; but, according to ſome recent accounts, the beginning of their year was transferred (B. C. 1740) to the new moon neareſt to the winter ſolſtice. This likewiſe is the date of the Japaneſe year. Diemſchid, or Gemſchid, king of Perſia, obſerved, on the day of his public entry into Perſepolis, that the ſun entered into Aries. In commemoration of this fortunate event and coincidence, he ordained the beginning of the year to be removed from the autumnal to the vernal equinox. This epoch was denominated *Neuruz*, viz. new-day; and is ſtill celebrated with great pomp and feſtivity.

(See Epochs). The ancient Swediſh year commenced at the winter ſolſtice, or rather at the time of the ſun's appearance in the horizon, after an abſence of about 40 days. The feaſt of this epoch was ſolemniſed on the 20th day after the ſolſtice. Some of the Grecian ſtates computed from the vernal, ſome from the autumnal equinox, and others from the ſummer tropic. The year of Romulus commenced in March, and that of Numa in January. The Turks and Arabs date the year from the 16th of July and the American Indians reckon from the firſt appearance of the new moon of the vernal equinox. The church of Rome has fixed new-year's-day on the Sunday that correſponds with the full moon of the ſame ſeaſon. The Venetians, Florentines, and Piſans in Italy, and the inhabitants of Treves in Germany, begin the year at the vernal equinox. The ancient clergy reckoned from the 25th of March; and this method was obſerved in Britain, until the introduction of the new ſtyle (A. D. 1752); after which the year commenced on the 1ſt day of January.

26 Of cycles.

Beſides the natural diviſions of time ariſing immediately from the revolutions of the heavenly bodies, there are others formed from ſome of the leſs obvious conſequences of theſe revolutions, which are called *cycles*, from the Greek κυκλος, *a circle*. The moſt remarkable of theſe are the following.

1. The *cycle of the ſun* is a revolution of 28 years, in which time the days of the months return again to the ſame days of the week; the ſun's place to the ſame ſigns and degrees of the ecliptic on the ſame months and days, ſo as not to differ one degree in 100 years; and the leap-years begin the ſame courſe over again with reſpect to the days of the week on which the days of the months fall.

27 Golden number.

The *cycle of the moon*, commonly called the *golden number*, is a revolution of 19 years; in which time the conjunctions, oppoſitions, and other aſpects of the moon, are within an hour and a half of being the ſame as they were on the ſame days of the months 19 years before. The *indiction* is a revolution of 15 years, uſed only by the Romans for indicating the times of certain payments made by the ſubjects to the republic: It was eſtabliſhed by Conſtantine, A. D. 312.

28 To find the year of any cycle.

The year of our Saviour's birth, according to the vulgar era, was the 9th year of the ſolar cycle, the firſt year of the lunar cycle; and the 312th year after his birth was the firſt year of the Roman indiction. Therefore, to find the year of the ſolar cycle, add 9 to any given year of Chriſt, and divide the ſum by 28, the quotient is the number of cycles elapſed ſince his birth, and the remainder is the cycle for the given year; If nothing remains, the cycle is 28. To find the lunar cycle, add one to the given year of Chriſt, and divide the ſum by 19; the quotient is the number of cycles elapſed in the interval, and the remainder is the cycle for the given year: If nothing remains, the cycle is 19. Laſtly, ſubtract 312 from the given year of Chriſt, and divide the remainder by 15; and what remains after this diviſion is the indiction for the given year: If nothing remains, the indiction is 15.

29 Variation of the golden numbers.

Although the above deficiency in the lunar circle of an hour and an half every 19 years be but ſmall, yet in time it becomes ſo ſenſible as to make a whole natural day in 310 years. So that, although this cycle be of uſe, when the golden numbers are rightly placed againſt the days of the months in the kalendar, as in the Common Prayer Books, for finding the days of the mean conjunctions or oppoſitions of the ſun and moon, and conſequently the time of Eaſter; it will only ſerve for 310 years, old ſtile. For as the new and full moons anticipate a day in that time, the golden numbers ought to be placed one day earlier in the kalendar for the next 310 years to come. Theſe numbers were rightly placed again the days of new moon in the kalendar, by the council of Nice, A. D. 325; but the anticipation, which has been neglected ever ſince, is now grown almoſt into 5 days: And therefore all the golden numbers ought now to be placed five days higher in the kalendar for the old ſtile than they were at the time of the ſaid council; or 6 days lower for the new ſtyle, becauſe at preſent it differs 11 days from the old.

30 To find the golden number.

In the firſt of the following tables the golden numbers under the months ſtand againſt the days of new moon in the left-hand column, for the new ſtyle; adapted chiefly to the ſecond year after leap-year, as being the neareſt mean for all the four; and will ſerve till the year 1900. Therefore to find the day of new moon in any month of a given year till that time, look for the golden number of that year under the deſired month, and againſt it you have the day of new moon in the left hand column. Thus, ſuppoſe it were required to find the day of new moon in September 1789; the golden number for that year is 4, which I look for under December, and right againſt it in the left-hand column you will find 17, which is the day of new moon in that month. *N. B.* If all the golden numbers, except 17, and 6, were ſet one day lower in the table, it would ſerve from the beginning of the year 1900 till the end of the year 2199. The table at the end of this ſection ſhows the golden number for 4000 years after the birth of Chriſt, by looking for the even hundreds of any given year at the left-hand, and for the reſt to make up that year at the head of the table; and where the columns meet, you have the golden number (which is the ſame both in old and new ſtyle) for the given year. Thus, ſuppoſe the golden number was wanted for the year 1789; look for 1700 at the left-hand of the table, and for 89 at the top of it; then guiding your eye downward from 89 to over-againſt 1700, you will find 4, whch is the golden number for that year.

But becauſe the lunar cycle of 19 years ſometimes includes five leap-years, and at other times only four, this table will ſometimes vary a day from the truth in leap-years after February. And it is impoſſible to have one more correct, unleſs we extend it to four times 19 or 76 years; in which there are 19 leap-years without a remainder. But even then to have it of perpetual uſe, it muſt be adapted to the old ſtyle; becauſe, in every centurial year not diviſible by 4, the regular courſe of leap-years is interrupted in the new, as will be the caſe in the year 1800.

31 Dionyſian period, or cycle of Eaſter.

2. The *cycle of Eaſter*, alſo called the *Dionyſian period*, is a revolution of 532 years, found by multiplying the ſolar cycle 28 by the lunar cycle 19. If the new moons did not anticipate upon this cycle, Eaſter-day would always

always be the Sunday next after the firſt full moon which follows the 21ſt of March. But, on account of the above anticipation, to which no proper regard was had before the late alteration of the ſtyle, the eccleſiaſtic Eaſter has ſeveral times been a week different from the true Eaſter within this laſt century: which inconvenience is now remedied by making the table, which uſed to find Eaſter for ever, in the Common Prayer Book, of no longer uſe than the lunar difference from the new ſtyle will admit of.

The earlieſt Eaſter poſſible is the 22d of March, the lateſt the 25th of April. Within theſe limits are 35 days, and the number belonging to each of them is called the *number of direction;* becauſe thereby the time of Eaſter is found for any given year.

32
Dominical letter.

The firſt ſeven letters of the alphabet are commonly placed in the annual almanacs, to ſhow on what days of the week the days of the months fall throughout the year. And becauſe one of thoſe ſeven letters muſt neceſſarily ſtand againſt Sunday, it is printed in a capital form, and called the *dominical letter;* the other ſix being inſerted in ſmall characters, to denote the other ſix days of the week. Now, ſince a common Julian year contain 365 days, if this number be divided by 7 (the number of days in a week) there will remain one day. If there had been no remainder, it is plain the year would conſtantly begin on the ſame day of the week: but ſince one remains, it is plain, that the year muſt begin and end on the ſame day of the week; and therefore the next year will begin on the day following. Hence, when January begins on Sunday, A is the dominical or Sunday letter for that year: Then, becauſe the next year begins on Monday, the Sunday will fall on the ſeventh day, to which is annexed the ſeventh letter G, which therefore will be the dominical letter for all that year: and as the third year will begin on Tueſday, the Sunday will be on the ſixth day; therefore F will be the Sunday letter for that year. Whence it is evident, that the Sunday letters will go annually in a retrograde order, thus, G, F, E, D, C, B, A. And, in the courſe of ſeven years, if they were all common ones, the ſame days of the week and dominical letters would return to the ſame days of the months. But becauſe there are 366 days in a leap-year, if this number be divided by 7, there will remain two days over and above the 52 weeks of which the year conſiſts. And therefore, if the leap-year begins on Sunday, it will end on Monday; and the next year will begin on Tueſday, the firſt Sunday whereof muſt fall on the ſixth of January, to which is annexed the letter F, and not G, as in common years. By this means, the leap-year returning every fourth year, the order of the dominical letter is interrupted; and the ſeries cannot return to its firſt ſtate till after four times ſeven, or 28 years; and then the ſame days of the months return in order to the ſame days of the week as before.

33 Julian period.

From the multiplication of the ſolar cycle of 28 years into the lunar cycle of 19 years, and the Roman indiction of 15 years, ariſes the great Julian period, conſiſting of 7980 years, which had its beginning 764 years before Strauchius's ſuppoſed year of the creation (for no later could all the three cycles begin together), and it is not yet completed: And therefore it includes all other cycles, periods, and eras. There is but one year in the whole period that has the ſame numbers for the three cycles of which it is made up: And therefore, if hiſtorians had remarked in their writings the cycles of each year, there had been no diſpute about the time of any action recorded by them.

34 To find the year of the Julian period.

The Dionyſian or vulgar era of Chriſt's birth was about the end of the year of the Julian period 4713: and conſequently the firſt year of his age, according to that account, was the 4714th year of the ſaid period. Therefore, if to the current year of Chriſt we add 4713, the ſum will be the year of the Julian period. So the year 1789 will be found to be the 6502d year of that period. Or, to find the year of the Julian period anſwering to any given year before the firſt year of Chriſt, ſubtract the number of that given year from 4471, and the remainder will be the year of the Julian period. Thus, the year 585 before the firſt year of Chriſt) which was the 584th before his birth) was the 4129th year of the ſaid period. Laſtly, to find the cycles of the ſun, moon, and indiction for any given year of this period, divide the given year by 28, 19, and 15; the three remainders will be the cycles ſought, and the quotients the numbers of cycles run ſince the beginning of the period. So in the above 4714th year of the Julian period, the cycle of the ſun was 10, the cycle of the moon 2, and the cycle of the indiction 4; the ſolar cycle having run through 168 courſes, the lunar 248, and the indiction 314.

35 Year of Chriſt's birth when ſettled.

The vulgar era of Chriſt's birth was never ſettled till the year 527, when Dionyſius Exiguus, a Roman abbot, fixed it to the end of the 4713th year of the Julian period, which was four years too late; for our Saviour was born before the death of Herod, who ſought to kill him as ſoon as he heard of his birth. And, according to the teſtimony of Joſephus [*B.* xvii. *ch.* 8.), there was an eclipſe of the moon in the time of Herod's laſt illneſs: which eclipſe appears by our aſtronomical tables to have been in the year of the Julian period 4710, March 13th, at 3 hours paſt midnight, at Jeruſalem. Now, as our Saviour muſt have been born ſome months before Herod's death, ſince in the interval he was carried into Egypt, the lateſt time in which we can fix the true æra of his birth is about the end of the 4709th year of the Julian period.

36 Eras or Epochs.

As there are certain fixed points in the heavens from which aſtronomers begin their computations, ſo there are

are certain points of time from which hiſtorians begin to reckon; and theſe points or roots of time are called *eras* or *epochs*. The moſt remarkable eras are, thoſe of the Creation, the Greek Olympiads, the building of Rome, the era or Nabonaſſar, the death of Alexander, the birth of Chriſt, the Arabian Hegira, and the Perſian Jeſdegird: All which, together with ſeveral others of leſs note, have their beginnings fixed by chronologers to the years of the Julian period, to the age of the world at thoſe times, and to the years before and after the year of Chriſt's birth.

37 Hiſtoric chronology

Having thus treated, as fully as our limits will admit, of the various diviſions of time, we muſt now conſider the ſecond part of chronology, *viz.* that which more immediately relates to hiſtory, and which has already been obſerved to have the four following foundations: 1. Aſtronomical obſervations, particularly of eclipſes. 2. The teſtimonies of credible authors. 3. Epochs in hiſtory univerſally allowed to be true. 4. Ancient medals, coins, monuments, and inſcriptions. We ſhall conſider theſe four principal parts in the order they here ſtand.

I.

38 Of eclipſes of the ſun and moon.

It is with great reaſon that the eclipſes of the ſun and moon, and the aſpects of the other planets, have been called public and celeſtial characters of the times, as their calculations afford chronologers infallible proofs of the preciſe epochs in which a great number of the moſt ſignal events in hiſtory have occurred. So that in chronological matters we cannot make any great progreſs, if we are ignorant of the uſe of aſtronomic tables, and the calculation of eclipſes. The ancients regarded the latter as prognoſtics of the fall of empires, of the loſs of battles, of the death of monarchs, *&c.* And it is to this ſuperſtition, to this wretched ignorance, that we happily owe the vaſt labour that hiſtorians have taken to record ſo great a number of them. The moſt able chronologers have collected them with ſtill greater labour. Calviſius, for example, founds his chronology on 144 eclipſes of the ſun, and 127 of the moon, that he ſays he had calculated. The grand conjunction of the two ſuperior planets, Saturn and Jupiter, which, according to Kepler, occurs once in 800 years in the ſame point of the zodiac, and which has happened only eight times ſince the creation (the laſt time in the month of December (1603), may alſo furniſh chronology with inconteſtable proofs. The ſame may be ſaid of the tranſit of Venus over the ſun, which has been obſerved in our days, and all the other uncommon poſitions of the planets. But among theſe celeſtial and natural characters of times, there are alſo ſome that are named *civil* or *artificial*, and which, nevertheleſs, depend on aſtronomic calculation.

Such are the ſolar and lunar cycles; the Roman indiction; the feaſt of Eaſter; the biſſextile year; the jubilees; the ſabbatic years; the combats and Olympic games of the Greeks; and hegira of the Mahometans, *&c.* And to theſe may be added the periods, eras, epochs, and years of different nations, ancient and modern. We ſhall only remark on this occaſion, that the period or era of the Jews commences with the creation of the world; that of the ancient Romans with the foundation of the city of Rome; that of the Greeks at the eſtabliſhment of the Olympic games; that of Nebuchadnezzar, with the advancement of the firſt king of Babylon to the throne; the Yezdegerdic years, with the laſt king of the Perſians of that name; the hegira of the Turks with the flight of Mahomet from Mecca to Medina, *&c.* The year of the birth of Chriſt was the 4713th year of the Julian period, according to the common method of reckoning. Aſtronomical chronology teaches us to calculate the preciſe year of the Julian period in which each of theſe epochs happened.

II.

39 Of the teſtimony of authors.

The teſtimony of authors is the ſecond principal part of hiſtoric chronology. Though no man whatever has a right to pretend to infallibility, or to be regarded as a ſacred oracle, it would, however, be making a very unjuſt judgment of mankind, to treat them all as dupes or impoſtors; and it would be an injury offered to public integrity, were we to doubt the veracity of authors univerſally eſteemed, and of facts that are in themſelves right worthy of belief. It would be even a kind of infatuation to doubt that there have been ſuch cities as Athens, Sparta, Rome, Carthage, *&c.* or that Xerxes reigned in Perſia, and Auguſtus in Rome: whether Hannibal ever was in Italy; or that the emperor Conſtantine built Conſtantinople, *&c.* The unanimous teſtimony of the moſt reſpectable hiſtorians will not admit any doubt of theſe matters. When an hiſtorian is allowed to be completely able to judge of an event, and to have no intent of deceiving by his relation, his teſtimony is irrecuſable. But to avoid the danger of adopting error for truth, and to be ſatisfied of a fact that appears doubtful in hiſtory, we may make uſe of the four following rules, as they are founded in reaſon.

1. We ought to pay a particular regard to the teſtimonies of thoſe who wrote at the ſame time the events happened, and that have not been contradicted by any cotemporary author of known authority. Who can doubt, for example, of the truth of the facts related by admiral Anſon, in the hiſtory of his voyage round the world? The admiral ſaw all the facts there mentioned with his own eyes, and publiſhed his book when two hundred companions of his voyage were ſtill living in London, and could have contradicted him immediately, if he had given any falſe or exaggerated relations.

2. After the cotemporary authors, we ſhould give more credit to thoſe who lived near the time the events happened, than thoſe who lived at a diſtance.

3. Thoſe doubtful hiſtories, which are related by authors that are but little known, can have no weight if they are at variance with reaſon, or eſtabliſhed tradition.

4. We muſt diſtruſt the truth of a hiſtory that is related by modern authors, when they do not agree among themſelves in ſeveral circumſtances, nor with ancient hiſtorians, who are to be regarded as original ſources. We ſhould eſpecially doubt the truth of thoſe brilliant portraits, that are drawn at pleaſure by ſuch as never knew the perſons they are intended for, and even made ſeveral centuries after their deceaſe.

The moſt pure and moſt fruitful ſource of ancient hiſtory

hiſtory is doubtleſs to be found in the Holy Bible. Let us here for a moment ceaſe to regard it as divine, and let us preſume to conſider it as a common hiſtory. Now, when we regard the writers of the books of the Old Teſtament, and conſider them ſometimes as authors, ſometimes as ocular witneſſes, and ſometimes as reſpectable hiſtorians; whether we reflect on the ſimplicity of the narration, and the air of truth that is there conſtantly viſible; or, when we conſider the care that the people, the governments, and the learned men of all ages, have taken to preſerve the true text of the Bible; or that we have regard to the happy conformity of the chronology of the holy ſcriptures with that of profane hiſtory: or, if we obſerve the admirable harmony that is between theſe books and the moſt reſpectable hiſtorians, as Joſephus and others: and laſtly, when we conſider that the books of the holy ſcripture furniſh us alone with an accurate hiſtory of the world from the creation, through the line of patriarchs, kings, judges, and princes of the Hebrews; and that we may, by its aid, form an almoſt intire ſeries of events down to the birth of Chriſt, or the time of Auguſtus, which comprehends a ſpace of about 4000 years, ſome ſmall interruptions excepted, and which are eaſily ſupplied by profane hiſtory: when all theſe reflections are juſtly made, we muſt conſtantly allow that the ſcriptures form a book which merits the firſt rank among all the ſources of ancient hiſtory. It has been objected, that this book contains contradictions; but the moſt able interpreters have reconciled theſe ſeeming contradictions. It has been ſaid, that the chronology of the Hebrew text and the Vulgate do not agree with the chronology of the verſion of the Septuagint; but the ſoundeſt critics have ſhown that they may be made to agree. It has been obſerved, moreover, that the ſcriptures abound with miracles and prodigies; but they are miracles that have really happened: and what ancient hiſtory is there that is not filled with miracles, and other marvellous events? And do we for that reject their authority? Cannot the true God be ſuppoſed to have performed thoſe miracles which Pagan hiſtorians have attributed to their falſe divinities? Muſt we pay no regard to the writings of Livy, becauſe his hiſtory contains many fabulous relations?

III.

40 Epochs.

THE *epochs* form the third principal part of chronology. Theſe are thoſe fixed points in hiſtory that have never been conteſted, and of which there can, in fact, be no doubt. Chronologers fix on the events that are to ſerve as epochs, in a manner quite arbitrary; but this is of little conſequence, provided the dates of theſe epochs agree, and that there is no contradiction in the facts themſelves. When we come to treat expreſsly on hiſtory, we ſhall mention, in our progreſs, all the principal epochs.

IV.

41 Medals, &c.

MEDALS, monuments, and inſcriptions, form the fourth and laſt principal part of chronology. It is ſcarce more than 150 years ſince cloſe application has been made to the ſtudy of theſe; and we owe to the celebrated Spanheim the greateſt obligations, for the progreſs that is made in this method: his excellent work, *De præſtantia et uſu numiſmatum antiquorum*, has ſhown the great advantages of it; and it is evident that theſe monuments are the moſt authentic witneſſes that can be produced. It is by the aid of medals that M. Vailant has compoſed his judicious hiſtory of the kings of Syria, from the time of Alexander the Great to that of Pompey: they have been, moreover, of the greateſt ſervice in elucidating all ancient hiſtory, eſpecially that of the Romans; and even ſometimes that of the middle age. Their uſe is more fully ſpoken of in the article MEDALS. What we here ſay of medals, is to be underſtood equally, in its full force, of ancient inſcriptions, and of all other authentic monuments that have come down to us.

Every reader, endowed with a juſt diſcernment will readily allow that theſe four parts of chronology afford clear lights, and are excellent guides to conduct us through the thick darkneſs of antiquity. That impartiality, however, which directs us to give a faithful relation of that which is true and falſe, of the certainty and uncertainty of all the ſciences, obliges us here freely to confeſs, that theſe guides are not infallible, nor the proofs that they afford mathematical demonſtrations. In fact, with regard to hiſtory in general, and ancient hiſtory in particular, ſomething muſt be always left to conjecture and hiſtoric faith. It would be an offence againſt common probity, were we to ſuffer ourſelves to paſs over in ſilence thoſe objections which authors of the greateſt reputation have made againſt the certainty of chronology. We ſhall extract them from their own works; and we hope that their is no magiſtrate, theologian, or public profeſſor in Europe, who would be mean enough to accuſe us of a crime, for not unworthily diſguiſing the truth.

1. The prodigious difference there is between the Septuagint Bible and the Vulgate, in point of chronology, occaſions an embarraſſment, which is the more difficult to avoid as we cannot poſitively ſay on which ſide the error lies. The Greek Bible counts, for example, from the creation of the world to the birth of Abraham, 1500 years more than the Hebrew and Latin Bibles, *&c.* 2. How difficult is it to aſcertain the years of the judges of the Jewiſh nation, in the Bible? What darkneſs is ſpread over the ſucceſſion of the kings of Judah and Iſrael? The calculation of time is there ſo inaccurate, that the ſcripture never marks if they are current or complete years. For we cannot ſuppoſe that a patriarch, judge, or king, lived exactly 60, 90, 100, or 969 years, without any odd months or days. 3. The different names that the Aſſyrians, Egyptains, Perſians and Greeks, have given to the ſame prince, have contributed not a little to embarraſs all ancient chronology. Three or four princes have borne the name of Aſſuerus, though they had alſo other names. If we did not know that Nabucodonoſor, Nabucodroſor, and Nabucolaſſar, were the ſame name, or the name of the ſame man, we ſhould ſcarcely believe it. Sargon is Senacherib; Ozias is Azarias; Sedecias is Mathanias; Joachas is alſo called Sellum; Aſaraddon, which is pronounced indifferently Eſarhaddon and Aſarhaddon, is called Aſenaphar by the Cuthæans; and by an oddity of which we do not know the origin, Sardanapalus is called by

by the Greeks Tenos Concoleros. 4. There remain to us but few monuments of the firſt monarchs of the world. Numberleſs books have been loſt, and thoſe which have came down to us are mutilated or altered by tranſcribers. The Greeks began to write very late. Herodotus, their firſt hiſtorian, was of a credulous diſpoſition, and believed all the fables that were related by the Egyptain prieſts. The Greeks were in general vain, partial, and held no nation in eſteem but their own. The Romans were ſtill more infatuated with notions of their own merit and grandeur, their hiſtorians were altogether as unjuſt as was their ſenate, toward other nations that were frequently far more reſpectable. 5. The eras, the years, the periods and epochs, were not the ſame in each nation; and they, moreover, began at different ſeaſons of the year. All this has thrown ſo much obſcurity over chronology, that it appears to be beyond all human capacity totally to diſperſe it.

Chriſtianity itſelf had ſubſiſted near 1200 years, before they knew preciſely how many years had paſſed ſince the birth of our Saviour. They ſaw clearly that the vulgar era was defective, but it was a long time before they could comprehend that it required four whole years to make up the true period. Abbe Denis the Little, who in the year 532 was the firſt among the Chriſtians to form the era of that grand epoch, and to count the years from that time, in order to make their chronology altogether Chriſtian, erred in his calculation, and led all Europe into his error. They count 132 contrary opinions of different authors concerning the year in which the Meſſiah appeared on the earth. M. Vallemont names 64 of them, and all celebrated writers. Among all theſe authors, however, there is none that reckon more than 7000, nor leſs than 3700 years. But even this difference is enormous. The moſt moderate fix the birth of Chriſt in the 4000th year of the world. The reaſons, however, on which they found their opinion, appear to be ſufficiently arbitrary.

Be theſe matters, however, as they may, the wiſdom of Providence has ſo diſpoſed all things, that there remain ſufficient lights to enable us nearly to connect the ſeries of events: for in the firſt 3000 years of the world, where profane hiſtory is defective we have the chronology of the Bible to direct us; and after that period, where we find more obſcurity in the chronology of the holy ſcriptures, we have, on the other hand, greater lights from profane authors. It is at this period that begins the time which Varro calls *hiſtoric*: as, ſince the time of the Olympiads, the truth of ſuch events as have happened ſhines clear in hiſtory. Chronology, therefore, draws its principal lights from hiſtory; and in return, ſerves it as a guide. Referring the reader, therefore, to the article HISTORY, and the *Chart* thereto annexed, we ſhall conclude the preſent article with

A CHRONOLOGICAL TABLE *of Remarkable Events, Diſcoveries, and Inventions, from the Creation to the Year* 1789.

Bef. Chriſt.

4008 THE creation of the world, and Adam and Eve
4007 The birth of Cain, the firſt who was born of a woman.
3017 Enoch, for his piety, is tranſlated to heaven.
2352 The old world is deſtroyed by a deluge which continued 377 days.
2247 The tower of Babel is built about this time by Noah's poſterity; upon which God miraculouſly confounds their language, and thus diſperſes them into different nations.
2237 About this time, Noah is, with great probability, ſuppoſed to have parted from his rebellious offspring, and to have led a colony of ſome of the more tractable into the eaſt, and there either he, or one of his ſucceſſors to have founded the ancient Chineſe monarchy.
2234 The celeſtial obſervations are begun at Babylon, the city which firſt gave birth to learning and the ſciences.
2188 Miſraim, the ſon of Ham, founds the kingdom of Egypt, which laſted 1663 years, down to the conqueſt of Cambyſes, in 525 before Chriſt.
2059 Ninus, the ſon of Belus, founds the kingdom of Aſſyria, which laſted above 1000 years, and out of its ruins were formed the Aſſyrians of Babylon, thoſe of Nineveh, and the kingdom of the Medes.
1985 The covenant of God made with Abram, when he leaves Haran to go into Canaan, which begin, the 430 years of ſojourning.
1961 The cities of Sodom and Gomorra are deſtroyed for their wickedneſs by fire from heaven.
1856 The kingdom of Argos, in Greece, begins under Inachus.
1822 Memnon, the Egyptain, invents the letters.
1715 Prometheus firſt ſtruck fire from flints.
1635 Joſeph dies in Egypt.
1574 Aaron born in Egypt; 1490, appointed by God firſt high-prieſt of the Iſraelites.
1571 Moſes, brother to Aaron, born in Egypt, and adopted by Pharaoh's daghter, who educates him in all the learning of the Egyptains.
1556 Cecrops brings a colony of Saites from Egypt into Attica, and begins the kingdom of Athens in Greece.
1555 Moſes performs a number of miracles in Egypt; and departs from that kingdom, together with 600,000 Iſraelites, beſides children, which completed the 430 years of ſojourning. They miraculouſly paſs through the Red Sea, and come to the deſart of Sinai, where Moſes receives from God, and delivers to the people, the Ten Commandments, and the other laws, and ſets up the tabernacle, and in it the ark of the covenant.
1546 Scamander comes from Crete into Phrygia, and begins the kingdom of Troy.
1515 The Iſraelites, after ſojourning in the wilderneſs forty years, are led under Joſhua into the land of Canaan, where they fix themſelves, after having ſubdued the natives; and the period of the ſabbatical year commences.
1503 The deluge of Deucalion.
1496 The council of Amphictyons eſtabliſhed at Thermopylæ.
1493 Cadmus carried the Phenician letters into Greece and built the citadel of Thebes.
1490 Sparta built by Lacedemon.

Before Chriſt.

1485 The firſt ſhip that appeared in Greece was brought from Egypt by Danaus, who arrived at Rhodes, and brought with him his fifty daughters.
1480 Troy built by Dardanus.
1452 The Pentateuch, or five firſt books of Moſes, are written in the land of Moab, where he died the year following, aged 110.
1406 Iron is found in Greece, from the accidental burning of the woods.
1344 The kingdom of Mycenæ begins.
1326 The Iſthmian games inſtituted at Corinth.
1325 The Egyptian canicular year began July 20th.
1307 The Olympic games inſtituted by Pelops.
1300 The Lupercalia inſtituted.
1294 The firſt colony came from Italy into Sicily.
1264 The ſecond colony came from Italy into Sicily.
1252 The city of Tyre built.
1243 A colony of Arcadians conducted by Evander into Italy.
1233 Carthage founded by the Tyrians.
1225 The Argonautic expedition.
1204 The rape of Helen by Paris, which gave riſe to the Trojan war, ending with the deſtruction of the city in 1184.
1176 Salamis in Cyprus built by Teucer.
1152 Aſcanius builds Alba Longa.
1130 The kingdom of Sicyon ended.
1124 Thebes built by the Bœotians.
1115 The mariner's compaſs known in China.
1104 The expedition of the Heraclidæ into Peloponneſus; the migration of the Dorians thither; and the end of the kingdom of Mycenæ.
1102 The kingdom of Sparta commenced.
1070 The kingdom of Athens ended.
1051 David beſieged and took Jeruſalem.
1044 Migration of the Ionian colonies.
1008 The Temple is ſolemnly dedicated by Solomon.
996 Solomon prepared a fleet on the Red Sea to ſend to Ophir.
986 Samos and Utica in Africa built.
979 The kingdom of Iſrael divided.
974 Jeruſalem taken and plundered by Shiſhak king of Egypt.
911 The prophet Elijah flouriſhed.
894 Money firſt made of gold and ſilver at Argos.
884 Olympic games reſtored by Iphitus and Lycurgus.
873 The art of ſculpture in marble found out.
869 Scales and meaſures invented by Phidon.
864 The city of Carthage, in Africa, enlarged by queen Dido.
821 Nineveh taken by Arbaces.
814 The kingdom of Macedon begins.
801 The city of Capua in Compania built.
799 The kingdom of Lydia began.
786 The ſhips called *Triremes* invented by the Corinthians.
779 The race of kings in Corinth ended.
776 The era of the Olympiads began.
760 The Ephori eſtabliſhed at Sparta.
758 Syracuſe built by Archias of Corinth.
754 The government of Athens changed.
753 Era of the building of Rome in Italy by Romulus, firſt king of the Romans.
747 The era of Nabonaſſar commenced on the 26th of February; the firſt day of Thoth.
746 The government of Corinth changed into a republic.
743 The firſt war between the Meſſenians and Spartans.
724 Mycenæ reduced by the Spartans.
723 A colony of the Meſſenians ſettled at Rhegium in Italy.
720 Samaria taken, after three years ſiege, and the kingdom of Iſreal finiſhed by Salmanazer king of Aſſyria, who carries the ten tribes into captivity.
The firſt eclipſe of the moon on record.
713 Gela in Sicily built.
703 Corcyra, now Corfu, founder of the Corinthians.
702 Ecbatan in Media built by Deioces.
685 The ſecond Meſſenian war under Ariſtomenes.
670 Byzantium (now Conſtantinople) built by a colony of Athenians.
666 The city of Alba deſtroyed.
648 Cyrene in Africa founded.
634 Cyaxares beſieges Nineveh, but is obliged to raiſe the ſiege by an incurſion of the Scythians, who remained maſters of Aſia for 28 years.
624 Draco publiſhed his inhuman laws at Athens.
610 Pharaoh Necho attempted to make a canal from the Nile to the Red Sea, but was not able to accompliſh it.
607 By order of the ſame monarch, ſome Phenicians ſailed from the Red Sea round Africa, and returned by the Mediterranean.
606 The firſt captivity of the Jews by Nebuchadnezzar. Nineveh deſtroyed by Cyaxares.
600 Thales, of Miletus, travels into Egypt, conſults the prieſts of Memphis, acquires the knowledge of geometry, aſtronomy, and philoſophy; returns to Greece, calculates eclipſes, gives general notions of the univerſe, and maintains that an only Supreme Intelligence regulates all its motions.
Maps, globes, and the ſigns of the zodiac, invented by Anaximander, the ſcholar of Thales.
598 Jehoiakin, king of Judah, is carried away captive, by Nebuchadnezzar, to Babylon.
594 Solon made Archon at Athens.
591 The Pythian games inſtituted in Greece, and tragedy firſt acted.
588 The firſt irruption of the Gauls into Italy.
586 The city of Jeruſalem taken, after a ſiege of 18 months.
582 The laſt captivity of the Jews by Nebuchadnezzar.
581 The Iſthmian games reſtored.
580 Money firſt coined at Rome.
571 Tyre taken by Nebuchadnezzar after a ſiege of 13 years.
566 The firſt cenſus at Rome, when the number of citizens was found to be 84,000.
562 The firſt comedy at Athens acted upon a moveable ſcaffold.
559 Cyrus the firſt king of Perſia.
538 The kingdom of Babylon finiſhed; that city being

ing taken by Cyrus, who, in 536, gives an edict for the return of the Jews.
534 The foundation of the temple laid by the Jews.
526 Learning is greatly encouraged at Athens, and a public library firſt founded.
520 The ſecond edict to rebuild Jeruſalem.
515 The ſecond temple at Jeruſalem is finiſhed under Darius.
510 Hippias baniſhed from Athens.
509 Tarquin, the ſeventh and laſt king of the Romans, is expelled, and Rome is governed by two conſuls, and other republican magiſtrates, till the battle of Pharſalia, being a ſpace of 461 years.
508 The firſt alliance between the Romans and Carthaginians.

1635 Province of Maryland planted by lord Baltimore.
Regular poſts eſtabliſhed from London to Scotland, Ireland, &c.
1636 A tranſit of Mercury over the Sun's diſk obſerved by Caſſini.
1639 A tranſit of Venus over the ſun's diſk firſt obſerved by Mr Horrox, November 24th. O. S. 3 h 15′ P. M.
1640 King Charles diſobliges his Scottiſh ſubjects: on which their army, under general Leſley, enters England, and takes Newcaſtle, being encouraged by the malecontents in England.
The maſſacre in Ireland, when 40,000 Engliſh Proteſtants were killed.
The independency of Portugal recovered by John duke of Braganza.
1642 King Charles impeaches five refractory members, which begins the civil wars in England.
1643 Exciſe on beer, ale, &c. firſt impoſed by parliament.
Barometers invented by Torricelli.
1648 A new ſtar obſerved in the tale of the Whale by Fabricius.
1649 Charles I. beheaded by Cromwell at Whitehall, January 30, aged 49.
Pendulums firſt applied to clocks by Huygens.
1651 The ſect called *Quakers* appeared in England.
1652 The Dutch colony at the Cape of Good Hope eſtabliſhed.
1654 Cromwell aſſumes the protectorſhip.
The air-pump invented by Otto Guericke of Magdeburg.
1655 The Engliſh, under Admiral Penn, take Jamaica from the Spaniards.
One of Saturn's ſatellites obſerved by Huygens.
1658 Cromwell dies, and is ſucceeded in the protectorſhip by his ſon Richard.
1660 King Charles II. is reſtored by Monk, commander of the army, after an exile of twelve years in France and Holland.
The people of Denmark, being oppreſſed by the nobles, ſurrender their privileges to Frederic III. who becomes abſolute.
1661 The obliquity of the ecliptic obſerved by Hevelius to be 23° 29′ 7″.
1662 The Royal Society eſtabliſhed at London by Charles II.
1663 Carolina planted; 1728, divided into ſeparate governments.
Pruſſia declared independent of Poland.
1664 The New Netherlands in North America conquered from the Swedes and Dutch by the Engliſh.

1665 The plague rages in London, and carries off 68,000 perſons.

The magic lanthorn invented by Kircher.

1666 The great fire of London began Sept. 2. and continued three days, in which were deſtroyed 13,000 houſes and 400 ſtreets.

Tea firſt uſed in England.

1667 The peace of Breda, which confirms to the Engliſh the New Netherlands, now the States of Pennſylvania, New York, and New Jerſey.

1668 ——ditto Aix la Chapelle.

St James's park planted, and made a thoroughfare for public uſe by Charles II.

1669 The iſland of Candia taken by the Turks.

1670 The Engliſh Hudſon's Bay company incorporated.

The obliquity of the ecliptic obſerved by Mengoli to be 23° 28′ 24″.

1672 Louis XIV. over-runs great part of Holland, when the Dutch opened their ſluices, being determined to drown their country, and retire to their ſettlements in the Eaſt Indies.

African company eſtabliſhed.

The obliquity of the ecliptic obſerved by Richer to be 23° 28′ 54″.

1677 The micrometer invented by Kircher.

1678 The peace of Nimeguen.

The habeas corpus act paſſed.

A ſtrange darkneſs at noon-day, Jan. 12.

1680 A great comet appeared, and from its nearneſs to our earth alarmed the inhabitants. It continued viſible from Nov. 3. to March 9.

William Penn, a Quaker, receives a charter for planting Pennſylvania.

1683 India ſtock ſold from 360 to 500 *per cent.*

1685 Charles II. dies, aged 55, and is ſucceeded by his brother James II.

The duke of Monmouth, natural ſon to Charles II. raiſes a rebellion, but is defeated at the battle of Sedgmore, and beheaded.

The edict of Nantes is revoked by Louis XIV. and the Proteſtants are greatly diſtreſſed.

1686 The Newtonian philoſophy publiſhed.

1687 The palace of Verſailles, near Paris, finiſhed by Louis XIV.

1688 The Revolution in Great Britain begins Nov. 5. King James abdicates, and retires to France, Dec. 3.

King William and Queen Mary, daughter and ſon-in-law to James, are proclaimed February 16.

Viſcount Dundee ſtands out for James in Scotland, but is killed by general Mackay at the battle of Killycrankie; upon which the Highlanders, wearied with repeated misfortunes, diſperſe.

Smyrna deſtroyed by an earthquake.

1689 The land-tax paſſed in England.

The toleration-act paſſed in ditto.

Several biſhops are deprived for not taking the oaths to William.

William Fuller, who pretended to prove the prince of Wales ſpurious, was voted by the commons to be a notorious cheat, impoſtor, and falſe accuſer.

1689 Epiſcopacy aboliſhed in Scotland.

1690 The battle of the Boyne, gained by William againſt James, in Ireland.

1691 The war in Ireland finiſhed, by ſurrender of Limerick to William.

The obliquity of the ecliptic obſerved by Flamſtead to be 23° 28′ 32″.

1692 The Engliſh and Dutch fleets, commanded by Admiral Ruſſel, defeat the French fleet off La Hogue.

The maſſacre of Glencoe in Scotland, Jan. 31. O. S.

Earthquakes in England and Jamaica, September 8.

Hanover made an electorate of the empire.

1693 Bayonets at the end of loaded muſkets firſt uſed by the French againſt the confederates in the battle of Turin.

Bank of England eſtabliſhed by King William.

The firſt public lottery was drawn this year.

1694 Queen Mary dies at the age of 33, and William reigns alone.

Stamp duties inſtituted in England.

1696 The peace of Ryſwick.

1699 The Scots ſettled a colony at the iſthmus of Darien in America, and called it *Caledonia*.

1700 Charles XII. of Sweden begins his reign.

King James II. dies at St Germains in the 68th year of his age.

1701 Pruſſia erected into a kingdom.

Society for the propagation of the goſpel in foreign parts eſtabliſhed.

1702 King William dies, aged 50, and is ſucceeded by Queen Anne, daughter to James II. who, with the Emperor and States General, renews the war againſt France and Spain.

the French ſent colonies to the Miſſiſipppi.

1703 The obliquity of the ecliptic obſerved by Bianchini to be 23° 28′ 25″.

1704 Gibraltar taken from the Spaniards by Admiral Rooke.

The battle of Blenheim won by the Duke of Marlborough and allies againſt the French.

The court of Exchequer inſtituted in England.

1706 The treaty of Union betwixt England and Scotland, ſigned July 22.

The battle of Ramilies won by Marlborough and the allies.

1707 The firſt Britiſh parliament.

The allies defeated at Almanza.

1708 Minorca taken from the Spaniards by General Stanhope.

The battle of Oudenarde won by Marlborough and the allies.

1709 Peter the Great, czar of Moſcovy, defeats Charles XII. at Poltowa, who flies to Turkey.

The battle of Malplaquet won by Marlborough and the allies.

1710 Queen Anne changes the whig miniſtry for others more favourable to the intereſt of her brother the late Pretender.

The cathedral church of St Paul, London, rebuilt by Sir Chriſtopher Wren in 37 years, at one million expence, by a duty on coals.

The Engliſh South-ſea company began.

1712 Duke of Hamilton and Lord Mohun killed in a duel in Hide-Park.

1713 The peace of Utrecht, whereby Newfoundland, Nova Scotia, New Britain, and Hudſon's bay, in North America, were yielded to Great Britain; Gibraltar and Minorca, in Europe, were alſo confirmed to the ſaid crown by this treaty.

1714 Queen Anne dies, at the age of 50, and is ſucceeded by George I.

Intereſt in England reduced to five *per cent.*

1715 Louis XIV. dies, and is ſucceeded by his great-grandſon Louis XV. the late king of France.

The rebellion in Scotland begins in September under the Earl of Mar, in favour of the Pretender. The action of Sheriffmuir, and the ſurrender of Preſton, both in November, when the rebels diſperſe.

The obliquity of the ecliptic obſerved by Louville to be 23° 28′ 24″.

1716 The Pretender married the princeſs Sobieſka, grand-daughter of John Sobieſki, late king of Poland.

An act paſſed for ſeptennial parliaments.

1718 Sardinia erected into a kingdom, and given to the duke of Savoy.

1719 The Miſſiſippi ſcheme at its height in France.

Lombe's ſilk-throwing machine, containing 26,586 wheels, erected at Derby in England: takes up one-eighth of a mile; one water-wheel moves the reſt; and in 24 hours it works 318,504,960 yards of organzine ſilk thread.

1720 The ſouth-ſea ſcheme in England begun April 7, was at its height at the end of June, and quite ſunk about September 29.

A great earthquake in China.

1724 An earthquake in Denmark.

1727 King George dies, in the 68th year of his age; and is ſucceeded by his only ſon, George II.

Inoculation firſt tried on criminals with ſucceſs.

Ruſſia, formerly a dukedom, is now eſtabliſhed as an empire.

The abberration of the fixed ſtars diſcovered and accounted for by Dr Bradley.

1732 Kouli Khan uſurps the Perſian throne, conquers the Mogul empire, and returns with two hundred thirty-one millions Sterling.

Several public-ſpirited gentleman begin the ſettlement of Georgia in North America.

1733 The Jeſuits expelled from Paraguay.

1736 Capt. Porteous having ordered his ſoldiers to fire upon the populace at an execution of a ſmuggler, is himſelf hanged by the mob at Edinburgh.

A tranſit of Mercury obſerved by Caſſini.

1737 A dreadful hurricane at the mouth of the Ganges, Oct. 10.

1738 Weſtminiſter bridge, conſiſting of 15 arches, begun; finiſhed in 1750, at the expence of 389,000 l. defrayed by parliament.

The order of St Januarius eſtabliſhed at Naples.

1739 Letters of marque iſſued out in Britain againſt Spain July 21. and war declared, Oct. 23.

The empire of Indoſtan ruined by Kouli Khan.

An intenſe froſt in Britain.

1743 The battle of Dettingen won by the Engliſh and allies in favour of the Queen of Hungary.

1743 A dreadful plague in Sicily.

1744 War declared againſt France.—Commodore Anſon returns from his voyage round the world.

1745 The allies loſe the battle at Fontenoy.

The rebellion breaks out in Scotland, and the Pretender's army defeated by the Duke of Cumberland at Culloden, April 16, 1746.

1746 Britiſh Linen Company erected.

Lima deſtroyed by an earthquake.

1747 Kouli Khan murdered.

1748 The peace of Aix-la-Chapelle, by which a reſtitution of all places taken during the war was to be made on all ſides.

1749 The intereſt on the Britiſh funds reduced to 3 *per cent.*

Britiſh herring-fiſhery incorporated.

The colony of Nova Scotia founded.

1750 Earthquake in England.

1751 Frederic prince of Wales, father to his preſent majeſty, died.

Antiquarian ſociety at London incorporated.

1752 The new ſtile introduced into Great Britain; the 3d of September being counted the 14th.

1753 The Britiſh muſeum erected at Montague-houſe.

Society of arts, manufactures, and commerce, inſtituted in London.

1754 A dreadful eruption of mount Ætna.

A great earthquake at Conſtantinople, Cairo, &c. Sept. 2d.

1755 Quito in Peru deſtroyed by an earthquake, April 28th.

Liſbon deſtroyed by an earthquake, Nov. 1ſt.

1756 146 Engliſhmen are confined in the black hole at Calcutta in the Eaſt Indies by order of the nabob, and 123 found dead next morning.

Marine ſociety eſtabliſhed at London.

The King of Pruſſia commenced hoſtilities in the month of Auguſt in Saxony. Defeats the Auſtrians at Lo.

1757 Damien attempted to aſſaſſinate the French king.

The King of Pruſſia invades Bohemia. Defeats the Auſtrians at Reichenberg, April 21ſt, and at Prague, May 6th. Repulſed by Count Daun at Kolin, June 18th.

The allies defeated by the French at Haſtenbeck, July 26th.

Convention of Cloſter Seven, Sep. 8th.

The king of Pruſſia defeats the French and Auſtrians at Roſbach, Nov. 5. The Pruſſians defeated near Breſlaw, Nov. 22d. The Auſtrians defeated at Liſſa, Dec. 5th.

1758 Senegal taken by the Britiſh, May 1ſt. They take Louiſbourg, July 27th.

The King of Pruſſia defeats the Ruſſians at Zorndorf, Auguſt 25th. Is defeated by Count Daun at Hoch-kirchen, Oct. 14th.

Goree taken by Commodore Keppel, Dec. 29th.

Attempt to aſſaſſinate the King of Portugal, Dec. 3.

1759 General Wolfe is killed in the battle of Quebec, which is gained by the Britiſh.

The French defeated by Prince Ferdinand at Bergen, April 13th.

Guadaloupe taken by the Britiſh, May 1ſt.

King of Pruſſia defeated by the Ruſſians at Cunerſdorf, Aug. 12th.

1759 The French fleet defeated by Admiral Hawke, Nov. 20th.

Balbec and Tripoli deſtroyed by an earthquake, Dec. 5th.

1760 King George II. dies October 25th, in the 77th year of his age, and is ſucceeded by his preſent majeſty, who, on the 22d of September 1761, married the princeſs Charlotte of Mecklenburgh Strelitz.

Blackfriars-bridge, conſiſting of 9 arches, begun, finiſhed 1770, at the expence of 152,840l. to be diſcharged by a toll.

A tranſit of Venus over the ſun June 6th.

Earthquakes in Syria Oct. 13th.

The King of Pruſſia defeats the Auſtrians at Torgau Nov. 3d.

1761 Pondicherry taken by Col. Coote Jan. 15th.

Belleiſle ſurrendered to the Britiſh Feb. 4th.

1762 War declared againſt Spain.

Peter III. emperor of Ruſſia, is depoſed, impriſoned, and murdered.

American philoſophical ſociety eſtabliſhed in Philadelphia.

George Auguſtus Frederic, prince of Wales, born Aug. 12th

Martinico ſurrended to the Britiſh Feb. 4th.

Havannah ſurrendered to ditto Aug. 12th.

Manilla taken by ditto Oct. 6th

1763 The definitive treaty of peace between Great Britain, France, Spain, and Portugal, concluded at Paris February 10th; which confirms to Great Britain the extenſive provinces of Canada, Eaſt and Weſt Florida, and part of Louiſiana, in North America: alſo the iſlands of Granada, St Vincent, Dominica, and Tobago, in the Weſt Indies.

The Jeſuits expelled from France.

1764 The parliament granted 10,000 l. to Mr Harriſon for his diſcovery of the longitude by his time-piece.

Famine and peſtilence in Italy.

An earthquuke at Liſbon.

1765 His majeſty's royal charter paſſed for incorporating the ſociety of artiſts.

An act paſſed annexing the ſovereignty of the iſland of Man to the crown of Great Britain.

1766 April 21ſt. a ſpot or macula of the ſun, more than thrice the bigneſs of our earth, paſſed the ſun's centre.

The American ſtamp-act repealed March 18th

A great earthquake at Conſtantinople.

The Jeſuits expelled from Bohemia and Denmark.

1767 The Jeſuits expelled from Spain, Venice, and Genoa, April 2d.

Martinico almoſt deſtroyed by an earthqnake.

The proteſtants tolerated in Poland Nov. 2d.

1768 Academy of painting eſtabliſhed in London.

The Turks impriſon the Ruſſian ambaſſador, and declare war againſt that empire.

The Jeſuits expelled from Naples, Malta, and Parma.

1769 Paoli fled from Corſica June 13th. The iſland then reduced by the French.

1770 An earthquake at St Domingo.

1771 Dr Solander and Mr Banks, in his Britannic majeſty's ſhip the Endeavour, Lieut. Cook, return from a voyage round the world, having made ſeveral important diſcoveries in the Southſeas.

An emigration of 500,000 Tourgouths from the coaſts of the Caſpian Sea to the frontiers of China.

1772 The King of Sweden changes the conſtitution from ariſtocracy to a limited monarchy.

The pretender marries a princeſs of Germany, grand-daughter of Thomas late Earl of Ayleſbury.

The emperor of Germany, Empreſs of Ruſſia, and the King of Pruſſia, ſtrip the King of Poland of a great part of his dominions, which they divide among themſelves, in violation of the moſt ſolemn treaties

1773 Captain Phipps is ſent to explore the North Pole; but having made 81 degrees, is in danger of being locked up by the ice, and his attempt to diſcover a paſſage in that quarter proves fruitleſs.

The Engliſh Eaſt India company having, by conqueſt or treaty, acquired the extenſive provinces of Bengal, Orixa, and Bahar, containing 15 millions of inhabitants, great irregularities are committed by their ſervants abroad; upon which government interferes, and ſends out judges &c. for the better adminiſtration of juſtice.

The war between the Ruſſians and the Turks proves diſgraceful to the latter, who loſe the Iſlands in the Archipelago, and by the ſea are every where unſucceſsful.

The ſociety of Jeſuits ſuppreſſed by the Pope's bull Auguſt 25th.

1774 Peace is proclaimed between the Ruſſians and the Turks.

The Britiſh parliament having paſſed an act laying a duty of 3d. *per* pound upon all teas imported into America, the coloniſts, conſidering this as a greivance, deny the right of the Britiſh parliament to tax them.

The American colonies ſend deputies to Philadelphia, who aſſume the title of *The Congreſs of the Thirteen United Provinces.*

1775 The the American war commences. Action at Bunker's Hill June 7th.

The Spaniards land near Algiers and are defeated July 8th.

1776 The congreſs declare the United States of America independent of the crown and parliament of Great Britain, 4th July.

The Americans receive a dreadful defeat at Long-Iſland Auguſt 27th.

1777 Philadelphia taken by the Britiſh Oct. 3d.

General Burgoyne with his army ſurrender to the Americans.

1778 Philadelphia evacuated by the Britiſh, June 18th.

1779 A moſt extraordinary eruption of Veſuvius Auguſt 8th.

The ſiege of Gibraltar begun by the Spaniards July 8th.

1780 Jan. 14th, 6 h. A. M. the thermometer ſuſpended in the open air at Glaſgow, ſtood at 46° below 0.
The Spaniſh fleet defeated by Admiral Rodney Jan. 16th.
Charleſton ſurrendered to the Britiſh May 12th.
A dreadful inſurrection in London, and riots in many other places of the kingdom.
A great number of Britiſh ſhips taken by the combined fleets of France and Spain.
Lord Cornwallis defeats the Americans at Camden.
A dreadful hurricane in the Leeward Iſlands Oct. 9th.
An extraordinary ſtorm of wind in England.
War declared againſt the Dutch Dec. 20th.

1781 A terrible engagement between the Dutch and Britiſh fleets near the Dogger Bank Aug. 5.
Lord Cornwallis with his army ſurrender to the united forces of France and America Oct. 18th.

1782 Minorca ſurrendered to the Spaniards February 4th.
The French fleet under De Graſſe defeated and almoſt deſtroyed by Admiral Rodney April 12th.
The Spaniſh floating batteries before Gibraltar entirely deſtroyed Sept. 12th.

1783 Preliminaries of a general peace ſigned. America declared independent Jan. 20th.
A dreadful earthquake, attended with many extraordinary circumſtances, in Italy and Sicily.
The ſun obſcured by a kind of fog during the whole ſummer.
A volcanic eruption in Iceland ſurpaſſing any thing recorded in hiſtory. The lava ſpouted up in three places to the height of two miles perpendicular, and continued thus for two months; during which time it covered at tract of 3600 ſquare miles of ground, in ſome places more than 100 feet deep.
A large meteor appears to the northward of Shetland, and takes its direction ſouthward, with a velocity little inferior to that of the earth in its annual courſe round the ſun. Its tract obſerved for more than 1000 miles.

1787 General Convention meet at Philadelphia for the purpoſe of forming a new conſtitution, which was afterwards adopted by all the ſtates.

1789 Firſt Congreſs meet under the federal conſtitution March 4th.
States General opened at Paris April 25th.
Baſtile demoliſhed by the people July 14th.
Conſtitution of France framed Auguſt 6th.

CHRONOMETER, in general, denotes any inſtrument or machine uſed in meaſuring time; ſuch are dials, clocks, watches, *&c.* See Dial, *&c.*

The term *chronometer*, however, is generally uſed in a more limited ſenſe, for a kind of clock ſo contrived as to meaſure a ſmall portion of time with great exactneſs, even to the ſixteenth part of a ſecond: of ſuch a one there is a deſcription in Deſaguliers's experimental philoſophy, invented by the late ingenious Mr George Graham; which muſt be allowed to be of great uſe for meaſuring ſmall portions of time in aſtronomical obſervations, the time of the fall of bodies, the velocity of running waters, *&c.* But long ſpaces of time cannot be meaſured by it with ſufficient exactneſs, unleſs its pendulum be made to vibrate in a cycloid; becauſe, otherwiſe it is liable to err conſiderably, as all clocks are which have ſhort pendulums that ſwing in large arches of a circle.

There have been ſeveral machines contrived for meaſuring time, under the name of *chronometers*, upon principles very different from thoſe on which clocks and watches are conſtructed.

Plate CXXXVI. fig. 1. repreſents an air-chronometer, which is conſtructed in the following manner. Provide a glaſs tube of about an inch in diameter, and three or four feet long: the diameter of the inſide of this tube muſt be preciſely equal in every part: at the bottom muſt be a ſmall hole, cloſely covered with a valve. In the tube place a piſton E, fig. 2. which is made to fit it exactly, and muſt be oiled, that it may move in the tube with the greateſt freedom: in this piſton there is a cock that ſhuts quite cloſe; and from the top of it there goes a cord F, which paſſes through the handle G. The cock of the piſton being cloſed, it is to be let down to the bottom of the tube, and being then drawn up to the top, the air will then ruſh in by the valve at the bottom of the tube, and ſupport the piſton. You are then to turn the cock, ſo as to make a very ſmall vent; and the air paſſing ſlowly through that vent, the piſton will gradually deſcend, and ſhow the hour, either by lines cut in the tube with a diamond, or marked with paint, or by ſmall ſlips of paper painted on the glaſs. If this chronometer ſhould go too faſt or two ſlow, it may be eaſily regulated by altering the poſition of the cock in the piſton, as it is on that the whole depends.

If, inſtead of marking the tube, you would have the time ſhown by a dial, it may be eaſily effected by placing an axis to which the hand of the dial is fixed, directly over the tube, and winding the ſtring to which the piſton is joined round that axis; for then, as the piſton deſcends, the axis will gradually turn the hand, and ſhow the hour: but it muſt be obſerved, that as the deſcent of the piſton is not conſtantly regular, on account of the decreaſe of reſiſtence from the quantity of the ſubjacent air as the piſton deſcends, the axis therefore muſt not be a regular cylinder, but conical like the fuſee of a watch, as in fig. 3. by which means the motion of the hand of the dial will be conſtant and regular.

Fig. 4. repreſents a lamp-chronometer. It conſiſts of a chamber lamp A, which is a cylindrical veſſel about three inches high, and one inch diameter, placed in the ſtand B. The inſide of this veſſel muſt be every where exactly of the ſame diameter. To the ſtand B is fixed the handle C, which ſupports the frame DEFG, about 12 inches high, and four wide. This frame is to be covered with oiled paper, and divided into twelve equal parts by horizontal lines; at the end of which are wrote the numbers for the hours, from 1 to 12, and between the horizontal lines are diagonals that are divided into halves, quarters, *&c.* On the handle B, and cloſe to the glaſs, is fixed the ſtyle or gnomon H. Now, as the diſtance of the ſtyle from the flame of the lamp is only half an inch, if the diſtance of the frame from the ſtyle is only ſix inches, then, while the float that contains the light deſcends,

deſcends, by the decreaſe of the oil, one inch, the ſhadow of the ſtyle on the frame will aſcend twelve inches, that is, its whole length, and ſhow by its progreſſion the regular increaſe of the hours, with their ſeveral diviſions. It is abſolutely neceſſary, however, that the oil uſed in this lamp be always of the ſame ſort and quite pure, and that the wick alſo be conſtantly of the ſame ſize and ſubſtance, as it is on theſe circumſtances, and the uniform figure of the veſſel, that the regular, progreſs of the ſhadow depends.

CHRONOMETER, among muſicians, an inſtrument invented by *Loulie*, a French muſician, for the purpoſe of meaſuring time by means of a pendulum. The form of the inſtrument, as deſcribed by him, is that of an Ionic pilaſter, and is thus deſcribed by Malcolm in his Treatiſe of Muſic, p. 407.—" The chronometer conſiſts of a large ruler or board, ſix feet or 72 inches long, to be ſet on end; it is divided into its inches, and the numbers ſet ſo as to count upwards; and at every diviſion there is a ſmall round hole, through whoſe centre the line of diviſion runs. At the top of this ruler, about an inch above the diviſion 72, and perpendicular to the ruler, is inſerted a ſmall piece of wood, in the upper ſide of which there is a groove, hollowed along from the end that ſtands out to that which is fixed in the ruler, and near each end of it a hole is made: through theſe holes a pendulum cord is drawn, which runs in the groove: at that end of the cord which comes through the hole furtheſt from the ruler, the ball is hung; and at the other end there is a ſmall wooden pin, which can be put in any of the holes of the ruler: when the pin is in the upmoſt hole at 72, then the pendulum from the top to the centre of the ball muſt be exactly 72 inches; and therefore, whatever hole of the ruler it is put in, the pendulum will be juſt ſo many inches as that figure at the hole denotes. The manner of uſing the machine is this: The compoſer lengthens or ſhortens his pendulum, till one vibration be equal to the deſigned length of his bar, and then the pin ſtands at a certain diviſion, which marks the length of the pendulum; and this number being ſet with the cliff at the beginning of the ſong, is a direction for others how to uſe the chronometer, in meaſuring the time according to the compoſer's deſign: for with the number is ſet the note, crotchet, or minim, whoſe value he would have the vibration to be; which in briſk duple time is beſt a minim or half bar, or even a whole bar, when that is but a minim; and in ſlow time a crotchet. In triple time, it would do well to be the third part or half, or fourth part of a bar; and in the ſimple triples that are allegro, let it be a whole bar. And if, in every time that is allegro, the vibration is applied to a whole or half bar, practice will teach us to ſubdivide it juſtly and equally. Obſerve, that, to make this machine of univerſal uſe, ſome canonical meaſure of the diviſions muſt be agreed upon, that the figure may give a certain direction for the length of the pendulum.

CHROSTASIMA, in natural hiſtory, a genus of pellucid gems, comprehending all thoſe which appear of one ſimple and permanent colour in all lights; ſuch are the diamond, carbuncle, ruby, garnet, amethyſt, ſapphire, beryl, emerald, and the topaz. See DIAMOND, CARBUNCLE, *&c.*

CHRYSA, (anc. geog.), a town of Myſia, on the ſinus Adramyttenus; extinct in Pliny's time: it had a temple of Apollo Smintheus (Homer, Strabo). The country of the fair Chryſeis, who gave firſt riſe to the quarrel between Agamemnon and Achilles.

CHRYSALIS, or AURELIA, in natural hiſtory, a ſtate of reſt and ſeeming inſenſibility, which butterflies, moths, and ſeveral other kinds of inſects, muſt paſs through before they arrive at their winged or moſt perfect ſtate.

In this ſtate, no creatures afford ſo beautiful a variety as the butterfly kinds, and they all paſs through this middle ſtate without one exception. The figure of the aurelia or chryſalis generally approaches to that of a cone, or at leaſt the hinder part of it is in this ſhape; and the creature, while in this ſtate, ſeems to have neither legs nor wings, nor has any power of walking. It ſeems indeed to have hardly ſo much as life. It takes no nouriſhment in this ſtate, nor has it any organs for taking any; and indeed its poſterior part is all that ſeems animated, this having a power of giving itſelf ſome motions. The external covering of the chryſalis is cartilaginous, and conſiderably large, and is uſually ſmooth and gloſſy: but ſome few of them have a few hairs; ſome are alſo as hairy as the caterpillars from which they are produced; and others are rough, and, as it were, ſhagreened all over.

In all of theſe there may be diſtinguiſhed two ſides; the one of which is the back, the other the belly of the animal. On the anterior part of the latter, there may always be diſtinguiſhed certain little elevations running in ridges, and reſembling the fillets wound about mummies: the part whence theſe have their origin, is eſteemed the head of the animal. The other ſide, or back, is ſmooth, and of a rounded figure in moſt of the chryſaliſes; but ſome have ridges on the anterior part, and ſides of this part; and theſe uſually terminate in a point, and make an angular appearance on the chryſalis.

From this difference is drawn the firſt general diſtinction of theſe bodies. They are by this divided into two claſſes; the round and the angular kinds. The firſt are, by the French naturaliſts, called *feves*; from the common cuſtom of calling the chryſalis of the ſilkworm, which is round, by this name.

There is ſomething more regular in this diſtinction than might at firſt be conceived; for the diviſion is continued from the fly-ſtate: the rounded chryſaliſes being almoſt all produced by the *phalenæ*, or moths; and the angular ones by the *papilios*, or day-flies. There are ſeveral ſubordinate diſtinctions of theſe kinds; but, in general, they are leſs different from one another than the caterpillars from whence they are produced.

The head of thoſe of the firſt claſs uſually terminates itſelf by two angular parts, which ſtand ſeparate one from the other, and reſemble a pair of horns. On the back, eminences and marks are diſcovered, which imagination may form into eyes, noſe, chin, and other parts of the human face.

There is a great variety and a great deal of beauty in the figures and arrangement of the eminences and ſpots on the other part of the body of the chryſaliſes of different kinds. It is a general obſervation, that thoſe chryſaliſes which are terminated by a ſingle horn, afford day-butterflies of the kind of thoſe which have buttoned

buttoned antennæ, and whoſe wings, in a ſtate of reſt, cover the under part of their body, and which uſe all their ſix legs in walking, thoſe of many other kinds uſing only four of them. Thoſe chryſaliſes which are terminated by two angular bodies, and which are covered with a great number of ſpines, and have the figure of a human face on their back in the greateſt perfection, afford butterflies of the day-kind; and of that claſs the characters of which are, their walking on four legs, and uſing the other two, that is, the anterior part, in the manner of arms or hands. The chryſaliſes which have two angular bodies on their heads, but ſhorter than thoſe of the preceding, and whoſe back ſhows but a faint ſketch of the human face, and which have fewer ſpines, and thoſe leſs ſharp, always turn to that ſort of butterfly the upper wings of which are divided into ſegments, one of which is ſo long as to repreſent a tail, and whoſe under wings are folded over the upper part of the back. A careful obſervation will eſtabliſh many more rules of this kind, which are not ſo perfect as to be free from all exceptions; yet are of great uſe, as they teach us in general what ſort of fly we are to expect from the chryſalis, of which we know not the caterpillar, and therefore can only judge from appearances.

Theſe are the principal differences of the angular chryſaliſes; the round ones alſo have their different marks not leſs regular than thoſe.

The greater number of the round chryſaliſes have the hinder part of their body of the figure of a cone; but the upper end, which ought to be its circular plane baſe, is uſually bent and rounded into a ſort of knee: this is uſually called the head of the chryſalis; but there are alſo ſome of this kind, the head of which is terminated by a nearly plane ſurface: ſome of the creeping ten-legged caterpillars give chryſaliſes of this kind, which have each of them two eminences that ſeem to bring them towards the angular kind.

Among the angular chryſaliſes there are ſome whoſe colours ſeem as worthy our obſervation as the ſhapes of the others. Many of them appear ſuperbly clothed in gold. Theſe elegant ſpecies have obtained the name of *chryſalis* and *aurelia*, which are derived from Greek and Latin words, ſignifying gold; and from theſe all other bodies of the ſame kind have been called by the ſame names, though leſs, or not at all, intitled to them. As ſome kinds are thus gilded all over, ſo others are ornamented with this gay appearance in a ſparing manner, having only a few ſpots of it in different places on their back and belly. Theſe obvious marks, however, are not to be depended upon as certain characters of diſtinction: for accidents in the formation of the chryſalis may alter them; and thoſe which naturally would have been gilded all over, may be ſometimes only ſo in part; and either theſe or the others may, by accident, be ſo formed, as to ſhow nothing of this kind at all, but be only of a duſky brown. Thoſe, however, which have neither ſilver nor gold to recommend them to your eyes, do not want other colours, and thoſe beautifully variegated. Some of them are all over of an elegant green, as is the chryſalis of the fennel-caterpillar; others of an elegant yellow; and ſome of a bright greeniſh tinge, variegated with ſpots of a ſhining black: we have a very beautiful inſtance of this laſt kind in the chryſalis of the elegant cabbage-caterpillar. The general colour of the chryſalis of the common butterflies, however, is brown.

Some are alſo of a fine deep black; and of theſe many are ſo ſmooth and gloſſy, that they are equal to the fineſt Indian japan. The common caterpillar of the fig-tree gives an inſtance of one of theſe moſt beautiful gloſſy ones; the caterpillar of the vine affords another of theſe fine black chryſaliſes.

The rounded chryſaliſes do not afford any thing of that variety of colouring ſo remarkably beautiful in the angular ones; they are uſually of a duſky yellow, in different ſhades, and are often variouſly ſpotted with black: but theſe, as well as all other chryſaliſes, before they arrive at their fixed colour, paſs through ſeveral other temporary ones; ſome being of a different colour when firſt produced from the caterpillar, from what they are a few days afterwards; and ſome varying ſo greatly, though only in degree, as not to be diſtinguiſhable, even by the moſt converſant eye, from what they were when firſt produced. The green rough caterpillar of the cabbage has a chryſalis which is green at firſt; and from that gradually goes through all the ſhades of green to faint yellow, which is its laſting colour; and one of the oak caterpillars yields a chryſalis beautifully ſpotted with red at its firſt appearance; but theſe ſpots change to brown for their fixed colour: the third day from their formation uſually fixes their laſting colours; and if they are obſerved to turn black in any part after this time, it is a ſign that they are dead or dying.

The ſeveral ſpecies of inſects, as a fly, ſpider, and an ant, do not differ more evidently from one another in regard to appearance, than do a caterpillar, its chryſalis, and a butterfly produced from it; yet it is certain, that theſe are all the product of the ſame individual egg; and nothing is more certain, than that the creature which was for a while a caterpillar, is, after a certain time, a chryſalis, and then a butterfly. Theſe great changes produced in ſo ſudden a manner, ſeem like the *metamorphoſes* recorded in the fables of the ancients; and indeed it is not improbable that thoſe fables firſt took their origin from ſuch changes.

The parts being diſtinguiſhable in the chryſalis, we eaſily find the difference of the ſpecies of the fly that is to proceed from it. The naked eye ſhows whether it be one of thoſe that have, or of thoſe that have not, a trunk; and the aſſiſtance of a microſcope ſhows the antennæ ſo diſtinctly, that we are able to diſcern whether it belongs to the day or night claſs; and often to what genus, if not the very ſpecies: nay, in the plumoſe horned kinds, we may ſee, by the antennæ, whether a male or female phalæna is to be produced from the chryſalis; the horns of the female being in this ſtate evidently narrower, and appearing leſs elevated above the common ſurface of the body, than thoſe of the male.

All theſe parts of the chryſalis, however, though ſeen very diſtinctly, are laid cloſe to one another, and ſeem to form only one maſs; each of them is covered with its own peculiar membrane in this ſtate, and all are ſurrounded together by a common one; and it is only through theſe that we ſee them; or rather we ſee on theſe the figures of all the parts moulded within, and

and therefore it requires attention to diſtinguiſh them. The chryſalis is ſoft when firſt produced, and is wetted on the front with a viſcous liquor; its ſkin, though very tender at firſt, dries and hardens by degrees: but this viſcous liquor, which ſurrounds the wings, legs, *&c.* hardens almoſt immediately; and in conſequence faſtens all thoſe limbs, *&c.* into a maſs, which were before looſe from one another: this liquor, as it hardens, loſes its tranſparence, and becomes brown; ſo that it is only while it is yet moiſt that theſe parts are to be ſeen diſtinct.

It is evident from the whole, that the chryſalis is no other than a butterfly, the parts of which are hid under certain membranes which faſten them together; and, when the limbs are arrived at their due ſtrength, they become able to break through theſe membranes, and then expand and arrange themſelves in their proper order.

The firſt metamorphoſis, therefore, differs nothing from the ſecond, except that the butterfly comes from the body of the caterpillar in a weak ſtate, with limbs unable to perform their offices, whereas it comes from the chryſalis perfect.

Hiſtory of Inſects, vol. i. p. 2.—28.

M. Reaumur has given us many curious obſervations on the ſtructure and uſes of the ſeveral coverings that attend the varieties of the caterpillar-kind in this ſtate.

The creatures in general remain wholly immoveable in this ſtate, and ſeem to have no buſineſs in it but a patient attendance on the time when they are to become butterflies; and this is a change that can happen to them only as their parts, before extremely ſoft and weak, are capable of hardening and becoming firm by degrees, by the tranſpiration of that abundant humidity which before kept them ſoft: and this is proved by an experiment of M. Reaumur, who, incloſing ſome chryſaliſes in a glaſs tube, found, after ſome time, a ſmall quantity of water at the bottom of it; which could have come there no other way, but from the body of the incloſed animal. This tranſpiration depends greatly on the temperature of the air; it is increaſed by heat, and diminiſhed by cold; but it has alſo its peculiarities in regard to the ſeveral ſpecies of butterfly to which the chryſalis belongs.

According to theſe obſervations, the time of the duration of the animal in the chryſalis ſtate muſt be, in different ſpecies, very different; and there is indeed this wide difference in the extremes, that ſome ſpecies remain only eight days in this ſtate, and others eight months.

We know that the caterpillar changes its ſkin four or five times during its living in that ſtate; and that all theſe ſkins are at firſt produced with it from the egg, lying cloſely over one another. It parts with, or throws off all theſe one by one, as the butterfly, which is the real animal, all this time within, grows more and more perfect in the ſeveral firſt changes. When it throws off one, it appears in another ſkin exactly of the ſame form; but at its final change from this appearance, that is, when it throws off the laſt ſkin, as the creature within is now arrived at ſuch a degree of perfection as to need no farther taking of nouriſhment, there is no farther need of teeth, or any of the other parts of a caterpillar. The creature, in this laſt change, proceeds in the very ſame manner as in all the former, the ſkin opening at the back, and the animal making its way out in this ſhape. If a caterpillar, when about to throw off this laſt ſkin, be thrown into ſpirits of wine, and left there for a few days, the membranes within will harden, and the creature may be afterwards carefully opened, and the chryſalis taken out, in which the form of the tender butterfly may be traced in all its lineaments, and its eyes, legs, *&c.* evidently ſeen. It is not neceſſary, however, to ſeize upon this exact time for proving the exiſtence of the chryſalis or butterfly in the caterpillar: for if one of theſe animals be thrown into ſpirit of wine, or into vinegar, ſome days before that time, and left there for the fleſh to harden, it may afterwards be diſſected, and all the lineaments of the butterfly traced out in it, the wings, legs, antennæ, *&c.* being as evident here, and as large, as in the chryſalis.

It is very plain from this, that the change of the caterpillar into chryſalis, is not the work of a moment; but is carrying on for a long time before, even from the very hatching of the creature from the egg. The parts of the butterfly, however, are not diſpoſed exactly in the ſame manner while in the body of the caterpillar, as when left naked in the form of the chryſalis: for the wings are proportionally longer and narrower, being wound up into the form of a cord; and the antennæ are rolled up on the head; the trunk is alſo twiſted up and laid upon the head; but this in a very different manner from what it is in the perfect animal, and very different from that in which it lies within the chryſalis; ſo that the firſt formation of the butterfly in the caterpillar, by time arrives at a proper change of the diſpoſition of its parts, in order to its being a chryſalis. The very eggs, hereafter to be depoſited by the butterfly, are alſo to be found not only in the chryſalis, but in the caterpillar itſelf, arranged in their natural, regular order. They are indeed in this ſtate very ſmall and tranſparent; but after the change into the chryſalis, they have their proper colour.

As ſoon as the ſeveral parts of the butterfly, therefore, are arrived at a ſtate proper for being expoſed to the more open air, they are thrown out from the body of the caterpillar, ſurrounded only with their membranes; and as ſoon as they are arrived after this at a proper degree of ſtrength and ſolidity, they labour to break through theſe thinner coverings, and to appear in their proper and natural form. The time of their duration in this ſtate of chryſalis is very uncertain, ſome remaining in it only a few days, others ſeveral months, and ſome almoſt a year in appearance. But there is a fallacy in this that many are not aware of. It is natural to think, that as ſoon as the creature has incloſed itſelf in its ſhell, be that of what matter it will, it undergoes its change into the chryſalis ſtate. And this is the caſe with the generality: yet there are ſome which are eight or nine months in the ſhell before they become chryſaliſes; ſo that their duration in the real chryſalis ſtate is much ſhorter than it naturally appears to be. M. Reaumur carefully watched the auriculated caterpillar of the oak in its ſeveral changes, and particularly from its chryſalis, which is of this laſt kind, into the fly; and has given an account of the method of this as an inſtance of the general courſe of nature in theſe operations.

The membranes which envelope the creature in this chryſalis ſtate are at firſt tough and firm, and immediately touch the ſeveral parts of the incloſed animal; but by degrees, as theſe parts harden, they become covered, ſome with hairs, and others with ſcales. Theſe, as they continue to grow, by degrees fall off the ſeveral particular membranes which cover the parts on which they are placed, to a greater diſtance, and by degrees looſen them from the limbs. This is one reaſon of thoſe membranes drying and becoming brittle.

The middle of the upper part of the CORSELET is uſually marked with a line which runs in a longitudinal direction: and this part is always more elevated than the reſt, even in the conic kinds, which are no otherwiſe angular. This line is in ſome very bold and plain; in others it is ſo faint as not to be diſtinguiſhable without glaſſes; but it is always in the midſt of that line that the ſhell begins to open. The motion of the head of the butterfly backwards firſt occaſions this crack; and a few repetitions of the ſame motion open it the whole length of the line.

The clearing itſelf, however, entirely, is a work of more time in this caſe, than is the paſſing of the chryſalis out of the body of the caterpillar. In that caſe there is a crack ſufficiently large in the ſkin of the back, and the whole chryſalis being looſe comes out at once. But in this caſe, every particular limb, and part of the body, has its ſeparate caſe; and theſe are almoſt inconceivably thin and tender, yet it is neceſſary that every part be drawn out of them before it appear naked to the open air. As ſoon as all this is effected, and the animal is at full liberty, it either continues ſome time upon the remains of its covering, or creeps a little way diſtant from it, and there reſts. The wings are what we principally admire in this creature. Theſe are at this time ſo extremely folded up, and placed in ſo narrow a compaſs, that the creature ſeems to have none at all: but they by degrees expand and unfold themſelves; and finally, in a quarter of an hour, or half an hour at the utmoſt, they appear at their full ſize, and in all their beauty. The manner of this ſudden unfolding of the wings is this: the ſmall figure they make when the creature firſt comes out of its membranes, does not prevent the obſerving that they are at that time conſiderably thick. This is owing to its being a large wing folded up in the niceſt manner, and with folds ſo arranged as to be by no means ſenſible to the eye, for the wing is never ſeen to unfold; but, when obſerved in the moſt accurate manner ſeems to grow under the eye to this extent. When the creature is firſt produced from the ſhell, it is every where moiſt and tender; even its wings have no ſtrength or ſtiffneſs till they expand themſelves; but they then dry by degrees, and, with the other parts, become rigid and firm. But if any accident prevents the wings from expanding at their proper time, that is, as ſoon as the creature is out of its ſhell, they never afterwards are able to expand themſelves; but the creature continues to wear them in their contracted and wholly uſeleſs ſtate; and very often, when the wings are in part extended before ſuch an accident happens, it ſtops them in a partial extenſion, and the creature muſt be contented to paſs its whole life with them in that manner.

M. Reaumur has proved, that heat and cold make great differences in the time of hatching the butterfly from its chryſalis ſtate: and this he particularly tried with great accuracy and attention, by putting them in veſſels in warm rooms, and in ice-houſes; and it ſeemed wholly owing to the haſtening or retarding the evaporation of the abundant humidity of the animal in the chryſalis ſtate, that it ſooner or later appeared in the butter-fly form. He varniſhed over ſome chryſaliſes, in order to try what would be the effect of thus wholly preventing their tranſpiration; and the conſequence was, that the butterfly came forth from theſe two months later than their natural time. Thus was the duration of the animal in this ſtate lengthened; that is, its exiſtence was lengthened: but without any advantage to the creature, ſince it was in the time of its ſtate of inaction, and probably of inſenſibility.

Though this was of no conſequence, M. Reaumur deduces a hint from it that ſeems to be of ſome uſe. He obſerves, that hens eggs, of which we make ſo many uſes, and eat in ſo many forms, are properly a ſort of chryſalis of the animal; their germ, after they are impregnated by the cock, containing the young animal alive, and waiting only a due degree of warmth to be hatched, and appear in its proper form. Eggs tranſpire notwithſtanding the hardneſs of their ſhells; and when they have been long kept, there is a road found near one of their ends, between the ſhell and the internal membrane; this is a mark of their being ſtale, and is the effect of an evaporation of part of their humidity: and the ſame varniſh which had been uſed to the chryſalis, being tried on eggs, was found to preſerve them for two years, as freſh as if laid but the ſame day, and ſuch as the niceſt palate could not diſtinguiſh from thoſe that were ſo. See EGGS.

It is not yet known how much farther this uſeful ſpeculation might be carried, and whether it might not be of great uſe even to human life, to invent ſomething that ſhould act in the manner of this varniſh, by being rubbed over the body, as the *athletæ* did of old, and the ſavages of the Weſt Indies do at this time, without knowing why. But to return to the inſects which are the ſubjects of this article; their third ſtate, that in which they are winged, is always very ſhort, and ſeems deſtined for no other action but the propagation of the ſpecies. See PAPILIO.

CHRYSANTHEMUM, CORN-MARIGOLD: A genus of the polygamia ſuperflua order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The receptacle is naked; the pappus marginated, or conſiſting only of a border: the calyx hemiſpherical and imbricated, with the marginal ſcales membranaceous. There are 19 ſpecies, of which the following are the moſt remarkable: 1. The ſerotinum is a native of North America. The roots of this plant creep far under the ſurface, and ſend up ſtrong ſtalks more than four feet high, garniſhed with long ſawed leaves ending in points. Theſe ſtalks divide upward into many ſmaller; each being terminated by a large, white, radiated flower, which appears in the end of Auguſt or September. 2. The coronarium hath been long cultivated in the gardens on account of the beauty of its flowers. It grows to the height of three feet, with a ſingle upright ſtalk divided into numerous branches, garniſhed with pinnated leaves, and crowned with elegant compound flowers of different colours and properties. The varieties are, ſingle and double flowers of a cream-colour; yellow; yellow and white: brimſtone-coloured: fiſtular, or quilled; or thoſe with finely jagged leaves, and flowers of all the above colours and properties. All the varieties begin flowering in July: the flowers are exceedingly numerous, and exhibit a conſtant ſucceſſion of full bloom till November; and both ſingle and double are ſucceeded by abundance of ſeed. 3. The puteſcens is a native of the Canary iſlands. It riſes with a ſhrubby ſtalk near two feet high, dividing into many branches, which are garniſhed with pretty thick ſucculent leaves, of a greyiſh colour, cut into many ſegments. The flowers come out from the wings of the leaves, growing upon naked footſtalks ſingly, which greatly reſemble thoſe of chamomile. There is a ſucceſſion of flowers on the ſame plant for the greateſt part of the year, for which it is chiefly eſteemed. This plant will perfect ſeeds in Britain when the ſeaſons are favourable.

Culture. The firſt kind multiplies very faſt by its creeping roots, and will thrive in any ſoil or ſituation. The ſecond may be raiſed in abundance from ſeed, either in a hot-bed or warm border, in the ſpring, for tranſplanting; alſo by cuttings and ſlips of their branches in autumn. The latter method is practiſed only for the propagation of the fine doubles, for an early bloom the following ſummer; and the beſt time to perform it is in September, or early in October. Cut off at that time a quantity of the robuſt ſide ſhoots, from three to ſix inches long, without flowers; diveſt them of the lower leaves, and plant many of them together in large pots, within an inch or two of their tops, and two or three inches apart, give ſome water, and place them in the ſhade during the hot weather: by the end of October they will be rooted, when the pots are to be removed either into a greenhouſe or garden-frame, for the winter; but the latter is the moſt eligible, where they may enjoy the full air in mild weather, and have occaſional ſhelter from froſt. In April they may be tranſplanted ſingly into borders and ſome in pots. The plants thus raiſed will flower a month or ſix weeks ſooner the ſucceeding ſummer than thoſe raiſed in the ſpring from ſeed; but as they ſoon become barren, it is proper to have always a quantity of plants raiſed from the ſeed. The third ſort may be raiſed either from ſeeds or cuttings, but requires to be ſheltered in the green-houſe in winter.

CHRYSES, the prieſt of Apollo, father of Aſtynome, called from him *Chryſeis.* When Lyrneſſus was taken, and the ſpoils divided among the conquerors, Chryſeis fell to the ſhare of Agamemnon. Chryſes upon this went to the Grecian camp to ſolicit his daughter's reſtoration; and when his prayers were fruitleſs, he implored the aid of Apollo, who viſited the Greeks with a plague, and obliged them to reſtore Chryſeis.

CHRYSIPPUS, a ſtoic philoſopher, born at Solos in Cilicia, was diſciple to Cleanthus, Zeno's ſucceſſor. He wrote many books, ſeveral of which related to logic. None of the philoſophers ſpoke in ſtronger terms of the fatal neceſſity of every thing, nor more pompouſly of the liberty of man, than the Stoics, Chryſippus in particular. He was ſo conſiderable among them, as to eſtabliſh it into a proverb, that if it had not been for Chryſippus, the porch had never been. Yet the Stoics complained, as Cicero relates, that he had collected ſo many arguments in favour of the ſceptical hypotheſis, that he could not anſwer them himſelf; and thus had furniſhed Carneades, their antagoniſt, with weapons againſt them. There is an apophthegm of this philoſopher preſerved, which does him honour. Being told that ſome perſons ſpoke ill of him, "It is no matter (ſaid he), I will live ſo that they ſhall not be believed."

CHRYSIS, or GOLDEN-FLY, in natural hiſtory: A genus of inſects belonging to the order of hymenoptera. The mouth is armed with jaws, but has no proboſcis; the antennæ are filiform, bent, and conſiſt of 12 articulations; the abdomen is arched, with a ſcale on each ſide; the anus is dentated, and armed with a ſting; the wings lie plain; and the body appears as if gilt. There are ſeveral ſpecies; but the ignita, or flaming chryſis, is beautified with the moſt reſplendent colours. The fore-part of its head is green and gold, and the hinder of a lovely azure. The thorax is likewiſe azured over, with a mixture of green, and terminates at its extremity with ſharp points on both ſides. The abdomen is green and gold before, and of a coppery-red behind, imitating molten copper highly poliſhed. The whole inſect is dotted on its upper part, which gives it a great reſplendency of colour. The antennæ are black, and legs green intermixed with gold. This ſpecies dwells in holes of walls between the ſtones, and in the mortar that cements them. It is often ſeen iſſuing from ſuch holes, where it neſtles and performs its work. The larvæ, which reſemble thoſe of the waſp, likewiſe inhabit the holes of decayed walls.

CHRYSITRIX, in botany: a genus of the dioecia order, belonging to the polygamia claſs of plants. In the hermaphrodite the glume is two-valved, the corollæ from chaff numerous and briſtly; many ſtamina, one within each chaff; one piſtillum. The male is the hermaphrodite; there is no piſtillum.

CHRYSOBALANUS, COCOA PLUM: A genus of the monogynia order, belonging to the icoſandria claſs of plants; and in the natural method ranking under the 36th order, *Pomaceæ.* The calyx is quinquefid, the petals five; plum-kernel five furrowed and five-valved. There is only one ſpecies, the icaco, which is a native of the Bahama iſlands and many other parts of America, but commonly grows near the ſea. It riſes with a ſhrubby ſtalk eight or nine feet high, ſending out ſeveral ſide-branches, which are covered with a dark brown bark. The flowers are white, and are ſucceeded by plums like damſons; ſome blue, ſome red, and others yellow. The ſtone is ſhaped like a pear, and has five longitudinal furrows. The plums have a ſweet luſcious taſte, and are brought to the tables of the inhabitants, by whom they are much eſteemed.

CHRYSOCOMA, GOLDY-LOCKS: A genus of the polygamia æqualis order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ.* The receptacle is na-

naked; the pappus ſimple; the calyx hemiſpherical and imbricated; the ſtyle hardly longer than the florets. There are nine ſpecies, the moſt remarkable of which are, the linoſyris, the coma aurea, and the cornua. Theſe are herbaceous flowering perennials, growing from one to two feet high, ornamented with narrow leaves, and compound floſcular flowers of a yellow colour. They are eaſily propagated by dividing the roots or by cuttings; but the two laſt require to be ſheltered in the green-houſe in winter.

CHRYSOGONUM, in botany: A genus of the polygamia neceſſaria order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The receptacle is paleaceous; the pappus monophyllous, and tridented; the calyx pentaphyllous; the ſeeds wrapped up each in a tetraphyllous calyculus, or little cup.

CHRYSOLARUS (Emanuel), one of thoſe learned men in the 14th century who brought the Greek literature into the weſt. He was a man of rank; and deſcended from an ancient family, ſaid to have removed with Conſtantine from Rome to Byzantium. He was ſent into Europe by the emperor of the eaſt to implore the aſſiſtance of the Chriſtian princes. He afterwards taught at Florence, Venice, Pavia, and Rome; and died at Conſtantinople, in 1415, aged 47. He wrote a Greek grammar, and ſome other ſmall pieces.

CHRYSOLITE, or YELLOWISH-GREEN TOPAZ; a precious ſtone of a graſs green colour, found in the Eaſt Indies, Brazil, Bohemia, Saxony, Spain, in Auvergne and Bourbon in France, and in Derbyſhire in England. Some are likewiſe found with volcanic lavas, as in the Vevarais, where ſome large lumps have been ſeen of 20 or 30 pounds weight; but it is remarkable, that ſome of theſe chryſolites are partly decompoſed into an argillaceous ſubſtance. All chryſolites, however, are far from being of the ſame kind. The oriental is the ſame with the peridot, and differs only by its green hue from the ſapphires, topazes, and rubies of the ſame denomination. This becomes electric by being rubbed; has a priſmatic form of ſix, or ſometimes of five ſtriated faces; and does not loſe its colour or tranſparency in the fire, which the common chryſolite often does; becoming either opaque, or melting entirely in a ſtrong heat. The inſtant it melts, it emits a phoſphoric light like the baſis of alum and gypſeous ſpar: with borax it produces a thin colourleſs glaſs. Its ſpecific gravity is between 3.600 and 3.700; according to Briſſon it is 2.7821, or 2.6923; and that of the Spaniſh chryſolite 3.0989.

The ſubſtance of this precious ſtone is lamellated in the direction of the axis of its primitive form: but the chryſolite from Saxony is foliated in a perpendicular direction to the ſame axis. The chryſolite of the ancients was the ſame gem which is now called *topaz*, and the name of itſelf indicates that it ought to be ſo. Pliny ſays that the colour of the chryſolite is yellow like gold.

CHRYSOLITE-*Paſte*, a kind of glaſs made in imitation of natural chryſolite, by mixing two ounces of prepared cryſtal with ten ounces of red-lead, adding 12 grains of crocus martis made with vinegar; and then baking the whole for 24 hours, or longer in a well luted cucurbit.

CHRYSOMELA, in zoology, a genus of inſects belonging to the order of coleoptera. The antennæ are ſhaped like bracelets, and thicker on the outſide; and neither the breaſt nor the elytra are marginated. There are no leſs than 122 ſpecies enumerated by Linnæus, principally diſtinguiſhed by differences in their colour. They are to be found almoſt every where, in woods, gardens, &c. Their progreſſive motion is ſlow; and ſome when caught emit an oily liquor of a diſagreeable ſmell. The glittering colours with which ſeveral ſpecies of Chryſomelæ are adorned, and which ſeem to exhibit the brilliancy of gold and copper, have occaſioned their bearing that pompous name. The larvæ of theſe inſects have in general an oval body, rather oblong and ſoft; on the fore-part of which are ſituated ſix feet, which are ſcaly, as is alſo the head. They prey upon the ſubſtance of leaves, rejecting the fibrous part. Thoſe of the leaping chryſomelæ infeſt the cotyledons and tender leaves of plants. Of this genus is that very pernicious inſect called by the country people the *turnip fly*, which infeſts turnips and many crops in the garden, deſtroying often whole fields while in their ſeedling leaves. In very hot ſummers they abound to an amazing degree, and, as you walk in a field or in a garden, make a pattering like rain, by jumping on the leaves of the turnips or cabbages. See Plate CXLIX.

CHRYSOPHYLLUM, or BULLY-TREE: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 43d order, viz. *Dumoſæ*. The corolla is campanulated, decemfid, with the ſegments alternately a little patent. The fruit is a ten-ſeeded berry. There are two ſpecies, the cainito and glabrum, both natives of the Weſt Indies. The firſt riſes 30 or 40 feet high, with a large trunk covered with a brown bark, and divides into many flexible ſlender branches, which generally hang downward, garniſhed with ſpear-ſhaped leaves, whoſe under ſides are of a bright ruſſet colour. The flowers come out at the extremities of the branches diſpoſed in oblong bunches, which are ſucceeded by fruit of the ſize of a golden pippin, that are very rough to the palate, and aſtringent; but when kept ſome time mellow, as is practiſed here with medlars, they have an agreeable flavour. The ſecond ſort never riſes to the height of the firſt, nor do the trunks grow to half the ſize; but the branches are ſlender and garniſhed with leaves like thoſe of the firſt. The flowers come out in cluſters from the ſide of the branches, which are ſucceeded by oval ſmooth fruit about the ſize of a bergamot pear. This contains a white clammy juice when freſh; but after being kept a few days, it becomes ſweet, ſoft, and delicious. Incloſed are four or five black ſeeds about the ſize of thoſe of a pomkin. Both theſe plants are frequently preſerved in gardens where there are large ſtoves, and are propagated by ſeeds, but the plants can never bear the open air in Britan.

CHRYSOPLENIUM, in botany: a genus of the digynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 12th order, *Succulentæ*. The calyx is quadrifid or quinquefid, and coloured; no corolla; the capſule biroſtrated, unilocular and polyſpermous.

CHRYSOPRASUS, or CHRYSOPRASIUS, the 10th of the precious ſtones mentioned in the Revelations, as forming

forming the foundation of the heavenly Jeruſalem. The chryſopraſius is by mineralogiſts reckoned to be a variety of the chryſolite, and by Cronſtedt called the *yellowiſh green and cloudy topaz*. He conjectures that it may perhaps be the ſubſtance which ſerves as a matrix to the chryſolite; as thoſe that he had ſeen were like the clear veined quartz, called in Sweden *milk cryſtal*, which is the firſt degree of cryſtallization.

The chryſopraſus, according to M. Magellan, is of a green colour, deeper than the chryſolite, but with a yellowiſh tinge inclining to blue like the green leek. M. Achard ſays that it is never found chryſtallized, and that it is ſemitranſparent. By others it is reckoned among the quartz, and its colour is ſuppoſed to be owing to the mixture of cobalt, as it gives a fine blue glaſs when melted with borax, or with fixed alkali. Mr Achard, however, found the glaſs of a deep yellow when the fuſion was made with borax; and that it really contains ſome calx of copper inſtead of cobalt. Mr Dutens ſays, that ſome gold has been found in this kind of ſtone: but this laſt belongs in all probablity, ſays M. Magellan, to another claſs of ſubſtances, viz. the vitreous ſpars.

To the latter belongs moſt probably the aventurine, whoſe colour is generally a yellow-brown red; though ſometimes it inclines more to the yellow, or greeniſh, than to the red. Theſe ſtones are not quite tranſparent: ſome indeed ſhine with ſuch a brilliancy, as to render them of conſiderable value, but they are very rare. The common aventurine is but an artificial glaſs of various colours with which powder of gold has been mixed; and theſe imitated aventurines ſo frequently excel the native ones in ſplendor, that the eſteem of the latter is now much lowered. With regard to the chryſopraſus, its name from πρασον, ſhows it to be of a greeniſh-blue colour, like the leaves of a leek; it only differs from the chryſolite in its bluiſh hue.

CHRYSOSTOM (St John), a celebrated patriarch of Conſtantinople, and one of the moſt admired fathers of the Chriſtian church, was born of a noble family at Antioch about the year 347. He ſtudied rhetoric under Libavius, and philoſophy under Andragathus: after which he ſpent ſome time in ſolitude in the mountains near Antioch; but the auſterities he endured having impaired his health, he returned to Antioch, where he was ordained deacon by Meletius. Flavian, Meletius's ſucceſſor, raiſed him to the office of preſbyter five years after; when he diſtinguiſhed himſelf ſo greatly by his eloquence, that he obtained the ſurname of *Golden mouth*. Nectarius patriarch of Conſtantinople, dying in 397, St Chryſoſtom, whoſe fame was ſpread throughout the whole empire, was choſen in his room by the unanimous conſent of both the clergy and the people. The emperor Arcadius confirmed this election, and cauſed him to leave Antioch privately, where the people were very unwilling to part with him. He was ordained biſhop on the 26th of February 398; when he obtained an order from the emperor againſt the Eunomians and Montaniſts; reformed the abuſes which ſubſiſted amongſt his clergy: retrenched a great part of the expences in which his predeceſſors had lived, in order to enable him to feed the poor and build hoſpitals; and preached with the utmoſt zeal againſt the pride, luxury, and avarice of the great. But his pious liberty of ſpeech procured him many powerful enemies. He differed with Theophilus of Alexandria, who got him depoſed and baniſhed; but he was ſoon recalled. After this, declaiming againſt the dedication of a ſtatue erected to the empreſs, ſhe baniſhed him into Cucuſus in Armenia, a moſt barren unhoſpitable place; afterwards, as they were removing him from Petyus, the ſoldiers treated him ſo roughly, that he died by the way, A. D. 407. The beſt edition of his works is that publiſhed at Paris in 1718, by Mountfaucon.

CHRYSTAL. See CRYSTAL.

CHUB, or CHUBB, in ichthyology. See CYPRINUS.

The reſorts of this fiſh are eaſily found; for they are generally holes, overſhaded by trees, and this fiſh will be ſeen floating in ſuch almoſt on the ſurface of the water in a hot day in great numbers. They are but a poor fiſh for the table, and are very full of bones; but they entertain the angler very much, and are of the number of thoſe that are eaſily taken. The beſt manner of fiſhing for him is thus: prepare a very ſtrong rod of a ſufficient length; fix to the hook a graſshopper; place yourſelf ſo as to be perfectly out of ſight of the fiſh, and drop in the bait about two feet from the place where a large chub lies; if he does not ſee the angler he very ſeldom fails biting, and is immediately taken; but he is ſo ſtrong a fiſh that he ſhould be taken out carefully, after a great deal of playing, otherwiſe the tackle will be in danger; a beetle, or any large fly, will anſwer the purpoſe in the place of a graſshopper; and if none of them are to be had, the method of fiſhing muſt be altered, and the line be long enough for fiſhing at the bottom. In March and April this fiſh is to be caught with large red worms; in June and July with flies, ſnails, and cherries; but in Auguſt and September the proper bait is good cheeſe pounded in a mortar, with ſome ſaffron, and a little butter; ſome make a paſte of cheeſe and Venice turpentine for the chub in winter, at which ſeaſon this fiſh is better than at any other; the bones are leſs troubleſome in this ſeaſon, and the fleſh is more firm and better taſted; the row is alſo well flavoured in general. The angler muſt keep this bait for this fiſh at the bottom in cold weather, and near the top in hot, and the fiſh will bite eagerly.

CHUBB (Thomas), a noted polemical writer, born at Eaſt Harnham, a village near Saliſbury, England, in 1679. He was put apprentice to a glover at Saliſbury, and afterwards entered into partnerſhip with a tallow-chandler. Being a man of ſtrong natural parts, he employed all his leiſure in reading; and though a ſtranger to the learned languages, became tolerably verſed in geography, mathematics, and other branches of ſcience. His favourite ſtudy was divinity; and he formed a little ſociety for the purpoſe of debating upon religious ſubjects, about the time that the Trinitarian controverſy was ſo warmly agitated between Clarke and Waterland. This ſubject, therefore, falling under the cognizance of Chubb's theological aſſembly, he at their requeſt drew up and arranged his ſentiments on it, in a kind of diſſertation; which was afterward publiſhed under the title of *The Supremacy of the Father aſſerted*, &c. In this piece Mr Chubb ſhowed great talents in reaſoning; and acquired ſo

much

much reputation, that the late Sir Joſeph Jekyl, maſter of the rolls, took him into his family to enjoy his converſation: but though he is ſaid to have been tempted to remain with him by the offer of a genteel allowance, he did not continue with him many years; but choſe to return to his friends at Saliſbury. He publiſhed afterwards a 4to volume of tracts, which Mr Pope informs his friend Gay, he "read through with admiration of the writer, though not always with approbation of his doctrine." He died a ſingle man in the 68th year of his age, and left behind him 2 vols. of poſthumous tracts, in which he appears to have had little or no belief in revelation. But however licentious his way of thinking may be deemed, nothing irregular or immoral has been fairly imputed to him in his life and actions.

CHUDLEIGH (Lady Mary), was born in 1656, and married to Sir George Chudleigh, baronet, by whom ſhe had ſeveral children: her poems and eſſays have been much admired for delicacy of ſtyle. She died in 1710; and is ſaid to have written ſeveral dramatic pieces, which, though not printed, are preſerved in the family.

CHUPMESSAHITES, a ſect among the Mahometans, who believe that Jeſus Chriſt is God, and the true Meſſiah, the Redeemer of the world; but without rendering him any public or declared worſhip. The word in the Turkiſh language ſignifies *protector of the Chriſtians.* Ricaut ſays, there are abundance of theſe Chupmeſſahites among the people of faſhion in Turkey, and ſome even in the ſeraglio.

CHURCH, has different ſignifications, according to the different ſubjects to which it is applied.

1. It is underſtood of the collective body of Chriſtians, or all thoſe over the face of the whole earth who profeſs to believe in Chriſt, and acknowledge him to be the Saviour of mankind. This is what the ancient writers call the *catholic* or *univerſal church.* Sometimes the word church is conſidered in a more extenſive ſenſe, and divided into ſeveral branches; as the church militant is the aſſembly of the faithful upon earth; the church triumphant, that of the faithful already in glory; to which the Papiſts add the church patient; which, according to their doctrines, is that of the faithful in purgatory.

2. Church is applied to any particular congregation of Chriſtians, who aſſociate together and concur in the participation of all the inſtitutions of Jeſus Chriſt, with their proper paſtors and miniſters. Thus we read of the church of Antioch, the church of Alexandria, the church of Theſſalonica, and the like.

3. Church denotes a particular ſect of Chriſtians diſtinguiſhed by particular doctrines and ceremonies. In this ſenſe we ſpeak of the Romiſh church, the Greek church, the Reformed church, the church of England, &c.

The Latin or Weſtern church, comprehends all the churches of Italy, France, Spain, Africa, the north, and all other countries whither the Romans carried their language. Great Britain, part of the Netherlands, of Germany, and of the North, have been ſeparated from hence ever ſince the time of Henry VIII.; and conſtitute what we call the Reformed church, and what the Romaniſts call the weſtern ſchiſm.

The Greek or Eaſtern church, comprehends the churches of all the countries anciently ſubject to the Greek or eaſtern empire, and through which their language was carried; that is, all the ſpace extended from Greece to Meſopotamia and Perſia, and thence into Egypt. This church has been divided from the Roman, ever ſince the time of the emperor Phocas.

The Gallican church, denotes the church of France, under the government and direction of their reſpective biſhops and paſtors. This church has always enjoyed certain franchiſes and immunities; not as grants from popes, but as derived to her from her firſt original, and which ſhe has taken care never to relinquiſh. Theſe liberties depend upon two maxims; the firſt, that the pope has no authority or right to command or order any thing either in general or in particular, in which the temporalities and civil rights of the kingdom are concerned; the ſecond, that notwithſtanding the pope's ſupremacy is owned in caſes purely ſpiritual, yet in France his power is limited and regulated by the decrees and canons of ancient councils received in that realm.

4. The word church is uſed to ſignify the body of eccleſiaſtics, or the clergy, in contradiſtinction to the laity. See CLERGY.

5. Church is uſed for the place where a particular congregation or ſociety of Chriſtians aſſemble for the celebration of divine ſervice. In this ſenſe churches are variouſly denominated, according to the rank, degree, diſcipline, &c. as Metropolitan church, Patriarchal church, Cathedral church, Parochial church, Collegiate church, &c. See METROPOLIS, PATRIARCH, &c.

In eccleſiaſtical writers, we meet with *grand church,* for the chief church of a place; particularly in the Greek lithurgy, for the church of St Sophia at Conſtantinople, the ſee of the patriarch, founded by Conſtantine, and conſecrated under Juſtinian. It was at that time ſo magnificent, that Juſtinian is ſaid to have cried out in the conſecration thereof, Ενικησα σε, Σολομον; *I have outdone thee, Solomon.* The dome, which is ſaid to have been the firſt that was built, is 330 feet diameter.

The firſt church publicly built by the Chriſtians, ſome authors maintain to be that of St Saviour at Rome, founded by Conſtantine; others contend, that ſeveral churches abroad, called by the name of *St Peter Vivus,* were built in honour of that apoſtle during his life-time.

CHURCH, with regard to architecture, Daviler defines a large oblong edifice, in form of a ſhip, with nave, choir, iſles, chapel, belfry, &c. See each part under its proper head.

CHURCH, ſimple, is that which has only a nave and a choir.

CHURCH with Iſles, that which has a row of porticos, in form of vaulted galleries, with chapels in its circumference.

CHURCH in a Greek croſs, that where the length of the traverſe part is equal to that of the nave; ſo called becauſe moſt of the Greek churches are built in this form.

CHURCH in a Latin croſs, that whoſe nave is longer than the croſs part, as in moſt of the Gothic churches.

CHURCH in Rotundo, that whoſe plan is a perfect circle, in imitation of the Pantheon.

For the form of the ancient Greek churches, when they had all their parts, it was as follows: firſt was a porch, or portico, called the *vaunt-nave*, ϖροναος: this was adorned with columns on the outſide, and on the inſide ſurrounded with a wall; in the middle whereof was a door, through which they paſſed into a ſecond portico. The firſt of theſe porticos was deſtined for *the energumeni*, and penitents in the firſt ſtage of their repentance; the ſecond was much longer, deſtined for penitents of the ſecond claſs, and the catechumens, and hence called ναρθης, *ferula*, becauſe thoſe placed in it began to be ſubject to the diſcipline of the church. Theſe two porticos took up about one-third of the ſpace of the church. From the ſecond portico, they paſſed into the nave, ναος, which took up near another third of the church. In the middle, or at one ſide of the nave, was the ambo, where the deacons and prieſts read the goſpel, and preached. The nave was deſtined for the reception of the people, who here aſſiſted at prayers.

Near the entrance of this was the baptiſtery or font. Beyond the nave was the choir, χορος, ſet with ſeats, and round: the firſt ſeat on the right, next the ſanctuary, being for the chantor, or *choragus*.

From the choir they aſcended by ſteps to the ſanctuary, which was entered at three doors. The ſanctuary had three apſides in its length; a great one in the middle under which was the altar, crowned with a baldachin, ſupported by four columns. Under each of the ſmall apſides, was a kind of table or cupboard, in manner of a beaufet.

Though, of the Greek churches now remaining, few have all the parts above deſcribed, moſt of them having been reduced to ruins or converted into moſques.

*High-*CHURCH was a denomination originally given to thoſe otherwiſe called *Non-jurors*, who refuſed to acknowledge the title of William III. to the crown of Great Britain, under a notion that James II. though excluded, was ſtill their rightful ſovereign. This appellation was given them, becauſe they entertained high notions of the dignity and power of the church, and the extent of its prerogative and juriſdiction. And thoſe, on the contrary, were called *low-church men*, who diſapproved of the ſeceſſion and obſtinacy of the non-jurors, diſtinguiſhed themſelves by their moderation toward diſſenters, and were leſs ardent in extending the limits of church authority. The denomination of *high-church men* is now more generally applied to all who form pompous and ambitious conceptions of the authority and juriſdiction of the church, and who would raiſe it to an abſolute independence on all human power.

CHURCH-*Ale*. See WHITSUN-*Ale*.

CHURCH-*Reeves*, the ſame with CHURCH-*Wardens*.

CHURCH-*Scot*, or *Churcheſſet*, a payment or contribution, by the Latin writers frequently called *primitiæ ſeminum*; being, at firſt, a certain meaſure of wheat, paid to the prieſt on St Martin's day, as the firſt fruits of harveſt. This was enjoined by the laws of king Malcom IV. and Canute, c. 10. But after this, *Church-ſcot* came to ſignify a reſerve of corn-rent paid to the ſecular prieſts, or to the religious; and ſometimes was taken in ſo general a ſenſe as to include poultry, or any other proviſion that was paid in kind to the religious. See TITHE.

CHURCH-*Wardens* (*eccleſiæ guardiani*), in the Engliſh eccleſiaſtical polity, are the guardians or keepers of the church, and repreſentatives of the body of the pariſh. They are ſometimes appointed by the miniſter, ſometimes by the pariſh, ſometimes by both together, as cuſtom directs. They are taken, in favour of the church, to be, for ſome purpoſes, a kind of corporation at the common law; that is, they are enabled, by that name, to have a property in goods and chattels, and to bring actions for them, for the uſe and profit of the pariſh. Yet they may not waſte the church goods, but may be removed by the pariſh, and then called to account by actions at common law: but there is no method of calling them to account but by firſt removing them; for none can legally do it but thoſe who are put in their place. As to lands or other real property, as the church, church-yard, &c. they have no ſort of intereſt therein; but if any damage is done thereto, the perſon only or vicar ſhall have the action. Their office alſo is to repair the church, and make rates and levies for that purpoſe: but theſe are recoverable only in the eccleſiaſtical courts. They are alſo joined with the overſeers in the care and maintenance of the poor. They are to levy a ſhilling forfeiture on all ſuch as do not repair to church on Sundays and holidays; and are empowered to keep all perſons orderly while there; to which end it has been held that a church-warden may juſtify the pulling off a man's hat, without being guilty of either an aſſault or a treſpaſs. There are alſo a multitude of other petty parochial powers committed to their charge by divers acts of parliament.

CHURCHILL (Sir Winſton), the father of the great duke of Marlborough, was deſcended from an ancient and honourable family in Dorſetſhire. He was born at Wotton Glanvile in that county in 1610; and educated at St John's college at Oxford. He engaged in the cauſe of his unfortunate ſovereign Cha. I. for which he ſuffered ſeverely in his fortune; and having married while young, Elizabeth, the daughter of Sir John Drake of Aſhe in Devonſhire, ſhe was forced to ſeek a refuge in her father's houſe, when Mr Churchill's misfortunes left him none that he could call his own; and there moſt of his children were born. After the reſtoration, he was elected a burgeſs to ſerve in parliament for the borough of Weymouth; and, in 1669, his majeſty was pleaſed to confer on him the honour of knighthood. The next year he was made one of the commiſſioners of claims in Ireland; and upon his return from thence, was conſtituted one of the clerks comptrollers of the green-cloth: but writing a kind of political eſſay upon the Hiſtory of England, which gave great offence to the parliament, he was, in 1678, diſmiſſed from his poſt. He was, however, ſoon reſtored to it again; and lived to ſee his eldeſt ſurviving ſon raiſed to the peerage, and the reſt of his children in a fair way to promotion. He died in 1688.

CHURCHILL (John) Duke of Marlborough, and prince of the holy Roman empire, a moſt renowned general and ſtateſman, was born at Aſhe in Devonſhire in 1650. He was eldeſt ſon of Sir Winſton Churchill, who carried him to court while very young, and where he was particularly favoured by James duke of York, afterwards king James II. when only twelve years of age. In 1666, he was made an enſign of the guards during the firſt Dutch war; and afterwards improved himſelf greatly in the military art at Tangier. In 1672, Mr Churchill attended the duke of Monmouth who commanded a body of auxiliaries in the French ſervice, and was ſoon after made a captain in the duke's own regiment. At the ſiege of Nimeguen, which happened in that campaign, he diſtinguiſhed himſelf ſo much that he was taken notice of by the celebrated marſhal Turenne, who beſtowed on him the name of the *handſome Engliſhman*.—In 1673 he was at the ſiege of Maeſtricht, where he gained ſuch applauſe, that the king of France made him a public acknowledgment of his ſervice; and the duke of Monmouth, who had the direction of the attack, told king Charles II. that he owed his life to Mr Churchill's bravery. In 1681, he married Sarah daughter and co-heireſs (with her ſiſter the counteſs of Tyrconnel) of Richard Jenning , Eſq; of Sandrich, in Hertfordſhire. The duke of York recommended him in a very particular manner to the king: who, in 1682, created him baron of Eymouth in the county of Berwick in Scotland, and made him colonel of the third troop of guards. A little after king James's acceſſion, he was created baron Churchill of Sandrich in the county of Hertford, and made brigadier-general of his majeſty's army in the weſt; where, when the duke of Monmouth came to ſurpriſe the king's army, while the earl of Feverſham and the majority of the officers were in their beds, he kept the enemy in play till the king's forces had formed themſelves, and thereby ſaved the whole army. When James ſhowed an intention of eſtabliſhing the catholic religion in Britain, lord Churchill, notwithſtanding the great obligations he owed him, thought it his duty to abandon the royal cauſe; but even then did not leave him without acquainting him by letter with the reaſon of his ſo doing. Lord Churchill was graciouſly received by the prince of Orange; and was by him employed firſt to re-aſſemble the troop of guards at London, and afterwards to reduce ſome lately raiſed regiments, and to new-model the army; for which purpoſe he was inveſted with the rank and title of lieutenant-general. In 1689, he was ſworn one of the privy council, and one of the gentlemen of the king's bed-chamber; and on the 9th of April following, was raiſed to the dignity of earl of Marlborough in the county of Wilts. He aſſiſted at the coronation of their majeſties; and was ſoon after made commander in chief of the Engliſh forces ſent over to Holland; and here he firſt laid the foundation of that fame which was afterwards ſpread over all Europe. In 1690, he was made general of the forces ſent to Ireland: where he made the ſtrong garriſons of Cork and Kinſale priſoners of war. The year following, king William ſhowed the good opinion he had of his conduct, by ſending him to Flanders to put all things in readineſs, and to draw the army together againſt his arrival. In 1692, he was diſmiſſed from all his employments: and, not long after, was with ſome other peers committed to the tower on an accuſation of high treaſon; which, however, was afterwards found to be a falſe and malicious report, the authors of which were puniſhed. Marlborough was ſoon reſtored to favour, and in 1698 was appointed governor to the earl of Glouceſter; with this extraordinary compliment from king William, "My lord, make him but what you are, and my nephew will be all I wiſh to ſee him." The ſame day he was again ſworn one of the privy council; and in July following was declared one of the lord juſtices of England, for the adminiſtration of the government, in which great truſt he was three times ſucceſſively in the king's abſence. In 1701 he was appointed general of the foot, commander in chief of the Engliſh forces, and ambaſſador extraordinary and plenipotentiary at the Hague. Upon the acceſſion of queen Anne to the throne, he was elected into the order of the garter, declared captain-general of all her majeſty's forces, and ſent ambaſſador extraordinary and plenipotentiary to Holland. After ſeveral conferences about a war, he put himſelf at the head of the army, where all the other generals had orders to obey him. His exploits in the field have been taken notice of under the article BRITAIN, n° 349—370: we ſhall therefore only take notice in this place, of the rewards and honours conferred upon him for theſe exploits. After this firſt campaign he was created marquis of Blandford and duke of Marlborough, with a penſion of L. 5000 out of the poſt-office, to devolve for ever upon thoſe enjoying the title of Duke of Marlborough. In 1703, he met Charles III. late emperor, going to Spain, who preſented him with a ſword ſet with diamonds. In 1704, having forced the enemy's lines at Schellenberg, he received a letter of thanks from the emperor Leopold, written with his own hand; an honour ſeldom done to any but ſovereign princes. After the battle of Blenheim, he received congratulatory letters from moſt of the potentates in Europe, particularly from the States General, and from the emperor, who deſired him to accept of the dignity of a prince of the empire, which with the queen's leave was conferred upon him by the title of *Prince of Mildenheim in the province of Swabia*. After the campaign was ended, he viſited the court of Pruſſia, where he laid ſuch ſchemes as ſuſpended the diſputes with the Dutch about king William's eſtate; which wiſe conduct cauſed the whole confederacy to acknowledge that he had done the greateſt ſervice poſſible to the common cauſe. Upon his return to England, the queen, to perpetuate his memory, granted the intereſt of the crown in the honour and manor of Woodſtock and hundred of Wotton to him and his heirs for ever. In 1705 he made a tour to Vienna, upon an invitation of the emperor Joſeph; who highly careſſed him, and made him a grant of the lordſhip of Mildenheim. After the campaign of 1708, the ſpeaker of the houſe of commons was ſent to Bruſſels on purpoſe to compliment him; and on his return to England he was again complimented in the houſe of lords by lord chancellor Cowper. All his ſervices, however, and all the honours conferred upon him, were not ſufficient to preſerve him from being diſgraced. After the change of the miniſtry in 1710, his intereſt daily declined; and in 1712, on the firſt day of the new year, he was removed from all his places. Finding all arts uſed to render him obnoxious in his native country, he viſited his principality of Mildenheim, and ſeveral towns in Germany; after which he returned to England, and arrived there on the day of the queen's death. After being welcomed by the nobility and foreign miniſters, he attended on king George I. in his public entry through London, who appointed him captain-general, colonel of the firſt regiment of foot-guards, one of the commiſſioners for the government of Chelſea hoſpital, and maſter-general of the ordnance. Some years before his death, he retired from public buſineſs. He died at Windſor-lodge in 1722, aged 73; leaving behind him a very numerous poſterity, allied to the nobleſt and greateſt families in the three kingdoms. Upon his demiſe all parties united in doing honour or rather juſtice to his merit, and his corpſe was interred the 9th of Auguſt following, with all the ſolemnity due to a perſon who had deſerved ſo highly of his country, in Weſtminſter-abbey. The noble pile near Woodſtock, which bears the name of Blenheim-houſe, may be juſtly ſtyled his monument; but without pretending to the gift of prophecy, one may venture to foretel, that his glory will long ſurvive that ſtructure; and that ſo long as Britiſh hiſtories remain, or indeed the hiſtories of Europe, his memory will live and be the boaſt of Britain, which by his labours was raiſed to be the firſt of nations, as during the age in which he lived he was deſervedly eſteemed the firſt of men. If he had foibles, as theſe are inſeparable from human nature, they were ſo hidden by the glare of his virtues as to be ſcarcely perceived or were willingly forgotten. A certain paraſite, who thought to pleaſe Lord Bolingbroke by ridiculing the avarice of the Duke, was ſtopt ſhort by his Lordſhip; who ſaid, "He was ſo very great a man, that I forget he had that vice."

Out of a variety of anecdotes and teſtimonies concerning this illuſtrious perſonage, collected in the new edition of the *Biographia Britannica*, the following ſelection may ſerve to illuſtrate more particularly his diſpoſition and manners.

One of the firſt things which he did, when very young, was to purchaſe a box to put his money in; an indication this of the economical, not to ſay avaricious, temper that accompanied him through life. Dr Joſeph Warton relates, that, on the evening of an important battle, the duke was heard to chide his ſervant for having been ſo extravagant as to light four candles in his tent when Prince Eugene came to confer with him. Mr Tyers, on the other hand, mentioned a circumſtance which, if well founded, redounds to his grace's generoſity, though in a different reſpect it is much to his diſcredit: It is, that during the rebellion 1715 he ſent L 10,000 to the earl of Mar. We conſider the ſtory as only a traditional report, which has not in itſelf any great degree of probability; and therefore we are by no means convinced of its truth. The late Mr Richardſon junior, the painter, hath recorded a pleaſing inſtance of the duke's calmneſs of diſpoſition; for which, indeed, he was always remarkable. "The duke of Marlborough (ſays the writer), riding out once with Commiſſary Marriot, near the commiſſary's houſe in the country, it began to rain, and the duke called for his cloak; Marriot having his put on by his ſervant immediately. The duke's ſervant not bringing the cloak, he called for it again; but the man was ſtill puzzling about the ſtraps and buckles. At laſt, it raining now very hard, the duke called again, and aſked him, 'what he was about that he did not bring his cloak?' 'You muſt ſtay (grumbles the fellow), if it rains cats and dogs, till I can get at it.' The duke only turned to Marriot, and ſaid, 'I would not be of that fellow's temper." The duke of Marlborough (adds Mr Richardſon) did by nature and conſtitution, what Seneca judged by philoſophy ought to be done. *Quid eſt quare ego ſervi mei hilarius reſponſum, et contumaciorem vultum, flagellis et compedibus expiem?*

Dr Swift, in one of his letters to Stella, relates the following particulars concerning the duke of Marlborough. "I was early this morning with ſecretary St John, and gave him a memorial to get the queen's letter for the firſt-fruits, who has promiſed to do it in a very few days. He told me 'he had been with the duke of Marlborough, who was lamenting his former wrong ſteps in joining with the Whigs, and ſaid he was worn out with age, fatigue, and misfortunes.' I ſwear it pitied me; and I really think they will not do well in too much mortifying that man, although indeed it is his own fault. He is covetous as hell, and ambitious as the prince of it: he would fain have been general for life, and has broken all endeavours for peace, to keep his greatneſs, and get money. He told the queen 'he was neither covetous nor ambitious.' She ſaid, 'if ſhe could have conveniently turned about, ſhe ſhould have laughed, and could hardly forbear it in his face.' He fell in with all the abominable meaſures of the late miniſtry, becauſe they gratified him for their own deſigns. Yet he has been a ſucceſsful general, and I hope he will continue his command."

Various characters have been drawn of the duke of Marlborough; moſt of which we ſhall omit, as either already ſufficiently known, or as not meriting particular notice. That which is given of him by Dr Swift, in his "Hiſtory of the four laſt years of the queen," has all the malignity and meanneſs of a party pamphlet. It is even ſo fooliſh as to inſinuate, that the duke's military accompliſhments were problematical, and that he was deſtitute of perſonal courage. Mr Macpherſon's character of his grace is very elaborately compoſed, and diſplays no ſmall degree of ability and penetration; though it is not, perhaps, entirely free from prejudice. The hiſtorian conſiders it as a fact, that lord Churchill, at the time of the Revolution, had a deſign of placing his unfortunate maſter king James II. a priſoner in the hands of his rival the prince of Orange. But this ſtory muſt be regarded as wholly unworthy of credit. It is founded upon ſuggeſtions and informations ſo groundleſs, and even ridiculous, that it cannot deſerve a formal refutation. On the other hand, Mr Macpherſon has done juſtice to the duke of Marlborough's proſecution of the war in Flanders, and hath ſhown that he conducted it upon the principles of ſound wiſdom and good policy.

There are two teſtimonies to the honour of the duke's memory, by two celebrated noble writers, which cannot be paſſed over. One is by lord Bolingbroke, in his letters on the Study and Uſe of Hiſtory. Speaking of the conſternation raiſed among the allies of the grand confederacy by the death of king William, and of the joy which that event gave to the French, his lordſhip obſerves, that "a ſhort time ſhowed how vain the fears of ſome and the hopes of others were. By his death, the duke of Marlborough was raiſed to the head of the army, and indeed of the con-

confederacy: where he, a new, a private man, a ſubject, acquired, by merit and by management, a more decided influence than high birth, confirmed authority, and even the crown of Great Britain, had given to king William. Not only all the parts of that vaſt machine, the grand alliance, were kept more compact and entire, but a more rapid and vigorous motion was given to the whole: and, inſtead of languiſhing out diſaſtrous campaigns, we ſaw every ſcene of the war full of action. All thoſe wherein he appeared, and many of thoſe wherein he was not then an actor, but abbettor however of their action, were crowned with the moſt triumphant ſucceſs. I take, with pleaſure, this opportunity in doing juſtice to that great man, whoſe faults I knew, whoſe virtues I admired; and whoſe memory, as the greateſt general, and as the greateſt miniſter, that our country, or perhaps any other, has produced, I honour."

The other teſtimony to the duke's accompliſhments is by the earl of Cheſterfield, in his Letters to his Son, "Of all the men (ſays his lordſhip) that ever I knew in my life (and I knew him extremely well), the late duke of Marlborough poſſeſſed the graces in the higheſt degree, not to ſay engroſſed them: and indeed he got the moſt by them; for I will venture (contrary to the cuſtom of profound hiſtorians, who always aſſign deep cauſes for great events) to aſcribe the better half of the duke of Marlborough's greatneſs and riches to thoſe graces. He was eminently illiterate: wrote bad Engliſh, and ſpelled it ſtill worſe. He had no ſhare of what is commonly called *parts*; that is, he had no brightneſs, nothing ſhining in his genius. He had, moſt undoubtedly, an excellent good plain underſtanding, with ſound judgment. But theſe alone would probably have raiſed him but ſomething higher than they found him; which was page to king James II.'s queen. There the graces protected and promoted him: for while he was an enſign of the guards, the ducheſs of Cleveland, then favourite miſtreſs to king Charles II. ſtruck by thoſe very graces, gave him L.5000; with which he immediately bought an annuity for his life of L.500 a-year, of my grandfather Halifax; which was the foundation of his ſubſequent fortune. His figure was beautiful; but his manner was irreſiſtable, by either man or woman. It was by this engaging graceful manner that he was enabled, during all his war, to connect the various jarring powers of the grand alliance, and to carry them on to the main object of the war, notwithſtanding their private and ſeparate views, jealouſies, and wrongheadedneſſes. Whatever court he went to (and he was often obliged to go himſelf to ſome teſty and refractory ones), he as conſtantly prevailed, and brought them into his meaſures. The penſionary Heinſius, a venerable old miniſter, grown grey in buſineſs, and who had governed the republic of the United Provinces for more than 40 years, was abſolutely governed by the duke of Marlborough, as that republic feels to this day. He was always cool, and nobody ever obſerved the leaſt variation in his countenance: he could refuſe more gracefully than other people could grant; and thoſe who went away from him the moſt diſſatiſfied as to the ſubſtance of their buſineſs, were yet perſonally charmed with him, and in ſome degree comforted by his manner. With all his gentleneſs and gracefulneſs, no man living was more conſcious of his ſituation, nor maintained his dignity better."

A peruſal of the above paſſage will convince us of the frivolous turn of the earl of Cheſterfield's mind. His lordſhip, in his zeal to exalt the duke of Marlborough's external accompliſhments, either forgets or depreciates the far greater talents of which he was poſſeſſed. There is an obſervation upon the ſubject in the Britiſh Biography, with which we entirely concur. "That the duke of Marlborough (ſays the writer) was eminently diſtinguiſhed by the gracefulneſs of his manners, cannot be queſtioned: but the earl of Cheſterfield appears to have attributed too much to their influence, when he aſcribes—the better half of the duke of Marlborough's greatneſs and riches to thoſe graces. That the uncommon gracefulneſs of his manners facilitated his advancement, and contributed to the ſucceſs of his negociations, may readily be admitted; but ſurely it muſt have been to much higher qualities that he owed the eſteem of king William and of prince Eugene, his reputation throughout all Europe, and his many victories and conqueſts. It was not by a polite exterior that he obtained his laurels at Schellenberg, at Oudenarde, at Ramillies, and at Blenheim."

How much the duke of Marlborough has been celebrated by our poets, is well known by Addiſon's "Campaign," and Philips "Blenheim." Mr Addiſon, in his Roſamond, has properly aſſumed another and voluntary occaſion of paying a fine compliment to his grace's military expoits, and the glory by which they would be followed. Upon the duke's removal from his places, an ode was inſcribed to him by Mr Somerville, animated with all the zeal of whiggiſh enthuſiaſm, and containing ſome paſſages that are truly poetical. Another ode, not much inferior in ſpirit, was addreſſed to his grace, on occaſion of his embarking for Oſtend in the year 1712.

The duke of Marlborough's Scots title of Baron Eymouth, being to heirs-male, died with himſelf; but his Engliſh title going to his daughters and their heirs-male went into the Spencer family, who retain their own ſurname of Spencer.

Churchill (Charles), a celebrated ſatiriſt, the ſon of Mr Charles Churchill curate and lecturer of St John's, Weſtminſter, was educated at Weſtminſter ſchool, and received ſome applauſe for his abilities from his tutors in that famous ſeminary. His capacity, however, was greater than his application, ſo that he acquired the character of a boy that could do good if he would. As the ſlighteſt accounts of perſons ſo noted are agreeable, it may not be amiſs to obſerve, that having one day got an exerciſe to make, and from idleneſs or inattention having failed to bring it at the time appointed, his maſter thought proper to chaſtiſe him with ſome ſeverity, and even reproached his ſtupidity; what the fear of ſtripes could not effect, the fear of ſhame ſoon produced, and he brought his exerciſe the next day, finiſhed in ſuch a manner, that he received the public thanks of all the maſters. Still, however, his progreſs in the learned languages was but ſlow; nor is it to be wondered at, if we conſider how difficult it was for a ſtrong imagination, ſuch as he was poſſeſſed of, to conform and walk tamely forward in the trammels of a ſchool education: minds like his are ever ſtarting aſide after new purſuits; deſirous of embracing a multiplicity of amuſing objects; eager to come at the end, without the painful inveſtigation of the means. In ſhort, for want of proper ſkill in theſe languages, he was rejected from Oxford, whither his father had ſent him; and probably this might have given occaſion to the frequent invectives we find in his works againſt that moſt reſpectable univerſity. Upon his return from thence, he again applied to his ſtudies in Weſtminſter ſchool, where, at 17 years of age, he contracted an intimacy with a lady, to whom he was married, and their mutual regard for each other continued for ſeveral years. At the uſual age of going into orders, Mr Churchill was ordained by the late biſhop of London, and obtained a ſmall curacy in Wales of L.30 a-year. Thither he carried his wife: they took a ſmall houſe; and he paſſed through the duties of his ſtation with aſſiduity and cheerfulneſs. Happy had it been for him had he continued there to enjoy the fruits of piety, peace, and ſimplicity of manners. He was beloved and eſteemed by his pariſhioners; and though his ſermons were rather above the level of his audience, they were commended and followed. But endeavouring to advance his fortune, by keeping a cyder cellar, it involved him in difficulties which obliged him to leave Wales and come to London. His father dying ſoon after, he ſtepped into the church in which he had officiated; and, in order to improve his income, which ſcarcely produced L.100 a year, he taught young ladies to read and write Engliſh at a boarding ſchool, kept by Mrs Dennis, where he behaved with that decency and decorum which became his profeſſion. His method of living, however, bearing no proportion to his income, he contracted ſeveral debts in the city; which being unable to pay, a jail, the terror of indigent genius, ſeemed ready to complete his misfortunes: but from this ſtate of wretchedneſs he was relieved by the benevolence of Mr Lloyd, father to the poet of that name. Mean while, Mr Lloyd, the ſon, wrote a poetical epiſtle called the *Actor*; which being read and approved by the public, gave the author a diſtinguiſhed place among the writers of his age. This induced Mr Churchill to write the *Roſciad*. It firſt came out without the author's name; but the juſtneſs of the remarks, and the ſeverity of the ſatire, ſoon excited public curioſity. Though he never diſowned his having written this piece, and even openly gloried in it; yet the public, unwilling to give ſo much merit to one alone, aſcribed it to a combination of wits: nor were Meſſrs Lloyd, Thornton, or Colman, left unnamed upon this occaſion. This miſplaced praiſe ſoon induced Mr Churchill to throw off the maſk, and the ſecond edition appeared with his name at full length. As the Roſciad was the firſt of this poet's performances, ſo many are of opinion that it is the beſt. In it we find a very cloſe and minute diſcuſſion of the particular merit of each performer; their defects pointed out with candour, and their merits praiſed without adulation. This poem, however, ſeems to be one of thoſe few works which are injured by ſucceeding editions: when he became popular, his judgment, began to grow drunk with applauſe; and we find, in the latter editions, men blamed whoſe merit is inconteſtable, and others praiſed that were at that time in no degree of eſteem with the judicious. His next performance was his *Apology to the Critical Reviewers*. This work is not without its peculiar merit; and as it was written againſt a ſet of critics whom the world was willing enough to blame, the public read it with their uſual indulgence. In this performance he ſhowed a particular happineſs of throwing his thoughts, if we may ſo expreſs it, into poetical paragraphs; ſo that the ſentence ſwells to the break or concluſion, as we find in proſe.

But while his writings amuſed the town, his actions diſguſted it. He now quitted his wife, with whom he had cohabited many years; and reſigning his gown and all clerical functions, commenced a complete *man of the town*, got drunk, frequented ſtews; and, giddy with falſe praiſe, thought his talents a ſufficient atonement for all his follies. In ſome meaſure to palliate the abſurdities of his conduct, he now undertook a poem called *Night*, written upon a general ſubject indeed, but upon falſe principles; namely, that whatever our follies are, we ſhould never attempt to conceal them. This, and Mr Churchill's other poems, being ſhown to Dr Johnſon, and his opinion being aſked, he allowed them but little merit; which being told to the author, he reſolved to requite this private opinion with a public one. In his next poem, therefore, of the *Ghoſt*, he has drawn this gentleman under the character of Pompoſo; and thoſe who diſliked Mr Johnſon allowed it to have merit. Mr Johnſon's only reply to Churchill's abuſe was, "that he thought him a ſhallow fellow in the beginning, and could ſay nothing worſe of him ſtill." The poems of Night and the Ghoſt had not the rapid ſale the author expected; but his *Prophecy of Famine* ſoon made ample amends for the late paroxyſm in his fame. In this piece, written in the ſpirit of the famous North Briton, he exerted his virulent pen againſt the whole Scotch nation; adopting the prejudices of the mob, and dignifying ſcurrility by the aid of a poetic imagination. It had a rapid and extenſive ſale, as propheſied by Mr Wilkes; who ſaid, before its publication, that he was ſure it muſt take, as it was at once perſonal, poetical, and political. After its appearance, it was even aſſerted by his admirers, that Mr Churchill was a better Poet than Pope. This exaggerated adulation, as it had before corrupted his morals, began now to impair his mind: ſeveral ſucceeding pieces were publiſhed, which, being written without effort, are read without pleaſure. His *Gotham*, *Independence*, *The Times*, ſeem merely to have been written by a man who deſired to avail himſelf of the avidity of the public curioſity in his favour, and are rather aimed at the pockets than the hearts of his readers.—Mr Churchill died in 1764, of a miliary fever, with which he was ſeized at Boulogne in France, whither he had gone on a viſit to Mr Wilkes. After his death his poems were collected and printed together in two volumes 8vo.

CHURCHING OF WOMEN AFTER CHILD-BIRTH, took its riſe from the Jewiſh rite of purification. In the Greek church it was limited to the fortieth day after delivery; but in the weſtern parts of Europe no certain time is obſerved. There is an office in the liturgy for this purpoſe.

CHURCHYARD, a piece of ground adjoining to a church, ſet apart for interment or burial of the dead.—In the church of Rome they are bleſſed or conſecrated with great ſolemnity. If a churchyard, which has been thus conſecrated, ſhall afterwards be polluted by any indecent action, or profaned by the burial of an infidel, an heretic, an excommunicated or unbaptized perſon, it muſt be *reconciled;* and the ceremony of the reconciliation is performed with the ſame ſolemnity as that of the bleſſing or conſecration.

Churchyard (Thomas), a poet who flouriſhed in the reigns of Henry VIII. Edward VI. queen Mary and queen Elizabeth, was born at Shrewſbury; and inherited a fortune, which he ſoon exhauſted in a fruitleſs attendance on the court, by which he only gained the favour of being retained a domeſtic, in the family of lord Surrey; when, by his lordſhip's encouragement, he commenced poet. Upon his patron's death, he betook himſelf to arms; was in many engagements; was frequently wounded, and was twice made priſoner. He publiſhed 12 pieces, which he afterwards printed together in one volume, under the title of *Churchyard's Chips;* and alſo the tragedy of Thomas Moubray duke of Norfolk. He died in 1570.

CHURLE, Ceorle, or Carl, in the Saxon times, ſignified a tenant at will, who held of the thanes on condition of rent and ſervice. They were of two ſorts: one rented the eſtate like our farmers; the other tilled and manured the demeſnes, and were called ploughmen. See Ceorle.

CHURNING, in country affairs, the operation of making butter by agitating milk in a well known veſſel called a churn. For accelerating this operation, a correſpondent in the Bath Society Papers recommends a little diſtilled vinegar to be poured into the churn; and the butter will be produced in an hour afterwards. He acknowledges, however, that his experiments have not as yet aſcertained the exact quantity of the acid which is neceſſary to the proper effect, nor the preciſe time of its being mixed with the cream. But he apprehends a table ſpoonful or two to a gallon of cream will be ſufficient; nor would he recommend it to be applied till the cream has undergone ſome conſiderable agitation. His firſt trial was after the churning had been going forward half a day: whether he obſerved the ſame rule afterwards, he does not ſay; but all his trials proved ſucceſsful, the butter being uniformly obtained in about an hour after the mixture.

CHUS, or *Chuſch,* (Bible.) It is a tradition of an ancient ſtanding, that the *Chus* of the Scriptures denotes *Ethiopia,* and *Chuſchi* an *Ethiopian:* the Septuagint and Vulgate conſtantly tranſlate it ſo; and in this they are followed by moſt interpreters, and by Joſephus and Jerome. And yet what Bochart urges to the contrary is of no inconſiderable weight; from Ezekiel xxix. 10. in which the two oppoſite extremes of Egypt are deſigned; and therefore *Chus,* which is oppoſite to Syene, muſt be Arabia: but this is more ſtrongly pointed out by Xenophon, by whom Ethiopia is ſaid to be the ſouth boundary of Cyrus's empire; and Herodotus diſtinguiſhes between the Ethiopians of Aſia and Africa, conjoining the former with the Arabians.

CHYLE, in the animal economy, a milky fluid ſecreted from the aliments by means of digeſtion. See Anatomy, p. 734, 735.

CHYLIFICATION, the formation of the chyle, or the act whereby the food is changed into chyle.

The chyle has by ſome authors been thought to have a great reſemblance in its nature and chemical analyſis to milk. The ſubject, however, hath as yet been but little inquired into. See the article Milk.

CHYME, or chymus, in the common ſignification of the word, denotes every kind of humour which is incraſſated by concoction; under which notion it comprehends all the humours fit or unfit for preſerving and nouriſhing the body, whether good or bad. It frequently imports the fineſt part of the chyle, when ſeparated from the fæces, and contained in the lacteal and thoracic duct.

CHYMISTRY. See Chemistry.

CHYMOLOGI, an appellation given to ſuch naturaliſts as have employed their time in inveſtigating the properties of plants from their taſte and ſmell.

CHYMOSIS, in medicine, the act of making or preparing chyme. The word comes from χυμος, *ſuccus,* of χεω, *fundo,* "I melt." Chymoſis, according to ſome, is the ſecond of the concoctions made in the body; being a repeated preparation of the moſt impure and groſs parts of the chyle, which being rejected by the lacteals, is imbibed by the meſeraics, and thence carried to the liver, to be there elaborated, purified, and ſubtilized afreſh. It is of this, according to Rogers, that the animal ſpirits are formed.

Chymosis is alſo a diſtortion of the eye-lids, ariſing from an inflammation; alſo an inflammation of the tunica cornea in the eye.

CHYTLA, in antiquity, a liquor made of wine and oil, and ſometimes uſed in divination.

CHYTRI, among the Athenians, a feſtival in honour of Bacchus and Mercury, kept on the 13th of the month Antheſterion.

CHYTRIUM (anc. geog.) a place in Ionia, in which formerly ſtood Clazomene; the Clazomenians through fear of the Perſians, removing from the continent to an adjacent iſland (Pauſanias). Alexander reduced the iſland, by a mole or cauſeway, to a peninſula.

CHYTRUS (anc. geog.), an inland town of Cyprus, to the north of Citium: famous for its excellent honey.

CIANUS Sinus, (anc. geog.), a bay of Bithynia, named from the town and river Cius.

CIBALÆ, or Cibalis, (anc. geog.), a town of Pannonia Inferior, on an eminence, near the lake Hiulka, to the north-weſt of Sirmium; the country of the emperor Gratian, where he was brought up to rope-making: a place rendered famous for the ſurpriſal and defeat of Licinius by Conſtantine.

CIBBER (Colley), a celebrated comedian, dramatic writer, and poet laureat to the king, was born at London in 1671. His father Caius Gabriel Cibber, was a native of Holſtein, and a ſkilful ſtatuary, who executed the baſſo relievo on the pedeſtal of the monument, and the two admired figures of lunatics over the piers of the gate to Bethlem Hoſpital in Moorfields. Colley, who derived his Chriſtian name from the ſurname of his mother's family, was intended for the church, but betook himſelf to the ſtage, for which he conceived an early inclination; and he was ſome time before he acquired any degree of notice, or even a competent ſalary. His firſt eſſay in writing, was the comedy of *Love's laſt Shift*, acted in 1695, which met with ſucceſs: as did his own performance of the character of the fop in it. From that time, as he ſays himſelf, "My muſe and my ſpouſe were ſo equally prolific, that the one was ſeldom the mother of a child, but in the ſame year the other made me the father of a play. I think we had a dozen of each ſort between us; of both which kinds ſome died in their infancy, and near an equal number of each were alive when we quitted the theatre." The *Careleſs Huſband*, acted in 1704, met with great applauſe, and is reckoned his beſt play; but none was of more importance to him than the *Non-juror*, acted in 1718, and levelled againſt the Jacobites. This laid the foundation of the miſunderſtanding between him and Mr Pope, raiſed him to be the hero of the Dunciad, and made him poet laureat in 1730. He then quitted the ſtage, except a few occaſional performances; and died in 1757. Cibber neither ſucceeded in acting nor in writing tragedy; and his odes were not thought to partake of the genius or ſpirit he ſhowed in his comedies.

His ſon *Theophilus*, alſo a comic actor after him, was born during a great ſtorm in 1703; and after paſſing a life of extravagance, diſtreſs, and perplexity, periſhed in another ſtorm in 1758, in the paſſage between Dublin and England. Theophilus married the ſiſter of Thomas Auguſtin Arne, the famous muſical compoſer; who became a celebrated tragic actreſs, and whoſe honour was ſacrificed to her huſband's extravagance.

CIBDELOPLACIA, in natural hiſtory; a genus of ſpars debaſed by a very large admixture of earth; they are opaque, formed of thin cruſts, covering vegetables and other bodies, by way of incruſtrations.

Of this genus we have the following ſpecies: 1. A greyiſh-white one, with a rough ſurface. 2. A whitiſh brown one: both theſe are friable. 3. A hard, pale-brown kind, which is the oſteocolla of the ſhops. 4. The whitiſh grey kind, with a ſmooth ſurface: this is the unicornu foſſile and ceratites of authors 5. The whitiſh brown corralloide kind.

CIBDELOSTRACIA, in natural hiſtory, terrene ſpars, deſtitute of all brightneſs and tranſparence, formed into thin plates, and uſually found coating over the ſides of fiſſures, and other cavities of ſtones, with congeries of them of great extent, and of plain or botroyide ſurfaces.

Of theſe there are uſually reckoned ſeven kinds: the firſt is the hard, browniſh-white cibdeloſtracium, found in Germany: the ſecond is the hard, whitiſh cibdeloſtracium, with thin cruſts, and a ſmother ſurface, found alſo in the Harts-foreſts in Germany: the third is the hard, pale-brown cibdeloſtracium, with numerous very thin cruſts, found in ſubterranean caverns in many parts of England as well as Germany: the fourth is the white, light, and friable cibdeloſtracium, found alſo in Germany, but very rarely in any part of England: the fifth is the light, hard, pale-brown cibdeloſtracium, with a ſmooth ſurface, found in almoſt all parts of the world: the ſixth is the whitiſh, friable cruſtaceous cibdeloſtracium, with a rougher ſurface, frequent in Germany and England; and the ſeventh is the browniſh-white friable cibdeloſtracium, with a duſty ſurface, found in ſeveral parts of Ireland, as well as Germany.

CIBORIA, in antiquity, the large huſk of Egyptian beans, which are ſaid to have been ſo large as to ſerve for drinking cups; whence they had their name *ciborium*, ſignifying a cup, in the Egyptian language.

CIBORIUM, in eccleſiaſtical writers, the covering for the altar. This covering is ſupported by four high columns, and forms a kind of tent for the euchariſt, in the Romiſh churches. Some authors call it *turris geſtatoria* and others *pyxis*; but the pyxis is properly the box in which the euchariſt is preſerved.

CIBUS FERIALIS, in antiquity, an entertainment peculiar to a funeral; for which purpoſe, beans, parſley, lettuce, bread, eggs, lentils, and ſalts were in uſe.

Plate CXLIX.

CICADA, the FROG-HOPPHER or FLEA-LOCUST, in zoology, a genus of inſects belonging to the order of hemiptera. The beak is inflected; the antennæ are ſetaceous; the four wings are membranaceous and deflected: and the feet, in moſt of the ſpecies, are of the jumping kind. The ſpecies are fifty-one. The larvæ of ſeveral of this genus evacuate great quantities of a frothy matter upon the branches and leaves of plants, in the midſt of which they conſtantly reſide, probably for ſhelter againſt the ſearch of other animals, to which it would become a prey. Nature has afforded this kind of defence to inſects whoſe naked and ſoft bodies might otherwiſe very eaſily be injured; perhaps alſo the moiſture of this foam may ſerve to ſcreen it from the ſultry beams of the ſun. On removing the foam, you diſcover the larva concealed underneath; but it does not long remain uncovered. It ſoon emits freſh foam, that hides it from the eye of obſervation. It is in the midſt of this foamy ſubſtance the larva goes through its metamorphoſis into a chryſalis and perfect inſect. Other larvæ, whoſe bodies are not ſo ſoft, run over plants without any manner of defence, and eſcape from inſects that might hurt them, by the nimbleneſs of their running, but eſpecially of their leaping.

The chryſalids, and all the larvæ that produce them, differ little from each other, only that the former have the rudiments of wings, a kind of knob at the place where the wings will afterwards be in the perfect inſect. As to other reſpects, the chryſalids walk, leap, and run over plants and trees; as do the larva and the frog hopper, which they are to produce. At length they through off their teguments of chryſalids, ſlip their laſt ſlough, and then the inſect appears in its utmoſt ſtate of perfection. The male alone is then endowed with the faculty of ſinging, which it exerciſes not with its throat, but with an organ ſituated under the abdomen. Behind the legs of the male are obſerved two valvulæ, which, raiſed up, diſcover ſeveral cavities, ſeparated by various membranes. The middle contains a ſcaly triangle. Two vigorous muſcles give motion to another membrane, which alternately becomes concave and convex. The air agitated by this membrane, is modified within the other cavities; and by the help of this ſonorous inſtrument, he amorouſly ſolicits his female. By pulling the muſcles of a frog-hopper lately dead, it may be made to ſing. This inſect begins its ſong early in the morning, and continues it during the heat of the noontide ſun. Its lively and animated muſic is, to the country people, a preſage of a fine ſummer, a plentiful harveſt, and the ſure return of ſpring. The cicadæ have a head almoſt triangular, an oblong body, their wings faſtigiated or in form of a roof, and ſix legs with which they walk and leap pretty briſkly. In the females at the extremity of the abdomen are ſeen two large laminæ, between which is incloſed, as in a ſheath, a ſpine, or lamina, ſomewhat ſerrated, which ſerves them for the purpoſe of depoſiting their eggs, and probably to ſink them into the ſubſtance of thoſe plants which the young larvæ are to feed upon.

Cicada *ſeptemdecim*, or Locuſt of North America, ranks with the cricket and graſs-hopper, as one genus of inſects belonging to the order of hemiptera, and has moſt of the diſtinguiſhing characteriſtics of the graſshopper, though its legs do not appear formed for leaping, as it is obſerved the inſect ſeldom removes without uſing its wings.—The characters of the Cicada, or American locuſt, are theſe: The beak is inflected; the antennæ are ſetaceous; the four wings are membranaceous, and deflected, and have much the appearance of the wings of ſome of the fly kind; the thorax is compreſſed and angulated, and the feet, in moſt of the ſpecies, are of the jumping kind.—A gentleman who obſerved it in Pennſylvania in 1782, gives the following account.

“ This remarkable inſect, though but trivial attention has been given to its hiſtory, appears as an extraordinary phenomenon in the works of creation. Its periodical viſits—its long abſence—the numbers which riſe from the earth, where they have, perhaps, undergone various transformations, whilſt they have lain, entombed, for the ſpace of 15, 16, or even 17 years, (for they are not always regular in their viſits) certainly deſerve ſome enquiry.

“ We know not the progreſs of the American locuſt, through its ſeveral changes during its long confinement in the earth. I have no doubt but it often alters its appearance, and though theſe changes remain, as yet, amongſt the arcana of nature, yet ſome intereſting obſervations may reſult from a purſuit of the enquiry, as far as their laſt appearance, which was in the year 1782, will admit of.

“ Towards the latter end of May, under ſuch trees as had been planted, previous to their former viſit, the ground was perforated; ſo as, in ſome degree to reſemble a honey-comb; and from theſe perforations, iſſued an army of theſe inſects; which, if they had been endued with the voraciouſneſs of the locuſts of the eaſt, muſt have ſpread devaſtation and terror throughout the country they fixed upon for a viſit.—But happily the cicada or locuſt, in this ſtate, is not more injurious than the ſportive ſummer graſs-hopper.

“ The appearance of the locuſt, when firſt eſcaping from its earthy manſion, is a large amber-coloured grub-worm, about one inch and an half in length, and about an inch and half in circumference; the feet are more ſtrongly formed than thoſe of the graſshopper, and conſiderably ſhorter;—the inſect ſeldom leaping, as has been before obſerved;—in the outer covering, *or grub-caſe, if the term may be admitted*, near the back of the neck, begins an opening, which continues down the body, nearly half the length of the inſect: through this opening the locuſt protrudes itſelf, and appears, at firſt a white coloured moth, nearly reſembling a ſilkworm, in its moth ſtate, though much larger. The wings in this tender ſtate of the inſect are wonderfully folded in cloſe rolls near their baſis, ſo exquiſitely compact, that it required ſeveral careful obſervations, to comprehend the poſſibility of the wings being formed with the inſect, as it really appeared an almoſt inſtantaneous creation, when they were expanded, which was performed by the locuſt ſhaking itſelf with a conſiderable force.

“ When the inſect relieves itſelf from the outer covering or grub-worm caſe, the wings are of the hue of rich milk. In this ſtate, the filaments, which add ſtrength to them, are of the ſame white colour, and inſtead of the tranſparency which they afterwards obtain, they are now remarkably opaque; but as ſoon as the moiſture dries from off the wings of the inſect, theſe filaments become more firm, and have a dark brown colour which approaches a black as the locuſt becomes ſtronger.

“ The time when they iſſue from the ground, is about an hour or two after ſun-ſet; ſoon after which they begin their exertions to free themſelves from the grub caſe, which the ſtronger ones effect in an hour or two.—They remain on the branches of the trees, which they have attained, (before this laſt metamorphoſis) until morning, when they are of an high amber colour—have acquired their ſtrength, and are able to contend with ſome of their enemies. The weaker ones, and thoſe who do not leave the earth till morning, do not ſo eaſily effect their transformation, and often prove a delicious prey to the larger and even the ſmaller birds.

“ While in the grub-worm ſtate, there is a fiſſure in the back of the ſkin, ſufficiently large to admit the locuſt to paſs therefrom, which, notwithſtanding, is not done without great exertions. At the time of their leaving the grub-caſe, for it cannot be, with propriety, termed a chryſalis, life and motion is ſtrong in the inſect, even when it is about aſſuming its new form. And when we conſider that every particular limb, every part of the body however delicately and tenderly formed,—and really ſome of them, at this time, are almoſt inconceivably thin and tender—is incloſed in a ſeparate caſe, and that theſe tender parts muſt be neceſſarily extricated from their ſheaths, before the inſect can enjoy uninterrupted freedom, we certainly feel our aſtoniſhment increaſe, in obſerving, that thoſe ſo elegantly formed members eſcape uninjured from even the extremities of their covering.—When this eſcape is effected, the inſect leaves the place where its covering is, and reſts at a very ſhort diſtance from it, where it remains until the moiſture is evaporated from its body. The wings, as well as the inſects, when firſt protruded from the grubcaſe, are very moiſt and tender; though by degrees they dry, and become more firm and rigid. But ſhould any accident prevent the cicada from a free expanſion of its wings, for a conſiderable time after the grub-caſe is forſaken, the poor inſect is doomed to remain either in a ſtate of total or partial debility;—for ſhould it be ſo weak as to be unable to expand its wings thoroughly, while the moiſture and pliancy remain, as ſoon as they become dry and rigid, they are fixed in that particular or total want of expanſion; and in this helpleſs ſtate, the cicada is a certain prey even to the long-applauded induſtrious emmet.

"The locuſt-grub, riſing from the ground, is nearly the colour of the locuſt when it has attained its full perfection, though not altogether as dark; its ſtrength is very great, nearly equalling that of the ſcarabæus carnifex (or the beetle which forms the balls from ordure): But as it is about to leave the caſe, it becomes weaker.

"At the time of their laſt appearance, an apple-tree was approved of for the theatre of my enquiry; and though it muſt have been very ſmall at the time of their former viſit, yet, having carefully collected the grubs which came up under its branches, the firſt evening I numbered 500, which I removed; the ſecond evening 600 more had made their appearance, and the third evening upwards of 400. Several ſtragglers remained, who were neglected, as the numbers were already ſufficiently great to claim my whole attention.

"Two or three days after their aſſuming the moth ſtate, the air reſounded with their notes, which were re-echoed either on the wing, or on the branches of the trees indiſcriminately. Theſe notes, expreſſive as thoſe of the feathered ſongſters, proved a call to courtſhip. The power of ſong, which ſomewhat reſembled the noiſe of a ſtocking-loom, was confined to the male—which it was eaſy to diſcover was produced by inflating air into his body, and expreſſing it through two ſmall apertures, placed a little below the baſe of his wings;—theſe holes lead from a muſical table, on each ſide of which are five or ſix thin bars, connected by exquiſitely fine membranes; which, during the time of ſong, maintain a continual vibration. Like the graſshopper, the locuſt very ſeldom ſports its ſocial call without a reſponſe from almoſt all the males within hearing; and frequently when the courtſhip has obtained his mate's approbation, an intruder allured by the concert, which is eaſily diſtinguiſhed, challenges the hero to combat, and the fight is often long and deſperate—as the victory always confers an intereſting reward.*

"When geſtation is fully accompliſhed, which is generally two or three days after they have aſſumed the flying ſtate, the female prepares to depoſit her burden; and although her body does not appear greatly diſtended, yet ſhe generally lays about 140 eggs.—The egg is of a white colour, and about a line in length, and one-third of a line in diameter. Nature has wonderfully provided her with an inſtrument in her tail, ſomewhat reſembling a two-edged ſword, which, like the graſshopper, ſhe can ſheath and unſheath at pleaſure: with this ſhe perforates the tender twigs of ſuch trees as will afford a convenient nidus for the eggs, and depoſits them by 14 or 15, under the bark, in the form of the letter V; and ſometimes ſhe pierces thro' a twig one-fourth of an inch thick.—After ſhe has carefully depoſited her eggs in the ſmaller branches, a ſudden blaſt of wind frequently lops the branch ſhe has choſen for their reſidence.

"It is thus that the parent provides for a ſucceſſion of the ſpecies, in which employment ſhe is generally buſied until about the tenth day of her moth ſtate, ſeldom if ever feeding on any thing but the early dew: For, as they fly in ſuch numbers, (and always careleſsly, without a leader, as is uſual with the eaſtern locuſts) were they to feed on plants the damage muſt certainly be obſervable: and as they live in the moth ſtate twelve or thirteen days, it is probable they have a portion of the dew of heaven for their ſuſtenance. Then they dry up as the ſilk-worm moth,—the male becoming ſuperannuated two or three days before the female.

"Having purſued the locuſt thro' its ſeveral moth ſtages, the numerous offspring it has depoſited in the ſlender twigs of trees, have ſtill ſome claim to an inveſtigation.—The eggs are of a cylindrical form, rounded at the ends, and are of ſuch a conſiſtence, that they require a hard preſſure between the fingers to cruſh them. The ſubſtance within, as in moſt other ſmall eggs, is a white, tranſparent, and viſcous fluid. In about the ſpace of fourteen days, from the time of their firſt being left by the parent, the egg produces a whitiſh inſect, ſomewhat larger than the ſilk-worm, when freſh hatched, which leaves the branch where the neſt was, and, dropping on the ground, either enters into the hole through which the old locuſt iſſued, or turns the earth aſide afreſh, and entombs itſelf there, to undergo the metamorphoſis of its anceſtors.

"In digging wells, cellars, &c. in America, inſects of very different appearances have been diſcovered, ſome twenty feet deep, which have been ſuppoſed to be of this ſpecies—others have been diſcovered nearer the ſurface, of which no doubt remains but that they are the grub of the locuſt—and early in the ſpring, previous to their aſſuming the moth ſtate, the ploughſhare often furniſhes the blackbird, which follows the ploughman, with a rich repaſt of them; for which, by his clamours and flutterings, he endeavours to expreſs his obligations. Varieties of this genus appear annually, they are in general much larger than the cicada ſeptemdecim, and of a greyiſh caſt; the dark brown or amber colour which the others have, appearing in theſe mottled with a dirty white."

CICATRICULA, among natural hiſtorians, denotes a ſmall whitiſh ſpeck in the yolk of an egg, ſuppoſed to be the firſt rudiments of the future chick.

CICATRIX, in ſurgery, a little ſeam or elevation of callous fleſh riſing on the ſkin, and remaining there after the healing of a wound or ulcer. It is commonly called a *ſcar*.

CICATRIZANTS, in pharmacy, medicines which aſſiſt nature to form a cicatrix. Such are Armenian bole, powder of tutty, &c.

Cicatrizants are otherwiſe called *eſcharotics*, *epulotics*, *incarnatives*, *agglutinants*, &c.

CICCA, in botany; a genus of the tetrandria order, belonging to the monœcia claſs of plants. The male calyx is tetraphyllous; there is no corolla: the female calyx tryphyllous; no corolla; four ſtyles; the capſule quadricoccous, or four berried.

CICELY,

---

* Mas et feminina Cicada in coitu [æquè ac Grylli ſpecies] adeo firmiter uniti, ut ſine corporum mutilatione ſeparari nullo modo poſſint; et in hoc ſtatu per horas multas remanent, donec foecundationis opus perfectum ſit. Per lucos firmiter ſic uniti ſæpe volitant, et complures ſimul in conſpectu apparent.

Cicely, Cicer.

CICELY, in botany, the Engliſh name of a ſpecies of chærophyllum. See CHÆROPHYLLUM.

CICER, or CHICK-PEA, in botany: A genus of the decandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the *Papilionaceæ*, or 32d order. The calyx is quinquepartite, as long as the corolla, with its four uppermoſt ſegments incumbent on the vexillum: the legumen is rhomboidal, turgid, and diſpermous. There is but one ſpecies, which produces peaſe ſhaped like the common ones, but much ſmaller. They are much cultivated in Spain, where they are natives, being one of the ingredients in their olios: as alſo in France; but are rarely known in Britain.

Cicer.
