He grew cheerful again over the dessert. "You have no idea," he said, "the kind of man this Schwartz is. Did I ever tell you about his skull sutures?"

"They're primitive. You told me."

"But that's not all. He's got thirty-two teeth: three molars up and down, left and right, counting one false one that must be homemade. At least I've never seen a bridge that has metal prongs hooking it onto adjacent teeth instead of being grafted to the jawbone. . . .But have you ever seen anyone with thirty-two teeth?"

"I don't go about counting people's teeth, Father. What's the right number--twenty-eight?"

"It sure as Space is. . . .I'm still not finished, though. We took an internal analysis yesterday. What do you suppose we found?. . . Guess!"

"Intestines?"

"Pola, you're being deliberately annoying, but I don't care. You needn't guess; 111 tell you. Schwartz has a vermiform appendix, three and a half inches long, and it's open. Great Galaxy, it's completely unprecedented! I have checked with the Medical School--cautiously, of course--and appendixes are practically never longer than half an inch, and they're never open."

"And just what does that mean?"

"Why, he's a complete throwback, a living fossil." He had risen from his chair and paced the distance to the wall and back with hasty steps. "I tell you what, Pola, I don't think we ought to give Schwartz up. He's too valuable a specimen."

"No, no, Father," said Pola quickly, "you can't do that. You promised that farmer to return Schwartz, and you must for Schwartz's own sake. He's unhappy."

"Unhappy! Why, we're treating him like a rich Outsider."

"What difference does that make? The poor fellow is used to his farm and his people. He's lived there all his life. And now he's had a frightening experience--a painful one, for all I know--and his mind works differently now. He can't be expected to understand. We've got to consider his human rights and return him to his family."

"But, Pola, the cause of science--"

"Oh, slush! What is the cause of science worth to me? What do you suppose the Brotherhood will say when they hear of your unauthorized experiments? Do you think they care about the cause of science? I mean, consider yourself if you don't wish to consider Schwartz. The longer you keep him, the greater the chance of being caught. You send him home tomorrow night, the way you originally planned to, do you hear?. . . I'll go down and see if Schwartz wants anything before dinner."

But she was back in less than five minutes, face damp and chalky. "Father, he's gone!"

"Who's gone?" he asked, startled.

"Schwartz!" she cried, half in tears. "You must have forgotten to lock the door when you left him."

Shekt was on his feet, throwing a hand out to steady himself. "How long?"

"I don't know. But it can't be very long. When were you last there?"

"Not fifteen minutes. I had just been here a minute or two when you came in."

"Well, then," with sudden decision, "I'll run out. He may simply be wandering about the neighborhood. You stay here. If someone else picks him up, they mustn't connect him with you. Understand?"

Shekt could only nod.

Joseph Schwartz felt no lifting of the heart when he exchanged the confines of his prison hospital for the expanses of the city outside. He did not delude himself to the effect that he had a plan of action. He knew, and knew well, that he was simply improvising.

If any rational impulse guided him (as distinct from mere blind desire to exchange inaction for action of any sort), it was the hope that by chance encounter some facet of life would bring back his wandering memory. That he was an amnesiac he was now fully convinced.

The first glimpse of the city, however, was disheartening. It was late afternoon and, in the sunlight, Chica was a milky white. The buildings might have been constructed of porcelain, like that farmhouse he had first stumbled upon.

Stirrings deep within told him that cities should be brown and red. And they should be much dirtier. He was sure of that.

He walked slowly. He felt, somehow, that there would be no organized search for him. He knew that, without knowing how he knew. To be sure, in the last few days he had found himself growing increasingly sensitive to "atmosphere," to the "feel" of things about him. It was part of the strangeness in his mind, since--since. . .

His thought trailed away.

In any case, the "atmosphere" at the hospital prison was one of secrecy; a frightened secrecy, it seemed. So they could not pursue him with loud outcry. He knew that. Now why should he know that? Was this queer activity of his mind part of what went on in cases of amnesia?

He crossed another intersection. Wheeled vehicles were relatively few. Pedestrians were--well, pedestrians. Their clothes were rather laughable: seamless, buttonless,

colorful. But then so were his own. He wondered where his old clothes were, then wondered if he had ever really owned such clothes as he remembered. It is very difficult to be sure of anything, once you begin doubting your memory on principle.

But he remembered his wife so clearly; his children. They couldn't be fictions. He stopped in the middle of the walk to regain a composure suddenly lost. Perhaps they were distorted versions of real people, in this so unreal-seeming real life, whom he must find.

People were brushing past him and several muttered unamiably. He moved on. The thought occurred to him, suddenly and forcibly, that he was hungry, or would be soon, and that he had no money.

He looked about. Nothing like a restaurant in sight. Well, how did he know? He couldn't read the signs.

He gazed into each store front he passed. . . .And then he found an interior which consisted in part of small alcoved tables, at one of which two men sat and another at which a single man sat. And the men were eating.

At least that hadn't changed. Men who ate still chewed and swallowed.

He stepped in and, for a moment, stopped in considerable bewilderment. There was no counter, no cooking going on, no signs of any kitchen. It had been his idea to offer to wash the dishes for a meal, but--to whom could he make the offer?

Diffidently, he stepped up to the two diners. He pointed, and said painstakingly, "Food! Where? Please."

They looked up at him, rather startled. One spoke fluently, and quite incomprehensibly, patting a small structure at the wall end of the table. The other joined in, impatiently.

Schwartz's eyes fell. He turned to leave, and there was a hand upon his sleeve--

Granz had seen Schwartz while the latter was still only a plump and wistful face at the window.

He said "What's he want?"

Messter, sitting across the little table, with his back to the street, turned, looked, shrugged his shoulders, and said nothing.

Granz said, "He's coming in," and Messter replied, "So what?"

"Nothing. Just mentioning it."

But a few moments later the newcomer, after looking about helplessly, approached and pointed to their beef stew, saying in a queer accent, "Food! Where? Please."

Granz looked up. "Food right here, bud. Just pull up a chair at any table you want and use the Foodomat. . . . Foodomat! Don't you know what a Foodomat is?. . . Look at the poor jerk, Messter. He's looking at me as if he doesn't understand a word I say. Hey, fella--this thing, see. Just put a coin in and let me eat, will you?"

"Leave him alone," grunted Messter. "He's just a bum, looking for a handout."

"Hey, hold on." Granz seized Schwartz's sleeve as the latter turned to go. He added in an aside to Messter, "Space, let the guy eat. He's probably getting the Sixty soon. It's the least I can do to give him a break. . . .Hey, bud, you got any money?. . .

Well, I'll be damned, he still doesn't understand me. Money, pal, money! This--" And he drew a shining half-credit piece out of his pocket, flipping it so that it sparkled in the air.

"Got any?" he asked.

Slowly Schwartz shook his head.

"Well, then, have this on me!" He replaced the half-credit piece in his pocket and tossed over a considerably smaller coin.

Schwartz held it uncertainly.

"All right. Don't just stand there. Stick it in the Foodomat. This thing here."

Schwartz suddenly found himself understanding. The Foodomat had a series of slits for coins of different sizes and a series of knobs opposite little milky rectangles, the writing upon which he could not read. Schwartz pointed to the food on the table and ran a forefinger up and down the knobs, raising his eyebrows in question.

Messter said in annoyance, " A sandwich isn't good enough for him. We're getting classy bums in this burg nowadays. It doesn't pay to humor them, Granz."

"All right, so I lose point eight five credits. Tomorrow's payday, anyway. . . .Here," he said to Schwartz. He placed coins of his own into the Foodomat and withdrew the wide metal container from the recess in the wall. "Now take it to another table. . . .Nab, keep that tenth piece. Buy yourself a cup of coffee with it."

Schwartz carried the container gingerly to the next table. It had a spoon attached to the side by means of a transparent, filmy material, which broke with a slight pop under the pressure of a fingernail. As it did so, the top of the container parted at a seam and curled back upon itself.

The food, unlike that which he saw the others eating, was cold; but that was a detail. It was only after a minute or so that he realized the food was getting warmer and that the container had grown hot to the touch. He stopped, in alarm, and waited.

The gravy first steamed, then bubbled gently for a moment. It cooled again and Schwartz completed the meal.

Granz and Messter were still there when he left. So was the third man, to whom, throughout, Schwartz had paid no attention.

Nor had Schwartz noticed, at any time since he had left the Institute, the thin, little man who, without seeming to, had managed to remain always within eyesight.

Bel Arvardan, having showered and changed his clothes, promptly followed his original intention of observing the human animal, subspecies Earth, in its native habitat. The weather was mild, the light breeze refreshing, the village itself--pardon, the city--bright, quiet, and clean.

Not so bad.

Chica first stop, he thought. Largest collection of Earth. men on the planet. Washenn next; local capital. Senloo! Senfran! Bonair!. . . He had plotted an itinerary all over the western continents (where most of the meager scattering of Earth's population lived) and, allowing two or three days at each, he would be back in Chica just about the time his expeditionary ship was due.

It would be educational.

As afternoon began to decline he stepped into a Foodomat and, as he ate, observed the small drama that played itself out between the two Earthmen who had entered shortly after himself and the plump, elderly man who came in last of all. But his observation was detached and casual, simply noting it as an item to set against his unpleasant experience on the jet transport. The two men at the table were obviously air-cab drivers and not wealthy, yet they could be charitable.

The beggar left, and two minutes later Arvardan left as well.

The streets were noticeably fuller, as the workday was approaching its end.

He stepped hastily aside to avoid colliding with a young girl.

"Pardon me," he said.

She was dressed in white, in clothing which bore the stereotyped lines of a uniform. She seemed quite oblivious of the near collision. The anxious look on her face, the sharp turning of her head from side to side, her utter preoccupation, made the situation quite obvious.

He laid a light finger on her shoulder. "May I help you, miss? Are you in trouble?"

She stopped and turned startled eyes upon him. Arvardan found himself judging her age at nineteen to twenty-one, observing carefully her brown hair and dark eyes, her high cheekbones and little chin, her slim waist and graceful carriage. He discovered, suddenly, that the thought of this little female creature being an Earthwoman lent a sort of perverse piquancy to her attractiveness.

But she was still staring, and almost at the moment of speaking she seemed to break down. "Oh, it's no use. Please don't bother about me. It's silly to expect to find someone when you don't have the slightest idea where he could have gone." She was drooping in discouragement, her eyes wet. Then she straightened and breathed deeply. "Have you seen a plump man about five-four, dressed in green and white, no hat, rather bald?"

Arvardan looked at her in astonishment. "What? Green and white? . . . Oh, I don't believe this. . . . Look, this man you're referring to--does he speak with difficulty?"

"Yes, yes. Oh yes. You have seen him, then?"

"Not five minutes ago he was in there eating with two men. . . . Here they are. . . . Say, you two." He beckoned them over.

Granz reached them first. "Cab, sir?"

"No, but if you tell the young lady what happened to the man you were eating with, you'll stand to make the fare, anyway."

Granz paused and looked chagrined. "Well, I'd like to help you, but I never saw him before in my life."

Arvardan turned to the girl. "Now look, miss, he can't have gone in the direction you came from or you'd have seen him. And he can't be far away. Suppose we move north a bit. I'll recognize him if I see him."

His offer of help was an impulse, yet Arvardan was not, ordinarily, an impulsive man. He found himself smiling at her.

Granz interrupted suddenly. "What's he done, lady? He hasn't broken any of the Customs, has he?"

"No, no," she replied hastily. "He's only a little sick, that's all."

Messter looked after them as they left. "A little sick?" He shoved his visored cap back upon his head, then pinched balefully at his chin. "How d'ya like that, Granz? A little sick."

His eyes looked askance at the other for a moment.

"What's got into you?" asked Granz uneasily.

"Something that's making me a little sick. That guy must've been straight out of the hospital. That was a nurse looking for him, and a plenty worried nurse, too. Why should she be worried if he was just a little sick? He couldn't hardly talk, and he didn't hardly understand. You noticed that, didn't you?"

There was a sudden panicky light in Granz's eyes. "You don't think it's Fever?"

"I sure do think it's Radiation Fever--and he's far gone. He was within a foot of us, too. It's never any good--"

There was a little thin man next to them. A little thin man with bright, sharp eyes and a twittering voice, who had stepped out of nowhere. "What's that, gents? Who's got Radiation Fever?"

He was regarded with disfavor. "Who are you?"

"Ho," said the sharp little man, "you want to know, do you? It so happens that I'm a messenger of the Brotherhood, to be sure." He flashed a little glowing badge on the inner lapel of his jacket. "Now, in the name of the Society of Ancients, what's all this about Radiation Fever?"

Messter spoke in cowed and sullen tones. "I don't know nothing. There's a nurse looking for somebody who's sick, and I was wondering if it was Radiation Fever. That's not against the Customs, is it?"

"Ho! You're telling me about the Customs, are you? You better go about your business and let me worry about the Customs."

The little man rubbed his hands together, gazed quickly about him, and hurried northward.

"There he is!" and Pola clutched feverishly at her companion's elbow. It had happened quickly, easily, and accidentally. Through the despairing blankness he had suddenly materialized just within the main entrance of the self-service department store, not three blocks from the Foodomat.

"I see him," whispered Arvardan. "Now stay back and let me follow him. If he sees you and dashes into the mob, we'll never locate him."

Casually they followed in a sort of nightmare chase. The human contents of the store was a quicksand which could absorb its prey slowly--or quickly--keep it hidden impenetrably, spew it forth unexpectedly; set up barriers that somehow would not yield. The mob might almost have had a malevolent conscious mind of its own.

And then Arvardan circled a counter watchfully, playing Schwartz as though he were at the end of a fishing line. His huge hand reached out and closed on the other's shoulder.

Schwartz burst into incomprehensible prose and jerked away in panic. Arvardan's grip, however, was unbreakable to men far stronger than Schwartz, and he contented himself with smiling and saying, in normal tones, for the benefit of the curious spectator, "Hello, old chap, haven't seen you in months. How are you?"

A palpable fraud, he supposed, in the face of the other's gibberish, but Pola had joined them.

"Schwartz," she whispered, "come back with us."

For a moment Schwartz stiffened in rebellion, then he drooped.

He said wearily, "I--go--along--you," but the statement was drowned in the sudden blare of the store's loud-speaker system.

"Attention! Attention! Attention! The management requests that all patrons of the store leave by the Fifth Street exit in orderly fashion. You will present your registration cards to the guards at the door. It is essential that this be done rapidly. Attention! Attention! Attention!"

The message was repeated three times, the last time over the sound of scuffling feet as crowds were beginning to line up at the exits. A many-tongued cry was making itself heard, asking in various fashions the forever-unanswerable question of "What's happened? What's going on?"

Arvardan shrugged and said, "Let's get on line, miss. We're leaving anyway."

But Pola shook her head. "We can't. We can't--"

"Why not?" The archaeologist frowned.

The girl merely shrank away from him. How could she tell him that Schwartz had no registration card? Who was he? Why had he been helping her? She was in a whirl of suspicion and despair.

She said huskily, "You'd better go, or you'll get into trouble."

They were pouring out the elevators as the upper floors emptied. Arvardan, Pola, and Schwartz were a little island of solidity in the human river.

Looking back on it later, Arvardan realized that at this point he could have left the girl. Left her! Never seen her again! Have nothing to reproach himself with! . . . And all would have been different. The great Galactic Empire would have dissolved in chaos and destruction.

He did not leave the girl. She was scarcely pretty in her fear and despair. No one could be. But Arvardan felt disturbed at the sight of her helplessness.

He had taken a step away, and now he turned. "Are you going to stay here?"

She nodded.

"But why?" he demanded.

"Because"--and the tears now overflowed--"I don't know what else to do."

She was just a little, frightened girl, even if she was an Earthie. Arvardan said, in a softer voice, "If you'll tell me what's wrong, I'll try to help."

There was no answer.

The three formed a tableau. Schwartz had sunk to the floor in a squatting posture, too sick at heart to try to follow the conversation, to be curious at the sudden emptiness of the store, to do anything but bury his head in his hands in the last unspoken and unuttered whimper of despair. Pola, weeping, knew only that she was more frightened than she had ever thought it possible for anyone to be. Arvardan, puzzled and waiting, tried clumsily and ineffectually to pat Pola's shoulder in encouraging fashion, and was conscious only of the fact that for the first time he had touched an Earthgirl.

The little man came upon them thus.

9. CONFLICT AT CHICA

Lieutenant Marc Claudy of the Chica garrison yawned slowly and gazed into the middle distance with an ineffable boredom. He was completing his second year of duty on Earth and waited yearningly for replacement.

Nowhere in the Galaxy was the problem of maintaining a garrison quite so complicated as it was on this horrible world. On other planets there existed a certain camaraderie between soldier and civilian, particularly female civilian. There was a sense of freedom and openness.

But here the garrison was a prison. There were the radiation-proof barracks and the filtered atmosphere, free of radioactive dust. There was the lead-impregnated clothing, cold and heavy, which could not be removed without grave risk. As a corollary to that, fraternization with the population (assuming that the desperation of loneliness could drive a soldier to the society of an "Earthie" girl) was out of the question.

What was left, then, but short snorts, long naps, and slow madness?

Lieutenant Claudy shook his head in a futile attempt to clear it, yawned again, sat up and began dragging on his shoes. He looked at his watch and decided it was not yet quite time for evening chow.

And then he jumped to his feet, only one shoe on, acutely conscious of his uncombed hair, and saluted.

The colonel looked about him disparagingly but said nothing directly on the subject. Instead he directed crisply, "Lieutenant, there are reports of rioting in the business district. You will take a decontamination squad to the Dunham department store and take charge. You will see to it that all your men are thoroughly protected against infection by Radiation Fever."

"Radiation Fever!" cried the lieutenant. "Pardon me, sir, but--"

"You will be ready to leave in fifteen minutes," said the colonel coldly.

Arvandan saw the little man first, and stiffened as the other made a little gesture of greeting. "Hi, guv'ner. Hi, big fella. Tell the little lady there ain't no call for the waterworks. "

Pola's head had snapped up, her breath sucked in. Automatically she leaned toward the protecting bulk of Arvandan, who, as automatically, put a protective arm about her. It did not occur to him that that was the second time he had touched an Earthgirl.

He said sharply, "What do you want?"

The little man with the sharp eyes stepped diffidently out from behind a counter piled high with packages. He spoke in a manner which managed to be both ingratiating and impudent simultaneously.

"Here's a weird go outside," he said, "but it don't need to bother you, miss. I'll get your man back to the Institute for you."

"What institute?" demanded Pola fearfully.

"Aw, come off it," said the little man. "I'm Natter, fella with the fruit stand right across the street from the Institute for Nuclear Research. I seen you here lots of times."

"See here," said Arvardan abruptly, "what's all this about?"

Natter's little frame shook with merriment. "They think this fella here has Radiation Fever--"

"Radiation Fever?" It came from both Arvardan and Pola at once.

Natter nodded. "That's right. Two cabbies ate with him and that's what they said. News like that kinda spreads, you know."

"The guards outside," demanded Pola, "are just looking for someone with fever?"

"That's right."

"And just why aren't you afraid of the fever?" demanded Arvardan abruptly. "I take it that it was fear of contagion that caused the authorities to empty the store."

"Sure. The authorities are waiting outside, afraid to come in, too. They're waiting for the Outsiders' decontamination squad to get here."

"And you're not afraid of the fever, is that it?"

"Why should I be? This guy don't have no fever. Look at him. Where's the sores on his mouth? He isn't flushed. His eyes are all right. I know what fever looks like. Come on, miss, we'll march out of here, then."

But Pola was frightened again. "No, no. We can't. He's--he's--" She couldn't go on.

Natter said insinuatingly, "I could take him out. No questions asked. No registration card necessary--"

Pola failed to suppress a little cry, and Arvardan said, with considerable distaste, "What makes you so important?"

Natter laughed hoarsely. He flipped his lapel. "Messenger for the Society of Ancients. Nobody'll ask me questions."

"And what's in it for you?"

"Money! You're anxious and I can help you. There ain't no fairer than that. It's worth, say, a hundred credits to you, and it's worth a hundred credits to me. Fifty credits now, fifty on delivery."

But Pola whispered in horror, "You'll take him to the Ancients."

"What for? He's no good to them, and he's worth a hundred credits to me. If you wait for the Outsiders, they're liable to kill the fella before they find out he's fever-free. You know Outsiders--they don't care if they kill an Earthman or not. They'd rather, in fact."

Arvardan said, "Take the young lady with you."

But Natter's little eyes were very sharp and very sly. "Oh no. Not that guv'ner. I take what you call calculated risks. I can get by with one, maybe not with two. And if I only take one, I take the one what's worth more. Ain't that reasonable to you?"

"What," said Arvardan, "if I pick you up and pull your legs off? What'll happen then?"

Natter flinched, but found his voice, nevertheless, and managed a laugh. "Why, then, you're a dope. They'll get you anyway, and there'll be murder, too, on the list. . . .All right, gov'ner. Keep your hands off."

"Please"--Pola was dragging at Arvardan's arm--"we must take a chance. Let him do as he says. . . .You'll be honest with us, w-won't you, Mr. Natter?"

Natter's lips were curling. "Your big friend wrenched my arm. He had no call to do that, and I don't like nobody to push me around. I'll just take an extra hundred credits for that. Two hundred in all."

"My father'll pay you--"

"One hundred in advance," he replied obdurately.

"But I don't have a hundred credits," Pola wailed.

"That's all right, miss," said Arvardan stonily. "I can swing it."

He opened his wallet and plucked out several bills. He threw them at Natter. "Get going!"

"Go with him, Schwartz," whispered Pola.

Schwartz did, without comment, without caring. He would have gone to hell at that moment with as little emotion.

And they were alone, staring at each other blankly. It was perhaps the first time that Pola had actually looked at Arvardan, and she was amazed to find him tall and craggily handsome, calm and self-confident. She had accepted him till now as an inchoate, unmotivated helper, but now--She grew suddenly shy, and all the events of the last hour or two were enmeshed and lost in a scurry of heartbeating.

They didn't even know each other's name.

She smiled and said, "I'm Pola Shekt."

Arvardan had not seen her smile before, and found himself interested in the phenomenon. It was a glow that entered her face, a radiance. It made him feel--But he put that thought away roughly. An Earthgirl!

So he said, with perhaps less cordiality than he intended, "My name is Bel Arvardan." He held out a bronzed hand, into which her little one was swallowed up for a moment.

She said, "I must thank you for all your help."

Arvardan shrugged it away. "Shall we leave? I mean, now that your friend is gone; safely, I trust."

"I think we would have heard quite a noise if they had caught him, don't you think so?" Her eyes were pleading for confirmation of her hope, and he refused the temptation toward softness.

"Shall we go?"

She was somehow frozen. "Yes, why not?" sharply.

But there was a whining in the air, a shrill moan on the horizon, and the girl's eyes were wide and her outstretched hand suddenly withdrawn again,

"What's the matter now?" asked Arvardan.

"It's the Imperials."

"And are you frightened of them too?" It was the self-consciously non-Earthman Arvardan who spoke--the Sirian archaeologist. Prejudice or not, however the logic might be chopped and minced, the approach of Imperial soldiers meant a trace of sanity and humanity. There was room for condescension here, and he grew kind.

"Don't worry about the Outsiders," he said, even stooping to use their term for non-Earthmen. "I'll handle them, Miss Shekt."

She was suddenly concerned. "Oh no, don't try anything like that. Just don't talk to them at all. Do as they say, and don't even look at them."

Arvardan's smile broadened.

The guards saw them while they were still a distance from the main entrance and fell back. They emerged into a little space of emptiness and a strange hush. The whine of the army cars was almost upon them.

And then there were armored cars in the square and groups of glass-globe-headed soldiers springing out therefrom. The crowds scattered before them in panic, aided in their scramblings by clipped shouts and thrusts with the butt ends of the neuronic whips.

Lieutenant Claudy, in the lead, approached an Earthman guard at the main entrance. "All right, you, who's got the fever?"

His face was slightly distorted within the enclosing glass, with its content of pure air. His voice was slightly metallic as a result of radio amplification.

The guard bent his head in deep respect. "If it please your honor, we have isolated the patient within the store. The two who were with the patient are now standing in the doorway before you."

"They are, are they? Good! Let them stand there. Now in the first place, I want this mob out of here. Sergeant! Clear the square!"

There was a grim efficiency in the proceedings thereafter. The deepening twilight gloomed over Chica as the crowd melted into the darkening air. The streets were beginning to gleam in soft, artificial lighting.

Lieutenant Claudy tapped his heavy boots with the butt of his neuronic whip. "You're sure the sick Earthie is inside?"

"He has not left, your honor. He must be."

"Well, we'll assume he is and waste no time about it. Sergeant! Decontaminate the building!"

A contingent of soldiers, hermetically sealed away from all contact with Terrestrial environment, charged into the building. A slow quarter hour passed, while Arvardan watched all in absorbed fashion. It was a field experiment in intercultural relationships that he was professionally reluctant to disturb.

The last of the soldiers were out again, and the store was shrouded in deepening night.

"Seal the doors!"

Another few minutes and then the cans of disinfectant which had been placed in several spots on each floor were discharged at long distance. In the recesses of the building those cans were flung open and the thick vapors rolled out and curled up the

walls, clinging to every square inch of surface, reaching through the air and into the inmost crannies. No protoplasm, from germ to man, could remain alive in its presence, and chemical flushing of the most painstaking type would be required eventually for decontamination.

But now the lieutenant was approaching Arvardan and Pola.

"What was his name?" There was not even cruelty in his voice, merely utter indifference. An Earthman, he thought, had been killed. Well, he had killed a fly that day also. That made two.

He received no answer, Pola bending her head meekly and Arvardan watching curiously. The Imperial officer did not take his eyes off them. He beckoned curtly. "Check them for infection."

An officer bearing the insignia of the Imperial Medical Corps approached them, and was not gentle in his investigation; His gloved hands pushed hard under their armpits and yanked at the corners of their mouths so that he might investigate the inner surfaces of their cheeks.

"No infection, Lieutenant. If they had been exposed this afternoon, the stigmata would be clearly visible by now if infection had occurred."

"Umm." Lieutenant Claudy carefully removed his globe and enjoyed the touch of "live" air, even that of Earth. He tucked the ungainly glass object into the crook of his left elbow and said harshly, "Your name, Earthie-squaw?"

The term itself was richly insulting; the tone in which it was uttered added disgrace to it, but Pola showed no sign of resentment.

"Pola Shekt, sir," she responded in a whisper.

"Your papers!"

She reached into the small pocket of her white jacket and removed the pink folder.

He took it, flared it open in the light of his pocket flash, and studied it. Then he tossed it back. It fell, fluttering, to the floor, and Pola bent quickly for it.

"Stand up," the officer ordered impatiently, and kicked the booklet out of reach. Pola, white-faced, snatched her fingers away.

Arvardan frowned and decided it was time to interfere. He said, "Say, look here, now."

The lieutenant turned on him in a flash, his lips drawn back. "What did you say, Earthie?"

Pola was between them at once. "If you please, sir, this man has nothing to do with anything that has happened today. I never saw him before--"

The lieutenant yanked her aside. "I said, What did you say, Earthie?"

Arvardan returned his stare coolly. "I said, Look here, now. And I was going to say further that I don't like the way you treat women and that I'd advise you to improve your manners."

He was far too irritated to correct the lieutenant's impression of his planetary origin.

Lieutenant Claudy smiled without humor. . . And where have you been brought up, Earthie? Don't you believe in saying 'sir' when you address a man? You don't know your place, do you? Well, it's been a while since I've had the pleasure of teaching the way of life to a nice big Earthie-buck. Here, how's this--"

And quickly, like the flick of a snake, his open palm was out and across Arvardan's face, back and forth, once, twice. Arvardan stepped back in surprise and then felt the roaring in his ears. His hand shot out to catch the extended arm that pecked at him. He saw the other's face twist in surprise.

The muscles in his shoulders writhed easily.

The lieutenant was on the pavement with a crashing thud that sent the glass globe rolling into shattered fragments. He lay still, and Arvardan's half-smile was ferocious. He dusted his hands lightly. . . Any other bastard here think he can play pattycake on my face?"

But the sergeant had raised his neuronc whip'. The contact closed and there was the dim violet flash that reached out and licked at the tall archaeologist.

Every muscle in Arvardan's body stiffened in unbearable pain, and he sank slowly to his knees. Then, with total paralysis upon him, he blacked out.

When Arvardan swam out of the haze he was conscious first of all of a wash of welcome coolness on his forehead. He tried to open his eyes and found his lids reacting as if swinging on rusty hinges. He let them remain closed and, with infinitely slow jerks (each fragmentary muscular movement shooting pins through him), lifted his arm to his face.

A soft, damp towel, held by a little hand. . .

He forced an eye open and battled with the mist.

"Pola," he said.

There was a little cry of sudden joy. "Yes. How do you feel?"

"As if I were dead," he croaked, "without the advantage of losing pain. . . .What happened?"

"We were carted off to the military base. The colonel's been in here. They've searched you--and I don't know what they're going to do, but--Oh, Mr. Arvardan, you shouldn't ever have struck the lieutenant. I think you broke his arm. "

A faint smile wrenched at Arvardan's face. "Good! I wish I'd broken his back."

"But resisting an Imperial officer--it's a capital offense." Her voice was a horrified whisper.

"Indeed? We'll see about that."

"Ssh. They're coming back."

Arvardan closed his eyes and relaxed. Pola's cry was faint and far-off in his ears, and when he felt the hypodermic's thrust he could not gather his muscles into motion.

And then there was the wash of wonderful soothing nonpain along his veins and nerves. His arms unknotted and his back released itself slowly from its rigid arch, settling down. He fluttered his eyelids rapidly and, with a thrust of his el. bow, sat up. "

The colonel was regarding him thoughtfully; Pola, apprehensively, yet, somehow, joyfully.

The colonel said, "Well, Dr. Arvardan, we seem to have had an unpleasant contretemps in the city this evening."

Dr. Arvardan. Pola realized the little she knew about him, not even his occupation. . .She had never felt quite like this.

Arvardan laughed shortly. "Unpleasant, you say. I consider that a rather inadequate adjective."

"You have broken the arm of an officer of the Empire about the performance of his duty."

"That officer struck me first. His duty in no way included the necessity for grossly insulting me, both verbally and physically. In doing so he forfeited any claim he might have to treatment as an officer and gentleman. As a free citizen of the Empire, I had every right to resent such cavalier, not to say illegal, treatment."

The colonel harumphed and seemed at a loss for words. Pola stared at both of them with wide, unbelieving eyes.

Finally the colonel said softly, "Well, I need not say that I consider the whole incident to have been unfortunate. Apparently the pain and indignity involved have been equally spread on both sides. It may be best to forget this matter."

"Forget? I think not. I have been a guest at the Pro. curator's palace, and he may be interested in hearing exactly in what manner his garrison maintains order on Earth."

"Now, Dr. Arvardan, if I assure you that you will receive a public apology--"

"To hell with that. What do you intend doing with Miss Shekt?"

"What would you suggest?"

"That you free her instantly, return her papers, and tender your apologies--right now."

The colonel reddened, then said with an effort, "Of course." He turned to Pola. "If the young lady will accept my deepest regrets..."

They had left the dark garrison walls behind them. It had been a short and silent ten-minute air-taxi ride to the city proper, and now they stood at the deserted blackness of the Institute. It was past midnight.

Pola said, "I don't think I quite understand. You must be very important. It seems silly of me not to know your name. I didn't ever imagine that Outsiders could treat an Earthman so."

Arvardan felt oddly reluctant and yet compelled to end the fiction. "I'm not an Earthman, Pola. I'm an archaeologist from the Sirian Sector."

She turned on him quickly, her face white in the moonlight. For the space of a slow count to ten she said nothing. "Then you outfaced the soldiers because you were safe, after all, and knew it. And I thought--I should have known."

There was an outraged bitterness about her. "I humbly beg your pardon, sir, if at any time today, in my ignorance, I affected any disrespectful familiarity with you--"

"Pola," he cried angrily, "what's the matter? What if I'm not an Earthman? How does that make me different from what I seemed to you to be five minutes ago?"

"You might have told me, sir."

"I'm not asking you to call me 'sir.' Don't be like the rest of them, will you?"

"Like the rest of whom, sir? The rest of the disgusting animals that live on Earth? . . . I owe you a hundred credits."

"Forget it," said Arvardan disgustedly.

"I cannot follow that order. If you'll give me your address, I will send you a money order for the amount tomorrow."

Arvardan was suddenly brutal. "You owe me much more than a hundred credits."

Pola bit her lip and said in lowered tones, "It is the only part of my great debt, sir, that I can repay. Your address?"

"State House, " he flung at her across his shoulder. He was lost in the night. And Pola found herself weeping. Shekt met Pola at the door of his office.

"He's back," he said. "A little thin man brought him."

"Good!" She was having difficulty speaking.

"He asked for two hundred credits. I gave it to him."

"He was to ask for one hundred, but never mind."

She brushed past her father. He said wistfully, "I was terribly worried. The commotions in the neighborhood--I dared not ask; I might have endangered you."

"It's all right. Nothing's happened. . . .Let me sleep here tonight, Father."

But not all her weariness could make her sleep, for something had happened. She had met a man, and he was an Outsider.

But she had his address. She had his address.

10. INTERPRETATION OF EVENTS

They presented a complete contrast, these two Earthmen--one with the greatest semblance of power on Earth, and one with the greatest reality.

Thus the High Minister was the most important Earthman on Earth, the recognized ruler of the planet by direct and definite decree of the Emperor of all the Galaxy--subject, of course, to the orders of the Emperor's Procurator. His Secretary seemed no one at all, really--merely a member of the Society of Ancients, appointed, theoretically, by the High Minister to take care of certain unspecified details, and dismissable, theoretically, at will.

The High Minister was known to all the Earth and was looked up to as the supreme arbiter on matters of Custom. It was he who announced the exemptions to the Sixty and it was he who judged the breakers of ritual, the defiers of rationing and of production schedules, the invaders of restricted territory and so on. The Secretary, on the other hand, was known to nobody, not even by name, except to the Society of Ancients and, of course, to the High Minister himself.

The High Minister had a command of language and made frequent speeches to the people, speeches of high emotional content and copious flow of sentiment. He had fair hair, worn long, and a delicate and patrician countenance. The Secretary, snub-nosed and wry-faced, preferred a short word to a long one, a grunt to a word, and silence to a grunt--at least in public.

It was the High Minister, of course, who had the semblance of power; the Secretary who had the reality. And in the privacy of the High Minister's office that circumstance was quite plain.

For the High Minister was pettishly puzzled and the Secretary coolly indifferent.

"What I don't see," said the High Minister, "is the connection of all these reports you bring me. Reports, reports!" He lifted an arm above his head and struck viciously at an imaginary heap of paper. "I don't have the time for them."

"Exactly," said the Secretary coldly. "It is why you hire me. I read them, digest them, transmit them."

"Well, good Balkis, about your business, then. And quickly, since these are minor matters."

"Minor? Your Excellency may lose a great deal someday if your judgment is not sharpened. . . .Let us see what these reports mean, and I shall then ask you if you still consider them minor. First we have the original report, now seven days old, from Shekt's underling, and it is that which first put me on the trail."

"What trail?"

Balkis's smile was faintly bitter. "May I recall to Your Excellency certain important projects which have been nurtured here on Earth for several years."

"Ssh!" the High Minister, in sudden loss of dignity, could not forbear looking about hastily.

"Your Excellency, it is not nervousness but confidence that will win for us. . . .You know further that the success of this project has depended upon the judicious use of Shekt's little toy, the Synapsifier. Until now, at least as far as we know, it has been utilized under our direction only, and for definite purposes. And now, without warning, Shekt has Synapsified an unknown man, in complete violation of our orders."

"This," said the High Minister, "is a simple matter. Discipline Shekt, take the treated man into custody, and end the matter. "

"No, no. You are far too straightforward, Your Excellency. You miss the point. It is not what Shekt has done, but why he has done so. Note that there exists a coincidence about the matter, one of a considerable series of subsequent coincidences. The Procurator of Earth had visited Shekt that same day, and Shekt himself reported to us, in loyal and trustworthy fashion, all that had passed between them. Ennius had wanted the Synapsifier for Imperial use. He made promise, it seems, of great help and gracious assistance from the Emperor."

"Hmm," said the High Minister.

"You are intrigued? A compromise such as that seems attractive as compared to the dangers attending our present course?. . . Do you remember the promises of food to us during the famine five years ago? Do you? Shipments were refused because we lacked Imperial credits, and Earth-manufactured products would not be accepted, as being radioactively contaminated. Was there a free gift of food as promised? Was there even a loan? A hundred thousand died of starvation. Don't put your trust in Outsider promises."

"But that does not matter. What does is that Shekt made a great display of loyalty. Surely we could never doubt him again. With compounded certainty, we could not suspect him of treason that very day" Yet so it came to pass."

"You mean in this unauthorized experiment, Balkis?"

"I do, Your Excellency. Who was the man treated? We have photographs of him and, with the help of Shekt's technician, retinal patterns. A check with the Planetary Registry shows no record of him. The conclusion must therefore be reached that he is no Earthman, but an Outsider. Furthermore, Shekt must have been aware of it, since a registration card cannot be forged or transferred, if checked with retinal patterns. So, in simple fashion, the unalterable facts lead us to the conclusion that Shekt has Synapsified, knowingly, an Outsider. And why?. . .

"The answer to that may be disturbingly simple. Shekt is not an ideal instrument for our purposes. In his youth he was an Assimilationist; he even once stood for election to the Washenn Council on a platform of conciliation with the Empire. He was defeated, by the way."

The High Minister interrupted. "I didn't know that."

"That he was defeated?"

"No, that he ran. Why wasn't I informed of this? Shekt is a very dangerous man in the position he now holds."

Balkis smiled softly and tolerantly. "Shekt invented the Synapsifier and still represents the one man truly experienced in its operation. He has always been watched,

and will now be watched more closely than ever. Do not forget that a traitor within our ranks, known to us, can do more harm to the enemy than a loyal man can do good to us.

"Now, let us continue to deal with the facts. Shekt has Synapsified an Outsider. Why? There is only one reason why a Synapsifier can possibly be used--to improve a mind. And why that? Because only so can the minds of our scientists, already improved by Synapsification, be overtaken. Eh? This means that the Empire has at least a faint suspicion of what is going on upon Earth. Is that minor, Your Excellency?"

There was a scattered dew on the High Minister's forehead. "Do you really think so?"

"The facts are a jigsaw puzzle that can fit only one way. The Outsider so treated was a man of undistinguished, even contemptible, appearance. A good stroke, too, since a bald and fat old man can still be the Empire's most skilled espionage agent. Oh yes. Yes. Who else could be trusted on a mission such as this? . . . But we have followed this stranger, whose alias, by the way, is Schwartz, as far as we can. Let us take this second file of reports."

The High Minister cast an eye upon them. "The ones concerning Bel Arvardan?"

"Dr. Bel Arvardan," assented Balkis, "eminent archaeologist of the gallant Sirian Sector, those worlds of brave and chivalrous bigots," He spat the last out. Then, "Well, never mind. In any case, we have here a queer mirror image to Schwartz, an almost poetic contrast. He is not unknown, but, instead, a famous figure. He is not a secret intruder, but one who comes floating on a tidal wave of publicity. We are warned of him not by an obscure technician, but by the Procurator of Earth himself."

"Do you think there is a connection, Balkis?"

"Your Excellency may suppose it possible that one may be designed to distract our attention from the other. Or else, since the ruling classes of the Empire are skilled enough in intrigue, we have an example of two methods of camouflage. In the case of Schwartz, the lights are put out. In the case of Arvardan, the lights are flashed in our eyes. In neither case are we intended to see anything? . . . Come, of what did Ennius warn us concerning Arvardan?"

The High Minister rubbed his nose thoughtfully. . . . Arvardan, he said, was on an archaeological expedition under Imperial sponsorship and wished to enter the Forbidden Areas for scientific purposes. No sacrilege, he said, was intended, and if we could stop him in gentle fashion, he would back our action to the Imperial Council. Something like that. "

"So then we will watch Arvardan closely, but for what purpose? Why, to see that he makes no unauthorized entry into the Forbidden Areas. Here's the head of an archaeological expedition without men, ships, or equipment. Here's an Outsider who does not remain at Everest, where he belongs, but wanders about Earth; for some reason--and goes to Chica first. And how is our attention distracted from all these most curious and suspicious circumstances? Why, by urging us to watch carefully something that is of no importance.

"But notice, Your Excellency, that Schwartz was kept hidden in the Institute for Nuclear Research for six days. And then he escaped. Isn't that strange? The door, suddenly, wasn't locked. The corridor, suddenly, wasn't guarded. What queer negligence. And on what day was it that he escaped? Why, on the same day that Arvardan arrived at Chica. A second peculiar coincidence."

"You think, then. . . " said the High Minister tensely.

"I think that Schwartz is the Outsider agent on Earth, that Shekt is the contact man with the Assimilationist traitors among us, and that Arvardan is the contact man with the Empire. Observe the skill with which the meeting between Schwartz and Arvardan was arranged. Schwartz is allowed to escape, and after an appropriate interval his nurse-- Shekt's daughter, by a not-too-surprising additional coincidence--is out after him. If anything were to go wrong with their split-second timetable, it is obvious that she would have found him suddenly; that he would have become a poor, sick patient for the benefit of anyone's curiosity; that he would have been brought back to safety for another attempt later. In fact, two overcurious cabbies were told that he was a sick man, and that, ironically enough, backfired upon them.

"Follow it closely, now. Schwartz and Arvardan meet first in a Foodomat. They are, apparently, unaware of each other's existence. It is a preliminary meeting, designed, simply, to indicate that all has gone well so far and that the next step may be taken. . . .At least they don't underestimate us, which is gratifying.

"Then Schwartz leaves; a few minutes later Arvardan leaves and the Shekt girl meets him. It is stop-watch timing. Together, after playing a little part for the benefit of the afore-mentioned cabbies, they head for the Dunham department store, and now all three are together. Where else but a department store? It is an ideal meeting place. It has a secrecy no cave in the mountains could duplicate. Too open to be suspected. Too crowded to be stalked. Wonderful--wonderful--I give credit to my opponent."

The High Minister writhed in his chair. "If our opponent deserves too much credit, he will win."

"Impossible. He is already defeated. And in that respect we must give credit to the excellent Natter."

"And who is Natter?"

"An insignificant agent who must be used to the limit after this. His actions yesterday could not have been improved upon. His long-range assignment has been to watch Shekt. For the purpose, he keeps a fruit stand across the street from the Institute. For the last week he has been specifically instructed to watch the development of the Schwartz affair.

"He was on hand when the man, known to him through photographs and through a glimpse at the time he was first brought to the Institute, escaped, He observed every action, himself unobserved, and it is his report that details yesterday's events. With incredible intuition, he decided that the entire purpose of the 'escape' was to arrange a meeting with Arvardan. He felt himself to be not in a position, single-handed, to exploit that meeting, so he decided to prevent it. The cabbies, to whom the Shekt girl had

described Schwartz as being sick, speculated on Radiation Fever. Natter seized on that with the swiftness of genius. As soon as he observed the meeting in the department store, he reported the case of fever and the local authorities at Chica were, praised be Earth, intelligent enough to co-operate quickly.

"The store was emptied, and the camouflage which they counted upon to hide their conversation was stripped from them. They were alone and very conspicuous in the store. Natter went further. He approached them and talked them into allowing him to escort Schwartz back to the Institute. They agreed. What could they do? . . . So that the day ended without a single word passing between Arvandan and Schwartz.

"Nor did he commit the folly of arresting Schwartz. The two are still in ignorance of their detection and will yet lead us to bigger game

"And Natter went further still. He notified the Imperial garrison, and that is beyond praise. It presented Arvandan with a situation he could not possibly have counted upon. He must either reveal himself to be an Outsider and destroy his usefulness, which apparently depends upon conducting himself upon Earth as though he were an Earthman, or he must keep the fact secret and subject himself to whatever unpleasantness might result. He took the more heroic alternative, and even broke the arm of an officer of the Empire, in his passion for realism. That, at least, must be remembered in his favor.

"It is significant that his actions were as they were. Why should he, an Outsider, expose himself to the neuronc whip for an Earthgirl if the matter at stake was not supremely important?"

Both fists of the High Minister were on the desk before him. He glowered savagely, the long, smooth lines of his face crumpled in distress. "It is well for you, Balkis, from such meager details, to construct the spider web you do. It is skillfully done, and I feel that it is as you say. Logic leaves us no other alternative. . . .But it means that they are too close, Balkis. They are too close. . . .And they will have no mercy this time."

Balkis shrugged. "They cannot be too close, or, in a case of such potential destructiveness for all the Empire, they would have already struck. . . .And their time is running short. Arvandan must still meet with Schwartz if anything is to be accomplished, and so I can predict for you the future."

"Do so--do so."

"Schwartz must be sent away now and events allowed to quiet down from their current high pitch."

"But where will he be sent?"

"We know that too. Schwartz was brought to the Institute by a man, obviously a farmer. Descriptions reached us from both Shekt's technician and from Natter. We went through the registration data of every farmer within sixty miles of Chica, and Natter identified one Arbin Maren as the man. The technician supported that decision independently. We investigated the man quietly, and it seems that is is supporting a father-in-law, a helpless cripple. in evasion of the Sixty."

The High Minister pounded the table. "Such cases are entirely too frequent, Balkis. The laws must be tightened--"

"It is not now the point, Your Excellency. What is important is the fact that since the farmer is violating the customs, he can be blackmailed."

"Oh. . . "

"Shekt, and his Outsider allies, need a tool for just such a case--that is, where Schwartz must remain in seclusion for a longer period than he can safely stay hidden in the Institute. This farmer, probably helpless and innocent, is perfect' for the purpose. Well, he will be watched. Schwartz will never be out of sight. . . .Now, eventually another meeting between him and Arvardan will have to be arranged, and that time we will be prepared. Do you understand everything now?"

"I do."

"Well, praise Earth. Then I will leave you now." And, with a sardonic smile, he added, "With your permission, of course. "

And the High Minister, completely oblivious to the sarcasm, waved a hand in dismissal.

The Secretary, on his way to his own small office, was alone, and, when alone, his thoughts sometimes escaped from beneath his firm control and disported themselves in the secrecy of his mind.

They concerned themselves very little with Dr. Shekt, Schwartz, Arvardan--least of all with the High Minister.

Instead there was the picture of a planet, Trantor--from whose huge, planet-wide metropolis all the Galaxy was ruled. And there was the picture of a palace whose spires and sweeping arches he had never seen in reality; that no other Earthman had ever seen. He thought of the invisible lines of power and glory that swept from sun to sun in gathering strings, ropes, and cables to that central palace and to that abstraction, the Emperor, who was, after all, merely a man.

His mind held that thought fixedly--the thought of that power which could alone bestow a divinity during life--concentrated in one who was merely human.

Merely human! Like himself!

He could be—

11. THE MIND THAT CHANGED

The coming of the change was dim in Joseph Schwartz's mind. Many times, in the absolute quiet of the night--how much more quiet the nights were now; were they ever noisy and bright and clanging with the life of energetic millions? --in the new quiet, he traced it back. He would have liked to say that here, here was the moment.

There was first that old, shattering day of fear when he was alone in a strange world--a day as misty in his mind now as the memory of Chicago itself. There was the trip to Chica, and its strange, complicated ending. He thought of that often.

Something about a machine--pills he had taken. Days of recuperation and then the escape, the wandering, the inexplicable events that last hour in the department store. He couldn't possibly remember that part correctly. Yet, in the two months since, how clear everything was, how unfaulted his memory.

Even then things had begun to seem strange. He had been sensitive to atmosphere. The old doctor and his daughter had been uneasy, even frightened. Had he known that then? Or had it just been a fugitive impression, strengthened by the hindsight of his thoughts since?

But then, in the department store, just before that big man had reached out and trapped him--just before that--he had become conscious of the coming snatch. The warning had not been soon enough to save him, but it was a definite indication of the change.

And, since then, the headaches. No, not quite headaches. Throbbings, rather, as though some hidden dynamo in his brain had started working and, with its unaccustomed action, was vibrating every bone of his skull. There had been nothing like it in Chicago--supposing his fantasy of Chicago had meaning--or even during his first few days here in reality.

Had they done something to him that day in Chica? The machine? The pills--that had been anesthetic. An operation? And his thoughts, having reached that point for the hundredth time, stopped once more.

He had left Chica the day after his abortive escape, and now the days passed easily.

There had been Grew in his wheel chair, repeating words and pointing, or making motions, just as the girl, Pola, had done before him. Until one day Grew stopped speaking nonsense and began talking English. Or no, he himself--he, Joseph Schwartz--had stopped speaking English and had begun talking nonsense. Except that it wasn't nonsense, any more.

It was so easy. He learned to read in four days. He surprised himself. He had had a phenomenal memory once, in Chicago, or it seemed to him that he had. But he had not been capable of such feats. Yet Grew did not seem surprised.

Schwartz gave it up.

Then, when the autumn had become really golden, things were clear again, and he was out in the fields working. It was amazing, the way he picked it up. There it was again--he never made a mistake. There were complicated machines that he could run without trouble after a single explanation.

He waited for the cold weather and it never quite came. The winter was spent in clearing ground, in fertilizing, in preparing for the spring planting in a dozen ways.

He questioned Grew, tried to explain what snow was, but the latter only stared and said, "Frozen water falling like rain, eh? Oh! The word for that is snow! I understand it does that on other planets but not on Earth."

Schwartz watched the temperature thereafter and found that it scarcely varied from day to day--and yet the days shortened, as would be expected from a northerly location, say as northerly as Chicago. He wondered if he was on Earth.

He tried reading some of Grew's book films but gave up. People were people still, but the minutiae of daily life, the knowledge of which was taken for granted, the historical and sociological allusions that meant nothing to him, forced him back.

The puzzles continued. The uniformly warm rains, the wild instructions he received to remain away from certain regions. For instance, there had been the evening that he had finally become too intrigued by the shining horizon, the blue glow to the south. . .

He had slipped off after supper, and when not a mile had passed, the almost noiseless whir of the biwheel engine came up behind him and Arbin's angry shout rang out in the evening air. He had stopped and had been taken back.

Arbin had paced back and forth before him and had said, "You must stay away from anywhere that it shines at night."

Schwartz had asked mildly, "Why?"

And the answer came with biting incision, "Because it is forbidden." A long pause, then, "You really don't know what it's like out there, Schwartz?"

Schwartz spread his hands.

Arbin said, "Where do you come from? Are you an--an Outsider?"

"What's an Outsider?"

Arbin shrugged and left.

But that night had had a great importance for Schwartz, for it was during that short mile toward the shiningness that the strangeness in his mind had coalesced into the Mind Touch. It was what he called it, and the closest he had come, either then or thereafter, to describing it.

He had been alone in the darkling purple. His own footsteps against the springy pavement were muted. He hadn't seen anybody. He hadn't heard anybody. He hadn't touched anything.

Not exactly. . . It had been something like a touch, but not anywhere on his body. It was in his mind. . . .Not exactly a touch, but a presence--a somethingness there like a velvety tickle.

Then there had been two--two touches, distinct, apart. And the second--how could he tell them apart?--had grown louder (no, that wasn't the right word) ; it had grown distincter, more definite.

And then he knew it was Arbin. He knew it five minutes, at least, before he caught the sound of the biwheel, ten minutes before he laid eyes on Arbin.

Thereafter it occurred again and again with increasing frequency.

It began to dawn on him that he always knew when Arbin, Loa, or Grew was within a hundred feet of himself, even when he had no reason for knowing, even when he had every reason to suppose the opposite. It was a hard thing to take for granted, yet it began to seem so natural.

He experimented, and found that he knew exactly where any of them were, at any time. He could distinguish between them, for the Mind Touch differed from person to person. Not once had he the nerve to mention it to the others.

And sometimes he would wonder what that first Mind Touch on the road to the Shiningness had been. It had been neither Arbin, Loa, nor Grew. Well? Did it make a difference?

It did later. He had come across the Touch again, the same one, when he brought in the cattle one evening. He came to Arbin then and said :

"What about that patch of woods past the South Hills, Arbin?"

"Nothing about it," was the gruff answer. "It's Ministerial Ground."

"What's that?"

Arbin seemed annoyed. "It's of no importance to you, is it? They call it Ministerial Ground because it is the property of the High Minister."

"Why isn't it cultivated?"

"It's not intended for that." Arbin's voice was shocked. "It was a great Center. In ancient days. It is very sacred and must not be disturbed. Look, Schwartz, if you want to remain here safely, curb your curiosity and tend to your job."

"But if it's so sacred, then nobody can live there?"

"Exactly. You're right."

"Are you sure?"

"I'm sure. . . .And you're not to trespass. It will mean the end for you."

"I won't."

Schwartz walked away, wondering and oddly uneasy. It was from that wooded ground that the Mind Touch came, quite powerfully, and now something additional had been added to the sensation. It was an unfriendly Touch, a threatening Touch.

Why? Why?

And still he dared not speak. They would not have believed him, and something unpleasant would happen to him as a consequence. He knew that too. He knew too much, in fact.

He was younger these days, also. Not so much in the physical sense, to be sure. He was thinner in his stomach and broader in his shoulders. His muscles were harder and

springier and his digestion was better. That was the result of work in the open. But it was something else he was chiefly conscious of. It was his way of thinking.

Old men tend to forget what thought was like in their youth; they forget the quickness of the mental jump, the daring of the youthful intuition, the agility of the fresh insight. They become accustomed to the more plodding varieties of reason, and because this is more than made up by the accumulation of experience, old men think themselves wiser than the young.

But to Schwartz experience remained, and it was with a sharp delight that he found he could understand things at a bound, that he gradually progressed from following Arbin's explanations to anticipating them, to leaping on ahead. As a result, he felt young in a far more subtle way than any amount of physical excellence could account for.

Two months passed, and it all came out--over a game of chess with Grew in the arbor.

Chess, somehow, hadn't changed, except for the names of the pieces. It was as he remembered it, and therefore it was always a comfort to him. At least, in this one respect, his poor memory did not play him false.

Grew told him of variations of chess. There was fourhanded chess, in which each player had a board, touching each other at the corners, with a fifth board filling the hollow in the center as a common No Man's Land. There were three-dimensional chess games in which eight transparent boards were placed one over the other and in which each piece moved in three dimensions as they formerly moved in two, and in which the number of pieces and pawns were doubled, the win coming only when a simultaneous check of both enemy kings occurred. There were even the popular varieties, in which the original position of the chessmen were decided by throws of the dice, or where certain squares conferred advantages or disadvantages to the pieces upon them, or where new pieces with strange properties were introduced.

But chess itself, the original and unchangeable, was the same--and the tournament between Schwartz and Grew had completed its first fifty games.

Schwartz had a bare knowledge of the moves when he began, so that he lost constantly in the first games. But that had changed and losing games were becoming rarer. Gradually Grew had grown slow and cautious, had taken to smoking his pipe into glowing embers in the intervals between moves, and had finally subsided into rebellious and querulous losses.

Grew was White and his pawn was already on King 4.

"Let's go," he urged sourly. His teeth were clamped hard on his pipe and his eyes were already searching the board tensely.

Schwartz took his seat in the gathering twilight and sighed. The games were really becoming uninteresting as more and more he became aware of the nature of Grew's moves before they could be made. It was as if Grew had a misty window in his skull. And the fact that he himself knew, almost instinctively, the proper course of chess play to take was simply of a piece with the rest of his problem.

They used a "night-board," one that glowed in the darkness in a checkered blue-and-orange glimmer. The pieces, ordinary lumpish figures of a reddish clay in the sunlight, were metamorphosed at night. Half were bathed in a creamy whiteness that lent them the look of cold and shining porcelain, and the others sparked in tiny glitters of red.

The first moves were rapid. Schwartz's own King's Pawn met the enemy advance head on. Grew brought out his King's Knight to Bishop 3; Schwartz countered with Queen's Knight to Bishop 3. Then the White Bishop leaped to Queen's Knight 5, and Schwartz's Queen's Rook's Pawn slid ahead a square to drive it back to Rook 4. He then advanced his other Knight to Bishop 3.

The shining pieces slid across the board with an eery volition of their own as the grasping fingers lost themselves in the night.

Schwartz was frightened. He might be revealing insanity, but he had to know. He said abruptly, "Where am I?"

Grew looked up in the midst of a deliberate move of his Queen's Knight to Bishop 3 and said, "What?"

Schwartz didn't know the word for "country," or "nation." He said, "What world is this?" and moved his Bishop to King 2.

"Earth," was the short reply, and Grew castled with great emphasis, first the tall figurine that was the King, moving, and then the lumpish Rook topping it and resting on the other side.

That was a thoroughly unsatisfactory answer. The word Grew had used Schwartz translated in his mind as "Earth." But what was "Earth"? Any planet is "Earth" to those that live on it. He advanced his Queen's Knight's Pawn two spaces, and again Grew's Bishop had to retreat, to Knight 3 this time. Then Schwartz and Grew, each in turn, advanced the Queen's Pawn one space, each freeing his Bishop for the battle in the center that was soon to begin.

Schwartz asked, as calmly and casually as he could, "What year is this?" He castled.

Grew paused. He might have been startled. "What is it you're harping on today? Don't you want to play? If it will make you happy, this is 827." He added sarcastically, "G.E." He stared frowningly at the board, then slammed his Queen's Knight to Queen 5, where it made its first assault.

Schwartz dodged quickly, moving his own Queen's Knight to Rook 4 in counterattack. The skirmish was on in earnest. Grew's Knight seized the Bishop, which leaped upward in a bath of red fire to be dropped with a sharp click into the box where it might lie, a buried warrior, until the next game. And then the conquering Knight fell instantly to Schwartz's Queen. In a moment of overcaution, Grew's attack faltered and he moved his remaining Knight back to the haven of King 1, where it was relatively useless. Schwartz's Queen's Knight now repeated the first exchange, taking the Bishop and falling prey in its turn to the Rook's Pawn.

Now another pause, and Schwartz asked mildly, "What's G.E.?"

"What?" demanded Grew bad-humoredly. "Oh--you mean you're still wondering what year this is? Of all the fool--Well, I keep forgetting you just learned to talk a month

or so ago. But you're intelligent. Don't you really know? Well, it's 827 of the Galactic Era. Galactic Era: G.E.--see? It's 827 years since the foundation of the Galactic Empire; 827 years since the coronation of Frankenn the First. Now, please, it's your move."

But the Knight that Schwartz held was swallowed up in the grip of his hand for the moment. He was in a fury of frustration. He said, "Just one minute," and put the Knight down on Queen 2. "Do you recognize any of these names? America, Asia, the United States, Russia, Europe--" He groped for identification.

In the darkness Grew's pipe was a sullen red glow and the dim shadow of him hunched over the shining chessboard as if it had the less life of the two. He might have shaken his head curtly, but Schwartz could not see that. He didn't have to. He sensed the other's negation as clearly as though a speech had been delivered.

Schwartz tried again. "Do you know where I can get a map?"

"No maps," growled Grew, "unless you want to risk your neck in Chica. I'm no geographer. I never heard of the names you mention, either. What are they? People?"

Risk his neck? Why that? Schwartz felt the coldness gather. Had he committed a crime? Did Grew know about it?

He asked doubtfully, "The sun has nine planets, hasn't it?"

"Ten," was the uncompromising answer.

Schwartz hesitated. Well, they might have discovered another that he hadn't heard about. But then why should Grew have heard about it? He counted on his fingers, and then, "How about the sixth planet? Has it got rings?"

Grew was slowly moving the King's Bishop's Pawn forward two squares, and Schwartz instantly did the same.

Grew said, "Saturn, you mean? Of course it has rings." He was calculating now. He had the choice of taking either the Bishop's Pawn or the King's Pawn, and the consequences of the choice were not too clear.

"And is there an asteroid belt--little planets--between Mars and Jupiter? I mean between the fourth and fifth planets?"

"Yes," mumbled Grew. He was relighting his pipe and thinking feverishly. Schwartz caught that agonized uncertainty and was annoyed at it. To him, now that he was sure of Earth's identity, the chess game was less than a trifle. Questions quivered along the inner surface of his skull, and one slipped out.

"Your book films are real, then? There are other worlds? With people?"

And now Grew looked up from the board, eyes probing uselessly in the darkness. "Are you serious?"

"Are there?"

"By the Galaxy! I believe you really don't know."

Schwartz felt humiliated in his ignorance. "Please--"

"Of course there are worlds. Millions of them! Every star you see has worlds, and most of those you don't see. It's all part of the Empire."

Delicately, inside, Schwartz felt the faint echo of each of Grew's intense words as they sparked directly from mind to mind. Schwartz felt the mental contacts growing

stronger with the days. Maybe, soon, he could hear those tiny words in his mind even when the person thinking them wasn't talking.

And now, for the first time, he finally thought of an alternative to insanity. Had he passed through time, somehow? Slept through, perhaps?

He said huskily, "How long since it's all happened, Grew? How long since the time when there was only one planet?"

"What do you mean?" He was suddenly cautious. "Are you a member of the Ancients?"

"Of the what? I'm not a member of anything, but wasn't Earth once the only planet? . . . Well, wasn't it?"

"The Ancients say so," said Grew grimly, "but who knows? Who really knows? The worlds up there have been existing all history long as far as I know."

"But how long is that?"

"Thousands of years, I suppose. Fifty thousand, a hundred --I can't say."

Thousands of years! Schwartz felt a gurgle in his throat and pressed it down in panic. All that between two steps? A breath, a moment, a flicker of time--and he had jumped thousands of years? He felt himself shrinking back to amnesia. His identification of the Solar System must have been the result of imperfect memories penetrating the mist.

But now Grew was making his next move--he was taking the other's Bishop's Pawn, and it was almost mechanically that Schwartz noted mentally the fact that it was the wrong choice. Move fitted to move now with no conscious effort. His King's Rook swooped forward to take the foremost of the now-doubled White Pawns. White's Knight advanced again to Bishop 3. Schwartz's Bishop moved to Knight 2, freeing itself for action. Grew followed suit by moving his own Bishop to Queen 2.

Schwartz paused before launching the final attack. He said, "Earth is boss, isn't it?"

"Boss of what?"

"Of the Emp--"

But Grew looked up with a roar at which the chessmen quivered. "Listen, you, I'm tired of your questions. Are you a complete fool? Does Earth look as if it's boss of anything?" There was a smooth whir as Grew's wheel chair circled the table. Schwartz felt grasping fingers on his arm.

"Look! Look there!" Grew's voice was a whispered rasp. "You see the horizon? You see it shine?"

"Yes."

"That is Earth--all Earth. Except here and there, where a few patches like this one exist."

"I don't understand."

"Earth's crust is radioactive. The soil glows, always glowed, will glow forever. Nothing can grow. No one can live--You really didn't know that? Why do you suppose we have the Sixty?"

The paralytic subsided. He circled his chair about the table again. "It's your move."

The Sixty! Again a Mind Touch with an indefinable aura of menace. Schwartz's chess pieces played themselves, while he wondered about it with a tight-pressed heart. His King's Pawn took the opposing Bishop's Pawn. Grew moved his Knight to Queen 4 and Schwartz's Rook side-stepped the attack to Knight 4. Again Grew's Knight attacked, moving to Bishop 3, and Schwartz's Rook avoided the issue again to Knight 5. But now Grew's King's Rook's Pawn advanced one timorous square and Schwartz's Rook slashed forward. It took the Knight's Pawn, checking the enemy King. Grew's King promptly took the Rook, but Schwartz's Queen plugged the hole instantly, moving to Knight 4 and checking. Grew's King scurried to Rook 1, and Schwartz brought up his Knight, placing it on King 4. Grew moved his Queen to King 2 in a strong attempt to mobilize his defenses, and Schwartz countered by marching his Queen forward two squares to Knight 6, so that the fight was now in close quarters. Grew had no choice; he moved his Queen to Knight 2, and the two female majesties were now face to face. Schwartz's Knight pressed home, taking the opposing Knight on Bishop 6, and when the now-attacked White Bishop moved quickly to Bishop 3, the Knight followed to Queen 5. Grew hesitated for slow minutes, then advanced his outflanked Queen up the long diagonal to take Schwartz's Bishop.

Then he paused and drew a relieved breath. His sly opponent had a Rook in danger with a check in the offing and his own Queen ready to wreak havoc. And he was ahead a Rook to a Pawn.

"Your move," he said with satisfaction.

Schwartz said finally, "What--what is the Sixty?"

There was a sharp unfriendliness to Grew's voice. "Why do you ask that? What are you after?"

"Please," humbly. He had little spirit left in him. "I am a man with no harm in me. I don't know who I am or what happened to me. Maybe I'm an amnesia case."

"Very likely," was the contemptuous reply. "Are you escaping from the Sixty? Answer truthfully."

"But I tell you I don't know what the Sixty is!"

It carried conviction. There was a long silence. To Schwartz, Grew's Mind Touch was ominous, but he could not, quite, make out words.

Grew said slowly, "The Sixty is your sixtieth year. Earth supports twenty million people, no more. To live, you must produce. If you cannot produce, you cannot live. Past Sixty--you cannot produce."

"And so. . ." Schwartz's mouth remained open.

"You're put away. It doesn't hurt."

"You're killed?"

"It's not murder," stiffly. "It must be that way. Other worlds won't take us, and we must make room for the children some way. The older generation must make room for the younger."

"Suppose you don't tell them you're sixty?"

"Why shouldn't you? Life after sixty is no joke. . . .And there's a Census every ten years to catch anyone who is foolish enough to try to live. Besides, they have your age on record."

"Not mine." The words slipped out, Schwartz couldn't stop them. "Besides, I'm only fifty--next birthday."

"It doesn't matter. They can check by your bone structure. Don't you know that? There's no way of masking it. They'll get me next time. . . .Say, it's your move."

Schwartz disregarded the urging. "You mean they'll--"

"Sure, I'm only fifty-five, but look at my legs. I can't work, can I? There are three of us registered in our family, and our quota is adjusted on a basis of three workers. When I had the stroke I should have been reported, and then the quota would have been reduced. But I would have gotten a premature Sixty, and Arbin and Loa wouldn't do it. They're fools, because it has meant hard work for them--till you came along. And they'll get me next year, anyway. . . . Your move."

"Is next year the Census?"

"That's right....Your move."

"Wait!" urgently. "Is everyone put away after sixty? No exceptions at all?"

"Not for you and me. The High Minister lives a full life, and members of the Society of Ancients; certain scientists or those performing some great service. Not many qualify. Maybe a dozen a year. . . .It's your move!"

"Who decides who qualifies?"

"The High Minister, of course. Are you moving?"

But Schwartz stood up. "Never mind. It's checkmate in five moves. My Queen is going to take your Pawn to check you; you've got to move to Knight 1; I bring up the Knight to check you at King 2; you must move to Bishop 2; my Queen checks you at King 6; you must move to Knight 2; my Queen goes to Knight 6, and when you're then forced to Rook 1, my Queen mates you at Rook 6.

"Good game," he added automatically.

Grew stared long at the board, then, with a cry, dashed it from the table. The gleaming pieces rolled dejectedly about on the lawn.

"You and your damned distracting chatter," yelled Grew.

But Schwartz was conscious of nothing. Nothing except the overwhelming necessity of escaping the Sixty. For though Browning said: "Grow old along with me! The best is yet to be. . . .", that was in an Earth of teeming billions and of unlimited food. The best that was now to be was the Sixty--and death.

Schwartz was sixty-two.

Sixty-two. . .

12. THE MIND THAT KILLED

It worked out so neatly in Schwartz's methodical mind. Since he did not want to die, he would have to leave the farm. If he stayed where he was, the Census would come, and with it, death.

Leave the farm, then. But where would he go?

There was the--what was it, a hospital?--in Chica. They had taken care of him before. And why? Because he had been a medical "case." But wasn't he still a case? And he could talk now; he could give them the symptoms, which he couldn't before. He could even tell them about the Mind Touch.

Or did everyone have the Mind Touch? Was there any way he could tell? . . . None of the others had it. Not Arbin or Loa or Grew. He knew that. They had no way of telling where he was unless they saw or heard him. Why, he couldn't beat Grew in chess if Grew could--

Wait, now, chess was a popular game. And it couldn't be played if people had the Mind Touch. Not really.

So that made him a peculiarity--a psychological specimen. It might not be a particularly gay life, being a specimen, but it would keep him alive,

And suppose one considered the new possibility that had just arisen. Suppose he were not an amnesiac but a man who had stumbled through time. Why, then, in addition to the Mind Touch, he was a man from the past. He was a historical specimen, an archaeological specimen; they couldn't kill him.

If they believed him.

Hmm, if they believed him.

That doctor would believe. He had needed a shave that morning Arbin took him to Chica. He remembered that very well. After that his hair never grew, so they must have done something to him. That meant that the doctor knew that he--he, Schwartz--had had hair on his face. Wouldn't that be significant? Grew and Arbin never shaved. Grew had once told him that only animals had hair on their face.

So he had to get to the doctor.

What was his name? Shekt?. . . Shekt, that was right.

But he knew so little of this horrible world. To leave by night or cross-country would have entangled him in mysteries, would have plunged him into radioactive danger pockets of which he knew nothing. So, with the boldness of one with no choice, he struck out upon the highway in the early afternoon.

They wouldn't be expecting him back before suppertime, and by that time he would be well away. They would have no Mind Touch to miss.

For the first half hour he experienced a feeling of elation, the first such sensation he had had since all this had started. He was finally doing something; he was making an

attempt to fight back at his environment. Something with a purpose, and not mere unreasoning flight as that time in Chica.

Ah, for an old man he wasn't bad. He'd show them.

And then he stopped--He stopped in the middle of the highway, because something obtruded itself upon his notice, something he had forgotten.

There was the strange Mind Touch, the unknown Mind Touch; the one he had detected first when he had tried to reach the shining horizon and had been stopped by Arbin; the one that had been watching from the Ministerial Ground.

It was with him now--behind him and watching.

He listened closely--or, at least, he did that which was the equivalent of listening with regard to the Mind Touch. It came no closer, but it was fastened upon himself. It had within it watchfulness and enmity, but not desperation.

Other things became clear. The follower must not lose sight of him, and the follower was armed.

Cautiously, almost automatically, Schwartz turned, picking apart the horizon with eager eyes.

And the Mind Touch changed instantly.

It became doubtful and cautious, dubious as to its own safety, and the success of its own project, whatever that was. The fact of the follower's weapons became more prominent, as though he were speculating upon using it if trapped.

Schwartz knew that he himself was unarmed and helpless. He knew that the follower would kill him rather than allow him to get out of sight; kill him at the first false move. . . .And he saw no one.

So Schwartz walked on, knowing that his follower remained close enough to kill him. His back was stiff in the anticipation of he knew not what. How does death feel? . . . How does death feel? . . . The thought jostled him in time to his steps, jounced in his mind, jiggled in his subconscious, until it went nearly past endurance.

He held onto the follower's Mind Touch as the one salvation. He would detect that instant's increase in tension that would mean that a weapon was being leveled, a trigger being pulled, a contact being closed. At that instant he would drop, he would run.

But why? If it were the Sixty, why not kill him out of hand?

The time-slip theory was fading out in his mind; amnesia again. He was a criminal, perhaps-a dangerous man, who must be watched. Maybe he had once been a high official, who could not be simply killed but must be tried. Perhaps his amnesia was the method used by his unconscious to escape the realization of some tremendous guilt.

And so now he was walking down an empty highway toward a doubtful destination, with death walking at his back.

It was growing dark, and the wind had a dying chill to it. As usual, it didn't seem right. Schwartz judged it to be December, and certainly sunset at four-thirty was right for it, but the wind's chill was not the iciness of a midwestern winter.

Schwartz had long decided that the reason for the prevalent mildness was that the planet (Earth?) did not depend on the sun entirely for its heat. The radioactive soil itself gave off heat, small by the square foot but huge by the million square miles.

And in the darkness the follower's Mind Touch grew nearer. Still attentive, and keyed up to a gamble. In the darkness, following was harder. He had followed him that first night--toward the shiningness. Was he afraid to take the risk again?

"Hey! Hey, fella--"

It was a nasal, high-pitched voice. Schwartz froze.

Slowly, in one piece, he turned around. The small figure coming up to him waved its hand, but in the sunless time of day he could not make it out clearly. It approached, unhurrying. He waited.

"Hey, there. Glad to see you. It ain't much fun beating it along the road without company. Mind if I go along with you?"

"Hello," said Schwartz dully. It was the correct Mind Touch. It was the follower. And the face was familiar. It belonged to that hazy time, in Chica.

And then the follower gave every sign of recognition. "Say, I know you. Sure! . . . Don't you remember me?"

It was impossible for Schwartz to say whether under ordinary conditions, in another time, he might or might not have believed the other to be sincere. But now how could he avoid seeing that thin, ragged layer of synthetic recognition that overlay the deep currents of a Touch that told him--shouted at him--that the little man with the very sharp eyes had known him from the start? Knew him and had a death weapon ready for him, if necessary.

Schwartz shook his head.

"Sure," insisted the little man. "It was in the department store. I got you away from that mob." He seemed to double up in artificial laughter. "They thought you had Radiation Fever. You remember."

Schwartz did, too, vaguely--dimly. A man like this, for a few minutes, and a crowd, which had first stopped them and then parted for them.

"Yes," he said. "Pleased to meet you." It wasn't very brilliant conversation, but Schwartz could do no better, and the little man did not seem to mind.

"My name's Natter," he said, shoving out a limp hand at the other. "I didn't get a chance to talk much with you that first time--overlooked it in the crisis of things, you might say--but I'm sure glad to get a second chance. . . .Let's have the mitt."

"I'm Schwartz." And he touched palms with the other, briefly.

"How come you're walking?" asked Natter. "Going somewheres?"

Schwartz shrugged. "Just walking."

"A hiker, huh? That's for me too. All year round I'm on the road--puts the old kibosh on the grummies."

"What?"

"You know. Makes you full of life. You get to breathe that air and feel the blood pumping, hey?. . . Walked too far this time. Hate to get back after night by my lonesome. Always glad for the company. Where you going?"

It was the second time Natter had asked the question, and the Mind Touch made plain the importance attached to it. Schwartz wondered how long he could evade the issue. There was a questing anxiety in the follower's mind. And no lie would do. Schwartz didn't know enough about this new world to lie.

He said, "I'm going to the hospital."

"The hospital? What hospital?"

"I was there when I was in Chica."

"You mean the Institute. Ain't that it? That's where I took you before, that time in the department store, I mean." Anxiety and increasing tension.

"To Dr. Shekt," said Schwartz. "Do you know him?"

"I've heard of him. He's a big shot. Are you sick?"

"No, but I'm supposed to report once in a while." Did that sound reasonable?

"Walking?" said Natter. "Doesn't he send a car for you?" Apparently it did not seem reasonable.

Schwartz said nothing now--a clammy silence.

Natter, however, was buoyant. "Look here, chum, soon's I pass a public Communi-wave, I'll order a taxi from the city. It'll meet us on the road."

"A Communi-wave?"

"Sure. They have 'em all along the highway. See, there's one."

He took a step away from Schwartz, and the latter found himself in a sudden shriek. "Stop! Don't move."

Natter stopped. There was a queer coldness in his expression as he turned.

"What's eating you, bud?"

Schwartz found the new language almost inadequate for the rapidity with which he hurled words at the other. "I'm tired of this acting. I know you, and I know what you're going to do. You're going to call somebody to tell them I'm going to Dr. Shekt. They'll be ready for me in the city and they'll send out a car to pick me up. And you'll kill me if I try to get away."

There was a frown on Natter's face. He muttered, "You're sure right on the gizzbo with that last--" It was not intended for Schwartz's ears, nor did it reach them, but the words rested lightly on the very surface of his Mind Touch.

Aloud he said, "Mister, you've got me confused. You're shoving a fast one right past my nose." But he was making room, and his hand was drifting toward his hip.

And Schwartz lost control of himself. He waved his arms in a wild fury. "Leave me alone, why don't you? What have I done to you?. . . Go away! Go away!"

He ended in a voice-cracked shriek, his forehead ridged with hate and fear of the creature who stalked him and whose mind was so alive with enmity. His own emotions heaved and thrust at the Mind Touch, attempting to evade the clingingness of it, rid itself of the breath of it.

And it was gone. Suddenly and completely gone. There had been the momentary consciousness of overwhelming pain--not in himself, but in the other--then nothing. No Mind Touch. It had dropped away like the grip of a fist growing lax and dead.

Natter was a crumpled smear on the darkening highway. Schwartz crept toward him. Natter was a little man, easy to turn over. The look of agony on his face might have been stamped on, deeply, deeply. The lines remained, did not relax. Schwartz felt for the heartbeat and did not find it.

He straightened in a deluge of self-horror.

He had murdered a man!

And then a deluge of amazement--

Without touching him! He had killed this man just by hating him, by striking somehow at the Mind Touch.

What other powers did he have? He made a quick decision. He searched the other's pockets and found money. Good! He could use that. Then he dragged the corpse into the fields and let the high grass cover it.

He walked on for two hours. No other Mind Touch disturbed him.

He slept in an open field that night, and the next morning, after two hours more, reached the outskirts of Chica.

Chica was only a village to Schwartz, and by comparison with the Chicago he remembered, the motion of the populace was still thin and sporadic. Even so, the Mind Touches were for the first time numerous. They amazed and confused him.

So many! Some drifting and diffuse; some pointed and intense. There were men who passed with their minds popping in tiny explosions; others with nothing inside their skulls but, perhaps, a gentle rumination on the breakfast just completed.

At first Schwartz turned and jumped with every Touch that passed, taking each as a personal contact; but within the hour he learned to ignore them.

He was hearing words now, even when "they were not actually mouthed. This was something new, and he found himself listening. They were thin, eery phrases, disconnected and wind-whipped; far off, far off. . . And with them, living, crawling emotion and other subtle things that cannot be described--so that all the world was a panorama of boiling life visible to himself only.

He found he could penetrate buildings as he walked, sending his mind in as though it were something he held on a leash, something that could suck its way into crannies invisible to the eye and bring out the bones of men's inner thoughts.

It was before a huge stone-fronted building that he halted, and considered. They (whoever they were) were after him. He had killed the follower, but there must be others--the others that the follower had wanted to call. It might be best for him to make no move for a few days, and how to do that best? . . . A job? . . . "

He probed the building before which he had stopped. In there was a distant Mind Touch that to him might mean a job. They were looking for textile workers in there--and he had once been a tailor.

He stepped inside, where he was promptly ignored by everyone. He touched someone's shoulder.

"Where do I see about a job, please?"

"Through that door!" The Mind Touch that reached him was full of annoyance and suspicion.

Through the door, and then a thin, point-chin fellow fired questions at him and fingered the classifying machine onto which he punched the answers.

Schwartz stammered his lies and truths with equal uncertainty.

But the personnel man began, at least, with a definite unconcern. The questions were fired rapidly: "Age? . . . Fifty-two? Hmm. State of health? . . . Married? . . . Experience? . . . Worked with textiles? . . . Well, what kind? . . . Thermoplastic? Elastomeric? . . . What do you mean, you think all kinds? . . . Whom did you work with last? . . . Spell his name. . . .You're not from Chica, are you? . . . Where are your papers? . . . You'll have to bring them here if you want action taken. . . .What's your registration number? . . . "

Schwartz was backing away. He hadn't foreseen this end when he had begun. And the Mind Touch of the man before him was changing. It had become suspicious to the point of single-trackedness, and cautious too. There was a surface layer of sweetness and good-fellowship that was so shallow. and which overlay animosity so thinly, as to be the most dangerous feature of all.

"I think," said Schwartz nervously, "that I'm not suited for this job."

"No, no, come back." And the man beckoned at him. "We have something for you. Just let me look through the files a bit." He was smiling, but his Mind Touch was clearer now and even more unfriendly.

He had punched a buzzer on his desk--

Schwartz, in a sudden panic, rushed for the door.

"Hold him!" cried the other instantly. dashing from behind his desk.

Schwartz struck at the Mind Touch, lashing out violently with his own mind, and he heard a groan behind him. He looked quickly over his shoulder. The personnel man was seated on the floor, face contorted and temples buried in his palms. Another man bent over him; then, at an urgent gesture, headed for Schwartz. Schwartz waited no more.

He was out on the street, fully aware now that there must be an alarm out for him with a complete description made public, and that the personnel man, at least, had recognized him.

He ran and doubled along the streets blindly. He attracted attention; more of it now, for the streets were filling up--suspicion, suspicion everywhere--suspicion because he ran--suspicion because his clothes were wrinkled and ill-fitting.

In the multiplicity of Mind Touches and in the confusion of his own fear and despair. he could not identify the true enemies, the ones in which there was not only suspicion but certainty, and so he hadn't the slightest warning of the neuroniac whip.

There was only that awful pain, which descended like the whistle of a lash and remained like the crush of a rock. For seconds he coasted down the slope of that descent into agony before drifting into the black.

13. SPIDER WEB AT WASHENN

The grounds of the College of Ancients in Washenn are nothing if not sedate. Austerity is the key word, and there is something authentically grave about the clustered knots of novices taking their evening stroll among the trees of the Quadrangle--where none but Ancients might trespass. Occasionally the green-robed figure of a Senior Ancient might make its way across the lawn, receiving reverences graciously.

And, once in a long while, the High Minister himself might appear.

But not as now, at a half run, almost in a perspiration, disregarding the respectful raising of hands, oblivious to the cautious stares that followed him, the blank looks at one another, the slightly raised eyebrows.

He burst into the Legislative Hall by the private entrance and broke into an open run down the empty, step-ringing ramp. The door that he thundered at opened at the foot pressure of the one within, and the High Minister entered.

His Secretary scarcely looked up from behind his small, plain desk, where he hunched over a midget Field-shielded Televisor, listening intently and allowing his eyes to rove over a quire or so of official-looking communications that piled high before him.

The High Minister rapped sharply on the desk. "What is this? What is going on?"

The Secretary's eyes flicked coldly at him, and the Televisor was put to one side. "Greetings, Your Excellency."

"Greet me no greetings!" retorted the High Minister impatiently. "I want to know what is going on."

"In a sentence, our man has escaped."

"You mean the man who was treated by Shekt with the Synapsifier--the Outsider--the spy--the one on the farm outside Chica--"

It is uncertain how many qualifications the High Minister, in his anxiety, might have rattled out had not the Secretary interrupted with an indifferent "Exactly."

"Why was I not informed? Why am I never informed?"

"Immediate action was necessary and you were engaged. I substituted, therefore, to the best of my ability."

"Yes, you are careful about my engagements when you wish to do without me. Now, I'll not have it. I will not permit myself to be by-passed and sidetracked. I will not--"

"We delay," was the reply at ordinary speaking volume, and the High Minister's half shout faded. He coughed, hovered uncertainly at further speech, then said mildly:

"What are the details, Balkis?"

"Scarcely any. After two months of patient waiting, with nothing to show for it, this man Schwartz left--was followed--and was lost."

"How lost?"

"We are not sure, but there is a further fact. Our agent, Natter, missed three reporting periods last night. His alternates set out after him along the highway toward Chica and found him at dawn. He was in a ditch at the side of the highway--quite dead."

The High Minister paled. "The Outsider had killed him?"

"Presumably, though we cannot say certainly. There were no visible signs of violence other than a look of agony on the dead face. There will be an autopsy, of course. He might have died of a stroke just at that inconvenient moment."

"That would be an incredible coincidence."

"So I think, " was the cool response, "but if Schwartz killed him, it makes subsequent events puzzling. You see, Your Excellency, it seemed quite obvious from our previous analysis that Schwartz would make for Chica in order to see Shekt, and Natter was found dead on the highway between the Maren farm and Chica. We therefore sent out an alarm to that city three hours ago and the man was caught."

"Schwartz?" incredulously.

"Certainly."

"Why didn't you say that immediately?"

Balkis shrugged. "Your Excellency, there is more important work to be done. I said that Schwartz was in our hands. Well, he was caught quickly and easily, and that fact does not seem to me to jibe very well with the death of Natter. How could he be at once so clever as to detect and kill Natter--a most capable man--and so stupid as to enter Chica the very next morning and openly enter a factory, without disguise, to find a job?"

"Is that what he did?"

"That's what he did. . . . There are two possible thoughts that this gives rise to, therefore. Either he has already transmitted such information as he has to Shekt or Arvardan, and has now let himself be caught in order to divert out attention, or else other agents are involved, whom we have not detected and whom he is now covering. In either case, we must not be overconfident."

"I don't know," said the High Minister helplessly, his handsome face twisted into anxious lines. "It gets too deep for me."

Balkis smiled with more than a trace of contempt and volunteered a statement.

"You have an appointment four hours from now with Professor Bel Arvardan."

"I have? Why? What am I to say to him? I don't want to see him."

"Relax. You must see him, Your Excellency. It seems obvious to me that since the date of commencement of his fictitious expedition is approaching, he must play out the game by asking you for permission to investigate the Forbidden Areas. Ennius warned us he would, and Ennius must know exactly the details of this comedy. I suppose that you are able to return him froth for froth in this matter and to counter pretense with pretense."

The High Minister bowed his head. "Well, I shall try."

Bel Arvardan arrived in good time, and was able to look about him. To a man well acquainted with the architectural triumphs of all the Galaxy, the College of Ancients could scarcely seem more than a brooding block of steel-ribbed granite, fashioned in an archaic

style. To one who was an archaeologist as well, it might signify, in its gloomy, nearly savage austerity, the proper home of a gloomy, nearly savage way of life. It's very primitiveness marked the turning back of eyes to the far past.

And Arvardan's thoughts slipped away once again. His two-month tour about Earth's western continents had proven not quite--amusing. That first day had ruined things. He found himself thinking back to that day at Chica.

He was instantly angry with himself for thinking about it again. She had been rude, egregiously ungrateful, a common Earthgirl. Why should he feel guilty? And yet. . .

Had he made allowances for her shock at discovering him to be an Outsider, like that officer who had insulted her and whose arrogant brutality he had repaid with a broken arm? After all, how could he know how much she had already suffered at the hands of Outsiders? And then to find out, like that, without any softening of the blow, that he was one.

If he had been more patient. . . Why had he broken it off so brutally? He didn't even remember her name. It was Pola something. Strange! His memory was ordinarily better than that. Was it an unconscious effort to forget?

Well, that made sense. Forget! What was there to remember, anyway? An Earthgirl. A common Earthgirl.

She was a nurse in a hospital. Suppose he tried to locate the hospital. It had been just a vague blot in the night when he parted from her, but it must be in the neighborhood of that Foodomat.

He snatched at the thought and broke into a thousand angry fragments. Was he mad? What would he have gained? She was an Earthgirl. Pretty, sweet, somehow entic--
An Earthgirl!

The High Minister was entering, and Arvardan was glad. It meant relief from that day in Chica. But, deep in his mind, he knew that they would return. They--the thoughts, that is--always did.

As for the High Minister, his robe was new and glistening in its freshness. His forehead showed no trace of haste or doubt; perspiration might have been a stranger to it.

And the conversation was friendly, indeed. Arvardan was at pains to mention the well-wishings of some of the great men of the Empire to the people of Earth. The High Minister was as careful to express the thorough gratification that must be felt by all Earth at the generosity and enlightenment of the Imperial Government.

Arvardan expounded on the importance of archaeology to Imperial philosophy, on its contribution to the great conclusion that all humans of whatever world of the Galaxy were brothers--and the High Minister agreed blandly and pointed out that Earth had long held such to be the case and could only hope that the time would shortly come when the rest of the Galaxy might turn theory into practice.

Arvardan smiled very shortly at that and said, "It is for that very purpose, Your Excellency, that I have approached you. The differences between Earth and some of the Imperial Dominions neighboring it rest largely, perhaps, on differing ways of thinking.

Still, a good deal of friction could be removed if it could be shown that Earthmen were not different, racially, from other Galactic citizens."

"And how would you propose to do that, sir?"

"That is not easy to explain in a word. As Your Excellency may know, the two main currents of archaeological thinking are commonly called the Merger Theory and the Radiation Theory."

"I am acquainted with a layman's view of both."

"Good. Now the Merger Theory, of course, involves the notion that the various types of humanity, evolving independently, have intermarried in the very early, scarcely documented days of primitive space travel. A conception like that is necessary to account for the fact that Humans are so alike one to the other now."

"Yes," commented the High Minister dryly, "and such a conception also involves the necessity of having several hundred, or thousand, separately evolved beings of a more or less human type so closely related chemically and biologically that intermarriage is possible."

"True," replied Arvardan with satisfaction. "You have put your finger on an impossibly weak point. Yet most archaeologists ignore it and adhere firmly to the Merger Theory, which would, of course, imply the possibility that in isolated portions of the Galaxy there might be subspecies of humanity who remained different, didn't intermarry--"

"You mean Earth," commented the High Minister.

"Earth is considered an example. The Radiation Theory, on the other hand--"

"Considers us all descendants of one planetary group of humans."

"Exactly."

"My people," said the High Minister, "because of the evidence (our own history, and of certain writings which are sacred to us and cannot be exposed to the view of Outsiders, are of the belief that Earth itself is the original home of humanity."

"And so I believe as well, and I ask your help to prove this point to all the Galaxy."

"You are optimistic. Just what is involved?"

"It is my conviction, Your Excellency, that many primitive artifacts and architectural remains may be located in those areas of your world which are now, unfortunately, masked by radioactivity. The age of the remains could be accurately calculated from the radioactive decay present and compared--"

But the High Minister was shaking his head.. "That is out of the question."

"Why?" And Arvardan frowned in thorough amazement.

"For one thing," said the High Minister, reasoning mildly, "what do you expect to accomplish? If you prove your point, even to the satisfaction of all the worlds, what does it matter that a million years ago all of you were Earthmen? After all, a billion years ago we were all apes, yet we do not admit present-day apes into the relationship."

"Come, Your Excellency, the analogy is unreasonable."

"Not at all, sir. Isn't it reasonable to assume that Earthmen, in their long isolation, have so changed from their emigrating cousins, especially under the influence of radioactivity, as now to form a different race?"

Arvardan bit at his lower lip and answered reluctantly, "You argue well on the side of your enemy."

"Because I ask myself what my enemy will say. So you will accomplish nothing, sir, except perhaps to further exacerbate the hatred against us."

"But," said Arvardan, "there is still the matter of the interests of pure science, the advance of knowledge--"

The High Minister nodded gravely. "I am truly sorry to have to stand in the way of that. I speak now, sir, as one gentleman of the Empire to another. I myself would cheerfully help you, but my people are an obstinate and stiff-necked race, who over centuries have withdrawn into themselves because of the--uh--lamentable attitudes toward them in parts of the Galaxy. They have certain taboos, certain fixed Customs--which even I could not afford to violate."

"And the radioactive areas--"

"Are one of the most important taboos. Even if I were to grant you permission, and certainly my every impulse is to do so, it would merely provoke rioting and disturbances, which would not only endanger your life and those of the members of your expedition but would, in the long run, bring down upon Earth the disciplinary action of the Empire. I would betray my position and the trust of my people if I were to allow that."

"But I am willing to take all reasonable precautions. If you wish to send observers with me--Or, of course, I can offer to consult you before publishing any results obtained."

The High Minister said, "You tempt me, sir. It is an interesting project. But you overestimate my power, even if we leave the people themselves out of consideration. I am not an absolute ruler. In fact, my power is sharply limited--and all matters must be submitted to the consideration of the Society of Ancients before final decisions are possible."

Arvardan shook his head. "This is most unfortunate. The Procurator warned me of the difficulties, yet I was hoping that--When can you consult your legislature, Your Excellency?"

"The Presidium of the Society of Ancients will meet three days hence. It is beyond my power to alter the agenda, so it may be a few days more before the matter can be discussed. Say a week."

Arvardan nodded abstractedly. "Well, it will have to do. . . .By the way, Your Excellency--"

"Yes?"

"There is a scientist upon your planet whom I would like to meet. A Dr. Shekt at Chica. Now, I've been in Chica, but left before I could do much and would like to repair the omission. Since I am sure he is a busy man, I wonder if I could trouble you for a letter of introduction?"

The High Minister had stiffened visibly and for several moments said nothing. Then, "May I ask what it is you want to see him about?"

"Certainly. I have read of an instrument he has developed, which he calls a Synapsifier, I believe. It concerns the neurochemistry of the brain and could have something very interesting to do with another project of mine. I have been doing some work on the classification of humanity into encephalographic groups--brain-current types, you understand."

"Umm. . . I have heard vaguely about the device. I seem to recall that it was not a success."

"Well, maybe not, but he is an expert in the field and could probably be very helpful to me."

"I see. In that case a letter of introduction will be prepared immediately for you. Of course there must be no mention of your intentions with regard to the Forbidden Areas."

"That is understood, Your Excellency." He rose. "I thank you for your courtesy and your kind attitude and can only hope that the Council of Ancients will be liberal with respect to my project."

The Secretary entered after Arvardan left. His lips were spread in his characteristic cold, savage smile.

"Very good," he said. "You handled yourself well, Your Excellency."

The High Minister looked at him somberly and said, "What was that last about Shekt?"

"You are puzzled? Don't be. All things are working out well. You noticed his lack of heat when you vetoed his project. Was that the response of a scientist whose heart is set upon something withdrawn from his grasp for no apparent reason? Or is it the response of one who is playing a part and is relieved to be well rid of it?"

"And again we have a queer coincidence. Schwartz escapes and makes his way to Chica. The very next day Arvardan appears here and, after a lukewarm rigmarole about his expedition, mentions casually that he is going to Chica to see Shekt."

"But why mention it, Balkis? It seems foolhardy."

"Because you are straightforward. Put yourself in his position. He imagines we suspect nothing. In such a case it is audacity that wins. He's going to see Shekt. Good! He mentions it frankly. He even asks for a letter of introduction. What better guarantee of honest and innocent intentions can he present? And that brings up another point. Schwartz may have discovered that he was being watched. He may have killed Natter. But he has had no time to warn the others, or this comedy could not have played itself out in just this fashion."

The Secretary's eyes were half lidded as he spun his spider web. "There is no way of telling how long it will be before Schwartz's absence becomes suspicious for them, but it is at least safe to allow sufficient time for Arvardan to meet Shekt. We'll catch them together; there will be that much less they can deny."

"How much time do we have?" demanded the High Minister.

Balkis looked up thoughtfully. "The schedule is fluid, and ever since we uncovered Shekt's treason they've been on triple shift--and things are proceeding well. We await only the mathematical computations for the necessary orbits. What holds us up there is the inadequacy of our computers. Well. . . it may be only a matter of days now."

"Days!" It was said in a tone queerly compounded of triumph and horror.

"Days!" repeated the Secretary. "But remember--one bomb even two seconds before zero time will be enough to stop us. And even afterward there will be a period of from one to six months when reprisals can be taken. So we are not yet entirely safe."

Days! And then the most incredibly one-sided battle in the history of the Galaxy would be joined and Earth would attack all the Galaxy.

The High Minister's hands were trembling gently.

Arvardan was seated in a stratoplane again. His thoughts were savage ones. There seemed no reason to believe that the High Minister and his psychopathic subject population would allow an official invasion of the radioactive areas. He was prepared for that. Somehow he wasn't even sorry about it. He could have put up a better fight--if he had cared more.

As it was, by the Galaxy, there would be illegal entry. He would arm his ship and fight it out, if necessary. He would rather.

The bloody fools! Who the devil did they think they were?

Yes, yes, he knew. They thought they were the original humans, the inhabitants of the planet. The worst of it was he knew that they were right.

Well. . . The ship was taking off. He felt himself sinking back into the soft cushion of his seat and knew that within the hour he'd be seeing Chica.

Not that he was eager to see Chica, he told himself, but the Synapsifier thing could be important, and there was no use being on Earth if he didn't take advantage of it. He certainly never intended to return once he left.

Rathole! Ennius was right. This Dr. Shekt, however. . . He fingered his letter of introduction, heavy with official formality.

And then he sat bolt upright--or tried to, struggling bitterly against the forces of inertia that were compressing him down into his seat as the Earth still sank away and the blue of the sky was deepened into a rich purple.

He remembered the girl's name. It was Pola Shekt. Now why had he forgotten? He felt angry and cheated. His mind was plotting against him, holding back the last name till it was too late.

But, deep underneath, something was rather glad of it.

14. SECOND MEETING

In the two months that had elapsed from the day that Dr. Shekt's Synapsifier had been used on Joseph Schwartz, the physicist had changed completely. Physically not so much, though perhaps he was a thought more stooped, a shade thinner. It was his manner--abstracted, fearful. He lived in an inner communion, withdrawn from even his closest colleagues, and from which he emerged with a reluctance that was plain to the blindest.

Only to Pola could he unburden himself, perhaps because she, too, had been strangely withdrawn those two months.

"They're watching me," he would say. "I feel it somehow. Do you know what the feeling is like? . . . There's been a turnover in the Institute in the last month or so, and it's the ones I like and feel I can trust that go. . . .I never get a minute to myself. Always someone about. They won't even let me write reports."

And Pola would alternately sympathize with him and laugh at him, saying over and over again, "But what can they possibly have against you to do all this? Even if you did experiment on Schwartz, that's not such a terrible crime. They'd have just called you on the carpet for it."

But his face was yellow and thin as he muttered, "They won't let me live. My Sixty is coming and they won't let me live."

"After all you've done. Nonsense!"

"I know too much, Pola, and they don't trust me."

"Know too much about what?"

He was tired that night, aching to remove the load. He told her. At first she wouldn't believe him, and finally, when she did, she could only sit there, in cold horror.

Pola called up the State House the next day from a public Communi-wave at the other end of town. She spoke through a handkerchief and asked for Dr. Bel Arvardan.

He wasn't there. They thought he might be in Bonair, six thousand miles away, but he hadn't been following his scheduled itinerary very closely. Yes, they did expect him back in Chica eventually, but they didn't know exactly when. Would she leave her name? They would try to find out.

She broke connections at that and leaned her soft cheek against the glass enclosure, grateful for the coolness thereof. Her eyes were deep with unshed tears and liquid with disappointment.

Fool. Fool!

He had helped her and she had sent him away in bitterness. He had risked the neuronc whip and worse to save the dignity of a little Earthgirl against an Outsider and she had turned on him anyway.

The hundred credits she had sent to the State House the morning after that incident had been returned without comment. She had wanted then to reach him and

apologize, but she had been afraid. The State House was for Outsiders only, and how could she invade it? She had never even seen it, except from a distance.

And now--She'd have gone to the palace of the Procurator himself to--to--

Only he could help them now. He, an Outsider who could talk with Earthmen on a basis of equality. She had never guessed him to be an Outsider until he had told her. He was so tall and self-confident. He would know what to do.

And someone had to know, or it would mean the ruin of all the Galaxy.

Of course so many Outsiders deserved it--but did all of them? The women and children and sick and old? The kind and the good? The Arvardans? The ones who had never heard of Earth? And they were humans, after all. Such a horrible revenge would for all time drown whatever justice might be--no, was--in Earth's cause in an endless sea of blood and rotting flesh.

And then, out of nowhere, came the call from Arvardan. Dr. Shekt shook his head. "I can't tell him."

"You must," said Pola savagely.

"Here? It is impossible--it would mean ruin for both."

"Then turn him away. I'll take care of it."

Her heart was singing wildly. It was only because of this chance to save so many countless myriads of humans, of course. She remembered his wide, white smile. She remembered how he had calmly forced a colonel of the Emperor's own forces to turn and bow his head to her in apology--to her, an Earthgirl, who could stand there and forgive him.

Bel Arvardan could do anything!

Arvardan could, of course, know nothing of all this. He merely took Shekt's attitude for what it seemed--an abrupt and odd rudeness, of a piece with everything else he had experienced on Earth.

He felt annoyed, there in the anteroom of the carefully lifeless office, quite obviously an unwelcome intruder.

He picked his words. "I would never have dreamed of imposing upon you to the extent of visiting you, Doctor, were it not that I was professionally interested in your Synapsifier. I have been informed that, unlike many Earthmen, you are not unfriendly to men of the Galaxy."

It was apparently an unfortunate phrase, for Dr. Shekt jumped at it. "Now, whoever your informant is, he does wrong to impute any especial friendliness to strangers as such. I have no likes and dislikes. I am an Earthman--"

Arvardan's lips compressed and he half turned.

"You understand, Dr. Arvardan"--the words were hurried and whispered--"I am sorry if I seem rude, but I really cannot--"

"I quite understand," the archaeologist said coldly, though he did not understand at all. "Good day, sir."

Dr. Shekt smiled feebly. "The pressure of my work--"

"I am very busy too, Dr. Shekt."

He turned to the door, raging inwardly at all the tribe of Earthmen, feeling within him, involuntarily, some of the catchwords that were bandied so freely on his home world. The proverbs, for instance: "Politeness on Earth is like dryness in the ocean" or "An Earthman will give you anything as long as it costs nothing and is worth less."

His arm had already broken the photoelectric beam that opened the front door when he heard the flurry of quick steps behind him and a hiss of warning in his ear. A piece of paper was thrust in his hand, and when he turned there was only a flash of red as a figure disappeared.

He was in his rented ground car before he unraveled the paper in his hand. Words were scrawled upon it:

"Ask your way to the Great Playhouse at eight this evening. Make sure you are not followed."

He frowned ferociously at it and read it over five times, then stared all over it, as though expecting invisible ink to bound into visibility. Involuntarily, he looked behind him. The street was empty. He half raised his hand to throw the silly scrap out of the window, hesitated, then stuffed it into his vest pocket.

Undoubtedly, if he had had one single thing to do that evening other than what the scrawl had suggested, that would have been the end of it, and, perhaps, of several trillions of people. But, as it turned out, he had nothing to do.

And, as it turned out, he wondered if the sender of the note had been.

At eight o'clock he was making his slow way as part of a long line of ground cars along the serpentine way that apparently led to the Great Playhouse. He had asked only once, and the passerby questioned had stared suspiciously at him (apparently no Earthman was ever free of that all-pervasive suspicion) and had said curtly, "You just follow all the rest of the cars."

It seemed that all the rest of the cars were indeed going to the Playhouse, for when he got there he found all being swallowed, one by one, into the gaping maw of the underground parking lot. He swung out of line and crawled past the Playhouse, waiting for he knew not what.

A slim figure dashed down from the pedestrian ramp and hung outside his window. He stared at it, startled, but it had the door open and was inside in a single gesture.

"Pardon me," he said, "but--"

"Ssh!" The figure was hunched down low in the seat. "Were you followed?"

"Should I have been?"

"Don't be funny. Go straight ahead. Turn when I tell you. . . .My goodness, what are you waiting for?"

He knew the voice. A hood had shifted down to the shoulders, and light brown hair was showing. Dark eyes were gazing at him.

"You'd better move on," she said softly.

He did, and for fifteen minutes, except for an occasional muffled but curt direction, she said nothing. He stole glances at her and thought, with a sudden pleasure, that she was even prettier than he had remembered her. Strange that now he felt no resentment.

They stopped--or Arvardan did, at the girl's direction--at the corner of an unpeopled residential district. After a careful pause the girl motioned him ahead once more and they inched down a drive that ended in the gentle ramp of a private garage.

The door closed behind them and the light in the car was the only source of illumination.

And now Pola looked at him gravely and said, "Dr. Arvardan, I'm sorry that I had to do this in order to speak to you privately. I know that I have no standing in your good opinion to lose--"

"Don't think that," he said awkwardly.

"I must think that. I want you to believe that I fully realize how small and vicious I was that night. I don't have the proper words to apologize--"

"Please don't." He glanced away from her. "I might have been a little more diplomatic."

"Well. . . ." Pola paused a few moments to regain a certain minimal composure. "It's not what I've brought you here for. You're the only Outsider I've ever met that could be kind and noble--and I need your help."

A cold pang shot through Arvardan. Was this what it was all about? He packed that thought into a cold "Oh?"

And she cried, "No," in return. "It is not for me, Dr. Arvardan. It is for all the Galaxy. Nothing for myself. Nothing!"

"What is it?"

"First--I don't think anyone followed us, but if you hear any noise at all, would you--would you"--her eyes dropped--"put your arms about me, and--and--you know."

He nodded his head and said dryly, "I believe I can improvise without any trouble. Is it necessary to wait for noise?"

Pola reddened. "Please don't joke about it, or mistake my intentions. It would be the only way of avoiding suspicion of our real intentions. It is the one thing that would be convincing."

Arvardan said softly, "Are things that serious?"

He looked at her curiously. She seemed so young and so soft. In a way he felt it to be unfair. Never in his life did he act unreasoningly. He took pride in that. He was a man of strong emotions, but he fought them and beat them. And here, just because a girl seemed weak, he felt the unreasoning urge to protect her.

She said, "Things are that serious. I'm going to tell you something, and I know you won't believe it at first. But I want you to try to believe it. I want you to make up your mind that I'm sincere. And most of all I want you to decide that you will stick with us after I tell you and see it through. Will you try? I'll give you fifteen minutes, and if you think at the end of that time that I'm not worth trusting or bothering with, I'll leave, and that's the end of it."

"Fifteen minutes?" His lips quirked in an involuntary smile, and he removed his wrist watch and put it before him. " All right."

She clasped her hands in her lap and looked firmly ahead through the windshield that afforded a view only of the blank wall of the garage ahead.

He watched her thoughtfully--the smooth, soft line of her chin, belying the firmness into which she was attempting to force it, the straight and thinly drawn nose, the peculiarly rich overtone to the complexion, so characteristic of Earth.

He caught the corner of her eye upon him. It was hastily withdrawn.

"What's the matter?" he said.

She turned to him and caught her underlip in two teeth. "I was watching you."

"Yes, I could see that. Smudge on my nose?"

"No." She smiled tinily, the first since she had entered his car. He was becoming absurdly conscious of little things about her: the way her hair seemed to hover and float gently each time she shook her head. "It's just that I've been wondering ever since--that night--why you don't wear that lead clothing, if you're an Outsider. That's what fooled me. Outsiders generally look like sacks of potatoes."

"And I don't?"

"Oh no"--and there was a sudden tinge of enthusiasm in her voice--"you look--you look quite like an ancient marble statue, except that you're alive and warm. . . .I'm sorry. I'm being impertinent."

"You mean you think that it's my opinion you're an Earthgirl who doesn't know your place. You'll have to stop thinking that of me, or we can't be friendly. . . .I don't believe in the radioactivity superstition. I've measured the atmospheric radioactivity of Earth and I've conducted laboratory experiments on animals. I'm quite convinced that under ordinary circumstances the radiations won't hurt me. I've been here two months and I don't feel sick yet. My hair isn't falling out"--he pulled at it--"my stomach isn't in knots. And I doubt that my fertility is being endangered, though I will admit to taking slight precautions in that respect. But lead-impregnated shorts, you see, don't show."

He said that gravely, and she was smiling again. "You're slightly mad, I think," she said.

"Really? You'd be surprised how many very intelligent and famous archaeologists have said that--and in long speeches, too."

And she said suddenly, "Will you listen to me now? The fifteen minutes are up."

"What do you think?"

"Why, that you might be. If you weren't, you wouldn't still be sitting here. Not after what I've done."

He said softly, "Are you under the impression that I have to force myself very hard to sit here next to you? If you do, you're wrong. . . .Do you know, Pola, I've never seen, I really believe I've never seen, a girl quite as beautiful as yourself."

She looked up quickly, with fright in her eyes. "Please don't. I'm not trying for that. Don't you believe me?"

"Yes, I do, Pola. Tell me whatever it is you want to. I'll believe it and I'll help you." He believed himself, implicitly. At the moment Arvardan would cheerfully have undertaken to unseat the Emperor. He had never been in love before, and at that point he ground his thoughts to a halt. He had not used that word before.

Love? With an Earthgirl?

"You've seen my father, Dr. Arvardan?"

"Dr. Shekt is your father? . . . Please call me Bel. I'll call you Pola."

"If you want me to, I'll try. I suppose you were pretty angry with him."

"He wasn't very polite."

"He couldn't be. He's being watched. In fact, he and I arranged in advance that he was to get rid of you and I was to see you here. This is our house, you know. . . . You see"--her voice dropped to a tight whisper--"Earth is going to revolt."

Arvardan couldn't resist a moment of amusement.

"No!" he said, opening his eyes wide. "All of it?"

But Pola flared into instant fury. "Don't laugh at me. You said you would listen and believe me. Earth is going to revolt, and it is serious, because Earth can destroy all the Empire."

"Earth can do that?" Arvardan struggled successfully against a burst of laughter. He said gently, "Pola, how well do you know your Galactography?"

"As well as anybody, teacher, and what has that to do with it, anyway?"

"It has this to do with it. The Galaxy has a volume of several million cubic light-years. It contains two hundred million inhabited planets and an approximate population of five hundred quadrillion people. Right?"

"I suppose so, if you say so."

"It is, believe me. Now Earth is one planet, with a population of twenty millions, and no resources besides. In other words, there are twenty-five billion Galactic citizens for every single Earthman. Now what harm can Earth do against odds of twenty-five billion to one?"

For a moment the girl seemed to sink into doubt, then she emerged. "Bel, " she said firmly, "I can't answer that, but my father can. He has not told me the crucial details. because he claims that that would endanger my life. But he will now, if you come with me. He's told me that Earth knows a way by which it can wipe out all life outside Earth, and he must be right. He's always been right before."

Her cheeks were pink with earnestness, and Arvardan longed to touch them. (Had he ever before touched her and felt horrified at it? What was happening to him?)

"Is it after ten?" asked Pola.

"Yes," he replied.

"Then he should be upstairs now--if they haven't caught him." She looked about with an involuntary shudder. "We can get into the house directly from the garage now. and if you'll come with me--"

She had her hand on the knob that controlled the car door, when she froze. Her voice was a husky whisper: "There's someone coming. . . Oh, quick--"

The rest was smothered. It was anything but difficult for Arvardan to remember her original injunction. His arms swept about her with an easy motion, and, in an instant, she was warm and soft against him. Her lips trembled upon his and were limitless seas of sweetness. . .

For about ten seconds he swiveled his eyes to their extremes in an effort to see that first crack of light or hear that first footstep, but then he was drowned and swept under by the excitement of it all. Blinded by stars, deafened by his own heartbeat.

Her lips left his, but he sought them again, frankly, and found them. His arms tightened, and she melted within them until her own heartbeat was shaking him in time to his own.

It was quite a while before they broke apart, and for a moment they rested, cheek against cheek.

Arvardan had never been in love before, and this time he did not start at the word. What of it? Earthgirl or not, the Galaxy could not produce her equal.

He said, with a dreamy pleasure, "It must have been only a traffic noise."

"It wasn't," she whispered. "I didn't hear any noise."

He held her at arm's distance, but her eyes did not falter. "You devil. Are you serious?"

Her eyes sparkled. "I wanted you to kiss me. I'm not sorry."

"Do you think I am? Kiss me again, then, for no reason but that I want to this time."

Another long, long moment and she was suddenly away from him, arranging her hair and adjusting the collar of her dress with prim and precise gestures. "I think we had better go into the house now. Put out the car light. I've got a pencil flash."

He stepped out of the car after her, and in the new darkness she was the vaguest shadow in the little pockmark of light that came from her pencil flash.

She said, "You'd better hold my hand. There's a flight of stairs we must go up."

His voice was a whisper behind her. "I love you, Pola." It came out so easily--and it sounded so right. He said it again. "I love you, Pola."

She said softly, "You hardly know me."

"No. All my life. I swear! All my life. Pola, for two months I've been thinking and dreaming of you. I swear it."

"I am an Earthgirl, sir."

"Then I will be an Earthman. Try me."

He stopped her and bent her hand up gently until the pocket flash rested upon her flushed, tear-marked face. "Why are you crying?"

"Because when my father tells you what he knows, you'll know that you cannot love an Earthgirl."

"Try me on that too."

15. THE ODDS THAT VANISHED

Arvardan and Shekt met in a back room on the second story of the house, with the windows carefully polarized to complete opaqueness. Pola was downstairs, alert and sharp-eyed in the armchair from which she watched the dark and empty street.

Shekt's stooped figure wore somehow an air different from that which Arvardan had observed some ten hours previously. The physicist's face was still haggard, and infinitely weary, but where previously it had seemed uncertain and timorous, it now bore an almost desperate defiance.

"Dr. Arvardan," he said, and his voice was firm, "I must apologize for my treatment of you in the morning. I had hoped you would understand--"

"I must admit I didn't, sir, but I believe I do now."

Shekt seated himself at the table and gestured toward the bottle of wine. Arvardan waved his hand in a deprecating motion. "If you don't mind, I'll have some of the fruit instead. . . .What is this? I don't think I've ever seen anything like it."

"It's a kind of orange," said Shekt. "I don't believe it grows outside Earth. The rind comes off easily." He demonstrated, and Arvardan, after sniffing at it curiously, sank his teeth into the winy pulp. He came up with an exclamation.

"Why, this is delightful, Dr. Shekt! Has Earth ever tried to export these objects?"

"The Ancients," said the biophysicist grimly, "are not fond of trading with the Outside. Nor are our neighbors in space fond of trading with us. It is but an aspect of our difficulties here."

Arvardan felt a sudden spasm of annoyance seize him. "That is the most stupid thing yet. I tell you that I could despair of human intelligence when I see what can exist in men's minds."

Shekt shrugged with the tolerance of lifelong use. "It is part of the nearly insoluble problem of anti-Terrestrialism, I fear."

"But what makes it so nearly insoluble," exclaimed the archaeologist, "is that no one seems to really want a solution! How many Earthmen respond to the situation by hating all Galactic citizens indiscriminately? It is an almost universal disease--hate for hate. Do your people really want equality, mutual tolerance? No! Most of them want only their own turn as top dog."

"Perhaps there is much in what you say," said Shekt sadly. "I cannot deny it. But that is not the whole story. Give us but the chance, and a new generation of Earthmen would grow to maturity, lacking insularity and believing wholeheartedly in the oneness of Man. The Assimilationists, with their tolerance and belief in wholesome compromise, have more than once been a power on Earth. I am one. Or, at least, I was one once. But the Zealots rule all Earth now. They are the extreme nationalists, with their dreams of past rule and future rule. It is against them that the Empire must be protected."

Arvardan frowned. "You refer to the revolt Pola spoke of?"

"Dr. Arvardan," Shekt said grimly, "it's not too easy a job to convince anyone of such an apparently ridiculous possibility as Earth conquering the Galaxy, but it's true. I am not physically brave, and I am most anxious to live. You can imagine, then, the immense crisis that must now exist to force me to run the risk of committing treason with the eye of the local administration already upon me."

"Well," said Arvardan, "if it is that serious, I had better tell you one thing immediately. I will help you all I can, but only in my own capacity as a Galactic citizen. I have no official standing here, nor have I any particular influence at the Court or even at the Procurator's Palace. I am exactly what I seem to be--an archaeologist on a scientific expedition which involves only my own interests. Since you are prepared to risk treason, hadn't you better see the Procurator about this? He could really do something."

"That is exactly what I cannot do, Dr. Arvardan. It is that very contingency against which the Ancients guard me. When you came to my house this morning I even thought you might be a go-between. I thought that Ennius suspected."

"He may suspect--I cannot answer for that. But I am not a go-between. I'm sorry. If you insist on making me your confidant, I can promise to see him for you."

"Thank you. It is all I ask. That--and to use your good offices to intercede for Earth against too strong a reprisal."

"Of course." Arvardan was uneasy. At the moment he was convinced that he was dealing with an elderly and eccentric paranoiac, perhaps harmless, but thoroughly cracked. Yet he had no choice but to remain, to listen, and to try to smooth over the gentle insanity--for Pola's sake.

Shekt said, "Dr. Arvardan, you have heard of the Synapsifier? You said so this morning."

"Yes, I did. I read your original article in Physical Reviews. I discussed the instrument with the Procurator and with the High Minister."

"With the High Minister?"

"Why, certainly. When I obtained the letter of introduction that you--uh--refused to see, I'm afraid."

"I'm sorry for that. But I wish you had not--What is the extent of your knowledge concerning the Synapsifier?"

"That it is an interesting failure. It is designed to improve learning capacity. It has succeeded to some extent on rats, but has failed on human beings."

Shekt was chagrined. "Yes, you could think nothing else from that article. It was publicized as a failure, and the eminently successful results have been suppressed, deliberately."

"Hmp. A rather unusual display of scientific ethics, Dr. Shekt."

"I admit it. But I am fifty-six, sir, and if you know anything of the customs of Earth, you know that I haven't long to live."

"The Sixty. Yes, I have heard of it--more than I would have liked, in fact." And he thought wryly of that first trip on a Terrestrial stratoliner. "Exceptions are made for noted scientists, among others, I have heard."

"Certainly. But it is the High Minister and the Council of Ancients who decide on that, and there is no appeal from their decisions, even to the Emperor. I was told that the price of life was secrecy concerning the Synapsifier and hard work for its improvement." The older man spread his hands helplessly. "Could I know then of the outcome, of the use to which the machine would be put?"

"And the use?" Arvardan extracted a cigarette from his shirt-pocket case and offered one to the other, which was refused.

"If you'll wait a moment--One by one, after my experiments had reached the point where I felt the instrument might be safely applied to human beings, certain of Earth's biologists were treated. In each case they were men I knew to be in sympathy with the Zealots--the extremists, that is. They all survived, though secondary effects made themselves shown after a time. One of them was brought back for treatment eventually. I could not save him. But, in his dying delirium, I found out."

It was close upon midnight. The day had been long and much had happened. But now something stirred within Arvardan. He said tightly, "I wish you'd get to the point."

Shekt said, "I beg your patience. I must explain thoroughly, if you're to believe me. You, of course, know of Earth's peculiar environment--its radioactivity--"

"Yes, I have a fair knowledge of the matter."

"And of the effect of this radioactivity upon Earth and its economy?"

"Yes."

"Then I won't belabor the point. I need only say that the incidence of mutation on Earth is greater than in the rest of the Galaxy. The idea of our enemies that Earthmen are different thus has a certain basis of physical truth. To be sure, the mutations are minor, and most possess no survival value. If any permanent change has occurred in Earthmen, it is only in some aspects of their internal chemistry which enables them to display greater resistance to their own particular environment. Thus they show greater resistance to radiation effects, more rapid healing of burned tissues--"

"Dr. Shekt, I am acquainted with all you say."

"Then has it ever occurred to you that these mutational processes occur in living species on Earth other than human?"

There was a short silence, and then Arvardan said, "Why, no, it hasn't, though, of course, it is quite inevitable, now that you mention it."

"That is so. It happens. Our domestic animals exist in greater variety than on any other inhabited world. The orange you ate is a mutated variety, which exists nowhere else. It is this, among other things, which makes the orange so unacceptable for export. Outsiders suspect it as they suspect us--and we ourselves guard it as a valuable property peculiar to ourselves. And of course what applies to animals and plants applies also to microscopic life."

And now, indeed, Arvardan felt the thin pang of fear enter.

He said, "You mean--bacteria?"

"I mean the whole domain of primitive life. Protozoa, bacteria, and the self-reproducing proteins that some people call viruses. "

"And what are you getting at?"

"I think you have a notion of that, Dr. Arvardan. You seem suddenly interested. You see, there is a belief among your people that Earthmen are bringers of death, that to associate with an Earthman is to die, that Earthmen are the bearers of misfortune, possess a sort of evil eye--"

"I know all that. It is merely superstition."

"Not entirely. That is the dreadful part. Like all common beliefs, however superstitious, distorted, and perverted, it has a speck of truth at bottom. Sometimes, you see, an Earthman carries Within his body some mutated form of microscopic parasite which is not quite like any known elsewhere, and to which, sometimes, Outsiders are not particularly resistant. What follows is simple biology, Dr. Arvardan. "

Arvardan was silent.

Shekt went on, "We are caught sometimes, too, of course. A new species of germ will make its way out of the radioactive mists and an epidemic will sweep the planet, but, by and large, Earthmen have kept pace. For each variety of germ and virus, we build our defense over the generations, and we survive. Outsiders don't have the opportunity."

"Do you mean," said Arvardan with a strangely faint sensation, "that contact with you now--" He pushed his chair back. He was thinking of the evening's kisses.

Shekt shook his head. "Of course not. We don't create the disease; we merely carry it. And even such carriage occurs very rarely. If I lived on your world, I would no more carry the germ than you would; I have no special affinity for it. Even here it is only one out of every quadrillion germs, or one out of every quadrillion of quadrillions, that is dangerous. The chances of your infection right now are less than that of a meteorite penetrating the roof of this house and hitting you. Unless the germs in question are deliberately searched for, isolated, and concentrated."

Again a silence, longer this time. Arvardan said in a queer, strangled voice, "Have Earthmen been doing that?"

He had stopped thinking in terms of paranoia. He was ready to believe.

"Yes. But for innocent reasons, at first. Our biologists are, of course, particularly interested in the peculiarities of Earth life, and, recently, isolated the virus of Common Fever."

"What is Common Fever?"

"A mild endemic disease on Earth. That is, it is always with us. Most Earthmen have it in their childhood, and its symptoms are not very severe. A mild fever, a transitory rash, and inflammation of the joints and of the lips, combined with an annoying thirst. It runs its course in four to six days, and the subject is thereafter immune. I've had it. Pola has had it. Occasionally there is a more virulent form of this same disease--a slightly different strain of virus is concerned, presumably--and then it is called Radiation Fever."

"Radiation Fever. I've heard of it," said Arvardan.

"Oh, really? It is called Radiation Fever because of the mistaken notion that it is caught after exposure to radioactive areas. Actually, exposure to radioactive areas is often followed by Radiation Fever, because it is in those areas that the virus is most apt to mutate to dangerous forms. But it is the virus and not the radiation which does it. In the case of Radiation Fever, symptoms develop in a matter of two hours. The lips are so badly affected that the subject can scarcely talk, and he may be dead in a matter of days.

"Now, Dr. Arvardan, this is the crucial point. The Earthman has adapted himself to Common Fever and the Outsider has not. Occasionally a member of the Imperial garrison is exposed to it, and, in that case, he reacts to it as an Earthman would to Radiation Fever. Usually he dies within twelve hours. He is then burned--by Earthmen--since any other soldier approaching also dies.

"The virus, as I say, was isolated ten years ago. It is a nucleoprotein, as are most filtrable viruses, which, however, possesses the remarkable property of containing an unusually high concentration of radioactive carbon, sulphur, and phosphorus. When I say unusually high I mean that fifty per cent of its carbon, sulphur, and phosphorus is radioactive. It is supposed that the effects of the organism on its host is largely that of its radiations, rather than of its toxins. Naturally it would seem logical that Earthmen, who are adapted to gamma radiations, are only slightly affected. Original research in the virus centered at first about the method whereby it concentrated its radioactive isotopes. As you know, no chemical means can separate isotopes except through very long and tedious procedures. Nor is any organism other than this virus known which can do so. But then the direction of research changed.

"I'll be short, Dr. Arvardan. I think you see the rest. Experiments might be conducted on animals from outside Earth, but not on Outsiders themselves. The numbers of Outsiders on Earth were too few to allow several to disappear without notice. Nor could premature discovery of their plans be allowed. So it was a group of bacteriologists that was sent to the Synapsifier.. to return with insights enormously developed. It was they who developed a new mathematical attack on protein chemistry and on immunology, which enabled them finally to develop an artificial strain of virus that was designed to affect Galactic human beings--Outsiders--only. Tons of the crystallized virus now exist."

Arvardan was haggard. He felt the drops of perspiration glide sluggishly down his temple and cheek.

"Then you are telling me," he gasped, "that Earth intends to set loose this virus on the Galaxy; that they will initiate a gigantic bacteriological warfare--"

"Which we cannot lose and you cannot win. Exactly. Once the epidemic starts, millions will die each day, and nothing will stop it. Frightened refugees fleeing across space will carry the virus with them, and if you attempt to blow up entire planets, the disease can be started again in new centers. There will be no reason to connect the matter with Earth. By the time our own survival becomes suspicious, the ravages will have progressed so far, the despair of the Outsiders will be so deep, that nothing will matter to them."

"And all will die?" The appalling horror did not penetrate--could not.

"Perhaps not. Our new science of bacteriology works both ways. We have the antitoxin as well, and the means of production thereof. It might be used in case of early surrender. Then there may be some out-of-the-way eddies of the Galaxy that could escape, or even a few cases of natural immunity."

In the horrible blankness that followed--during which Arvardan never thought of doubting the truth of what he had heard, the horrible truth which at a stroke wiped out the odds of twenty-five billion to one--Shekt's voice was small and tired.

"It is not Earth that is doing this. A handful of leaders, perverted by the gigantic pressure that excluded them from the Galaxy, hating those who keep them outside, wanting to strike back at any cost, and with insane intensity--

Once they have begun, the rest of Earth must follow. What can it do? In its tremendous guilt, it will have to finish what it started. Could it allow enough of the Galaxy to survive and thus risk a later punishment?

"Yet before I am an Earthman, I am a man. Must trillions die for the sake of millions? Must a civilization spreading over a Galaxy crumble for the sake of the resentment, however justified, of a single planet? And will we be better off for all that? The power in the Galaxy will reside still on those worlds with the necessary resources--and we have none. Earthmen may even rule at Trantor for a generation, but their children will become Trantorians, and in their turn will look down upon the remnant on Earth.

"And besides, is there an advantage to Humanity to exchange the tyranny of a Galaxy for the tyranny of Earth? No--no--There must be a way out for all men, a way to justice and freedom."

His hands stole to his face, and behind their gnarled fingers he rocked gently to and fro.

Arvardan had heard all this in a numbed haze. He mumbled, "There is no treason in what you have done, Dr. Shekt. I will go to Everest immediately. The Procurator will believe me. He must believe me."

There was the sound of running footsteps, the flash of a frightened face into the room, the door left swinging open.

"Father--Men are coming up the walk."

Dr. Shekt went gray. "Quickly, Dr. Arvardan, through the garage." He was pushing violently. "Take Pola, and don't worry about me. I'll hold them back."

But a man in a green robe waited for them as they turned. He wore a thin smile and carried, with a casual ease, a neuronc whip. There was a thunder of fists at the main door, a crash, and the sound of pounding feet.

"Who are you?" demanded Arvardan in a feeble defiance of the armed green-robe. He had stepped before Pola.

"I?" said Green-robe harshly. "I am merely the humble Secretary of His Excellency, the High Minister." He advanced. "I almost waited too long. But not quite. Hmm, a girl, too. Injudicious--"

Arvardan said evenly, "I am a Galactic citizen, and I dispute your right to detain me--or, for that matter, to enter this house--without legal authority."

"I"--and the Secretary tapped his chest gently with his free hand--"am all the right and authority on this planet. Within a short time I will be all the right and authority on the Galaxy. We have all of you, you know--even Schwartz."

"Schwartz!" cried Dr. Shekt and Pola, nearly together.

"You are surprised? Come, I will bring you to him."

The last thing Arvardan was conscious of was that smile, expanding--and the flash of the whip. He toppled through a crimson sear of pain into unconsciousness.

16. CHOOSE YOUR SIDE!

For the moment Schwartz was resting uneasily on a hard bench in one of the small sub-basement rooms of the Chica "Hall of Correction."

The Hall, as it was commonly termed, was the great token of the local power of the High Minister and those surrounding him. It lifted its gloominess in a rocky, angular height that overshadowed the Imperial barracks beyond it, just as its shadow clutched at the Terrestrial malefactor far more than did the unexerted authority of the Empire.

Within its walls many an Earthman in past centuries had waited for the judgment that came to one who falsified or evaded the quotas of production, who lived past his time, or connived at another's such crime, or who was guilty of attempting subversion of the local government. Occasionally, when the petty prejudices of Terrestrial justice made particularly little sense to the sophisticated and usually blase Imperial government of the time, a conviction might be set aside by the Procurator, but this meant insurrection, or, at the very least, wild riots.

Ordinarily, where the Council demanded death, the Procurator yielded. After all. it was only Earthmen who suffered--

Of all this, Joseph Schwartz, very naturally, knew nothing. To him, immediate optical awareness consisted of a small room, its walls transfused with but a dim light, its furniture consisting of two hard benches and a table, plus a small recess in the wall that served as washroom and sanitary convenience combined. There was no window for a glimpse of sky, and the drift of air into the room through the ventilating shaft was feeble.

He rubbed the hair that circled his bald spot and sat up ruefully. His attempt to escape to nowhere (for where on Earth was he safe?) had been short, not sweet, and had ended here.

At least there was the Mind Touch to play with.

But was that bad or good?

At the farm it had been a queer, disturbing gift, the nature of which he did not know, the possibilities of which he did not think of. Now it was a flexible gift to be investigated.

With nothing to do for twenty-four hours but brood on imprisonment, he could have been courting madness. As it was, he could Touch the jailers as they passed, reach out for guardsmen in the adjacent corridors, extend the furthest fibrils of his mind even to the Captain of the Hall in his distant office.

He turned the minds over delicately and probed them. They fell apart like so many walnuts--dry husks out of which emotions and notions fell in a sibilant rain.

He learned much in the process of Earth and Empire--more than he had, or could have, in all two months on the farm.

Of course one of the items that he learned, over and over again, beyond any chance of mistaking, was just this: He was condemned to death! There was no escape, no doubt, no reservation. It might be today; it might be tomorrow. But he would die.

Somehow it sank in and he accepted it almost gratefully. The door opened, and he was on his feet, in tense fear. One might accept death reasoningly, with every aspect of the conscious mind, but the body was a brute beast that knew nothing of reason. This was it!

No--it wasn't. The entering Mind Touch held nothing of death in it. It was a guard with a metal rod held ready in his hand. Schwartz knew what it was.

"Come with me," he said sharply.

Schwartz followed him, speculating on this odd power of his. Long before his guard could use his weapon, long before he could possibly know he should, he could be struck down without a sound, without a giveaway moment. His Mind was in Schwartz's mental hands. A slight squeeze and it would be over.

But why? There would be others. How many could he handle at once? How many pairs of hands were in his mind?

He followed, docilely.

It was a large, large room that he was brought into. Two men and a girl occupied it, stretched out corpse-wise on high, high benches. Yet not corpses--since three active minds were much in evidence.

Paralyzed! Familiar? . . . Were they familiar?

He was stopping to look, but the guard's hard hand was on his shoulder. "Get on."

There was a fourth slab, empty. There was no death in the guard's mind, so Schwartz climbed on. He knew what was coming.

The guard's steely rod touched each of his limbs. They tingled and left him, so that he was nothing but a head, floating on nothingness.

He turned it.

"Pola," he cried. "You're Pola, aren't you? The girl who--"

She was nodding. He hadn't recognized her Touch as such. He had never been aware of it that time two months ago. At that time his mental progression had reached only the stage of sensitivity to "atmosphere." In the brilliance of hindsight, he remembered that well.

But from the contents he could still learn much. The one past the girl was Dr. Shekt; the one furthest of all was Dr. Bel Arvardan. He could filch their names, sense their despair, taste the last dregs of horror and fright in the young girl's mind.

For a moment he pitied them, and then he remembered who they were and what they were. And he hardened his heart.

Let them die!

The other three had been there for the better part of an hour. The room in which they were left was evidently one used for assemblies of several hundred. The prisoners were lost and lonely in its size. Nor was there anything to say. Arvardan's throat bummed

dryly and he turned his head from side to side with a futile restlessness. It was the only part of his body that he could move.

Shekt's eyes were closed and his lips were colorless and pinched.

Arvardan whispered fiercely, "Shekt. Shekt, I say!"

"What?. . . What?" A feeble whisper at best.

"What are you doing? Going to sleep? Think, man, think!"

"Why? What is there to think of?"

"Who is this Joseph Schwartz?"

Pola's voice sounded, thin and weary. "Don't you remember, Bel? That time in the department store, when I first met you--so long ago?"

Arvardan wrenched wildly and found he could lift his head two aching inches. A bit of Pola's face was just visible.

"Pola! Pola!" If he could have moved toward her--as for two months he might have and hadn't. She was looking at him, smiling so wanly that it might be a statue's smile, and he said, "We'll win out yet. You'll see."

But she was shaking her head--and his neck gave way, its tendons in panging agony.

"Shekt," he said again. "Listen to me. How did you meet this Schwartz? Why was he a patient of yours?"

"The Synapsifier. He came as a volunteer."

"And was treated?"

"Yes."

Arvardan revolved that in his mind. "What made him come to you?"

"I don't know."

"But then--Maybe he is an Imperial agent."

(Schwartz followed his thought well and smiled to himself. He said nothing, and he meant to keep on saying nothing.)

Shekt stirred his head. "An Imperial agent? You mean because the High Priest's Secretary says he is. Oh, nonsense. And what difference does it make? He's as helpless as we. . . .Listen, Arvardan, maybe, if we tell some sort of concerted story, they might wait. Eventually we might--"

The archaeologist laughed hollowly, and his throat burned at the friction. "We might live, you mean. With the Galaxy dead and civilization in ruins? Live? I might as well die!"

"I'm thinking of Pola," muttered Shekt.

"I am too," said the other. "Ask her. . . .Pola, shall we surrender? Shall we try to live?"

Pola's voice was firm. "I have chosen my side. I don't want to die, but if my side dies, I'll go with it."

Arvardan felt somehow triumphant. When he brought her to Sirius, they might call her an Earthgirl, but she was their equal, and he would, with a great and good pleasure, smash teeth into the throat of any--

And he remembered that he wasn't likely to bring her to Sirius--to bring anyone to Sirius. There wasn't likely to be a Sirius.

Then, as though to escape from the thought, to escape anywhere, he shouted, "You! Whatchername! Schwartz!"

Schwartz raised his head for a moment and allowed a glance to ooze out toward the other. He still said nothing.

"Who are you?" demanded Arvardan. "How did you get mixed up in this? What's your part in it?"

And at the question, all the injustice of everything descended on Schwartz. All the harmlessness of his past, all the infinite horror of the present burst in upon him, so that he said in a fury, "I? How did I get mixed up in it? Listen. I was once a nobody. An honest man, a hard-working tailor. I hurt nobody, I bothered nobody, I took care, of my family. And then, for no reason, for no reason--I came here."

"To Chica?" asked Arvardan, who did not quite follow.

"No, not to Chica!" shouted Schwartz in wild derision. "I came to this whole mad world. . . .Oh, what do I care if you believe me or not? My world is in the past. My world had land and food and two billion people, and it was the only world."

Arvardan fell silent before the verbal assault. He turned to Shekt. "Can you understand him?"

"Do you realize," said Shekt in feeble wonder, "that he has a vermiform appendix, which is three and a half inches long? Do you remember, Pola? And wisdom teeth. And hair on his face."

"Yes, yes," shouted Schwartz defiantly. "And I wish I had a tail I could show you. I'm from the past. I traveled through time. Only I don't know how, and I don't know why. Now leave me alone." He added suddenly, "They will soon be here for us. This wait is just to break us."

Arvardan said suddenly, "Do you know that? Who told you?"

Schwartz did not answer.

"Was it the Secretary? Stocky man with a pug nose?" Schwartz had no way of telling the physical appearance of those he Touched only by mind, but--secretary? There had been just a glimpse of a Touch, a powerful one of a man of power, and it seemed he had been a secretary.

"Balkis?" he asked in curiosity.

"What?" said Arvardan, but Shekt interrupted, "That's the name of the Secretary."

"Oh--What did he say?"

"He didn't say anything," said Schwartz. "I know. It's death for an of us, and there's no way out."

Arvardan lowered his voice. "He's mad, wouldn't you say?"

"I wonder. . . .His skull sutures, now. They were primitive, very primitive."

Arvardan was amazed. "You mean--Oh, come, it's impossible."

"I've always supposed so." For the moment Shekt's voice was a feeble imitation of normality, as though the presence of a scientific problem had switched his mind to that

detached and objective groove in which personal matters disappeared. "They've calculated the energy required to displace matter along the time axis and a value greater than infinity was arrived at, so the project has always been looked upon as impossible. But others have talked of the possibility of 'time faults,' analogous to geological faults, you know. Space ships have disappeared, for one thing, almost in fun view. There's the famous case of Hor Devallow in ancient times, who stepped into his house one day and never came out, and wasn't inside, either. . . .And then there's the planet, which you'll find in the Galactography books of the last century, which was visited by three expeditions that brought back fun descriptions--and then was never seen again.

"Then there are certain developments in nuclear chemistry that seem to deny the law of conservation of mass-energy. They've tried to explain that by postulating the escape of some mass along the time axis. Uranium nuclei, for instance, when mixed with copper and barium in minute but definite proportions, under the influence of light gamma irradiation, set up a resonating system--"

"Father," said Pola, "don't! There's no use--"

But Arvardan's interruption was peremptory. "Wait, now. Let me think. I'm the one who can settle this. Who better? Let me ask him a few questions. . . .Look, Schwartz."

Schwartz looked up again.

"Yours was the only world in the Galaxy?"

Schwartz nodded, then said dully, "Yes."

"But you only thought that. I mean you didn't have space travel, so you couldn't check up. There might have been many other inhabited worlds."

"I have no way of telling that."

"Yes, of course. A pity. What about atomic power?"

"We had an atomic bomb. Uranium--and plutonium--I guess that's what made this world radioactive. There must have been another war after all--after I left. . . .Atomic bombs." Somehow Schwartz was back in Chicago, back in his old world, before the bombs. And he wits sorry. Not for himself, but for that beautiful world. . . .

But Arvardan was muttering to himself. Then, " All right. You had a language, of course."

"Earth? Lots of them."

"How about you?"

"English--after I was a grown man."

"Well, say something in it."

For two months or more Schwartz had said nothing in English. But now, with lovingness, he said slowly, "I want to go home and be with my own people."

Arvardan spoke to Shekt. "18 that the language he used when he was Synapsified, Shekt?"

"I can't tell," said Shekt, in mystification. "Queer sounds then and queer sounds now. How can I relate them?"

"Well, never mind. . . .What's your word for 'mother' in your language, Schwartz?" Schwartz told him.

"Uh-huh. How about 'father'.. 'brother'. . . 'one'--the numeral, that is... 'two' ... 'three' ... 'house' ... 'man' ... 'wife' ..."

This went on and on, and when Arvardan paused for breath his expression was one of awed bewilderment.

"Shekt," he said, "either this man is genuine or I'm the victim of as wild a nightmare as can be conceived. He's speaking a language practically equivalent to the inscriptions found in the fifty-thousand-year-old strata on Sirius, Arcturus, Alpha Centauri, and twenty others. He speaks it. The language has only been deciphered in the last generation, and there aren't a dozen men in the Galaxy besides myself who can understand it."

"Are you sure of this?"

"Am I sure? Of course I'm sure. I'm an archaeologist. It's my business to know."

For an instant Schwartz felt his armor of aloofness cracking. For the first time he felt himself regaining the individuality he had lost. The secret was out; he was a man from the past, and they accepted it. It proved him sane, stilled forever that haunting doubt, and he was grateful. And yet he held aloof.

"I've got to have him." It was Arvardan again, burning in the holy flame of his profession. "Shekt, you have no idea what this means to archaeology. Shekt--it's a man from the past. Oh, Great Space!. . . Listen, we can make a deal. This is the proof Earth is looking for. They can have him. They can--"

Schwartz interrupted sardonically. "I know what you're thinking. You think that Earth will prove itself to be the source of civilization through me and that they will be grateful for it. I tell you, no! I've thought of it and I would have bartered for my own life. But they won't believe me--or you."

"There's absolute proof."

"They won't listen. Do you know why? Because they have certain fixed notions about the past. Any change would be blasphemy in their eyes, even if it were the truth. They don't want the truth; they want their traditions."

"Bel," said Pola, "I think he's right."

Arvardan ground his teeth. "We could try."

"We would fail," insisted Schwartz.

"How can you know?"

"I know!" And the words fell with such oracular insistence that Arvardan was silent before them.

It was Shekt who was looking at him now with a strange light in his tired eyes.

He asked softly, "Have you felt any bad effects as a result of the Synapsifier?"

Schwartz didn't know the word but caught the meaning. They had operated, and on his mind. How much he was learning!

He said, "No bad effects."

"But I see you learned our language rapidly. You speak it very well. In fact, you might be a native. Doesn't it surprise you?"

"I always had a very good memory," was the cold response.

"And so you feel no different now than before you were treated?"

"That's right."

Dr. Shekt's eyes were hard now, and he said, "Why do you bother? You know that I'm certain you know what I'm thinking."

Schwartz laughed shortly. "That I can read minds? Well. what of it?"

But Shekt had dropped him. He had turned his white, helpless face to Arvardan. "He can sense minds, Arvardan. How much I could do with him. And to be here--to be helpless. . . "

"What--what--what--" Arvardan popped wildly.

And even Pola's face somehow gained interest. "Can you really?" she asked Schwartz.

He nodded at her. She had taken care of him. and now they would kill her. Yet she was a traitor.

Shekt was saying, " Arvardan, you remember the bacteriologist I told you about, the one who died as a result of the effects of the Synapsifier? One of the first symptoms of mental breakdown was his claim that he could read minds. And he could. I found that out before he died, and it's been my secret. I've told no one--but it's possible, Arvardan, it's possible. You see, with the lowering of brain-cell resistance, the brain may be able to pick up the magnetic fields induced by the microcurrents of other's thoughts and reconvert it into similar vibrations in itself. It's the same principle as that of any ordinary recorder. It would be telepathy in every sense of the word--"

Schwartz maintained a stubborn and hostile silence as Arvardan turned slowly in his direction. "If this is so, Shekt, we might be able to use him." The archaeologist's mind was spinning wildly, working out impossibilities. "There may be a way out now. There must be a way out. For us and the Galaxy."

But Schwartz was cold to the tumult in the Mind Touch he sensed so clearly. He said, "You mean by my reading their minds? How would that help? Of course I can do more than read minds. How's that, for instance?"

It was a light push, but Arvardan yelped at the sudden pain of it..

"I did that," said Schwartz. "Want more?"

Arvardan gasped, "You can do that to the guards? To the Secretary? Why did you let them bring you here? Great Galaxy, Shekt, there'll be no trouble. Now, listen, Schwartz--"

"No," said Schwartz, "you listen. Why do I want to get out? Where will I be? Still on this dead world. I want to go home, and I can't go home. I want my people and my world, and I can't have them. And I want to die."

"But it's a question of all the Galaxy, Schwartz. You can't think of yourself."

"Can't I? Why not? Must I worry about your Galaxy now? I hope your Galaxy rots and dies. I know what Earth is planning to do, and I am glad. The young lady said before she had chosen her side. Well, I've chosen my side, and my side is Earth."

"What?"

"Why not? I'm an Earthman!"

17. CHANGE YOUR SIDE!

An hour had passed since Arvardan had first waded thickly out of unconsciousness to find himself slabbed like a side of beef awaiting the cleaver. And nothing had happened. Nothing but this feverish, inconclusive talk that unbearably passed the unbearable time.

None of it lacked purpose. He knew that much. To lie prone, helpless, without even the dignity of a guard, without even that much concession to a conceivable danger, was to become conscious of overwhelming weakness. A stubborn spirit could not survive it, and when the inquisitor did arrive there would be little defiance, or none, for him to be presented with.

Arvardan needed a break in the silence. He said, "I suppose this place is Spy-waved. We should have talked less."

"It isn't," came Schwartz's voice flatly. "There's nobody listening."

The archaeologist was ready with an automatic "How do you know?" but never said it.

For a power like that to exist! And not for him, but for a man of the past who called himself an Earthman and wanted to die!

Within optical sweep was only a patch of ceiling. Turning, he could see Shekt's angular profile; the other way, a blank wall. If he lifted his head he could make out, for a moment, Pola's pale, worn expression.

Occasionally there was the burning thought that he was a man of the Empire--of the Empire, by the Stars; a Galactic citizen--and that there was a particularly vile injustice in his imprisonment, a particularly deep impurity in the fact that he had allowed Earthmen to do this to him.

And that faded too.

They might have put him next to Pola. . . No, it was better this way. He was not an inspiring sight.

"Bel?" The word trembled into sound and was strangely sweet to Arvardan, coming as it did in this vortex of coming death.

"Yes, Pola?"

"Do you think they'll be much longer?"

"Maybe not, darling. . . It's too bad. We wasted two months, didn't we?"

"My fault," she whispered. "My fault. We might have had these last few minutes, though. It's so--unnecessary."

Arvardan could not answer. His mind whirred in circles of thought, lost on a greased wheel. Was it his imagination, or did he feel the hard plastic on which he was so stiffly laid? How long would the paralysis last?

Schwartz must be made to help. He tried guarding his thoughts--knew it to be ineffective.

He said, "Schwartz--"

Schwartz lay there as helpless, and with an added, uncalculated refinement to his suffering. He was four minds in one.

By himself he might have maintained his own shrinking eagerness for the infinite peace and quiet of death, fought down the last remnants of that love of life which even as recently as two days previously--three?--had sent him reeling away from the farm. But how could he? With the poor, weak horror of death that hung like a pall over Shekt; with the strong chagrin and rebellion of Arvardan's hard, vital mind; with the deep and pathetic disappointment of the young girl.

He should have closed his own mind. What did he need to know of the sufferings of others? He had his own life to live, his own death to die.

But they battered at him, softly, incessantly--probing and sifting through the crannies.

And Arvardan said, "Schwartz," then, and Schwartz knew that they wanted him to save them. Why should he? Why should he?

"Schwartz," repeated Arvardan insinuatingly, "you can live a hero. You have nothing to die for here--not for those men out there."

But Schwartz was gathering the memories of his own youth, clutching them desperately to his wavering mind. It was a queer amalgamation of past and present that finally brought forth his indignation.

But he spoke calmly, restrainedly. "Yes, I can live a hero--and a traitor. They want to kill me, those men out there. You call them men, but that was with your tongue; your mind called them something I didn't get, but it was vile. And not because they were vile, but because they were Earthmen."

"That's a lie," hotly.

"That is not a lie," as hotly, "and everyone here knows that. They want to kill me, yes--but that is because they think I'm one of your kind of people, who can condemn an entire planet at a stroke and drench it with your contempt, choke it slowly with your insufferable superiority. Well, protect yourself against these worms and vermin who are somehow managing to threaten their Godlike overlords. Don't ask for the help of one of them."

"You talk like a Zealot," said Arvardan with amazement. "Why? Have you suffered? You were a member of a large and independent planet, you say. You were an Earthman when Earth was the sole repository of life. You're one of us, man; one of the rulers. Why associate yourself with a desperate remnant? This is not the planet you remember. My planet is more like the old Earth than is this diseased world."

Schwartz laughed. "I'm one of the rulers, you say? Well, we won't go into that. It isn't worth explaining. Let's take you instead. You're a fine sample of the product sent us by the Galaxy. You are tolerant and wonderfully bighearted, and admire yourself because you treat Dr. Shekt as an equal. But underneath--yet not so far underneath that I can't see it plainly in your mind--you are uncomfortable with him. You don't like the way he talks or the way he looks. In fact, you don't like him, even though he is offering to betray Earth. . .

.Yes, and you kissed a girl of Earth recently and look back upon it as a weakness. You're ashamed of it--"

"By the Stars, I'm not. . . .Pola," desperately, "don't believe him. Don't listen to him."

Pola spoke quietly. "Don't deny it, or make yourself unhappy about it, Bel. He's looking below the surface to the residue of your childhood. He would see the same if he looked into mine. He would see things similar if he could look into his own in as ungentlemanly a fashion as he probes ours."

Schwartz felt himself reddening.

Pola's voice did not rise in pitch or intensity as she addressed him directly. "Schwartz, if you can sense minds, investigate mine. Tell me if I intend treason. Look at my father. See if it is not true that he could have avoided the Sixty easily enough if he had co-operated with the madmen who will ruin the Galaxy. What has he gained by his treason?. . . And look again, see if any of us wish to harm Earth or Earthmen.

"You say you have caught a glimpse of Balkis's mind. I don't know what chance you have had to poke through its dregs. But when he's back, when it's too late, sift it, strain his thoughts. Find out that he's a madman--Then, die!"

Schwartz was silent.

Arvardan broke in hurriedly, "All right. Schwartz, tackle my mind now. Go as deep as you want. I was born on Baronn in the Sirius Sector. I lived my life in an atmosphere of anti-Terrestrialism in the formative years, so I can't help what flaws and follies lie at the roots of my subconscious. But look on the surface and tell me if, in my adult years, I have not fought bigotry in myself. Not in others; that would be easy. But in myself, and as hard as I could.

"Schwartz, you don't know our history! You don't know of the thousands and tens of thousands of years in which Man spread through the Galaxy--of the wars and misery. You don't know of the first centuries of the Empire, when still there was merely a confusion of alternating despotism and chaos. It is only in the last two hundred 'years, now, that our Galactic government has become a representative one. Under it the various worlds are allowed their cultural autonomy--have been allowed to govern themselves--have been allowed voices in the common rule of all.

"At no time in history has Humanity been as free from war and poverty as now; at no time has Galactic economy been so wisely adjusted; at no time have prospects for the future been as bright. Would you destroy it and begin all over? And with what? A despotic theocracy with only the unhealthy elements of suspicion and hatred in it.

"Earth's grievance is legitimate and will be solved someday, if the Galaxy lives. But what they will do is no solution. Do you know what they intend doing?"

If Arvardan had had the ability that had come to Schwartz, he would have detected the struggle in Schwartz's mind. Intuitively, however, he knew the time had come to halt for a moment.

Schwartz was moved. All those worlds to die--to fester and dissolve in horrible disease. . . Was he an Earthman after all? Simply an Earthman? In his youth he had left

Europe and gone to America, but was he not the same man despite that? And if after him men had left a torn and wounded earth for the worlds beyond the sky, were they less Earthmen? Was not all the Galaxy his? Were not they all--all--descended from himself and his brothers?

He said heavily, "All right, I'm with you. How can I help?"

"How far out can you reach for minds?" asked Arvardan eagerly, with a hastening quickness as though afraid still of a last change of mind.

"I don't know. There are minds outside. Guards, I suppose. I think I can reach out into the street even, but the further I go, the less sharp it becomes."

"Naturally," said Arvardan. "But how about the Secretary? Could you identify his mind?"

"I don't know," mumbled Schwartz.

A pause. . . The minutes stretched by unbearably.

Schwartz said, "Your minds are in the way. Don't watch me. Think of something else."

They tried to. Another pause. Then, "No--I can't--I can't."

Arvardan said with a sudden intensity, "I can move a bit--Great Galaxy, I can wiggle my feet. . . .Ouch!" Each motion was a savage twinge.

He said, "How hard can you hurt someone, Schwartz? Can you do it harder than the way you hurt me a while back I mean?"

"I've killed a man."

"You have? How did you do that?"

"I don't know. It just gets done. It's--it's--" Schwartz looked almost comically helpless in his effort to put the wordless into words.

"Well, can you handle more than one at a time?"

"I've never tried, but I don't think so. I can't read two minds at one time."

Pola interrupted. "You can't have him kill the Secretary, Bel. It won't work."

"Why not?"

"How will we get out? Even if we caught the Secretary alone and killed him, there would be hundreds waiting for us outside. Don't you see that?"

But Schwartz broke in, huskily, "I've got him."

"Whom?" It came from all three. Even Shekt was staring wildly at him.

"The Secretary. I think it's his Mind Touch."

"Don't let him go." Arvardan almost rolled over in his attempts at exhortation, and tumbled off the slab, thumping to the floor with one half-paralyzed leg working futilely to wedge underneath his body and lift.

Pola cried, "You're hurt!" and suddenly found the hinges of her arm uncreaking as she tried to lift her elbow.

"No, it's all right. Suck him dry, Schwartz. Get all the information you can."

Schwartz reached out until his head ached. He clutched and clawed with the tendrils of his own mind, blindly, clumsily--like an infant thrusting out fingers it can't quite

handle for an object it can't quite reach. Until now he had taken whatever he could find, but now he was looking--looking--

Painfully, he caught wisps. "Triumph! He's sure of the results. . . .Something about space bullets. He's started them. . . .No, not started. Something else. . . .He's going to start them."

Shekt groaned. "They're automatically guided missiles to carry the virus, Arvardan. Aimed at the various planets."

"But where are they kept, Schwartz?" insisted Arvardan. "Look, man, look--"

"There's a building I--can't--quite--see. . . .Five points--a star--a name; Sloo, maybe--"

Shekt broke in again. "That's it. By all the stars in the Galaxy, that's it. The Temple of Senloo. It's surrounded by radioactive pockets on all sides. No one would ever go there but the Ancients. Is it near the meeting of two large rivers, Schwartz?"

"I can't--Yes--yes--yes."

"When, Schwartz, when? When will they be set off?"

"I can't see the day, but soon--soon. His mind is bursting with that--It will be very soon." His own head seemed bursting with the effort.

Arvardan was dry and feverish as he raised himself finally to his hands and knees, though they wobbled and gave under him. "Is he coming?"

"Yes. He's at the door."

His voice sank and stopped as the door opened.

Balkis's voice was one of cold derision as he filled the room with success and triumph. "Dr. Arvardan! Had you not better return to your seat?"

Arvardan looked up at him, conscious of the cruel indignity of his own position, but there was no answer to make, and he made none. Slowly he allowed his aching limbs to lower him to the ground. He waited there, breathing heavily. If his limbs could return a bit more, if he could make a last lunge, if he could somehow seize the other's weapons.

That was no neuronc whip that dangled so gently from the smoothly gleaming Flexiplast belt that held the Secretary's robe in place. It was a full-size blaster that could shred a man to atoms in an instantaneous point of time.

The Secretary watched the four before him with a savage sense of satisfaction. The girl he tended to ignore, but otherwise it was a clean sweep. There was the Earthman traitor; there the Imperial agent; and there the mysterious creature they had been watching for two months. Were there any others?

To be sure, there was still Ennius, and the Empire. Their arms, in the person of these spies and traitors, were pinioned, but there remained an active brain somewhere--perhaps to send out other arms.

The Secretary stood easily, hands clasped in contemptuous disregard of any possible necessity of quickly reaching his weapon. He spoke quietly and gently. "Now it is necessary to make things absolutely clear. There is war between Earth and the Galaxy--undeclared as yet, but, nevertheless, war. You are our prisoners and will be treated as will

be necessary under the circumstances. Naturally the recognized punishment for spies and traitors is death--"

"Only in the case of legal and declared war," broke in Arvardan fiercely.

"Legal war?" questioned the Secretary with more than a trace of a sneer. "What is legal war? Earth has always been at war with the Galaxy, whether we made polite mention of the fact or not."

"Don't bother with him," said Pola to Arvardan softly. "Let him have his say and finish with it."

Arvardan smiled in her direction. A queer, spasmodic smile, for it was with a vast strain that he staggered to his feet and remained there, gasping.

Balkis laughed softly. With unhurried steps he shortened the distance between himself and the Sirian archaeologist to nothing. With an equally unhurried gesture he rested a soft hand upon the broad chest of the other and shoved.

With splintering arms that would not respond to Arvardan's demand for a warding motion, with stagnant trunk muscles that could not adjust the body's balance at more than snail speed, Arvardan toppled.

Pola gasped. Lashing her own rebellious flesh and bone, she descended from her particular bench slowly--so slowly.

Balkis let her crawl toward Arvardan.

"Your lover," he said. "Your strong Outsider lover. Run to him, girl! Why do you wait? Clasp your hero tightly and forget in his arms that he steams in the sweat and blood of a billion martyred Earthmen. And there he lies, bold and valiant--brought to Earth by the gentle push of an Earthman's hand."

Pola was on her knees beside him now, her fingers probing beneath the hair for blood or the deadly softness of crushed bone. Arvardan's eyes opened slowly and his lips formed a "Never mind!"

"He's a coward," said Pola, "who would fight a paralyzed man and boast his victory. Believe me, darling, few Earthmen are like that."

"I know it, or you would not be an Earthwoman."

The Secretary stiffened. "As I said, all lives here are forfeit, but, nevertheless, can be bought. Are you interested in the price?"

Pola said proudly, "In our case, you would be. That I know."

"Ssh, Pola." Arvardan had not yet recovered his breath entirely. "What are you proposing?"

"Oh," said Balkis, "you are willing to sell yourself? As I would be, for instance? I, a vile Earthman?"

"You know best what you are," retorted Arvardan. "As for the rest, I am not selling myself; I am buying her."

"I refuse to be bought," said Pola.

"Touching," grated the Secretary. "He stoops to our females, our Earthie-squaws--and can still play-act at sacrifice."

"What are you proposing?" demanded Arvardan.

"This. Obviously, word of our plans has leaked out. How it got to Dr. Shekt is not difficult to see, but how it got to the Empire is puzzling. We would like to know, therefore, just what the Empire does know. Not what you have learned, Arvardan, but what the Empire now knows."

"I am an archaeologist and not a spy," bit out Arvardan. "I don't know anything at all about what the Empire knows --but I hope they know a damned lot."

"So I imagine. Well, you may change your mind. Think, all of you."

Throughout, Schwartz had contributed nothing; nor had he raised his eyes.

The Secretary waited, then said, perhaps a trifle savagely, "Then I'll outline the price to you of your non-co-operation. It will not be simply death, since I am quite certain that all of you are prepared for that unpleasant and inevitable eventuality. Dr. Shekt and the girl, his daughter, who, unfortunately for herself, is implicated to a deadly extent, are citizens of Earth. Under the circumstances, it will be most appropriate to have both subjected to the Synapsifier. You understand, Dr. Shekt?"

The physicist's eyes were pools of pure horror.

"Yes, I see you do," said Balkis. "It is, of course, possible to allow the Synapsifier to damage brain tissue just sufficiently to allow the production of an acerebral imbecile. It is a most disgusting state: one in which you will have to be fed, or starve; be cleaned, or live in dung; be shut up, or remain a study in horror to all who see. It may be a lesson to others in the great day that is coming.

"As for you"--and the Secretary turned to Arvardan--"and your friend Schwartz, you are Imperial citizens, and therefore suitable for an interesting experiment. We have never tried our concentrated fever virus on you Galactic dogs. It would be interesting to show our calculations correct.

A small dose, you see, so that death is not quick. The disease might work its way to the inevitable over a period of a week, if we dilute the injection sufficiently. It will be very painful."

And now he paused and watched them through slitted eyes. "All that," he said, "is the alternative to a few well-chosen words at the present time. How much does the Empire know? Have they other agents active at the present moment? What are their plans, if any, for counteraction?"

Dr. Shekt muttered, "How do we know that you won't have us killed anyway, once you have what you want of us?"

"You have my assurance that you will die horribly if you refuse. You will have to gamble on the alternative. What do you say?"

"Can't we have time?"

"Isn't that what I'm giving you now? Ten minutes have passed since I entered, and I am still listening. . . .Well, have you anything to say? What, nothing? Time will not endure forever, you must realize. Arvardan, you still knot your muscles. You think perhaps you can reach me before I can draw my blaster. Well, what if you can? There are hundreds outside, and my plans will continue without me. Even your separate modes of punishment will continue without me.

"Or perhaps you, Schwartz. You killed our agent. It was you, was it not? Perhaps you think you can kill me?"

For the first time Schwartz looked at Balkis. He said coldly, "I can, but I won't."

"That is kind of you."

"Not at all. It is very cruel of me. You say yourself that there are things worse than simple death."

Arvardan found himself suddenly staring at Schwartz in a vast hope.

18. DUEL!

Schwartz's mind was whirling. In a queer, hectic way he felt at ease. There was a piece of him that seemed in absolute control of the situation, and more of him that could not believe that. Paralysis had been applied later to him than to the others. Even Dr. Shekt was sitting up, while he himself could just budge an arm and little more.

And, staring up at the leering mind of the Secretary, infinitely foul and infinitely evil, he began his duel.

He said, "I was on your side originally, for all that you were preparing to kill me. I thought I understood your feelings and your intentions. . . .But the minds of these others here are relatively innocent and pure, and yours is past description. It is not even for the Earthman you fight, but for your own personal power. I see in you not a vision of a free Earth, but of a re-enslaved Earth. I see in you not the disruption of the Imperial power, but its replacement by a personal dictatorship."

"You see all that, do you?" said Balkis. "Well, see what you wish. I don't need your information after all, you know--not so badly that I must endure insolence. We have advanced the hour of striking, it seems. Had you expected that? Amazing what pressure will do, even on those who swear that more speed is impossible. Did you see that, my dramatic mind reader?"

Schwartz said, "I didn't. I wasn't looking for it, and it passed my notice. . . .But I can look for it now. Two days--Less--Let's see--Tuesday--six in the morning--Chica time."

The blaster was in the Secretary's hand, finally. He advanced in abrupt strides and towered over Schwartz's drooping figure.

"How did you know that?"

Schwartz stiffened; somewhere mental tendrils bunched and grasped. Physically his jaw muscles clamped rigorously shut and his eyebrows curled low, but these were purely irrelevant--involuntary accompaniments to the real effort. Within his brain there was that which reached out and seized hard upon the Mind Touch of the other.

To Arvandan, for precious, wasting seconds, the scene was meaningless; the Secretary's sudden motionless silence was not significant.

Schwartz muttered gaspingly, "I've got him. . . .Take away his gun. I can't hold on--" It died away in a gurgle.

And then Arvandan understood. With a lurch he was on all fours. Then slowly, grindingly, he lifted himself once more, by main force, to an unsteady erectness. Pola tried to rise with him, could not quite make it. Shekt edged off his slab, sinking to his knees. Only Schwartz lay there, his face working.

The Secretary might have been struck by the Medusa sight. On his smooth and unfurrowed forehead perspiration gathered slowly, and his expressionless face hinted of no emotion. Only that right hand, holding the blaster, showed any signs of life. Watch closely, and you might see it jerk ever so gently; note the curious flexing pressure of it

upon the contact button: a gentle pressure, not enough to do harm, but returning, and returning--

"Hold him tight," gasped Arvardan with a ferocious joy. He steadied himself on the back of a chair and tried to gain his breath. "Let me get to him."

His feet dragged. He was in a nightmare, wading through molasses, swimming through tar; pulling with torn muscles, so slowly--so slowly.

He was not--could not be--conscious of the terrific duel that proceeded before him.

The Secretary had only one aim, and that was to put just the tiniest force into his thumb--three ounces, to be exact, since that was the contact pressure required for the blaster's operation. To do so his mind had only to instruct a quivering balanced tendon, already half contracted, to--to--

Schwartz had only one aim, and that was to restrain that pressure--but in all the inchoate mass of sensation presented to him by the other's Mind Touch, he could not know which particular area was alone concerned with that thumb. So it was that he bent his efforts to produce a stasis, a complete stasis--

The Secretary's Mind Touch heaved and billowed against restraint. It was a quick and fearfully intelligent mind that confronted Schwartz's untried control. For seconds it remained quiescent, waiting--then, in a terrific, tearing attempt, it would tug wildly at this muscle or that--

To Schwartz it was as if he had seized a wrestling hold which he must maintain at all costs, though his opponent threw him about in frenzies.

But none of this showed. Only the nervous clenching and unclenching of Schwartz's jaw; the quivering lips, bloodied by the biting teeth--and that occasional soft movement on the part of the Secretary's thumb, straining--straining.

Arvardan paused to rest. He did not want to. He had to. His outstretched finger just touched the fabric of the Secretary's tunic and he felt he could move no more. His agonized lungs could not pump the breath his dead limbs required. His eyes were blurred with the tears of effort, his mind with the haze of pain.

He gasped, "Just a few more minutes, Schwartz. Hold him, hold him--"

Slowly, slowly, Schwartz shook his head. "I can't--I can't--"

And indeed, to Schwartz all the world was slipping away into dull, unfocused chaos. The tendrils of his mind were becoming stiff and nonresilient.

The Secretary's thumb pressed once again upon the contact. It did not relax. The pressure grew by tiny stages.

Schwartz could feel the bulging of his own eyeballs, the writhing expansion of the veins in his forehead. He could sense the awful triumph that gathered in the mind of the other.

Then Arvardan lunged. His stiff and rebellious body toppled forward, hands outstretched and clawing.

The yielding, mind-held Secretary toppled with him. The blaster flew sideways, clanging along the hard floor.

The Secretary's mind wrenched free almost simultaneously, and Schwartz fell back, his own skull a tangled jungle of confusion.

Balkis struggled wildly beneath the clinging dead weight of Arvardan's body. He jerked a knee into the other's groin with a vicious strength while his clenched fist came down sideways on Arvardan's cheekbone. He lifted and thrust--and Arvardan rolled off in huddled agony.

The Secretary staggered to his feet, panting and disheveled, and stopped again.

Facing him was Shekt, half reclining. His right hand, shakingly supported by the left, was holding the blaster, and although it quivered, the business end pointed at the Secretary.

"You pack of fools," shrilled the Secretary, passion-choked, "what do you expect to gain? I have only to raise my voice--"

"And you, at least," responded Shekt weakly, "will die."

"You will accomplish nothing by killing me," said the Secretary bitterly, "and you know it. You will not save the Empire you would betray us to--and you would not save even yourselves. Give me that gun and you will go free."

He extended a hand, but Shekt laughed wistfully. "I am not mad enough to believe that."

"Perhaps not, but you are half paralyzed." And the Secretary broke sharply to the right, far faster than the physicist's feeble wrist could veer the blaster.

But now Balkis's mind, as he tensed for the final jump" was utterly and entirely on the blaster he was avoiding. Schwartz extended his mind once again in a final jab, and the Secretary tripped and slammed downward as if he had been clubbed.

Arvardan had risen painfully to his feet. His cheek was red and swollen and he hobbled when he walked. He said, "Can you move, Schwartz?"

"A little," came the tired response. Schwartz slid out of his seat.

"Anyone else coming this way, maybe?"

"Not that I can detect."

Arvardan smiled grimly down at Pola. His hand was resting on her soft brown hair and she was looking up at him with brimming eyes. Several times in the last two hours he had been sure that never, never would he feel her hair or see her eyes again.

"Maybe there will be a later after an, Pola?"

And she could only shake her head and say, "There's not enough time. We only have till six o'clock Tuesday."

"Not enough time? Well, let's see." Arvardan bent over the prone Ancient and pulled his head back, none too gently.

"Is he alive?" He felt futilely for a pulse with his still-numb finger tips and then placed a palm beneath the green robe. He said, "His heart's beating, anyway. . . .You've a dangerous power there, Schwartz. Why didn't you do this in the first place?"

"Because I wanted to see him held static." Schwartz clearly showed the effects of his ordeal. "I thought that if I could hold him, we could lead him out before; use him as decoy; hide behind his skirts."

Shekt said, in sudden animation, "We might. There's the Imperial garrison in Fort Dibburn not half a mile away. Once there, we're safe and can get word to Ennius."

"Once there! There must be a hundred guards outside, with hundreds more between here and there--And what can we do with a stiff green-robe? Carry him? Shove him along on little wheels?" Arvardan laughed humorlessly.

"Besides," said Schwartz gloomily, "I couldn't hold him very long. You saw--I failed."

Shekt said earnestly, "Because you're not used to it. Now listen, Schwartz, I've got a notion as to what it is you do with your mind. It's a receiving station for the electromagnetic fields of the brain. I think you can transmit also. Do you understand?"

Schwartz seemed painfully uncertain.

"You must understand, " insisted Shekt. "You'll have to concentrate on what you want him to do--and first we're going to give him his blaster back."

"What!" The outraged exclamation was neatly triple.

Shekt raised his voice. "He's got to lead us out of here. We can't get out otherwise, can we? And how can it look less suspicious than to allow him to be obviously armed?"

"But I couldn't hold him. I tell you I couldn't." Schwartz was flexing his arms, slapping them, trying to get back into the feel of normality. "I don't care what your theories are, Dr. Shekt. You don't know what goes on. It's a slippery, painful thing, and it's not easy."

"I know, but it's the chance we take. Try it now, Schwartz. Have him move his arm when he comes to." Shekt's voice was pleading.

The Secretary moaned as he lay there, and Schwartz felt the reviving Mind Touch. Silently, almost fearfully, he let it gather strength--then spoke to it. It was a speech that included no words; it was the silent speech you send to your arm when you want it to move, a speech so silent you are not yourself aware of it.

And Schwartz's arm did not move; it was the Secretary's that did. The Earthman from the past looked up with a wild smile, but the others had eyes only for Balkis--Balkis, that recumbent figure, with a lifting head, with eyes from which the glaze of unconsciousness was vanishing, and an arm which peculiarly and incongruously jerked outward at a ninety-degree angle.

Schwartz bent to his task.

The Secretary lifted himself up in angular fashion; nearly, but not quite, overbalancing himself. And then, in a queer and involuntary way, he danced.

It lacked rhythm; it lacked beauty; but to the three who watched the body, and to Schwartz, who watched body and mind, it was a thing of indescribable awe. For in those moments the Secretary's body was under the control of a mind not materially connected with it.

Slowly, cautiously, Shekt approached the robotlike Secretary and, not without a qualm, extended his hand. In the open palm thereof lay the blaster, butt first.

"Let him take it, Schwartz," said Shekt.

Balkis's hand reached out and grasped the weapon clumsily. For a moment there was a sharp, devouring glitter in his eyes, and then it all faded. Slowly, slowly, the blaster was put into its place in the belt, and the hand fell away.

Schwartz's laugh was high-pitched. "He almost got away, there." But his face was white as he spoke.

"Well? Can you hold him?"

"He's fighting like the devil. But it's not as bad as before."

"That's because you know what you're doing," said Shekt, with an encouragement he did not entirely feel. "Transmit, now. Don't try to hold him; just pretend you're doing it yourself."

Arvardan broke in. "Can you make him talk?"

There was a pause, then a low, rasping growl from the Secretary. Another pause; another rasp.

"That's all," panted Schwartz.

"But why won't it work?" asked Pola. She looked worried.

Shekt shrugged. "Some pretty delicate and complicated muscles are involved. It's not like yanking at the long limb muscles. Never mind, Schwartz. We may get by without."

The memory of the next two hours was something no two of those that took part in the queer odyssey could duplicate. Dr. Shekt, for instance, had acquired a queer rigidity in which all his fears were drowned in one breathless and helpless sympathy with the inwardly struggling Schwartz. Throughout he had eyes only for that round face as it slowly furrowed and twisted with effort. For the others he had hardly time for more than a moment's glance.

The guards immediately outside the door saluted sharply at the appearance of the Secretary, his green robe redolent of officialdom and power. The Secretary returned the salute in a fumbling, flat manner. They passed, unmolested.

It was only when they had left the great Hall that Arvardan became conscious of the madness of it all. The great, unimaginable danger to the Galaxy and the flimsy reed of safety that bridged, perhaps, the abyss. Yet even then, even then, Arvardan felt himself drowning in Pola's eyes. Whether it was the life that was being snatched from him, the future that was being destroyed about him, the eternal unavailability of the sweetness he had tasted--whatever it was, no one had ever seemed to him to be so completely and devastatingly desirable.

In aftertime she was the sum of his memories. Only the girl--

And upon Pola the sunny brightness of the morning burned down so that Arvardan's downturned face blurred before her. She smiled up at him and was conscious of that strong, hard arm on which her own rested so lightly. That was the memory that lingered afterward. Flat, firm muscle lightly covered by glossy-textured plastic cloth, smooth and cool under her wrist--

Schwartz was in a sweating agony. The curving drive that led away from the side entrance from which they had emerged was largely empty. For that he was hugely thankful.

Schwartz alone knew the full cost of failure. In the enemy Mind that he controlled he could sense the unbearable humiliation, the surpassing hatred, the utterly horrible resolves. He had to search that Mind for the information that guided him--the position of the official ground car, the proper route to take--And, in searching, he also experienced the galling bitterness of the determined revenge that would lash out should his control waver for but the tenth part of the second.

The secret fastnesses of the Mind in which he was forced to rummage remained his personal possession forever. In aftertimes there came the pale gray hours of many an innocent dawn during which once again he had guided the steps of a madman down the dangerous walks of an enemy stronghold.

Schwartz gasped at the words when they reached the ground car. He no longer dared relax sufficiently to utter connected sentences. He choked out quick phrases: "Can't--drive car--can't make--him--make drive--complicated--can't--"

Shekt soothed him with a soft, clucking sound. He dared not touch him, dared not speak in an ordinary way, dared not distract Schwartz's mind for a second.

He whispered, "Just get him into the back seat, Schwartz. I'll drive. I know how. From now on just keep him still. and I'll take the blaster away."

The Secretary's ground car was a special model. Because it was special, it was different. It attracted attention. Its green headlight turned to the right and left in rhythmic swings as the light dimmed and brightened in emerald flashes. Men paused to watch. Ground cars advancing in the opposite direction moved to the side in a respectful hurry.

Had the car been less noticed, had it been less obtrusive. the occasional passer-by might have had time to note the pale, unmoving Ancient in the back seat--might have wondered--might have scented danger--

But they noticed only the car, so that time passed. . . .

A soldier blocked the way at the gleaming chromium gates that rose sheerly in the expansive, overwhelming way that marked all Imperial structures in sharp contrast to the squatly massive and brooding architecture of Earth. His huge force gun shot out horizontally in a barring gesture, and the car halted.

Arvardan leaned out. "I'm a citizen of the Empire, soldier. I'd like to see your commanding officer."

"I'll have to see your identification, sir."

"That's been taken from me. I am Bel Arvardan of Baronn, Sirius. I am on the Procurator's business and I'm in a hurry."

The soldier lifted a wrist to his mouth and spoke softly into the transmitter. There was a pause while he waited for an answer, and then he lowered his rifle and stepped aside. Slowly the gate swung open.

19. THE DEADLINE THAT APPROACHED

The hours that followed saw turmoil within and without Fort Dibburn. More so, perhaps, in Chica itself.

It was at noon that the High Minister at Washenn inquired via Communi-wave after his Secretary, and a search for the latter failed. The High Minister was displeased; the minor officials at the Hall of Correction were perturbed.

Questioning followed, and the guards outside the assembly room were definite that the Secretary had left with the prisoners at ten-thirty in the morning. . . .No, he had left no instructions. They could not say where he was going; it was, of course, not their place to ask.

Another set of guards was equally uninformed and uninformative. A general air of anxiety mounted and swirled.

At 2 P.M. the first report arrived that the Secretary's ground car had been seen that morning--no one had seen if the Secretary was within--some thought he had been driving, but had only assumed it, it turned out--

By two-thirty it had been ascertained that the car had entered Fort Dibburn.

At not quite three, it was finally decided to put in a call to the commander of the fort. A lieutenant had answered.

It was impossible at that time, they learned, for information on the subject to be given. However, His Imperial Majesty's officers requested that order be maintained for the present. It was further requested that news of the absence of a member of the Society of Ancients be not generally distributed until further notice.

But that was enough to achieve the direct opposite of the Imperial desires.

Men engaged in treason cannot take chances when one of the prime members of a conspiracy is in the hands of the enemy forty-eight hours before trigger time. It can mean only discovery or betrayal, and these are but the reverse sides of a single coin. Either alternative would mean death.

So word went out--

And the population of Chica stirred--

The professional demagogues were on the street corners. The secret arsenals were broken open and the hands that reached withdrew with weapons. There was a twisting drift toward the fort, and at 6 P.M. a new message was sent to the commandant, this time by personal envoy.

Meanwhile, this activity was matched in a smaller way by events within the fort. It had begun dramatically when the young officer meeting the entering ground car reached out a hand for the Secretary's blaster.

"I'll take that," he said curtly.

Shekt said, "Let him take it, Schwartz."

The Secretary's hand lifted the blaster and stretched out; the blaster left it, was carried away--and Schwartz, with a heaving sob of breaking tension, let go.

Arvardan was ready. When the Secretary lashed out like an insane steel coil released from compression, the archaeologist pounced upon him, fists pumping down hard.

The officer snapped out orders. Soldiers were running up. When rough hands laid hold of Arvardan's shirt collar and dragged him up, the Secretary was limp upon the seat. Dark blood was flowing feebly from the corner of his mouth. Arvardan's own already bruised cheek was open and bleeding.

He straightened his hair shakily. Then, pointing a rigid finger, said firmly, "I accuse that man of conspiring to overthrow the Imperial Government. I must have an immediate interview with the commanding officer."

"We'll have to see about that, sir," said the officer civilly. "If you don't mind, you will have to follow me--all of you."

And there, for hours, it rested. Their quarters were private, and reasonably clean. For the first time in twelve hours they had a chance to eat, which they did, despite considerations, with dispatch and efficiency. They even had the opportunity of that further necessity of civilization, a bath.

Yet the room was guarded, and as the hours passed, Arvardan finally lost his temper and cried, "But we've simply exchanged prisons."

The dull, meaningless routine of an army camp drifted about them, ignoring them. Schwartz was sleeping and Arvardan's eyes went to him. Shekt shook his head.

"We can't," he said. "It's humanly impossible. The man is exhausted. Let him sleep."

"But there are only thirty-nine hours left."

"I know--but wait."

A cool and faintly sardonic voice sounded. "Which of you claims to be a citizen of the Empire?"

Arvardan sprang forward. "I am. I--"

And his voice failed as he recognized the speaker. The latter smiled rigidly. His left arm he held a bit stiffly as a remaining memento of their last meeting.

Pola's voice was faint behind him. "Bel, it's the officer--the one of the department store."

"The one whose arm he broke," came the sharp addition. "My name is Lieutenant Claudy and yes, you are the same man. So you are a member of the Sirian worlds, are you? And yet you consort with these. Galaxy, the depths a man can sink to! And you've still got the girl with you." He waited and then said slowly and deliberately, "The Earthie-squaw!"

Arvardan bristled, then subsided. He couldn't--not yet.

He forced humbleness into his voice. "May I see the colonel, Lieutenant?"

"The colonel, I am afraid, is not on duty now."

"You mean he's not in the city?"

"I didn't say that. He can be reached--if the matter is sufficiently urgent."

"It is. . . .May I see the officer of the day?"

"At the moment I am the officer of the day."

"Then call the colonel."

And slowly the lieutenant shook his head. "I could scarcely do so without being convinced of the gravity of the situation.'

Arvardan was shaking with impatience. "By the Galaxy, stop fencing with me! It's life and death."

"Really?" Lieutenant Claudy swung a little swagger stick with an air of affected dandyism. "You might crave an audience with me."

"All right. . . .Well, I'm waiting. . . ."

"I said--you might crave one."

"May I have an audience, Lieutenant?"

But there was no smile on the lieutenant's face. "I said, crave one--before the girl. Humbly."

Arvardan swallowed and drew back. Pola's hand was on his sleeve. "Please, Bel. You mustn't get him angry."

The archaeologist growled huskily, "Bel Arvardan of Sirius humbly craves audience with the officer of the day."

Lieutenant Claudy said, "That depends. "

He took a step toward Arvardan and quickly and viciously brought the flat of his palm down hard upon the bandage that dressed Arvardan's open cheek.

Arvardan gasped and stifled a shriek.

The lieutenant said, "You resented that once. Don't you this time?"

Arvardan said nothing.

The lieutenant said, "Audience granted."

Four soldiers fell in before and behind Arvardan. Lieutenant Claudy led the way.

Shekt and Pola were alone with the sleeping Schwartz, and Shekt said, "I don't hear him any more, do you?"

Pola shook her head. "I haven't either, for quite a while. But, Father, do you suppose he'll do anything to Bel?"

"How can he?" said the old man gently. "You forget that he's not really one of us. He's a citizen of the Empire and cannot be easily molested. . . .You are in love with him, I suppose?"

"Oh, terribly, Father. It's silly, I know. . . ."

"Of course it is." Shekt smiled bitterly. "He is honest. I do not say he isn't. But what can he do? Can he live here with us on this world? Can he take you home? Introduce an Earthgirl to his friends? His family?"

She was crying. "I know. But maybe there won't be any afterwards."

And Shekt was on his feet again, as though the last phrase had reminded him. He said again, "I don't hear him."

It was the Secretary he did not hear. Balkis had been placed in an adjoining room, where his caged-lion steps had been clearly and ominously audible. Except that now they weren't.

It was a little point, but in the single mind and body of the Secretary there had somehow become centered and symbolized all the sinister force of disease and destruction that were being loosed on the giant network of living stars. Shekt jarred Schwartz gently. "Wake up," he said.

Schwartz stirred. "What is it?" He felt scarcely rested. His tiredness went in and in, so deep as to come out at the other side, projecting in jagged streaks.

"Where's Balkis?" urged Shekt.

"Oh--oh yes." Schwartz looked about wildly, then remembered that it was not with his eyes that he looked and saw most clearly. He sent out the tendrils of his mind and they circled, sensing tensely for the Mind they knew so well.

He found it, and avoided touching it. His long immersion in it had not increased his fondness for the clinging of its diseased wretchedness.

Schwartz muttered, "He's on another floor. He's talking to someone."

"To whom?"

"No one whose mind I've even Touched before. Wait--let me listen. Maybe the Secretary will--Yes, he calls him Colonel."

Shekt and Pola looked quickly at one another.

"It can't be treason, can it?" whispered Pola. "I mean, surely an officer of the Empire wouldn't deal with an Earthman against the Emperor, would he?"

"I don't know," said Shekt miserably. "I am ready to believe anything."

Lieutenant Claudy was smiling. He was behind a desk, with a blaster at his finger tips and the four soldiers behind him. He spoke with the authority that such a situation would lend one.

"I don't like Earthies," he said. "I never liked them. They're the scum of the Galaxy. They're diseased, superstitious, and lazy. They're degenerate and stupid. But, by the Stars, most of them know their place.

"In a way, I can understand them. That's the way they were born, and they can't help it. Of course I wouldn't endure what the Emperor endures from them--I mean their blasted customs and traditions--if I were the Emperor. But that's all right. Someday we'll learn--"

Arvardan exploded. "Now look here. I didn't come to listen--"

"You'll listen, because I'm not finished. I was about to say that what I can't understand is the workings of the mind of an Earthie-lover. When a man--a real man, supposedly--can get so low in filth as to crawl in among them and go nosing after their womenfolk, I have no respect for him. He's worse than they are--"

"Then to Space with you and your poor filthy excuse of a mind!" fiercely. "Do you know that there's treason against the Empire afoot? Do you know just how dangerous the situation is? Every minute you delay endangers everyone of the quadrillions in the Galaxy--"

"Oh, I don't know, Dr. Arvardan. It is Dr., isn't it? I mustn't forget your honors. You see, I've got a theory of my own. You're one of them. Maybe you were born in Sirius, but you've got a black Earthman's heart, and you're using your Galactic citizenship to advance their cause. You've kidnaped this official of theirs, this Ancient. (A good thing, by the way, in itself, and I wouldn't mind rattling his throat for him.) But the Earthmen are looking for him already. They've sent a message to the fort."

"They have? Already? Then why are we talking here? I must see the colonel if I have to--"

"You expect a riot, trouble of any sort? Perhaps you even planned one as the first step in an arranged revolt, eh?"

"Are you mad? Why would I want to do that?"

"Well, then, you wouldn't mind if we released the Ancient?"

"You cannot." Arvardan rose to his feet, and for a moment it looked as though he might hurl himself across the desk at the other.

But the blaster was in Lieutenant Claudy's hand. "Oh, can't we? Look here, now. I've gotten a little of my own back. I've slapped you and made you crawl before your Earthie pals. I've made you sit here while I told you to your face what a low worm you are. And now I would love an excuse to blast your arm off in exchange for what you did to mine. Now make another move."

Arvardan froze.

Lieutenant Claudy laughed and put his blaster away. "It's too bad I have to save you for the colonel He's to see you at five-fifteen."

"You knew that--you knew that all the time." Frustration tore his throat into hoarse sandpaper.

"Certainly."

"If the time we have lost, Lieutenant Claudy, means that the issue is lost, then neither of us will have much time to live." He spoke with an iciness that distorted his voice into something horrible. "But you will die first, because I shall spend my last minutes smashing your face into splintered bone and mashed brain."

"I'll be waiting for you, Earthie-lover. Any time!"

The commanding officer of Fort Dibburn had grown stiff in the service of the Empire. In the profound peace of the last generations there was little in the way of "glory" that any army officer could earn, and the colonel, in common with others, earned none. But in the long, slow rise from military cadet he had seen service in every part of the Galaxy--so that even a garrison on the neurotic world of Earth was to him but an additional chore. He wanted only the peaceful routine of normal occupation. He asked nothing beyond this, and for it was willing to humble himself--even, when it was necessary, to apologize to an Earthgirl.

He seemed tired when Arvardan entered. His shirt collar was open and his tunic, with its blazing yellow "Spaceship and Sun" of Empire, hung loosely over the back of his chair. He cracked the knuckles of his right hand with an abstracted air as he stared solemnly at Arvardan.

"A very confusing story, all this," he said, "very. I recall you well, young man. You are Bel Arvardan of Baronn, and the principal of a previous moment of considerable embarrassment. Can't you keep out of trouble?"

"It is not only myself that is in trouble, Colonel, but all the rest of the Galaxy as well."

"Yes, I know," somewhat impatiently. "Or at least I know that that is what you claim. I am told that you no longer have papers of identification."

"They were taken from me, but I am known at Everest. The Procurator himself can identify me, and will, I hope, before evening falls."

"We'll see about that." The colonel crossed his arms and teetered backward on his chair. "Suppose you give me your side of the story."

"I have been made aware of a dangerous conspiracy on the part of a small group of Earthmen to overthrow the Imperial Government by force, which, if not made known at once to the proper authorities, may well succeed in destroying both the Government and much of the Empire itself."

"You go too far, young man, in this very rash and farfetched statement. That the men of Earth could stage annoying riots, lay siege to this fort, do considerable damage, I am quite prepared to admit--but I do not for a moment conceive them capable of as much as driving the Imperial forces from this planet, let alone destroying the Imperial Government. Yet I will listen to the details of this--uh--plot."

"Unfortunately, the seriousness of the matter is such that I feel it vital that the details be told to the Procurator himself in person. I request, therefore, to be put into communication with him now, if you don't mind."

"Umm. . . .Let us not act too hurriedly. Are you aware that the man you have brought in is Secretary to the High Minister of Earth, one of their Ancients and a very important man to them?"

"Perfectly!"

"And yet you say that he is a prime mover in this conspiracy you mention."

"He is."

"Your evidence?"

"You will understand me, I am sure, when I say that I cannot discuss that with anyone but the Procurator."

The colonel frowned and regarded his fingernails. "Do you doubt my competency in the case?"

"Not at all, sir. It is simply that only the Procurator has the authority to take the decisive action required in this case."

"What decisive action do you refer to?"

"A certain building on Earth must be bombed and totally destroyed within thirty hours, or the lives of most, or all, of the inhabitants of the Empire will be lost."

"What building?" asked the colonel wearily. Arvardan snapped back. "May I be connected with the Procurator, please?"

There was a pause of deadlock. The colonel said stiffly, "You realize that in forcibly kidnaping an Earthman you have rendered yourself liable to trial and punishment by the Terrestrial authorities? Ordinarily the government will protect its citizens as a matter of principle and insist upon a Galactic trial. However, affairs on Earth are delicate and I have strict instructions to risk no avoidable clash. Therefore, unless you answer my questions fully, I will be forced to turn you and your companions over to the local police."

"But that would be a death sentence. For yourself too. . . Colonel, I am a citizen of the Empire, and I demand an audience with the Pro--"

A buzzer on the colonel's desk interrupted him. The colonel turned to it, closing a contact. "Yes?"

"Sir," came the clear voice, "a body of natives have encircled the fort. It is believed they are armed."

"Has there been any violence?"

"No, sir."

There was no sign of emotion on the colonel's face. This, at least, was what he was trained for. "Artillery and aircraft are to be made ready--all men to battle stations. Withhold all fire except in self-defense. Understood?"

"Yes, sir. An Earthman under flag of truce wishes audience."

"Send him in. Also send the High Minister's Secretary here again."

And now the colonel glared coldly at the archaeologist. "I trust you are aware of the appalling nature of what you have caused."

"I demand to be present at the interview," cried Arvardan, nearly incoherent with fury, "and I further demand the reason for your allowing me to rot under guard here for hours while you closet yourself with a native traitor. I tell you that I am not ignorant that you interviewed him before speaking with me."

"Are you making any accusations, sir?" demanded the colonel, his own voice ascending the scale. "If so, make them plainly."

"I make no accusations. But I will remind you that you will be accountable for your actions hereafter, and that you may well be known in the future, if you have a future, as the destroyer, by your stubbornness, of your people."

"Silence! I am not accountable to you, at any rate. We will conduct affairs, henceforward, as I choose. Do you understand?"

20. THE DEADLINE THAT WAS REACHED

The Secretary passed through the door held open by a soldier. On his purpling, swollen lips there was a brief, cold smile. He bowed to the colonel and remained completely unaware, to all appearances, of the presence of Arvardan.

"Sir," said the colonel to the Earthman, "I have communicated to the High Minister the details of your presence here and the manner in which it came about. Your detention here is, of course, entirely--uh--unorthodox, and it is my purpose to set you free as soon as I can. However, I have here a gentleman who, as you probably know, has lodged against you a very serious accusation; one which, under the circumstances, we must investigate--"

"I understand, Colonel," said the Secretary calmly. "However, as I have already explained to you, this man has been on Earth, I believe, only a matter of two months or so, so that his knowledge of our internal politics is nonexistent. This is a flimsy basis, indeed, for any accusation."

Arvardan retorted in anger, "I am an archaeologist by profession, and one who has specialized of late on Earth and its customs. My knowledge of its politics is far from nonexistent. And in any case, I am not the only one who makes the accusation."

The Secretary did not look at the archaeologist either now or later. He spoke exclusively to the colonel. He said, "One of our local scientists is involved in this; one who, approaching the end of his normal sixty years, is suffering from delusions of persecution. Then, in addition, there is another man, one of unknown antecedents and a history of idiocy. All three could not raise a respectable accusation among them."

Arvardan jumped to his feet. "I demand to be heard--"

"Sit down," said the colonel coldly and unsympathetically. "You have refused to discuss the matter with me. Let the refusal stand. Bring in the man with the flag of truce."

It was another member of the Society of Ancients. Scarcely a flicker of the eyelid betrayed any emotion on his part at the sight of the Secretary. The colonel rose from his chair and said, "Do you speak for the men outside?"

"I do, sir."

"I assume, then, that this riotous and illegal assembly is based upon a demand for the return of your fellow countryman here?"

"Yes, sir. He must be immediately freed."

"Indeed! Nevertheless, the interest of law and order and the respect due His Imperial Majesty's representatives on this world require that the matter cannot possibly be discussed while men are gathered in armed rebellion against us. You must have your men disperse."

The Secretary spoke up pleasantly. "The colonel is perfectly correct, Brother Cori. Please calm the situation. I am perfectly safe here, and there is no danger--for anybody. Do you understand? For anybody. It is my word as an Ancient."

"Very well, Brother. I am thankful you are safe."

He was ushered out.

The colonel said curtly, "We will see that you leave here safely as soon as matters in the city have returned to normal. Thank you for your co-operation in this matter just concluded."

Arvardan was again on his feet. "I forbid it. You will let loose this would-be murderer of the human race while forbidding me an interview with the Procurator when that would be simply in accord with my rights as a Galactic citizen." Then, in a paroxysm of frustration, "Will you show more consideration to an Barthman dog than you will to me?"

The Secretary's voice sounded over that last near-incoherent rage. "Colonel, I will gladly remain until such time as my case is heard by the Procurator, if that is what this man wants. An accusation of treason is serious, and the suspicion of it--however farfetched--may be sufficient to ruin my usefulness to my people. I would really appreciate the opportunity to prove to the Procurator that none is more loyal to the Empire than myself."

The colonel said stiffly, "I admire your feelings, sir, and freely admit that were I in your place my attitude would be quite different. You are a credit to your race, sir. I will attempt contact with the Procurator."

Arvardan said nothing more until led back to his cell.

He avoided the glance of the others. For a long time he sat motionless, with a knuckle pinched between gnawing teeth.

Until Shekt said, "Well?"

Arvardan shook his head. "I just about ruined everything."

"What did you do?"

"Lost my temper; offended the colonel; got nowhere--I'm no diplomat, Shekt."

He felt riven with the sudden urge for self-defense. "What could I do?" he cried. "Balkis had already been to the colonel, so that I couldn't trust him. What if he'd been offered his life? What if he's been in on the plot all along? I know it's a wild thought, but I couldn't take the chance. It was too suspicious. I wanted to see Ennius himself."

The physicist was on his feet, withered hands clasped behind his back. "Well, then--is Ennius coming?"

"I suppose so. But it is only at Balkis's own request, and that I don't understand."

"Balkis's own request? Then Schwartz must be right."

"Yes? What has Schwartz been saying?"

The plump Earthman was sitting on his cot. He shrugged his shoulders when the eyes turned to him and spread out his hands in a helpless gesture. "I caught the Secretary's Mind Touch when they took him past our room just now. He's definitely had a long talk with this officer you talked to."

"I know."

"But there's no treason in that officer's mind."

"Well," miserably, "then I guessed wrong. I'll eat worms when Ennius comes. What about Balkis?"

"There's no worry or fear in his mind; only hate. And now it's mostly hate for us, for capturing him, for dragging him here. We've wounded his vanity horribly, and he intends to square it with us. I saw little daydream pictures in his mind. Of himself, singlehanded, preventing the entire Galaxy from doing anything to stop him even while we, with our knowledge, work against him. He's giving us the odds, the trumps, and then he'll smash us anyway and triumph over us."

"You mean that he will risk his plans, his dreams of Empire, just to vent a little spite at us? That's mad."

"I know," said Schwartz with finality. "He is mad."

"And he thinks he'll succeed?"

"That's right."

"Then we must have you, Schwartz. We'll need your mind. Listen to me--"

But Shekt was shaking his head. "No, Arvardan, we couldn't work that. I woke Schwartz when you left and we discussed the matter. His mental powers, which he can describe only dimly, are obviously not under perfect control. He can stun a man, or paralyze him, or even kill him. Better than that, he can control the larger voluntary muscles even against the subject's will, but no more than that. In the case of the Secretary, he couldn't make the man talk. The small muscles about the vocal cords being beyond him. He couldn't coordinate motion well enough to have the Secretary drive a car; he even balanced him while walking only with difficulty. Obviously, then, we couldn't control Ennius, for instance, to the point of having him issue an order, or write one. I've thought of that, you see. . . ." Shekt shook his head as his voice trailed away.

Arvardan felt the desolation of futility descend upon him. Then, with a sudden pang of anxiety, "Where's Pola?"

"She's sleeping in the alcove."

He would have longed to wake her--longed--Oh, longed a lot of things.

Arvardan looked at his watch. It was almost midnight, and there were only thirty hours left.

He slept for a while after that, then woke for a while, as it grew light again. No one approached, and a man's very soul grew haggard and pale.

Arvardan looked at his watch. It was almost midnight, and there were only six hours left.

He looked about him now in a dazed and hopeless way. They were all here now--even the Procurator, at last. Pola was next to him, her warm little fingers on his wrist and that look of fear and exhaustion on her face that more than anything else infuriated him against all the Galaxy.

Maybe they all deserved to die, the stupid, stupid--stupid--

He scarcely saw Shekt and Schwartz. They sat on his left. And there was Balkis, the damnable Balkis, with his lips still swollen, one cheek green, so that it must hurt like the

devil to talk--and Arvardan's own lips stretched into a furious, aching smile at the thought and his fists clenched and writhed. His own bandaged cheek ached less at the thought.

Facing all of them was Ennius, frowning, uncertain, almost ridiculous, dressed as he was in those heavy, shapeless, leadimpregnated clothes.

And he was stupid, too. Arvardan felt a thrill of hatred shoot through him at the thought of these Galactic trimmers who wanted only peace and ease. Where were the conquerors of three centuries back? Where? . . .

Six hours left--

Ennius had received the call from the Chica garrison some eighteen hours before and he had streaked half around the planet at the summons. The motives that led him to that were obscure but nonetheless forceful. Essentially, he told himself, there was nothing to the matter but a regrettable kidnaping of one of those green-robed curiosities of superstitious, hagridden Earth. That, and these wild and undocumented accusations. Nothing, certainly, that the colonel on the spot could not have handled.

And yet there was Shekt--Shekt was in this--And not as the accused, but as an accuser. It was confusing.

He sat now facing them, thinking, quite conscious that his decision in this case might hasten a rebellion, perhaps weaken his own position at court, ruin his chances at advancement--As for Arvardan's long speech just now about virus strains and unbridled epidemics, how seriously could he take it? After all, if he took action on the basis of it, how credible would the matter sound to his superiors?

And yet Arvardan was an archaeologist of note.

So he postponed the matter in his mind by saying to the Secretary, "Surely you have something to say in this matter?"

"Surprisingly little," said the Secretary with easy confidence. "I would like to ask what evidence exists for supporting the accusation?"

"Your Excellency," said Arvardan with snapping patience, "I have already told you that the man admitted it in every detail at the time of our imprisonment day before yesterday."

"Perhaps," said the Secretary, "you choose to credit that, Your Excellency, but it is simply an additional unsupported statement. Actually the only facts to which outsiders can bear witness to are that I was the one violently taken prisoner, not they; that it was my life that was in peril, not theirs. Now I would like my accuser to explain how he could find all this out in the nine weeks that he has been on the planet, when you, the Procurator, in years of service here, have found nothing to my disadvantage?"

"There is reason in what the Brother says," admitted Ennius heavily. "How do you know?"

Arvardan replied stiffly, "Prior to the accused's confession I was informed of the conspiracy by Dr. Shekt."

"Is that so, Dr. Shekt?" The Procurator's glance shifted to the physicist.

"That is so, Your Excellency."

"And how did you find out?"

Shekt said, "Dr. Arvardan was admirably thorough and accurate in his description of the use to which the Synapsifier was put and in his remarks concerning the dying statements of the bacteriologist, F. Smitko. This Smitko was a member of the conspiracy. His remarks were recorded and the recording is available."

"But, Dr. Shekt, the dying statements of a man known to be in delirium--if what Dr. Arvardan said is true--cannot be of very great weight. You have nothing else?"

Arvardan interrupted by striking his fist on the arm of his chair and roaring, "Is this a law court? Has someone been guilty of violating a traffic ordinance? We have no time to weigh evidence on an analytical balance or measure it with micrometers. I tell you we have till six in the morning, five and a half hours, in other words, to wipe out this enormous threat. . . . You knew Dr. Shekt previous to this time, Your Excellency. Have you known him to be a liar?"

The Secretary interposed instantly, "No one accused Dr. Shekt of deliberately lying, Your Excellency. It is only that the good doctor is aging and has, of late, been greatly concerned over his approaching sixtieth birthday. I am afraid that a combination of age and fear have induced slight paranoiac tendencies, common enough here on Earth. . . . Look at him! Does he seem to you quite normal?"

He did not, of course. He was drawn and tense, shattered by what had passed and what was to come.

Yet Shekt forced his voice into normal tones, even into calmness. He said, "I might say that for the last two months I have been under the continual watch of the Ancients; that my letters have been opened and my answers censored. But it is obvious that all such complaints would be attributed to the paranoia spoken of. However, I have here Joseph Schwartz, the man who volunteered as a subject for the Synapsifier one day when you were visiting me at the Institute."

"I remember." There was a feeble gratitude in Ennius's mind that the subject had, for the moment, veered. "Is that the man?"

"Yes."

"He looks none the worse for the experience."

"He is far the better. The exposure to the Synapsifier was uncommonly successful, since he had a photographic memory to begin with, a fact I did not know at the time. At any rate, he now has a mind which is sensitive to the thoughts of others."

Ennius leaned far forward in his chair and cried in a shocked amazement, "What? Are you telling me he reads minds?"

"That can be demonstrated, Your Excellency. But I think the Brother will confirm the statement."

The Secretary darted a quick look of hatred at Schwartz, boiling in its intensity and lightninglike in its passage across his face. He said, with but the most imperceptible quiver in his voice, "It is quite true, Your Excellency. This man they have here has certain hypnotic faculties, though whether that is due to the Synapsifier or not I don't know. I might add that this man's subjection to the Synapsifier was not recorded, a matter which you'll agree is highly suspicious."

"It was not recorded," said Shekt quietly, "in accordance with my standing orders from the High Minister." But the Secretary merely shrugged his shoulders at that.

Ennius said peremptorily, "Let us get on with the matter and avoid this petty bickering. . . .What about this Schwartz? What have his mind-reading powers, or hypnotic talents, or whatever they are, to do with the case?"

"Shekt intends to say," put in the Secretary, "that Schwartz can read my mind."

"Is that it? Well, and what is he thinking?" asked the Procurator, speaking to Schwartz for the first time.

"He's thinking," said Schwartz, "that we have no way of convincing you of the truth of our side of what you call the case."

"Quite true," scoffed the Secretary, "though that deduction scarcely calls for much mental power."

"And also," Schwartz went on, "that you are a poor fool, afraid to act, desiring only peace, hoping by your justice and impartiality to win over the men of Earth, and all the more a fool for so hoping."

The Secretary reddened. "I deny all that. It is an obvious attempt to prejudice you, Your Excellency."

But Ennius said, "I am not so easily prejudiced." And then, to Schwartz, "And what am I thinking?"

Schwartz replied, "That even if I could see clearly within a man's skull, I need not necessarily tell the truth about what I see."

The Procurator's eyebrows lifted in surprise. "You are correct, quite correct. Do you maintain the truth of the claims put forward by Drs. Arvardan and Shekt?"

"Every word of it?"

"So! Yet unless a second such as you can be found, one who is not involved in the matter, your evidence would not be valid in law even if we could obtain general belief in you as a telepath."

"But it is not a question of the law," cried Arvardan, "but of the safety of the Galaxy."

"Your Excellency"--the Secretary rose in his seat--"I have a request to make. I would like to have this Joseph Schwartz removed from the room."

"Why so?"

"This man, in addition to reading minds, has certain powers of mental force. I was captured by means of a paralysis induced by this Schwartz. It is my fear that he may attempt something of the sort now against me, or even against you, Your Excellency, that forces me to the request."

Arvardan rose to his feet, but the Secretary overshouted him to say, "No hearing can be fair if a man is present who might subtly influence the mind of the judge by means of admitted mental gifts."

Ennius made his decision quickly. An orderly entered, and Joseph Schwartz, offering no resistance, nor showing the slightest sign of perturbation on his moonlike face, was led away.

To Arvardan it was the final blow.

As for the Secretary, he rose now and for the moment stood there--a squat, grim figure in green; strong in his self-confidence.

He began, in serious, formal style, "Your Excellency, all of Dr. Arvardan's beliefs and statements rest upon the testimony of Dr. Shekt. In turn, Dr. Shekt's beliefs rest upon the dying delirium of one man. And all this, Your Excellency, all this, somehow never reached the surface until after Joseph Schwartz was submitted to the Synapsifier.

"Who, then, is Joseph Schwartz? Until Joseph Schwartz appeared on the scene, Dr. Shekt was a normal, untroubled man. You yourself, Your Excellency, spent an afternoon with him the day Schwartz was brought in for treatment. Was he abnormal then? Did he inform you of treason against the Empire? Of certain babblings on the part of a dying biochemist? Did he seem even troubled? Or suspicious? He says now that he was instructed by the High Minister to falsify the results of the Synapsifier tests, not to record the names of those treated. Did he tell you that then? Or only now, after that day on which Schwartz appeared?

"Again, who is Joseph Schwartz? He spoke no known language at the time he was brought in. So much we found out for ourselves later, when we first began to suspect the stability of Dr. Shekt's reason. He was brought in by a farmer who knew nothing of his identity, or, indeed, any facts about him at all. Nor have any since been discovered.

"Yet this man has strange mental powers. He can stun at a hundred yards by thought alone--kill at closer range. I myself have been paralyzed by him; my arms and legs were manipulated by him; my mind might have been manipulated by him if he had wished.

"I believe, certainly, that Schwartz did manipulate the minds of these others. They say I captured them, that I threatened them with death, that I confessed to treason and to aspiring to Empire--Yet ask of them one question, Your Excellency. Have they not been thoroughly exposed to the influence of Schwartz, that is, of a man capable of controlling their minds?

"Is not perhaps Schwartz a traitor? If not, who is Schwartz?"

The Secretary seated himself, calm, almost genial.

Arvardan felt as though his brain had mounted a cyclotron and was spinning outward now in faster and faster revolutions.

What answer could one make? That Schwartz was from the past? What evidence was there for that? That the man spoke a genuinely primitive speech? But only he himself--Arvardan--could testify to that. And he, Arvardan, might well have a manipulated mind. After all, how could he tell his mind had not been manipulated? Who was Schwartz? What had so convinced him of this great plan of Galactic conquest?

He thought again. From where came his conviction of the truth of the conspiracy? He was an archaeologist, given to doubting, but now--Had it been one man's word? One girl's kiss? Or Joseph Schwartz?

He couldn't think! He couldn't think!

"Well?" Ennius sounded impatient. "Have you anything to say, Dr. Shekt? Or you, Dr. Arvardan?"

But Pola's voice suddenly pierced the silence. "Why do you ask them? Can't you see that it's all a lie? Don't you see that he's tying us all up with his false tongue? Oh, we're all going to die, and I don't care any more--but we could stop it, we could stop it-- And instead we just sit here and--and--talk--" She burst into wild sobs.

The Secretary said, "So we are reduced to the screams of a hysterical girl. . . .Your Excellency, I have this proposition. My accusers say that all this, the alleged virus and whatever else they have in mind, is scheduled for a definite time--six in the morning, I believe. I offer to remain in your custody for a week. If what they say is true, word of an epidemic in the Galaxy ought to reach Earth within a few days. If such occurs, Imperial forces will still control Earth--"

"Earth is a fine exchange, indeed, for a Galaxy of humans," mumbled the white-faced Shekt.

"I value my own life, and that of my people. We are hostages for our innocence, and I am prepared at this instant to inform the Society of Ancients that I will remain here for a week of my own free will and prevent any disturbances that might otherwise occur."

He folded his arms.

Ennius looked up, his face troubled. "I find no fault in this man--"

Arvardan could stand it no more. With a quiet and deadly ferocity, he arose and strode quickly toward the Procurator. What he meditated was never known. Afterward he himself could not remember. At any rate, it made no difference. Ennius had a neuroniac whip and used it.

For the third time since landing on Earth everything about Arvardan flamed up into pain, spun about, and vanished.

In the hours during which Arvardan was unconscious the six o'clock deadline was reached—

21. THE DEADLINE THAT PASSED

And passed!

Light--

Blurring light and misty shadows--melting and twisting, and then coming into focus.

A face--Eyes upon his--

"Pola!" Things were sharp and clear to Arvardan in a single, leaping bound. "What time is it?"

His fingers were hard upon her wrist, so that she winced involuntarily.

"It's past seven," she whispered. "Past the deadline."

He looked about wildly, starting from the cot on which he lay, disregarding the burning in his joints. Shekt, his lean figure huddled in a chair, raised his head to nod in brief mournfulness.

"It's all over, Arvardan."

"Then Ennius--"

"Ennius," said Shekt, "would not take the chance. Isn't that strange?" He laughed a queer, cracked, rasping laugh. "The three of us singlehandedly discover a vast plot against humanity, singlehandedly we capture the ringleader and bring him to justice. It's like a visicast, isn't it, with the great all-conquering heroes zooming to victory in the nick of time? That's where they usually end it. Only in our case the visicast went on and we found that nobody believed us. That doesn't happen in visicasts, does it? Things end happily there, don't they? It's funny--" The words turned into rough, dry sobs.

Arvardan looked away, sick. Pola's eyes were dark universes, moist and tear-filled. Somehow, for an instant, he was lost in them--they were universes, star-filled. And toward those stars little gleaming metallic cases were streaking, deevouring the light-years as they penetrated hyperspace in calculated, deadly paths. Soon--perhaps already--they would approach, pierce atmospheres, fall apart into unseen deadly rains of virus--

Well, it was over. It could no longer be stopped. "Where is Schwartz?" he asked weakly. But Pola only shook her head. "They never brought him back."

The door opened, and Arvardan was not so far gone in the acceptance of death as to fail to look up with a momentary wash of hope upon his face.

But it was Ennius, and Arvardan's face hardened and turned away.

Ennius approached and looked momentarily at the father and daughter. But even now Shekt and Pola were primarily Earth creatures and could say nothing to the Procurator, even though they knew that short and violent as their future lives were to be, that of the Procurator would be even shorter and more violent.

Ennius tapped Arvardan on the shoulder. "Dr. Arvardan?"

"Your Excellency?" said Arvardan in a raw and bitter imitation of the other's intonation.

"It is after six o'clock." Ennius had not slept that night. With his official absolution of Balkis had come no absolute assurance that the accusers were completely mad--or under mental control. He had watched the soulless chronometer tick away the life of the Galaxy.

"Yes," said Arvardan. "It is after six and the stars still shine."

"But you still think you were right?"

"Your Excellency," said Arvardan, "in a matter of hours the first victims will die. They won't be noticed. Human beings die every day. In a week hundreds of thousands will have died. The percentage of recovery will be close to zero. No known remedies will be available. Several planets will send out emergency calls for epidemic relief. In two weeks scores of planets will have joined the call and States of Emergency will be declared in the nearer sectors. In a month the Galaxy will be a writhing mass of disease. In two months not twenty planets will remain untouched. In six months the Galaxy will be dead. . . .And what will you do when those first reports come in?"

"Let me predict that as well. You will send out reports that the epidemics may have started on Earth. This will save no lives. You will declare war on the Ancients of Earth. This will save no lives. You will wipe the Earthman from the face of his planet. This will save no lives. . . .Or else you will act as go-between for your friend Balkis and the Galactic Council, or the survivors thereof. You may then have the honor of handing the wretched remnants of the crumbs of the Empire to Balkis in return for antitoxin, which may not reach sufficient worlds in sufficient quantities in sufficient time to save a single human being."

Ennius smiled without conviction. "Don't you think you're being ridiculously overdramatic?"

"Oh yes. I'm a dead man and you're a corpse. But let's be devilishly cool and Imperial about it, don't y'know?"

"If you resent the use of the neuronc whip--"

"Not at all," ironically. "I'm used to it. I hardly feel it any more."

"Then I am putting it to you as logically as I can. This has been a nasty mess. It would be difficult to report sensibly, yet as difficult to suppress without reason. Now the other accusers involved are Earthmen; your voice is the only one which would carry weight. Suppose you sign a statement to the effect that the accusation was made at a time when you were not in your--Well, we'll think of some phrase that will cover it without bringing in the notion of mental control."

"That would be simple. Say I was crazy, drunk, hypnotized, or drugged. Anything goes."

"Will you be reasonable? Now look, I tell you that you have been tampered with." He was whispering tensely. "You're a man of Sirius. Why have you fallen in love with an Earthgirl?"

"What?"

"Don't shout. I say--in your normal state, could you ever have gone native? Could you have considered that sort of thing?" He nodded his head just perceptibly in the direction of Pola.

For an instant Arvardan stared at him in surprise. Then, quickly, his hand shot out and seized the highest Imperial authority on Earth by the throat. Ennius's hands wrenched wildly and futilely at the other's grip.

Arvardan said, "That sort of thing, eh? Do you mean Miss Shekt? If you do, I want to hear the proper respect, eh? Ah, go away. You're dead anyway."

Ennius said gaspingly, "Dr. Arvardan, you will consider yourself under ar--"

The door opened again, and the colonel was upon them.

"Your Excellency, the Earth rabble has returned."

"What? Hasn't this Balkis spoken to his officials? He was going to arrange for a week's stay."

"He has spoken and he's still here. But so is the mob. We are ready to fire upon them, and it is my advice as military commander that we proceed to do that. Have you any suggestions, Your Excellency?"

"Hold your fire until I see Balkis. Have him sent in here." He turned. "Dr. Arvardan, I will deal with you later."

Balkis was brought in, smiling. He bowed formally to Ennius, who yielded him the barest nod in return.

"See here," said the Procurator brusquely, "I am informed your men are packing the approaches to Fort Dibburn. This was not part of our agreement. . . .Now, we do not wish to cause bloodshed, but our patience is not inexhaustible. Can you disperse them peaceably?"

"If I choose, Your Excellency."

"If you choose? You had better choose. And at once."

"Not at all, Your Excellency!" And now the Secretary smiled and flung out an arm. His voice was a wild taunt, too long withheld, now gladly released. "Fool! You waited too long and can die for that! Or live a slave, if you prefer--but remember that it will not be an easy life."

The wildness and fervor of the statement produced no shattering effect upon Ennius. Even here, at what was undoubtedly the profoundest blow of Ennius's career, the stolidity of the Imperial career diplomat did not desert him. It was only that the grayness and deep-eyed weariness about him deepened.

"Then I lost so much in my caution? The story of the virus--was true?" There was almost an abstract, indifferent wonder in his voice. "But Earth, yourself--you are all my hostages."

"Not at all," came the instant, victorious cry. "It is you and yours that are my hostages. The virus that now is spreading through the Universe has not left Earth immune. Enough already saturates the atmosphere of every garrison on the planet, including Everest itself. We of Earth are immune, but how do you feel. Procurator? Weak? Is your

throat dry? Your head feverish? It will not be long, you know. And it is only from us that you can obtain the antidote."

For a long moment Ennius said nothing, his face thin and suddenly incredibly haughty.

Then he turned to Arvardan and in cool, cultured tones said, "Dr. Arvardan, I find I must beg your pardon for having doubted your word. Dr. Shekt, Miss Shekt--my apologies."

Arvardan bared his teeth. "Thank you for your apologies. They will be of great help to everybody."

"Your sarcasm is deserved," said the Procurator. "If you will excuse me, I will return to Everest to die with my family. Any question of compromise with this--man is, of course, out of the question. My soldiers of the Imperial Procuracy of Earth will, I am sure, acquit themselves properly before their death, and not a few Earthmen will undoubtedly have time to light the way for us through the passages of death. . . . Good-by."

"Hold on. Hold on. Don't go." Slowly, slowly, Ennius looked up to the new voice.

Slowly, slowly, Joseph Schwartz, frowning a bit, swaying a bit with weariness, stepped across the threshold.

The Secretary tensed and sprang backward. With a sudden, wary suspicion, he faced the man from the past.

"No," he gritted, "you can't get the secret of the antidote out of me. Only certain men have it, and only certain others are trained to use it properly. All these are safely out of your reach for the time it takes the toxin to do its work."

"They are out of reach now," admitted Schwartz, "but not for the time it would take the toxin to do its work. You see, there is no toxin, and no virus to stamp out."

The statement did not quite penetrate. Arvardan felt a sudden choking thought enter his mind. Had he been tampered with? Had all this been a gigantic hoax, one that had taken in the Secretary as well as himself? If so, why?

But Ennius spoke. "Quickly, man. Your meaning."

"It's not complicated," said Schwartz. "When we were here last night I knew I could do nothing by simply sitting and listening. So I worked carefully on the Secretary's mind for a long time. . . . I dared not be detected. And then, finally, he asked that I be ordered out of the room. This was what I wanted, of course, and the rest was easy."

"I stunned my guard and left for the airstrip. The fort was on a twenty-four-hour alert. The aircraft were fueled, armed, and ready for flight. The pilots were waiting. I picked one out--and we flew to Senloo."

The Secretary might have wished to say something. His jaws writhed soundlessly.

It was Shekt who spoke. "But you could force no one to fly a plane, Schwartz. It was all you could do to make a man walk."

"Yes, when it's against his will. But from Dr. Arvardan's mind I knew how Sirians hated Earthmen--so I looked for a pilot who was born in the Sirius Sector and found Lieutenant Claudy."

"Lieutenant Claudy?" cried Arvardan.

"Yes--Oh, you know him. Yes, I see. It's quite clear in your mind."

"I'll bet. . . .Go ahead, Schwartz."

"This officer hated Earthmen with a hate that's difficult to understand, even for me, and I was inside his mind. He wanted to bomb them. He wanted to destroy them. It was only discipline that tied him fast and kept him from taking out his plane then and there.

"That kind of a mind is different. Just a little suggestion, a little push, and discipline was not enough to hold him. I don't even think he realized that I climbed into the plane with him."

"How did you find Senloo?" whispered Shekt.

"In my time," said Schwartz, "there was a city called St. Louis. It was at the junction of two great rivers. . . .We found Senloo. It was night, but there was a dark patch in a sea of radioactivity--and Dr. Shekt had said the Temple was an isolated oasis of normal soil. We dropped a flare--at least it was my mental suggestion--and there was a five-pointed building below us. It jibed with the picture I had received in the Secretary's mind. . . .Now there's only a hole, a hundred feet deep, where that building was. That happened at three in the morning. No virus was sent out and the universe is free."

It was an animal--like howl that emerged from the Secretary's lips--the unearthly screech of a demon. He seemed to gather for a leap, and then--collapsed.

A thin froth of saliva trickled slowly down his lower lip.

"I never touched him," said Schwartz softly. Then, staring thoughtfully at the fallen figure, "I was back before six, but I knew I would have to wait for the deadline to pass. Balkis would have to crow. I knew that from his mind, and it was from his own mouth, only, that I could convict him. . . .Now there he lies."

22. THE BEST IS YET TO BE

Thirty days had passed since Joseph Schwartz had lifted off an airport runway on a night dedicated to Galactic destruction. with alarm bells shrilling madly behind him and orders to re. turn burning the ether toward him.

He had not returned; not, at least, until he had destroyed the Temple of Senloo.

The heroism was finally made official now. In his pocket he had the ribbon of the Order of the Spaceship and Sun, First Class. Only two others in all the Galaxy had ever gotten it nonposthumously.

That was something for a retired tailor.

No one, of course, outside the most official of officialdom, knew exactly what he had done, but that didn't matter. Some. day, in the history books, it would all become part of a bright and indelible record.

He was walking through the quiet night now toward Dr. Shekt's house. The city was peaceful, as peaceful as the starry glitter above. In isolated places on Earth bands of Zealots still made trouble, but their leaders were dead or captive and the moderate Earthmen, themselves, could take care of the rest.

The first huge convoys of normal soil were already on their way. Ennius had again made his original proposal that Earth's population be moved to another planet, but that was out. Charity was not wanted. Let Earthmen have a chance to remake their own planet. Let them build once again the home of their fathers, the native world of man. Let them labor with their hands, removing the diseased soil and replacing it with healthy, seeing the green grow where all had been dead and making the desert blossom in beauty once again.

It was an enormous job; it could take a century--but what of that? Let the Galaxy lend machinery; let the Galaxy ship food; let the Galaxy supply soil. Of their incalculable resources, it would be a trifle--and it would be repaid.

And someday, once again, the Earthman would be a people among peoples, inhabiting a planet among planets, looking all humanity in the eye in dignity and equality.

Schwartz's heart pounded at the wonder of it an as he walked up the steps to the front door. Next week he left with Arvardan for the great central worlds of the Galaxy. Who else of his generation had ever left Earth?

And momentarily he thought of the old Earth, his Earth. So long dead. So long dead.

And yet but three and a half months had passed. . .

He paused, his hand on the point of signaling at the door, as the words from within sounded in his mind. How clearly he heard thoughts now, like tiny bells.

It was Arvardan, of course, with more in his mind than words alone could ever handle. "Pola, I've waited and thought, and thought and waited. I won't any more. You're coming with me."

And Pola, with a mind as eager as his, yet with words of the purest reluctance, said, "I couldn't, Bel. It's quite impossible. My backwoods manners and bearing. . . I'd feel silly in those big worlds out there. And, besides, I'm only an Ear--"

"Don't say it. You're my wife, that's an. If anyone asks what and who you are, you're a native of Earth and a citizen of the Empire. If they want further details, you're my wife."

"Well, and after you make this address at Trantor to your archaeological society, what next?"

"What next? Well, first we take a year off and see every major world in the Galaxy. We won't skip one, even if we have to get on and off it by mail ship. You'll get yourself an eyeful of the Galaxy and the best honeymoon that government money can buy."

"And then. . . "

"And then it's back to Earth, and we'll volunteer for the labor battalions and spend the next forty years of our lives lugging dirt to replace the radioactive areas."

"Now why are you going to do that?"

"Because"--there was the suspicion of a deep breath at this point in Arvardan's Mind Touch--"I love you and it's what you want, and because I'm a patriotic Earthman and have the honorary naturalization papers to prove it. "

"All right. . . "

And at this point the conversation stopped. But, of course, the Mind Touches did not, and Schwartz, in full satisfaction, and a little embarrassment, backed away.

He could wait. Time enough to disturb them when things had settled down further.

He waited in the street, with the cold stars burning down--a whole Galaxy of them, seen and unseen.

And for himself, and the new Earth, and all those millions of planets far beyond, he repeated softly once more that ancient poem that he alone now, of so many quadrillions, knew:

"Grow old along with me!

The best is yet to be,

The last of life, for which the first was made. . . "

THE STARS, LIKE DUST

1951

ABOUT THE AUTHOR

Isaac Asimov, noted biochemist and professor and the Boston University School of Medicine, is not only recognized as one of the greatest science fiction writers of our time, but also has been praised for the excitement he brings to the writing of scientific fact.

In *THE STARS, LIKE DUST*, Dr. Asimov's probing imagination has created a fascinating tale set in a terrifying world of tomorrow--an adventure that could change from fiction to fact any day now. . .

1. THE BEDROOM MURMURED

The bedroom murmured to itself gently. It was almost below the limits of hearing-- an irregular little sound, yet quite unmistakable, and quite deadly.

But it wasn't that which awakened Biron Farrill and dragged him out of a heavy, unrefreshing slumber. He turned his head restlessly from side to side in a futile struggle against the periodic burr-r-r on the end table.

He put out a clumsy hand without opening his eyes and closed contact.

"Hello," he mumbled.

Sound tumbled instantly out of the receiver. It was harsh and loud, but Biron lacked the ambition to reduce the volume.

It said, "May I speak to Biron Farrill?"

Biron said, fuzzily, "Speaking. What d'you want?"

"May I speak to Biron Farrill?" The voice was urgent.

Biron's eyes opened on the thick darkness. He became conscious of the dry unpleasantness of his tongue and the faint odor that remained in the room.

He said, "Speaking. Who is this?"

It went on, disregarding him, gathering tension, a loud voice in the night. "Is anyone there? I would like to speak to Biron Farrill."

Biron raised himself on one elbow and stared at the place where the visiphone sat. He jabbed at the vision control and the small screen was alive with light.

"Here I am," he said. He recognized the smooth, slightly asymmetric features of Sander Jonti. "Call me in the morning, Jonti."

He started to turn the instrument off once more, when Jonti said, "Hello, Hello. Is anyone there? Is this University Hall, Room 526? Hello."

Biron was suddenly aware that the tiny pilot light which would have indicated a live sending circuit was not on. He swore under his breath and pushed the switch. It stayed off.

Then Jonti gave up, and the screen went blank, and was merely a small square of featureless light.

Biron turned it off. He hunched his shoulder and tried to burrow into the pillow again. He was annoyed. In the first place, no one had the right to yell at him in the middle of the night. He looked quickly at the gently luminous figures just over the headboard.

Three-fifteen. House lights wouldn't go on for nearly four hours.

Besides, he didn't like having to wake to the complete darkness of his room. Four years' custom had not hardened him to the Earthman's habit of building structures of reinforced concrete, squat, thick, and windowless. It was a thousand-year-old tradition dating from the days when the primitive nuclear bomb had not yet been countered by the force-field defense.

But that was past. Atomic warfare had done its worst to Earth. Most of it was hopelessly radioactive and useless. There was nothing left to lose, and yet architecture mirrored the old fears, so that when Biron woke, it was to pure darkness.

Biron rose on his elbow again. That was strange. He waited. It wasn't the fatal murmur of the bedroom he had become aware of. It was something perhaps even less noticeable and certainly infinitely less deadly.

He missed the gentle movement of air that one took so for granted, that trace of continuous renewal. He tried to swallow easily and failed. The atmosphere seemed to become oppressive even as he realized the situation. The ventilating system had stopped working, and now he really had a grievance. He couldn't even use the visiphone to report the matter.

He tried again, to make sure. The milky square of light sprang out and threw a faint, pearly luster on the bed. It was receiving, but it wouldn't send. Well, it didn't matter.

Nothing would be done about it before day, anyway.

He yawned and groped for his slippers, rubbing his eyes with the heels of his palms.

No ventilation, eh? That would account for the queer smell. He frowned and sniffed sharply two or three times. No use. It was familiar, but he couldn't place it.

He made his way to the bathroom, and reached automatically for the light switch, although he didn't really need it to draw himself a glass of water. It closed, but uselessly.

He tried it several times, peevishly. Wasn't anything working? He shrugged, drank in the dark, and felt better. He yawned again on his way back to the bedroom where he tried the main switch. All the lights were out.

Biron sat on the bed, placed his large hands on his hard-muscled thighs and considered. Ordinarily, a thing like this would call for a terrific discussion with the service staff. No one expected hotel service in a college dormitory, but, by Space, there were certain minimum standards of efficiency one could demand. Not that it was of vital importance just now. Graduation was coming and he was through. In three days he'd be saying a last good-by to the room and to the University of Earth; to Earth itself, for that matter.

Still, he might report it anyway, without particular comment. He could go out and use the hall phone. They might bring in a self-powered light or even rig up a fan so he could sleep without psychosomatic choking sensations. If not, to Space with them! Two more nights.

In the light of the useless visiphone, he located a pair of shorts. Over them he slipped a one-piece jumper, and decided that that would be enough for the purpose. He retained his slippers. There was no danger of waking anybody even if he clumped down the corridors in spiked shoes, considering the thick, nearly soundproof partitions of this concrete pile, but he saw no point in changing.

He strode toward the door and pulled at the lever. It descended smoothly and he heard the click that meant the door release had been activated. Except that it wasn't. And although his biceps tightened into lumps, nothing was accomplished.

He stepped away. This was ridiculous. Had there been a general power failure? There couldn't have been. The clock was going. The visiphone was still receiving properly.

Wait! It could have been the boys, bless their erratic souls. It was done sometimes.

Infantile, of course, but he'd taken part in these foolish practical jokes himself. It wouldn't have been difficult, for instance, for one of his buddies to sneak in during the day and arrange matters. But, no, the ventilation and lights were working when he had gone to sleep.

Very well, then, during the night. The hall was an old, outmoded structure. It wouldn't have taken an engineering genius to hocus the lighting and ventilation circuits. Or to jam the door, either. And now they would wait for morning and see what would happen when good old Biron found he couldn't get out. They would probably let him out toward noon and laugh very hard.

"Ha, ha," said Biron grimly, under his breath. All right, if that's the way it was.

But he would have to do something about it; turn the tables some way.

He turned away and his toe kicked something which skidded metallically across the floor. He could barely make out its shadow moving through the dim visiphone light. He reached under the bed, patting the floor in a wide arc. He brought it out and held it close to the light. (They weren't so smart. They should have put the visiphone entirely out of commission, instead of just yanking out the sending circuit.) He found himself holding a small cylinder with a little hole in the blister on top.

He put it close to his nose and sniffed at it. That explained the smell in the room, anyway.

It was Hypnite. Of course, the boys would have had to use it to keep him from waking up while they were busy with the circuits.

Biron could reconstruct the proceedings step by step now. The door was jimmied open, a simple thing to do, and the only dangerous part, since he might have wakened then. The door might have been prepared during the day, for that matter, so that it would seem to close and not actually do so. He hadn't tested it. Anyway, once open, a can of Hypnite would be put just inside and the door would be closed again. The anesthetic would leak out slowly, building up to the one in ten thousand concentration necessary to put him definitely under.

Then they could enter--masked, of course. Space! A wet handkerchief would keep out the Hypnite for fifteen minutes and that would be all the time needed.

It explained the ventilation system situation. That had to be eliminated to keep the Hypnite from dispersing too quickly. That would have gone first, in fact. The visiphone elimination kept him from getting help; the door jamming kept him from getting out; and the absence of lights induced panic. Nice kids!

Biron snorted. It was socially impossible to be thin-skinned about this. A joke was a joke and all that. Right now, he would have liked to break the door down and have done with it. The well-trained muscles of his torso tensed at the thought, but it would be useless. The door had been built with atom blasts in mind. Damn that tradition!

But there had to be some way out. He couldn't let them get away with it. First, he would need a light, a real one, not the immovable and unsatisfactory glow of the visiphone.

That was no problem. He had a self-powered flashlight in the clothes closet.

For a moment, as he fingered the closet-door controls, he wondered if they had jammed that too. But it moved open naturally, and slid smoothly into its wall socket. Biron nodded to himself. It made sense. There was no reason, particularly, to jam the closet, and they didn't have too much time, anyway.

And then, with the flashlight in his hand, as he was turning away, the entire structure of his theory collapsed in a horrible instant. He stiffened, his abdomen ridging with tension, and held his breath, listening.

For the first time since awakening, he heard the murmuring of the bedroom. He heard the quiet, irregular chuckling conversation it was holding with itself, and recognized the nature of the sound at once.

It was impossible not to recognize it. The sound was "Earth's death rattle." It was the sound that had been invented one thousand years before.

To be exact, it was the sound of a radiation counter, ticking off the charged particles and the hard gamma waves that came its way, the soft clicking electronic surges melting into a low murmur. It was the sound of a counter, counting the only thing it could count--death!

Softly, on tiptoe, Biron backed away. From a distance of six feet he threw the white beam into the recesses of the closet. The counter was there, in the far corner, but seeing it told him nothing.

It had been there ever since his freshman days. Most freshmen from the Outer Worlds bought a counter during their first week on Earth. They were very conscious of Earth's radioactivity then, and felt the need of protection. Usually they were sold again to the next class, but Biron had never disposed of his. He was thankful for that now.

He turned to the desk, where he kept his wrist watch while sleeping. It was there. His hand was shaking a little as he held it up to the flashlight's beam. The watch strap was an interwoven flexible plastic of an almost liquidly smooth whiteness. And it was white. He held it away and tried it at different angles. It was white.

That strap had been another freshman purchase. Hard radiation turned it blue, and blue on Earth was the color of death. It was easy to wander into a path of radiating soil during the day if you were lost or careless. The government fenced off as many patches as it could, and of course no one ever approached the huge areas of death that began several miles outside the city. But the strap was insurance.

If it should ever turn a faint blue, you would show up at the hospital for treatment.

There was no argument about it. The compound of which it was made was precisely as sensitive to radiation as you were, and appropriate photoelectric instruments could be used to measure the intensity of the blueness so that the seriousness of the case might be determined quickly.

A bright royal blue was the finish. Just as the color would never change back, neither would you. There was no cure, no chance, no hope. You just waited anywhere from a day to a week, and all the hospital could do was to make final arrangements for cremation.

But at least it was still white, and some of the clamor in Biron's thoughts subsided.

There wasn't much radioactivity then. Could it be just another angle of the joke?

Biron considered and decided that it couldn't. Nobody would do that to anyone else. Not on Earth, anyway, where illegal handling of radioactive material was a capital offense. They took radioactivity seriously here on Earth. They had to. So nobody would do this without overpowering reason.

He stated the thought to himself carefully and explicitly, facing it boldly. The overpowering reason, for instance, of a desire to murder. But why? There could be no motive.

In his twenty-three years of life, he had never made a serious enemy. Not this serious. Not murder serious.

He clutched at his clipped hair. This was a ridiculous line of thought, but there was no escaping it. He stepped cautiously back to the closet. There had to be something there that was sending out radiation; something that had not been there four hours earlier. He saw it almost at once.

It was a little box not more than six inches in any direction. Biron recognized it and his lower lip trembled slightly. He had never seen one before, but he had heard of them. He lifted the counter and took it into the bedroom. The little murmur fell off, almost ceased. It started again when the thin mica partition, through which the radiation entered, pointed toward the box. There was no question in his mind. It was a radiation bomb.

The present radiations were not in themselves deadly; they were only a fuse. Somewhere inside the box a tiny atomic pile was constructed. Short-lived artificial isotopes heated it slowly, permeating it with the appropriate particles. When the threshold of heat and particle density was reached, the pile reacted. Not in an explosion, usually, although the heat of reaction would serve to fuse the box itself into a twist of metal, but in a tremendous burst of deadly radiation that would kill anything living within a radius of six feet to six miles, depending on the bomb's size.

There was no way of telling when the threshold would be reached. Perhaps not for hours, and perhaps the next moment. Biron remained standing helplessly, flashlight held loosely in his damp hands. Half an hour before, the visiphone had awakened him, and he had been at peace then. Now he knew he was going to die.

Biron didn't want to die, but he was penned in hopelessly, and there was no place to hide. He knew the geography of the room. It was at the end of a corridor, so that there was another room only on one side, and, of course, above and below. He could do nothing about the room above. The room on the same floor was on the bathroom side, and it adjoined via its own bathroom. He doubted that he could make himself heard.

That left the room below.

There were a couple of folding chairs in the room, spare seats to accommodate company.

He took one. It made a flat, slapping sound when it hit the floor. He turned it edgewise and the sound became harder and louder.

Between each blow, he waited; wondering if he could rouse the sleeper below and annoy him sufficiently to have him report the disturbance.

Abruptly, he caught a faint noise, and paused, the splintering chair raised above his head. The noise came again, like a faint shout. It was from the direction of the door.

He dropped the chair and yelled in return. He crushed his ear up against the crack where door joined wall, but the fit was good, and the sound even there was dim.

But he could make out his own name being called.

"Farrill! Farrill!" several times over, and something else. Maybe "Are you in there?" or "Are you all right?"

He roared back, "Get the door open." He shouted it three or four times. He was in a feverish sweat of impatience. The bomb might be on the point of letting loose even now.

He thought they heard him. At least, the muffled cry came back, "Watch out. Something, something, blaster." He knew what they meant and backed hurriedly away from the door.

There were a couple of sharp, cracking sounds, and he could actually feel the vibrations set up in the air of the room. Then there followed a splitting noise and the door was flung inward. Light poured in from the corridor.

Biron dashed out, arms flung wide. "Don't come in," he yelled. "For the love of Earth, don't come in. There's a radiation bomb in there."

He was facing two men. One was Jonti. The other was Esbak, the superintendent. He was only partly dressed.

"A radiation bomb?" he stuttered.

But Jonti said, "What size?" Jonti's blaster was still in his hand, and that alone jarred with the dandyish effect of his ensemble, even at this time of night.

Biron could only gesture with his hands.

"All right," said Jonti. He seemed quite cool about it, as he turned to the superintendent. "You'd better evacuate the rooms in this area, and if you have leadsheets anywhere on the university grounds, have them brought out here to line the corridor. And I wouldn't let anyone in there before morning."

He turned to Biron. "It probably has a twelve-to-eighteen-foot radius. How did it get there?"

"I don't know," said Biron. He wiped his forehead with the back of his hand. "If you don't mind, I've got to sit down somewhere." He threw a glance at his wrist, then realized his wrist watch was still in the room. He had a wild impulse to return after it.

There was action now. Students were being hustled out of their rooms.

"Come with me," said Jonti. "I think you had better sit down too. "

Biron said, "What brought you out to my room? Not that I'm not thankful, you understand."

"I called you. There was no answer, and I had to see you."

"To see me?" He spoke carefully, trying to control his irregular breathing. "Why?"

"To warn you that your life was in danger."

Biron laughed raggedly. "I found out."

"That was only the first attempt. They'll try again."

"Who are 'they'?"

"Not here, Farrill," said Jonti. "We need privacy for this. You're a marked man, and I may already have endangered myself as well."

2. THE NET ACROSS SPACE

The student lounge was empty; it was dark as well. At four-thirty in the morning it could scarcely have been otherwise. Yet Jonti hesitated a moment as he held the door open, listening for occupants.

"No," he said softly, "leave the lights out. We won't need them to talk."

"I've had enough of the dark for one night," muttered Biron.

"We'll leave the door ajar."

Biron lacked the will to argue. He dropped into the nearest chair and watched the rectangle of light through the closing door narrow down to a thin line. Now that it was all over, he was getting the shakes.

Jonti steadied the door and rested his little swagger stick upon the crack of light on the floor. "Watch it. It will tell us if anyone passes, or if the door moves."

Biron said, "Please, I'm not in a conspiratorial mood. If you don't mind, I'd appreciate your telling me whatever it is you want to tell me. You've saved my life, I know, and tomorrow I'll be properly thankful. Right now, I could do with a short drink and a long rest."

"I can imagine your feelings," Jonti said, "but the too-long rest you might have had has been avoided, momentarily. I would like to make it more than just momentarily. Do you know that I know your father?"

The question was an abrupt one, and Biron raised his eyebrows, a gesture lost in the dark. He said, "He has never mentioned knowing you."

"I would be surprised if he did. He doesn't know me by the name I use here. Have you heard from your father recently, by the way?"

"Why do you ask?"

"Because he is in great danger."

"What?"

Jonti's hand found the other's arm in the dimness and gripped it firmly. "Please! Keep your voice as it has been." Biron realized, for the first time that they had been whispering.

Jonti resumed, "I'll be more specific. Your father has been taken into custody. You understand the significance?"

"No, I certainly don't understand. Who has taken him into custody, and what are you getting at? Why are you bothering me?" Biron's temples were throbbing. The Hypnite and the near death had made it impossible to fence with the cool dandy sitting so close to him that his whispers were as plain as shouts.

"Surely," came the whisper, "you have some inkling of the work your father is doing?"

"If you know my father, you know he is Rancher of Widemos. That is his work."

Jonti said, "Well, there is no reason you should trust me, other than that I am risking my own life for you. But I already know all that you can tell me. As an example, I know that your father has been conspiring against the Tyranni."

"I deny that," said Biron tensely. "Your service to me this night does not give you the right to make such statements about my father."

"You are foolishly evasive, young man, and you are wasting my time. Don't you see that the situation is beyond verbal fencing? I'll say it outright. Your father is in the custody of the Tyranni. He may be dead by now."

"I don't believe you." Biron half rose.

"I am in a position to know."

"Let's break this off, Jonti. I am in no mood for mystery, and I resent this attempt of yours to--"

"Well, to what?" Jonti's voice lost some of its refined edge. "What do I gain by telling you this? May I remind you that this knowledge of mine, which you will not accept, made it plain to me that an attempt might be made to kill you. Judge by what has happened, Farrill."

Biron said, "Start again and tell it straight. I'll listen."

"Very well. I imagine, Farrill, that you know me to be a fellow countryman from the Nebular Kingdoms, although I've been passing myself off as a Vegan."

"I judged that might be a possibility by your accent. It didn't seem important."

"It's important, my friend. I came here because, like your father, I didn't like the Tyranni. They've been oppressing our people for fifty years. That's a long time."

"I'm not a politician."

Again Jonti's voice had an irritated edge to it. "Oh, I'm not one of their agents trying to get you into trouble. I'm telling you the truth. They caught me a year ago as they have caught your father now. But I managed to get away, and came to Earth where I thought I might be safe until I was ready to return. That's all I need to tell you about myself."

"It is more than I have asked for, sir." Biron could not force the unfriendliness out of his voice. Jonti affected him unfavorably with his too-precise mannerisms.

"I know that. But it is necessary to tell you so much at least, for it was in this manner that I met your father. He worked with me, or, rather, I with him. He knew me but not in his official capacity as the greatest nobleman on the planet of Nephelos. You understand me?"

Biron nodded uselessly in the darkness and said, "Yes."

"It is not necessary to go into that further. My sources of information have been maintained even here, and I know that he has been imprisoned. It is knowledge. If it were merely suspicion, this attempt on your life would have been sufficient proof."

"In what way?"

"If the Tyranni have the father, would they leave the son at large?"

"Are you trying to tell me that the Tyranni set that radiation bomb in my room? That's impossible."

"Why is it impossible? Can't you understand their position? The Tyranni rule fifty worlds; they are outnumbered hundreds to one. In such a position, simple force is insufficient. Devious methods, intrigue, assassination are their specialties. The net they weave across space is a wide one, and close-meshed. I can well believe that it extends across five hundred light-years to Earth."

Biron was still in the grip of his nightmare. In the distance there were the faint sounds of the lead shields being moved into place. In his room the counter must still be murmuring.

He said, "It doesn't make sense. I am going back to Nephelos this week. They would know that. Why should they kill me here? If they'd wait, they'd have me." He was relieved to find the flaw, eager to believe his own logic.

Jonti leaned closer and his spiced breath stirred the hairs on Biron's temple. "Your father is popular. His death--and once imprisoned by the Tyranni, his execution becomes a probability you must face--will be resented even by the cowed slave race the Tyranni are trying to breed. You could rally that resentment as the new Rancher of Widemos, and to execute you as well would double the danger for them. To make martyrs is not their purpose. But if you were to die in a faraway world, by accident, it would be convenient for them."

"I don't believe you," said Biron. It had become his only defense.

Jonti rose, adjusting his thin gloves. He said, "You go too far, Farrill. Your role would be more convincing if you pretended to no such complete ignorance. Your father has been shielding you from reality for your own protection, presumably, yet I doubt that you could remain completely uninfluenced by his beliefs. Your hate for the Tyranni cannot help being a reflection of his own. You cannot help being ready to fight them."

Biron shrugged.

Jonti said, "He may even recognize your new adulthood to the point of putting you to use. You are conveniently here on Earth and it is not unlikely you may be combining your education with a definite assignment. An assignment, perhaps, for the failure of which the Tyranni are ready to kill you."

"That's silly melodrama."

"Is it? Let it be so, then. If the truth will not persuade you now, events will later.

There will be other attempts on your life, and the next one will succeed. From this moment on, Farrill, you are a dead man."

Biron looked up. "Wait! What's your own private interest in the matter?"

"I am a patriot. I would like to see the Kingdoms free again, with governments of their own choosing."

"No. Your private interest. I cannot accept idealism only, because I won't believe it of you. I am sorry if that offends you." Biron's words pounded doggedly.

Jonti seated himself again. He said, "My lands have been confiscated. Before my exile it was not comfortable to be forced to take orders from those dwarfs. And since then it has become more imperative than ever to become once again the man my grandfather

had been before the Tyranni came. Is that enough of a practical reason for wanting a revolution? Your father would have been a leader of that revolution. Failing him, you!"

"I? I am twenty-three and know nothing of all this. You could find better men."

"Undoubtedly I could, but no one else is the son of your father. If your father is killed, you will be Rancher of Widemos, and as such you would be valuable to me if you were only twelve and an idiot besides. I need you for the same reason the Tyranni must be rid of you. And if my necessity is unconvincing to you, surely theirs cannot be. There was a radiation bomb in your room. It could only have been meant to kill you. Who else would want to kill you?"

Jonti waited patiently and picked up the other's whisper.

"No one," said Biron. "No one would want to kill me that I know of. Then it's true about my father!"

"It is true. View it as a casualty of war."

"You think that would make it better? They'll put up a monument to him someday, perhaps? One with a radiating inscription that you can see ten thousand miles out in space?"

His voice was becoming a bit ragged. "Is that supposed to make me happy?"

Jonti waited, but Biron said nothing more. Jonti said, "What do you intend doing?"

"I'm going home."

"You still don't understand your position, then."

"I said, I'm going home. What do you want me to do? If he's alive, I'll get him out of there. And if he's dead, I'll--I'll--"

"Quiet!" The older man's voice was coldly annoyed. "You rave like a child. You can't go to Nephelos. Don't you see that you can't? Am I talking to an infant or to a young man of sense?"

Biron muttered, "What do you suggest?"

"Do you know the Director of Rhodia?"

"The friend of the Tyranni? I know the man. I know who he is. Everyone in the Kingdoms knows who he is. Hinrik V, Director of Rhodia."

"Have you ever met him?"

"No."

"That is what I meant. If you haven't met him, you don't know him. He is an imbecile, Farrill. I mean it literally. But when the Ranchy of Widemos is confiscated by the Tyranni--and it will be, as my lands were--it will be awarded to Hinrik. There the Tyranni will feel them to be safe, and there you must go."

"Why?"

"Because Hinrik, at least, has influence with the Tyranni; as much influence as a lickspittle puppet may have. He may arrange to have you reinstated."

"I don't see why. He's more likely to turn me over to them."

"So he is. But you'll be on your guard against it, and there is a fighting chance you may avoid it. Remember, the title you carry is valuable and important, but it is not all-

sufficient. In this business of conspiracy, one must be practical above all. Men will rally about you out of sentiment and respect for your name, but to hold them, you will need money."

Biron considered. "I need time to decide."

"You have no time. Your time ran out when the radiation bomb was planted in your room.

Let us take action. I can give you a letter of introduction to Hinrik of Rhodia."

"You know him so well, then?"

Your suspicion never sleeps very soundly, does it? I once headed a mission to Hinrik's court on behalf of the Autarch of Lingane. His imbecile's mind will probably not remember me, but he will not dare to show he has forgotten. It will serve as introduction and you can improvise from there. I will have the letter for you in the morning. There is a ship leaving for Rhodia at noon. I have tickets for you. I am leaving myself, but by another route. Don't linger. You're all through here, aren't you?"

"There is the diploma presentation."

A scrap of parchment; Does it matter to you?"

"Not now."

"Do you have money?"

"Enough."

"Very well. Too much would be suspicious." He spoke sharply. "Farrill!"

Biron stirred out of what was nearly a stupor. "What?"

"Get back to the others. Tell no one you are leaving. Let the act speak."

Biron nodded dumbly. Far away in the recesses of his mind there was the thought that his mission remained unaccomplished and that in this way, too, he failed his dying father. He was racked with a futile bitterness. He might have been told more. He might have shared the dangers. He should not have been allowed to act in ignorance.

And now that he knew the truth, or at least more of it, concerning the extent of his father's role in conspiracy, there was an added importance to the document he was to have obtained from Earth's archives. But there was no time any longer. No time to get the document.

No time to wonder about it. No time to save his father. No time, perhaps, to live.

He said, "I'll do as you say, Jonti."

Sander Jonti looked briefly out over the university campus as he paused on the steps of the dormitory. Certainly there was no admiration in his glance.

As he stepped down the bricked walk that wound unsubtly through the pseudo-rustic atmosphere affected by all urban campuses since antiquity, he could see the lights of the city's single important street gleam just ahead. Past it, drowned in daytime, but visible now, was the eternal radioactive blue of the horizon, mute witness of prehistoric wars.

Jonti considered the sky for a moment. Over fifty years had passed since the Tyranni had come and put a sudden end to the separate lives of two dozen sprawling,

brawling political units in the depths beyond the Nebula. Now, suddenly and prematurely, the peace of strangulation lay upon them.

The storm that had caught them in one vast thunderclap had been something from which they had not yet recovered. It had left only a sort of twitching that futilely agitated a world here and there, now and then. To organize those twitchings, to align them into a single well-timed heave would be a difficult task, and a long one. Well, he had been rustivating here on Earth long enough. It was time to go back.

The others, back home, were probably trying to get in touch with him at his rooms right now.

He lengthened his stride a bit.

He caught the beam as he entered his room. It was a personal beam, for whose security there were as yet no fears and in whose privacy there was no chink. No formal receiver was required; no thing of metal and wires to catch the faint, drifting surges of electrons, with their whispered impulses swimming through hyperspace from a world half a thousand light-years away.

Space itself was polarized in his room, and prepared for reception. Its fabric was smoothed out of randomness. There was no way of detecting that polarization, except by receiving. And in that particular volume of space, only his own mind could act as receiver; since only the electrical characteristics of his own particular nerve-cell system could resonate to the vibrations of the carrier beam that bore the message.

The message was as private as the unique characteristics of his own brain waves, and in all the universe, with its quadrillions of human beings, the odds against a duplication sufficiently close to allow one man to pick up another's personal wave was a twenty-figured number to one.

Jonti's brain tickled to the call as it whined through the endless empty incomprehensibility of hyperspace.

". . . calling. . . calling. . . calling. . . "

Sending was not quite so simple a job as receiving. A mechanical contrivance was needed to set up the highly specific carrier wave that would carry back to the contact beyond the Nebula. That was contained in the ornamental button that he carried on his right shoulder.

It was automatically activated when he stepped into his volume of space polarization, and after that he had only to think purposefully and with concentration.

"Here I am!" No need for more specific identification.

The dull repetition of the calling signal halted and became words that took form within his mind. "We greet you, sir. Widemos has been executed. The news is, of course, not yet public."

"It does not surprise me. Was anyone else implicated?"

"No, sir. The Rancher made no statements at any time. A brave and loyal man."

"Yes. But it takes more than simply bravery and loyalty, or he would not have been caught. A little more cowardice might have been useful. No matter! I have spoken to his son, the new Rancher, who has already had his brush with death. He will be put to use."

"May one inquire in what manner, sir?"

"It is better to let events answer your question. Certainly I cannot foretell consequences at this early date. Tomorrow he will set off to see Hinrik of Rhodia. "

"Hinrik! The young man will run a fearful risk. Is he aware that--"

"I have told him as much as I can," responded Jonti sharply. "We cannot trust him too far until he has proved himself. Under the circumstances as they exist, we can only view him as a man to be risked, like any other man. He is expendable, quite expendable. Do not call me here again, as I am leaving Earth."

And, with a gesture of finality, Jonti broke the connection mentally.

Quietly and thoughtfully, he went over the events of the day and the night, weighing each event. Slowly, he smiled. Everything had been arranged perfectly, and the comedy might now play itself out.

Nothing had been left to chance.

3. CHANCE AND THE WRIST WATCH

The first hour of a space-ship's rise from planetary thralldom is the most prosaic. There is the confusion of departure, which is much the same in essence as that which must have accompanied the shoving off of the first hollowed-out tree trunk on some primeval river.

You have your accommodations; your luggage is taken care of; there is the first stiff moment of strangeness and meaningless hustle surrounding you. The shouted last-moment intimacies, the quieting, the muted clang of the air locks, followed by the slow soughing of air as the locks screw inward automatically, like gigantic drills, becoming airtight.

Then the portentous silence and the red signs flicking in every room: "Adjust acceleration suits. . . .Adjust acceleration suits. . . .Adjust acceleration suits."

The stewards scour the corridors, knocking shortly on each door and jerking it open.

"Beg pardon. Suits on."

You battle with the suits, cold, tight, uncomfortable, but cradled in a hydraulic system which absorbs the sickening pressures of the take-off.

There is the faraway rumble of the atom-driven motors, on low power for atmospheric maneuvering, followed instantly by the giving back against the slow-yielding oil of the suit cradle. You recede almost indefinitely back, then very slowly forward again as the acceleration decreases. If you survive nausea during this period, you are probably safe from space sickness for duration.

The view-room was not open to the passengers for the first three hours of the flight, and there was a long line waiting when the atmosphere had been left behind and the double doors were ready to separate. There were present not only the usual hundred-percent turnout of all Planetaries (those, in other words, who had never been in space before), but a fair proportion of the more experienced travelers as well.

The vision of Earth from space, after all, was one of the tourist "musts."

The view-room was a bubble on the ship's "skin," a bubble of curved two-foot-thick, steel-hard transparent plastic. The retractile iridium-steel lid which protected it against the scouring of the atmosphere and its dust particles had been sucked back. The lights were out and the gallery was full. The faces peering over the bars were clear in the Earth-shine.

For Earth was suspended there below, a gigantic and gleaming orange-and-blue-and-white-patched balloon. The hemisphere showing was almost entirely sunlit; the continents between the clouds, a desert orange, with thin, scattered lines of green. The seas were blue, standing out sharply against the black of space where they met the horizon.

And all around in the black, undusted sky were the stars.

They waited patiently, those who watched.

It was not the sunlit hemisphere they wanted. The polar cap, blinding bright, was shifting down into view as the ship maintained the slight, unnoticed sidewise acceleration that was lifting it out of the ecliptic. Slowly the shadow of night encroached upon the globe and the huge World-Island of Eurasia-Africa majestically took the stage, north side "down."

Its diseased, unliving soil hid its horror under a night-induced play of jewels. The radioactivity of the soil was a vast sea of iridescent blue, sparkling in strange festoons that spelled out the manner in which the nuclear bombs had once landed, a full generation before the force-field defense against nuclear explosions had been developed so that no other world could commit suicide in just that fashion again.

The eyes watched until, with the hours, Earth was a bright little half coin in the endless black.

Among the watchers was Biron Farrill. He sat by himself in the front row, arms upon the railing, eyes brooding and thoughtful. This was not the way he had expected to leave Earth. It was the wrong manner, the wrong ship, the wrong destination.

His tanned forearm rubbed against the stubble of his chin and he felt guilty about not having shaved that morning. He'd go back to his room after a while and correct that.

Meanwhile, he hesitated to leave. There were people here. In his room he would be alone.

Or was that just the reason he should leave?

He did not like the new feeling he had, that of being hunted; that of being friendless.

All friendship had dropped from him. It had shriveled from the very moment he had been awakened by the phone call less than twenty-four hours earlier.

Even in the dormitory he had become an embarrassment. Old Esbak had pounced upon him when he had returned after his talk with Jonti in the student lounge. Esbak was in turmoil; his voice overshrill.

"Mr. Farrill, I've been looking for you. It has been a most unfortunate incident. I can't understand it. Do you have any explanation?"

"No," he half shouted, "I don't. When can I get into my room and get my stuff out?"

"In the morning, I am sure. We've just managed to get the equipment up here to test the room. There is no longer any trace of radioactivity above normal background level. It was a very fortunate escape for you. It must have missed you only by minutes."

"Yes, yes, but if you don't mind, I would like to rest."

"Please use my room till morning and then we'll get you relocated for the few days remaining you. Umm, by the way, Mr. Farrill, if you don't mind, there is another matter."

He was being overly polite. Biron could almost hear the egg-shells give slightly beneath his finicky feet.

"What other matter?" asked Biron wearily.

"Do you know of anyone who might have been interested in--er--hazing you?"

"Hazing me like this? Of course not."

"What are your plans, then? The school authorities would, of course, be most unhappy to have publicity arise as a result of this incident."

How he kept referring to it as an "incident"! Biron said dryly, "I understand you. But don't worry. I'm not interested in investigations or in the police. I'm leaving Earth soon, and I'd just as soon not have my own plans disrupted. I'm not bringing any charges. After all, I'm still alive."

Esbak had been almost indecently relieved. It was all they wanted from him. No unpleasantness. It was just an incident to be forgotten.

He got into his old room again at seven in the morning. It was quiet and there was no murmuring in the closet. The bomb was no longer there, nor was the counter. They had probably been taken away by Esbak and thrown into the lake. It came under the head of destroying evidence, but that was the school's worry. He threw his belongings into suitcases and then called the desk for assignment to another room. The lights were working again, he noticed, and so, of course, was the visiphone. The one remnant of last night was the twisted door, its lock melted away.

They gave him another room. That established his intention to stay for anyone that might be listening. Then, using the hall phone, he had called an air cab. He did not think anyone saw him. Let the school puzzle out his disappearance however they pleased.

For a moment he had caught sight of Jonti at the space port. They met in the fashion of a glancing blow. Jonti said nothing; gave no sign of recognition, but after he had passed by, there were in Biron's hand a featureless little black globe that was a personal capsule and a ticket for passage to Rhodia.

He spent a moment upon the personal capsule. It was not sealed. He read the message later in his room. It was a simple introduction with minimum wordage.

Biron's thoughts rested for a while upon Sander Jonti, as he watched Earth shrivel with time there in the view-room. He had known the man very superficially until Jonti had whirled so devastatingly into his life, first to save it and then to set it upon a new and untried course. Biron had known his name; he had nodded when they passed; had exchanged polite formalities occasionally, but that was all. He had not liked the man, had not liked his coldness, his overdressed, overmannered personality. But all that had nothing to do with affairs now.

Biron rubbed his crew cut with a restless hand and sighed. He actually found himself hungering for Jonti's presence. The man was at least master of events. He had known what to do; he had known what Biron was to do; he had made Biron do it. And now Biron was alone and feeling very young, very helpless, very friendless, and almost frightened.

Through it all, he studiously avoided thinking of his father. It would not help.

"Mr. Malaine."

The name was repeated two or three times before Biron started at the respectful touch upon his shoulder and looked up.

The robot messenger said again, "Mr. Malaine," and for five seconds Biron stared blankly, until he remembered that that was his temporary name. It had been penciled lightly upon the ticket which Jonti had given him. A stateroom had been reserved in that name.

"Yes, what is it? I am Malaine." The messenger's voice hissed very faintly as the spool within whirled off its message. "I have been asked to inform you that your stateroom has been changed, and that your baggage has already been shifted. If you will see the purser, you will be given your new key. We trust that this will cause no inconvenience for you."

"What's all this?" Biron whirled in his seat, and several of the thinning group of passengers, still watching, looked up at the explosive sound. "What's the idea?"

Of course, it was no use arguing with a machine that had merely fulfilled its function. The messenger had bowed its metal head respectfully, its gently fixed imitation of a human smile of ingratiation unchanging, and had left.

Biron strode out of the view-room and accosted the ship's officer at the door with somewhat more energy than he had planned.

"Look here. I want to see the captain."

The officer showed no surprise. "Is it important, sir?"

"It sure as Space is. I've just had my stateroom shifted without my permission and I'd like to know the meaning of it."

Even at the time, Biron felt his anger to be out of proportion to the cause, but it represented an accumulation of resentment. He had nearly been killed; he had been forced to leave Earth like a skulking criminal; he was going he knew not where to do he knew not what; and now they were pushing him around aboard ship. It was the end.

Yet, through it all, he had the uncomfortable feeling that Jonti, in his shoes, would have acted differently, perhaps more wisely. Well, he wasn't Jonti.

The officer said, "I will call the purser."

"I want the captain," insisted Biron.

"If you wish, then." And after a short conversation through the small ship's communicator suspended from his lapel, he said urbanely, "You will be called for. Please Wait."

Captain Hirm Gordell was a rather short and thickset man, who rose politely and leaned over his desk to shake hands with Biron when the latter entered.

"Mr. Malaine," he said, "I am sorry we had to trouble you."

He had a rectangular face, iron-gray hair, a short, well-kept mustache of slightly darker hue, and a clipped smile.

"So am I," said Biron. "I had a stateroom reservation to which I was entitled and I feel that not even you, sir, had the right to change it without my permission."

"Granted, Mr. Malaine. But, you understand, it was rather an emergency. A last-minute arrival, an important man, insisted on being moved to a stateroom closer the gravitational center of the ship. He had a heart condition and it was important to keep ship's gravity as low as possible for him. We had no choice."

"All right, but why pick on me as the one to be shifted."

"It had to be someone. You were traveling alone; you are a young man who we felt would have no difficulty in taking a slightly higher gravity." His eyes traveled automatically up and down Biron's six-feet-two of hard musculature. "Besides, you will find your new room rather more elaborate than your old one. You have not lost by the exchange. No indeed."

The captain stepped from behind his desk. "May I show you your new quarters personally?"

Biron found it difficult to maintain his resentment. It seemed reasonable, this whole matter, and then again, not reasonable either.

The captain was saying as they left his quarters, "May I have your company at my table for tomorrow night's dinner? Our first Jump is scheduled for that time."

Biron heard himself saying, "Thank you. I will be honored."

Yet he thought the invitation strange. Granted that the captain was merely trying to soothe him, yet surely the method was stronger than necessary.

The captain's table was a long one, taking up an entire wall of the salon. Biron found himself near the center, taking an unsuitable precedence over others. Yet there was his place card before him. The steward had been quite firm; there was no mistake.

Biron was not particularly overmodest. As son of the Rancher of Widemos, there had never been any necessity for the development of any such characteristic. And yet as Biron Malaine, he was quite an ordinary citizen, and these things ought not to happen to ordinary citizens.

For one thing, the captain had been perfectly correct about his new stateroom. It was more elaborate. His original room had been what his ticket called for, a single, second class, while the replacement was a double room, first. There was a bathroom adjoining, private, of course, equipped with a stall shower and an air dryer.

It was near "officer's country," and the presence of uniforms was almost overpowering.

Lunch had been brought to his room on silver service. A barber made a sudden appearance just before dinner. All this was perhaps to be expected when one traveled on a luxury space liner, first class, but it was too good for Biron Malaine.

It was far too good, for by the time the barber had arrived, Biron had just returned from an afternoon walk that had taken him through the corridors in a purposely devious path.

There had been crewmen in his path wherever he had turned--polite, clinging. He shook them free somehow and reached 140 D, his first room, the one he had never slept in.

He stopped to light a cigarette and, in the interval spent thus, the only passenger in sight turned a corridor. Biron touched the signal light briefly and there was no answer.

Well, the old key had not been taken from him yet. An oversight, no doubt. He placed the thin oblong sliver of metal into its orifice and the unique pattern of leaden

opacity within the aluminum sheath activated the tiny phototube. The door opened and he took one step inside.

It was all he needed. He left and the door closed automatically behind him. He had learned one thing immediately. His old room was not occupied; neither by an important personage with a weak heart nor by anyone else. The bed and furnishings were too neat; no trunks, no toilet articles were in sight; the very air of occupancy was missing.

So the luxury they were surrounding him with served only to prevent his taking further action to get back his original room. They were bribing him to stay quietly out of the old room. Why? Was it the room they were interested in, or was it himself?

And now he sat at the captain's table with the questions unanswered and rose politely with the rest as the captain entered, strode up the steps of the dais on which the long table was set, and took his place.

Why had they moved him?

There was music in the ship, and the walls that separated the salon from the view-room had been retracted. The lights were low and tinged with orange-red. The worst of such space sickness as there might have been after the original acceleration or as the result of first exposure to the minor gravity variations between various parts of the ship had passed by now; the salon was full.

The captain leaned forward slightly and said to Biron, "Good evening, Mr. Malaine. How do you find your new room?"

"Almost too satisfactory, sir. A little rich for my way of life." He said it in a flat monotone, and it seemed to him that a faint dismay passed momentarily over the captain's face.

Over the dessert, the skin of the view-room's glass bubble slid smoothly back into its socket, and the lights dimmed to nearly nothing. Neither sun, earth, nor any planet was in view on that large, dark screen. They were facing the Milky Way, that longwise view of the Galactic Lens, and it made a luminous diagonal track among the hard, bright stars.

Automatically the tide of conversation ebbed. Chairs shifted so that all faced the stars. The dinner guests had become an audience, the music a faint whisper.

The voice over the amplifiers was clear and well balanced in the gathered question.

"Ladies, gentlemen! We are ready for our first Jump. Most of you, I suppose, know, at least theoretically, what a Jump is. Many of you, however--more than half, in point of fact--have never experienced one. It is to those last I would like to speak in particular.

"The Jump is exactly what the name implies. In the fabric of space-time itself, it is impossible to travel faster than the speed of light. That is a natural law, first discovered by one of the ancients, the traditional Einstein, perhaps, except that so many things are credited to him. Even at the speed of light, of course, it would take years, in resting time, to reach the stars.

"Therefore one leaves the space-time fabric to enter the little-known realm of hyperspace, where time and distance have no meaning. It is like traveling across a narrow

isthmus to pass from one ocean to another, rather than remaining at sea and circling a continent to accomplish the same distance.

"Great amounts of energy are required, of course, to enter this 'space within space' as some call it, and a great deal of ingenious calculation must be made to insure re-entry into ordinary space time at the proper point. The result of the expenditure of this energy and intelligence is that immense distances can be traversed in zero time. It is only the Jump which makes interstellar travel possible.

"The Jump we are about to make will take place in about ten minutes. You will be warned. There is never more than some momentary minor discomfort; therefore, I hope all of you will remain calm. Thank you."

The ship lights went out altogether, and there were only the stars left.

It seemed a long while before a crisp announcement filled the air momentarily: "The Jump will take place in exactly one minute." And then the same voice counted the seconds backwards: "Fifty. . . forty. . . thirty. . . twenty. . . ten. . . five. . . three. . . two. . . one. . ."

It was as though there had been a momentary discontinuity in existence, a bump which joggled only the deep inside of a man's bones.

In that immeasurable fraction of a second, one hundred light-years had passed, and the ship, which had been on the outskirts of the solar system, was now in the depths of interstellar space.

Someone near Biron said shakily, "Look at the stars!"

In a moment the whisper had taken life through the large room and hissed itself across the tables: "The stars! See!"

In that same immeasurable fraction of a second the star view had changed radically.

The center of the great Galaxy, which stretched thirty thousand light-years from tip to tip, was closer now, and the stars had thickened in number. They spread across the black velvet vacuum in a fine powder, back-dropping the occasional brightness of the nearby stars.

Biron, against his will, remembered the beginning of a poem he himself had once written at the sentimental age of nineteen, on the occasion of his first space flight; the one that had first taken him to the Earth he was now leaving. His lips moved silently: "The stars, like dust, encircle me In living mists of light; And all of space I seem to see In one vast burst of sight."

The lights went on then, and Biron's thoughts were snapped out of space as suddenly as they had entered it. He was in a space liner's salon again, with a dinner dragging to an end, and the hum of conversation rising to a prosaic level again.

He glanced at his wrist watch, half looked away, then, very slowly, brought the wrist watch into focus again. He stared at it for a long minute. It was the wrist watch he had left in his bedroom that night; it had withstood the killing radiation of the bomb, and he had collected it with the rest of his belongings the next morning. How many times had

he looked at it since then? How many times had he stared at it, taken mental note of the time and no note at all of the other piece of information it shouted at him?

For the plastic wristband was white, not blue. It was white!

Slowly the events of that night, all of them, fell into place. Strange how one fact could shake an the confusion out of them.

He rose abruptly, murmuring, "Pardon me!" under his breath. It was a breach of etiquette to leave before the captain, but that was a matter of small importance to him then.

He hastened to his room, striding up the ramps rapidly, rather than waiting for the non-gravity elevators. He locked the door behind him and looked quickly through the bathroom and the built-in closets. He had no real hope of catching anyone. What they had had to do, they must have done hours ago.

Carefully, he went through his baggage. They had done a thorough job. With scarcely any sign to show that they had come and gone, they had carefully withdrawn his identification papers, a packet of letters from his father, and even his capsular introduction to Hinrik of Rhodia.

That was why they had moved him. It was neither the old room nor the new that they were interested in; merely the process of moving. For nearly an hour they must have legitimately--legitimately, by Space!--concerned themselves with his baggage, and served their own purposes thereby.

Biron sank down upon the double bed and thought furiously, but it didn't help. The trap had been perfect. Everything had been planned. Had it not been for the completely unpredictable chance of his leaving his wrist watch in the bedroom that night, he would not even now have realized how close-meshed the Tyranni's net through space was.

There was a soft burr as his door signal sounded.

"Come in," he said.

It was the steward, who said respectfully, "The captain wishes to know if there is anything he can do for you. You seemed ill as you left the table."

"I'm all right," he said.

How they watched him! And in that moment he knew that there was no escape, and that the ship was carrying him politely, but surely, to his death.

4. FREE?

Sander Jonti met the other's eyes coldly. He said, "Gone, you say?"

Rizzett passed a hand over his ruddy face. "Something is gone. I don't know its identity. It might have been the document we're after, certainly. All we know about it is that it had been dated somewhere in the fifteenth to twenty-first century of Earth's primitive calendar, and that it is dangerous."

"Is there any definite reason to believe that the missing one is the document?"

"Only circumstantial reasoning. It was guarded closely by the Earth government."

"Discount that. An Earthman will treat any document relating to the pre-Galactic past with veneration. It's their ridiculous worship of tradition."

"But this one was stolen and yet they never announced the fact. Why do they guard an empty case?"

"I can imagine their doing that rather than finding themselves forced to admit that a holy relic has been stolen. Yet I cannot believe that young Farrill obtained it after all. I thought you had him under observation."

The other smiled. "He didn't get it."

"How do you know?"

Jonti's agent quickly exploded his land mine. "Because the document has been gone twenty years."

"What?"

"It has not been seen for twenty years."

"Then it can't be the right one. It was less than six months ago that the Rancher learned of its existence."

"Then somebody else beat him to it by nineteen and a half years."

Jonti considered. He said, "It does not matter. It cannot matter."

"Why so?"

"Because I have been here on Earth for months. Before I came, it was easy to believe that there might be information of value on the planet. But consider now. When Earth was the only inhabited planet in the Galaxy, it was a primitive place, militarily speaking. The only weapon they had ever invented worth mentioning was a crude and inefficient nuclear-reaction bomb for which they had not even developed the logical defense." He flung his arm outward in a delicate gesture to where the blue horizon gleamed its sickly radio. activity beyond the thick concrete of the room.

He went on. "All this is placed in sharp focus for me as a temporary resident here. It is ridiculous to assume that it is possible to learn anything from a society at that level of military technology. It is always very fashionable to assume that there are lost arts and lost sciences, and there are always these people who make a cult of primitivism and who make all sorts of ridiculous claims for the prehistoric civilizations on Earth."

Rizzett said, "Yet the Rancher was a wise man. He told us specifically that it was the most dangerous document he knew. You remember what he said. I can quote it. He said, 'The matter is death for the Tyranni, and death for us as well; but it would mean final life for the Galaxy.' "

"The Rancher, like all human beings, can be wrong."

"Consider, sir, that we have no idea as to the nature of the document. It could, for instance, be somebody's laboratory notes which had never been published. It might be something that could relate to a weapon the Earthmen had never recognized as a weapon; something which on the face of it might not be a weapon--"

"Nonsense. You are a military man and should know better. If there is one science into which man has probed continuously and successfully, it is that of military technology. No potential weapon would remain unrealized for ten thousand years. I think, Rizzett, we will return to Lingane."

Rizzett shrugged. He was not convinced.

Nor, a thousandfold, was Jonti. It had been stolen, and that was significant. It had been worth stealing! Anyone in the Galaxy might have it now.

Unwillingly the thought came to him that the Tyranni might have it. The Rancher had been most evasive on the matter. Even Jonti himself had not been trusted sufficiently. The Rancher had said it carried death; it could not be used without having it cut both ways.

Jonti's lips clamped shut. The fool and his idiotic hintings! And now the Tyranni had him.

What if a man like Aratap were now in the possession of such a secret as this might be? Aratap! The one man, now that the Rancher was gone, who remained unpredictable; the most dangerous Tyrannian of them all.

Simok Aratap was a small man; a little bandy-legged, narrow-eyed fellow. He had the stumpy, thick-limbed appearance of the average Tyrannian, yet though he faced an exceptionally large and well-muscled specimen of the subject worlds, he was completely self-possessed. He was the confident heir (in the second generation) of those who had left their windy, infertile worlds and sparked across the emptiness to capture and enchain the rich and populous planets of the Nebular Regions.

His father had headed a squadron of small, flitting ships that had struck and vanished, then struck again, and made scrap of the lumbering titanic ships that had opposed them.

The worlds of the Nebula had fought in the old fashion, but the Tyranni had learned a new one. Where the huge, glittering vessels of the opposed navies attempted single combat, they found themselves flailing at emptiness and wasting their stores of energy. Instead, the Tyranni, abandoning power alone, stressed speed and co-operation, so that the opposed Kingdoms toppled one after the other, singly; each waiting (half joyfully at the discomfiture of its neighbors), fallaciously secure behind its steel-shipped ramparts, until its own turn came.

But those wars were fifty years earlier. Now the Nebular Regions were satrapies that required merely the acts of occupation and taxation. Previously there had been worlds to gain, Aratap thought wearily, and now there was little left to do but to contend with single men.

He looked at the young man who faced him. He was quite a young man. A tall fellow with very good shoulders indeed; an absorbed, intent face with the hair of his head cut ridiculously short in what was undoubtedly a collegiate affectation. In an unofficial sense, Aratap was sorry for him. He was obviously frightened.

Biron did not recognize the feeling inside him as "fright." If he had been asked to put a name to the emotion, he would have described it as "tension." All his life he had known the Tyranni to be the overlords. His father, strong and vital though he was, unquestioned on his own estate, respectfully heard on others, was quiet and almost humble in the presence of the Tyranni.

They came occasionally to Widemos on polite visits, with questions as to the annual tribute they called taxation. The Rancher of Widemos was responsible for the collection and delivery of these funds on behalf of the planet Nephelos and, perfunctorily, the Tyranni would check his books.

The Rancher himself would assist them out of their small vessels. They would sit at the head of the table at mealtimes, and they would be served first. When they spoke, all other conversation stopped instantly.

As a child, he wondered that such small, ugly men should be so carefully handled, but he learned as he grew up that they were to his father what his father was to a cow hand. He even learned to speak softly to them himself, and to address them as "Excellency."

He had learned so well that now that he faced one of the overlords, one of the Tyranni, he could feel himself shiver with tension.

The ship which he had considered his prison became officially one on the day of landing upon Rhodia. They had signaled at his door and two husky crewmen had entered and stood on either side of him. The captain, who followed, had said in a flat voice, "Biron Farrill, I take you into custody by the power vested in me as captain of this vessel, and hold you for questioning by the Commissioner of the Great King."

The Commissioner was this small Tyrannian who sat before him now, seemingly abstracted and uninterested. The "Great King" was the Khan of the Tyranni, who still lived in the legendary stone palace on the Tyrannian's home planet.

Biron looked furtively about him. He was not physically constrained in any way, but four guards in the slate blue of the Tyrannian Outer Police flanked him, two and two. They were armed. A fifth, with a major's insignia, sat beside the Commissioner's desk.

The Commissioner spoke to him for the first time. "As you may know"--his voice was high--pitched, thin--"the old Rancher of Widemos, your father, has been executed for treason."

His faded eyes were fixed on Biron's. There seemed nothing beyond mildness in them.

Biron remained stolid. It bothered him that he could do nothing. It would have been so much more satisfying to howl at them, to flail madly at them, but that would not make his father less dead. He thought he knew the reason for this initial statement. It was intended to break him down, to make him give himself away. Well, it wouldn't.

He said evenly, "I am Biron Malaine of Earth. If you are questioning my identity, I would like to communicate with the Terrestrial Consul."

"Ah yes, but we are at a purely informal stage just now. You are Biron Malaine, you say, of Earth. And yet"--Aratap indicated the papers before him--"there are letters here which were written by Widemos to his son. There is a college registration receipt and tickets to commencement exercises made out to a Biron Farrill. They were found in your baggage."

Biron felt desperate but he did not let it show. "My baggage was searched illegally, so that I deny that those can be admitted as evidence."

"We are not in a court of law, Mr. Farrill or Malaine. How do you explain them?"

"If they were found in my baggage, they were placed there by someone else."

The Commissioner passed it by, and Biron felt amazed. His statements sounded so thin, so patently foolish. Yet the Commissioner did not remark upon them, but only tapped the black capsule with his forefinger. "And this introduction to the Director of Rhodia? Also not yours?"

"No, that is mine." Biron had planned that. The introduction did not mention his name.

He said, "There is a plot to assassinate the Director--"

He stopped, appalled. It sounded so completely unconvincing when he finally put the beginning of his carefully prepared speech into actual sound. Surely the Commissioner was smiling cynically at him?

But Aratap was not. He merely sighed a little and with quick, practiced gestures removed contact lenses from his eyes and placed them carefully in a glass of saline solution that stood on the desk before him. His naked eyeballs were a little watery.

He said, "And you know of it? Even back on Earth, five hundred light-years away? Our own police here on Rhodia have not heard of it."

"The police are here. The plot is being developed on Earth."

"I see. And are you their agent? Or are you going to warn Hinrik against them?"

"The latter, of course."

"Indeed? And why do you intend to warn him?"

"For the substantial reward which I expect to get."

Aratap smiled. "That, at least, rings true and lends a certain truthful gloss to your previous statements. What are the details of the plot you speak of?"

"That is for the Director only."

A momentary hesitation, then a shrug. "Very well. The Tyranni are not interested and do not concern themselves with local politics. We will arrange an interview between yourself and the Director and that will be our contribution to his safety. My men will hold you until your baggage can be collected, and then you will be free to go. Remove him."

The last was to the armed men, who left with Biron. Aratap replaced his contact lenses, an action which removed 'instantly that look of vague incompetence their absence had seemed to induce.

He said to the major, who had remained, "We will keep an eye, I think, on this young Farrill."

The officer nodded shortly. "Good! For a moment I thought you might have been taken in. To me, his story was quite incoherent."

"It was. It's just that which makes him maneuverable for the while. All young fools who get their notions of interstellar intrigue from the video spy thrillers are easily handled. lie is, of course, the son of the ex-Rancher."

And now the major hesitated. "Are you sure? It's a vague and unsatisfactory accusation we have against him."

"You mean that it might be arranged evidence after all? For what purpose?"

"It could mean that he is a decoy, sacrificed to divert our attention from a real Biron Farrill elsewhere."

"No. Improbably theatrical, that. Besides, we have a photocube."

"What? Of the boy?"

"Of the Rancher's son. Would you like to see it?"

"I certainly would."

Aratap lifted the paperweight upon his desk. It was a simple glass cube, three inches on each side, black and opaque. He said, "I meant to confront him with it if it had seemed best. It is a cute process, this one, Major. I don't know if you're acquainted with it. It's been developed recently among the inner worlds. Outwardly, it seems an ordinary photocube, but when it is turned upside down, there's an automatic molecular re-arrangement which renders it totally opaque. It is a pleasant conceit."

He turned the cube right side up. The opacity shimmered for a moment, then cleared slowly like a black fog wisping and feathering before the wind. Aratap watched it calmly, hands folded across his chest.

And then it was water-clear, and a young face smiled brightly out of it, accurate and alive, trapped and solidified in mid-breath forever.

"An item," said Aratap, "in the ex-Rancher's possessions. What do you think?"

"It is the young man, without question."

"Yes." The Tyrannian official regarded the photocube thoughtfully. "You know, using this same process, I don't see why six photographs could not be taken in the same cube. It has six faces, and by resting the cube on each of them in turn, a series of new molecular orientations might be induced. Six connected photographs, flowing one into another as you turned, a static phenomenon turned dynamic and taking on new breadth and vision. Major, it would be a new art form." A mounting enthusiasm had crept into his voice.

But the silent major looked faintly scornful, and Aratap left his artistic reflections to say, abruptly, "Then you will watch Farrill?"

"Certainly."

"Watch Hinrik as well."

"Hinrik?"

"Of course. It is the whole purpose of freeing the boy. I want some questions answered. Why is Farrill seeing Hinrik? What is the connection between them? The dead Rancher did not play a lone hand, There was--there must have been--a well-organized conspiracy behind them. And we have not yet located the workings of that conspiracy."

"But surely Hinrik could" not be involved. He lacks the intelligence, even if he had the courage."

"Granted. But it is just because he is half an idiot that he may serve them as a tool.

If so, he represents a weakness in our scheme of things. We obviously cannot afford to neglect the possibility."

He gestured absently; the major saluted, turned on his heel, and left.

Aratap sighed, thoughtfully turned the photocube in his hand, and watched the blackness wash back like a tide of ink.

Life was simpler in his father's time. To smash a planet had a cruel grandeur about it; while this careful maneuvering of an ignorant young man was simply cruel.

And yet necessary.

5. UNEASY LIES THE HEAD

The directorship of Rhodia is not ancient, when compared with Earth, as a habitat for *Homo sapiens*. It is not ancient even when compared with the Centaurian or Sirian worlds. The planets of Arcturus, for instance, had been settled for two hundred years when the first space ships circled the Horsehead Nebula to find the nest of hundreds of oxygen-water planets behind. They clustered thickly and it was a real find, for although planets infest space, few can satisfy the chemical necessities of the human organism.

There are between one and two hundred billion radiant stars in the Galaxy. Among them are some five hundred billion planets. Of these, some have gravities more than 120 per cent that of Earth, or less than 60 per cent, and are therefore unbearable in the long run. Some are too hot, some too cold. Some have poisonous atmospheres. Planetary atmospheres consisting largely or entirely of neon, methane, ammonia, chlorine--even silicon tetrafluoride--have been recorded. Some planets lack water, one with oceans of almost pure sulphur dioxide having been described. Others lack carbon.

Any one of these failings is sufficient, so that not one world in a hundred thousand can be lived on. Yet this still leaves an estimated four million habitable worlds.

The exact number of these which are actually occupied is disputable. According to the Galactic Almanac, admittedly dependent on imperfect records, Rhodia was the 1098th world settled by man.

Ironically enough, Tyrann, eventually Rhodia's conqueror, was the 1099th.

The pattern of history in the Trans-Nebular Region was distressingly similar to that elsewhere during the period of development and expansion. Planet republics were set up in rapid succession, each government confined to its own world. With expanding economy, neighboring planets were colonized and integrated with the home society. Small "empires" were established and these inevitably clashed.

Hegemony over sizable regions was established by first one, then another of these governments, depending upon the fluctuations of the fortunes of war and of leadership.

Only Rhodia maintained a lengthy stability, under the able dynasty of the Hinriads. It was perhaps well on the road to establishing finally a universal Trans-Nebular Empire in a stolid century or two, when the Tyranni came and did the job in ten years.

Ironical that it should be the men of Tyrann. Until then, during the seven hundred years of its existence, Tyrann had done little better than maintain a precarious autonomy, thanks largely to the undesirability of its barren landscape, which, because of a planetary water dearth, was largely desert.

But even after the Tyranni came, the Directorship of Rhodia continued. It had even grown. The Hinriads were popular with the people, so their existence served as a means of easy control. The Tyranni did not care who got the cheers as long as they themselves received the taxes.

To be sure, the Directors were no longer the Hinriads of old. The Directorship had always been elective within the family so that the ablest might be chosen. Adoptions into the family had been encouraged for the same purpose.

But now the Tyranni could influence the elections for other reasons, and twenty years earlier, for instance, Hinrik (fifth of that name) had been chosen Director. To the Tyranni, it had seemed a useful choice.

Hinrik had been a handsome man at the time of his election, and he still made an impressive appearance when he addressed the Rhodian Council. His hair had grayed smoothly, and his thick mustache remained, startlingly enough, as black as his daughter's eyes.

At the moment he faced his daughter, and she was furious. She lacked only two inches of his height, and the Director lacked less than an inch of six feet. She was a smoldering girl, dark of hair and of eyes, and, at the moment, loweringly dark of complexion.

She said again, "I can't do it! I won't do it!"

Hinrik said, "But, Art, Art, this is unreasonable. What am I to do? What can I do? In my position, what choice have I?"

"If Mother were alive, she would find a way out." And she stamped her foot. Her full name was Artemisia, a royal name that had been borne by at least one female of the Hinriads in every generation.

"Yes, yes, no doubt. Bless my soul! What a way your mother had with her! There are times when you seem all of her and none of me. But surely, Art, you haven't given him a chance. Have you observed his--ah--better points?"

"Which are those?"

"The ones which. . . ." He gestured vaguely, thought a while and gave it up. He approached her and would have put a consoling hand upon her shoulder, but she squirmed away from him, her scarlet gown shimmering in the air.

"I have spent an evening with him," she said bitterly, "and he tried to kiss me. It was disgusting!"

"But everyone kisses, dear. It's not as though this were your grandmother's time--of respected memory. Kisses are nothing--less than nothing. Young blood, Art, young blood!"

"Young blood, my foot. The only time that horrible little man has had young blood in him these fifteen years has been immediately after a transfusion. He's four inches shorter than I am, Father. How can I be seen in public with a pygmy?"

"He's an important man. Very important!"

"That doesn't add a single inch to his height. He is bowlegged, as they all are, and his breath smells."

"His breath smells?" Artemisia wrinkled her nose at her father. "That's right; it smells. It has an unpleasant odor. I didn't like it and I let him know it."

Hinrik dropped his jaw wordlessly for a moment, then said in a hoarse half whisper, "You let him know it? You implied that a high official of the Royal Court of Tyrann could have an unpleasant personal characteristic?"

"He did! I have a nose, you know! So when he got too close, I just held it and pushed.

A figure of man to admire, that one is. He went flat on his back, with his legs sticking up."

She gestured with her fingers in illustration, but it was lost on Hinrik, who, with a moan, hunched his shoulders and put his hands over his face.

He peered miserably from between two fingers. "What will happen now? How can you act so?"

"It didn't do me any good. Do you know what he said? Do you know what he said? It was the last straw. It was absolutely the limit. I made up my mind then that I couldn't stand that man if he were ten feet tall."

"But--but--what did he say?"

"He said--straight out of a video, Father--he said, 'Ha! A spirited wench! I like her all the better for that!' and two servants helped him stagger to his feet. But he didn't try to breathe in my face again."

Hinrik doubled into a chair, leaned forward and regarded Artemisia earnestly. "You could go through the motions of marrying him, couldn't you? You needn't be in earnest. Why not merely, for the sake of political expediency--"

"How do you mean, not in earnest, Father? Shall I cross the fingers of my left hand while signing the contract with my right?"

Hinrik looked confused. "No, of course not. What good would that do? How would crossing fingers alter the validity of the contract? Really, Arta, I'm surprised at your stupidity."

Artemisia sighed. "What do you mean, then?"

"Mean by what? You see, you've disrupted things. I can't keep my mind on matters properly when you argue with me. What was I saying?"

"I was merely to pretend I was getting married, or something. Remember?"

"Oh yes. I mean, you needn't take it too seriously, you see."

"I can have lovers, I suppose."

Hinrik stiffened and frowned. "Arta! I brought you up to be a modest, self-respecting girl. So did your mother. How can you say such things? It's shameful."

"But isn't that what you mean? "

"I can say it. I am a man, a mature man. A girl like you ought not to repeat it."

"Well, I have repeated it and it's out in the open. I don't mind lovers. I'll probably have to have them if I'm forced to marry for reasons of state, but there are limits." She placed her hands upon her hips, and the cape-like sleeves of her gown slithered away from her tanned and dimpled shoulders. "What will I do between lovers? He'll still be my husband and I just can't bear that particular thought."

"But he's an old man, my dear. Life with him would be short."

"Not short enough, thank you. Five minutes ago he had young blood. Remember?"

Hinrik spread his hands wide and let them drop. "Arta, the man is a Tyrannian, and a powerful one. He is in good odor at the Khan's court."

"The Khan might think it's a good odor. He probably would. He probably stinks himself."

Hinrik's mouth was an O of horror. Automatically, he looked over his shoulder. Then he said hoarsely, "Don't ever say anything like that again."

"I will if I feel like it. Besides, the man has had three wives already." She forestalled him. "Not the Khan, the man you want me to marry."

"But they're dead," Hinrik explained earnestly. "Arta, they're not alive. Don't think that. How can you imagine I would let my daughter marry a bigamist? We'll have him produce documents. He married them consecutively, not simultaneously, and they're dead now, entirely dead, all of them."

"It's no wonder."

"Oh, bless my soul, what shall I do?" He made a last effort at dignity. "Arta, it is the price of being a Hinriad and a Director's daughter."

"I didn't ask to be a Hinriad and a Director's daughter."

"That has nothing to do with it. It is just that the history of all the Galaxy, Arta, shows that there are occasions when reasons of state, the safety of planets, the best interests of peoples require that, uh--"

"That some poor girl prostitute herself."

"Oh, this vulgarity! Someday, you'll see--someday you'll say something of the sort in public."

"Well, that's what it is, and I won't do it. I'd rather die. I'd rather do anything.

And I will."

The Director got to his feet and held out his arms to her. His lips trembled and he said nothing. She ran to him in a sudden agony of tears and clung desperately to him. "I can't, Daddy. I can't. Don't make me."

He patted her awkwardly. "But if you don't, what will happen? If the Tyranni are displeased, they will remove me, imprison me, maybe even exec--" He gagged on the word. "These are very unhappy times, Arta--very unhappy. The Rancher of Widemos was condemned last week and I believe he has been executed. You remember him, Arta? He was at court half a year ago. A big man, with a round head and deep-set eyes. You were frightened of him at first. "

"I remember."

"Well, he is probably dead. And who knows? Myself next, perhaps. Your poor, harmless old father next. It is a bad time. He was at our court and that's very suspicious."

She suddenly held herself out at arm's length. "Why should it be suspicious? You weren't involved with him, were you?"

"I? Indeed not. But if we openly insult the Khan of Tyrann by refusing an alliance with one of his favorites, they may choose to think even that."

Hinrik's hand wringing was interrupted by the muted buzz of the extension. He started uneasily.

"I'll take it in my own room. You just rest. You'll feel better after a nap. You'll see, you'll see. It's just that you're a little on edge now."

Artemisia looked after him and frowned. Her face was intensely thoughtful, and for minutes only the gentle tide of her breasts betrayed life.

There was the sound of stumbling feet at the door, and she turned.

"What is it?" The tone was sharper than she had intended.

It was Hinrik, his face sallow with fear. "Major Andros was calling."

"Of the Outer Police?" Hinrik could only nod.

Artemisia cried, "Surely, he's not--" She paused reluctantly at the threshold of putting the horrible thought into words, but waited in vain for enlightenment.

"There is a young man who wants an audience. I don't know him. Why should he come here? He's from Earth." He was gasping for breath and staggered as he spoke, as though his mind were on a turntable and he had to follow it in its gyrations.

The girl ran to him and seized his elbow. She said sharply, "Sit down, Father. Tell me what has happened." She took him and some of the panic drained out of his face.

"I don't know exactly," he whispered. "There's a young man coming here with details concerning a plot on my life. On my life. And they tell me I ought to listen to him."

He smiled foolishly. "I'm loved by the people. No one would want to kill me. Would they? Would they?"

He was watching her eagerly, and relaxed when she said, "Of course no one would want to kill you."

Then he was tense again. "Do you think it might be they?"

"Who?"

He leaned over to whisper. "The Tyranni. The Rancher of Widemos was here yesterday, and they killed him." His voice ascended the scale. "And now they're sending someone over to kill me."

Artemisia gripped his shoulder with such force that his mind turned to the present pain.

She said, "Father! Sit quietly! Not a word! Listen to me. No one will kill you. Do you hear me? No one will kill you. It was six months ago that the Rancher was here. Do you remember? Wasn't it six months ago? Think!"

"So long?" whispered the Director. "Yes, yes, it must have been so."

"Now you stay here and rest. You're overwrought. I'll see the young man myself and then I'll bring him to you if it's safe;"

"Will you, Arta? Will you? He won't hurt a woman. Surely he wouldn't hurt a woman."

She bent suddenly and kissed his cheek.

"Be careful," he murmured, and closed his eyes wearily.

6. THAT WEARS A CROWN

Biron Farrill waited uneasily in one of the outer buildings on the Palace Grounds. For the first time in his life he experienced the deflating sensation of being a provincial.

Widemos Hall, where he had grown up, had been beautiful in his eyes, and now his memory endowed it with merely barbaric glitter. Its curved lines, its filigree work, its curiously wrought turrets, its elaborate "false windows"--He winced at the thought of them.

But this--this was different.

The Palace Grounds of Rhodia were no mere lump of ostentation built by the petty lords of a cattle kingdom; nor were they the childlike expression of a fading and dying world.

They were the culmination, in stone, of the Hinriad dynasty.

The buildings were strong and quiet. Their lines were straight and vertical, lengthening toward the center of each structure, yet avoiding anything as effeminate as a spire effect. They held a bluntness about them, yet lifted into a climax that affected the onlooker without revealing their method of doing so at a casual glance. They were reserved, self-contained, proud.

And as each building was, so was the group as a whole, the huge Palace Central becoming a crescendo. One by one, even the few artificialities remaining in the masculine Rhodian style had dropped away. The very "false windows," so valued as decoration and so useless in a building of artificial light and ventilation, were done away with. And that, somehow, without loss.

It was only line and plane, a geometrical abstraction that led the eye upward to the sky.

The Tyrannian major stopped briefly at his side as he left the inner room.

"You will be received now," he said.

Biron nodded, and after a while a larger man in a uniform of scarlet and tan clicked heels before him. It struck Biron with sudden force that those who had the real power did not need the outward show and could be satisfied with slate blue. He recalled the splendid formality of a Rancher's life and bit his lip at the thought of its futility.

"Biron Malaine?" asked the Rhodian guard, and Biron rose to follow.

There was a little gleaming monorail carriage that was suspended delicately by diamagnetic forces upon a single ruddy shaft of metal. Biron had never seen one before. He paused before entering.

The little carriage, big enough for five or six at the most, swayed with the wind, a graceful teardrop returning the gleam of Rhodia's splendid sun. The single rail was slender, scarcely more than a cable, and ran the length of the carriage's underside without touching.

Biron bent and saw blue sky all the length between them. For a moment, as he watched, a lifting gust of wind raised it, so that it hovered a full inch above the rail, as though impatient for flight and tearing at the invisible force field that held it. Then it fluttered back to the rail, closer and still closer, but never touching.

"Get in," said the guard behind him impatiently, and Biron climbed two steps into the carriage.

The steps remained long enough for the guard to follow, then lifted quietly and smoothly into place, forming no break in the carriage's even exterior.

Biron became aware that the outer opacity of the carriage was an illusion. Once within, he found himself sitting in a transparent bubble. At the motion of a small control, the carriage lifted upward. It climbed the heights easily, buffeting the atmosphere which whistled past. For one moment, Biron caught the panorama of the Palace Grounds from the apex of the arc.

The structures became a gorgeous whole (could they --have been originally conceived other than as an air view?), laced by the shining copper threads, along one or two of which the graceful carriage bubbles skimmed.

He felt himself pressed forward, and the carriage came to a dancing halt. The entire run had lasted less than two minutes.

A door stood open before him. He entered and it closed behind him. There was no one in the room, which was small and bare. For the moment, no one was pushing him, but he felt no comfort because of it. He was under no illusions. Ever since that damned night, others had forced his moves.

Jonti had placed him on the ship. The Tyrannian Commissioner had placed him here. And each move had increased the measure of his desperation.

It was obvious to Biron that the Tyrannian had not been fooled. It had been too easy to get away from him. The Commissioner might have called the Terrestrial Consul. He might have hyper-waved Earth, or taken his retinal patterns. These things were routine; they could not have been omitted accidentally.

He remembered Jonti's analysis of affairs. Some of it might still be valid. The Tyranni would not kill him outright to create another martyr. But Hinrik was their puppet, and he was as capable as they of ordering an execution. And then he would have been killed by one of his own, and the Tyranni would merely be disdainful onlookers.

Biron clenched his fists tightly. He was tall and strong, but he was unarmed. The men who would come for him would have blasters and neuronics whips. He found himself backing against the wall.

He whirled quickly at the small sound of the opening door to his left. The man who entered was armed and uniformed but there was a girl with him. He relaxed a bit. It was only a girl with him. At another time he might have observed the girl closely, since she was worth observation and approval, but at the moment she was only a girl.

They approached together, stopping some six feet away. He kept his eye on the guard's blaster.

The girl said to the guard, "I'll speak to him first, Lieutenant."

There was a little vertical line between her eyes as she turned to him. She said, "Are you the man who has this story of an assassination plot against the Director?"

Biron said, "I was told I would see the Director."

"That is impossible. If you have anything to say, say it to me. If your information is truthful and useful, you will be well treated."

"May I ask you who you are? How do I know you are authorized to speak for the Director?"

The girl seemed annoyed. "I am his daughter. Please answer my questions. Are you from outside the System?"

"I am from Earth." Biron paused, then added, "Your Grace."

The addition pleased her. "Where is that?"

"It is a small planet of the Sirian Sector, Your Grace."

"And what is your name?"

"Biron Malaine, Your Grace."

She stared at him thoughtfully. "From Earth? Can you pilot a space ship?"

Biron almost smiled. She was testing him. She knew very well that space navigation was one of the forbidden sciences in the Tyranni-controlled worlds.

He said, "Yes, Your Grace." He could prove that when the performance test came, if they let him live that long. Space navigation was not a forbidden science on Earth, and in four years one could learn much.

She said, "Very well. And your story?"

He made his decision suddenly. To the guard alone, he would not have dared. But this was a girl, and if she were not lying, if she really were the Director's daughter, she might be a persuasive factor on his behalf.

He said, "There is no assassination plot, Your Grace."

The girl was startled. She turned impatiently to her companion. "Would you take over, Lieutenant? Get the truth out of him."

Biron took a step forward and met the cold thrust of the guard's blaster. He said urgently, "Wait, Your Grace. Listen to me! It was the only way to see the Director. Don't you understand?"

He raised his voice and sent it after her retreating form. "Will you tell His Excellency, at least, that I am Biron Farrill and claim my sanctuary right?"

It was a feeble straw at which to clutch. The old feudal customs had been losing their force with the generations even before the Tyranni came. Now they were archaisms. But there was nothing else. Nothing.

She turned, and her eyebrows were arched. "Are you claiming now to be of the aristocratic order? A moment ago your name was Malaine."

A new voice sounded unexpectedly. "So it was, but it is the second name which is correct. You are Biron Farrill indeed, my good sir. Of course you are. The resemblance is unmistakable."

A small, smiling man stood in the doorway. His eyes, widely spaced and brilliant, were taking in all of Biron with an amused sharpness. He cocked his narrow face upward at Biron's height and said to the girl, "Don't you recognize him, too, Artemisia?"

Artemisia hurried to him, her voice troubled. "Uncle Oil, What are you doing here?"

"Taking care of my interests, Artemisia. Remember that if there were an assassination, I would be the closest of the Hinriads to the possible succession." Gillbret oth Hinriad winked elaborately, then added, "Oh, get the lieutenant out of here. There isn't any danger."

She ignored that and said, "Have you been sounding the communicator again?"

"But yes. Would you deprive me of an amusement? It is pleasant to eavesdrop on them."

"Not if they catch you."

"The danger is part of the game, my dear. The amusing part. After all, the Tyranni do not hesitate to sound the .Palace. We can't do much without their knowing. Well, turnabout, you know. Aren't you going to introduce me?"

"No, I'm not," she said shortly. "This is none of your business."

"Then I'll introduce you. When I heard his name, I stopped listening and came in." He moved past Artemisia, stepped up to Biron, inspected him with an impersonal smile, and said, "This, is Biron Farrill."

"I have said so myself," said Biron. More than half his attention was upon the lieutenant, who still held his blaster in firing position.

"But you have not added that you are the son of the Rancher of Widemos."

"I would have but for your interruption. In any case, you've got the story now.

Obviously, I had to get away from the Tyranni, and that without giving them my real name."

Biron waited. This was it, he felt. If the next move was not an immediate arrest, there was still a trifling chance.

Artemisia said, "I see. This is a matter for the Director. You are sure there is no plot of any sort, then."

"None, Your Grace."

"Good. Uncle Gil, will you remain with Mr. Farrill? Lieutenant, will you come with me?"

Biron felt weak. He would have liked to sit down, but no suggestion to that effect was made by Gillbret, who still inspected him with an almost clinical interest.

"The Rancher's son! Amusing!"

Biron brought his attention downward. He was tired of cautious monosyllables and careful phrases. He said abruptly, "Yes, the Rancher's son. It is a congenital situation. Can I help you in any other way?"

Gillbret showed no offense. His thin face merely creased further as his smile widened.

He said, "You might satisfy my curiosity. You really came for Sanctuary? Here?"

"I'd rather discuss that with the Director, sir."

"Oh, get off it, young man. You'll find that very little business can be done with the Director. Why do you suppose you had to deal with his daughter just now? That's an amusing thought, if you'll consider it."

"Do you find everything amusing?"

"Why not? As an attitude toward life, it's an amusing one. It's the only adjective that will fit. Observe the universe, young man. If you can't force amusement out of it, you might as well cut your throat, since there's damned little good in it. I haven't introduced myself, by the way. I'm the Director's cousin."

Biron said coldly, "Congratulations!"

Gillbret shrugged. "You're right. It's not impressive. And I'm likely to remain just that indefinitely since there is no assassination to be expected after all."

"Unless you whip one up for yourself."

"My dear sir, your sense of humor! You'll have to get used to the fact that nobody takes me seriously. My remark was only an expression of cynicism. You don't suppose the Directorship is worth anything these days, do you? Surely you cannot believe that Hinrik was always like this? He was never a great brain, but with every year he becomes more impossible.

I forget! You haven't seen him yet. But you will! I hear him coming. When he speaks to you, remember that he is the ruler of the largest of the Trans-Nebular Kingdoms. It will be an amusing thought."

Hinrik bore his dignity with the ease of experience. He acknowledged Biron's painstakingly ceremonious bow with the proper degree of condescension. He said, with a trace of abruptness, "And your business with us, sir?"

Artemisia was standing at her father's side, and Biron noticed, with some surprise, that she was quite pretty. He said, "Your Excellency, I have come on behalf of my father's good name. You must know his execution was unjust."

Hinrik looked away. "I knew your father slightly. He was in Rhodia once or twice." He paused, and his voice quavered a bit. "You are very like him. Very. But he was tried, you know. At least I imagine he was. And according to law. Really, I don't know the details."

"Exactly, Your Excellency. But I would like to learn those details. I am sure that my father was no traitor."

Hinrik broke in hurriedly. "As his son, of course, it is understandable that you should defend your father, but, really, it is difficult to discuss such matters of state now. Highly irregular, in fact. Why don't you see Aratap?"

"I do not know him, Excellency."

"Aratap! The Commissioner! The Tyrannian Commissioner"

"I have seen him and he sent me here. Surely, you understand that I dare not let the Tyranni--"

But Hinrik had grown stiff. His hand had wandered to his lips, as though to keep them from trembling, and his words were consequently muffled. "Aratap sent you here, you say?"

"I found it necessary to tell him--"

"Don't repeat what you told him. I know," said Hinrik. "I can do nothing for you, Rancher--uh--Mr. Farrill. It is not in my jurisdiction alone. The Executive Council--stop pulling at me, Arta. How can I pay attention to matters when you distract me?--must be consulted. Gillbret! Will you see that Mr. Farrill is taken care of? I will see what can be done. Yes, I will consult the Executive Council. The forms of law, you know. Very important.

Very important."

He turned on his heel, mumbling.

Artemisia lingered for a moment and touched Biron's sleeve. "A moment. Was it true, your statement that you could pilot a spaceship?"

"Quite true," said Biron. He smiled at her, and after a moment's hesitation, she dimpled briefly in return.

"Gillbret," she said, "I want to speak to you later."

She hurried off. Biron looked after her till Gillbret tweaked at his sleeve.

"I presume you are hungry, perhaps thirsty, would like a wash?" asked Gillbret. "The ordinary amenities of life continue, I take it?"

"Thank you, yes," said Biron. The tension had almost entirely washed out of him. For a moment he was relaxed and felt wonderful. She was pretty. Very pretty.

But Hinrik was not relaxed; In his own chambers his thoughts whirled at a feverish pace. Try as he might, he could not wriggle out of the inevitable conclusion. It was a trap!

Aratap had sent him and it was a trap!

He buried his head in his hands to quiet and deaden the pounding, and then he knew what he had to do.

7. MUSICIAN OF THE MIND

Night settles in time on all habitable planets. Not always, perhaps, at respectable intervals, since recorded periods of rotation vary from fifteen to fifty-two hours. That fact requires the most strenuous psychological adjustment from those traveling from planet to planet.

On many planets such adjustments are made, and the waking-sleeping periods are tailored to fit. On many more the almost universal use of conditioned atmospheres and artificial lighting make the day-night question secondary except in so far as it modifies agriculture. On a few planets (those of the extremes) arbitrary divisions are made which ignore the trivial facts of light and dark.

But always, whatever the social conventions, the coming of night has a deep and abiding psychological significance, dating back to man's pre-human arboreal existence. Night will always be a time of fear and insecurity, and the heart will sink with the sun.

Inside Palace Central there was no sensory mechanism by which one could tell the coming of night, yet Biron felt that coming through some indefinite instinct hidden in the unknown corridors of the human brain. He knew that outdoors the night's blackness was scarcely relieved by the futile sparks of the stars. He knew that, if it were the right time of year, the jagged "hole in space" known as the Horsehead Nebula (so familiar to all the Trans-Nebular Kingdoms) inked out half the stars that might otherwise have been visible.

And he was depressed again. He had not seen Artemisia since the little talk with the Director, and he found himself resenting that. He had looked forward to dinner; he might have spoken to her. Instead, he had eaten alone, with two guards lounging discontentedly just outside the door. Even Gillbret had left him, presumably to eat a less lonely meal in the company one would expect in a palace of the Hinriads.

So that when Gillbret returned and said, "Artemisia and I have been discussing you," he obtained a prompt and interested reaction.

It merely amused him and he said so. "First I want to show you my laboratory," he had said then. He gestured and the two guards moved off.

"What kind of a laboratory?" asked Biron with a definite loss of interest.

"I build gadgets," was the vague response.

It was not a laboratory to the eye. It was more nearly a library, with an ornate desk in the corner.

Biron looked it over slowly. "And you build gadgets here? What kind of gadgets?"

"Well, special sounding devices to spy out the Tyrannian spy beams in a brand-new way.

Nothing they can detect. That's how I found out about you, when the first word came through from Aratap. And I have other amusing trinkets. My visonor, for instance. Do you like music?"

"Some kinds."

"Good. I invented an instrument, only I don't know if you can properly call it music."

A shelf of book films slid out and aside at a touch. "This is not really much of a hiding place, but nobody takes me seriously, so they don't look. Amusing, don't you think? But I forget, you're the unamused one."

It was a clumsy, boxlike affair, with that singular lack of gloss and polish that marks the homemade object. One side of it was studded with little gleaming knobs. He put it down with that side upward.

"It isn't pretty," Gillbret said, "but who in Time cares? Put the lights out. No, no!

No switches or contacts. Just wish the lights were out. Wish hard! Decide you want them out."

And the lights dimmed, with the exception of the faint pearly luster of the ceiling that made them two ghostly faces in the dark. Gillbret laughed lightly at Biron's exclamation.

"Just one of the tricks of my visisonor. It's keyed to the mind like personal capsules are. Do you know what I mean?"

"No, I don't, if you want a plain answer."

"Well," he said, "look at it this way. The electric field of your brain cells sets up an induced one in the instrument. Mathematically, it's fairly simple, but as far as I know, no one has ever jammed all the necessary circuits into a box this size before. Usually, it takes a five-story generating plant to do it. It works the other way too. I can close circuits here and impress them directly upon your brain, so that you'll see and hear without any intervention of eyes and ears. Watch!"

There was nothing to watch, at first. And then something fuzzy scratched faintly at the corner of Biron's eyes. It became a faint blue-violet ball hovering in mid-air. It followed him as he turned away, remained unchanged when he closed his eyes. And a clear, musical tone accompanied it, was part of it, was it.

It was growing and expanding and Biron became disturbingly aware that it existed inside his skull. It wasn't really a color, but rather a colored sound, though without noise.

It was tactile, yet without feeling.

It spun and took on an iridescence while the musical tone rose in pitch till it hovered above him like falling silk. Then it exploded so that goutts of color splattered at him in touches that burned momentarily and left no pain.

Bubbles of rain-drenched green rose again with a quiet, soft moaning. Biron thrust at them in confusion and became aware that he could not see his hands nor feel them move. There was nothing, only the little bubbles filling his mind to the exclusion of all else.

He cried out soundlessly and the fantasy ceased. Gillbret was standing before him once again in a lighted room, laughing. Biron felt an acute dizziness and wiped shakily at a chilled, moist forehead. He sat down abruptly.

"What happened?" he demanded, in as stiff a tone as he could manage.

Gillbret said, "I don't know. I stayed out of it. You don't understand? It was something your brain had lacked previous experience with. Your brain was sensing directly and it had no method of interpretation for such a phenomenon. So as long as you concentrated on the sensation, your brain could only attempt, futilely, to force the effect into the old, familiar pathways. It attempts separately and simultaneously to interpret it as sight and sound and touch. Were you conscious of an odor, by the way? Sometimes it seemed to me that I smelled the stuff. With dogs I imagine the sensation would be forced almost entirely into odor. I'd like to try it on animals someday.

"On the other hand, if you ignore it, make no attack upon it, it fades away. It's what I do, when I want to observe its effects on others, and it isn't difficult."

He placed a little veined hand upon the instrument, fingering the knobs aimlessly.

"Sometimes I think that if one could really study this thing, one could compose symphonies in a new medium; do things one could never do with simple sound or sight. I lack the capacity for it, I'm afraid."

Biron said abruptly, "I'd like to ask you a question."

"By all means."

"Why don't you put your scientific ability to worth-while use instead of--"

"Wasting it on useless toys? I don't know. It may not be entirely useless. This is against the law, you know."

"What is?"

"The visonor. Also my spy devices. If the Tyranni knew, it could easily mean a death sentence."

"Surely, you're joking."

"Not at all. It is obvious that you were brought up on a cattle ranch. The young people cannot remember what it was like in the old days, I see." Suddenly his head was to one side and his eyes were narrowed to slits. He asked, "Are you opposed to Tyrannian rule? Speak freely. I tell you frankly that I am. I tell you also that your father was."

Biron said calmly, "Yes, I am."

"Why?"

"They are strangers, outlanders. What right have they to rule in Nephelos or in Rhodia?"

"Have you always thought that?" Biron did not answer.

Gillbret sniffed. "In other words, you decided they were strangers and outlanders only after they executed your father, which, after all, was their simple right. Oh, look, don't fire up. Consider it reasonably. Believe me, I'm on your side. But think! Your father was Rancher. What rights did his herdsmen have? If one of them had stolen cattle for his own use or to sell to others, what would have been his punishment? Imprisonment as a thief. If he had plotted the death of your father, for whatever reason, for perhaps a worthy reason in his own eyes, what would have been the result? Execution, undoubtedly. And what right has your father to make laws and visit punishment upon his fellow human beings? He was their Tyranni.

"Your father, in his own eyes and in mine, was a patriot. But what of that? To the Tyranni, he was a traitor, and they removed him. Can you ignore the necessity of self-defense?"

The Hinriads have been a bloody lot in their time. Read your history, young man. All governments kill as part of the nature of things., "So find a better reason to hate the Tyranni. Don't think it is enough to replace one set of rulers by another; that the simple change brings freedom."

Biron pounded a fist into his cupped palm. "All this objective philosophy is fine. It is very soothing to the man who lives apart. But what if it had been your father who was murdered?"

"Well, wasn't it? My father was Director before Hinrik, and he was killed. Oh, not outright, but subtly. They broke his spirit, as they are breaking Hinrik's now. They wouldn't have me as Director when my father died; I was just a little too unpredictable. Hinrik was tall, handsome, and, above all, pliant. Yet not pliant enough, apparently. They hound him continuously, grind him into a pitiful puppet, make sure he cannot even itch without permission. You've seen him. He's deteriorating by the month now. His continual state of fear is pathetically psychopathic. But that--all that--is not why I want to destroy Tyrannian rule."

"No?" said Biron. "You have invented an entirely new reason?"

"An entirely old one, rather. The Tyranni are destroying the right of twenty billion human beings to take part in the development of the race. You've been to school. You've learned the economic cycle. A new planet is settled"--he was ticking the points off on his fingers--"and its first care is to feed itself. It becomes an agricultural world, a herding world. It begins to dig in the ground for crude ore to export, and sends its agricultural surplus abroad to buy luxuries and machinery. That is the second step. Then, as population increases and foreign investments grow, an industrial civilization begins to bud, which is the third step. Eventually, the world becomes mechanized, importing food, exporting machinery, investing in the development of more primitive worlds, and so on. The fourth step.

"Always the mechanized worlds are the most thickly populated, the most powerful, militarily--since war is a function of machines--and they are usually surrounded by a fringe of agricultural, dependent worlds.

"But what has happened to us? We were at the third step, with a growing industry. And now? That growth has been stopped, frozen, forced to recede. It would interfere with Tyrannian control of our industrial necessities. It is a short-term investment on their part, because eventually we'll become unprofitable as we become impoverished. But meanwhile, they skim the cream.

"Besides, if we industrialized ourselves, we might develop weapons of war. So industrialization is stopped; scientific research is forbidden. And eventually the people become so used to that, they lack the realization even that anything is missing. So that you are surprised when I tell you that I could be executed for building a visonor.

"Of course, someday we will beat the Tyranni. It is fairly inevitable. They can't rule forever. No one can. They'll grow soft and lazy. They will intermarry and lose much of their separate traditions. They will become corrupt. But it may take centuries, because history doesn't hurry. And when those centuries have passed, we will still all be agricultural worlds with no industrial or scientific heritage to speak of, while our neighbors on all sides, those not under Tyrannian control, will be strong and urbanized. The Kingdoms will be semicolonial areas forever. They will never catch up, and we will be merely observers in the great drama of human advance."

Biron said, "What you say is not completely unfamiliar."

"Naturally, if you were educated on Earth. Earth occupies a very peculiar position in social development."

"Indeed?"

"Consider! All the Galaxy has been in a continuous state of expansion since the first discovery of interstellar travel. We have always been a growing society, therefore, an immature society. It is obvious that human society reached maturity in only one place and at only one time and that this was on Earth immediately prior to its catastrophe. There we had a society which had temporarily lost all possibility for geographical expansion and was therefore faced with such problems as over-population, depletion of resources, and so on; problems that have never faced any other portion of the Galaxy.

"They were forced to study the social sciences intensively. We have lost much or all of that and it is a pity. Now here's an amusing thing. When Hinrik was a young man, he was a great Primitivist. He had a library on things Earthly that was unparalleled in the Galaxy.

Since he became Director, that's gone by the board along with everything else. But in a way, I've inherited it. Their literature, such scraps as survive, is fascinating. It has a peculiarly introspective flavor to it that we don't have in our extraverted Galactic civilization. It is most amusing."

Biron said, "You relieve me. You have been serious for so long that I began to wonder if you had lost your sense of humor."

Gillbret shrugged. "I am relaxing and it is wonderful. First time in months, I think.

Do you know what it is to play a part? To split your personality deliberately for twenty-four hours a day? Even when with friends? Even when alone, so that you will never forget inadvertently? To be a dilettante? To be eternally amused? To be of no account? To be so effete and faintly ridiculous that you have convinced all who know you of your own worthlessness? An so that your life may be safe even though it means it has become barely worth living. But, even so, once in a while I can fight them."

He looked up, and his voice was earnest, almost pleading. "You can pilot a ship. I cannot. Isn't that strange? You talk about my scientific ability, yet I cannot pilot a simple one-man space gig. But you can, and it follows then that you must leave Rhodia."

There was no mistaking the pleading, but Biron frowned coldly. "Why?"

Gillbret continued, speaking rapidly: "As I said, Artemisia and I have discussed you and arranged this. When you leave here, proceed directly to her room, where she is

waiting for you. I have drawn a diagram for you, so that you won't have to ask your way through the corridors." He was forcing a small sheet of metallene upon Biron. "If anyone does stop you, say that you have been summoned by the Director, and proceed. There will be no trouble if you show no uncertainty--"

"Hold on!" said Biron. He was not going to do it again. Jonti had chevied him to Rhodia and, consequently, succeeded in bringing him before the Tyranni. The Tyrannian Commissioner had then chevied him to Palace Central before he could feel his own secret way there and, consequently, subjected him, nakedly unprepared, to the whims of an unsteady puppet. But that was all! His moves, henceforward, might be severely limited, but, by Space and Time, they would be his own. He felt very stubborn about it.

He said, "I'm here on what is important business to me, sir. I'm not leaving."

"What! Don't be a young idiot." For a moment the old Gillbret was showing through. "Do you think you will accomplish anything here? Do you think you will get out of the Palace alive if you let the morning sun rise? Why, Hinrik will call in the Tyranni and you will be imprisoned within twenty-four hours. He is only waiting this while because it takes him so long to make up his mind to do anything. He is my cousin. I know him, I tell you."

Biron said, "And if so, what is that to you? Why should you be so concerned about me?"

He was not going to be chevied. He would never again be another man's fleeing marionette.

But Gillbret was standing, staring at him. "I want you to take me with you. I'm concerned about myself. I cannot endure life under the Tyranni any longer. It is only that neither Artemisia nor I can handle a ship or we would have left long ago. It's our lives too."

Biron felt a certain weakening of his resolve. "The Director's daughter? What has she to do with this?"

"I believe that she is the most desperate of us. There is a special death for women.

What should be ahead of a Director's daughter who is young, personable, and unmarried, but to become young, personable, and married? And who, in these days, should be the delightful groom?

Why, an old, lecherous Tyrannian court functionary who has buried three wives and wishes to revive the fires of his youth in the arms of a girl."

"Surely the Director would never allow such a thing!"

"The Director will allow anything. Nobody waits upon his permission."

Biron thought of Artemisia as he had last seen her. Her hair had been combed back from her forehead and allowed to fall in simple straightness, with a single inward wave at shoulder level. Clear, fair skin, black eyes, red lips! Tall, young, smiling! Probably the description of a hundred million girls throughout the Galaxy. It would be ridiculous to let that sway him.

Yet he said, "Is there a ship ready?"

Gillbret's face wrinkled under the impact of a sudden smile. But, before he could say a word, there came a pounding at the door. It was no gentle interruption of the photo.. beam, no tender of the weapon of authority.

It was repeated, and Gillbret said, "You'd better open the door."

Biron did so, and two uniforms were in the room. The foremost saluted Gillbret with abrupt efficiency, then turned to Biron. "Biron Farrill, in the name of the Resident Commissioner of Tyrann and of the Director of Rhodia, I place you under arrest."

"On what charge?" demanded Biron.

"On that of high treason."

A look of infinite loss twisted Gillbret's face momentarily. He looked away. "Hinrik was quick this once; quicker than I had ever expected. An amusing thought!"

He was the old Gillbret, smiling and indifferent, eyebrows a little raised, as though inspecting a distasteful fact with a faint tinge of regret.

"Please follow me," said the guard, and Biron was aware of the neuronic whip resting easily in the other's hand.

8. A LADY'S SKIRTS

Biron's throat was growing dry. He could have beaten either of the guards in fair fight. He knew that, and he itched for the chance. He might even have made a satisfactory showing against both together. But they had the whips, and he couldn't have lifted an arm without having them demonstrate the fact. Inside his mind he surrendered. There was no other way.

But Gillbret said, "Let him take his cloak, men."

Biron, startled, looked quickly toward the little man and retracted that same surrender. He knew he had no cloak.

The guard whose weapon was out clicked his heels as a gesture of respect. He motioned his whip at Biron. "You heard milord. Get your cloak and snap it up!"

Biron stepped back as slowly as he dared. He retreated to the bookcase and squatted, groping behind the chair for his nonexistent cloak. And as his fingers clawed at the empty space behind the chair, he waited tensely for Gillbret.

The visisonor was just a queer knobbed object to the guards. It would mean nothing to them that Gillbret fingered and stroked the knobs gently. Biron watched the muzzle of the whip intensely and allowed it to fill his mind. Certainly nothing else he saw or heard (thought he saw or heard) must enter.

But how much longer?

The armed guard said, "Is your cloak behind that chair? Stand up!" He took an impatient step forward, and then stopped. His eyes narrowed in deep amazement and he looked sharply to his left.

That was it! Biron straightened and threw himself forward and down. He clasped the guard's knees and jerked. The guard was down with a jarring thud, and Biron's large fist closed over the other's hand, grasping for the neuronc whip it contained.

The other guard had his weapon out, but for the moment it was useless. With his free hand, he was brushing wildly at the space before his eyes.

Gillbret's high-pitched laugh sounded. "Anything bothering you, Farrill?"

"Don't see a thing," he grunted, and then, "except this whip I've got now."

"All right, then leave. They can't do anything to stop you. Their minds are full of sights and sounds that don't exist." Gillbret skipped out of the way of the writhing tangle of bodies.

Biron wrenched his arms free and heaved upward. He brought his arm down solidly just below the other's ribs. The guard's face twisted in agony and his body doubled convulsively.

Biron rose, whip in hand.

"Careful," cried Gillbret.

But Biron did not turn quickly enough. The second guard was upon him, bearing him down again. It was a blind attack. What it was that the guard thought he was

grasping, it was impossible to tell. That he knew nothing of Biron at the moment was certain. His breath rasped in Biron's ear and there was a continuous incoherent gurgle bubbling in his throat.

Biron twisted in an attempt to bring his captured weapon into play and was frighteningly aware of the blank and empty eyes that must be aware of some horror invisible to anyone else.

Biron braced his legs and shifted weight in an effort to break loose, quite uselessly.

Three times he felt the guard's whip flung hard against his hip, and flinched at the contact.

And then the guard's gurgle dissolved into words. He yelled, "I'll get you all!" and the very pale, almost invisible shimmer of the ionized air in the path of the whip's energy beam made its appearance. It swept wide through the air, and the path of the beam intersected Biron's foot.

It was as though he had stepped into a bath of boiling lead. Or as if a granite block had toppled upon it. Or as if it had been crunched off by a shark. Actually, nothing had happened to it physically. It was only that the nerve endings that governed the sensation of pain had been universally and maximally stimulated, Boiling lead could have done no more.

Biron's yell tore his throat raw, and he collapsed. It did not even occur to him that the fight was over. Nothing mattered but the ballooning pain.

Yet, though Biron did not know it, the guard's grip had relaxed, and minutes later, when the young man could force his eyes open and blink away the tears, he found the guard backed against the wall, pushing feebly at nothing with both hands and giggling to himself.

The first guard was still on his back, arms and legs spread-eagled now. He was conscious, but silent. His eyes were following something in an erratic path, and his body quivered a little.

There was froth on his lips.

Biron forced himself to his feet. He limped badly as he made his way to the wall. He used the butt of the whip and the guard slumped. Then back to the first, who made no defense either, his eyes moving silently to the very moment of unconsciousness.

Biron sat down again, nursing his foot. He stripped shoe and stocking from it, and stared in surprise at the unbroken skin. He chafed it and grunted at the burning sensation. He looked up at Gillbret, who had put down his visisonor and was now rubbing one lean cheek with the back of his hand.

"Thank you," said Biron, "for the help of your instrument."

Gillbret shrugged. He said, "There'll be more here soon. Get to Artemisia's room. Please! Quickly!"

Biron realized the sense of that. His foot had subsided to a quiet quiver of pain, but it felt swollen and puffy. He put on a stocking and tucked the shoe under his elbow. He already had one whip, and he relieved the second guard of the other. He stuffed it precariously within his belt.

He turned at the door and asked, with a sense of crawling revulsion, "What did you make them see, sir?"

"I don't know. I can't control it. I just gave them all the power I could and the rest depended on their own complexes. Please don't stand there talking. Do you have the map to Artemisia's room?"

Biron nodded and set off down the corridor. It was quite empty. He could not walk quickly, since trying to do so made his walk a hobble.

He looked at his watch, then remembered that he had somehow never had the time to adjust it to Rhodian local chronometry. It still ran on Standard Interstellar Time as used aboard ship, where one hundred minutes made an hour and a thousand a day. So the figure 876 which gleamed pinkly on the cool metal face of the watch meant nothing now.

Still, it had to be well into the night, or into the planetary sleeping period, at any rate (supposing that the two did not coincide), as otherwise the halls would not be so empty and the bas-reliefs on the wall would not phosphoresce unwatched. He touched one idly as he passed, a coronation scene, and found it to be two-dimensional. Yet it gave the perfect illusion of standing out from the wall.

It was sufficiently unusual for him to stop momentarily in order to examine the effect. Then he remembered and hurried on.

The emptiness of the corridor struck him as another sign of the decadence of Rhodia.

He had grown very conscious of all these symbols of decline now that he had become a rebel. As the center of an independent power, the Palace would always have had its sentries and its quiet wardens of the night.

He consulted Gillbret's crude map and turned to the right, moving up a wide, curving ramp. There might have been processions here once, but nothing of that would be left now.

He leaned against the proper door and touched the photo-signal. The door moved ajar a bit, then opened wide.

"Come in, young man."

It was Artemisia. Biron slipped inside, and the door closed swiftly and silently. He looked at the girl and said nothing. He was gloomily conscious of the fact that his shirt was torn at the shoulder so that one sleeve flapped loosely, that his clothes were grimy and his face welted. He remembered the shoe he was still carrying, dropped it and wiggled his foot into it.

Then he said, "Mind if I sit down?"

She followed him to the chair, and stood before him, a little annoyed. "What happened?"

"What's wrong with your foot?"

"I hurt it," he said shortly. "Are you ready to leave?"

She brightened. "You'll take us, then?"

But Biron was in no mood to be sweet about it. His foot still twinged and he cradled it. He said, "Look, get me out to a ship. I'm leaving this damn planet. If you want to come along, I'll take you."

She frowned. "You might be more pleasant about it. Were you in a fight?"

"Yes, I was. With your father's guards, who wanted to arrest me for treason. So much for my Sanctuary Right."

"Oh! I'm sorry."

"I'm sorry too. It's no wonder the Tyranni can lord it over fifty worlds with a handful of men. We help them. Men like your father would do anything to keep in power; they would forget the basic duties of a simple gentleman--Oh, never mind!"

"I said I was sorry, Lord Rancher." She used the title with a cold pride. "Please don't set yourself up as judge of my father. You don't know all the facts."

"I'm not interested in discussing it. We'll have to leave in a hurry, before more of your father's precious guards come. Well, I don't mean to hurt your feelings. It's all right."

Biron's surliness canceled out any meaning to his apology, but, damn it, he had never been hit by a neuron whip before and it wasn't fun. And, by Space, they had owed him Sanctuary. At least that much.

Artemisia felt angry. Not at her father, of course, but at the stupid young man. He was so young. Practically a child, she decided, scarcely older than herself, if that.

The communicator sounded and she said sharply, "Please wait a minute and we'll go."

It was Gillbret's voice, sounding faintly. "Arta? All right at your end?"

"He's here," she whispered back.

"All right. Don't say anything. Just listen. Don't leave your room. Keep him there."

There's going to be a search of the Palace, which there's no way of stopping. I'll try to think of something, but, meanwhile, don't move." He waited for no reply. Contact was broken.

"So that's that," said Biron. He had heard also. "Shall I stay and get you into trouble, or shall I go out and give myself up? There's no reason to expect Sanctuary anywhere On Rhodia, I suppose."

She faced him in a rage, crying in a choked whisper, "Oh, shut up, you big, ugly fool."

They glared at each other. Biron's feelings were hurt. In a way, he was trying to help her too. There was no reason for her to be insulting.

She said, "I'm sorry," and looked away.

"That's all right," he said coldly, without meaning it. "You're entitled to your opinion."

"You don't have to say the things you do about my father. You don't know what being Director is like. He's working for his people, whatever you may think."

"Oh, sure. He has to sell me to the Tyranni for the sake of the people. That makes sense."

"In a way, it does. He has to show them he's loyal. Otherwise, they might depose him and take over the direct rule of Rhodia. Would that be better?"

"If a nobleman can't find Sanctuary--"

"Oh, you think only of yourself. That's what's wrong with you."

"I don't think it's particularly selfish not to want to die. At least for nothing."

"I've got some fighting to do before I go. My father fought them." He knew he was beginning to sound melodramatic, but she affected him that way.

She said, "And what good did it do your father?"

"None, I suppose. He was killed."

Artemisia felt unhappy. "I keep saying I'm sorry, and this time I really mean it. I'm all upset." Then, in defense, "I'm in trouble, too, you know."

Biron remembered. "I know. All right, let's start all over." He tried to smile. His foot was feeling better anyway.

She said, in an attempt at lightness, "You're not really ugly."

Biron felt foolish. "Oh well--"

Then he stopped, and Artemisia's hand flew to her mouth. Abruptly, their heads turned to the door.

There was the sudden, soft sound of many ordered feet on the semi-elastic plastic mosaic that floored the corridor outside. Most passed by, but there was a faint, disciplined heel-clicking just outside the door, and the night signal purred.

Gillbret had to work quickly. First, he had to hide his visonor. For the first time he wished he had a better hiding place. Damn Hinrik for making up his mind so quickly this once, for not waiting till morning. He had to get away; he might never have another chance.

Then he called the captain of the guard. He couldn't very well neglect a little matter of two unconscious guards and an escaped prisoner.

The captain of the guard was grim about it. He had the two unconscious men cleared out, and then faced Gillbret.

"My lord, I am not quite clear from your message exactly what happened," he said.

"Just what you see," said Gillbret. "They came to make their arrest, and the young man did not submit. He is gone, Space knows where."

"That is of little moment, my lord," said the captain. "The Palace is honored tonight with the presence of a personage, so it is well guarded despite the hour. He cannot get out and we will draw the net through the interior. But how did he escape? My men were armed. He was not."

"He fought like a tiger. From that chair, behind which I hid--"

"I am sorry, my lord, that you did not think to aid my men against an accused traitor."

Gillbret looked scornful. "What an amusing thought, Captain. When your men, wit{l doubled advantage in numbers and weapons, need help from myself, it is time you recruited yourself other men."

"Very well! We will search the Palace, find him, and see if he can repeat the performance."

"I shall accompany you, Captain."

It was the captain's turn to raise his eyebrows. He said, "I would not advise it, my lord. There would be some danger."

It was the kind of remark that one did not make to a Hinriad. Gillbret knew that, but he only smiled and let the wrinkles fill his lean face. "I know that," he said, "but occasionally I find even danger amusing."

It took five minutes for the company of guards to assemble. Gillbret, alone in his room during that time, called Artemisia.

Biron and Artemisia had frozen at the purring of the little signal. It sounded a second time and then there was the cautious rap upon the door, and Gillbret's voice was heard.

"Do let me try, Captain," it said. Then, more loudly, "Artemisia!"

Biron grinned his relief and took a step forward, but the girl put a sudden hand upon his mouth. She called out, "One moment, Uncle Oil," and pointed desperately toward the wall.

Biron could only stare stupidly. The wall was quite blank. Artemisia made a face and stepped quickly past him. Her hand on the wall caused a portion of it to slide noiselessly aside, revealing a dressing room. Her lips motioned a "Get inside!" and her hands were fumbling at the ornamental pin at her right shoulder. The unclasping of that pin broke the tiny force field that held an invisible seam tightly closed down the length of the dress. She stepped out of it.

Biron turned around after stepping across what had been the wall, and its closing endured just long enough for him to see her throwing a white-furred dressing gown across her shoulders. The scarlet dress lay crumpled upon the chair.

He looked about him and wondered if they would search Artemisia's room. He would be quite helpless if a search took place. There was no way out of the dressing room but the way he had entered, and there was nothing in it that could serve as a still more confined hiding place.

Along one wall there hung a row of gowns, and the air shimmered very faintly before it. His hand passed easily through the shimmer, with only a faint tingling where it crossed his wrist, but then it was meant to repel only dust so that the space behind it could be kept aseptically clean.

He might hide behind the skirts. It was what he was doing, really. He had manhandled two guards, with Gillbret's help, to get here, but, now that he was here, he was hiding behind a lady's skirts. A lady's skirts, in fact.

Incongruously, he found himself wishing he had turned a bit sooner before the wall had closed behind him. She had quite a remarkable figure. It was ridiculous of him to have been so childishly nasty awhile back. Of course she was not to blame for the faults of her father.

And now he could only wait, staring at the blank wall; waiting for the sound of feet within the room, for the wall to pull back once more, for the muzzles facing him again, this time without a visisonor to help him.

He waited, holding a neuronc whip in each hand.

9. AND AN OVERLORD'S TROUSERS

"What's the matter?" Artemisia did not have to feign uneasiness. She spoke to Gillbret, who, with the captain of the guard, was at the door. Half a dozen uniformed men hovered discreetly in the background. Then, quickly, "Has anything happened to Father?"

"No, no," Gillbret reassured her, "nothing has happened that need concern you at all.

Were you asleep?"

"Just about," she replied, "and my girls have been about their own affairs for hours.

There was no one to answer but myself and you nearly frightened me to death."

She turned to the captain suddenly, with a stiffening attitude. "What is wanted of me, Captain? Quickly, please. This is not the time of day for a proper audience."

Gillbret broke in before the other could more than open his mouth. "A most amusing thing, Arta. The young man, whatsisname--you know--has dashed off, breaking two heads on his way. We're hunting him on even terms now. One platoon of soldiers to one fugitive. And here I am myself, hot on the trail, delighting our good captain with my zeal and courage."

Artemisia managed to look completely bewildered.

Under his breath the captain muttered a monosyllabic imprecation. His lips scarcely moved. He said then, "If you please, my lord, you are not quite plain, and we are delaying matters insufferably. My Lady, the man who calls himself the son of the ex-Rancher of Widemos has been arrested for treason. He has managed to escape and is now at large. We must search the Palace for him, room by room."

Artemisia stepped back, frowning. "Including my room?"

"If Your Ladyship permits."

"Ah, but I do not. I would certainly know if there was a strange man in my room. And the suggestion that I might be having dealings with such a man, or any strange man, at this time of night is highly improper. Please observe due respect for my position, Captain."

It worked quite well. The captain could only bow and say, "No such implication was intended, my lady. Your pardon for annoying you at this time of night. Your statement that you have not seen the fugitive is, of course, sufficient. Under the circumstances, it was necessary to assure ourselves of your safety. He is a dangerous man."

"Surely not so. dangerous that he cannot be handled by you and your company."

Gillbret's high-pitched voice interposed again. "Captain, come--come. While you exchange courtly sentiments with my niece, our man has had time to rifle the armory. I would suggest that you leave a guard at the Lady Artemisia's door, so that what remains

of her sleep will not be further disturbed. Unless, my dear"--and he twinkled his fingers at Artemisia--"you would care to join us."

"I shall satisfy myself," said Artemisia coldly, "in locking my door and retiring, thank you."

"Pick a large one," cried Gillbret. "Take that one. A fine uniform our guards have, Artemisia. You can recognize a guard as far as you can see him by his uniform alone."

"My lord," said the captain impatiently, "there is no time. You delay matters."

At a gesture from him, a guard fell out of the platoon, saluted Artemisia through the closing door, then the captain. The sound of ordered footsteps fell away in both directions.

Artemisia waited, then slid the door quietly open an inch or two. The guard was there, legs apart, back rigid, right hand armed, left hand at his alarm button. He was the guard suggested by Gillbret, a tall one. As tall as Biron of Widemos, though without his breadth of shoulders.

It occurred to her, at that moment, that Biron, though young and, therefore, rather unreasonable in some of his viewpoints, was at least large and well muscled, which was convenient. It had been foolish of her to snap at him. Quite pleasant looking too.

She closed the door, and stepped toward the dressing room.

Biron tensed as the door slid away again. He held his breath and his fingers stiffened.

Artemisia stared at his whips. "Be careful!"

He puffed out his breath in relief and stuffed each into a pocket. They were very uncomfortable there, but he had no proper holsters. He said, "That was just in" case it was somebody looking for me."

"Come out. And speak in a whisper."

She was still in her night robe, woven out of a smooth fabric with which Biron was unfamiliar, adorned with little tufts of silvery fur, and clinging to the body through some faint static attraction inherent in the material, so that neither buttons, clasps, loops, or seam fields were necessary. Nor, as a consequence, did it do more than merely faintly dim the outlines of Artemisia's figure.

Biron felt his ears reddening, and liked the sensation very much.

Artemisia waited, then made a little whirling gesture with her forefinger and said, "Do you mind?"

Biron looked up at her face. "What? Oh, I'm sorry."

He turned his back to her and remained stiffly attentive to the faint rustling of the change of outer garments. It did not occur to him to wonder why she did not use the dressing room, or why, better still, she had not changed before opening the door. There are depths in feminine psychology, which, without experience, defy analysis.

She was in black when he turned, a two-piece suit which did not reach below the knee.

It had that more substantial appearance that went with clothing meant for the outdoors rather than for the ballroom.

Biron said, automatically, "Are we leaving, then?"

She shook her head. "You'll have to do your part first. You'll need other clothes yourself. Get to one side of the door, and I'll have the guard in."

"What guard?"

She smiled briefly. "They left a guard at the door, at Uncle Oil's suggestion."

The door to the corridor ran smoothly along its runners an inch or two. The guard was still there, stiffly immobile.

"Guard," she whispered. "In here, quickly."

There was no reason for a common soldier to hesitate in his obedience to the Director's daughter. He entered the widening door, with a respectful, "At your service, my 1--" and then his knees buckled under the weight which came down upon his shoulders, while his words were cut off, without even an interrupting squawk, by the forearm which slammed against his larynx.

Artemisia closed the door hurriedly and watched with sensations that amounted almost to nausea. The life in the Palace of the Hinriads was mild almost to decadence, and she had never before seen a man's face congest with blood and his mouth yawn and puff futilely under the influence of asphyxia. She looked away.

Biron bared his teeth with effort as he tightened the circle of bone and muscle about the other's throat. For a minute the guard's weakening hands ripped futilely at Biron's arm, while his feet groped in aimless kicks. Biron heaved him clear of the floor without relaxing his grip.

And then the guard's hands fell to his sides, his legs hung loosely, and the convulsive and useless heavings of the chest began to subside. Biron lowered him gently to the floor. The guard sprawled out limply, as though he were a sack which had been emptied.

"Is he dead?" asked Artemisia, in a horrified whisper.

"I doubt it," said Biron. "It takes four or five minutes of it to kill a man. But he'll be out of things for a while. Do you have anything to tie him up with?"

She shook her head. For the moment, she felt quite helpless.

Biron said, "You must have some Cellite stockings. They would do fine." He had already stripped the guard of weapons and outer clothing. "And I'd like to wash up too. In fact, I have to."

It was pleasant to step through the detergent mist in Artemisia's bathroom. It left him perhaps a trifle over-scented, but the open air would take care of the fragrance, he hoped. At least he was clean, and it had required merely the momentary passage through the fine, suspended droplets that shot past him forcefully in a warm air stream. No special drying chamber was required, since he stepped out dry as well as clean. They didn't have this on Widemos, or on Earth.

The guard's uniform was a bit tight, and Biron did not like the way the somewhat ugly, conical military cap fit over his brachycephalic head. He stared at his reflection with some dissatisfaction. "How do I look?"

"Quite like a soldier," she said.

He said, "You'll have to carry one of these whips. I can't handle three."

She took it between two fingers and dropped it into her bag, which was then suspended from her wide belt by another microforce, so that her hands remained free.

"We had better go now. Don't say a word if we meet anyone, but let me do the talking.

Your accent isn't right, and it would be impolite to talk in my presence unless you were directly addressed, anyway. Remember! You're a common soldier."

The guard on the floor was beginning to wriggle a bit and roll his eyes. His wrists and ankles were securely tied in a clump at the small of his back with stockings that had the tensile strength of more than an equal amount of steel. His tongue worked futilely at his gag.

He had been shoved out of the way, so that it was not necessary to step over him to get to the door.

"This way," breathed Artemisia.

At the first turning there was a footstep behind them, and a light hand came down on Biron's shoulder.

Biron stepped to one side quickly and turned, one hand catching the other's arm, while his other snatched at his whip.

But it was Gillbret who said, "Easy, man!"

Biron loosened his grip.

Gillbret rubbed his arm. "I've been waiting for you, but that's no reason to break my bones. Let me stare admiringly at you, Farrill. Your clothes seem to have shrunk on you, but not bad--not bad at all. Nobody would look twice at you in that getup. It's the advantage of a uniform. It's taken for granted that a soldier's uniform holds a soldier and nothing else."

"Uncle Gil," whispered Artemisia urgently, "don't talk so much. Where are the other guards?"

"Everyone objects to a few words," he said pettishly. "The other guards are working their way up the tower. They've decided that our friend is on none of the lower levels, so they've just left some men at the main exits and at the ramps, with the general alarm system in operation as well. We can get past it."

"Won't they miss you, sir?" asked Biron.

"Me? Hah. The captain was glad to see me go, for all his toe scraping. They won't look for me, I assure you."

They were speaking in whispers, but now even those died away. A guard stood at the bottom of the ramp, while two others flanked the large, carved double door that led to the open air.

Gillbret called out, "Any word of the escaped prisoner, men?"

"No, my lord," said the nearest. He clicked his heels together and saluted.

"Well, keep your eyes open," and they walked past them and out, one of the guards at the door carefully neutralizing that section of the alarm as they left.

It was nighttime outside. The sky was clear and starry, the ragged mass of the Dark Nebula blotting out the specks of light near the horizon. Palace Central was a dark mass behind them, and the Palace Field was less than half a mile away.

But after five minutes of walking along the quiet path, Gillbret grew restless.

"There's something wrong," he said.

Artemisia said, "Uncle Oil, you haven't forgotten to arrange to have the ship ready?"

"Of course not," he snapped at her, as nearly as one could snap in a whisper, "but why is the Field Tower lit up? It should be dark."

He pointed up through the trees, to where the tower was a honeycomb of white light.

Ordinarily, that would indicate business at the field: ships leaving for space or arriving from it.

Gillbret muttered, "Nothing was scheduled for tonight. That was definite."

They saw the answer at a distance, or Gillbret did. He stopped suddenly and spread his arms wide to hold back the others.

"That's all," he said, and giggled almost hysterically. "This time Hinrik has really messed things properly, the idiot. They're here! The Tyranni! Don't you understand? That's Aratap's private armored cruiser."

Biron saw it, gleaming faintly under the lights, standing out among the other undistinguished ships. It was smoother, thinner, more feline than the Rhodian vessels.

Gillbret said, "The captain said a 'personage' was being entertained today, and I paid no attention. There's nothing to do now. We can't fight Tyranni."

Biron felt something suddenly snap. "Why not?" he said savagely. "Why can't we fight them? They have no reason to suspect trouble, and we're armed. Let's take the Commissioner's own ship. Let's leave him with his trousers down."

He stepped forward, out of the relative obscurity of the trees and onto the bare field. The others followed. There was no reason to hide. They were two members of the royal family and an escorting soldier.

But it was the Tyranni they were fighting now.

Simok Aratap of Tyrann had been impressed the first time he had ever seen the Palace Grounds at Rhodia years earlier, but it had turned out to be only a shell that had impressed him. The interior was nothing but a musty relic. Two generations earlier Rhodia's legislative chambers had met on these grounds and most of the administrative offices had been quartered there. Palace Central had been the heartbeat of a dozen worlds.

But now the legislative chambers (still existing, for the Khan never interfered with local legalisms) met once a year to ratify the executive orders of the past twelve months. It was quite a formality. The Executive Council was still, nominally, in continuous session, but it consisted of a dozen men who remained on their estates nine weeks in ten. The various executive bureaus were still active, since one could not govern without them, whether the Director or the Khan ruled, but they were now scattered over the planet;

made less dependent upon the Director, more conscious of their new masters, the Tyranni.

Which left the Palace as majestic as it had always been in stone and metal, and that only. It housed the Directorial family, a scarcely adequate corps of servants, and an entirely inadequate corps of native guards.

Aratap felt uncomfortable in the shell and was unhappy. It was late, he was tired, his eyes burned so that he longed to remove his contact lenses, and, most of all, he was disappointed.

There was no pattern! He glanced occasionally at his military aide, but the major was listening to the Director with expressionless stolidity. As for Aratap himself, he paid little attention.

"Widemos's son! Indeed?" he would say, in abstraction. Then, later, "And so you arrested him? Quite right!"

But it meant little to him, since events lacked a design. Aratap had a neat and tidy mind which could not bear the thought of individual facts loosely clumped together with no decent arrangement.

Widemos had been a traitor, and Widemos's son had attempted a meeting with the Director of Rhodia. He had attempted it first in secret, and when that had failed, such was the urgency, he had attempted it openly with his ridiculous story of an assassination plot.

Surely that must have been the beginning of a pattern.

And now it fell apart. Hinrik was giving up the boy with indecent haste. He could not even wait the night, it seemed. And that did not fit at all. Or else Aratap had not yet learned all the facts.

He focused his attention on the Director again. Hinrik was beginning to repeat himself. Aratap felt a twinge of compassion. The man had been made into such a coward that even the Tyranni themselves grew impatient with him. And yet it was the only way. Only fear could insure absolute loyalty. That and nothing else.

Widemos had not been afraid, and despite the fact that his self-interest had been bound at every point with the maintenance of Tyrannian rule, he had rebelled. Hinrik was afraid and that made the difference, And because Hinrik was afraid, he sat there, lapsing into incoherence as he struggled to obtain some gesture of approval. The major would give none, of course, Aratap knew. The man had no imagination. He sighed and wished he had none either. Politics was a filthy business.

So he said, with some air of animation, "Quite so. I commend your, quick decision and your zeal in the service of the Khan. You may be sure he will hear of it."

Hinrik brightened visibly, his relief obvious.

Aratap said, "Have him brought in, then, and let us hear what our cockerel has to say." He suppressed a desire to yawn. He had absolutely no interest in what the "cockerel" had to say.

It was Hinrik's intention at this point to signal for the captain of the guard, but there was no necessity for that, as the captain stood in the doorway, unannounced.

"Excellency," he cried and strode in without waiting for permission.

Hinrik stared hard at his hand, still inches from the signal, as though wondering whether his intention had somehow developed sufficient force to substitute for the act.

He said uncertainly, "What is it, Captain?"

The captain said, "Excellency, the prisoner has escaped."

Aratap felt some of the weariness disappear. What was this? "The details, Captain!" he ordered, and straightened in his chair.

The captain gave them with a blunt economy of words.

He concluded, "I ask your permission, Excellency, to proclaim a general alarm. They are yet but minutes away."

"Yes, by all means," stuttered Hinrik, "by all means. A general alarm, indeed. Just the thing. Quickly! Quickly! Commissioner, I cannot understand how it could have happened.

Captain, put every man to work. There will be an investigation, Commissioner. If necessary, every man on the guards will be broken. Broken! Broken!"

He repeated the word in near hysteria but the captain remained standing. It was obvious that he had more to say.

Aratap said, "Why do you wait?"

"May I speak to Your Excellency in private?" said the captain abruptly.

Hinrik cast a quick, frightened look at the bland, unperturbed Commissioner. He mustered a feeble indignation. "There are no secrets from the soldiers of the Khan, our friends, our--"

"Say your say, Captain," interposed Aratap gently.

The captain brought his heels together sharply and said, "Since I am ordered to speak, Your Excellency, I regret to inform you that my Lady Artemisia and my Lord Gillbret accompanied the prisoner in his escape."

"He dared to kidnap them?" Hinrik was on his feet. "And my guards allowed it?"

"They were not kidnapped, Excellency. They accompanied him voluntarily."

"How do you know?" Aratap was delighted, and thoroughly awake. It formed a pattern now, after all. A better pattern than he could have anticipated.

The captain said, "We have the testimony of the guard they overpowered, and the guards who, unwittingly, allowed them to leave the building." He hesitated, then added grimly, "When I interviewed my Lady Artemisia at the door of her private chambers, she told me she had been on the point of sleep. It was only later that I realized that when she told me that, her face was elaborately made-up. When I returned, it was too late. I accept the blame for the mismanagement of this affair. After tonight I will request Your Excellency to accept my resignation, but first have I still your permission to sound the general alarm? Without your authority I could not interfere with members of the royal family."

But Hinrik was swaying on his feet and could only stare at him vacantly.

Aratap said, "Captain, you would do better to look to the health of your Director. I would suggest you call his physician."

"The general alarm!" repeated the captain.

"There will be no general alarm," said Aratap. "Do you understand me? No general alarm! No recapture of the prisoner! The incident is closed! Return your men to their quarters and ordinary duties and look to your Director. Come, Major."

The Tyrannian major spoke tensely once they had left the mass of Palace Central behind them.

"Aratap," he said, "I presume you know what you're doing. I kept my mouth shut in there on the basis of that presumption."

"Thank you, Major." Aratap liked the night air of a planet full of green and growing things. Tyrann was more beautiful in its way, but it was a terrible beauty of rocks and mountains. It was dry, dry!

He went on: "You cannot handle Hinrik, Major Andros. In your hands he would wilt and break. He is useful, but requires gentle treatment if he is to remain so."

The major brushed that aside. "I'm not referring to that. Why not the general alarm?"

Don't you want them?"

"Do you?" Aratap stopped. "Let us sit here for a moment, Andros. A bench on a pathway along a lawn. What more beautiful, and what place is safer from spy beams? Why do you want the young man, Major?"

"Why do I want any traitor and conspirator?"

"Why do you, indeed, if you only catch a few tools while leaving the source of the poison untouched? Whom would you have? A cub, a silly girl, a senile idiot?"

There was a faint splashing of an artificial waterfall nearby. A small one, but decorative. Now that was a real wonder to Aratap. Imagine water, spilling out, running to waste, pouring indefinitely down the rocks and along the ground. He had never educated himself out of a certain indignation over it.

"As it is," said the major, "we have nothing."

"We have a pattern. When the young man first arrived, we connected him with Hinrik, and that bothered us, because Hinrik is--what he is. But it was the best we could do. Now we see it was not Hinrik at all; that Hinrik was a misdirection. It was Hinrik's daughter and cousin he was after, and that makes more sense."

"Why didn't he call us sooner? He waited for the middle of the night."

"Because he is the tool of whoever is the first to reach him, and Gillbret, I am sure, suggested this night meeting as a sign of great zeal on his part."

"You mean we were called here on purpose? To witness their escape?"

"No, not for that reason. Ask yourself. Where do these people intend on going?"

The major shrugged.--"Rhodia is big."

"Yes, if it were the young Farrill alone who was concerned. But where on Rhodia would two members of the royal family go unrecognized? Particularly the girl."

"They would have to leave the planet, then? Yes, I agree."

"And from where? They can reach the Palace Field in a fifteen-minute walk. Now do you see the purpose of our being here?"

The major said, "Our ship?"

"Of course. A Tyrannian ship would seem ideal to them. Otherwise, they would have to choose among freighters. Farrill has been educated on Earth, and, I'm sure, can fly a cruiser."

"Now there's a point. Why do we allow the nobility to send out their sons in all directions? What business has a subject to know more about travel than will suffice him for local trade? We bring up soldiers against us."

"Nevertheless," said Aratap, with polite indifference, "at the moment Farrill has a foreign education, and let us take that into account objectively, without growing angry about it. The fact remains that I am certain they have taken our cruiser."

"I can't believe it."

"You have your wrist caller. Make contact with the ship, if you can."

The major tried, futilely.

Aratap said, "Try the Field Tower."

The major did so, and the small voice came out of the tiny receiver, in minute agitation: "But, Excellency, I don't understand--There is some mistake. Your pilot took off ten minutes ago."

Aratap was smiling. "You see? Work out the pattern and each little event becomes inevitable. And now do you see the consequences?"

The major did. He slapped his thigh, and laughed briefly. "Of course!" he said.

"Well," said Aratap, "they couldn't know, of course, but they have ruined themselves."

Had they been satisfied with the clumsiest Rhodian freighter on the field, they would surely have escaped and--what's the expression?--I would have been caught with my trousers down this night. As it is, my trousers are firmly belted, and nothing can save them. And when I pluck them back, in my own good time"--he emphasized the words with satisfaction--"I will have the rest of the conspiracy in my hands as well."

He sighed and found himself beginning to feel sleepy once more. "Well, we have been lucky, and now there is no hurry. Call Central Base, and have them send another ship after us."

10. MAYBE!

Biron Farrill's training in spationautics back on Earth had been largely academic. There had been the university courses in the various phases of spatial engineering, which, though half a semester was spent on the theory of the hyperatomic motor, offered little when it came to the actual manipulation of ships in space. The best and most skilled pilots learned their art in space and not in schoolrooms.

He had managed to take off without actual accident, though that was more luck than design. The Remorseless answered the controls far more quickly than Biron had anticipated. He had manipulated several ships on Earth out into space and back to the planet, but those had been aged and sedate models, maintained for the use of students. They had been gentle, and very, very tired, and had lifted with an effort and spiraled slowly upward through the atmosphere and into space.

The Remorseless, on the other hand, had lifted effortlessly, springing upward and whistling through the air, so that Biron had fallen backward out of his chair and all but dislocated his shoulder. Artemisia and Gillbret, who, with the greater caution of the inexperienced, had strapped themselves in, were bruised against the padded webbing. The Tyrannian prisoner had lain pressed against the wall, tearing heavily at his bonds and cursing in a monotone.

Biron had risen shakily to his feet, kicked the Tyrannian into a brooding silence, and made his way along the wall rail, hand over hand against the acceleration, back to his seat.

Forward blasts of power quivered the ship and reduced the rate of increasing velocity to a bearable quantity.

They were in the upper reaches of the Rhodian atmosphere by then. The sky was a deep violet and the hull of the ship was hot with air friction, so that warmth could be felt within.

It took hours thereafter to set the ship into an orbit about Rhodia. Biron could find no way of readily calculating the velocity necessary to overcome Rhodia's gravity. He had to work it by hit and miss, varying the velocity with puffs of power forward and backward, watching the massometer, which indicated their distance from the planet's surface by measuring the intensity of the gravitational field. Fortunately, the massometer was already calibrated for Rhodia's mass and radius. Without considerable experimentation, Biron could not have adjusted the calibration himself.

Eventually, the massometer held steady and over a period of two hours showed no appreciable drift. Biron allowed himself to relax, and the others climbed out of their belts.

Artemisia said, "You don't have a very light touch, my Lord Rancher."

"I'm flying, my lady," Biron replied curtly. "If you can do better, you're welcome to try, but only after I myself disembark."

"Quiet, quiet, quiet," said Gillbret. "The ship is too cramped for pettishness, and, in addition, since we are to be crushed into an inconvenient familiarity in this leaping prison pen, I suggest we discard the many 'lords' and 'ladies' which will otherwise encrust our conversation to an unbearable degree. I am Gillbret, you are Biron, she is Artemisia. I suggest we memorize those terms of address, or any variation we care to use. And as for piloting the ship, why not use the help of our Tyrannian friend here?"

The Tyrannian glared, and Biron said, "No. There is no way we could trust him. And my own piloting will improve as I get the hang of this ship. I haven't cracked you up yet, have I?"

His shoulder still hurt as a result of the first lurch and, as usual, pain made him peevish.

"Well," said Gillbret, "what do we do with him?"

"I don't like to kill him in cold blood," said Biron, "and that won't help us. It would just make the Tyranni doubly excited. Killing one of the master race is really the unforgivable sin."

"But what is the alternative?"

"We'll land him."

"All right. But where?"

"On Rhodia."

"What!"

"It's the one place they won't be looking for us. Besides which, we've got to go down pretty soon, anyway."

"Why?"

"Look, this is the Commissioner's ship, and he's been using it for hopping about the surface of the planet. It isn't provisioned for space voyages. Before we go anywhere, we'll have to take complete inventory aboard ship, and at least make sure that we have enough food and water."

Artemisia was nodding vigorously. "That's right. Good! I wouldn't have thought of that myself. That's very clever, Biron."

Biron made a deprecating gesture, but warmed with pleasure, nevertheless. It was the first time she had used his first name. She could be quite pleasant, when she tried.

Gillbret said, "But he'll radio our whereabouts instantly."

"I don't think so," said Biron. "In the first place, Rhodia has its desolate areas, I imagine. We don't have to drop him into the business section of a city, or into the middle of one of the Tyrannian garrisons. Besides, he may not be so anxious to contact his superiors as you might think. . . . Say, Private, what would happen to a soldier who allowed the Commissioner of the Khan to have his private cruiser stolen from him?"

The prisoner did not answer, but his lip line became, pale and thin.

Biron would not have wanted to be in the soldier's place. To be sure, he could scarcely be blamed. There was no reason why he should have suspected trouble resulting from mere politeness to members of the Rhodian royal family. Sticking to the letter of the Tyrannian military code, he had refused to allow them aboard ship without the permission

of his commanding officer. If the Director himself had demanded permission to enter, he insisted, he would have to deny it. But, in the meantime, they had closed in upon him, and by the time he realized he should have followed the military code still more closely and had his weapon ready, it was too late. A neuronic whip was practically touching his chest.

Nor had he given in tamely, even then. It had taken a whip blast at his chest to stop him. And, even so, he could face only court-martial and conviction. No one doubted that, least of all the soldier.

They had landed two days later at the outskirts of the city of Southwark. It had been chosen deliberately because it lay far from the main centers of Rhodian population. The Tyrannian soldier had been strapped into a repulsion unit and allowed to flutter downward some fifty miles from the nearest sizable town.

The landing, on an empty beach, was only mildly jerky, and Biron, as the one least likely to be recognized, made the necessary purchases. Such Rhodian currency as Gillbret had had the presence of mind to bring with him had scarcely sufficed for elementary needs, since much of it went for a little biwheel and tow cart, on which he could carry the supplies away piecemeal.

"You might have stretched the money farther," said Artemisia, "if you hadn't wasted so much of it on the Tyrannian mush you bought."

"I think there was nothing else to do," said Biron hotly. "It may be Tyrannian mush to you, but it's a well-balanced food, and will see us through better than anything else I could have gotten."

He was annoyed. It had been stevedore's work, getting all that out of the city and then aboard ship. And it had meant a considerable risk, buying it at one of the Tyrannian-run commissaries in the city. He had expected appreciation.

And there was no alternative anyway. The Tyrannian forces had evolved an entire technique of supply adapted strictly to the fact that they used tiny ships. They couldn't afford the huge storage spaces of other fleets which were stacked with the carcasses of whole animals, neatly hung in rows. They had had to develop a standard food concentrate containing what was necessary in the way of calories and food factors and let it go at that. It took up only one twentieth of the space that an equivalent supply of natural animal food would take, and it could be piled up in the low-temperature storeroom like packaged bricks.

"Well, it tastes awful," said Artemisia.

"Well, you'll get used to it," retorted Biron, mimicking her petulance, so that she flushed and turned away angrily.

What was bothering her, Biron knew, was simply the lack of space and all that accompanied the lack. It wasn't just a question of using a monotonous food stock because in that way more calories could be packed to the cubic inch. It was that there were no separate sleeping rooms, for instance. There were the engine rooms and the control room, which took up most of the ship's space. (After all, Biron thought, this is a warship, not a pleasure yacht.) Then there was the storeroom, and one small cabin, with

two tiers of three bunks on either side. The plumbing was located in a little niche just outside the cabin.

It meant crowding; it meant a complete absence of privacy; and it meant that Artemisia would have to adjust herself to the fact that there were no women's clothes aboard, no mirrors, no washing facilities.

Well, she would have to get used to it. Biron felt that he had done enough for her, gone sufficiently out of his way. Why couldn't she be pleasant about it and smile once in a while? She had a nice smile, and he had to admit that she wasn't bad, except for her temper.

But oh, that temper!

Well, why waste his time thinking about her?

The water situation was the worst. Tyrann was a desert planet, in the first place, where water was at a premium and men knew its value, so none was included on board ship for washing purposes. Soldiers could wash themselves and their personal effects once they had landed on a planet. During trips a little grime and sweat would not hurt them. Even for drinking purposes, water was barely sufficient for the longer trips. After all, water could be neither concentrated nor dehydrated, but had to be carried in bulk; and the problem was aggravated by the fact that the water content of the food concentrates was quite low.

There were distilling devices to re-use water lost by the body, but Biron, when he realized their function, felt sick and arranged for the disposal of waste products without attempt at water recovery. Chemically, it was a sensible procedure, but one has to be educated into that sort of thing.

The second take-off was, comparatively, a model of smoothness, and Biron spent time playing with the controls afterward. The control board resembled only in the dimmest fashion those of the ships he had handled on Earth. It had been compressed and compacted frightfully.

As Biron puzzled out the action of a contact or the purpose of a dial, he wrote out minute directions on paper and pasted them appropriately on the board.

Gillbret entered the pilot room.

Biron looked over his shoulder. "Artemisia's in the cabin, I suppose?"

"There isn't anyplace else she could be and stay inside the ship."

Biron said, "When you see her, tell her I'll make up a bunk here in the pilot room.

I'd advise you to do the same, and let her have the cabin to herself." He muttered the addition, "Now there's one childish girl."

"You have your moments, too, Biron," said Gillbret. "You'll have to remember the sort of life she's used to."

"All right. I do remember it, and so what? What sort of life do you think I'm used to?"

I wasn't born in the mine fields of some asteroidal belt, you know. I was born on the biggest Ranch of Nephelos. But if you're caught in a situation, you've got to make the best of it.

Damn it, I can't stretch the hull of the ship. It will hold just so much food and water, and I can't do anything about the fact that there isn't any shower bath. She picks on me as if I personally manufactured this ship." It was a relief to shout at Gillbret. It was a relief to shout at anybody.

But the door opened again, and Artemisia stood there. She said, freezingly, "I would refrain, Mr. Farrill, from shouting, if I were you. You can be distinctly heard all over the ship."

"That," said Biron, "does not bother me. And if the ship bothers you, just remember that if your father hadn't tried to kill me off and marry you off, neither one of us would be here."

"Don't talk about my father."

"I'll talk about anyone I please."

Gillbret put his hands over his ears. "Please!"

It brought the argument to a momentary halt. Gillbret said, "Shall we discuss the matter of our destination now? It's obvious at this point that the sooner we're somewhere else and out of this ship, the more comfortable we'll be."

"I agree with you there, Oil," said Biron. "Just let's go somewhere where I don't have to listen to her clacking. Talk about women on space ships!"

Artemisia ignored him and addressed Gillbret exclusively. "Why don't we get out of the Nebular area altogether?"

"I don't know about you," said Biron at once, "but I've got to get my Ranch back and do a little something about my father's murder. I'll stay in the Kingdoms."

"I did not mean," said Artemisia, "that we were to leave forever; only till the worst of the search was over. I don't see what you intend doing about your Ranch, anyway. You can't get it back unless the Tyrannian Empire is broken to pieces, and I don't see you doing that."

"You never mind what I intend doing. It's my business."

"Might I make a suggestion?" asked Gillbret mildly.

He took silence for consent, and went on, "Then suppose I tell you where we ought to go, and exactly what we ought to do to help break the Empire to pieces, just as Arta said."

"Oh? How do you propose doing that?" said Biron.

Gillbret smiled. "My dear boy, you're taking a very amusing attitude. Don't you trust me? You look at me as though you think that any enterprise I might be interested in was bound to be a foolish one. I got you out of the Palace."

"I know that. I'm perfectly willing to listen to you."

"Do so, then. I've been waiting for over twenty years for my chance to get away from them. If I had been a private citizen, I could have done it long since; but through the curse of birth, I've been in the public eye. And yet. if it hadn't been for the fact that I was born a Hinriad, I would not have attended the coronation of the present Khan of Tyrann, and in that case I would never have stumbled on the secret which will someday destroy that same Khan."

"Go on," said Biron.

"The trip from Rhodia to Tyrann was by Tyrannian warship, of course, as was the trip back. A ship like this, I might say, but rather larger. The trip there was uneventful. The stay on Tyrann had its points of amusements, but, for our purposes now, was likewise uneventful. On the trip back, however, a meteor hit us."

"What?"

Gillbret held up a hand. "I know quite well it's an unlikely accident. The incidence of meteors in space--especially in interstellar space--is low enough to make the chances of collision with a ship completely insignificant, but it does happen, as you know. And it did happen in this case. Of course any meteor that does hit, even when it is the size of a pinhead, as most of them are, can penetrate the hull of any but the most heavily armored ship."

"I know," said Biron. "It's a question of their momentum, which is a product of their mass and velocity. The velocity more than makes up for their lack of mass." He recited it glumly, like a school lesson, and caught himself watching Artemisia furtively.

She had seated herself to listen to Gillbret, and she was so close to him that they were almost touching. It occurred to Biron that her profile was beautiful as she sat there, even if her hair was becoming a little bedraggled. She wasn't wearing her little jacket, and the fluffy whiteness of her blouse was still smooth and unwrinkled after forty-eight hours. He wondered how she managed that.

The trip, he decided, could be quite wonderful if she would only learn to behave herself. The trouble was that no one had ever controlled her properly, that was all. Certainly not her father. She'd become too used to having her own way. If she'd been born a commoner, she would be a very lovely creature.

He was just beginning to slip into a tiny daydream in which he controlled her properly and brought her to a state of proper appreciation of himself, when she turned her head and met his eye calmly. Biron looked away and fastened his attention instantly on Gillbret. He had missed a few sentences.

"I haven't the slightest idea why the ship's screen had failed. It was just one of those things to which no one will ever know the answer, but it had failed. Anyway, the meteor struck amidships. It was pebble-sized and piercing the hull slowed it just sufficiently so that it couldn't blaze its way out again through the other side. If it had done that, there would have been little harm to it, since the hull could have been temporarily patched in no time.

"As it was, however, it plunged into the control room, ricocheted off the far wall and slammed back and forth till it came to a halt. It couldn't have taken more than a fraction of a minute to come to a halt, but at an original velocity of a hundred miles a minute, it must have crisscrossed the room a hundred times. Both crewmen were cut to pieces, and I escaped only because I was in the cabin at the time.

"I heard the thin clang of the meteor when it originally penetrated the hull, then the click-clack of its bouncing, and the terrifying short screams of the two crewmen. When I jumped into the control room, there was only the blood everywhere and the torn flesh.

The things that happened next I remember only vaguely, although for years I lived it over step by step in my nightmares.

"The cold sound of escaping air led me to the meteor hole. I slapped a disk of metal over it and air pressure made a decent seal of it. I found the little battered space pebble on the floor. It was warm to the touch, but I hit it with a spanner and split it in two. The exposed interior frosted over instantly. It was still at the temperature of space.

"I tied a cord to the wrist of each corpse and then tied each cord to a towing magnet.

I dumped them through the air lock, heard the magnets clank against the hold, and knew that the hard-frozen bodies would follow the ship now wherever it went. You see, once we returned to Rhodia, I knew I would need the evidence of their bodies to show that it had been the meteor that had killed them and not I.

"But how was I to return? I was quite helpless. There was no way I could run the ship, and there was nothing I dared try there in the depths of interstellar space. I didn't even know how to use the sub-etheric communication system, so that I couldn't SOS. I could only let the ship travel on its own course."

"But you couldn't very well do that, could you?" Biron said. He wondered if Gillbret 'were inventing this, either out of simple romantic imaginings or for some severely practical reason of his own. "What about the Jumps through hyperspace? You must have managed those, or you wouldn't be here."

"A Tyrannian ship," said Gillbret, "once the controls are properly set, will make any number of Jumps quite automatically."

Biron stared his disbelief. Did Gillbret take him for a fool? "You're making that up," he said.

"I am not. It's one of the damned military advances which won their wars for them.

They didn't defeat fifty planetary systems, outnumbering Tyrann by hundreds of times in population and resources, just by playing mumblety-peg, you know. Sure they tackled us one at a time, and utilized our traitors very skillfully, but they had a definite military edge as well. Everyone knows that their tactics were superior to ours, and part of that was due to the automatic Jump. It meant a great increase in the maneuverability of their ships and made possible much more elaborate battle plans than any we could set up.

"I'll admit it's one of their best-kept secrets, this technique of theirs. I never learned it until I was trapped alone on the Bloodsucker--the Tyranni have the most annoying custom of naming their ships unpleasantly, though I suppose it's good psychology--and watched it happen. I watched it make the Jumps without a hand on the controls."

"And you mean to say that this ship can do that too?"

"I don't know. I wouldn't be surprised."

Biron turned to the control board. There were still dozens of contacts he had not determined the slightest use for. Well, later!

He turned to Gillbret again. "And the ship took you home?"

"No, it didn't. When that meteor wove its pattern through the control room, it didn't leave the board untouched. It would have been most amazing if it had. Dials were smashed, the casing battered and dented. There was no way of telling how the previous set of the controls had been altered, but it must have been somehow, because it never took me back to Rhodia.

"Eventually, of course, it began deceleration, and I knew the trip was theoretically over. I couldn't tell where I was, but I managed to maneuver the visiplate so that I could tell there was a planet close enough to show a disk in the ship telescope. It was blind luck, because the disk was increasing in size. The ship was heading for the planet.

"Oh, not directly. That would have been too impossible to hope for. If I had just drifted, the ship would have missed the planet by a million miles, at least, but at that distance I could use ordinary etheric radio. I knew how to do that. It was after this was all over that I began educating myself in electronics. I made up my mind that I would never be quite so helpless again. Being helpless is one of the things that isn't altogether amusing."

Biron prompted, "So you used the radio."

Gillbret went on: "Exactly, and they came and got me;"

"Who?"

"The men of the planet. It was inhabited."

"Well, the luck piles up. What planet was it?"

"I don't know."

"You mean they didn't tell you?"

"Amusing, isn't it? They didn't. But it was somewhere among the Nebular Kingdoms!"

"How did you know that?"

"Because they knew the ship I was in was a Tyrannian vessel. They knew that by sight, and almost blasted it before I could convince them I was the only one on board alive."

Biron put his large hands on his knees and kneaded them. "Now hold on and pull back. I don't get this. If they knew it was a Tyrannian vessel and intending blasting it, isn't that the best proof that the world was not in the Nebular Kingdoms? that it was anywhere but there?"

"No, by the Galaxy." Gillbret's eyes were shining, and his voice climbed in enthusiasm. "It was in the Kingdoms. They took me to the surface, and what a world it was!"

There were men there from all over the Kingdoms. I could tell by the accents. And they had no fear of the Tyranni. The place was an arsenal. You couldn't tell from space. It might have been a rundown farming world, but the life of the planet was underground. Somewhere in the Kingdoms, my boy, somewhere there is that planet still, and it is not afraid of the Tyranni, and it is going to destroy the Tyranni as it would have destroyed the ship I was on then, if the crewmen had been still alive."

Biron felt his heart bound. For a moment he wanted to believe.

After all, maybe. Maybe!

11. AND MAYBE NOT!

And then again, maybe not!

Biron said, "How did you learn all this about its being an arsenal? How long did you stay? What did you see?"

Gillbret grew impatient. "It wasn't exactly what I saw at all. They didn't conduct me on any tours, or anything like that." He forced himself to relax. "Well, look, this is what happened. By the time they got me off the ship, I was in more or less of a bad state. I had been too frightened to eat much--it's a terrible thing, being marooned in space --and I must have looked worse than I really was.

"I identified myself, more or less, and they took me underground. With the ship, of course. I suppose they were more interested in the ship than in myself. It gave them a chance to study Tyrannian spatio-engineering. They took me to what must have been a hospital."

"But what did you see, Uncle?" asked Artemisia.

Biron interrupted, "Hasn't he ever told you this before?"

Artemisia said, "No."

And Gillbret added, "I've never told anyone till now. I was taken to a hospital, as I said. I passed research laboratories in that hospital that must have been better than anything we have on Rhodia. On the way to the hospital I passed factories in which some sort of metalwork was going on. The ships that had captured me were certainly like none I've ever heard about.

"It was all so apparent to me at the time that I have never questioned it in the years since. I think of it as my 'rebellion world,' and I know that someday swarms of ships will leave it to attack the Tyranni, and that the subject worlds will be called upon to rally round the rebel leaders. From year to year I've waited for it to happen. Each new year I've thought to myself: This may be the one. And, each time, I half hoped it wouldn't be, because I was longing to get away first, to join them so that I might be part of the great attack. I didn't want them to start without me."

He laughed shakily. "I suppose it would have amused most people to know what was going on in my mind. In my mind. Nobody thought much of me, you know."

Biron said, "All this happened over twenty years ago, and they haven't attacked?

There's been no sign of them? No strange ships have been reported? No incidents? And you still think--"

Gillbret fired at him, "Yes, I do. Twenty years isn't too long to organize a rebellion against a planet that rules fifty systems. I was there just at the beginning of the rebellion.

I know that too. Slowly, since then, they must have been honeycombing the planet with their underground preparations, developing newer ships and weapons, training more men, organizing the attack.

"It's only in the video thrillers that men spring to arms at a moment's notice; that a new weapon is needed one day, invented the next, mass-produced the third, and used the fourth.

These things take time, Biron, and the men of the rebellion world must know they will have to be completely ready before beginning. They won't be able to strike twice.

"And what do you call 'incidents'? Tyrannian ships have disappeared and never been found. Space is big, you might say, and they might simply be lost, but what if they were captured by the rebels? There was the case of the Tireless two years back. It reported a strange object close enough to stimulate the massometer, and then was never heard from again.

It could have been a meteor, I suppose, but was it?

"The search lasted months. They never found it. I think the rebels have it. The Tireless was a new ship, an experimental model. It would be just what they would want."

Biron said, "Once having landed there, why didn't you stay?"

"Don't you suppose I wanted to? I had no chance. I listened to them when they thought I was unconscious, and I learned a bit more then. They were just starting, out there, at that time. They couldn't afford to be found out then. They knew I was Gillbret oth Hinriad. There was enough identification on the ship, even if I hadn't told them myself, which I had. They knew that if I didn't return to Rhodia there would be a full-scale search that would not readily come to a halt.

"They couldn't risk such a search, so they had to see to it that I was returned to Rhodia. And that's where they took me."

"What!" cried Biron. "But that must have been an even greater risk. How did they do that?"

"I don't know." Gillbret passed his thin fingers through his graying hair, and his eyes seemed to be probing uselessly into the backward stretches of his memory. "They anesthetized me, I suppose. That part all blanks out. Past a certain point there is nothing. I can only remember that I opened my eyes and was back in the Bloodsucker; I was in space, just off Rhodia."

"The two dead crewmen were still attached by the tow magnets? They hadn't been removed on the rebellion world?" asked Biron.

"They were still there."

"Was there any evidence at all to indicate that you had been on the rebellion world?"

"None; except for what I remembered."

"How did you know you were off Rhodia?"

"I didn't. I knew I was near a planet; the massometer said so. I used the radio again, and this time it was Rhodian ships that came for me. I told my story to the Tyrannian Commissioner of that day, with appropriate modifications. I made no mention of the rebellion world, of course. And I said the meteor had hit just after the last Jump. I didn't want them to think I knew that a Tyrannian ship could make the Jumps automatically."

"Do you think the rebellion world found out that little fact? Did you tell them?"

"I didn't tell them. I had no chance. I wasn't there long enough. Conscious, that is. But I don't know how long I was unconscious and what they managed to find out for themselves."

Biron stared at the visiplat. Judging from the rigidity of the picture it presented, the ship they were on might have been nailed in space. The Remorseless was traveling at the rate of ten thousand miles an hour, but what was that to the immense distances of space. The stars were hard, bright, and motionless. They had a hypnotic quality about them.

He said, "Then where are we going? I take it you still don't know where the rebellion world is?"

"I don't. But I have an idea who would. I am almost sure I know." Gillbret was eager about it.

"Who?"

"The Autarch of Lingane."

"Lingane?" Biron frowned. He had heard the name some time back, it seemed to him, but he had forgotten the connection. "Why he?"

"Lingane was the last Kingdom captured by the Tyranni. It is not, shall we say, as pacified as the rest. Doesn't that make sense?"

"As far as it goes. But how far is that?"

"If you want another reason, there is your father."

"My father?" For a moment Biron forgot that his father was dead. He saw him standing before his mind's eye, large and alive, but then he remembered and there was that same cold wrench inside him. "How does my father come into this?"

"He was at court six months ago. I gained certain notions as to what he wanted. Some of his talks with my cousin, Hinrik, I overheard."

"Oh, Uncle," said Artemisia impatiently.

"My dear?"

"You had no right to eavesdrop on Father's private discussions."

Gillbret shrugged. "Of course not, but it was amusing, and useful as well."

Biron interrupted, "Now, wait. You say it was six months ago that my father was at Rhodia?" He felt excitement mount.

"Yes."

"Tell me. While there, did he have access to the Director's collection of Primitivism?"

You told me once that the Director had a large library of matters concerning Earth.

"

"I imagine so. The library is quite famous and it is usually made available to distinguished visitors, if they're interested. They usually aren't, but your father was. Yes, I remember that very well. He spent nearly a day there."

That checked. It had been half a year ago that his father had first asked his help.

Biron said, "You yourself know the library well, I imagine."

"Of course."

"Is there anything in the library that would suggest that there exists a document on Earth of great military value?"

Gillbret was blank of face and, obviously, blank of mind.

Biron said, "Somewhere in the last centuries of prehistoric Earth there must have been such a document. I can only tell you that my father thought it to be the most valuable single item in the Galaxy, and the deadliest. I was to have gotten it for him, but I left Earth too soon, and in any case"--his voice faltered--"he died too soon."

But Gillbret was still blank. "I don't know what you're talking about."

"You don't understand. My father mentioned it to me first six months ago. He must have learned of it in the library on Rhodia. If you've been through it yourself, can't you tell me what it was he must have learned?"

But Gillbret could only shake his head.

Biron said, "Well, continue with your story."

Gillbret said, "They spoke of the Autarch of Lingane, your father and my cousin.

Despite your father's cautious phraseology, Biron, it was obvious that the Autarch was the fount and head of the conspiracy.

"And then"--he hesitated--"there was a mission from Lingane and the Autarch himself was at its head. I--I told him of the rebellion world."

"You said a while ago you told nobody," said Biron.

"Except the Autarch. I had to know the truth."

"What did he tell you?"

"Practically nothing. But then, he had to be cautious too. Could he trust me? I might have been working for the Tyranni. How could he know? But he didn't close the door altogether.

It's our only lead."

"Is it?" Biron said. "Then we'll go to Lingane. One place, I suppose, is like another."

Mention of his father had depressed him, and, for the moment, nothing mattered much. Let it be Lingane.

Let it be Lingane! That was easy to say. But how does one go about pointing the ship.

At a tiny speck of light thirty-five light-years away. Two hundred trillion miles. A two with fourteen zeros after it. At ten thousand miles an hour (current cruising speed of the Remorseless) it would take well over two million years to get there.

Biron leafed through the Standard Galactic Ephemeris with something like despair. Tens of thousands of stars were listed in detail, with their positions crammed into three figures.

There were hundreds of pages of these figures, symbolized by the Greek letters ρ (rho), θ (theta), and ϕ (phi)? was the distance from the Galactic Center in parsecs?, the angular separation, along the plane of the Galactic Lens from the Standard Galactic Baseline (the line, that is, which connects the Galactic Center and the sun of the planet,

Earth) ; f the angular separation from the Baseline in the plane perpendicular to that of the Galactic Lens, the two latter measurements being expressed in radians. Given those three figures, one could locate any star accurately in all the vast immensity of space.

That is, on a given date. In addition to the star's position on the standard day for which all the data were calculated, one had to know the star's proper motion, both speed and direction. It was a small correction. comparatively, but necessary. A million miles is virtually nothing compared with stellar distances, but it is a long way with a ship.

There was, of course, the question of the ship's own position. One could calculate the distance from Rhodia by the reading of the massometer, or, more correctly, the distance from Rhodia's sun, since this far out in space the sun's gravitational field drowned out that of any of its planets. The direction they were traveling with reference to the Galactic Baseline was more difficult to determine. Biron had to locate two known stars other than Rhodia's sun.

From their apparent positions and the known distance from Rhodia's sun, he could plot their actual position. It was roughly done but, he felt sure, accurately enough. Knowing his own position and that of Lingane's sun, he had only to adjust the controls for the proper direction and strength of the hyperatronic thrust.

Biron felt lonely and tense. Not frightened! He rejected the word. But tense, definitely. He was deliberately calculating the elements of the Jump for a time six hours later. He wanted plenty of time to check his figures. And perhaps there might be the chance for a nap. He had dragged the bed makings out of the cabin and it was ready for him now.

The other two were, presumably, sleeping in the cabin. He told himself that that was a good thing and that he wanted nobody around bothering him, yet when he heard the small sound of bare feet outside, he looked up with a certain eagerness.

"Hello," he said, "why aren't you sleeping?"

Artemisia stood in the doorway, hesitating. She said, in a small voice, "Do you mind if I come in? Will I be bothering you?"

"It depends on what you do."

"I'll try to do the right things."

She seemed too humble, Biron thought suspiciously, and then the reason for it came out.

"I'm awfully frightened," she said. "Aren't you?"

He wanted to say no, not at all, but it didn't come out that way. He smiled sheepishly, and said, "Sort of."

Oddly enough, that comforted her. She knelt down on the floor beside him and looked at the thick volumes opened before him and at the sheets of calculations.

"They had all these books here?"

"You bet. They couldn't pilot a ship without them."

"And you understand all that?"

"Not all that. I wish I did. I hope I understand enough. We'll have to Jump to Lingane, you know."

"Is that hard to do?"

"No, not if you know the figures, which are all here, and have the controls, which are all there, and if you have experience, which I haven't. For instance, it should be done in several Jumps, but I'm going to try it in one because there'll be less chance of trouble, even though it means a wasteful use of energy."

He shouldn't tell her; there was no point in telling her; it would be cowardly to frighten her; and she'd be hard to handle if she got really frightened, panicky frightened. He kept telling himself all that and it did no good. He wanted to share it with somebody. He wanted part of it off his own mind.

He said, "There are some things I should know that I don't. Things like the mass density between here and Lingane affect the course of the Jump, because that mass density is what controls the curvature of this part of the universe. The Ephemeris--that's this big book here--mentions the curvature corrections that must be made in certain standard Jumps, and from those you're supposed to be able to calculate your own particular corrections. But then if you happen to have a super giant within ten light-years, all bets are off. I'm not even sure if I used the computer correctly."

"But what would happen if you were wrong?"

"We could re-enter space too close to Lingane's sun."

She considered that, then said, "You have no idea how much better I feel."

"After what I've just said?"

"Of course. In my bunk I simply felt helpless and lost with so much emptiness in all directions. Now I know that we're going somewhere and that the emptiness is under our control."

Biron was pleased. How different she was. "I don't know about it's being under our control."

She stopped him. "It is. I know you can handle the ship."

And Biron decided that maybe he could at that.

Artemisia had tucked her long unclad legs under her and sat facing him. She had only her filmy underclothes for cover, but seemed unconscious of the fact, though Biron was definitely not.

She said, "You know, I had an awfully queer sensation in the bunk, almost as if I were floating. That was one of the things that frightened me. Every time I'd turn, I'd give a queer little jump into the air and then flop back slowly as if there were springs in the air holding me back."

"You weren't sleeping in a top bunk, were you?"

"Yes, I was. The bottom ones give me claustrophobia, with another mattress six inches over your head."

Biron laughed. "Then that explains it. The ship's gravitational force is directed toward its base, and falls off as we move away from it. In the top bunk you were probably twenty or thirty pounds lighter than on the floor. Were you ever on a passenger liner? A really big one?"

"Once. When Father and I visited Tyrann last year."

"Well, on the liners they have the gravitation in all parts of the ship directed toward the outer hull, so that the long axis of the ship is always 'up,' no matter where you are. That's why the motors of one of those big babies are always lined up in a cylinder running right along the long axis. No gravity there."

"It must take an awful lot of power to keep an artificial gravity going."

"Enough to power a small town."

"There isn't any danger of our running short of fuel, is there?"

"Don't worry about that. Ships are fueled by the total conversion of mass to energy.

Fuel is the last thing we'll run out of. The outer hull will wear away first."

She was facing him. He noted that her face had been cleaned of its make-up and wondered how that had been done; probably with a handkerchief and as little of the drinking water as she could manage. She didn't suffer as a result, for her clear white skin was the more startlingly perfect against the black of her hair and eyes. Her eyes were very warm, thought Biron.

The silence had lasted a little too long. He said hurriedly, "You don't travel very much, do you? I mean, you were on a liner only once?"

She nodded. "Once too often. If we hadn't gone to Tyrann, that filthy chamberlain wouldn't have seen me and--I don't want to talk about that."

Biron let it go. He said, "Is that usual? I mean, not traveling."

"I'm afraid so. Father is always hopping around on state visits, opening agricultural expositions, dedicating buildings. He usually just makes some speech that Aratap writes for him. As for the rest of us, however, the more we stay in the Palace, the better the Tyranni like it. Poor Gillbret! The one and only time he left Rhodia was to attend the Khan's coronation as Father's representative. They've never let him get into a ship again."

Her eyes were downcast and, absently, she pleated the material of Biron's sleeve where it ended at the wrist. She said, "Biron."

"Yes--Arta?" He stumbled a bit, but it came out.

"Do you think Uncle Oil's story can be true?"

"Do you suppose it could be his imagination? He's been brooding about the Tyranni for years, and he's never been able to do anything, of course, except to rig up spy beams, which is only childish, and he knows it. He may have built himself a daydream and, over the years, gradually come to believe in it. I know him, you see."

"Could be, but let's follow it up a little. We can travel to Lingane, anyway."

They were closer to one another. He could have reached out and touched her, held her in his arms, kissed her.

And he did so.

It was a complete non sequitur. Nothing, it seemed to Biron, had led to it. One moment they were discussing Jumps and gravity and Gillbret, and the next she was soft and silky in his arms and soft silky on his lips.

His first impulse was to say he was sorry, to go through all the silly motions of apology, but when he drew away and would have spoken, she still made no attempt at escape but rested her head in the crook of his left arm. Her eyes remained closed.

So he said nothing at all but kissed her again, slowly and thoroughly. It was the best thing he could have done, and at the time he knew it.

Finally she said, a bit dreamily, "Aren't you hungry? I'll bring you some of the concentrate and warm it for you. Then, if you want to sleep, I can keep an eye on things for you. And--and I'd better put on more of my clothes."

She turned as she was about to go out the door. "The food concentrate tastes very nice after you get used to it. Thank you for getting it."

Somehow that, rather than the kisses, was the treaty of peace between them.

When Gillbret entered the control room, hours later, he showed no surprise at finding Biron and Artemisia lost in a foolish kind of conversation. He made no remarks about the fact that Biron's arm was about his niece's waist.

He said, "When are we Jumping, Biron?"

"In half an hour," said Biron.

The half hour passed; the controls were set; conversation languished and died.

At zero time Biron drew a deep breath and yanked a lever the full length of its arc, from left to right.

It was not as it had been on the liner. The Remorseless was smaller and the Jump was consequently less smooth. Biron staggered, and for a split second things wavered.

And then they were smooth and solid again.

The stars in the visiplat had changed. Biron rotated the ship, so that the star field lifted, each star moving in a stately arc. One star appeared finally, brilliantly white and more than a point. It was a tiny sphere, a burning speck of sand. Biron caught it, steadied the ship before it was lost again, and turned the telescope upon it, throwing in the spectroscopic attachment.

He turned again to the Ephemeris, and checked under the column headed "Spectral Characteristics." Then he got out of the pilot's chair and said, "It's still too far. I'll have to nudge up to it. But, anyway, that's Lingane right ahead."

It was the first Jump he had ever made, and it was successful.

12. THE AUTARCH COMES

The Autarch of Lingane pondered the matter, but his cool, well-trained features scarcely creased under the impact of thought.

"And you waited forty-eight hours to tell me," he said.

Rizzett said boldly, "There was no reason to tell you earlier. If we bombarded you with all matters, life would be a burden to you. We tell you now because we still make nothing of it. It is queer, and in our position we can afford nothing queer."

"Repeat this business. Let me hear it again."

The Autarch threw a leg upon the flaring window sill and looked outward thoughtfully.

The window itself represented perhaps the greatest single oddity of Linganian architecture. It was moderate in size and set at the end of a five-foot recess that narrowed gently toward it.

It was extremely clear, immensely thick, and precisely curved; not so much a window as a lens, funneling the light inward from all directions, so that, looking outward, one eyed a miniature panorama.

From any window in the Autarch's Manor a sweep of vision embracing half the horizon from zenith to nadir could be seen. At the edges there was increasing minuteness and distortion, but that itself lent a certain flavor to what one saw: the tiny flattened motions of the city; the creeping, curved orbits of the crescent-shaped stratospherics climbing from the airport. One grew so used to it that unhinging the window to allow the flat tameness of reality to enter would seem unnatural. When the position of the sun made the lenslike windows a focus for impossible heat and light, they were blanked out automatically, rather than opened, rendered opaque by a shift in the polarization characteristics of the glass.

And certainly the theory that a planet's architecture is the reflection of a planet's place in the Galaxy would seem to be borne out by the case of Lingane and its windows.

Like the windows, Lingane was small yet commanded a panoramic view. It was a "planet state" in a Galaxy, which, at the time, had passed beyond that stage of economic and political development. Where most political units were con. glomerations of stellar systems, Lingane remained what it had been for centuries--a single inhabited world. This did not prevent it from being wealthy. In fact, it was almost inconceivable that Lingane could be anything else.

It is difficult to tell in advance when a world is so located that many Jump routes may use it as a pivotal intermediate point; or even must use it in the interests of optimal economy. A great deal depends on the pattern of development of that region of space. There is the question of the distribution of the naturally habitable planets; the order in which they are colonized and developed; the types of economy they possess.

Lingane discovered its own values early, which was the great turning point of its history. Next to the actual possession of a strategic position, the capacity to appreciate and exploit that position is most important. Lingane had proceeded to occupy small planetoids with neither resources nor capacity for supporting an independent population, choosing them only because they would help maintain Lingane's trade monopoly. They built servicing stations on those rocks. All that ships would need, from hyperatomic replacements to new book reels, could be found there. The stations grew to huge trading posts. From all the Nebular Kingdoms fur, minerals, grain, beef, timber poured in; from the Inner Kingdoms, machinery, appliances, medicinals; finished products of all sorts formed a similar flood.

So that, like its windows, Lingane's minuteness looked out on all the Galaxy. It was a planet alone, but it did well.

The Autarch said, without turning from the window, "Start with the mail ship, Rizzett.

Where did it meet this cruiser in the first place?"

"Less than one hundred thousand miles off Lingane. The exact coordinates don't matter.

They've been watched ever since. The point is that, even then, the Tyrannian cruiser was in an orbit about the planet."

"As though it had no intention of landing, but, rather, was waiting for something?"

"Yes."

"No way of telling how long they'd been waiting?"

"Impossible, I'm afraid. They were sighted by no one else. We checked thoroughly."

"Very well," said the Autarch. "We'll abandon that for the moment. They stopped the mail ship, which is, of course, interference with the mails and a violation of our Articles of Association with Tyrann."

"I doubt that they were Tyranni. Their unsure actions are more those of outlaws, of prisoners in flight."

"You mean the men on the Tyrannian cruiser? It may be what they want us to believe, of course. ' At any rate, their only overt action was to ask that a message be delivered directly to me."

"Directly to the Autarch, that is right."

"Nothing else?"

"Nothing else."

"They at no time entered the mail ship?"

"All communications were by visiplate. The mail capsule was shot across two miles of empty space and caught by the ship's net."

"Was it vision communication or sound only?"

"Full vision. That's the point. The speaker was described by several as being a young man of 'aristocratic bearing,' whatever that means."

The Autarch's fist clenched slowly. "Really? And no photo-impression was taken of the face? That was a mistake."

"Unfortunately there was no reason for the mail captain to have anticipated the importance of doing so, if any importance exists! Does all this mean anything to you, sir?"

The Autarch did not answer the question. "And this is the message?"

"Exactly. A tremendous message of one word that we were supposed to bring directly to you; a thing we did not do, of course. It might have been a fission capsule, for instance. Men have been killed that way before."

"Yes, and Autarchs too," said the Autarch. "Just the word 'Gillbret.' One word, 'Gillbret.' "

The Autarch maintained his indifferent calm, but a certain lack of certainty was gathering, and he did not like to experience a lack of certainty. He liked nothing which made him aware of limitations. An Autarch should have no limitations, and on Lingane he had none that natural law did not impose.

There had not always been an Autarch. In its earlier days Lingane had been ruled by dynasties of merchant princes. The families who had first established the subplanetary service stations were the aristocrats of the state. They were not rich in land, hence could not compete in social position with the Ranchers and Grangers of the neighboring worlds. But they were rich in negotiable currency and so could buy and sell those same Ranchers and Grangers; and, by way of high finance, they sometimes did.

And Lingane suffered the usual fate of a planet ruled (or misruled) under such circumstances. The balance of power oscillated from one family to another. The various groups alternated in exile. Intrigues and palace revolutions were chronic, so that if the Directorship of Rhodia was the Sector's prime example of stability and orderly development, Lingane was the example of restlessness and disorder. "As fickle as Lingane," people said.

The outcome was inevitable, if one judges by hindsight. As the neighboring planet states consolidated into group states and became powerful, civil struggles on Lingane became increasingly expensive and dangerous to the planet. The general population was quite willing, finally, to barter anything for general calm. So they exchanged a plutocracy for an autocracy, and lost little liberty in the exchange. The power of several was concentrated in one, but that one, frequently enough, was deliberately friendly to the populace he sought to use as a make-weight against the never-reconciled merchants.

Under the Autarchy, Lingane increased its wealth and strength. Even the Tyranni, attacking thirty years earlier at the height of their power, had been fought to a standstill.

They had not been defeated, but they had been stopped. The shock, even of that, had been permanent. Not a planet had been conquered by the Tyranni since the year they had attacked Lingane.

Other planets of the Nebular Kingdoms were outright vassals of the Tyranni. Lingane, however, was an Associated State, theoretically the equal "ally" of Tyrann, with its rights guarded by the Articles of Association.

The Autarch was not fooled by the situation. The chauvinistic of the planet might allow themselves the luxury of considering themselves free, but the Autarch knew that the Tyrannian danger had been held at arm's length this past generation. Only that far. No farther.

And now it might be moving in quickly for the final, long-delayed bear hug. Certainly, he had given it the opportunity it was waiting for. The organization he had built up, ineffectual though it was, was sufficient grounds for punitive action of any type the Tyranni might care to undertake. Legally, Lingane would be in the wrong.

Was the cruiser the first reaching out for the final bear hug?

The Autarch said, "Has a guard been placed on that ship?"

"I said they were watched. Two of our freighters"--he smiled one-sidedly, "keep in massometer range."

"Well, what do you make of it?"

"I don't know. The only Gillbret I know whose name by itself would mean anything is Gillbret oth Hinriad of Rhodia. Have you had dealings with him?"

The Autarch said, "I saw him on my last visit to Rhodia."

"You told him nothing, of course."

"Of course."

Rizzett's eyes narrowed. "I thought there might have been a certain lack of caution on your part; that the Tyranni had been the recipients of an equal lack of caution on the part of this Gillbret--the Hinriads are notable weaklings these days--and that this now was a device to trap you into final self-betrayal."

"I doubt it. It comes at a queer time, this business. I have been away from Lingane for a year or more. I arrived last week and I shall leave in a matter of days again. A message such as this reaches me just when I am in a position to be reached."

"You don't think it is a coincidence?"

"I don't believe in coincidence. And there is one way in which all this would not be coincidence. I will therefore visit that ship. Alone."

"Impossible, sir." Rizzett was startled. He had a small, uneven scar just above his right temple and it suddenly showed red.

"You forbid me?" asked the Autarch dryly.

And he was Autarch, after all, since Rizzett's face fell, and he said, "As you please, sir."

Aboard the Remorseless, the wait was proving increasingly unpleasant. For two days they hadn't budged from their orbit.

Gillbret watched the controls with relentless concentration. His voice had an edge to it. "Wouldn't you say they were moving?"

Biron looked up briefly. He was shaving, and handling the Tyranni erosive spray with finicky care.

"No," he said, "they're not moving. Why should they? They're watching us, and they'll keep on watching us."

He concentrated upon the difficult area of the upper lip, and frowned impatiently as he felt the slightly sour taste of the spray upon his tongue. A Tyrannian could handle the spray with a grace that was almost poetic. It was undoubtedly the quickest and closest non-permanent shaving method in existence, in the hands of an expert. In essence, it was an extremely fine air-blown abrasive that scoured off the hairs without harming the skin.

Certainly the skin felt like nothing more than the gentle pressure of what might have been an air stream.

However, Biron felt queasy about it. There was the well-known legend, or story, or fact (whatever it was), about the incidence of face cancer being higher among the Tyranni than among other cultural groups, and some attributed this to the Tyranni shave spray. Biron wondered for the first time if it might not be better to have his face completely depilated.

It was done in some parts of the Galaxy, as a matter of course. He rejected the thought.

Depilation was permanent. The fashion might always shift to mustaches or cheek curls.

Biron was surveying his face in the mirror, wondering how he would look in sideburns down to the angle of the jaw, when Artemisia said from the doorway, "I thought you were going to sleep."

"I did," he said. "Then I woke up." He looked up at her and smiled.

She patted his cheek, then stroked it gently with her fingers. "It's smooth. You look about eighteen."

He carried her hand to his lips. "Don't let that fool you," he said., She said, "They're still watching?"

"Still watching. Isn't it annoying, these dull interludes that give you time to sit and worry?"

"I don't find this interlude dull."

"You're talking about other aspects of it now, Arta."

She said, "Why don't we cross them up and land on Lingane?"

"We've thought of it. I don't think we're ready for that kind of risk. We can afford to wait till the water supply gets a bit lower."

Gillbret said loudly, "I tell you they are moving."

Biron crossed over to the control panel and considered the massometer readings. He looked at Gillbret and said, "You may be right."

He pecked away at the calculator for a moment or two and stared at its dials.

"No, the two ships haven't moved relative to us, Gillbret. What's changed the massometer is that a third ship has joined them. As near as I can tell, it's five thousand miles off, about 46 degrees ? and 192 degrees f from the ship-planet line, if I've got the clockwise and counterclockwise conventions straight. If I haven't, the figures are, respectively, 314 and 168 degrees."

He paused to take another reading. "I think they're approaching. It's a small ship. Do you think you can get in touch with them, Gillbret?"

"I can try," said Gillbret.

"All right. No vision. Let's leave it at sound, till we get some notion of what's coming."

It was amazing to watch Gillbret at the controls of the etheric radio. He was obviously the possessor of a native talent. Contacting an isolated point in space with a tight radio beam remains, after all, a task in which the ship's control-panel information can participate only slightly. He had a notion of the distance of the ship which might be off by a hundred miles plus or minus. He had two angles, either or both of which might easily be wrong by five or six degrees in any direction.

This left a volume of about ten million cubic miles within which the ship might be.

The rest was left to the human operator, and a radio beam which was a probing finger not half a mile in cross section at the widest point of its receivable range. It was said that a skilled operator could tell by the feel of the controls how closely the beam missed the target. Scientifically, that theory was nonsense, of course, but it often seemed that no other explanation was possible.

In less than ten minutes the activity gauge of the radio was jumping and the Remorseless was both sending and receiving.

In another ten minutes Biron was able to lean back and say, "They're going to send a man aboard."

"Ought we to let them?" asked Artemisia.

"Why not? One man? We're armed."

"But if we let their ship get too close?"

"We're a Tyrannian cruiser, Arta. We've got three to five times their power, even if they were the best warship Lingane had. They're not allowed too much by their precious Articles of Association, and we've got five high-caliber blasters."

Artemisia said, "Do you know how to use the Tyrannian blasters? I didn't know you did."

Biron hated to turn the admiration off, but he said, "Unfortunately, I don't. At least, not yet. But then, the Linganian ship won't know that, you see."

Half an hour later the visiplat showed a visible ship. It was a stubby little craft, fitted with two sets of four fins, as though it were frequently called upon to double for stratospheric flight.

At its first appearance in the telescope, Gillbret shouted in delight. "That's the Autarch's yacht," he cried, and his face wrinkled into a grin. "It's his private yacht. I'm sure of it. I told you that the bare mention of my name was the surest way to get his attention."

There was the period of deceleration and adjustment of velocity on the part of the Linganian ship, until it hung motionless in the plate.

A thin voice came from the receiver. "Ready for boarding?"

"Ready!" clipped Biron. "One person only."

"One person," came the response.

It was like a snake uncoiling. The metal-mesh rope looped outward from the Linganian ship, shooting at them harpoon-fashion. It's thickness expanded in the visiplat, and the magnetized cylinder that ended it approached and grew in size. As it grew closer, it edged toward the rim of the cone of vision, then veered off completely.

The sound of its contact was hollow and reverberant. The magnetized weight was anchored, and the line was a spider thread that did not sag in a normal weighted curve but retained whatever kinks and loops it had possessed at the moment of contact, these moving slowly forward as units under the influence of inertia.

Easily and carefully, the Linganian ship edged away and the line straightened. It hung there then, taut and fine, thinning into space until it was an almost invisible thing, glancing with incredible daintiness in the light of Lingane's sun.

Biron threw in the telescopic attachment, which bloated the ship monstrously in the field of vision, so that one could see the origin of the half-mile length of connecting line and the little figure that was beginning to swing hand over hand along it.

It was not the usual form of boarding. Ordinarily, two ships would maneuver to near-contact, so that extensible air locks could meet and merge under intense magnetic fields.

A tunnel through space would connect the ships, and a man could travel from one to the other with no further protection than he needed to wear aboard ship. Naturally, this form of boarding required mutual trust.

By space line, one was dependent upon his space suit. The approaching Linganian was bloated in his, a fat thing of air-extended metal mesh, the joints of which required no small muscular effort to work. Even at the distance at which he was, Biron could see his arms flex with a snap as the joint gave and came to rest in a new groove.

And the mutual velocities of the two ships had to be carefully adjusted. An inadvertent acceleration on the part of either would tear the line loose and send the traveler tumbling through space under the easy grip of the faraway sun and of the initial impulse of the snapping line--with nothing, neither friction nor obstruction, to stop him this side of eternity.

The approaching Linganian moved on confidently and quickly. When he came closer it was easy to see that it was not a simple hand-over-hand procedure. Each time the forward hand flexed, pulling him on, he would let go and float onward some dozen feet before his other hand had reached forward for a new hold.

It was a brachiation through space. The spaceman was a gleaming metal gibbon. Artemisia said, "What if he misses?"

"He looks too expert to do that," said Biron, "but if he does, he'd still shine in the sun. We'd pick him up again."

The Linganian was close now. He had passed out of the field of the visiplat. In another five seconds there was the clatter of feet on the ship's hull.

Biron yanked the lever that lit the signals which outlined the ship's air lock. A moment later, in answer to an imperative series of raps, the outer door was opened.

There was a thump just beyond a blank section of the pilot-room's wall. The outer door closed, the section of wall slid away, and a man stepped through.

His suit frosted over instantly, blanking the thick glass of his helmet and turning him into a mound of white. Cold radiated from him. Biron elevated the heaters and the gush of air that entered was warm and dry. For a moment the frost on the suit held its own, then began to thin and dissolve into a dew.

The Linganian's blunt metal fingers were fumbling at the clasps of the helmet as though he were impatient with his snowy blindness. It lifted off as a unit, the thick, soft insulation inside rumpling his hair as it passed.

Gillbret said, "Your Excellency!" In glad triumph, he said, "Biron, it is the Autarch himself."

But Biron, in a voice that struggled vainly against stupefaction, could only say, "Jonti!"

13. THE AUTARCH REMAINS

The Autarch gently toed the suit to one side and appropriated the larger of the padded chairs.

He said, "I haven't had that sort of exercise in quite awhile. But they say it never leaves you once you've learned, and, apparently, it hasn't in my case. Hello, Farrill! My Lord Gillbret, good day. And this, if I remember, is the Director's daughter, the Lady Artemisia!"

He placed a long cigarette carefully between his lips and brought it to life with a single intake of breath. The scented tobacco filled the air with its pleasant odor. "I did not expect to see you quite so soon, Farrill," he said.

"Or at all, perhaps?" said Biron acidly.

"One never knows," agreed the Autarch. "Of course, with a message that read only 'Gillbret'; with the knowledge that Gillbret could not pilot a space ship; with the further knowledge that I had myself sent a young man to Rhodia who could pilot a space ship and who was quite capable of stealing a Tyrannian cruiser in his desperation to escape; and with the knowledge that one of the men on the cruiser was reported to be young and of aristocratic bearing, the conclusion was obvious. I am not surprised to see you."

"I think you are," said Biron. "I think you're as surprised as hell to see me. As an assassin, you should be. Do you think I am worse at deduction than you are?"

"I think only highly of you, Farrill."

The Autarch was completely unperturbed, and Biron felt awkward and stupid in his resentment. He turned furiously to the others. "This man is Sander Jonti--the Sander Jonti I've told you of. He may be the Autarch of Lingane besides, or fifty Autarchs. It makes no difference. To me he is Sander Jonti."

Artemisia said, "He is the man who--"

Gillbret put a thin and shaking hand to his brow. "Control yourself, Biron. Are you mad?"

"This is the man! I am not mad!" shouted Biron. He controlled himself with an effort.

"All right. There's no point yelling, I suppose. Get off my ship, Jonti. Now that's said quietly enough. Get off my ship."

"My dear Farrill. For what reason?"

Gillbret made incoherent sounds in his throat, but Biron pushed him aside roughly and faced the seated Autarch. "You made one mistake, Jonti. Just one. You couldn't tell in advance that when I got out of my dormitory room back on Earth I would leave my wrist watch inside.

You see, my wrist-watch strap happened to be a radiation indicator."

The Autarch blew a smoke ring and smiled pleasantly.

Biron said, "And that strap never turned blue, Jonti. There was no bomb in my room that night. There was only a deliberately planted dud! If you deny it, you are a liar, Jonti, or Autarch, or whatever you please to call yourself.

"What is more, you planted that dud. You knocked me out with Hypnite and arranged the rest of that night's comedy. It makes quite obvious sense, you know. If I had been left to myself, I would have slept through the night and would never have known that anything was out of the way. So who rang me on the visiphone until he was sure I had awakened? Awakened, that is, to discover the bomb, which had been deliberately placed near a counter so that I couldn't miss it. Who blasted my door in so that I might leave the room before I found out that the bomb was only a dud after all? You must have enjoyed yourself that night, Jonti."

Biron waited for effect, but the Autarch merely nodded in polite interest. Biron felt the fury mount. It was like punching pillows, whipping water, kicking air.

He said harshly, "My father was about to be executed. I would have learned of it soon enough. I would, have gone to Nephelos, or not gone. I would have followed my own good sense in the matter, confronted the Tyranni openly or not as I decided. I would have known my chances. I would have been prepared for eventualities.

"But you wanted me to go to Rhodia, to see Hinrik. But, ordinarily, you couldn't expect me to do what you wanted. I wasn't likely to go to you for advice. Unless, that is, you could stage an appropriate situation. You did!

"I thought I was being bombed and I could think of DO reason. You could. You seemed to have saved my life. You seemed to know everything; what I ought to do next, for instance. I was off balance, confused. I followed your advice."

Biron ran out of breath and waited for an answer. There was none. He shouted, "You did not explain that the ship on which I left Earth was a Rhodian ship and that you had seen to it that the captain had been informed of my true identity. You did not explain that you intended me to be in the hands of the Tyranni the instant I landed on Rhodia. Do you deny that?"

There was a long pause. Jonti stubbed out his cigarette.

Gillbret chafed one hand in the other. "Biron, you are being ridiculous. The Autarch wouldn't--"

Then Jonti looked up and said quietly, "But the Autarch would. I admit it all. You are quite right, Biron, and I congratulate you on your penetration. The bomb was a dud planted by myself, and I sent you to Rhodia with the intention of having you arrested by the Tyranni."

Biron's face cleared. Some of the futility of life vanished. He said, "Someday, Jonti, I will settle that matter. At the moment, it seems you are Autarch of Lingane with three ships waiting for you out there. That hampers me a bit more than I would like. However, the Remorseless is my ship. I am its pilot. Put on your suit and get out. The space line is still in place."

"It is not your ship. You are a pirate rather than a pilot."

"Possession is all the law here. You have five minutes to get into your suit."

"Please. Let's avoid dramatics. We need one another and I have no intention of leaving."

"I don't need you. I wouldn't need you if the Tyrannian home fleet were closing in right now and you could blast them out of space for me."

"Farrill," said Jonti, "you are talking and acting like an adolescent. I've let you have your say. May I have mine?"

"No. I see no reason to listen to you."

"Do you see one now?"

Artemisia screamed. Biron made one movement, then stopped. Red with frustration, he remained tense but helpless.

Jonti said, "I do take certain precautions. I am sorry to be so crude as to use a weapon as a threat. But I imagine it will help me force you to hear me."

The weapon he held was a pocket blaster. It was not designed to pain or stun. It killed!

He said, "For years I have been organizing Lingane against the Tyranni. Do you know what that means? It has not been easy. It has been almost impossible. The Inner Kingdoms will offer no help. We've known that from long experience. There is no salvation for the Nebular Kingdoms but what they work out for themselves. But to convince our native leaders of this is no friendly game. Your father was active in the matter and was killed. Not a friendly game at all. Remember that.

"And your father's capture was a crisis to us. It was life and horrible death to us.

He was in our inner circles and the Tyranni were obviously not far behind us. They had to be thrown off stride. To do so, I could scarcely temper my dealings with honor and integrity.

They fry no eggs.

"I couldn't come to you and say, 'Farrill, we've got to put the Tyranni on a false scent. You're the son of the Rancher and therefore suspicious. Get out there and be friendly with Hinrik of Rhodia so that the Tyranni may look in the wrong direction. Lead them away from Lingane. It may be dangerous; you may lose your life, but the ideals for which your father died come first."

"Maybe you would have done it, but I couldn't afford to experiment. I maneuvered you into doing it without your knowledge. It was hard, I'll grant you. Still, I had no choice. I thought you might not survive; I tell you that frankly. But you were expendable; and I tell you that frankly. As it turned out, you did survive, and I am pleased with that.

"And there was one more thing, a matter of a document--"

Biron said, "What document?"

"You jump quickly. I said your father was working for me. So I know what he knew. You were to obtain that document and you were a good choice, at first. You were on Earth legitimately. You were young and not likely to be suspected. I say, at first!

"But then, with your father arrested, you became dangerous. You would be an object of prime suspicion to the Tyranni; and we could not allow the document to fall into

your possession, since it would then almost inevitably fall into theirs. We had to get you off Earth before you could complete your mission. You see, it all hangs together."

"Then you have it now?" asked Biron.

The Autarch said, "No, I have not. A document which might have been, the right one has been missing from Earth for years. If it is the right one, I don't know who has it. May I put away the blaster now? It grows heavy."

Biron said, "Put it away."

The Autarch did so. He said, "What has your father told you about the document?"

"Nothing that you don't know, since he worked for you."

The Autarch smiled. "Quite so!" but the smile had little of real amusement in it.

"Are you quite through with your explanation now?"

"Quite through."

"Then," said Biron, "get off the ship."

Gillbret said, "Now wait, Biron. There's more than private pique to be considered here. There's Artemisia and myself, too, you know. We have something to say. As far as I'm concerned, what the Autarch says makes sense. I'll remind you that on Rhodia I saved your life, so I think my' views are to be considered."

"All right. You saved my life," shouted Biron. He pointed a finger towards the air lock. "Go with him, then. Go on. You get out of here too'. You wanted to find the Autarch.

There he is! I agreed to pilot you to him, and my responsibility is over. Don't try to tell me what to do."

He turned to Artemisia, some of his anger still brimming over. "And what about you?"

You saved my life too. Everyone went around saving my life. Do you want to go with him too?"

She said calmly, "Don't put words into my mouth, Biron. If I wanted to go with him, I'd say so."

"Don't feel any obligations. You can leave any time."

She looked hurt and he turned away. As usual, some cooler part of himself knew that he was acting childish. He had been made to look foolish by Jonti and he was helpless in the face of the resentment he felt. And besides, why should they all take so calmly the thesis that it was perfectly right to have Biron Farrill thrown to the Tyranni, like a bone to the dogs, in order to keep them off Jonti's neck. Damn it, what did they think he was?

He thought of the dud bomb, the Rhodian liner, the Tyranni, the wild night on Rhodia, and he could feel the stinging of self-pity inside himself.

The Autarch said, "Well, Farrill?"

And Gillbret said, "Well, Biron?"

Biron turned to Artemisia. "What do you think?"

Artemisia said calmly, "I think he has three ships out there still, and is Autarch of Lingane, besides. I don't think you really have a choice."

The Autarch looked at her, and he nodded his admiration. "You are an intelligent girl, my lady. It is good that such a mind should be in such a pleasant exterior." For a measurable moment his eyes lingered.

Biron said, "What's the deal?"

"Lend me the use of your names and your abilities, and I will take you to what my Lord Gillbret called the rebellion world."

Biron said sourly, "You think there is one?"

And Gillbret said simultaneously, "Then it is yours."

The Autarch smiled. "I think there is a world such as my lord described, but it is not mine."

"It's not yours," said Gillbret despondently. "Does that matter, if I can find it?"

"How?" demanded Biron.

The Autarch said, "It is not so difficult as you might think. If we accept the story as it has been told us, we must believe that there exists a world in rebellion against the Tyranni. We must believe that it is located somewhere in the Nebular Sector and that in twenty years it has remained undiscovered by the Tyranni. If such a situation is to remain possible, there is only one place in the Sector where such a planet can exist."

"And where is that?"

"You do not find the solution obvious? Doesn't it seem inevitable that the world could exist only within the Nebula itself?"

"Inside the Nebula!"

Gillbret said, "Great Galaxy, of course."

And, at the moment, the solution did indeed seem obvious and inescapable.

Artemisia said timidly, "Can people live on worlds inside the Nebula?"

"Why not?" said the Autarch. "Don't mistake the Nebula. It is a dark mist in space, but it is not a poison gas. It is an incredibly attenuated mass of sodium, potassium, and calcium atoms that absorb and obscure the light of the stars within it, and, of course, those on the side directly opposite the observer. Otherwise, it is harmless, and, in the direct neighborhood of a star, virtually undetectable.

"I apologize if I seem pedantic, but I have spent the last several months at the University of Earth collecting astronomical data on the Nebula."

"Why there?" said Biron. "It is a matter of little importance, but I met you there and I am curious."

"There's no mystery to it. I left Lingane originally on my own business. The exact nature is of no importance. About six months ago I visited Rhodia. My agent, Widemos-- your father, Biron--had been unsuccessful in his negotiations with the Director, whom we had hoped to swing to our side. I tried to improve matters and failed, since Hinrik, with apologies to the lady, is not the type of material for our sort of work."

"Hear, hear," muttered Biron.

The Autarch continued. "But I did meet Gillbret, as he may have told you. So I went to Earth, because Earth is the original home of humanity. It was from Earth that most

of the original explorations of the Galaxy set out. It is upon Earth that most of the records exist.

The Horsehead Nebula was explored quite thoroughly; at least, it was passed through a number of times. It was never settled, since the difficulties of traveling through a volume of space where stellar observations could not be made were too great. The explorations themselves, however, were all I needed.

"Now listen carefully. The Tyrannian ship upon which my Lord Gillbret was marooned was struck by a meteor after its first Jump. Assuming that the trip from Tyrann to Rhodia was along the usual trade route--and there is no reason to suppose anything else--the point in space at which the ship left its route is established. It would scarcely have traveled more than half a million miles in ordinary space between the first two Jumps. We can consider such a length as a point in space.

"It is possible to make another assumption. In damaging the control panels, it was quite possible that the meteor might have altered the direction of the Jumps, since that would require only an interference with the motion of the ship's gyroscope. This would be difficult but not impossible. To change the power of the hyperatomic thrusts, however, would require complete smashing of the engines, which, of course, were not touched by the meteor.

"With unchanged power of thrust, the length of the four remaining Jumps would not be changed, nor, for that matter, would their relative directions. It would be analogous to having a long, crooked wire bent at a single point in an unknown direction through an unknown angle. The final position of the ship would lie somewhere on the surface of an imaginary sphere, the center of which would be that point in space where the meteor struck, and the radius of which would be the vector sum of the remaining Jumps.

"I plotted such a sphere, and that surface intersects a thick extension of the Horsehead Nebula. Some six thousand square degrees of the sphere's surface, one fourth of the total surface, lies in the Nebula. It remains, therefore, only to find a star lying within the Nebula and within one million miles or so of the imaginary surface we are discussing. You will remember that when Gillbret's ship came to rest, it was within reach of a star.

"Now how many stars within the Nebula do you suppose we can find that close to the sphere's surface? Remember there are one hundred billion radiating stars in the Galaxy."

Biron found himself absorbed in the matter almost against his will. "Hundreds, I suppose."

"Five!" replied the Autarch. "Just five. Don't be fooled by the one hundred billion figure. The Galaxy is about seven trillion cubic light-years in volume, so that there are seventy cubic light-years per star on the average. It is a pity that I do not know which of those five have habitable planets. We might reduce the number of possibles to one.

Unfortunately, the early explorers had no time for detailed observations. They plotted the positions of the stars, the proper motions, and the spectral types."

"So that in one of those five stellar system," said Biron, "is located the rebellion world?"

"Only that conclusion would fit the facts we know."

"Assuming Oil's story can be accepted."

"I make that assumption."

"My story is true," interrupted Gillbret intensely. "I swear it."

"I am about to leave," said the Autarch, "to investigate each of the five worlds. My motives in doing so are obvious. As Autarch of Lingane I can take an equal part in their efforts."

"And with two Hinriads and a Widemos on your side, your bid for an equal part, and, presumably, a strong and secure position in the new, free worlds to come, would be so much the better," said Biron.

"Your cynicism doesn't frighten me, Farrill. The answer is obviously yes. If there is to be a successful rebellion, it would, again obviously, be desirable to have your fist on the winning side."

"Otherwise some successful privateer or rebel captain might be rewarded with the Autarchy of Lingane."

"Or the Ranchy of Widemos. Exactly."

"And if the rebellion is not successful?"

"There will be time to judge of that when we find what we look for."

Biron said slowly, "I'll go with you."

"Good! Then suppose we make arrangements for your transfer from this ship."

"Why that?"

"It would be better for you. This ship is a toy."

"It is a Tyrannian warship. We would be wrong in abandoning it."

"As a Tyrannian warship, it would be dangerously conspicuous."

"Not in the Nebula. I'm sorry, Jonti. I'm joining you out of expedience. I can be frank too. I want to find the rebellion world. But there's no friendship between us. I stay at my own controls."

"Biron," said Artemisia gently, "the ship is too small for the three of us."

"As it stands, yes, Arta. But it can be fitted with a trailer. Jonti knows that as well as I do. We'd have all the space we needed then, and still be masters at our own controls. And, for that matter, it would effectively disguise the nature of the ship."

The Autarch considered. "If there is to be neither friendship nor trust, Farrill, I must protect myself. You may have your own ship and a trailer to boot, outfitted as you may wish. But I must have some guarantee for your proper behavior. The Lady Artemisia, at least, must come with me."

"No!" said Biron.

The Autarch lifted his eyebrows. "No? Let the lady speak."

He turned toward Artemisia, and his nostrils flared slightly. "I dare say you would find the situation very comfortable, my lady."

"You, at least, would not find it comfortable, my lord. Be assured of that," she retorted. "I would spare you the discomfort and remain here."

"I think you might reconsider if--" began the Autarch, as two little wrinkles at the bridge of his nose marred the serenity of his expression.

"I think not," interrupted Biron. "The Lady Artemisia has made her choice."

"And you back her choice then, Farrill?" The Autarch was smiling again.

"Entirely! All three of us will remain on the Remorseless. There will be no compromise on that."

"You choose your company oddly."

"Do I?"

"I think so." The Autarch seemed idly absorbed in his fingernails. "You seem so annoyed with me because I deceived you and placed your life in danger. It is strange, then, is it not, that you should seem on such friendly terms with the daughter of a man such as Hinrik, who in deception is certainly my master."

"I know Hinrik. Your opinions of him change nothing."

"You know everything about Hinrik?"

"I know enough."

"Do you know that he killed your father?" The Autarch's finger stabbed toward Artemisia. "Do you know that the girl you are so deeply concerned to keep under your protection is the daughter of your father's murderer?"

14. THE AUTARCH LEAVES

The tableau remained unbroken for a moment. The Autarch had lit another cigarette. He was quite relaxed, his face untroubled. Gillbret had folded into the pilot's seat, his face screwed up as though he were going to burst into tears. The limp straps of the pilot's stress-absorbing outfit dangled about him and increased the lugubrious effect.

Biron, paper-white, fists clenched, faced the Autarch. Artemisia, her thin nostrils flaring, kept her eyes not on the Autarch, but on Biron only.

The radio signaled, the soft clickings crashing with the effect of cymbals in the small pilot room.

Gillbret jerked upright, then whirled on the seat.

The Autarch said lazily, "I'm afraid we've been more talkative than I'd anticipated. I told Rizzett to come get me if I had not returned in an hour."

The visual screen was alive now with Rizzett's grizzled head.

And then Gillbret said to the Autarch, "He would like to speak to you." He made room.

The Autarch rose from his chair and advanced so that his own head was within the zone of visual transmission.

He said, "I am perfectly safe, Rizzett."

The other's question was heard clearly: "Who are the crew members on the cruiser, sir?"

And suddenly Biron stood next to the Autarch. "I am Rancher of Widemos," he said proudly.

Rizzett smiled gladly and broadly. A hand appeared on the screen in sharp salute.

"Greetings, sir."

The Autarch interrupted. "I will be returning soon with a young lady. Prepare to maneuver for contact air locks." And he broke the visual connection between the two ships.

He turned to Biron, "I assured them it was you on board ship. There was some objection to my coming here alone otherwise. Your father was extremely popular with my men."

"Which is why you can use my name."

The Autarch shrugged.

Biron said, "It is all you can use. Your last statement to your officer was inaccurate."

"In what way?"

"Artemisia oth Hinriad stays with me."

"Still? After what I have told you?"

Biron said sharply, "You have told me nothing. You have made a bare statement, but I am not likely to take your unsupported word for anything. I tell you this without any attempt at tact. I hope you understand me."

"Is your knowledge of Hinrik such that my statement seems inherently implausible to you?"

Biron was staggered. Visibly and apparently, the remark had struck home. He made no answer.

Artemisia said, "I say it's not so. Do you have proof?"

"No direct proof, of course. I was not present at any conferences between your father and the Tyranni. But I can present certain known facts and allow you to make your own inferences. First, the old Rancher of Widemos visited Hinrik six months ago. I've said that already. I can add here that he was somewhat overenthusiastic in his efforts, or perhaps he overestimated Hinrik's discretion. At any rate, he talked more than he should have. My Lord Gillbret can verify that."

Gillbret nodded miserably. He turned to Artemisia, who had turned to him with moist and angry eyes. "I'm sorry, Arta, but it's true. I've told you this. It was from Widemos that I heard about the Autarch."

The Autarch said, "And it was fortunate for myself that my lord had developed such long mechanical ears with which to sate his lively curiosity concerning the Director's meetings of state. I was warned of the danger, quite unwittingly, by Gillbret when he first approached me. I left as soon as I could, but the damage, of course, had been done."

"Now, to our knowledge, it was Widemos's only slip, and Hinrik, certainly, has no enviable reputation as a man of any great independence and courage. Your father, Farrill, was arrested within half a year. If not through Hinrik, through this girl's father, then how?"

Biron said, "You did not warn him?"

"In our business we take our chances, Farrill, but he was warned. After that he made no contact, however indirect, with any of us, and destroyed whatever proof he had of connection with us. Some among us believed that he should leave the Sector, or, at the very least, go into hiding. He refused to do this."

"I think I can understand why. To alter his way of life would prove the truth of what the Tyranni must have learned, endanger the entire movement. He decided to risk his own life only. He remained in the open."

"For nearly half a year the Tyranni waited for a betraying gesture. They are patient, the Tyranni. None came, so that when they could wait no longer, they found nothing in their net but him."

"It's a lie," cried Artemisia. "It's all a lie. It's a smug, sanctimonious, lying story with no truth in it. If all you said were true, they would be watching you too. You would be in danger yourself. You wouldn't be sitting here, smiling and wasting time."

"My lady, I do not waste my time. I have already tried to do what I could toward discrediting your father as a source of information. I think I have succeeded somewhat. The Tyranni will wonder if they ought to listen further to a man whose daughter and cousin are obvious traitors. And then again, if they are still disposed to believe him, why, I am on the point of vanishing into the Nebula where they will not find me. I should think my actions tend to prove my story rather than otherwise."

Biron drew a deep breath and said, "Let us consider the interview at an end, Jonti. We have agreed to the extent that we will accompany you and that you will grant us needed supplies. That is enough. Granting that all you have just said is truth, it is still beside the point. The crimes of the Director of Rhodia are not inherited by his daughter. Artemisia oth Hinriad stays here with me, provided she herself agrees."

"I do," said Artemisia.

"Good. I think that covers everything. I warn you, by the way. You are armed; so am I.

Your ships are fighters, perhaps; mine is a Tyrannian cruiser."

"Don't be silly, Farrill. My intentions are quite friendly. You wish to keep the girl here? So be it. May I leave by contact air lock?"

Biron nodded. "We will trust you so far."

The two ships maneuvered ever closer, until the flexible airlock extensions pouted outward toward one another. Carefully, they edged about, trying for the perfect fit. Gillbret hung upon the radio.

"They'll be trying for contact again in two minutes," he said.

Three times already the magnetic field had been triggered, and each time the extending tubes had stretched toward one another and met off-center, gaping crescents of space between them.

"Two minutes," repeated Biron, and waited tensely.

The second hand moved and the magnetic field clicked into existence a fourth time, the lights dimming as the motors adjusted to the sudden drain of power. Again the airlock extensions reached out, hovered on the brink of instability, and then, with a noiseless jar, the vibration of which hummed its way into the pilot room, settled into place properly, clamps automatically locking in position. An air-tight seal had been formed.

Biron drew the back of his hand slowly across his forehead and some of the tension oozed out of him.

"There it is," he said.

The Autarch lifted his space suit. There was still a thin film of moisture under it.

"Thanks," he said pleasantly. "An officer of mine will be right back. You will arrange the details of the supplies necessary with him."

The Autarch left.

Biron said, "Take care of Jonti's officer for me for a while, will you, Oil. When he comes in, break the air-lock contact. All you'll have to do is remove the magnetic field. This is the photonic switch you'll flash."

He turned and stepped out of the pilot room. Right now he needed time for himself.

Time to think, mostly.

But there was the hurried footstep behind him, and the soft voice. He stopped.

"Biron," said Artemisia, "I want to speak to you." He faced her. "Later, if you don't mind, Arta."

She was looking up at him intently. "No, now."

Her arms were poised as though she would have liked to embrace him but was not sure of her reception. She said, "You didn't believe what he said about my father?"

"It has no bearing," said Biron. "Biron," she began, and stopped. It was hard for her to say it. She tried again, "Biron, I know that part of what has been going on between us has been because we've been alone and together and in danger, but--" She stopped again.

Biron said, "If you're trying to say you're a Hinriad, Arta, there's no need. I know it. I won't hold you to anything afterward."

"No. Oh no." She caught his arm and placed her cheek against his hard shoulder. She was speaking rapidly. "That's not it at all. It doesn't matter about Hinriad and Widemos at all. I--I love you, Biron."

Her eyes went up, meeting his. "I think you love me too. I think you would admit it if you could forget that I am a Hinriad. Maybe you will now that I've said it first. You told the Autarch you would not hold my father's deeds against me. Don't hold his rank against me, either."

Her arms were around his neck now. Biron could feel the softness of her breasts against him and the warmth of her breath on his lips. Slowly his own hands went upward and gently grasped her forearms. As gently, he disengaged her arms and, still as gently, stepped back from her.

He said, "I am not quits with the Hinriads, my lady."

She was startled. "You told the Autarch that--"

He looked away. "Sorry, Arta. Don't go by what I told the Autarch."

She wanted to cry out that it wasn't true, that her father had not done this thing, that in any case--

But he turned into the cabin and left her standing in the corridor, her eyes filling with hurt and shame.

15. THE HOLE IN SPACE

Tedor Rizzett turned as Biron entered the pilot room again. His hair was gray, but his body was still vigorous and his face was broad, red, and smiling.

He covered the distance between himself and Biron in a stride and seized the young man's hand heartily.

"By the stars," he said, "I'd need no word from you to tell me that you are your father's son. It is the old Rancher alive again."

"I wish it were," said Biron, somberly.

Rizzett's smile faltered. "So do we all. Every one of us. I'm Tedor Rizzett, by the way. I'm a colonel in the regular Linganian forces, but we don't use titles in our own little game. We even say 'sir' to the Autarch. That reminds me!" He looked grave. "We don't have lords and ladies or even Ranchers on Lingane. I hope I won't offend if I forget to throw in the proper title sometimes."

Biron shrugged. "As you said, no titles in our little game. But what about the trailer? I'm to make arrangements with you, I take it."

For a flickering moment he looked across the room. Gillbret was seated, quietly listening. Artemisia had her back to him. Her slim, pale fingers wove an abstracted pattern on the photocontacts of the computer. Rizzett's voice brought him back.

The Linganian had cast an all-inclusive glance about the room. "First time I've ever seen a Tyrannian vessel from the inside. Don't care much for it. Now you've got the emergency air lock due stern, haven't you? It seems to me the power thrusters girdle the midsection."

"That's right."

"Good. Then there won't be any trouble. Some of the old model ships had power thrusters due stern, so that trailers had to be set off at an angle. This makes the gravity adjustment difficult and the maneuverability in atmospheres just about nil."

"How long will it take, Rizzett?"

"Not long. How big would you want it?"

"How big could you get it?"

"Super deluxe? Sure. If the Autarch says so, there's no higher priority. We can get one that's practically a space ship in itself. It would even have auxiliary motors."

"It would have living quarters, I suppose."

"For Miss Hinriad? It would be considerably better than you have here--" He stopped abruptly.

At the mention of her name, Artemisia had drifted past coldly and slowly, moving out of the pilot room. Biron's eyes followed her.

Rizzett said, "I shouldn't have said Miss Hinriad, I suppose."

"No, no. It's nothing. Pay no attention. You were saying?"

"Oh, about the rooms. At least two sizable ones, with a communicating shower. It's got the usual closet room and plumbing arrangements of the big liners. She would be comfortable."

"Good. We'll need food and water."

"Sure. Water tank will hold a two months' supply; a little less if you want to arrange for a swimming pool aboard ship. And you would have frozen whole meats. You're eating Tyrannian concentrate now, aren't you?"

Biron nodded and Rizzett grimaced.

"It tastes like chopped sawdust, doesn't it? What else?"

"A supply of clothes for the lady," said Biron.

Rizzett wrinkled his forehead. "Yes, of course. Well, that will be her job."

"No, sir, it won't. We'll supply you with all the necessary measurements and you can supply us with whatever we ask for in whatever the current styles happen to be."

Rizzett laughed shortly and shook his head. "Rancher, she won't like that. She wouldn't be satisfied with any clothes she didn't pick. Not even if they were the identical items she would have picked if she had been given the chance. This isn't a guess, now. I've had experience with the creatures."

Biron said, "I'm sure you're right, Rizzett. But that's the way it will have to be."

"All right, but I've warned you. It will be your argument. What else?"

"Little things. Little things. A supply of detergents. Oh yes, cosmetics, perfume--the things women need. We'll make the arrangements in time. Let's get the trailer started."

And now Gillbret was leaving without speaking. Biron's eyes followed him, too, and he felt his jaw muscles tighten. Hinriads! They were Hinriads! There was nothing he could do about it. They were Hinriads! Gillbret was one and she was another.

He said, "And, of course, there'll be clothes for Mr. Hinriad and myself. That won't be very important."

"Right. Mind if I use your radio? I'd better stay on this ship till the adjustments are made."

Biron waited while the initial orders went out. Then Rizzett turned on the seat and said, "I can't get used to seeing you here, moving, talking, alive. You're so like him. The Rancher used to speak about you every once in a while. You went to school on Earth, didn't you?"

"I did. I would have graduated a little over a week ago, if things hadn't been interrupted."

Rizzett looked uncomfortable. "Look, about your being sent to Rhodia the way you were.

You mustn't hold it against us. We didn't like it. I mean, this is strictly between us, but some of the boys didn't like it at all. The Autarch didn't consult us, of course. Naturally, he wouldn't. Frankly, it was a risk on his part. Some of us--I'm not mentioning names--even wondered if we shouldn't stop the liner you were on and pull you off. Naturally that would have been the worst thing we could possibly have done. Still, we

might have done it, except that in the last analysis, we knew that the Autarch must have known what he was doing."

"It's nice to be able to inspire that kind of confidence."

"We know him. There's no denying it. He's got it here." A finger slowly tapped his forehead. "Nobody knows exactly what makes him take a certain course sometimes. But it always seems the right one. At least he's outsmarted the Tyranni so far and others don't."

"Like my father, for instance."

"I wasn't thinking of him, exactly, but in a sense, you're right. Even the Rancher was caught. But then he was a different kind of man. His way of thinking was straight. He would never allow for crookedness. He would always underestimate the worthlessness of the next man.

But then again, that was what we liked best, somehow. He was the same to everyone, you know.

"I'm a commoner for all I'm a colonel. My father was a metalworker, you see. It didn't make any difference to him. And it wasn't that I was a colonel, either. If he met the engineer's 'prentice walking down the corridor, he'd step aside and say a pleasant word or two, and for the rest of the day, the 'prentice would feel like a master engineman. It was the way he had.

"Not that he was soft. If you needed disciplining, you got it, but no more than your share. What you got, you deserved, and you knew it. When he was through, he was through. He didn't keep throwing it at you at odd moments for a week or so. That was the Rancher.

"Now the Autarch, he's different. He's just brains. You can't get next to him, no matter who you are. For instance. He doesn't really have a sense of humor. I can't speak to him the way I'm speaking to you right now. Right now, I'm just talking. I'm relaxed. It's almost free association. With him, you say exactly what's on your mind with no spare words.

And you use formal phraseology, or he'll tell you you're slovenly. But then, the Autarch's the Autarch, and that's that."

Biron said, "I'll have to agree with you as far as the Autarch's brains are concerned.

Did you know that he had deduced my presence aboard this ship before he ever got on?"

"He did? We didn't know that. Now, there, that's what I mean. He was going to go aboard the Tyrannian cruiser alone. To us, it seemed suicide. We didn't like it. But we assumed he knew what he was doing, and he did. He could have told us you were probably aboard ship. He must have known it would be great news that the Rancher's son had escaped. But it's typical. He wouldn't."

Artemisia sat on one of the lower bunks in the cabin. She had to bend into an uncomfortable position to avoid having the frame of the second bunk pry into her first thoracic vertebra, but that was a small item to her at the moment.

Almost automatically, she kept passing the palms of her hands down the side of her dress. She felt frayed and dirty, and very tired.

She was tired of dabbing at her hands and face with damp napkins. She was tired of wearing the same clothes for a week. She was tired of hair which seemed dank and stringy by now.

And then she was almost on her feet again, ready to turn about sharply; she wasn't going to see him; she wouldn't look at him.

But it was only Gillbret. She sank down again. "Hello, Uncle Oil."

Gillbret sat down opposite her. For a moment his thin face seemed anxious and then it started wrinkling into a smile. "I think a week of this ship is very unamusing too. I was hoping you could cheer me up."

But she said, "Now, Uncle Oil, don't start using psychology on me. If you think you're going to cajole me into feeling a responsibility for you, you're wrong. I'm much more likely to hit you."

"If it will make you feel better--"

"I warn you again. If you hold out your arm for me to hit, I'll do it, and if you say 'Does that make you feel better?' I'll do it again."

"In any case, it's obvious you've quarreled with Biron. What about?"

"I don't see why there's any necessity for discussion. Just leave me alone." Then, after a pause, "He thinks Father did what the Autarch said he did. I hate him for that."

"Your father?"

"No! That stupid, childish, sanctimonious fool!"

"Presumably Biron. Good. You hate him. You couldn't put a knife edge between the kind of hate that has you sitting here like this and something that would seem to my own bachelor mind to be a rather ridiculous excess of love."

"Uncle oil," she said, "could he really have done it?"

"Biron? Done what?"

"No! Father. Could Father have done it? Could he have informed against the Rancher?"

Gillbret looked thoughtful and very sober. "I don't know." He looked at her out of the corner of his eyes. "You know, he did give Biron up to the Tyranni."

"Because he knew it was a trap," she said vehemently. "And it was. That horrible Autarch meant it as such. He said so. The Tyranni knew who Biron was and sent him to Father on purpose. Father did the only thing he could do. That should be obvious to anybody."

"Even if we accept that"--and again that sideways look --"he did try to argue you into a rather unamusing kind of marriage. If Hinrik could bring himself to do that--"

She interrupted. "He had no way out there, either."

"My dear, if you're going to excuse every act of subservience to the Tyranni as something he had to do, why, then, how do you know he didn't have to hint something about the Rancher to the Tyranni?"

"Because I'm sure he wouldn't. You don't know Father the way I do. He hates the Tyranni. He does. I know it. He wouldn't go out of his way to help them. I admit that he's

afraid of them and doesn't dare oppose them openly, but if he could avoid it somehow, he would never help them.", "How do you know he could avoid it?"

But she shook her head violently, so that her hair tumbled about and hid her eyes. It hid the tears a bit too.

Gillbret watched a moment, then spread his hands helplessly and left.

The trailer was joined to the Remorseless by a waspwaist corridor attached to the emergency air lock in the rear of the ship. It was several dozen times larger than the Tyranni vessel in capacity, almost humorously outsized.

The Autarch joined Biron in a last inspection. He said, "Do you find anything lacking?"

Biron said, "No. I think we'll be quite comfortable."

"Good. And by the way, Rizzett tells me the Lady Artemisia is not well, or at least that she looks unwell. If she requires medical attention, it might be wise to send her to my ship."

"She is quite well," said Biron curtly.

"If you say so. Would you be ready to leave in twelve hours?"

"In two hours, if you wish."

Biron passed through the connecting corridor (he had to stoop a little) into the Remorseless proper.

He said with a careful evenness of tone, "You've got a private suite back there, Artemisia. I won't bother you. I'll stay here most of the time."

And she replied coldly, "You don't bother me, Rancher. It doesn't matter to me where you are."

And then the ships blasted off, and after a single Jump they found themselves at the edge of the Nebula. They waited for a few hours while the final calculations were made on Jonti's ship. Inside the Nebula it would be almost blind navigation.

Biron stared glumly at the visiplatte. There was nothing there! One entire half of the celestial sphere was taken up with blackness, unrelieved by a spark of light. For the first time, Biron realized how warm and friendly the stars were, how they filled space.

"It's like dropping through a hole in space," he muttered to Gillbret.

And then they Jumped again, into the Nebula.

Almost simultaneously Simok Aratap, Commissioner of the Great Khan, at the head of ten armed cruisers, listened to his navigator and said, "That doesn't matter. Follow them anyway."

And not one light-year from the point at which the Remorseless entered the Nebula, ten Tyranni vessels did likewise.

16. HOUNDS!

Simok Aratap was a little uncomfortable in his uniform. Tyrannian uniforms were made of moderately coarse materials and fit only indifferently well. It was not soldier-like to complain of such inconveniences. In fact, it was part of the Tyrannian military tradition that a little discomfort on the part of the soldier was good for discipline.

But still Aratap could bring himself to rebel against that tradition to the extent of saying, ruefully, "The tight collar irritates my neck."

Major Andros, whose collar was as tight, and who had been seen in no other than military dress in the memory of man, said, "When alone, it would be quite within regulations to open it. Before any of the officers or men, any deviation from regulation dress would be disturbing influence."

Aratap sniffed. It was the second change induced by the quasi-military nature of the expedition. In addition to being forced into uniform, he had to listen to an increasingly self-assertive military aide. That had begun even before they left Rhodia.

Andros had put it to him baldly.

He had said, "Commissioner, we will need ten ships."

Aratap had looked up, definitely annoyed. At the moment he was getting ready to follow the young Widemos in a single vessel. He laid aside the capsules in which he was preparing his report for the Khan's Colonial Bureau, to be forwarded in the unhappy case that he did not return from the expedition.

"Ten ships, Major?"

"Yes, sir. Less will not do."

"Why not?"

"I intend to maintain a reasonable security. The young man is going somewhere. You say there is a well-developed conspiracy in existence. Presumably, the two fit together."

"And therefore?"

"And therefore we must be prepared for a possibly well-developed conspiracy. One that might be able to handle a single ship."

"Or ten. Or a hundred. Where does security cease?"

"One must make a decision. In cases of military action, it is my responsibility. I suggest ten."

Aratap's contact lenses gleamed unnaturally in the wall light as he raised his eyebrows. The military carried weight. Theoretically, in times of peace, the civilian made the decisions, but here again, military tradition was a difficult thing to set aside.

He said cautiously, "I will consider the matter."

"Thank you. If you do not choose to accept my recommendations, and my suggestions have only been advanced as such, I assure you"--the major's heels clicked

sharply, but the ceremonial deference was rather empty, and Aratap knew it--"that would be your privilege. You would leave me, however, no choice but to resign my commission."

It was up to Aratap to retrieve what he could from that position. He said, "It is not my intention to hamper you in any decision you may make on a purely military question, Major."

I wonder if you might be as amenable to my decisions in matters of purely political importance."

"What matters are these?"

"There is the problem of Hinrik. You objected yesterday to my suggestion that he accompany us."

The major said dryly, "I consider it unnecessary. With our forces in action, the presence of outlanders would be bad for morale."

Aratap sighed softly, just below the limits of hearing. Yet Andros was a competent man in his way. There would be no use in displaying impatience.

He said, "Again, I agree with you. I merely ask you to consider the political aspects of the situation. As you know, the execution of the old Rancher of Widemos was politically uncomfortable. It stirred up the Kingdoms unnecessarily. However necessary the execution was, it makes it desirable to refrain from having the death of the son attributed to us. As far as the people of Rhodia know, the young Widemos has kidnapped the daughter of the Director, the girl, by the way, being a popular and much publicized member of the Hinriads. It would be quite fitting, quite understandable, to have the Director head the punitive expedition.

"It would be a dramatic move, very gratifying to Rhodian patriotism. Naturally, he would ask for Tyrannian assistance, and receive it, but that can be played down. It would be easy, and necessary, to fix this expedition in the popular mind as a Rhodian one. If the inner workings of the conspiracy are uncovered, it will have been a Rhodian discovery. If the young Widemos is executed, it would be a Rhodian execution, as far as the other Kingdoms are concerned."

The major said, "It would still be a bad precedent to allow Rhodian vessels to accompany a Tyrannian military expedition. They would hamper us in a fight. In that way, the question becomes a military one."

"I did not say, my dear Major, that Hinrik would command a ship. Surely you know him better than to think him capable of commanding or even anxious to try. He will stay with us.

There will be no other Rhodian aboard ship."

"In that case, I waive my objection, Commissioner," said the major.

The Tyrannian fleet had maintained their position two light-years off Lingane for the better part of a week and the situation was becoming increasingly unstable.

Major Andros advocated an immediate landing on Lingane. "The Autarch of Lingane," he said, "has gone to considerable lengths to have us think him a friend of the

Khan, but I do not trust these men who travel abroad. They gain unsettling notions. It is strange that just as he returns, the young Widemos travels to meet him."

"He has not tried to hide either his travels or his return, Major. And we do not know that Widemos goes to meet him. He maintains an orbit about Lingane. Why does he not land?"

"Why does he maintain an orbit? Let us question what he does and not what he does not do."

"I can propose something which will fit the pattern."

"I would be glad to hear it."

Aratap placed a finger inside his collar and tried futilely to stretch it. He said, "Since the young man is waiting, we can presume he is waiting for something or somebody. It would be ridiculous to think that, having gone to Lingane by so direct and rapid a route--a single Jump, in fact that he is merely waiting out of indecision. I say, then, that he is waiting for a friend or friends to reach him. Thus reinforced, he will proceed elsewhere. The fact that he is not landing on Lingane directly would indicate that he does not consider such an action safe. That would indicate that Lingane in general--the Autarch in particular--is not concerned in the conspiracy, although individual Linganians may be."

"I don't know if we can always trust the obvious solution to be the correct one."

"My dear Major, this is not merely an obvious solution. It is a logical one. It fits a pattern,"

"Maybe it does. But just the same, if there are no further developments in twenty-four hours, I will have no choice but to order an advance Linganeward."

Aratap frowned at the door through which the major had left. It was disturbing to have to control at once the restless conquered and the short-sighted conquerors. Twenty-four hours.

Something might happen; otherwise he might have to find some way of stopping Andros.

The door signal sounded and Aratap looked up with irritation. Surely it could not be Andros returning. It wasn't. The tall, stooped form of Hinrik of Rhodia was in the doorway, behind him a glimpse of the guard who accompanied him everywhere on the ship. Theoretically, Hinrik had complete freedom of movement. Probably he himself thought he had. At least, he never paid any attention to the guard at his elbow.

Hinrik smiled mistily. "Am I disturbing you, Commissioner?"

"Not at all. Take a seat, Director." Aratap remained standing. Hinrik seemed not to notice that.

Hinrik said, "I have something of importance to discuss with you." He paused, and some of the intentness passed out of his eyes. He added in quite a different tone, "What a large, fine ship this is!"

"Thank you, Director." Aratap smiled tightly. The nine accompanying ships were typically minute in size, but the flagship on which they stood was an outsized model adapted from the designs of the defunct Rhodian navy. It was perhaps the first sign of the gradual softening of the Tyrannian military spirit that more and more of such ships were

being added to the navy. The fighting unit was still the tiny two-to-three-man cruiser, but increasing the top brass found reasons for requiring large ships for their own headquarters.

It did not bother Aratap. To some of the older soldiers such increasing softness seemed a degeneration; to himself it seemed increasing civilization. In the end--in centuries, perhaps--it might even happen that the Tyranni would melt away as a single people, fusing with the present conquered societies of the Nebular Kingdoms--and perhaps even that might be a good thing.

Naturally, he never expressed such an opinion aloud.

"I came to tell you something," said Hinrik. He puzzled over it awhile, then added, "I have sent a message home today to my people. I have told them I am well and that the criminal will be shortly seized and my daughter returned to safety."

"Good," said Aratap. It was not news to him. He himself had written the message, though it was not impossible that Hinrik by now had persuaded himself that he was the writer, or even that he actually headed the expedition. Aratap felt a twinge of pity. The man was disintegrating visibly.

Hinrik said, "My people, I believe, are quite disturbed over this daring raid upon the Palace by these well-organized bandits. I think they will be proud of their Director now that I have taken such rapid action in response, eh, Commissioner? They will see that there is still force among the Hinriads." He seemed filled with a feeble triumph.

"I think they will," said Aratap.

"Are we within range of the enemy yet?"

"No, Director, the enemy remains where he was, just off Lingane."

"Still? I remember what I came to tell you." He grew excited, so that the words tumbled out. "It is very important, Commissioner. I have something to tell you. There is treachery on board. I have discovered it. We must take quick action. Treachery--" He was whispering.

Aratap felt impatient. It was necessary to humor the poor idiot of course, but this was becoming a waste of time. At this rate he would become so obviously mad that he would be useless even as a puppet, which would be a pity.

He said, "No treachery, Director. Our men are stanch and true. Someone has been misleading you. You are tired."

"No, no." Hinrik put aside Aratap's arm which, for a moment, had rested upon his shoulder. "Where are we?"

"Why, here!"

"The ship, I mean. I have watched the visiplat. We are near no star. We are in deep space. Did you know that?"

"Why, certainly."

"Lingane is nowhere near. Did you know that?"

"It is two light-years off."

"Ah! Ah! Ah! Commissioner, no one is listening? Are you sure?" He leaned closely, while Aratap allowed his ear to be approached. "Then how do we know the enemy is near Lingane?"

He is too far to detect. We are being misinformed, and this signifies treachery."

Well, the man might be mad, but the point was a good one. Aratap said, "This is something fit for technical men, Director, and not for men of rank to concern themselves with.

I scarcely know myself."

"But as head of the expedition I should know. I am head, am I not?" He looked about carefully. "Actually, I have a feeling that Major Andros does not always carry out my orders.

Is he trustworthy? Of course, I rarely give him orders. It would seem strange to order a Tyrannian officer. But then, I must find my daughter. My daughter's name is Artemisia. She has been taken from me, and I am taking all this fleet to get her back. So you see, I must know. I mean, I must know how it is known the enemy is at Lingane. My daughter would be there too. Do you know my daughter? Her name is Artemisia."

His eyes looked up at the Tyranni Commissioner in appeal. Then he covered them with his hand and mumbled something that sounded like "I'm sorry."

Aratap felt his jaw muscles clench. It was difficult to remember that the man before him was a bereaved father and that even the idiot Director of Rhodia might have a father's feelings. He could not let the man suffer.

He said gently, "I will try to explain. You know there is such a thing as a massometer which will detect ships in space."

"Yes, yes."

"It is sensitive to gravitational effects. You know what I mean?"

"Oh yes. Everything has gravity." Hinrik was leaning toward Aratap, his hands gripping one another nervously.

"That's good enough. Now naturally the massometer can only be used when the ship is close, you know. Less than a million miles away or so. Also, it has to be a reasonable distance from any planet, because if it isn't, all you can detect is the planet, which is much bigger."

"And has much more gravity."

"Exactly," said Aratap, and Hinrik looked pleased.

Aratap went on. "We Tyranni have another device. It is a transmitter which radiates through hyperspace in all directions, and what it radiates is a particular type of distortion of the space fabric which is not electromagnetic in character. In other words, it isn't like light or radio or even sub-etheric radio. See?"

Hinrik didn't answer. He looked confused.

Aratap proceeded quickly. "Well, it's different. It doesn't matter how. We can detect that something which is radiated, so that we can always know where any Tyrannian ship is, even if it's halfway across the Galaxy, or on the other side of a star."

Hinrik nodded solemnly.

"Now," said Aratap, "if the young Widemos had escaped in an ordinary ship, it would have been very difficult to locate him. As it is, since he took a Tyrannian cruiser, we know where he is at all times, although he doesn't realize that. That is how we know he is near Lingane, you see. And, what's more, he can't get away, so that we will certainly rescue your daughter."

Hinrik smiled. "That is well done. I congratulate you, Commissioner. A very clever ruse."

Aratap did not delude himself. Hinrik understood very little of what he had said, but that did not matter. It had ended with the assurance of his daughter's rescue, and somewhere in his dim understanding there must be the realization that this, somehow, was made possible by Tyrannian science.

He told himself that he had not gone to this trouble entirely because the Rhodian appealed to his sense of the pathetic. He had to keep the man from breaking down altogether for obvious political reasons. Perhaps the return of his daughter would improve matters. He hoped so.

There was the door signal again and this time it was Major Andros who entered.

Hinrik's arm stiffened on the armrest of his chair and his face assumed a hunted expression.

He lifted himself and began, "Major Andro--"

But Andros was already speaking quickly, disregarding the Rhodian.

"Commissioner," he said, "the Remorseless has changed position."

"Surely he has not landed on Lingane," said Aratap sharply.

"No," said the major. "He has Jumped quite away from Lingane."

"Ah. Good. He has been joined by another ship, perhaps."

"By many ships, perhaps. We can detect only his, as you are quite aware."

"In any case, we follow again."

"The order has already been given. I would merely like to point out that his Jump has taken him to the edge of the Horsehead Nebula."

"What?"

"No major planetary system exists in the indicated direction. There is only one logical conclusion."

Aratap moistened his lips and left hurriedly for the pilot room, the major with him.

Hinrik remained standing in the middle of the suddenly empty room, looking at the door for a minute or so. Then, with a little shrug of the shoulders, he sat down again. His expression was blank, and for a long while he simply sat.

The navigator said, "The space coordinates of the Remorseless have been checked, sir.

They are definitely inside the Nebula."

"That doesn't matter," said Aratap. "Follow them anyway."

He turned to Major Andros. "So you see the virtues of waiting. There is a good deal that is obvious now. Wherever else could the conspirators' headquarters be but in the Nebula itself? Where else could we have failed to locate them? A very pretty pattern."

And so the squadron entered the Nebula.

For the twentieth time Aratap glanced automatically at the visiplat. Actually, the glances were useless, since the visiplat remained quite black. There was no star in sight.

Andros said, "That's their third stop without landing. I don't understand it. What is their purpose? What are they after? Each stop of theirs is several days long. Yet they do not land."

"It may take them that long," said Aratap, "to calculate their next Jump. Visibility is nonexistent."

"You think so?"

"No. Their Jumps are too good. Each time they land very near a star. They couldn't do as well by massometer data alone, unless they actually knew the locations of the stars in advance."

"Then why don't they land?"

"I think," said Aratap, "they must be looking for habitable planets. Maybe they themselves do not know the location of the center of conspiracy. Or, at least, not entirely."

He smiled. "We need only follow."

The navigator clicked heels. "Sir!"

"Yes?" Aratap looked up.

"The enemy has landed on a planet."

Aratap signaled for Major Andros.

"Andros," said Aratap, as the major entered, "have you been told?"

"Yes. I've ordered a descent and pursuit."

"Wait. You may be again premature, as when you wanted to lunge toward Lingane. I think this ship only ought to go."

"Your reasoning?"

"If we need reinforcements, you will be there, in command of the cruisers. If it is indeed a powerful rebel center, they may think only one ship has stumbled upon them. I will get word to you somehow and you can retire to Tyrann."

"Retire!"

"And return with a full fleet."

Andros considered. "Very well. This is our least useful ship in any case. Too large."

The planet filled the visiplat as they spiraled down.

"The surface seems quite barren, sir," said the navigator.

"Have you determined the exact location of the Remorseless?"

"Yes, sir."

"Then land as closely as you can without being sighted."

They were entering the atmosphere now. The sky as they flashed along the day half of the planet was tinged with a brightening purple. Aratap watched the nearing surface. The long chase was almost over!

17. AND HARES!

To those who have not actually been in space, the investigation of a stellar system and the search for habitable planets may seem rather exciting, at the least, interesting. To the spaceman, it is the most boring of jobs.

Locating a star, which is a huge glowing mass of hydrogen fusing into helium, is almost too easy. It advertises itself. Even in the blackness of the Nebula, it is only a question of distance. Approach within five billion miles, and it will still advertise itself.

But a planet, a relatively small mass of rock, shining only by reflected light, is another matter. One could pass through a stellar system a hundred thousand times at all sorts of odd angles without ever coming close enough to a planet to see it for what it is, barring the oddest of coincidences.

Rather, one adopts a system. A position is taken up in space at a distance from the star being investigated of some ten thousand times the star's diameter. From Galactic statistics it is known that not one time in fifty thousand is a planet located farther from its primary than that. Furthermore, practically never is a habitable planet located farther from its primary than one thousand times its sun's diameter.

This means that from the position in space assumed by the ship, any habitable planet must be located within six degrees of the star. This represents an area only 1/3600th of the entire sky. That area can be handled in detail with relatively few observations.

The movement of the tele-camera can be so adjusted as to counteract the motion of the ship in its orbit. Under those conditions a time exposure will pinpoint the constellations in the star's neighborhood; provided, of course, that the blaze of the sun itself is blocked out, which is easily done. Planets, however, will have perceptible proper motions and therefore show up as tiny streaks on the film.

When no streaks appear, there is always the possibility that the planets are behind their primary. The maneuver is therefore repeated from another position in space and, usually, at a point closer to the star.

It is a very dull procedure indeed, and when it has been repeated three times for three different stars, each time with completely negative results, a certain depression of morale is bound to occur.

Gillbret's morale, for instance, had been suffering for quite a while. Longer and longer intervals took place between the moments when he found something "amusing."

They were readying for the Jump to the fourth star on the Autarch's list, and Biron said, "We hit a star each time, anyway. At least Jonti's figures are correct."

Gillbret said, "Statistics show that one out of three stars has a planetary system."

Biron nodded. It was a well-worn statistic. Every child was taught that in elementary Galactography.

Gillbret went on, "That means that the chances of finding three stars at random without a single planet--without one single planet--is two thirds cubed, which is eight twenty-sevenths, or less than one in three."

"So?"

"And we haven't found any. There must be a mistake."

"You saw the plates yourself. And, besides, what price statistics? For all we know, conditions are different inside a Nebula. Maybe the particle fog prevents planets from forming, or maybe the fog is the result of planets that didn't coalesce."

"You don't mean that?" said Gillbret, stricken.

"You're right. I'm just talking to hear myself. I don't know anything about cosmogony.

Why the hell are planets formed, anyway? Never heard of one that wasn't filled with trouble."

Biron looked haggard himself. He was still printing and pasting up little stickers on the control panels.

He said, "Anyway, we've got the blasters all worked out, range finders, power control--all that."

It was very difficult not to look at the visiplat. They'd be Jumping again soon, through that ink.

Biron said absently, "You know why they call it the Horsehead Nebula, Gil?"

"The first man to enter it was Horace Hedd. Are you going to tell me that's wrong?"

"It may be. They have a different explanation on Earth."

"Oh?"

"They claim it's called that because it looks like a horse's head."

"What's a horse?"

"It's an animal on Earth."

"It's an amusing thought, but the Nebula doesn't look like any animal to me, Biron."

"It depends on the angle you look at it. Now from Nephelos it looks like a man's arm with three fingers, but I looked at it once from the observatory at the University of Earth.

It does look a little like a horse's head. Maybe that is how the name started. Maybe there never was any Horace Hedd. Who knows?" Biron felt bored with the matter, already. He was still talking simply to hear himself talk.

There was a pause, a pause that lasted too long, because it gave Gillbret a chance to bring up a subject which Biron did not wish to discuss and could not force himself to stop thinking about.

Gillbret said, "Where's Arta?"

Biron looked at him quickly and said, "Somewhere in the trailer. I don't follow her about."

"The Autarch does. He might as well be living here."

"How lucky for her."

Gillbret's wrinkles became more pronounced and his small features seemed to screw together. "Oh, don't be a fool, Biron. Artemisia is a Hinriad. She can't take what you've been giving her."

Biron said, "Drop it."

"I won't. I've been spoiling to say this. Why are you doing this to her? Because Hinrik might have been responsible for your father's death? Hinrik is my cousin! You haven't changed toward me."

"All right," Biron said. "I haven't changed toward you. I speak to you as I always have. I speak to Artemisia as well."

"As you always have?"

Biron was silent.

Gillbret said, "You're throwing her at the Autarch. "

"It's her choice."

"It isn't. It's your choice. Listen, Biron"--Gillbret grew confidential; he put a hand on Biron's knee--"this isn't a thing I like to interfere with, you understand. It's just that she's the only good thing in the Hinriad family just ROW. Would you be amused if I said I loved her? I have no children of my own."

"I don't question your love."

"Then I advise you for her good. Stop the Autarch, Biron."

"I thought you trusted him, Oil."

"As the Autarch, yes. As an anti-Tyrannian leader, yes. But as a man for a woman, as a man for Artemisia, no."

"Tell her that."

"She wouldn't listen."

"Do you think she would listen if I told her?"

"If you told her properly."

For a moment Biron seemed to hesitate, his tongue dabbing slightly at dry lips. Then he turned away, saying harshly, "I don't want to talk about it."

Gillbret said sadly, "You'll regret this."

Biron said nothing. Why didn't Gillbret leave him alone? It had occurred to him many times that he might regret all this. It wasn't easy. But what could he do? There was no safe way of backing out.

He tried breathing through his mouth to get rid, somehow, of the choking sensation in his chest.

The outlook was different after the next Jump. Biron had set the controls in accordance with the instructions from the Autarch's pilot, and left the manuals to Gillbret.

He was going to sleep through this one. And then Gillbret was shaking his shoulder.

"Biron! Biron!"

Biron rolled over in his bunk and out, landing in a crouch, fists balled. "What is it?"

Gillbret stepped back hastily. "Now, take it easy. We've got an F-2 this time."

It sank in. Gillbret drew a deep breath and relaxed. "Don't ever wake me that way, Gillbret. An F-2, you say? I suppose you're referring to the new star."

"I surely am. It looks most amusing, I think."

In a way, it did. Approximately 95 per cent of habitable planets in the Galaxy circled stars of spectral types F or G; diameter from 750 to 1500 thousand miles, surface temperature from five to ten thousand centigrade. Earth's sun was G-0, Rhodia's F-8, Lingane's G-2, as was that of Nephelos. F-2 was a little warm, but not too warm.

The first three stars they had stopped at were of spectral type K, rather small and ruddy. Planets would probably not have been decent even if they had had any.

A good star is a good star! In the first day of photography, five planets were located, the nearest being one hundred and fifty million miles from the primary.

Tedor Rizzett brought the news personally. He visited the Remorseless as frequently as the Autarch, lighting the ship with his heartiness. He was whooping and panting this time from the hand-over-hand exercises along the metal line.

He said, "I don't know how the Autarch does it. He never seems to mind. Comes from being younger, I guess." He added abruptly, "Five planets!"

Gillbret said, "For this star? You're sure?"

"It's definite. Four of them are J-type, though."

"And the fifth?"

"The fifth may be all right. Oxygen in the atmosphere, anyway."

Gillbret set up a thin sort of yell of triumph, but Biron said, "Four are J-type. Oh well, we only need one."

He realized it was a reasonable distribution. The large majority of sizable planets in the Galaxy possessed hydrogenated atmospheres. After all, stars are mostly hydrogen, and they are the source material of planetary building blocks. J-type planets had atmospheres of methane or ammonia, with molecular hydrogen in addition sometimes, and also considerable helium. Such atmospheres were usually deep and extremely dense. The planets themselves were almost invariably thirty thousand miles in diameter and up, with a mean temperature of rarely more than fifty below zero, centigrade. They were quite uninhabitable.

Back on Earth they used to tell him that these planets were called J-type because the J stood for Jupiter, the planet in Earth's solar system which was the best example of the type. Maybe they were right. Certainly, the other planet classification was the E-type and E did stand for Earth. E-types were usually small, comparatively, and their weaker gravity could not retain hydrogen or the hydrogen-containing gases, particularly since they were usually closer to the sun and warmer. Their atmospheres were thin and contained oxygen and nitrogen usually, with, occasionally, an admixture of chlorine, which would be bad.

"Any chlorine?" asked Biron. "How well have they gone over the atmosphere?"

Rizzett shrugged. "We can only judge the upper reaches from out in space. If there were any chlorine, it would concentrate toward ground level. We'll see."

He clapped a hand on Biron's large shoulder. "How about inviting me to a small drink in your room, boy?"

Gillbret looked after them uneasily. With the Autarch courting Artemisia, and his right-hand man becoming a drinking companion of Biron, the Remorseless was becoming more Linganian than not. He wondered if Biron knew what he was doing, then thought of the new planet and let the rest go.

Artemisia was in the pilot room when they penetrated the atmosphere. There was a little smile on her face and she seemed quite contented. Biron looked in her direction occasionally. He had said, "Good day, Artemisia," when she came in (she hardly ever did come in; he had been caught by surprise), but she hadn't answered.

She had merely said, "Uncle Oil," very brightly; then, "Is it true we're landing?"

And Oil had rubbed his hands. "It seems so, my dear. We may be getting out of the ship in a few hours, walking on solid surface. How's that for an amusing thought?"

"I hope it's the right planet. If it isn't, it won't be so amusing."

"There's still another star," said Oil, but his brow furrowed and contracted as he said so.

And then Artemisia turned to Biron and said, coolly, "Did you speak, Mr. Farrill?"

Biron, caught by surprise again, started and said, "No, not really."

"I beg your pardon, then. I thought you had."

She passed by him so closely that the plastic flair of her dress brushed his knee and her perfume momentarily surrounded him. His jaw muscles knotted.

Rizzett was still with them. One of the advantages of the trailer was that they could put up a guest overnight. He said, "They're getting details on the atmosphere now. Lots of oxygen, almost 30 per cent, and nitrogen and inert gases. It's quite normal. No chlorine."

Then he paused and said, "Hmm."

Gillbret said, "What's the matter?"

"No carbon dioxide. That's not so good."

"Why not?" demanded Artemisia from her vantage point near the visiplat, where she watched the distant surface of the planet blur past at two thousand miles an hour.

Biron said curtly, "No carbon dioxide--no plant life."

"Oh?" She looked at him, and smiled warmly.

Biron, against his will, smiled back, and somehow, with scarcely a visible change in her countenance, she was smiling through him, past him, obviously unaware of his existence; and he was left there, caught in a foolish smile. He let it fade.

It was just as well he avoided her. Certainly, when he was with her, he couldn't keep it up. When he could actually see her, the anesthetic of his will didn't work. It began hurting.

Gillbret was doleful. They were coasting now. In the thick lower reaches of the atmosphere, the Remorseless, with its aerodynamically undesirable addition of a trailer, was difficult to handle. Biron fought the bucking controls stubbornly.

He said, "Cheer up, Gil!"

He felt not exactly jubilant himself. Radio signals had brought no response as yet, and if this were not the rebellion world, there would be no point in waiting longer. His line of action was set!

Gillbret said, "It doesn't look like the rebellion world. It's rocky and dead, and not much water, either." He turned. "Did they try for carbon dioxide again, Rizzett?"

Rizzett's ruddy face was long. "Yes. Just a trace. About a thousandth of a per cent or so."

Biron said, "You can't tell. They might pick a world like this, just because it would look so hopeless."

"But I saw farms," said Gillbret.

"All right. How much do you suppose we can see of a planet this size by circling it a few times? You know damn well, Oil, that whoever they are, they can't have enough people to fill a whole planet. They may have picked themselves a valley somewhere where the carbon dioxide of the air has been built up, say, by volcanic action, and where there's plenty of nearby water. We could whiz within twenty miles of them and never know it. Naturally, they wouldn't be ready to answer radio calls without considerable investigation."

"You can't build up a concentration of carbon dioxide that easily," muttered Gillbret.

But he watched the visiplat intently.

Biron suddenly hoped that it was the wrong world. He decided that he could wait no longer. It would have to be settled, now!

It was a queer feeling.

The artificial lights had been turned off and sunlight was coming in unhindered at the ports. Actually, it was the less efficient method of lighting the ship, but there was a sudden desirable novelty to it. The ports were open, in fact, and a native atmosphere could be breathed.

Rizzett advised against it on the grounds that lack of carbon dioxide would upset the respiratory regulation of the body, but Biron thought it might be bearable for a short time.

Gillbret had come upon them, heads together. They looked up and leaned away from each other.

Gillbret laughed. Then he looked out of the open port, sighed, and said, "Rocks!"

Biron said mildly, "We're going to set up a radio transmitter at the top of the high ground. We'll get more range that way. At any rate, we ought to be able to contact all of this hemisphere. And if it's negative, we can try the other side of the planet."

"Is that what you and Rizzett were discussing?"

"Exactly. The Autarch and I will do the job. It's his suggestion, which is fortunate; since otherwise I would have had to make the same suggestion myself." He looked fleetingly at Rizzett as he spoke. Rizzett was expressionless.

Biron stood up. "I think it would be best if I unzipped my space-suit lining and wore that."

Rizzett was in agreement. It was sunny on this planet; there was little water vapor in the air and no clouds, but it was briskly cold.

The Autarch was at the main lock of the Remorseless. His overcoat was of thin foamite that weighed a fraction of an ounce, yet did a nearly perfect job of insulation. A small carbon-dioxide cylinder was strapped to his chest, adjusted to a slow leak that would maintain a perceptible CO2 vapor tension in his immediate vicinity.

He said, "Would you care to search me, Farrill?" He raised his hands and waited, his lean face quietly amused.

"No," said Biron. "Do you want to check me for weapons?"

"I wouldn't think of it."

The courtesies were as frigid as the weather.

Biron stepped out into the hard sunlight and tugged at the handle of the two-handed suitcase in which the radio equipment was stowed. The Autarch caught the other.

"Not too heavy," said Biron. He turned, and Artemisia was standing just within the ship, silent.

Her dress was a smooth, unfigured white which folded in a smooth drape that fled before the wind. The semitransparent sleeves whipped back against her arms, turning them to silver.

For a moment Biron melted dangerously. He wanted to return quickly; to run, leap into the ship, grasp her so that his fingers would leave bruises on her shoulders, feel his lips meet hers--

But he nodded briefly instead, and her returning smile, the light flutter of her fingers was for the Autarch.

Five minutes later he turned and there was still that glimmer of white at the open door, and then the rise in the ground cut off the view of the ship. The horizon was free of everything but broken and bare rock now.

Biron thought of what lay ahead, and wondered if he would ever see Artemisia again--and if she would care if he never returned.

18. OUT OF THE JAWS OF DEFEAT!

Artemesia watched them as they became tiny figures, trudging up the bare granite, then dipping below and out of sight. For a moment, just before they disappeared, one of them had turned.

She couldn't be sure which one, and, for a moment, her heart hardened.

He had not said a word on parting. Not one word. She turned away from the sun and rock toward the confined metal interior of the ship. She felt alone, terribly alone; she had never felt so alone in her life.

It was that, perhaps, that made her shiver, but it would have been an intolerable confession of weakness to admit that it wasn't simply the cold.

She said peevishly, "Uncle Gil! Why don't you close the ports? It's enough to freeze a person to death." The thermometer dial read plus seven centigrade with the ship's heaters on high.

"My dear Arta," said Gillbret mildly, "if you will persist in your ridiculous habit of wearing nothing but a little fog here and there, you must expect to be cold." But he closed certain contacts, and, with little clicks, the air lock slid shut, the ports sunk inward and molded themselves into the smooth, gleaming hull. As they did so, the thick glass polarized and became nontransparent. The lights of the ship went on and the shadows disappeared.

Artemesia sat down in the heavily padded pilot's seat and fingered the arms aimlessly.

His hands had often rested there, and the slight warmth that flooded her as she thought that (she told herself) was only the result of the heaters making themselves felt decently, now that the outer winds were excluded.

The long minutes passed, and it became impossible to sit quietly. She might have gone with him! She corrected the rebellious thought instantly as it passed through her mind, and changed the singular "him" to the plural "them."

She said, "Why do they have to set up a radio transmitter anyway, Uncle Gil?"

He looked up from the visiplat, the controls of which he was fingering delicately, and said, "Eh?"

"We've been trying to contact them from out in space," she said, "and we haven't reached anyone. What special good would a transmitter on the planet's surface do?"

Gillbret was troubled. "Why, we must keep trying, my dear. We must find the rebellion world." And, between his teeth, he added to himself, "We must!"

A moment passed, and he said, "I can't find them."

"Find whom?"

"Biron and the Autarch. The ridge cuts me off no matter how I arrange the external mirrors. See?"

She saw nothing but the sunny rock flashing past.

Then Gillbret brought the little gears to rest and said, "Anyway, that's the Autarch's ship."

Artemisia accorded it the briefest of glances. It lay deeper in the valley, perhaps a mile away. It glistened unbearably in the sun. It seemed to her, at the moment, to be the real enemy. It was, not the Tyranni. She wished suddenly, sharply, and very strongly that they had never gone to Lingane; that they had remained in space, the three of them only. Those had been funny days, so uncomfortable and yet so warm, somehow. And now she could only try to hurt him.

Something made her hurt him, though she would have liked--

Gillbret said, "Now what does he want?"

Artemisia looked up at him, seeing him through a watery mist, SO that she had to blink rapidly to put him into normal focus. "Who?"

"Rizzett. I think that's Rizzett. But he's certainly not coming this way."

Artemisia was at the visiplat. "Make it larger," she ordered.

"At this short distance?" objected Gillbret. "You won't see anything. It will be impossible to keep it centered."

"Larger, Uncle Gil."

Muttering, he threw in the telescopic attachment and searched the bloated nubbles of rock that resulted. They jumped faster than the eye could follow at the lightest touch on the controls. For one moment, Rizzett, a large, hazy figure, flashed past, and in that moment his identity was unmistakable. Gillbret backtracked wildly, caught him again, hung on for a moment, and Artemisia said, "He's armed. Did you see that?"

"No."

"He's got a long-range blasting rifle, I tell you!"

She was up, tearing away at the locker.

"Arta! What are you doing?"

She was unzipping the lining from another space suit. "I'm going out there. Rizzett's following them. Don't you understand? The Autarch hasn't gone out to set up a radio. It's a trap for Biron." She was gasping as she forced herself into the thick, coarse lining.

"Stop it! You're imagining things."

But she was staring at Gillbret without seeing him, her face pinched and white. She should have seen it before, the way Rizzett had been coddling that fool. That emotional fool!

Rizzett had praised his father, told him what a great man the Rancher of Widemos had been, and Biron had melted immediately. His every action was dictated by the thought of his father. How could a man let himself be so ruled by a monomania?

She said, "I don't know what controls the air lock. Open it."

"Arta, you're not leaving the ship. You don't know where they are."

"I'll find them. Open the air lock."

Gillbret shook his head.

But the space suit she had stripped had borne a holster. She said, "Uncle Oil, I'll use this. I swear I will."

And Gillbret found himself staring at the wicked muzzle of a neuronc whip. He forced a smile. "Don't now!"

"Open the lock!" she gasped.

He did and she was out, running into the wind, slipping across the rocks and up the ridge. The blood pounded in her ears. She had been as bad as he, dangling the Autarch before him for no purpose other than her silly pride. It seemed silly now, and the Autarch's personality sharpened in her mind, a man so studiously cold as to be bloodless and tasteless.

She quivered with repulsion.

She had topped the ridge, and there was nothing ahead of her. Stolidly she walked onward, holding the neuronc whip before her.

Biron and the Autarch had not exchanged a word during their walk, and now they came to a halt where the ground leveled off. The rock was fissured by the action of sun and wind through the millennia. Ahead of them there was an ancient fault, the farther lip of which had crumbled downward, leaving a sheer precipice of a hundred feet.

Biron approached cautiously and looked over it. It slanted outward past the drop, the ground riddled with craggy boulders which, with time and infrequent rains, had scattered out as far as he could see.

"It looks," he said, "like a hopeless world, Jonti."

The Autarch displayed none of Biron's curiosity in his surroundings. He did not approach the drop. He said, "This is the place we found before landing. It's ideal for our purposes."

It's ideal for your purposes, at least, thought Biron. He stepped away from the edge and sat down. He listened to the tiny hiss from his carbon-dioxide cylinder, and waited a moment.

Then he said, very quietly, "What will you tell them when you get back to your ship, Jonti? Or shall I guess?"

The Autarch paused in the act of opening the two-handed suitcase they had carried. He straightened and said, "What are you talking about?"

Biron felt the wind numb his face and rubbed his nose with his gloved hand. Yet he unbuttoned the foamite lining that wrapped him, so that it flapped wide as the gusts hit it.

He said, "I'm talking about your purpose in coming here."

"I would like to set up the radio rather than waste my time discussing the matter, Farrill."

"You won't set up a radio. Why should you? We tried reaching them from space, without a response. There's no reason to expect more of a transmitter on the surface. It's not a question of ionized radio-opaque layers in the upper atmosphere, either, because we tried the sub-ether as well and drew a blank. Nor are we particularly the radio experts in our party."

So why did you really come up here, Jonti?"

The Autarch sat down opposite Biron. A hand patted the suitcase idly. "If you are troubled by these doubts, why did you come?"

"To discover the truth. Your man; Rizzett, told me you were planning this trip, and advised me to join you. I believe that your instructions to him were to tell me that by joining you I might make certain you received no messages that I remained unaware of. It was a reasonable point, except that I don't think you will receive any message. But I allowed it to persuade me, and I've come with you."

"To discover truth?" said Jonti mockingly.

"Exactly that. I can guess truth already."

"Tell me then. Let me discover truth as well."

"You came to kill me. I am here alone with you, and there is a cliff before us over which it would be certain death to fall. There would be no signs of deliberate violence. There would be no blasted limbs or any thought of weapon play. It would make a nice, sad story to take back to your ship. I had slipped and fallen. You might bring back a party to gather me up and give me a decent burial. It would all be very touching and I would be out of your way."

"You believe this, and yet you came?"

"I expect it, so you won't catch me by surprise. We are unarmed and I doubt that you could force me over by muscular power alone." For a moment Biron's nostrils flared. He half flexed his right arm, slowly and hungrily.

But Jonti laughed. "Shall we concern ourselves with our radio transmitter, then, since your death is now impossible?"

"Not yet. I am not done. I want your admission that you were going to try to kill me."

"Oh? Do you insist that I play my proper role in this impromptu drama you have developed? How do you expect to force me to do so? Do you intend to beat a confession out of me? Now understand, Farrill, you are a young man and I am disposed to make allowances because of that and because of the convenience of your name and rank. However, I must admit you have until now been more trouble than help to me."

"So I have been. By keeping alive, despite you!"

"If you refer to the risks you ran on Rhodia, I have explained it; I will not explain it again."

Biron rose. "Your explanation was not accurate. It has a flaw in it which was obvious from the beginning."

"Really?"

"Really! Stand up and listen to me, or I'll drag you to your feet."

The Autarch's eyes narrowed to slits as he rose. "I would not advise you to attempt violence, youngster."

"Listen." Biron's voice was loud and his cloak still bellied open in the breeze, disregarded. "You said that you sent me to a possible death on Rhodia only to implicate the Director in an anti-Tyrannian plot."

"That remains true."

"That remains a lie. Your prime object was to have me killed. You informed the captain of the Rhodian ship of my identity at the very beginning. You had no real reason for believing that I would ever be allowed to reach Hinrik."

"If I had wanted to kill you, Farrill, I might have planted a real radiation bomb in your room."

"It would have been obviously more convenient to have the Tyranni maneuvered into doing the killing for you."

"I might have killed you in space when I first boarded the Remorseless."

"So you might. You came equipped with a blaster and you had it leveled at me at one point. You had expected me on board, but you hadn't told your crew that. When Rizzett called and saw me, it was no longer possible to blast me. You made a mistake then. You told me you had told your men I was probably on board, and awhile later Rizzett told me you had not. Don't you brief your men concerning your exact lies as you tell them, Jonti?"

Jonti's face had been white in the cold, but it seemed to whiten further. "I should kill you now for giving me the lie, certainly. But what held back my trigger finger before Rizzett got on the visiplat and saw you?"

"Politics, Jonti. Artemisia oth Hinriad was aboard, and for the moment she was a more important object than myself. I'll give you credit for a quick change of plans. To have killed me in her presence would have ruined a bigger game."

"I had fallen in love so rapidly, then?"

"Love! When the girl concerned is a Hinriad, why not? You lost no time. You tried first to have her transferred to your ship, and when that failed, you told me that Hinrik had betrayed my father." He was silent for a moment, then said, "So I lost her and left you the field undisputed. Now, I presume, she is no longer a factor. She is firmly on your side and you may proceed with your plan to kill me without any fear that by doing it you may lose your chance at the Hinriad succession."

Jonti sighed and said, "Farrill, it is cold, and getting colder. I believe the sun is heading downward. You are unutterably foolish and you weary me. Before we end this farrago of nonsense, will you tell me why I should be in the least interested in killing you anyway? That is, if your obvious paranoia needs any reason."

"There is the same reason that caused you to kill my father."

"What?"

"Did you think I believed you for an instant when you said Hinrik had been the traitor? He might have been, were it not for the fact that his reputation as a wretched weakling is so well established. Do you suppose that my father was a complete fool? Could he possibly have mistaken Hinrik for anything but what he was? If he had not known his reputation, would not five minutes in his presence have revealed him completely as a hopeless puppet? Would my father have blabbed foolishly to Hinrik anything that might have been used to support a charge of treason against him? No, Jonti. The man who betrayed my father must have been one who was trusted by him."

Jonti took a step backward and kicked the suitcase aside. He poised himself to withstand a charge and said, "I see your vile implication. My only explanation for it is that you are criminally insane."

Biron was trembling, and not with cold. "My father was popular with your men, Jonti.

Too popular. An Autarch cannot allow a competitor in the business of ruling. You saw to it that he did not remain a competitor. And it was your next job to see to it that I did not remain alive either to replace or to avenge him." His voice raised to a shout, which whipped away on the cold air. "Isn't this true?"

"No."

Jonti bent to the suitcase. "I can prove you are wrong!" He flung it open. "Radio equipment. Inspect it. Take a good look at it." He tossed the items to the ground at Biron's feet.

Biron stared at them. "How does that prove anything?"

Jonti rose. "It doesn't. But now take a good look at this."

He had a blaster in his hand, and his knuckles were white with tension. The coolness had left his voice. He said, "I am tired of you. But I won't have to be tired much longer."

Biron said tonelessly, "You hid a blaster in the suitcase with the equipment?"

"Did you think I wouldn't? You honestly came here expecting to be thrown off a cliff and you thought I would try to do it with my hands as though I were a stevedore or a coal miner? I am Autarch of Lingane"--his face worked and his left hand made a flat, cutting gesture before him--"and I am tired of the cant and fatuous idealism of the Ranchers of Widemos." He whispered then, "Move on. Toward the cliff." He stepped forward.

Biron, hands raised, eyes on the blaster, stepped back. "You killed my father, then."

"I killed your father!" said the Autarch. "I tell you this so you may know in the last few moments of your life that the same man who saw to it that your father was blasted to bits in a disintegration chamber will see to it that you will follow him--and keep the Hinriad girl for himself thereafter, along with all that goes with her. Think of that! I will give you an extra minute to think of that! But keep your hands steady, or I will blast you and risk any questions my men may care to ask." It was as though his cold veneer, having cracked, left nothing but a burning passion exposed.

"You tried to kill me before this, as I said."

"I did. Your guesses were in every way correct. Does that help you now? Back!"

"No," said Biron. He brought his hands down and said, "H you're going to shoot, do so."

The Autarch said, "You think I will not dare?"

"I've asked you to shoot."

"And I will." The Autarch aimed deliberately at Biron's head and at a distance of four feet closed contact on his blaster.

19. DEFEAT!

Tedor Rizzett circled the little piece of tableland warily. He was not yet ready to be seen, but to remain hidden was difficult in this world of bare rock. In the patch of tumbled, crystalline boulders he felt safer. He threaded his way through them. Occasionally he paused to pass the soft back of the spongy gloves he wore over his face. The dry cold was deceptive.

He saw them now from between two granite monoliths that met in a V. He rested his blaster in the crotch. The sun was on his back. He felt its feeble warmth soak through, and he was satisfied. If they happened to look in his direction, the sun would be in their eyes and he himself would be that much less visible.

Their voices were sharp in his ear. Radio communication was in operation and he smiled at that. So far, according to plan. His own presence, of course, was not according to plan, but it would be better so. The plan was a rather overconfident one and the victim was not a complete fool, after all. His own blaster might yet be needed to decide the issue.

He waited. Stolidly he watched the Autarch lift his blaster as Biron stood there, unflinching.

Artemisia did not see the blaster lift. She did not see the two figures on the flat rock surface. Five minutes earlier she had seen Rizzett silhouetted for a moment against the sky, and since then she had followed him.

Somehow, he was moving too fast for her. Things dimmed and wavered before her and twice she found herself stretched on the ground. She did not recall falling. The second time, she staggered to her feet with one wrist oozing blood where a sharp edge had scraped her.

Rizzett had gained again and she had to reel after him. When he vanished in the glistening boulder forest, she sobbed in despair. She leaned against a rock, completely weary.

Its beautiful flesh-pink tint, the glassy smoothness of its surface, the fact that it stood as an ancient reminder of a primeval volcanic age was lost upon her.

She could only try to fight the sensation of choking that pervaded her.

And then she saw him, dwarfed at the forked-rock formation, his back to her. She held the neuronc whip before her as she ran unevenly over the hard ground. He was sighting along the barrel of his rifle, intent upon the process, taking aim, getting ready.

She wouldn't make it in time.

She would have to distract his attention. She called, "Rizzett!" And again, "Rizzett, don't shoot!"

She stumbled again. The sun was blotting out, but consciousness lingered. It lingered long enough for her to feel the ground jar thuddingly against her, long enough

to press her finger upon the whip's contact; and long enough for her to know that she was well out of range, even if her aim was accurate, which it could not be.

She felt arms about her, lifting. She tried to see, but her eyelids would not open.

"Biron?" It was a weak whisper.

The answer was a rough blur of words, but it was Rizzett's voice. She tried to speak further, then abruptly gave up. She had failed!

Everything was blotted out.

The Autarch remained motionless for the space it would take a man to count to ten slowly. Biron faced him as motionlessly, watching the barrel of the blaster that had just been fired point-blank at him. The barrel sank slowly as he watched.

Biron said, "Your blaster seems not be in firing order. Examine it."

The Autarch's bloodless face turned alternately from Biron to his weapon. He had fired at a distance of four feet. It should have been all over. The congealed astonishment that held him broke suddenly and he disjointed the blaster in a quick movement.

The energy capsule was missing. Where it should have been, there was a useless cavity.

The Autarch whimpered with rage as he hurled the lump of dead metal aside. It turned over and over, a black blot against the sun, smashing into the rock with a faint ringing sound.

"Man to man!" said Biron. There was a trembling eagerness in his voice.

The Autarch took a step backward. He said nothing.

Biron took a slow step forward. "There are many ways I could kill you, but not all would be satisfying. If I blasted you, it would mean that a millionth of a second would separate your life from your death. You would have no consciousness of dying. That would be bad. I think that instead there would be considerable satisfaction in using the somewhat slower method of human muscular effort."

His thigh muscles tensed, but the lunge they prepared was never completed. The cry that interrupted was thin and high, packed with panic.

"Rizzett!" it came. "Rizzett, don't shoot!"

Biron whirled in time to see the motion behind the rocks a hundred yards away and the glint of sun on metal. And then the hurled weight of a human body was upon his back. He bent under it, dropping to his knees.

The Autarch had landed fairly, his knees clasped hard about the other's waist, his fist thudding at the nape of Biron's neck. Biron's breath whooshed out in a whistling grunt.

Biron fought off the gathering blackness long enough to throw himself to one side. The Autarch jumped free, gaining clear footing while Biron sprawled on his back.

He had just time to double his legs up against himself as the Autarch lunged down upon him again. The Autarch bounced off. They were up together this time, perspiration turning icy upon their cheeks.

They circled slowly. Biron tossed his carbon-dioxide cylinder to one side. The Autarch likewise unstrapped his, held it suspended a moment by its mesh-metal hose,

then stepped in rapidly and swung it. Biron dropped, and both heard and felt it whistle above his head.

He was up again, leaping on the other before the Autarch could regain his balance. One large fist clamped down on the other fist exploded in the Autarch's face. He let the Autarch drop and stepped back.

Biron said, "Stand up. I'll wait for you with more of the same. There's no hurry."

The Autarch touched his gloved hand to his face then stared sickly at the blood that smeared off upon it. His mouth twisted and his hand snaked out for the metal cylinder he had dropped. Biron's foot came heavily down upon it, and the Autarch yelled in agony.

Biron said, ".You're too close to the edge of the cliff, Jonti. Mustn't reach in that direction. Stand up. I'll throw you the other way now."

But Rizzett's voice rang out: "Wait!"

The Autarch screamed, "Shoot this man, Rizzett! Shoot him now! His arms first, then his legs, and we'll leave him."

Rizzett brought his weapon up slowly against his shoulder.

Biron said, "Who saw to it that your own blaster was unloaded, Jonti?"

"What?" The Autarch stared blankly.

"It was not I who had access to your blaster, Jonti. Who did have? Who is pointing a blaster at you right now, Jonti? Not at me, Jonti, but at you"

The Autarch turned to Rizzett and screamed, "Traitor!"

Rizzett said, in a low voice. "Not I, sir. That man is the traitor who betrayed the loyal Rancher of Widemos to his death."

"That is not I," cried the Autarch. "If he has told you I have, he lies."

"It is you yourself who have told us. I not only emptied your weapon, I also shorted your communicator switch, so that every word you said today was received by myself and by every member of the crew. We all know you for what you are."

"I am your Autarch."

"And also the greatest traitor alive."

For a moment the Autarch said nothing, but looked wildly from one to the other as they watched him with somber, angry faces. Then he wrenched to his feet, pulled together the parted seams of his self-control, and held them tightly by sheer nervous force.

His voice was almost cool as he said, "And if it were all true, what would it matter?

You have no choice but to let matters stand as they are. One last intranebular planet remains to be visited. It must be the rebellion world, and only I know the coordinates."

He retained dignity somehow. One hand hung uselessly from a broken wrist; his upper lip had swollen ludicrously, and blood was caking his cheek, but he radiated the hauteur of one born to rule.

"You'll tell us," said Biron.

"Don't delude yourself that I will under any circumstances. I have told you already that there is an average of seventy cubic light-years per star. If you work by trial and error, without me, the odds are two hundred and fifty quadrillion to one against your coming within a billion miles of any star. Any star!"

Something went click! in Biron's mind.

He said, "Take him back to the Remorseless!"

Rizzett said in a low voice, "The Lady Artemisia--"

And Biron interrupted, "Then it was she. Where is she?"

"It's all right. She's safe. She came out without a carbon-dioxide cylinder.

Naturally, as the CO₂ washed out of her blood stream, the automatic breathing mechanism of the body slowed. She was trying to run, didn't have the sense to breathe deeply voluntarily, and fainted."

Biron frowned. "Why was she trying to interfere with you, anyway? Making sure her boy friend didn't get hurt?"

Rizzett said, "Yes, she was! Only she thought I was the Autarch's man and was going to shoot you. I'll take back this rat now, and, Biron--"

"Yes?"

"Get back as soon as you can. He's still the Autarch, and the crew may need talking to. It's hard to break a lifetime habit of obedience. . . .She's behind that rock. Get to her before she freezes to death, will you? She won't leave."

Her face was almost buried in the hood that covered her head, and her body was formless in the thick, enveloping folds of the space-suit lining, but his steps quickened as he approached her.

He said, "How are you?"

She said, "Better, thank you. I am sorry if I caused any trouble."

They stood looking at each other, and the conversation seemed to have burned itself out in two lines.

Then Biron said, "I know we can't turn time backward, undo things that have been done, unsay things that have been said. But I do want you to understand."

"Why this stress on understanding?" Her eyes flashed. "I have done nothing but understand for weeks now. Will you tell me again about my father?"

"No. I knew your father was innocent. I suspected the Autarch almost from the start, but I had to find out definitely. I could only prove it, Arta, by forcing him to confess. I thought I could get him to confess by trapping him into attempting to kill me, and there was only one way of doing that."

He felt wretched. He went on, "It was a bad thing to do. As bad, almost, as what he did to my father. I don't expect you to forgive me."

She said, "I don't follow you." He said, "I knew he wanted you, Arta. Politically, you would be a perfect matrimonial object. The name of Hinriad would be more useful for his purposes than that of Widemos. So once he had you, he would need me no longer. I deliberately forced you on him, Arta. I acted as I did, hoping you would turn to him."

When you did, he thought he was ready to rid himself of me, and Rizzett and I laid our trap."

"And you loved me an the time?"

Biron said, "Can't you bring yourself to believe that, Arta?"

"And of course you were ready to sacrifice your love to the memory of your father and the honor of your family. How does the old doggerel go? You could not love me half so much, loved you not honor more!"

Biron said, miserably, "Please, Arta! I am not proud of myself but I could think of no other way."

"You might have told me your plan, made me your confederate rather than your tool."

"It was not your fight. If I had failed--and I might have --you would have remained out of it. If the Autarch had killed me and you were no longer on my side, you would be less hurt. You might even have married him, even been happy."

"Since you have won, it might be that I would be hurt at his loss."

"But you aren't."

"How do you know?"

Biron said desperately, "At least try to see my motives. Granted that I was foolish--criminally foolish--can't you understand? Can't you try not to hate me?"

She said softly, "I have tried not to love you and, as you see, I have failed."

"Then you forgive me."

"Why? Because I understand? No! If f were a matter of simply understanding, of seeing your motives, I would not forgive you your actions for anything I might have in life. If it were only that and nothing more! But I will forgive you, Biron, because I couldn't bear not to. How could I ask you to come back to me unless I forgave you?"

And she was in his arms, her weather-cold lips turning up to his. They were held apart by a double layer of thick garments. His gloved hands could not feel the body they embraced, but his lips were aware of her white, smooth face.

At last he said in concern, "The sun is getting lower. It's going to get colder."

But she said softly, "It's strange, then, that I seem to be getting warmer."

Together they walked back to the ship.

Biron faced them now with an appearance of easy confidence which he did not feel. The Linganian ship was large, and there were fifty in the crew. They sat now facing him. Fifty faces! Fifty Linganian faces bred from birth to unquestioning obedience to their Autarch.

Some had been convinced by Rizzett; others had been convinced by the arranged eavesdropping on the Autarch's statements to Biron earlier that day. But how many others were still uncertain or even definitely hostile?

So far Biron's talking had done little good. He leaned forward, let his voice grow confidential. "And what are you fighting for, men? What are you risking your lives for? A free Galaxy, I think. A Galaxy in which each world can decide what is best in its own way,

produce its own wealth for its own good, be slave to none and master of none. Am I right?"

There was a low murmur of what might have been agreement, but it lacked enthusiasm.

Biron went on, "And what is the Autarch fighting for? For himself. He is the Autarch of Lingane. If he won, he would be Autarch of the Nebular Kingdoms. You would replace a Khan by an Autarch. Where would be the benefit of that? Is that worth dying for?"

One in the audience cried out, "He would be one of us, not a filthy Tyranni."

Another shouted. "The Autarch was looking for the rebellion world to offer his services. Was that ambition?"

"Ambition should be made of sterner stuff, eh?" Biron shouted back, ironically. "But he would come to the rebellion world with an organization at his back. He could offer them all of Lingane; he could offer them, he thought, the prestige of an alliance with the Hinriads. In the end, he was pretty sure, the rebellion world would be his to do with what he pleased. Yes, this was ambition.

"And when the safety of the movement ran counter to his own plans, did he hesitate to risk your lives for the sake of his ambition? My father was a danger to him. My father was honest and a friend of liberty. But he was too popular, so he was betrayed. In that betrayal, the Autarch might have brought to ruins the entire cause and all of you with it. Which one of you is safe under a man who will deal with the Tyranni whenever it suits his purpose? Who can be safe serving a cowardly traitor?"

"Better," whispered Rizzett. "Stick to that. Give it to them."

Again the same voice called from the back rows. "The Autarch knows where the rebellion world is. Do you know?"

"We will discuss that later. Meanwhile, consider instead that under the Autarch we were all headed for complete ruin; that there is still time to save ourselves by turning from his guidance to a better and nobler way; that it is still possible from the jaws of defeat to snatch--"

"--only defeat, my dear young man," came a soft interrupting voice, and Biron turned in horror.

The fifty crewmen came babbling to their feet, and for a moment it seemed as though they might surge forward, but they had come to council unarmed; Rizzett had seen to that. And now a squad of Tyrannian guardsmen were filing through the various doors, weapons ready.

And Simok Aratap himself, a blaster in each hand, stood behind Biron and Rizzett.

20. WHERE?

Simok Aratap weighed carefully the personalities of each of the four who faced him and felt the stirring of a certain excitement within him. This would be the big gamble. The threads of the pattern were weaving toward a close. He was thankful that Major Andros was no longer with him; that the Tyrannian cruisers had gone as well.

He was left with his flagship, his crew and himself. They would be sufficient. He hated unwieldiness.

He spoke mildly, "Let me bring you up to date, my lady and gentlemen. The Autarch's ship has been boarded by a prize crew and is now being escorted back to Tyrann by Major Andros. The Autarch's men will be tried according to law and if convicted will receive the punishment for treason. They are routine conspirators and will be treated routinely. But what shall I do with you?"

Hinrik of Rhodia sat beside him, his face crumpled in utter misery. He said, "Consider that my daughter is a young girl. She was led into this unwillingly. Artemisia, tell them that you were "

"Your daughter," interposed Aratap, "will probably be released. She is, I believe, the matrimonial object of a highly placed Tyrannian nobleman. Obviously, that will be kept in mind."

Artemisia said, "I'll marry him, if you'll let the rest go."

Biron half rose, but Aratap waved him down. The Tyrannian Commissioner smiled and said, "My lady, please! I can strike bargains, I admit. However, I am not the Khan, but merely one of his servants. Therefore, any bargain I do make will have to be justified thoroughly at home. So what is it exactly that you offer?"

"My agreement to the marriage."

"That is not yours to offer. Your father has already agreed and that is sufficient. Do you have anything else?"

Aratap was waiting for the slow erosion of their wills to resist. The fact that he did not enjoy his role did not prevent him from filling it efficiently. The girl, for instance, might at this moment burst into tears and that would have a salutary effect on the young man.

They had obviously been lovers. He wondered if old Pohang would want her under the circumstances, and decided that he probably would. The bargain would still be all in the ancient's favor. For the moment he thought distantly that the girl was very attractive.

And she was maintaining equilibrium. She was not breaking down. Very good, thought Aratap. She was strong willed as well. Pohang would not have joy of his bargain after an.

He said to Hinrik, "Do you wish to plead for your cousin too?"

Hinrik's lips moved soundlessly.

Gillbret cried, "No one pleads for me. I don't want anything of any Tyranni. Go ahead."

Order me shot."

"You are hysterical," said Aratap. "You know that I cannot order you shot without trial."

"He is my cousin," whispered Hinrik.

"That will be considered too. You noblemen will some day have to learn that you cannot presume too far on your usefulness to us. I wonder if your cousin has learned that lesson yet."

He was satisfied with Gillbret's reactions. That fellow, at least, sincerely wanted death. The frustration of life was too much for him. Keep him alive, then, and that alone would break him.

He paused thoughtfully before Rizzett. This was one of the Autarch's men. At the thought he felt a faint embarrassment. At the start of the chase, he had dismissed the Autarch as a factor on the basis of what seemed iron logic. Well, it was healthy to miss occasionally.

It kept self-confidence balanced at a point safely short of arrogance.

He said, "You're the fool who served a traitor. You would have been better off with us."

Rizzett flushed.

Aratap went on, "If you ever had any military reputation, I am afraid this would destroy it. You are not a nobleman and considerations of state will play no part in your case.

Your trial will be public and it will become known that you were a tool of a tool. Too bad."

Rizzett said, "But you are about to suggest a bargain, I suppose?"

"A bargain?"

"Khan's evidence, for instance? You have only a shipload. Wouldn't you want to know the rest of the machinery of revolt?"

Aratap shook his head slightly. "No. We have the Autarch. He will do as a source of information. Even without it, we need only make war on Lingane. There would be little left of revolt thereafter, I'm sure. There will be no bargain of that sort."

And this brought him to the young man. Aratap had left him for last because he was the cleverest of the lot. But he was young, and young people were often not dangerous. They lacked patience.

Biron spoke first, saying, "How did you follow us? Was he working with you?"

"The Autarch? Not in this case. I believe the poor fellow was trying to play both sides of the game, with the usual success of the unskillful."

Hinrik interrupted, with an incongruously childish eagerness, "The Tyranni have an invention that follows ships through hyperspace."

Aratap turned sharply. "If Your Excellency will refrain from interrupting, I would be obliged," and Hinrik cringed.

It really didn't matter. None of these four would be dangerous hereafter, but he had no desire to decrease by even one any of the uncertainties in the young man's mind.

Biron said, "Now, look, let's have facts, or nothing. You don't have us here because you love us. Why aren't we on the way back to Tyrann with the others? It's that you don't know how to go about killing us. Two of us are Hinriads. I am a Widemos. Rizzett is a well-known officer of the Linganian fleet. And that fifth one you have, your own pet coward and traitor, is still Autarch of Lingane. You can't kill any of us without stinking up the Kingdoms from Tyrann to the edge of the Nebula itself. You've got to try to make some sort of bargain with us, because there's nothing else you can do."

Aratap said, "You are not altogether wrong. Let me weave a pattern for you. We followed you, no matter how. You may disregard, I think, the Director's overactive imagination. You paused near three stars without landing on any planet. You came to a fourth and found a planet to land on. There we landed with you, watched, waited. We thought there might be something to wait for and we were right. You quarreled with the Autarch and both of you broadcast without limitation. That had been arranged by you for your own purposes, I know, but it suited our purpose as well. We overheard.

"The Autarch said that only one last intra-nebular planet remained to be visited and that it must be the rebellion world. This is interesting, you see. A rebellion world. You know, my curiosity is aroused. Where would that fifth and last planet be located?"

He let the silence last. He took a seat and watched them dispassionately--first one, then another.

Biron said, "There is no rebellion world."

"You were looking for nothing, then?"

"We were looking for nothing."

"You are being ridiculous."

Biron shrugged wearily. "You are yourself ridiculous if you expect more of an answer."

Aratap said, "Observe that this rebellion world must be the center of the octopus. To find it is my only purpose in keeping you alive. You each have something to gain. My lady, I might free you of your marriage. My Lord Gillbret, we might establish a laboratory for you, let you work undisturbed. Yes, we know more of you than you think." (Aratap turned away hastily. The man's face was working. He might weep and that would be unpleasant.) "Colonel Rizzett, you will be saved the humiliation of court-martial and the certainty of conviction and the ridicule and loss of reputation that would go with it. You, Biron Farrill, would be Rancher of Widemos again. In your case, we might even reverse the conviction of your father."

"And bring him back to life?"

"And restore his honor."

"His honor," said Biron, "rests in the very actions that led to his conviction and death. It is beyond your power to add to or detract from it."

Aratap said, "One of you four will tell me where to find this world you seek. One of you will be sensible. He will gain, whichever one it is, what I have promised. The rest of you will be married, imprisoned, executed--whatever will be worst for you. I warn you, I can be sadistic if I must be."

He waited a moment. "Which one will it be? If you don't speak, the one next to you will. You will have lost everything and I will still have the information I want."

Biron said, "It's no use. You're setting this up so carefully, and yet it won't help you. There is no rebellion world."

"The Autarch says there is."

"Then ask the Autarch your question."

Aratap frowned. The young man was carrying the bluff forward past the point of reason.

He said, "My own inclination is to deal with one of you."

"Yet you have dealt with the Autarch in the past. Do so again. There is nothing you can sell to us that we are willing to buy from you." Biron looked about him. "Right?"

Artemisia crept closer to him and her hand folded slowly about his elbow. Rizzett nodded curtly and Gillbret muttered, "Right!" in a breathless manner.

"You have decided," said Aratap, and put his finger on the correct knob.

The Autarch's right wrist was immobilized in a light metal sheath, which was held magnetically tight to the metal band about his abdomen. The left side of his face was swollen and blue with bruise except for a ragged, force-healed scar that seamed it redly. He stood before them without moving after that first wrench which had freed his good arm from the grip of the armed guard at his side.

"What do you want?"

"I will tell you in a moment," said Aratap. "First, I want you to consider your audience. See whom we have here. There is the young man, for instance, whom you planned death for, yet who lived long enough to cripple you and destroy your plans, although you were an Autarch and he was an exile."

It was difficult to tell whether a flush had entered the Autarch's mangled face. There was no single muscle motion upon it.

Aratap did not look for one. He went on quietly, almost indifferently, "This is Gillbret oth Hinriad, who saved the young man's life and brought him to you. This is the Lady Artemisia, whom, I am told, you courted in your most charming manner and who betrayed you, nevertheless, for love of the youngster. This is Colonel Rizzett, your most trusted military aide, who also ended by betraying you. What do you owe these people, Autarch?"

The Autarch said again, "What do you want?"

"Information. Give it to me and you will be Autarch again. Your earlier dealings with us would be held in your favor at the Khan's court. Otherwise--"

"Otherwise?"

"Otherwise I will get it from these, you see. They will be saved and you will be executed. That is why I ask whether you owe them anything, that you should give them the opportunity of saving their lives by yourself being mistakenly stubborn."

The Autarch's face twisted painfully into a smile. "They cannot save their lives at my expense. They do not know the location of the world you seek. I do."

"I have not said what the information I want is, Autarch."

"There is only one thing you can want." His voice was hoarse--all but unrecognizable.

"If my decision is to speak, then my Autarchy will be as before, you say."

"More closely guarded, of course," amended Aratap politely.

Rizzett cried out, "Believe him, and you'll but add treason to treason and be killed for it in the end."

The guard stepped forward, but Biron anticipated him. He flung himself upon Rizzett, struggling backward with him.

"Don't be a fool," he muttered. "There's nothing you can do."

The Autarch said, "I don't care about my Autarchy, or myself, Rizzett." He turned to Aratap. "Will these be killed? That, at least, you must promise." His horribly discolored face twisted savagely. "That one, above all." His finger stabbed toward Biron.

"If that is your price, it is met."

"If I could be his executioner, I would relieve you of all further obligation to me.

If my finger could control the execution blast, it would be partial repayment. But if not that, at least I will tell you what he would have you not know. I give you rho, theta, and phi in parsecs and radians: 7352.43, 1.7836, 5.2112. Those three points will determine the position of the world in the Galaxy. You have them now."

"So I have," said Aratap, writing them down.

And Rizzett broke away, crying, "Traitor! Traitor!"

Biron, caught off balance, lost his grip on the Linganian and was thrown to one knee.

"Rizzett," he yelled futilely.

Rizzett, face distorted, struggled briefly with the guard. Other guards were swarming in, but Rizzett had the blaster now. With hands and knees he struggled against the Tyrannian soldiers. Hurling himself through the huddle of bodies, Biron joined the fight. He caught Rizzett's throat, choking him, pulling him back.

"Traitor," Rizzett gasped, struggling to maintain aim as the Autarch tried desperately to squirm aside. He fired! And then they disarmed him and threw him on his back.

But the Autarch's right shoulder and half his chest had been blasted away.

Grotesquely, the forearm dangled freely from its magnetized sheath. Fingers, wrist, and elbow ended in black ruin. For a long moment it seemed that the Autarch's eyes flickered as his body remained in crazy balance, and then they were glazed and he dropped and was a charred remnant upon the floor.

Artemisia choked and buried her face against Biron's chest. Biron forced himself to look once, firmly and without flinching, at the body of his father's murderer, then turned his eyes away. Hinrik, from a distant corner of the room, mumbled and giggled to himself.

Only Aratap was calm. He said, "Remove the body."

They did so, flaring the floor with a soft heat ray for a few moments to remove the blood. Only a few scattered char marks were left.

They helped Rizzett to his feet. He brushed at himself with both hands, then whirled fiercely toward Biron. "What were you doing? I almost missed the bastard."

Biron said wearily, "You fell into Aratap's trap, Rizzett. "

"Trap? I killed the bastard, didn't I?"

"That was the trap. You did him a favor."

Rizzett made no answer, and Aratap did not interfere. He listened with a certain pleasure. The young fellow's brains worked smoothly.

Biron said, "If Aratap overheard what he claimed to have overheard, he would have known that only Jonti had the information he wanted. Jonti said that, with emphasis, when he faced us after the fight. It was obvious that Aratap was questioning us only to rattle us, to get us to act brainlessly at the proper time. I was ready for the irrational impulse he counted upon. You were not."

"I had thought," interposed Aratap softly, "that you would have done the job."

"I," said Biron, "would have aimed at you." He turned to Rizzett again. "Don't you see that he didn't want the Autarch alive? The Tyranni are snakes. He wanted the Autarch's information; he didn't want to pay for it; he couldn't risk killing him. You did it for him."

"Correct," said Aratap, "and I have my information."

Somewhere there was the sudden clamor of bells.

Rizzett began, "All right. If I did him a favor, I did myself one at the same time."

"Not quite," said the Commissioner, "since our young friend has not carried the analysis far enough. You see, a new crime has been committed. Where the only crime is treason against Tyrann, your disposal would be a delicate matter politically. But now that the Autarch of Lingane has been murdered, you may be tried, convicted, and executed by Linganian law and Tyrann need play no part in it. This will be convenient for--"

And then he frowned and interrupted himself. He heard the clanging, and stepped to the door. He kicked the release.

"What is happening?"

A soldier saluted. "General alarm, sir. Storage compartments."

"Fire?"

"It is not yet known, sir."

Aratap thought to himself, Great Galaxy! and stepped back into the room. "Where is Gillbret?"

And it was the first anyone knew of the latter's absence.

Aratap said, "We'll find him."

They found him in the engine room, cowering amid the giant structures, and half dragged, half carried him back to the Commissioner's room.

The Commissioner said dryly, "There is no escape on a ship, my lord. It did you no good to sound the general alarm. The time of confusion is even then limited."

He went on, "I think it is enough. We have kept the cruiser you stole, Farrill, my own cruiser, on board ship. It will be used to explore the rebellion world. We will make for

the lamented Autarch's reference points as soon as the Jump can be calculated. This will be an adventure of a sort usually missing in this comfortable generation of ours."

There was the sudden thought in his mind of his father in command of a squadron, conquering worlds. He was glad Andros was gone. This adventure would be his alone.

They were separated after that. Artemisia was placed with her father, and Rizzett and Biron were marched off in separate directions. Gillbret struggled and screamed.

"I won't be left alone. I won't be in solitary."

Aratap sighed. This man's grandfather had been a great ruler, the history books said.

It was degrading to have to watch such a scene. He said, with distaste, "Put my lord with one of the others."

And Gillbret was put with Biron. There was no speech between them till the coming of space-ship "night," when the lights turned a dim purple. It was bright enough to allow them to be watched through the tele-viewing system by the guards, shift and shift about, yet dim enough to allow sleep.

But Gillbret did not sleep.

"Biron," he whispered. "Biron."

And Biron, roused from a dull semi-drowse, said, "What do you want?"

"Biron, I have done it. It is all right, Biron."

Biron said, "Try to sleep, Oil."

But Gillbret went on, "But I've done it, Biron. Aratap may be smart, but I'm smarter.

Isn't that amusing? You don't have to worry, Biron. Biron, don't worry. I've fixed it." He was shaking Biron again, feverishly.

Biron sat up. "What's the matter with you?"

"Nothing. Nothing. It's all right. But I fixed it." Gillbret was smiling. It was a sly smile, the smile of a little boy who has done something clever.

"What have you fixed?" Biron was on his feet. He seized the other by the shoulders and dragged him upright as well. "Answer me."

"They found me in the engine room." The words were jerked out. "They thought I was hiding. I wasn't. I sounded the general alarm for the storage room because I had to be alone for just a few minutes--a very few minutes. Biron, I shorted the hyperatomics."

"What?"

"It was easy. It took a minute. And they won't know. I did it cleverly. They won't know until they try to Jump, and then all the fuel will be energy in one chain reaction and the ship and us and Aratap and all knowledge of the rebellion world will be a thin expansion of iron vapor."

Biron was backing away, eyes wide. "You did that?"

"Yes." Gillbret buried his head in his hands and rocked to and fro. "We'll be dead.

Biron, I'm not afraid to die, but not alone. Not alone. I had to be with someone. I'm glad I'm with you. I want to be with someone when I die. But it won't hurt; it will be so quick. It won't hurt. It won't hurt."

Biron said, "Fool! Madman! We might still have won out but for this."

Gillbret didn't hear him. His ears were filled with his own moans. Biron could only dash to the door.

"Guard," he yelled. "Guard!" Were there hours or merely minutes left?

21. HERE?

The soldier came clattering down the corridor. "Get back in there." His voice was sour and sharp.

They stood facing one another. There were no doors to the small bottom-level rooms which doubled as prison cells, but a force field stretched from side to side, top to bottom.

Biron could feel it with his hand. There was a tiny resilience to it, like rubber stretched nearly to its extreme, and then it stopped giving, as though the first initial pressure turned it to steel.

It tingled Biron's hand, and he knew that though it would stop matter completely, it would be as transparent as space to the energy beam of a neuronic whip. And there was a whip in the guard's hand.

Biron said, "I've got to see Commissioner Aratap."

"Is that what you're making a noise about?" The guard was not in the best of humors.

The night watch was unpopular and he was losing at cards. "I'll mention it after lights-on."

"It won't wait." Biron felt desperate. "It's important. "

"It will have to wait. Will you get back, or do you want a bit of the whip?"

"Look," said Biron, "the man with me is Gillbret oth Hinriad. He is sick. He may be dying. If a Hinriad dies on a Tyrannian ship because you will not let me speak to the man in authority, you will not have a good time of it."

"What's wrong with him?"

"I don't know. Will you be quick or are you tired of life?"

The guard mumbled something and was off.

Biron watched him as far as he could see in the dim purple. He strained his ears in an attempt to catch the heightened throbbing of the engines as energy concentration climbed to a pre-Jump peak, but he heard nothing at all.

He strode to Gillbret, seized the man's hair, and pulled his head back gently. Eyes stared into his out of a contorted face. There was no recognition in them, only fear.

"Who are you?"

"It's only me--Biron. How do you feel?"

It took time for the words to penetrate. Gillbret said, blankly, "Biron?" Then, with a quiver of life, "Biron! Are they Jumping? Death won't hurt, Biron."

Biron let the head drop. No point in anger against Gillbret. On the information he had, or thought he had, it was a great gesture. All the more so, since it was breaking him.

But he was writhing in frustration. Why wouldn't they let him speak to Aratap? Why wouldn't they let him out? He found himself at a wall and beat upon it with his fists. If

there were a door, he could break it down; if there were bars, he could pull them apart or drag them out of their sockets, by the Galaxy.

But there was a force field, which nothing could damage. He yelled again.

There were footsteps once more. He rushed to the open-yet-not-open door. He could not look out to see who was coming down the corridor. He could only wait.

It was the guard again. "Get back from the field," he barked. "Step back with your hands in front of you." There was an officer with him.

Biron retreated. The other's neuronic whip was on him, unwaveringly. Biron said, "The man with you is not Aratap. I want to speak to the Commissioner."

The officer said, "If Gillbret oth Hinriad is ill, you don't want to see the Commissioner. You want to see a doctor."

The force field was down, with a dim blue spark showing as contact broke. The officer entered, and Biron could see the Medical Group insignia on his uniform.

Biron stepped in front of him. "All right. Now listen to me. This ship mustn't Jump.

The Commissioner is the only one who can see to that, and I must see him. Do you understand that? You're an officer. You can have him awakened."

The doctor put out an arm to brush Biron aside, and Biron batted it away. The doctor cried out sharply and called, "Guard, get this man out of here."

The guard stepped forward and Biron dived. They went thumping down together, and Biron clawed up along the guard's body, hand over hand, seizing first the shoulder and then the wrist of the arm that was trying to bring its whip down upon him.

For a moment they remained frozen, straining against one another, and then Biron caught motion at the corner of his eye. The medical officer was rushing past them to sound the alarm.

Biron's hand, the one not holding the other's whip wrist, shot out and seized the officer's ankle. The guard writhed nearly free, and the officer kicked out wildly at him, but, with the veins standing out on his neck and temples, Biron pulled desperately with each hand.

The officer went down; shouting hoarsely. The guard's whip clattered to the floor with a harsh sound.

Biron fell upon it, rolled with it, and came up on his knees and one hand. In his other was the whip.

"Not a sound," he gasped. "Not one sound. Drop anything else you've got."

The guard, staggering to his feet, his tunic ripped, glared hatred and tossed a short, metal-weighted, plastic club away from himself. The doctor was unarmed.

Biron picked up the club. He said, "Sorry. I have nothing to tie and gag you with and no time anyway."

The whip flashed dimly once, twice. First the guard and then the doctor stiffened in agonized immobility and dropped solidly, in one piece, legs and arms bent grotesquely out from their bodies as they lay, in the attitude they had last assumed before the whip struck.

Biron turned to Gillbret, who was watching with dull, soundless vacuity.

"Sorry," said Biron, "but you, too, Gillbret," and the whip flashed a third time. The vacuous expression was frozen solid as Gillbret lay there on his side. The force field was still down and Biron stepped out into the corridor. It was empty.

This was space-ship "night" and only the watch and the night details would be up. There would be no time to try to locate Aratap. It would have to be straight for the engine room. He set off. It would be toward the bow, of course.

A man in engineer's work clothes hurried past him.

"When's the next Jump?" called out Biron.

"About half an hour," the engineer returned over his shoulder.

"Engine room straight ahead?"

"And up the ramp." The man turned suddenly. "Who are you?"

Biron did not answer. The whip flared a fourth time. He stepped over the body and went on. Half an hour left.

He heard the noise of men as he sped up the ramp. The light ahead was white, not purple. He hesitated. Then he put the whip into his pocket. They would be busy. There would be no reason for them to suspect him.

He stepped in quickly. The men were pygmies scurrying about the huge matter-energy converters. The room glared with dials, a hundred thousand eyes staring their information out to all who would look. A ship this size, one almost in the class of a large passenger liner, was considerably different from the tiny Tyrannian cruiser he had been used to. There, the engines had been all but automatic. Here they were large enough to power a city, and required considerable supervision.

He was on a railed balcony that circled the engine room. In one corner there was a small room in which two men handled computers with flying fingers.

He hurried in that direction, while engineers passed him without looking at him, and stepped through the door.

The two at the computers looked at him.

"What's up?" one asked. "What are you doing up here? Get back to your post." He had a lieutenant's stripes.

Biron said, "Listen to me. The hyperatomics have been shorted. They've got to be repaired."

"Hold on," said the second man, "I've seen this man. He's one of the prisoners. Hold him, Lancy."

He jumped up and was making his way out the other door. Biron hurdled the desk and the computer, seized the belt of the controlman's tunic and pulled him backward.

"Correct," he said. "I'm one of the prisoners. I'm Biron of Widemos. But what I say is true. The hyperatomics are shorted. Have them inspected, if you don't believe me."

The lieutenant found himself staring at a neuronc whip. He said, carefully, "It can't be done, sir, without orders from Officer of the Day, or from the Commissioner. It would mean changing the Jump calculations and delaying us hours."

"Get the authority, then. Get the Commissioner."

"May I use the communicator?"

"Hurry."

The lieutenant's arm reached out for the flaring mouthpiece of the communicator, and halfway there plummeted down hard upon the row of knobs at one end of his desk. Bells clamored in every corner of the ship.

Biron's club was too late. It came down hard upon the lieutenant's wrist. The lieutenant snatched it away, nursing it and moaning over it, but the warning signals were sounding.

Guards were rocketing in upon the balcony through every entrance. Biron slammed out of the control room, looked in either direction, then hopped the railing.

He plummeted down, landing knees bent, and rolled. He rolled as rapidly as he could to prevent setting himself up as a target. He heard the soft hissing of a needle gun near his ear, and then he was in the shadow of one of the engines.

He stood up in a crouch, huddling beneath its curve. His right leg was a stabbing pain. Gravity was high so near the ship's hull and the drop had been a long one. He had sprained his knee badly. It meant that there would be no more chase. If he Won out, it was to be from where he stood.

He called out, "Hold your firer I am unarmed." First the club and then the whip he had taken from the guard went spinning out toward the center of the engine room. They lay there in stark impotence and plain view.

Biron shouted, "I have come to warn you. The hyperatomics are shorted. A Jump will mean the death of us all. I ask only that you check the motors. You will lose a few hours, perhaps, if I am wrong. You will save your lives, if I am right."

Someone called, "Go down there and get him."

Biron yelled, "Will you sell your lives rather than listen?"

He heard the cautious sound of many feet, and shrank backward. Then there was a sound above. A soldier was sliding down the engine toward him, hugging its faintly warm skin as though it were a bride. Biron waited. He could still use his arms.

And then the voice came from above, unnaturally loud, penetrating every corner of the huge room. It said, "Back to your places. Halt preparations for the Jump. Check the hyperatomics."

It was Aratap, speaking through the public-address system. The order then came, "Bring the young man to me."

Biron allowed himself to be taken. There were two soldiers on each side, holding him as though they expected him to explode. He tried to force himself to walk naturally, but he was limping badly.

Aratap was in semidress. His eyes seemed different: faded, peering, unfocused. It occurred to Biron that the man wore contact lenses.

Aratap said, "You have created quite a stir, Farrill."

"It was necessary to save the ship. Send these guards away. As long as the engines are being investigated, there's nothing more I intend doing."

"They will stay just awhile. At least, until I hear from my engine men."

They waited, silently, as the minutes dragged on, and then there was a flash of red upon the frosted-glass circle above the glowing lettering that read "Engine Room."

Aratap opened contact. "Make your report!"

The words that came were crisp and hurried: "Hyperatomics on the C Bank completely shorted. Repairs under way."

Aratap said, "Have Jump recalculated for plus six hours."

He turned to Biron and said coolly, "You were right."

He gestured. The guards saluted, turned on their heels, and left one by one with a smooth precision. Aratap said, "The details, please."

"Gillbret oth Hinriad during his stay in the engine room thought the shorting would be a good idea. The man is not responsible for his actions and must not be punished for it."

Aratap nodded. "He has not been considered responsible for years. That portion of the events will remain between you and me only. However, my interest and curiosity are aroused by your reasons for preventing the destruction of the ship. You are surely not afraid to die in a good cause?"

"There is no cause," said Biron. "There is no rebellion world. I have told you so already and I repeat it. Lingane was the center of revolt, and that has been checked. I was interested only in tracking down my father's murderer, the Lady Artemisia only in escaping an unwanted marriage. As for Gillbret, he is mad."

"Yet the Autarch believed in the existence of this mysterious planet. Surely he gave me the coordinates of something!"

"His belief is based on a madman's dream. Gillbret dreamed something twenty years ago.

Using that as a basis, the Autarch calculated five possible planets as the site of this dream world. It is all nonsense."

The commissioner said, "And yet something disturbs me."

"What?"

"You are working so hard to persuade me. Surely I will find all this out for myself once I have made the Jump. Consider that it is not impossible that in desperation one of you might endanger the ship and the other save it as a complicated method for convincing me that I need look no further for the rebellion world. I would say to myself: If there were really such a world, young Farrill would have let the ship vaporize, for he is a young man and romantically capable of dying what he would consider a hero's death. Since he has risked his life to prevent that happening, Gillbret is mad, there is no rebellion world, and I will return without searching further. Am I too complicated for you?"

"No. I understand you."

"And since you have saved our lives, you will receive appropriate consideration in the Khan's court. You will have saved your life and your cause. No, young sir, I am not quite so ready to believe the obvious. We will still make the Jump."

"I have no objections," said Biron.

"You are cool," said Aratap. "It is a pity you were not born one of us."

He meant it as a compliment. He went on, "We'll take you back to your cell now, and replace the force field. A simple precaution."

Biron nodded.

The guard that Biron had knocked out was no longer there when they returned to the prison room, but the doctor was. He was bending over the still-unconscious form of Gillbret.

Aratap said, "Is he still under?"

At his voice the doctor jumped up. "The effects of the whip have worn off, Commissioner, but the man is not young and has been under a strain. I don't know if he will recover."

Biron felt horror fill him. He dropped to his knees, disregarding the wrenching pain, and reached out a hand to touch Gillbret's shoulder gently.

"Gil," he whispered. He watched the damp, white face, anxiously.

"Out of the way, man." The medical officer was scowling at him. He removed his black doctor's wallet from an inner pocket.

"At least the hypodermics aren't broken," he grumbled. He leaned over Gillbret, the hypodermic, filled with its colorless fluid, poised. It sank deep, and the plunger pressed inward automatically. The doctor tossed it aside and they waited.

Gillbret's eyes flickered, then opened. For a while they stared unseeingly. When he spoke finally, his voice was a whisper. "I can't see, Biron. I can't see."

Biron leaned close again. "It's all right, Oil. Just rest."

"I don't want to." He tried to struggle upright. "Biron, when are they jumping?"

"Soon, soon!"

"Stay with me, then. I don't want to die alone." His fingers clutched feebly, and then relaxed. His head lolled backward.

The doctor stooped, then straightened. "We were too late. He's dead."

Tears stung at Biron's eyelids. "I'm sorry, Oil," he said, "but you didn't know. You didn't understand." They didn't hear him.

They were hard hours for Biron. Aratap had refused to allow him to attend the ceremonies involved in the burial of a body at space. Somewhere in the ship, he knew, Gillbret's body would be blasted in an atomic furnace and then exhausted into space, where its atoms might mingle forever with the thin wisps of interstellar matter.

Artemisia and Hinrik would be there. Would they understand? Would she understand that he had done only what he had to do?

The doctor had injected the cartilaginous extract that would hasten the healing of Biron's torn ligaments, and already the pain in his knee was barely noticeable, but then that was only physical pain, anyway. It could be ignored.

He felt the inner disturbance that meant the ship had jumped and then the worst time came.

Earlier he had felt his own analysis to be correct. It had to be. But what if he were wrong? What if they were now at the very heart of rebellion? The information would go

streaking back to Tyrann and the armada would gather. And he himself would die knowing that he might have saved the rebellion, but had risked death to ruin it.

It was during that dark time that he thought of the document again. The document he had once failed to get.

Strange the way the notion of the document came and went. It would be mentioned, and then forgotten. There was a mad, intensive search for the rebellion world and yet no search at all for the mysterious vanished document.

Was the emphasis being misplaced?

It occurred to Biron then that Aratap was willing to come upon the rebellion world with a single ship. What was that confidence he had? Could he dare a planet with a ship?

The Autarch had said the document had vanished years before, but then who had it?

The Tyranni, perhaps. They might have a document the secret of which would allow one ship to destroy a world.

If that were true, what did it matter where the rebellion world was, or if it existed at all.

Time passed and then Aratap entered. Biron rose to his feet.

Aratap said, "We have reached the star in question. There is a star there. The coordinates given us by the Autarch were correct."

"Well?"

"But there is no need to inspect it for planets. The star, I am told by my astrogators, was a nova less than a million years ago. If it had planets then, they were destroyed. It is a white dwarf now. It can have no planets."

Biron stared. "Then--"

Aratap said, "So you are right. There is no rebellion world."

22. THERE!

All of Aratap's philosophy could not completely wipe out the feeling of regret within him. For a while he had not been himself, but his father over again. He, too, these last weeks had been leading a squadron of ships against the enemies of the Khan.

But these were degenerate days, and where there might have been a rebellion world, there was none. There were no enemies of the Khan after all; no worlds to gain. He remained only a Commissioner, still condemned to the soothing of little troubles. No more.

Yet regret was a useless emotion. It accomplished nothing.

He said, "So you are right. There is no rebellion world."

He sat down and motioned Biron into a seat as well. "I want to talk to you."

The young man was staring solemnly at him, and Aratap found himself gently amazed that they had met first less than a month ago. The boy was older now, far more than a month older, and he had lost his fear. Aratap thought to himself, I am growing completely decadent. How many of us are beginning to like individuals among our subjects? How many of us wish them well?

He said, "I am going to release the Director and his daughter. Naturally, it is the politically intelligent thing to do. In fact, it is politically inevitable. I think, though, that I will release them now and send them back on the Remorseless. Would you care to pilot them?"

Biron said, "Are you freeing me?"

"Yes."

"Why?"

"You saved my ship, and my life as well."

"I doubt that personal gratitude would influence your actions in matters of state."

Aratap was within a hair of laughing outright. He did like the boy. "Then I'll give you another reason. As long as I was tracking a giant conspiracy against the Khan, you were dangerous. When that giant conspiracy failed to materialize, when all I had was a Langanian cabal of which the leader is dead: you were no longer dangerous. In fact, it would be dangerous to try either you or the Langanian captives.

"The trials would be in Langanian courts and therefore not under our full control.

They would inevitably involve discussion of the so-called rebellion world. And though there is none, half the subjects of Tyrann would think there might be one after all, that where there was such a deal of drumming, there must be a drum. We would have given them a concept to rally round, a reason for revolt, a hope for the future. The Tyrannian realm would not be free of rebellion this side of a century."

"Then you free us all?"

"It will not be exactly freedom, since none of you is exactly loyal. We will deal with Lingane in our own way, and the next Autarch will find himself bound by closer ties to the

Khanate. It will be no longer an Associated State, and trials involving Linganians will not necessarily be tried in Linganian courts hereafter. Those involved in the conspiracy, including those in our hands now, will be exiled to worlds nearer Tyrann, where they will be fairly harmless. You yourself cannot return to Nephelos and need not expect to be restored to your Ranch. You will stay on Rhodia, along with Colonel Rizzett."

"Good enough, " said Biron, "but what of the Lady Artemisia's marriage?"

"You wish it stopped?"

"You must know that we would like to marry each other. You said once there might be some way of stopping the Tyrannian affair."

"At the time I said that I was trying to accomplish something. What is the old saying?"

'The lies of lovers and diplomats shall be forgiven them.' "

"But there is a way, Commissioner. It need only be pointed out to the Khan that when a powerful courtier would marry into an important subject family, it may be motives of ambition that lead him on. A subject revolt may be led by an ambitious Tyrannian as easily as by an ambitious Linganian."

Aratap did laugh this time. "You reason like one of us. But it wouldn't work. Would you want my advice?"

"What would it be?"

"Marry her yourself, quickly. A thing once done would be difficult to undo under the circumstances. We would find another woman for Pohang."

Biron hesitated. Then he put out a hand. "Thank you, sir."

Aratap took it. "I don't like Pohang particularly, anyway. Still, there is one thing further for you to remember. Don't let ambition mislead you. Though you marry the Director's daughter, you will never yourself be Director. You are not the type we want."

Aratap watched the shrinking Remorseless in the visiplat and was glad the decision had been made. The young man was free; a message was already on its way to Tyrann through the sub-ether. Major Andros would undoubtedly swell into apoplexy, and there would not be wanting men at court to demand his recall as Commissioner.

If necessary, he would travel to Tyrann. Somehow he would see the Khan and make him listen. Given all the facts, the King of Kings would see plainly that no other course of action was possible, and thereafter he could defy any possible combination of enemies.

The Remorseless was only a gleaming dot now, scarcely distinguishable from the stars that were beginning to surround it now that they were emerging from the Nebula.

Rizzett watched the shrinking Tyrannian flagship in the visiplat. He said, "So the man let us got You know, if the Tyranni were all like him, damned if I wouldn't join their fleet. It upsets me in a way. I have definite notions of what Tyranni are like, and he doesn't fit. Do you suppose he can hear what we say?"

Biron set the automatic controls and swiveled in the pilot's seat. "No. Of course not."

He can follow us through hyperspace as he did before, but I don't think he can put a spy beam on us. You remember that when he first captured us all he knew about us was what he overheard on the fourth planet. No more."

Artemisia stepped into the pilot room, her finger on her lips. "Not too loudly," she said. "I think he's sleeping now. It won't be long before we reach Rhodia, will it, Biron?"

"We can do it in one Jump, Arta. Aratap had it calculated for us."

Rizzett said, "I've got to wash my hands."

They watched him leave, and then she was in Biron's arms. He kissed her lightly on forehead and eyes, then found her lips as his arms tensed about her. The kiss came to a lingering and breathless end. She said, "I love you very much," and he said, "I love you more than I can say." The conversation that followed was both as unoriginal as that and as satisfying.

Biron said after a while, "Will he marry us before we land?"

Artemisia frowned a little. "I tried to explain that he's Director and captain of the ship and that there are no Tyranni here. I don't know though. He's quite upset. He's not himself at all, Biron. After he's rested, I'll try again."

Biron laughed softly. "Don't worry. He'll be persuaded."

Rizzett's footsteps were noisy as he returned. He said, "I wish we still had the trailer. There isn't room here to take a deep breath."

Biron said, "We'll be on Rhodia in a matter of hours. We'll be Jumping soon."

"I know." Rizzett scowled. "And we'll stay on Rhodia till we die. Not that I'm complaining overloud; I'm glad I'm alive. But it's a silly end to it all."

"There hasn't been any ending," said Biron softly.

Rizzett looked up. "You mean we can start allover? No, I don't think so. You can, perhaps, but not I. I'm too old and there's nothing left for me. Lingane will be dragged into line and I'll never see it again. That bothers me most of all, I think. I was born there and lived there all my life. I won't be but half a man anywhere else. You're young; you'll forget Nephelos."

"There's more to life than a home planet, Tedor. It's been our great shortcoming in the past centuries that we've been unable to recognize that fact. All planets are our home planets."

"Maybe. Maybe. If there had been a rebellion world, why, then, it might have been so."

"There is a rebellion world, Tedor."

Rizzett said sharply, "I'm in no mood for that, Biron."

"I'm not telling a lie. There is such a world and I know its location. I might have known it weeks ago, and so might anyone in our party. The facts were all there. They were knocking at my mind without being able to get in until that moment on the fourth planet when you and I had beat down Jonti. Do you remember him standing there, saying that we would never find the fifth planet without his help? Do you remember his words?"

"Exactly? No."

"I think I do. He said, 'There is an average of seventy cubic light-years per star. If you work by trial and error, without me, the odds are two hundred and fifty quadrillion to one against your coming within a billion miles of any star. Any star!' It was at that moment, I think, that the facts got into my mind. I could feel the click."

"Nothing clicks in my mind," said Rizzett. "Suppose you explain a bit."

Artemisia said, "I don't see what you can mean, Biron."

Biron said, "Don't you see that it is exactly those odds which Gillbret is supposed to have defeated? You remember his story. The meteor hit, deflected his ship's course, and at the end of its Jumps, it was actually within a stellar system. That could have happened only by a coincidence so incredible as to be not worth any belief."

"Then it was a madman's story and there is no rebellion world."

"Unless there is a condition under which the odds against landing within a stellar system are less incredible, and there is such a condition. In fact, there is one set of circumstances, and only one, under which he must have reached a system. It would have been inevitable."

"Well?"

"You remember the Autarch's reasoning. The engines of Gillbret's ship were not interfered with, so the power of the hyperatomic thrusts, or, in other words, the lengths of the Jumps, were not changed. Only their direction was changed in such a way that one of the five stars in an incredibly vast area of the Nebula was reached. It was an interpretation which, on the very face of it, was improbable."

"But the alternative?"

"Why, that neither power nor direction was altered. There is no real reason to suppose the direction of drive to have been interfered with. That was only assumption. What if the ship had simply followed its original course? It had been aimed at a stellar system, therefore it ended in a stellar system. The matter of odds doesn't enter."

"But the stellar system it was aimed at--"

"--was that of Rhodia. So he went to Rhodia. Is that so obvious that it's difficult to grasp?"

Artemisia said, "But then the rebellion world must be at home! That's impossible."

"Why impossible? It is somewhere in the Rhodian System. There are two ways of hiding an object. You can put it where no one can find it, as, for instance, within the Horsehead Nebula. Or else you can put it where no one would ever think of looking, right in front of their eyes in plain view."

"Consider what happened to Gillbret after landing on the rebellion world. He was returned to Rhodia alive. His theory was that this was in order to prevent a Tyrannian search for the ship which might come dangerously close to the world itself. But then why was he kept alive? If the ship had been returned with Gillbret dead, the same purpose would have been accomplished and there would have been no chance of Gillbret's talking, as, eventually, he did."

"Again, that can only be explained by supposing the rebellion world to be within the Rhodian System. Gillbret was a Hinriad, and where else would there be such respect for the life of a Hinriad but in Rhodia?"

Artemisia's hands clenched spasmodically. "But if what you say is true, Biron, then Father is in terrible danger."

"And has been for twenty years," agreed Biron, "but perhaps not in the manner you think. Gillbret once told me how difficult it was to pretend to be a dilettante and a good-for-nothing, to pretend so hard that one had to live the part even with friends and even when alone. Of course, with him, poor fellow, it was largely self-dramatization. He didn't really live the part. His real self came out easily enough with you, Arta. It showed to the Autarch. He even found it necessary to show it to me on fairly short acquaintance.

"But it is possible, I suppose, to really live such a life completely, if your reasons are sufficiently important. A man might live a lie even to his daughter, be willing to see her terribly married rather than risk a lifework that depended on complete Tyrannian trust, be willing to seem half a madman--"

Artemisia found her voice. She said huskily, "You can't mean what you're saying!"

"There is no other meaning possible, Arta. He has been Director over twenty years. In that time Rhodia has been continually strengthened by territory granted it by the Tyranni, because they felt it would be safe with him. For twenty years he has organized rebellion without interference from them, because he was so obviously harmless."

"You're guessing, Biron," said Rizzett, "and this kind of a guess is as dangerous as the ones we've made before."

Biron said, "This is no guess. I told Jonti in that last discussion of ours that he, not the Director, must have been the traitor who murdered my father, because my father would never have been foolish enough to trust the Director with any incriminating information. But the point is--and I knew it at the time--that this was just what my father did. Gillbret learned of Jonti's conspiratorial role through what he overheard in the discussions between my father and the Director. There is no other way in which he could have learned it.

"But a stick points both ways. We thought my father was working for Jonti and trying to enlist the support of the Director. Why is it not equally probable, or even more probable, that he was working for the Director and that his role within Jonti's organization was as an agent of the rebellion world attempting to prevent a premature explosion on Lingane that would ruin two decades of careful planning?"

"Why do you suppose it seemed so important to me to save Aratap's ship when Gillbret shorted the motors? It wasn't for myself. I didn't, at the time, think Aratap would free me, no matter what. It wasn't even so much for you, Arta. It was to save the Director. He was the important man among us. Poor Gillbret didn't Understand that."

Rizzett shook his head. "I'm sorry. I just can't make myself believe all that."

It was a new voice that spoke. "You may as well. It is true." The Director was standing just outside the door, tall and somber-eyed. It was his voice and yet not quite his voice. It was crisp and sure of itself.

Artemisia ran to him. "Father! Biron says--"

"I heard what Biron said." He was stroking her hair with long, gentle motions of the hand. "And it is true. I would even have let your marriage take place."

She stepped back from him, almost in embarrassment. "You sound so different. You sound almost as if--"

"As if I weren't your father." He said it sadly. "It will not be for long, Arta. When we are back on Rhodia, I will be as you knew me, and you must accept me so."

Rizzett stared at him, his usually ruddy complexion as gray as his hair. Biron was holding his breath.

Hinrik said, "Come here, Biron."

He placed a hand on Biron's shoulder. "There was a time, young man, when I was ready to sacrifice your life. The time may come again in the future. Until a certain day I can protect neither of you. I can be nothing but what I have always seemed. Do you understand that?"

Each nodded.

"Unfortunately," said Hinrik, "damage has been done. Twenty years ago I was not as hardened to my role as I am today. I should have ordered Gillbret killed, but I could not.

Because I did not, it is now known that there is a rebellion world and that I am its leader."

"Only we know that," said Biron.

Hinrik smiled bitterly. "You think that because you are young. Do you think Aratap is less intelligent than yourself? The reasoning by which you determined the location and leadership of the rebellion world is based on facts known to him, and he can reason as well as you. It is merely that he is older, more cautious; that he has grave responsibilities. He must be certain.

"Do you think he released you out of sentiment? I believe that you have been freed now for the same reason you were freed once before--simply that you might lead him farther along the path that leads to me."

Biron was pale. "Then I must leave Rhodia?"

"No. That would be fatal. There would seem no reason for you to leave, save the true one. Stay with me and they will remain uncertain. My plans are nearly completed. One more year, perhaps, or less."

"But Director, there are factors you may not be aware of. There is the matter of the document--"

"For which your father was searching?"

"Yes."

"Your father, my boy, did not know all there was to know. It is not safe to have anyone in possession of all the facts. The old Rancher discovered the existence of the document independently in the references to it in my library. I'll give him credit. He recognized its significance. But if he had consulted me, I would have told him it was no longer on Earth."

"That's exactly it, sir. I am certain the Tyranni have it."

"But of course not. I have it. I've had it for twenty years. It was what started the rebellion world, for it was only when I had it that I knew we could hold our winnings once we had won."

"It is a weapon, then?"

"It is the strongest weapon in the universe. It will destroy the Tyranni and us alike, but will save the Nebular Kingdoms. Without it, we could perhaps defeat the Tyranni, but we would only have exchanged one feudal despotism for another, and as the Tyranni are plotted against, we would be plotted against. We and they must both be delivered into the ashcan of outmoded political systems. The time for maturity has come as it once came on the planet Earth, and there will be a new kind of government, a kind that has never yet been tried in the Galaxy. There will be no Khans, no Autarchs, Directors, or Ranchers."

"In the name of Space," roared Rizzett suddenly, "what will there be?"

"People."

"People? How can they govern? There must be some one person to make decisions."

"There is a way. The blueprint I have, dealt with a small section of one planet, but it can be adapted to all the Galaxy."

The Director smiled. "Come, children, I may as well marry you. It can do little more harm now."

Biron's hand tightly enclosed Artemisia's and she was smiling at him. They felt the queer inward twinge as the Remorseless made its single precalculated Jump.

Biron said, "Before you start, sir, will you tell me something about the blueprint you mention, so that my curiosity will be satisfied and I can keep my mind on Arta?"

Artemisia laughed and said, "You had better do it, Father. I couldn't bear an abstracted groom."

Hinrik smiled. "I know the document by heart. Listen."

And with Rhodia's sun bright on the visiplat, Hinrik began with those words that were older--far older--than any of the planets in the Galaxy save one: "'We the people of the United States, in order to form a more perfect Union, establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America. . . .'"

PRELUDE TO FOUNDATION

1988

AUTHOR'S NOTE

When I wrote "Foundation," which appeared in the May 1942 issue of *Astounding Science Fiction*, I had no idea that I had begun a series of stories that would eventually grow into six volumes and a total of 650,000 words (so far). Nor did I have any idea that it would be unified with my series of short stories and novels involving robots and my novels involving the Galactic Empire for a grand total (so far) of fourteen volumes and a total of about 1,450,000 words.

You will see, if you study the publication dates of these books, that there was a twenty-five-year hiatus between 1957 and 1982, during which I did not add to this series. This was not because I had stopped writing. Indeed, I wrote full-speed throughout the quarter century, but I wrote other things. That I returned to the series in 1982 was not my own notion but was the result of a combination of pressures from readers and publishers that eventually became overwhelming.

In any case, the situation has become sufficiently complicated for me to feel that the readers might welcome a kind of guide to the series, since they were not written in the order in which (perhaps) they should be read.

The fourteen books, all published by Doubleday, offer a kind of history of the future, which is, perhaps, not completely consistent, since I did not plan consistency to begin with. The chronological order of the books, in terms of future history (and not of publication date), is as follows:

1. *The Complete Robot* (1982). This is a collection of thirty-one robot short stories published between 1940 and 1976 and includes every story in my earlier collection *I, Robot* (1950). Only one robot short story has been written since this collection appeared. That is "Robot Dreams," which has not yet appeared in any Doubleday collection.
2. *The Caves of Steel* (1954). This is the first of my robot novels.
3. *The Naked Sun* (1957). The second robot novel.
4. *The Robots of Dawn* (1983). The third robot novel.
5. *Robots and Empire* (1985). The fourth robot novel.
6. *The Currents of Space* (1952). This is the first of my Empire novels.
7. *The Stars, Like Dust-* (1951). The second Empire novel.
8. *Pebble in the Sky* (1950). The third Empire novel.
9. *Prelude to Foundation* (1988). This is the first Foundation novel (although it is the latest written, so far).

10. Foundation (1951). The second Foundation novel. Actually, it is a collection of four stories, originally published between 1942 and 1944, plus an introductory section written for the book in 1949.

11. Foundation and Empire (1952). The third Foundation novel, made up of two stories, originally published in 1945.

12. Second Foundation (1953). The fourth Foundation novel, made up of two stories, originally published in 1948 and 1949.

13. Foundations Edge (1982). The fifth Foundation novel.

14. Foundation and Earth (1983). The sixth Foundation novel.

Will I add additional books to the series? I might. There is room for a book between Robots and Empire (5) and The Currents of Space (6) and between Prelude to Foundation (9) and Foundation (10) and of course between others as well. And then I can follow Foundation and Earth (14) with additional volumes-as many as I like.

Naturally, there's got to be some limit, for I don't expect to live forever, but I do intend to hang on as long as possible.

MATHEMATICIAN

CLEON I- . . . The last Galactic Emperor of the Entun dynasty. He was born in the year 11,988 of the Galactic Era, the same year in which Hari Seldon was born. (It is thought that Seldon's birthdate, which some consider doubtful, may have been adjusted to match that of Cleon, whom Seldon, soon after his arrival on Trantor, is supposed to have encountered.)

Having succeeded to the Imperial throne in 12,010 at the age of twenty-two, Cleon I's reign represented a curious interval of quiet in those troubled times.

This is undoubtedly due to the skills of his Chief of Staff, Eto Demerzel, who so carefully obscured himself from public record that little is known about him.

Cleon himself . . .

ENCYCLOPEDIA GALACTICA

All quotations from the ENCYCLOPEDIA GALACTICA here reproduced are taken from the 116th Edition, published 1,020 FE by the ENCYCLOPEDIA GALACTICA Publishing Co., Terminus, with permission of the publishers.

1.

Suppressing a small yawn, Cleon said, "Demerzel, have you by any chance ever heard of a man named Hari Seldon?"

Cleon had been Emperor for just over ten years and there were times at state occasions when, dressed in the necessary robes and regalia, he could manage to look stately. He did so, for instance, in the holograph of himself that stood in the niche in the wall behind him. It was placed so that it clearly dominated the other niches holding the holographs of several of his ancestors.

The holograph was not a totally honest one, for though Cleon's hair was light brown in hologram and reality alike, it was a bit thicker in the holograph.

There was a certain asymmetry to his real face, for the left side of his upper lip raised itself a bit higher than the right side, and this was somehow not evident in the holograph. And if he had stood up and placed himself beside the holograph, he would have been seen to be 2 centimeters under the 1.83-meter height that the image portrayed--and perhaps a bit stouter.

Of course, the holograph was the official coronation portrait and he had been younger then. He still looked young and rather handsome, too, and when he was not in

the pitiless grip of official ceremony, there was a kind of vague good nature about his face.

Demerzel said, with the tone of respect that he carefully cultivated, "Hari Seldon? It is an unfamiliar name to me, Sire. Ought I to know of him?"

"The Minister of Science mentioned him to me last night. I thought you might."

Demerzel frowned slightly, but only very slightly, for one does not frown in the Imperial presence. "The Minister of Science, Sire, should have spoken of this man to me as Chief of Staff. If you are to be bombarded from every side--"

Cleon raised his hand and Demerzel stopped at once. "Please, Demerzel, one can't stand on formality at all times. When I passed the Minister at last night's reception and exchanged a few words with him, he bubbled over. I could not refuse to listen and I was glad I had, for it was interesting."

"In what way interesting, Sire?"

"Well, these are not the old days when science and mathematics were all the rage. That sort of thing seems to have died down somehow, perhaps because all the discoveries have been made, don't you think? Apparently, however, interesting things can still happen. At least I was told it was interesting."

"By the Minister of Science, Sire?"

"Yes. He said that this Hari Seldon had attended a convention of mathematicians held here in Trantor - they do this every ten years, for some reason---and he said that he had proved that one could foretell the future mathematically."

Demerzel permitted himself a small smile. "Either the Minister of Science, a man of little acumen, is mistaken or the mathematician is. Surely, the matter of foretelling the future is a children's dream of magic."

"Is it, Demerzel? People believe in such things."

"People believe in many things, Sire."

"But they believe in such things. Therefore, .it doesn't matter whether the forecast of the future is true or not. If a mathematician should predict a long and happy reign for me, a time of peace and prosperity for the Empire- Eh, would that not be well?"

"It would be pleasant to hear, certainly, but what would it accomplish, Sire?"

"But surely if people believe this, they would act on that belief. Many a prophecy, by the mere force of its being believed, is transmuted to fact. These are 'self-fulfilling prophecies.' Indeed, now that I think of it, it was you who once explained this to me."

Demerzel said, "I believe I did, Sire." His eyes were watching the Emperor carefully, as though to see how far he might go on his own. "Still, if that be so, one could have any person make the prophecy. "

"Not all persons would be equally believed, Demerzel. A mathematician, however, who could back his prophecy with mathematical formulas and terminology, might be understood by no one and yet believed by everyone."

Demerzel said, "As usual, Sire, you make good sense. We live in troubled times and it would be worthwhile to calm them in a way that would require neither money nor military effort-which, in recent history, have done little good and much harm."

"Exactly, Demerzel," said the Emperor with excitement. "Reel in this Hari Seldon. You tell me you have your strings stretching to every part of this turbulent world, even where my forces dare not go. Pull on one of those strings, then, and bring in this mathematician. Let me see him."

"I will do so, Sire," said Demerzel, who had already located Seldon and who made a mental note to commend the Minister of Science for a job well done.

2.

Hari Seldon did not make an impressive appearance at this time. Like the Emperor Cleon I, he was thirty-two years old, but he was only 1.73 meters tall. His face was smooth and cheerful, his hair dark brown, almost black, and his clothing had the unmistakable touch of provinciality about it.

To anyone in later times who knew of Hari Seldon only as a legendary demigod, it would seem almost sacrilegious for him not to have white hair, not to have an old lined face, a quiet smile radiating wisdom, not to be seated in a wheelchair. Even then, in advanced old age, his eyes had been cheerful, however.

There was that.

And his eyes were particularly cheerful now, for his paper had been given at the Decennial Convention. It had even aroused some interest in a distant sort of way and old Osterfith had nodded his head at him and had said, "Ingenious, young man. Most ingenious." Which, coming from Osterfith, was satisfactory. Most satisfactory.

But now there was a new-and quite unexpected-development and Seldon wasn't sure whether it should increase his cheer and intensify his satisfaction or not.

He stared at the tall young man in uniform-the Spaceship -and- Sun neatly placed on the left side of his tunic.

"Lieutenant Alban Wellis," said the officer of the Emperor's Guard before putting away his identification. "Will you come with me now, sir?"

Wellis was armed, of course. There were two other Guardsmen waiting outside his door. Seldon knew he had no choice, for all the other's careful politeness, but there was no reason he could not seek information. He said, "To see the Emperor?"

"To be brought to the Palace, sir. That's the extent of my instructions. "

"But why?"

"I was not told why, sir. And I have my strict instructions that you must come with me-one way or another."

"But this seems as though I am being arrested. I have done nothing to warrant that."

"Say, rather, that it seems you are being given an escort of honor -if you delay me no further."

Seldon delayed no further. He pressed his lips together, as though to block off further questions, nodded his head, and stepped forward. Even if he was going to meet

the Emperor and to receive Imperial commendation, he found no joy in it. He was for the Empire-that is, for the worlds of humanity in peace and union but he was not for the Emperor.

The lieutenant walked ahead, the other two behind. Seldon smiled at those he passed and managed to look unconcerned. Outside the hotel they climbed into an official ground-car. (Seldon ran his hand over the upholstery; he had never been in anything so ornate.)

They were in one of the wealthiest sections of Trantor. The dome was high enough here to give a sensation of being in the open and one could swear-even one such as Hari Seldon, who had been born and brought up on an open world-that they were in sunlight. You could see no sun and no shadows, but the air was light and fragrant.

And then it passed and the dome curved down and the walls narrowed in and soon they were moving along an enclosed tunnel, marked periodically with the Spaceship-and-Sun and so clearly reserved (Seldon thought) for official vehicles.

A door opened and the ground-car sped through. When the door closed behind them, they were in the open-the true, the real open. There were 250 square kilometers of the only stretch of open land on Trantor and on it stood the Imperial Palace.

Seldon would have liked a chance to wander through that open land-not because of the Palace, but because it also contained the Galactic University and, most intriguing of all, the Galactic Library.

And yet, in passing from the enclosed world of Trantor into the open patch of wood and parkland, he had passed into a world in which clouds dimmed the sky and a chill wind rued his shirt. He pressed the contact that closed the ground-car's window.

It was a dismal day outside.

3.

Seldon was not at all sure he would meet the Emperor. At best, he would meet some official in the fourth or fifth echelon who would claim to speak for the Emperor.

How many people ever did see the Emperor? In person, rather than on holovision? How many people saw the real, tangible Emperor, an Emperor who never left the Imperial grounds that he, Seldon, was now rolling over.

The number was vanishingly small. Twenty-five million inhabited worlds, each with its cargo of a billion human beings or more---and among all those quadrillions of human beings, how many had, or would ever, lay eyes on the living Emperor. A thousand?

And did anyone care? The Emperor was no more than a symbol of Empire, like the Spaceship-and-Sun but far less pervasive, far less real. It was his soldiers and his officials, crawling everywhere, that now represented an Empire that had become a dead weight upon its people-not the Emperor.

So it was that when Seldon was ushered into a moderately sized, lavishly furnished room and found a young-looking man sitting on the edge of a table in a windowed

alcove, one foot on the ground and one swinging over the edge, he found himself wondering that any official should be looking at him in so blandly good-natured a way. He had already experienced the fact, over and over, that government officials--and particularly those in the Imperial service looked grave at all times, as though bearing the weight of the entire Galaxy on their shoulders. And it seemed the lower in importance they were, the graver and more threatening their expression.

This, then, might be an official so high in the scale, with the sun of power so bright upon him, that he felt no need of countering it with clouds of frowning.

Seldon wasn't sure how impressed he ought to be, but he felt that it would be best to remain silent and let the other speak first.

The official said, "You are Hari Seldon, I believe. The mathematician. "

Seldon responded with a minimal "Yes, sir," and waited again.

The young man waved an arm. "It should be 'Sire,' but I hate ceremony. It's all I get and I weary of it. We are alone, so I will pamper myself and eschew ceremony. Sit down, professor."

Halfway through the speech, Seldon realized that he was speaking to the Emperor Cleon, First of that Name, and he felt the wind go out of him. There was a faint resemblance (now that he looked) to the official holograph that appeared constantly in the news, but in that holograph, Cleon was always dressed imposingly, seemed taller, nobler, frozen-faced.

And here he was, the original of the holograph, and somehow he appeared to be quite ordinary.

Seldon did not budge.

The Emperor frowned slightly and, with the habit of command present even in the attempt to abolish it, at least temporarily, said peremptorily, "I said, 'Sit down,' man. That chair. Quickly."

Seldon sat down, quite speechless. He could not even bring himself to say, "Yes, Sire."

Cleon smiled. "That's better. Now we can talk like two fellow human beings, which, after all, is what we are once ceremony is removed. Eh, my man?"

Seldon said cautiously, "If Your Imperial Majesty is content to say so, then it is so."

"Oh, come, why are you so cautious? I want to talk to you on equal terms. It is my pleasure to do so. Humor me."

"Yes, Sire."

"A simple 'Yes,' man. Is there no way I can reach you?"

Cleon stared at Seldon and Seldon thought it was a lively and interested stare. Finally the Emperor said, "You don't look like a mathematician."

At last, Seldon found himself able to smile. "I don't know what a mathematician is suppose to look like, Your Imp--"

Cleon raised a cautioning hand and Seldon choked off the honorific.

Cleon said, "White-haired, I suppose. Bearded, perhaps. Old, certainly."

"Yet even mathematicians must be young to begin with."

"But they are then without reputation. By the time they obtrude themselves on the notice of the Galaxy, they are as I have described."

"I am without reputation, I'm afraid."

"Yet you spoke at this convention they held here."

"A great many of us did. Some were younger than myself. Few of us were granted any attention whatever."

"Your talk apparently attracted the attention of some of my officials. I am given to understand that you believe it possible to predict the future."

Seldon suddenly felt weary. It seemed as though this misinterpretation of his theory was constantly going to occur. Perhaps he should not have presented his paper.

He said, "Not quite, actually. What I have done is much more limited than that. In many systems, the situation is such that under some conditions chaotic events take place. That means that, given a particular starting point, it is impossible to predict outcomes. This is true even in some quite simple systems, but the more complex a system, the more likely it is to become chaotic. It has always been assumed that anything as complicated as human society would quickly become chaotic and, therefore, unpredictable. What I have done, however, is to show that, in studying human society, it is possible to choose a starting point and to make appropriate assumptions that will suppress the chaos. That will make it possible to predict the future, not in full detail, of course, but in broad sweeps; not with certainty, but with calculable probabilities."

The Emperor, who had listened carefully, said, "But doesn't that mean that you have shown how to predict the future?"

"Again, not quite. I have showed that it is theoretically possible, but no more. To do more, we would actually have to choose a correct starting point, make correct assumptions, and then find ways of carrying through calculations in a finite time. Nothing in my mathematical argument tells us how to do any of this. And even if we could do it all, we would, at best, only assess probabilities. That is not the same as predicting the future; it is merely a guess at what is likely to happen. Every successful politician, businessman, or human being of any calling must make these estimates of the future and do it fairly well or he or she would not be successful."

"They do it without mathematics."

"True. They do it by intuition."

"With the proper mathematics, anyone would be able to assess the probabilities. It wouldn't take the rare human being who is successful because of a remarkable intuitive sense."

"True again, but I have merely shown that mathematical analysis is possible; I have not shown it to be practical."

"How can something be possible, yet not practical?"

"It is theoretically possible for me to visit each world of the Galaxy and greet each person on each world. However, it would take far longer to do this than I have years to live and, even if I was immortal, the rate at which new human beings are being born is

greater than the rate at which I could interview the old and, even more to the point, old human beings would die in great numbers before I could ever get to them."

"And is this sort of thing true of your mathematics of the future?"

Seldon hesitated, then went on. "It might be that the mathematics would take too long to work out, even if one had a computer the size of the Universe working at hyperspatial velocities. By the time any answer had been received, enough years would have elapsed to alter the situation so grossly as to make the answer meaningless."

"Why cannot the process be simplified?" Cleon asked sharply.

"Your Imperial Majesty"-Seldon felt the Emperor growing more formal as the answers grew less to his liking and responded with greater formality of his own, "consider the manner in which scientists have dealt with subatomic particles. There are enormous numbers of these, each moving or vibrating in random and unpredictable manner, but this chaos turns out to have an underlying order, so that we can work out a quantum mechanics that answers all the questions we know how to ask. In studying society, we place human beings in the place of subatomic particles, but now there is the added factor of the human mind. Particles move mindlessly; human beings do not. To take into account the various attitudes and impulses of mind adds so much complexity that there lacks time to take care of all of it."

"Could not mind, as well as mindless motion, have an underlying order?"

"Perhaps. My mathematical analysis implies that order must underlie everything, however disorderly it may appear to be, but it does not give any hint as to how this underlying order may be found. Consider-Twenty-five million worlds, each with its overall characteristics and culture, each being significantly different from all the rest, each containing a billion or more human beings who each have an individual mind, and all the worlds interacting in innumerable ways and combinations! However theoretically possible a psychohistorical analysis may be, it is not likely that it can be done in any practical sense."

"What do you mean 'psychohistorical'?"

"I refer to the theoretical assessment of probabilities concerning the future as 'psychohistory.' "

The Emperor rose to his feet suddenly, strode to the other end of the room, turned, strode back, and stopped before the still-sitting Seldon.

"Stand up!" he commanded.

Seldon rose and looked up at the somewhat taller Emperor. He strove to keep his gaze steady.

Cleon finally said, "This psychohistory of yours . . . if it could be made practical, it would be of great use, would it not?"

"Of enormous use, obviously. To know what the future holds, in even the most general and probabilistic way, would serve as a new and marvelous guide for our actions, one that humanity has never before had. But, of course-" He paused.

"Well?" said Cleon impatiently.

"Well, it would seem that, except for a few decision-makers, the results of psychohistorical analysis would have to remain unknown to the public."

"Unknown!" exclaimed Cleon with surprise.

"It's clear. Let me try to explain. If a psychohistorical analysis is made and the results are then given to the public, the various emotions and reactions of humanity would at once be distorted. The psychohistorical analysis, based on emotions and reactions that take place without knowledge of the future, become meaningless. Do you understand?"

The Emperor's eyes brightened and he laughed aloud. "Wonderful!" He clapped his hand on Seldon's shoulder and Seldon staggered slightly under the blow.

"Don't you see, man?" said Cleon. "Don't you see? There's your use. You don't need to predict the future. Just choose a future--a good future, a useful future--and make the kind of prediction that will alter human emotions and reactions in such a way that the future you predicted will be brought about. Better to make a good future than predict a bad one."

Seldon frowned. "I see what you mean, Sire, but that is equally impossible."

"Impossible?"

"Well, at any rate, impractical. Don't you see? If you can't start with human emotions and reactions and predict the future they will bring about, you can't do the reverse either. You can't start with a future and predict the human emotions and reactions that will bring it about."

Cleon looked frustrated. His lips tightened. "And your paper, then? . . . Is that what you call it, a paper? . . . Of what use is it?"

"It was merely a mathematical demonstration. It made a point of interest to mathematicians, but there was no thought in my mind of its being useful in any way."

"I find that disgusting," said Cleon angrily.

Seldon shrugged slightly. More than ever, he knew he should never have given the paper. What would become of him if the Emperor took it into his head that he had been made to play the fool? And indeed, Cleon did not look as though he was very far from believing that.

"Nevertheless," he said, "what if you were to make predictions of the future, mathematically justified or not; predictions that government officials, human beings whose expertise it is to know what the public is likely to do, will judge to be the kind that will bring about useful reactions?"

"Why would you need me to do that? The government officials could make those predictions themselves and spare the middleman."

"The government officials could not do so as effectively. Government officials do make statements of the sort now and then. They are not necessarily believed."

"Why would I be?"

"You are a mathematician. You would have calculated the future, not . . . not intuited it-if that is a word."

"But I would not have done so."

"Who would know that?" Cleon watched him out of narrowed eyes.

There was a pause. Seldon felt trapped. If given a direct order by the Emperor, would it be safe to refuse? If he refused, he might be imprisoned or executed. Not without trial, of course, but it is only with great difficulty that a trial can be made to go against the wishes of a heavy-handed officialdom, particularly one under the command of the Emperor of the vast Galactic Empire.

He said finally, "It wouldn't work."

"Why not?"

"If I were asked to predict vague generalities that could not possibly come to pass until long after this generation and, perhaps, the next were dead, we might get away with it, but, on the other hand, the public would pay little attention. They would not care about a glowing eventuality a century or two in the future. "

"To attain results," Seldon went on, "I would have to predict matters of sharper consequence, more immediate eventualities. Only to these would the public respond. Sooner or later, though and probably sooner one of the eventualities would not come to pass and my usefulness would be ended at once. With that, your popularity might be gone, too, and, worst of all, there would be no further support for the development of psychohistory so that there would be no chance for any good to come of it if future improvements in mathematical insights help to make it move closer to the realm of practicality."

Cleon threw himself into a chair and frowned at Seldon. "Is that all you mathematicians can do? Insist on impossibilities?"

Seldon said with desperate softness, "It is you, Sire, who insist on impossibilities."

"Let me test you, man. Suppose I asked you to use your mathematics to tell me whether I would some day be assassinated? What would you say?"

"My mathematical system would not give an answer to so specific a question, even if psychohistory worked at its best. All the quantum mechanics in the world cannot make it possible to predict the behavior of one lone electron, only the average behavior of many."

"You know your mathematics better than I do. Make an educated guess based on it. Will I someday be assassinated?"

Seldon said softly, "You lay a trap for me, Sire. Either tell me what answer you wish and I will give it to you or else give me free right to make what answer I wish without punishment."

"Speak as you will."

"Your word of honor?"

"Do you want it an writing?" Cleon was sarcastic.

"Your spoken word of honor will be sufficient," said Seldon, his heart sinking, for he was not certain it would be.

"You have my word of honor."

"Then I can tell you that in the past four centuries nearly half the Emperors have been assassinated, from which I conclude that the chances of your assassination are roughly one in two."

"Any fool can give that answer," said Cleon with contempt. "It takes no mathematician."

"Yet I have told you several times that my mathematics is useless for practical problems."

"Can't you even suppose that I learn the lessons that have been given me by my unfortunate predecessors?"

Seldon took a deep breath and plunged in. "No, Sire. All history shows that we do not learn from the lessons of the past. For instance, you have allowed me here in a private audience. What if it were in my mind to assassinate you? "

"-Which it isn't, Sire," he added hastily.

Cleon smiled without humor. "My man, you don't take into account our thoroughness-or advances in technology. We have studied your history, your complete record. When you arrived, you were scanned. Your expression and voiceprints were analyzed. We knew your emotional state in detail; we practically knew your thoughts. Had there been the slightest doubt of your harmlessness, you would not have been allowed near me. In fact, you would not now be alive."

A wave of nausea swept through Seldon, but he continued. "Outsiders have always found it difficult to get at Emperors, even with technology less advanced. However, almost every assassination has been a palace coup. It is those nearest the Emperor who are the greatest danger to him. Against that danger, the careful screening of outsiders is irrelevant. And as for your own officials, your own Guardsmen, your own intimates, you cannot treat them as you treat me."

Cleon said, "I know that, too, and at least as well as you do. The answer is that I treat those about me fairly and I give them no cause for resentment."

"A foolish-" began Seldon, who then stopped in confusion.

"Go on," said Cleon angrily. "I have given you permission to speak freely. How am I foolish?"

"The word slipped out, Sire. I meant 'irrelevant.' Your treatment of your intimates is irrelevant. You must be suspicious; it would be inhuman not to be. A careless word, such as the one I used, a careless gesture, a doubtful expression and you must withdraw a bit with narrowed eyes. And any touch of suspicion sets in motion a vicious cycle. The intimate will sense and resent the suspicion and will develop a changed behavior, try as he might to avoid it. You sense that and grow more suspicious and, in the end, either he is executed or you are assassinated. It is a process that has proved unavoidable for the Emperors of the past four centuries and it is but one sign of the increasing difficulty of conducting the affairs of the Empire."

"Then nothing I can do will avoid assassination."

"No, Sire," said Seldon, "but, on the other hand, you may prove fortunate."

Cleon's fingers were drumming on the arm of his chair. He said harshly, "You are useless, man, and so is your psychohistory. Leave me." And with those words, the Emperor looked away, suddenly seeming much older than his thirty-two years.

"I have said my mathematics would be useless to you, Sire. My profound apologies."

Seldon tried to bow but at some signal he did not see, two guards entered and took him away. Cleon's voice came after him from the royal chamber. "Return that man to the place from which he was brought earlier."

4.

Eto Demerzel emerged and glanced at the Emperor with a hint of proper deference. He said, "Sire, you have almost lost your temper."

Cleon looked up and, with an obvious effort, managed to smile. "Well, so I did. The man was very disappointing."

"And yet he promised no more than he offered."

"He offered nothing."

"And promised nothing, Sire."

"It was disappointing."

Demerzel said, "More than disappointing, perhaps. The man is a loose cannon, Sire."

"A loose what, Demerzel? You are always so full of strange expressions. What is a cannon?"

Demerzel said gravely, "It is simply an expression I heard in my youth, Sire. The Empire is full of strange expressions and some are unknown on Trantor, as those of Trantor are sometimes unknown elsewhere."

"Do you come to teach me the Empire is large? What do you mean by saying that the man is a loose cannon?"

"Only that he can do much harm without necessarily intending it. He does not know his own strength. Or importance."

"You deduce that, do you, Demerzel?"

"Yes, Sire. He is a provincial. He does not know Trantor or its ways. He has never been on our planet before and he cannot behave like a man of breeding, like a courtier. Yet he stood up to "And why not? I gave him permission to speak. I left off ceremony. I treated him as an equal."

"Not entirely, Sire. You don't have it within you to treat others as equals. You have the habit of command. And even if you tried to put a person at his ease, there would be few who could manage it. Most would be speechless or, worse, subservient and sycophantic. This man stood up to you."

"Well, you may admire that, Demerzel, but I didn't like him." Cleon looked thoughtfully discontented. "Did you notice that he made no effort to explain his mathematics to me? It was as though he knew I would not understand a word of it."

"Nor would you have, Sire. You are not a mathematician, nor a scientist of any kind, nor an artist. There are many fields of knowledge in which others know more than you. It is their task to use their knowledge to serve you. You are the Emperor, which is worth all their specializations put together."

"Is it? I would not mind being made to feel ignorant by an old man who had accumulated knowledge over many years. But this man, Seldon, is just my age. How does he know so much?"

"He has not had to learn the habit of command, the art of reaching a decision that will affect the lives of others."

"Sometimes, Demerzel, I wonder if you are laughing at me."

"Sire?" said Demerzel reproachfully.

"But never mind. Back to that loose cannon of yours. Why should you consider him dangerous? He seems a naive provincial to me."

"He is. But he has this mathematical development of his."

"He says it is useless."

"You thought it might be useful. I thought so, after you had explained it to me. Others might. The mathematician may come to think so himself, now that his mind has been focused on it. And who knows, he may yet work out some way of making use of it. If he does, then to foretell the future, however mistily, is to be in a position of great power. Even if he does not wish power for himself, a kind of self-denial that always seems to me to be unlikely, he might be used by others."

"I tried to use him. He would not."

"He had not given it thought. Perhaps now he will. And if he was not interested in being used by you, might he not be persuaded by-let us say-the Mayor of Wye?"

"Why should he be willing to help Wye and not us?"

"As he explained, it is hard to predict the emotions and behavior of individuals."

Cleon scowled and sat in thought. "Do you really think he might develop this psychohistory of his to the point where it is truly useful? He is so certain he cannot."

"He may, with time, decide he was wrong in denying the possibility."

Cleon said, "Then I suppose I ought to have kept him."

Demerzel said, "No, Sire. Your instinct was correct when you let him go. Imprisonment, however disguised, would cause resentment and despair, which would not help him either to develop his ideas further or make him eager to help us. Better to let him go as you have done, but to keep him forever on an invisible leash. In this way, we can see that he is not used by an enemy of yourself, Sire, and we can see that when the time comes and he has fully developed his science, we can pull on our leash and bring him in. Then we could be . . . more persuasive."

"But what if he it picked up by an enemy of mine or, better, of the Empire, for I am the Empire after all, or if, of his own accord, he wishes to serve an enemy-I don't consider that out of the question, you see."

"Nor should you. I will see to it that this doesn't happen, but if, against all striving, it does happen, it would be better if no one has him than if the wrong person does."

Cleon looked uneasy. "I'll leave that all in your hands, Demerzel, but I hope we're not too hasty. He could be, after all, nothing but the purveyor of a theoretical science that does not and cannot work."

"Quite possibly, Sire, but it would be safer to assume the man is -or might be- important. We lose only a little time and nothing more if we find that we have concerned ourselves with a nonentity. We may lose a Galaxy if we find we have ignored someone of great importance."

"Very well, then," said Cleon, "but I trust I won't have to know the details-if they prove unpleasant."

Demerzel said, "Let us hope that will not be the case."

5.

Seldon had had an evening, a night, and part of a morning to get over his meeting with the Emperor. At least, the changing quality of light within the walkways, moving corridors, squares, and parks of the Imperial Sector of Trantor made it seem that an evening, a night, and part of a morning had passed.

He sat now in a small park on a small plastic seat that molded itself neatly to his body and he was comfortable. Judging from the light, it seemed to be midmorning and the air was just cool enough to seem fresh without possessing even the smallest bite.

Was it like this all the time? He thought of the gray day outside when he went to see the Emperor. And he thought of all the gray days and cold days and hot days and rainy days and snowy days on Helicon, his home, and he wondered if one could miss them. Was it possible to sit in a park on Trantor, having ideal weather day after day, so that it felt as though you were surrounded by nothing at all -and coming to miss a howling wind or a biting cold or a breathless humidity?

Perhaps. But not on the first day or the second or the seventh. He would have only this one day and he would leave tomorrow. He meant to enjoy it while he could. He might, after all, never return to Trantor.

Still, he continued to feel uneasy at having spoken as independently as he had to a man who could, at will, order one's imprisonment or execution-or, at the very least, the economic and social death of loss of position and status.

Before going to bed, Seldon had looked up Cleon I in the encyclopedic portion of his hotel room computer. The Emperor had been highly praised as, no doubt, had all Emperors in their own lifetime, regardless of their deeds. Seldon had dismissed that, but he was interested in the fact that Cleon had been born in the Palace and had never left its

grounds. He had never been in Trantor itself, in any part of the multi-domed world. It was a matter of security, perhaps, but what it meant was that the Emperor was in prison, whether he admitted the matter to himself or not. It might be the most luxurious prison in the Galaxy, but it was a prison just the same.

And though the Emperor had seemed mild-mannered and had shown no sign of being a bloody-minded autocrat as so many of his predecessors had been, it was not good to have attracted his attention. Seldon welcomed the thought of leaving tomorrow for Helicon, even though it would be winter (and a rather nasty one, so far) back home.

He looked up at the bright diffuse light. Although it could never rain in here, the atmosphere was far from dry. A fountain played not far from him; the plants were green and had probably never felt drought. Occasionally, the shrubbery rustled as though a small animal or two was hidden there. He heard the hum of bees.

Really, though Trantor was spoken of throughout the Galaxy as an artificial world of metal and ceramic, in this small patch it felt positively rustic.

There were a few other persons taking advantage of the park all wearing light hats, some quite small. There was one rather pretty young woman not far away, but she was bent over a viewer and he could not see her face clearly. A man walked past, looked at him briefly and incuriously, then sat down in a seat facing him and buried himself in a sheaf of teleprints, crossing one leg, in its tight pink trouser leg, over the other.

There was a tendency to pastel shades among the men, oddly enough, while the women mostly wore white. Being a clean environment, it made sense to wear light colors. He looked down in amusement at his own Heliconian costume, which was predominantly dull brown. If he were to stay on Trantor as he was not he would need to purchase suitable clothing or he would become an object of curiosity or laughter or repulsion. The man with the teleprints had, for instance, looked up at him more curiously this time-no doubt intrigued by his Outworldish clothing.

Seldon was relieved that he did not smile. He could be philosophical over being a figure of fun, but, surely, he could not be expected to enjoy it.

Seldon watched the man rather unobtrusively, for he seemed to be engaged in some sort of internal debate. At the moment he looked as if he was about to speak, then seemed to think better of it, then seemed to wish to speak again. Seldon wondered what the outcome would be. He studied the man. He was tall, with broad shoulders and no sign of a paunch, darkish hair with a glint of blond, smooth-shaven, a grave expression, an air of strength though there were no bulging muscles, a face that was a touch rugged-pleasant, but with nothing "pretty" about it. By the time the man had lost the internal fight with himself (or won, perhaps) and leaned toward him, Seldon had decided he liked him.

The man said, "Pardon me, weren't you at the Decennial Convention? Mathematics?"

"Yes, I was," said Seldon agreeably.

"Ah, I thought I saw you there. It was-excuse me-that moment of recognition that led me to sit here. If I am intruding on your privacy-

"Not at all. I'm just enjoying an idle moment."

"Let's see how close I can get. You're Professor Seldon."

"Seldon. Hari Seldon. Quite close. And you?"

"Chetter Hummin." The man seemed slightly embarrassed. "Rather a homespun name, I'm afraid."

"I've never come across any Chetters before," said Seldon. "Or Hummins. So that makes you somewhat unique, I should think. It might be viewed as being better than being mixed up with all the countless Haris there are. Or Seldons, for that matter."

Seldon moved his chair closer to Hummin, scraping it against the slightly elastic ceramoid tiles.

"Talk about homespun," he said, "What about this Outworldish clothing I'm wearing? It never occurred to me that I ought to get Trantorian garb."

"You could buy some," said Hummin, eyeing Seldon with suppressed disapproval.

"I'll be leaving tomorrow and, besides, I couldn't afford it. Mathematicians deal with large numbers sometimes, but never in their income. -I presume you're a mathematician, Hummin."

"No. Zero talent there."

"Oh." Seldon was disappointed. "You said you saw me at the Decennial Convention."

"I was there as an onlooker. I'm a journalist." He waved his teleprints, seemed suddenly aware that he was holding them and shoved them into his jacket pouch.

"I supply the material for the news holocasts." Then, thoughtfully, "Actually, I'm rather tired of it."

"The job?"

Hummin nodded. "I'm sick of gathering together all the nonsense from every world. I hate the downward spiral."

He glanced speculatively at Seldon. "Sometimes something interesting turns up, though. I've heard you were seen in the company of an Imperial Guard and making for the Palace gate. You weren't by any chance seen by the Emperor, were you?"

The smile vanished from Seldon's face. He said slowly, "If I was, it would scarcely be something I could talk about for publication."

"No no, not for publication. If you don't know this, Seldon, let me be the first to tell you-The first rule of the news game is that nothing is ever said about the Emperor or his personal entourage except what is officially given out. It's a mistake, of course, because rumors fly that are much worse than the truth, but that's the way it is."

"But if you can't report it, friend, why do you ask?"

"Private curiosity. Believe me, in my job I know a great deal more than ever gets on the air. -Let me guess. I didn't follow your paper, but I gathered that you were talking about the possibility of predicting the future."

Seldon shook his head and muttered, "It was a mistake."

"Pardon me?"

"Nothing."

"Well, prediction-accurate prediction-would interest the Emperor, or any man in government, so I'm guessing that Cleon, First of that Name, asked you about it and wouldn't you please give him a few predictions."

Seldon said stiffly, "I don't intend to discuss the matter."

Hummin shrugged slightly. "Eto Demerzel was there, I suppose. "

"Who?"

"You've never heard of Eto Demerzel?"

"Never. "

"Cleon's alter ego-Cleon's brain--Cleon's evil spirit. He's been called all those things-if we confine ourselves to the nonvituperative. He must have been there."

Seldon looked confused and Hummin said, "Well, you may not have seen him, but he was there. And if he thinks you can predict the future"

"I can't predict the future," said Seldon, shaking his head vigorously. "If you listened to my paper, you'll know that I only spoke of a theoretical possibility."

"Just the same, if he thinks you can predict the future, he will not let you go."

"He must have. Here I am."

"That means nothing. He knows where you are and he'll continue to know. And when he wants you, he'll get you, wherever you are. And if he decides you're useful, he'll squeeze the use out of you. And if he decides you're dangerous, he'll squeeze the life out of you."

Seldon stared. "What are you trying to do. Frighten me?"

"I'm trying to warn you."

"I don't believe what you're saying."

"Don't you? A while ago you said something was a mistake. Were you thinking that presenting the paper was a mistake and that it was getting you into the kind of trouble you don't want to be in?"

Seldon bit his lower lip uneasily. That was a guess that came entirely too close to the truth-and it was at this moment that Seldon felt the presence of intruders. They did not cast a shadow, for the light was too soft and widespread. It was a simply a movement that caught the corner of his eye-and then it stopped.

FLIGHT

TRANTOR - . . . The capital of the First Galactic Empire . . . Under Cleon 1, it had its "twilight glow." To all appearances, it was then at its peak. Its land surface of 200 million square kilometers was entirely domed (except for the Imperial Palace area) and underlaid with an endless city that extended beneath the continental shelves. The population was 40 billion and although the signs were plentiful (and clearly visible in hindsight) that there were gathering problems, those who lived on Trantor undoubtedly found it still the Eternal World of legend and did not expect it would ever .

. .

ENCYCLOPEDIA GALACTICA

6.

Seldon looked up. A young man was standing before him, looking down at him with an expression of amused contempt. Next to him was another young man--a bit younger, perhaps. Both were large and appeared to be strong. They were dressed in an extreme of Trantorian fashion, Seldon judged--boldly clashing colors, broad fringed belts, round hats with wide brims all about and the two ends of a bright pink ribbon extending from the brim to the back of the neck. In Seldon's eyes, it was amusing and he smiled.

The young man before him snapped, "What're you grinning at, misfit?"

Seldon ignored the manner of address and said gently, "Please pardon my smile. I was merely enjoying your costume."

"My costume? So? And what are you wearing? What's that awful offal you call clothes?" His hand went out and his finger flicked at the lapel of Seldon's jacket--disgracefully heavy and dull, Seldon himself thought, in comparison to the other's lighthearted colors.

Seldon said, "I'm afraid it's my Outworlder clothes. They're all I have."

He couldn't help notice that the few others who were sitting in the small park were rising to their feet and walking off. It was as though they were expecting trouble and had no desire to remain in the vicinity. Seldon wondered if his new friend, Hummin, was leaving too, but he felt it injudicious to take his eyes away from the young man who was confronting him. He teetered back on his chair slightly.

The young man said, "You an Outworlder?"

"That's right. Hence my clothes."

"Hence? What kind of word's that? Outworld word?"

"What I meant was, that was why my clothes seem peculiar to you. I'm a visitor here."

"From what planet?"

"Helicon."

The young man's eyebrows drew together. "Never heard of it."

"It's not a large planet."

"Why don't you go back there?"

"I intend to. I'm leaving tomorrow."

"Sooner! Now!"

The young man looked at his partner. Seldon followed the look and caught a glimpse of Hummin. He had not left, but the park was now empty except for himself, Hummin, and the two young men.

Seldon said, "I'd thought I'd spend today sight-seeing."

"No. You don't want to do that. You go home now."

Seldon smiled. "Sorry. I won't."

The young man said to his partner. "You like his clothes, Marbie?"

Marbie spoke for the first time. "No. Disgusting. Turns the stomach."

"Can't let him go around turning stomachs, Marbie. Not good for people's health."

"No, not by no means, Alem," said Marbie.

Alem grinned. "Well now. You heard what Marbie said."

And now Hummin spoke. He said, "Look, you two, Alem, Marbie, whatever your names are. You've had your fun. Why don't you go away?"

Alem, who had been leaning slightly toward Seldon, straightened and turned.

"Who are you?"

"That's not your business," snapped Hummin.

"You're Trantorian?" asked Alem.

"Also not your business."

Alem frowned and said, "You're dressed Trantorian. We're not interested in you, so don't go looking for problems."

"I intend to stay. That means there are two of us. Two against two doesn't sound like your kind of fight. Why don't you go away and get some friends so you can handle two people?"

Seldon said, "I really think you ought to get away if you can, Hummin. It's kind of you to try to protect me, but I don't want you harmed."

"These are not dangerous people, Seldon. Just half-credit lackeys. "

"Lackeys!" The word seemed to infuriate Alem, so that Seldon thought it must have a more insulting meaning on Trantor than it had on Helicon.

"Here, Marbie," said Alem with a growl. "You take care of that other motherlackey and I'll rip the clothes off this Seldon. He's the one we want."

Now- His hands came down sharply to seize Seldon's lapels and jerk him upright. Seldon pushed away, instinctively it would seem, and his chair tipped backward. He seized the hands stretched toward him, his foot went up, and his chair went down. Somehow Alem streaked overhead, turning as he did so, and came down hard on his

neck and back behind Seldon. Seldon twisted as his chair went down and was quickly on his feet, staring down at Alem, then looking sharply to one side for Marbie. Alem lay unmoving, his face twisted in agony. He had two badly sprained thumbs, excruciating pain in his groin, and a backbone that had been badly jarred.

Hummin's left arm had grabbed Marbie's neck from behind and his right arm had pulled the other's right arm backward at a vicious angle. Marbie's face was red as he labored uselessly for breath. A knife, glittering with a small laser inset, lay on the ground beside them.

Hummin eased his grip slightly and said, with an air of honest concern, "You've hurt that one badly."

Seldon said, "I'm afraid so. If he had fallen a little differently, he would have snapped his neck."

Hummin said, "What kind of a mathematician are you?"

"A Heliconian one." He stooped to pick up the knife and, after examining it, said, "Disgusting-and deadly."

Hummin said, "An ordinary blade would do the job without requiring a power source. -But let's let these two go. I doubt they want to continue any further."

He released Marbie, who rubbed first his shoulder then his neck. Gasping for air, he turned hate-filled eyes on the two men.

Hummin said sharply, "You two had better get out of here. Otherwise we'll have to give evidence against you for assault and attempted murder. This knife can surely be traced to you."

Seldon and Hummin watched while Marbie dragged Alem to his feet and then helped him stagger away, still bent in pain. They looked back once or twice, but Seldon and Hummin watched impassively.

Seldon held out his hand. "How do I thank you for coming to the aid of a stranger against two attackers? I doubt I would have been able to handle them both on my own."

Hummin raised his hand in a deprecatory manner. "I wasn't afraid of them.

They're just street-brawling lackeys. All I had to do was get my hands on them-and yours, too, of course."

"That's a pretty deadly grip you have," Seldon mused.

Hummin shrugged. "You too." Then, without changing his tone of voice, he said, "Come on, we'd better get out of here. We're wasting time." .

Seldon said, "Why do we have to get away? Are you afraid those two will come back?"

"Not in their lifetime. But some of those brave people who cleared out of the park so quickly in their eagerness to spare themselves a disagreeable sight may have alerted the police."

"Fine. We have the hoodlums' names. And we can describe them fairly well."

"Describe them? Why would the police want them?"

"They committed an assault-"

"Don't be foolish. We don't have a scratch. They're virtually hospital bait, especially Alem. We're the ones who will be charged."

"But that's impossible. Those people witnessed the fact that--"

"No people will be called. --Seldon, get this into your head. Those two came to find you--specifically you. They were told you were wearing Heliconian clothes and you must have been described precisely. Perhaps they were even shown a holograph. I suspect they were sent by the people who happen to control the police, so let's not wait any longer."

Hummin hurried off, his hand gripping Seldon's upper arm. Seldon found the grip impossible to shake and, feeling like a child in the hands of an impetuous nurse, followed.

They plunged into an arcade and, before Seldon's eyes grew accustomed to the dimmer light, they heard the burring sound of a ground-car's brakes.

"There they are," muttered Hummin. "Faster, Seldon." They hopped onto a moving corridor and lost themselves in the crowd.

7.

Seldon had tried to persuade Hummin to take him to his hotel room, but Hummin would have none of that.

"Are you mad?" he half-whispered. "They'll be waiting for you there."

"But all my belongings are waiting for me there too."

"They'll just have to wait."

And now they were in a small room in a pleasant apartment structure that might be anywhere for all that Seldon could tell. He looked about the one-room unit.

Most of it was taken up by a desk and chair, a bed, and a computer outlet. There were no dining facilities or washstand of any kind, though Hummin had directed him to a communal washroom down the hall. Someone had entered before Seldon was quite through. He had cast one brief and curious look at Seldon's clothes, rather than at Seldon himself, and had then looked away.

Seldon mentioned this to Hummin, who shook his head and said, "We'll have to get rid of your clothes. Too bad Helicon is so far out of fashion--"

Seldon said impatiently, "How much of this might just be your imagination, Hummin? You've got me half-convinced and yet it may be merely a kind of . . . of--"

"Are you groping for the word 'paranoia'?"

"All right, I am. This may be some strange paranoid notion of yours."

Hummin said, "Think about it, will you? I can't argue it out mathematically, but you've seen the Emperor. Don't deny it. He wanted something from you and you didn't give it to him. Don't deny that either. I suspect that details of the future are what he wants and you refused. Perhaps Demerzel thinks you're only pretending not to have the details that you're holding out for a higher price or that someone else is bidding for it too. Who knows? I told you that if Demerzel wants you, he'll get you wherever you are. I told you

that before those two splitheads ever appeared on the scene. I'm a journalist and a Trantorian. I know how these things go. At one point, Alem said, 'He's the one we want.' Do you remember that?"

"As it happens," said Seldon. "I do."

"To him I was only the 'other motherlackey' to be kept off, while he went about the real job of assaulting you."

Hummin sat down in the chair and pointed to the bed. "Stretch out, Seldon. Make yourself comfortable. Whoever sent those two, -it must have been Demerzel, in my opinion-can send others, so we'll have to get rid of those clothes of yours. I think any other Heliconian in this sector caught in his own world's garb is going to have trouble until he can prove he isn't you."

"Oh come on."

"I mean it. You'll have to take off the clothes and we'll have to atomize them-if we can get close enough to a disposal unit without being seen. And before we can do that I'll have to get you a Trantorian outfit. You're smaller than I am and I'll take that into account. It won't matter if it doesn't fit exactly-"

Seldon shook his head. "I don't have the credits to pay for it. Not on me. What credits I have-and they aren't much-am in my hotel safe."

"We'll worry about that another time. You'll have to stay here for an hour or two while I go out in search of the necessary clothing."

Seldon spread his hands and sighed resignedly. "All right. If it's that important, I'll stay."

"You won't try to get back to your hotel? Word of honor?"

"My word as a mathematician. But I'm really embarrassed by all the trouble you're taking for me. And expense too. After all, despite all this talk about Demerzel, they weren't really out to hurt me or carry me off. All I was threatened with was the removal of my clothes."

"Not all. They were also going to take you to the spaceport and put you on a hypership to Helicon."

"That was a silly threat-not to be taken seriously."

"Why not?"

"I'm going to Helicon. I told them so. I'm going tomorrow."

"And you still plan to go tomorrow?" asked Hummin.

"Certainly. Why not?"

"There are enormous reasons why not."

Seldon suddenly felt angry. "Come on, Hummin, I can't play this game any further. I'm finished here and I want to go home. My tickets are in the hotel room. Otherwise I'd try to exchange them for a trip today. I mean it."

"You can't go back to Helicon."

Seldon flushed. "Why not? Are they waiting for me there too?"

Hummin nodded. "Don't fire up, Seldon. They would be waiting for you there too. Listen to me. If you go to Helicon, you are as good as in Demerzel's hands. Helicon is

good, safe Imperial territory. Has Helicon ever rebelled, ever fallen into step behind the banner of an antiEmperor?"

"No, it hasn't---and for good reason. It's surrounded by larger worlds. It depends on the Imperial peace for security."

"Exactly! Imperial forces on Helicon can therefore count on the full cooperation of the local government. You would be under constant surveillance at all times. Any time Demerzel wants you, he will be able to have you. And, except for the fact that I am now warning you, you would have no knowledge of this and you would be working in the open, filled with a false security."

"That's ridiculous. If he wanted me in Helicon, why didn't he simply leave me to myself? I was going there tomorrow. Why would he send those two hoodlums simply to hasten the matter by a few hours and risk putting me on my guard?"

"Why should he think you would be put on your guard? He didn't know I'd be with you, immersing you in what you call my paranoia."

"Even without the question of warning me, why all the fuss to hurry me by a few hours?"

"Perhaps because he was afraid you would change your mind."

"And go where, if not home? If he could pick me up on Helicon, he could pick me up anywhere. He could pick me up on . . . on Anacreon, a good ten thousand parsecs away-if it should fall into my head to go there. What's distance to hyperspatial ships? Even if I find a world that's not quite as subservient to the Imperial forces as Helicon is, what world is in actual rebellion? The Empire is at peace. Even if some worlds are still resentful of injustices in the past, none are going to defy the Imperial armed forces to protect me. Moreover, anywhere but on Helicon I won't be a local citizen and there won't even be that matter of principle to help keep the Empire at bay."

Hummin listened patiently, nodding slightly, but looking as grave and as imperturbable as ever. He said, "You're right, as far as you go, but there's one world that is not really under the Emperor's control. That, I think, is what must be disturbing Demerzel."

Seldon thought a while, reviewing recent history and finding himself unable to choose a world on which the Imperial forces might be helpless. He said at last, "What world is that?"

Hummin said, "You're on it, which is what makes the matter so dangerous in Demerzel's eyes, I imagine. It is not so much that he is anxious to have you go to Helicon, as that he is anxious to have you leave Trantor before it occurs to you, for any reason-even if only tourist's mania-to stay."

The two men sat in silence until Seldon finally said sardonically, "Trantor! The capital of the Empire, with the home base of the fleet on a space station in orbit about it, with the best units of the army quartered here. If you believe that it is Trantor that is the safe world, you're progressing from paranoia to outright fantasy."

"No! You're an Outworlder, Seldon. You don't know what Trantor is like. It's forty billion people and there are few other worlds with even a tenth of its population. It is of

unimaginable technological and cultural complexity. Where we are now is the Imperial Sector-with the highest standard of living in the Galaxy and populated entirely by Imperial functionaries. Elsewhere on the planet, however, are over eight hundred other sectors, some of them with subcultures totally different from what we have here and most of them untouchable by Imperial forces."

"Why untouchable?"

"The Empire cannot seriously exert force against Trantor. To do so would be bound to shake some facet or other of the technology on which the whole planet depends. The technology is so interrelated that to snap one of the interconnections is to cripple the whole. Believe me, Seldon, we on Trantor observe what happens when there is an earthquake that manages to escape being damped out, a volcanic eruption that is not vented in time, a storm that is not defused, or just some human error that escapes notice. The planet totters and every effort must be made to restore the balance at once."

"I have never heard of such a thing."

A small smile flickered its way across Hummin's face. "Of course not. Do you want the Empire to advertise the weakness at its core? However, as a journalist, I know what happens even when the Outworlds don't, even when much of Trantor itself doesn't, even when the Imperial pressure is interested in concealing events. Believe me! The Emperor knows-and Eto Demerzel knows-even if you don't, that to disturb Trantor may destroy the Empire."

"Then are you suggesting I stay on Trantor for that reason?"

"Yes. I can take you to a place on Trantor where you will be absolutely safe from Demerzel. You won't have to change your name and you will be able to operate entirely in the open and he won't be able to touch you. That's why he wanted to force you off Trantor at once and if it hadn't been for the quirk of fate that brought us together and for your surprising ability to defend yourself, he would have succeeded in doing so."

"But how long will I have to remain on Trantor?"

"For as long as your safety requires it, Seldon. For the rest of your life, perhaps."

8.

Hari Seldon looked at the holograph of himself cast by Hummin's projector. It was more dramatic and useful than a mirror would have been. In fact, it seemed as though there were two of him in the room.

Seldon studied the sleeve of his new tunic. His Heliconian attitudes made him wish the colors were less vibrant, but he was thankful that, as it was, Hummin had chosen softer colors than were customary here on this world. (Seldon thought of the clothing worn by their two assailants and shuddered inwardly.)

He said, "And I suppose I must wear this hat."

"In the Imperial Sector, yes. To go bareheaded here is a sign of low breeding. Elsewhere, the rules are different."

Seldon sighed. The round hat was made of soft material and molded itself to his head when he put it on. The brim was evenly wide all around, but it was narrower than on the hats his attackers had worn. Seldon consoled himself by noticing that when he wore the hat the brim curved rather gracefully.

"It doesn't have a strap under the chin."

"Of course not. That's advanced fashion for young lanks."

"For young what?"

"A lank is someone who wears things for their shock value. I'm sure you have such people on Helicon."

Seldon snorted. "There are those who wear their hair shoulder-length on one side and shave the other." He laughed at the memory.

Hummin's mouth twisted slightly. "I imagine it looks uncommonly ugly."

"Worse. There are lefties and righties, apparently, and each finds the other version highly offensive. The two groups often engage in street brawls."

"Then I think you can stand the hat, especially without the strap."

Seldon said, "I'll get used to it."

"It will attract some attention. It's subdued for one thing and makes you look as if you're in mourning. And it doesn't quite fit. Then, too, you wear it with obvious discomfort. However, we won't be in the Imperial Sector long. --Seen enough?" And the holograph flickered out.

Seldon said, "How much did this cost you?"

"What's the difference?"

"It bothers me to be in your debt."

"Don't worry about it. This is my choice. But we've been here long enough. I will have been described, I'm quite certain. They'll track me down and they'll come here."

"In that case," said Seldon, "the credits you're spending are a minor matter. You're putting yourself into personal danger on my account. Personal danger!"

"I know that. But it's my free choice and I can take care of myself."

"But why-"

"We'll discuss the philosophy of it later. -I've atomized your clothes, by the way, and I don't think I was seen. There was an energy surge, of course, and that would be recorded. Someone might guess what happened from that-it's hard to obscure any action when probing eyes and mind are sharp enough. However, let us hope we'll be safely away before they put it all together."

9.

They traveled along walkways where the light was soft and yellow. Hummin's eyes moved this way and that, watchful, and he kept their pace at crowd speed, neither passing nor being passed. He kept up a mild but steady conversation on indifferent topics.

Seldon, edgy and unable to do the same, said, "There seems to be a great deal of walking here. There are endless lines in both directions and along the crossovers."

"Why not?" said Hummin. "Walking is still the best form of short-distance transportation. It's the most convenient, the cheapest, and the most healthful. Countless years of technological advance have not changed that. -Are you acrophobic, Seldon?"

Seldon looked over the railing on his right into a deep declivity that separated the two walking lanes-each in an opposite direction between the regularly spaced crossovers. He shuddered slightly. "If you mean fear of heights, not ordinarily. Still, looking down isn't pleasant. How far does it go down?"

"Forty or fifty levels at this point, I think. This sort of thing is common in the Imperial Sector and a few other highly developed regions. In most places, one walks at what might be considered ground level."

"I should imagine this would encourage suicide attempts."

"Not often. There are far easier methods. Besides, suicide is not a matter of social obloquy on Trantor. One can end one's life by various recognized methods in centers that exist for the purpose-if one is willing to go through some psychotherapy at first. There are, occasional accidents, for that matter, but that's not why I was asking about acrophobia. We're heading for a taxi rental where they know me as a journalist. I've done favors for them occasionally and sometimes they do favors for me in return. They'll forget to record me and won't notice that I have a companion. Of course, I'll have to pay a premium and, again of course, if Demerzel's people lean on them hard enough, they'll have to tell the truth and put it down to slovenly accounting, but that may take considerable time."

"Where does the acrophobia come in?"

"Well, we can get there a lot faster if we use a gravitic lift. Not many people use it and I must tell you that I'm not overjoyed at the idea myself, but if you think you can handle it, we had better."

"What's a gravitic lift?"

"It's experimental. The time may come when it will be widespread over Trantor, provided it becomes psychologically acceptable-or can be made so to enough people. Then, maybe, it will spread to other worlds too. It's an elevator shaft without an elevator cab, so to speak. We just step into empty space and drop slowly-or rise slowly-under the influence of antigravity. It's about the only application of antigravity that's been established so far, largely because it's the simplest possible application."

"What happens if the power blinks out while we're in transit?"

"Exactly what you would think. We fall and-unless we're quite near the bottom to begin with-we die. I haven't heard of it happening yet and, believe me, if it had happened I would know. We might not be able to give out the news for security reasons-that's the excuse they always advance for hiding bad news-but I would know. It's just up ahead. If you can't manage it, we won't do it, but the corridors are slow and tedious and many find them nauseating after a while."

Hummin turned down a crossover and into a large recess where a line of men and women were waiting, one or two with children.

Seldon said in a low voice, "I heard nothing of this back home. Of course, our own news media are terribly local, but you'd think there'd be some mention that this sort of thing exists."

Hummin said. "It's strictly experimental and is confined to the Imperial Sector. It uses more energy than it's worth, so the government is not really anxious to push it right now by giving it publicity. The old Emperor, Stanel VI, the one before Cleon who amazed everyone by dying in his bed, insisted on having it installed in a few places. He wanted his name associated with antigravity, they say, because he was concerned with his place in history, as old men of no great attainments frequently are. As I said, the technique may spread, but, on the other hand, it is possible that nothing much more than the gravitic lift will ever come of it."

"What do they want to come of it?" asked Seldon.

"Antigrav spaceflight. That, however, will require many breakthroughs and most physicists, as far as I know, are firmly convinced it is out of the question. -But, then, most thought that even gravitic lifts were out of the question."

The line ahead was rapidly growing shorter and Seldon found himself standing with Hummin at the edge of the floor with an open gap before him. The air ahead faintly glittered. Automatically, he reached out his hand and felt a light shock. It didn't hurt, but he snatched his hand back quickly.

Hummin grunted. "An elementary precaution to prevent anyone walking over the edge before activating the controls." He punched some numbers on the control board and the glitter vanished.

Seldon peered over the edge, down the deep shaft.

"You might find it better-or easier," said Hummin, "if we link arms and if you close your eyes. It won't take more than a few seconds."

He gave Seldon no choice, actually. He took his arm and once again there was no hanging back in that firm grip. Hummin stepped into nothingness and Seldon (who heard himself, to his own embarrassment, emit a small squeak) shuffled off with a lurch.

He closed his eyes tightly and experienced no sense of falling, no feeling of air movement. A few seconds passed and he was pulled forward. He tripped slightly, caught his balance, and found himself on solid ground.

He opened his eyes, "Did we make it?"

Hummin said dryly, "We're not dead," then walked away, his grip forcing Seldon to follow.

"I mean, did we get to the right level?"

"Of course."

"What would have happened if we were dropping down and someone else was moving upward?"

"There are two separate lanes. In one lane everyone drops at the same speed; in the other everyone rises at the same speed. The shaft clears only when there are no people within ten meters of each other. There is no chance of a collision if all works well."

"I didn't feel a thing."

"Why should you? There was no acceleration. After the first tenth of a second, you were at constant speed and the air in your immediate vicinity was moving down with you at the same speed."

"Marvelous."

"Absolutely. But uneconomic. And there seems no great pressure to increase the efficiency of the procedure and make it worthwhile. Everywhere one hears the same refrain. 'We can't do it. It can't be done.' It applies to everything."

Hummin shrugged in obvious anger and said, "But we're here at the taxi rental. Let's get on with it."

10.

Seldon tried to look inconspicuous at the air-taxi rental terminus, which he found difficult. To look ostentatiously inconspicuous-to slink about, to turn his face away from all who passed, to study one of the vehicles overintently - was surely the way to invite attention. The way to behave was merely to assume an innocent normality.

But what was normality? He felt uncomfortable in his clothes. There were no pockets, so he had no place to put his hands. The two pouches, which dangled from his belt on either side, distracted him by hitting against him as he moved, so that he was continually thinking someone had nudged him.

He tried looking at women as they passed. They had no pouches, at least none dangling, but they carried little boxlike affairs that they occasionally clipped to one hip or another by some device he could not make out. It was probably pseudomagnetic, he decided. Their clothes were not particularly revealing, he noted regretfully, and not one had any sign of décolletage, although some dresses seemed to be designed to emphasize the buttocks.

Meanwhile, Hummin had been very businesslike, having presented the necessary credits and returned with the superconductive ceramic tile that would activate a specific air-taxi.

Hummin said, "Get in, Seldon," gesturing to a small two-seated vehicle.

Seldon asked, "Did you have to sign your name, Hummin?"

"Of course not. They know me here and don't stand on ceremony. "

"What do they think you're doing?"

"They didn't ask and I volunteered no information." He inserted the tile and Seldon felt a slight vibration as the air-taxi came to life.

"We're headed for D-7," said Hummin, making conversation.

Seldon didn't know what D-7 was, but he assumed it meant some route or other. The air-taxi found its way past and around other ground-cars and finally moved onto a smooth upward-slanting track and gained speed. Then it lifted upward with a slight jolt. Seldon, who had been automatically strapped in by a webbed restraint, felt himself pushed down into his seat and then up against the webbing.

He said, "That didn't feel like antigravity."

"It wasn't," said Hummin. "That was a small jet reaction. Just enough to take us up to the tubes."

What appeared before them now looked like a cliff patterned with cave openings, much like a checkerboard. Hummin maneuvered toward the D-7 opening, avoiding other air-taxis that were heading for other tunnels.

"You could crash easily," said Seldon, clearing his throat.

"So I probably would if everything depended on my senses and reactions, but the taxi is computerized and the computer can overrule me without trouble. The same is true for the other taxis. -Here we go."

They slid into D-7 as if they had been sucked in and the bright light of the open plaza outside mellowed, turning a warmer yellow hue.

Hummin released the controls and sat back. He drew a deep breath and said, "Well, that's one stage successfully carried through. We might have been stopped at the station. In here, we're fairly safe."

The ride was smooth and the walls of the tunnel slipped by rapidly. There was almost no sound, just a steady velvety whirr as the taxi sped along.

"How fast are we going?" asked Seldon.

Hummin cast an eye briefly at the controls. "Three hundred and fifty kilometers per hour."

"Magnetic propulsion?"

"Yes. You have it on Helicon, I imagine."

"Yes. One line. I've never been on it myself, though I've always meant to. I don't think it's anything like this."

"I'm sure it isn't. Trantor has many thousands of kilometers of these tunnels honeycombing the land subsurface and a number that snake under the shallower extensions of the ocean. It's the chief method of long-distance travel."

"How long will it take us?"

"To reach our immediate destination? A little over five hours."

"Five hours!" Seldon was dismayed.

"Don't be disturbed. We pass rest areas every twenty minutes or so where we can stop, pull out of the tunnel, stretch our feet, cat, or relieve ourselves. I'd like to do that as few times as possible, of course. "

They continued on in silence for a while and then Seldon started when a blaze of light flared at their right for a few seconds and, in the flash, he thought he saw two air-taxis.

"That was a rest area," said Hummin in answer to the unspoken question.

Seldon said, "Am I really going to be safe wherever it is you are taking me?"

Hummin said, "Quite safe from any open movement on the part of the Imperial forces. Of course, when it comes to the individual operator-the spy, the agent, the hired assassin-one must always be careful. Naturally, I will supply you with a bodyguard."

Seldon felt uneasy. "The hired assassin? Are you serious? Would they really want to kill me?"

Hummin said, "I'm sure Demerzel doesn't. I suspect he wants to use you rather than kill you. Still, other enemies may turn up or there may be unfortunate concatenations of events. You can't go through life sleepwalking."

Seldon shook his head and turned his face away. To think, only forty-eight hours ago he had been just an insignificant, virtually unknown Outworld mathematician, content only to spend his remaining time on Trantor sight-seeing, gazing at the enormity of the great world with his provincial eye. And now, it was finally sinking in: He was a wanted man, hunted by Imperial forces. The enormity of the situation seized him and he shuddered.

"And what about you and what you're doing right now?"

Hummin said thoughtfully, "Well, they won't feel kindly toward me, I suppose. I might have my head laid open or my chest exploded by some mysterious and never-found assailant."

Hummin said it without a tremor in his voice or a change in his calm appearance, but Seldon winced.

Seldon said, "I rather thought you would assume that might be in store for you. You don't seem to be . . . bothered by it."

"I'm an old Trantorian. I know the planet as well as anybody can. I know many people and many of them are under obligation to me. I like to think that I am shrewd and not easy to outwit. In short, Seldon, I am quite confident that I can take care of myself."

"I'm glad you feel that way and I hope you're justified in thinking so, Hummin, but I can't get it through my head why you're taking this chance at all. What am I to you? Why should you take even the smallest risk for someone who is a stranger to you?"

Hummin checked the controls in a preoccupied manner and then he faced Seldon squarely, eyes steady and serious.

"I want to save you for the same reason that the Emperor wants to use you-for your predictive powers."

Seldon felt a deep pang of disappointment. This was not after all a question of being saved. He was merely the helpless and disputed prey of competing predators. He said angrily, "I will never live down that presentation at the Decennial Convention. I have ruined my life."

"No. Don't rush to conclusions, mathematician. The Emperor and his officers want you for one reason only, to make their own lives more secure. They are interested in your abilities only so far as they might be used to save the Emperor's rule, preserve that rule for his young son, maintain the positions, status, and power of his officials. I, on the other hand, want your powers for the good of the Galaxy."

"Is there a distinction?" spat Seldon acidly.

And Hummin replied with the stern beginning of a frown, "If you do not see the distinction, then that is to your shame. The human occupants of the Galaxy existed before this Emperor who now rules, before the dynasty he represents, before the Empire itself. Humanity is far older than the Empire. It may even be far older than the twenty-five million worlds of the Galaxy. There are legends of a time when humanity inhabited a single world."

"Legends!" said Seldon, shrugging his shoulders.

"Yes, legends, but I see no reason why that may not have been so in fact, twenty thousand years ago or more. I presume that humanity did not come into existence complete with knowledge of hyperspatial travel. Surely, there must have been a time when people could not travel at superluminal velocities and they must then have been imprisoned in a single planetary system. And if we look forward in time, the human beings of the worlds of the Galaxy will surely continue to exist after you and the Emperor are dead, after his whole line comes to an end, and after the institutions of the Empire itself unravel. In that case, it is not important to worry overmuch about individuals, about the Emperor and the young Prince Imperial. It is not important to worry even about the mechanics of Empire. What of the quadrillions of people that exist in the Galaxy? What of them?"

Seldon said, "Worlds and people would continue, I presume."

"Don't you feel any serious need of probing the possible conditions under which they would continue to exist. "

"One would assume they would exist much as they do now."

"One would assume. But could one know by this art of prediction that you speak of?"

"Psychohistory is what I call it. In theory, one could."

"And you feel no pressure to turn that theory into practice."

"I would love to, Hummin, but the desire to do so doesn't automatically manufacture the ability to do so. I told the Emperor that psychohistory could not be turned into a practical technique and I am forced to tell you the same thing."

"And you have no intention of even trying to find the technique?"

"No, I don't, any more than I would feel I ought to try to tackle a pile of pebbles the size of Trantor, count them one by one, and arrange them in order of decreasing mass. I would know it was not something I could accomplish in a lifetime and I would not be fool enough to make a pretense of trying."

"Would you try if you knew the truth about humanity's situation?"

"That's an impossible question. What is the truth about humanity's situation? Do you claim to know it?"

"Yes, I do. And in five words." Hummin's eyes faced forward again, turning briefly toward the blank changelessness of the tunnel as it pushed toward them, expanding until it passed and then dwindling as it slipped away. He then spoke those five words grimly.

He said, "The Galactic Empire is dying."

UNIVERSITY

STREELING UNIVERSITY-. . . An institution of higher learning in the Streeling Sector of ancient Trantor . . . Despite all these claims to fame in the fields of the humanities and silences alike, it is not for those that the University looms large in today's consciousness. It would probably have come as a coral surprise to the generations of scholars at the University to know that in later times Streeling University would be most remembered because a certain Hari Seldon, during the period of The Flight, had been in residence there for a short time.

ENCYCLOPEDIA GALACTICA

11.

Hari Seldon remained uncomfortably silent for a while after Hummin's quiet statement. He shrank within himself in sudden recognition of his own deficiencies.

He had invented a new science: psychohistory. He had extended the laws of probability in a very subtle manner to take into account new complexities and uncertainties and had ended up with elegant equations in innumerable unknowns. - Possibly an infinite number; he couldn't tell. But it was a mathematical game and nothing more.

He had psychohistory--or at least the basis of psychohistory but only as a mathematical curiosity. Where was the historical knowledge that could perhaps give some meaning to the empty equations?

He had none. He had never been interested in history. He knew the outline of Heliconian history. Courses in that small fragment of the human story had, of course, been compulsory in the Heliconian schools. But what was there beyond that? Surely what else he had picked up was merely the bare skeletons that everyone gathered half legend, the other half surely distorted.

Still, how could one say that the Galactic Empire was dying? It had existed for ten thousand years as an accepted Empire and even before that, Trantor, as the capital of the dominating kingdom, had held what was a virtual empire for two thousand years. The Empire had survived the early centuries when whole sections of the Galaxy would now and then refuse to accept the end of their local independence. It had survived the vicissitudes that went with the occasional rebellions, the dynastic wars, some serious periods of breakdown. Most worlds had scarcely been troubled by such things and Trantor itself had grown steadily until it was the worldwide human habitation that now called itself the Eternal World.

To be sure, in the last four centuries, turmoil had increased somehow and there had been a rash of Imperial assassinations and takeovers. But even that was calming down and right now the Galaxy was as quiet as it had ever been. Under Cleon I and before him under his father, Stanel VI, the worlds were prosperous-and Cleon himself was not considered a tyrant. Even those who disliked the Imperium as an institution rarely had anything truly bad to say about Cleon, much as they might inveigh against Eto Demerzel. Why, then, should Hummin say that the Galactic Empire was dying and with such conviction?

Hummin was a journalist. He probably knew Galactic history in some detail and he had to understand the current situation in great detail. Was it this that supplied him with the knowledge that lay behind his statement? In that case, just what was the knowledge? Several times Seldon was on the point of asking, of demanding an answer, but there was something in Hummin's solemn face that stopped him. And there was something in his own ingrained belief that the Galactic Empire was a given, an axiom, the foundation stone on which all argument rested that prevented him too. After all, if that was wrong, he didn't want to know. No, he couldn't believe that he was wrong. The Galactic Empire could no more come to an end than the Universe itself could. Or, if the Universe did end, then-and only then-would the Empire end.

Seldon closed his eyes, attempting to sleep but, of course, he could not. Would he have to study the history of the Universe in order to advance his theory of psychohistory? How could he? Twenty-five million worlds existed, each with its own endlessly complex history. How could he study all that? There were book-films in many volumes, he knew, that dealt with Galactic history. He had even skimmed one once for some now-forgotten reason and had found it too dull to view even halfway through.

The book-films had dealt with important worlds. With some, it dealt through all or almost all their history; with others, only as they gained importance for a time and only till they faded away. He remembered having looked up Helicon in the index and having found only one citation. He had punched the keys that would turn up that citation and found Helicon included in a listing of worlds which, on one occasion, had temporarily lined up behind a certain claimant to the Imperial throne who had failed to make good his claim. Helicon had escaped retribution on that occasion, probably because it was not even sufficiently important to be punished.

What good was such a history? Surely, psychohistory would have to take into account the actions and reactions and interactions of each world -each and every world. How could one study the history of twenty-five million worlds and consider all their possible interactions? It would surely be an impossible task and this was just one more reinforcement of the general conclusion that psychohistory was of theoretical interest but could never be put to any practical use.

Seldon felt a gentle push forward and decided that the air-taxi must be decelerating.

"What's up?" he asked.

"I think we've come far enough," said Hummin, "to risk a small stopover for a bite to eat, a glass of something or other, and a visit to a washroom."

And, in the course of the next fifteen minutes, during which the air-taxi slowed steadily, they came to a lighted recess. The taxi swerved inward and found a parking spot among five or six other vehicles.

12.

Hummin's practiced eye seemed to take in the recess, the other taxis, the diner, the walkways, and the men and women all at a glance. Seldon, trying to look inconspicuous and again not knowing how, watched him, trying not to do so too intently.

When they sat down at a small table and punched in their orders, Seldon, attempting to sound indifferent, said, "Everything okay?"

"Seems so," said Hummin.

"How can you tell?"

Hummin let his dark eyes rest on Seldon for a moment. "Instinct," he said.

"Years of news gathering. You look and know, 'No news here.'"

Seldon nodded and felt relieved. Hummin might have said it sardonically, but there must be a certain amount of truth to it.

His satisfaction did not last through the first bite of his sandwich. He looked up at Hummin with his mouth full and with a look of hurt surprise on his face.

Hummin said, "This is a wayside diner, my friend. Cheap, fast, and not very good. The food's homegrown and has an infusion of rather sharp yeast. Trantorians palates are used to it."

Seldon swallowed with difficulty. "But back in the hotel-

"You were in the Imperial Sector, Seldon. Food is imported there and where microfood is used it is high-quality. It is also expensive. "

Seldon wondered whether to take another bite. "You mean that as long as I stay on Trantor-

Hummin made a hushing motion with his lips. "Don't give anyone the impression that you're used to better. There are places on Trantor where to be identified as an aristocrat is worse than being identified as an Outworlder. The food won't be so bad everywhere, I assure you. These wayside places have a reputation for low quality. If you can stomach that sandwich, you'll be able to eat anywhere on Trantor. And it won't hurt you. It's not decayed or bad or anything like that. It just has a harsh, strong taste and, honestly, you may grow accustomed to it. I've met Trantorians who spit out honest food and say it lacks that homegrown tang."

"Do they grow much food on Trantor?" asked Seldon. A quick side glance showed him there was no one seated in the immediate vicinity and he spoke quietly.

"I've always heard it takes twenty surrounding worlds to supply the hundreds of freight ships required to feed Trantor every day."

"I know. And hundreds to carry off the load of wastes. And if you want to make the story really good, you say that the same freight ships carry food one way and waste the other. It's true that we import considerable quantities of food, but that's mostly luxury items. And we export considerable waste, carefully treated into inoffensiveness, as important organic fertilizer-every bit as important to other worlds as the food is to us. But that's only a small fraction of the whole."

"It is?"

"Yes. In addition to fish in the sea, there are gardens and truck farms everywhere. And fruit trees and poultry and rabbits and vast microorganism farms-usually called yeast farms, though the yeast makes up a minority of the growths. And our wastes are mostly used right here at home to maintain all that growth. In fact, in many ways Trantor is very much like an enormous and overgrown space settlement. Have you ever visited one of those?"

"Indeed I have."

"Space settlements are essentially enclosed cities, with everything artificially cycled, with artificial ventilation, artificial day and night, and so on. Trantor is different only in that even the largest space settlement has a population of only ten million and Trantor has four thousand times that. Of course, we have real gravity. And no space settlement can match us in our microfoods. We have yeast vats, fungal mats, and algae ponds vast beyond the imagination. And we are strong on artificial flavoring, added with no light hand. That's what gives the taste to what you're eating."

Seldon had gotten through most of his sandwich and found it not as offensive as the first bite had been. "And it won't affect me?"

"It does hit the intestinal flora and every once in a while it afflicts some poor Outworlder with diarrhea, but that's rare, and you harden even to that quickly. Still, drink your milkshake, which you probably won't like. It contains an antidiarrhetic that should keep you safe, even if you tend to be sensitive to such things."

Seldon said querulously, "Don't talk about it, Hummin. A person can be suggestible to such things."

"Finish the milkshake and forget the suggestibility."

They finished the rest of their meal in silence and soon were on their way again.

13.

They were now racing rapidly through the tunnel once more. Seldon decided to give voice to the question that had been nagging at him for the last hour or so.

"Why do you say the Galactic Empire is dying?"

Hummin turned to look at Seldon again. "As a journalist, I have statistics poured into me from all sides till they're squeezing out of my ears. And I'm allowed to publish very little of it. Trantor's population is decreasing. "

"Twenty-five years ago, it stood at almost forty-five billion. "

"Partly, this decrease is because of a decline in the birthrate. To be sure, Trantor never has had a high birthrate. If you'll look about you when you're traveling on Trantor, you won't encounter very many children, considering the enormous population. But just the same it's declining. Then too there is emigration. People are leaving Trantor in greater numbers than are arriving."

"Considering its large population," said Seldon, "that's not surprising."

"But it's unusual just the same because it hasn't happened before. Again, all over the Galaxy trade is stagnating. People think that because there are no rebellions at the moment and because things are quiet that all is well and that the difficulties of the past few centuries are over. However, political infighting, rebellions, and unrest are all signs of a certain vitality too. But now there's a general weariness. It's quiet, not because people are satisfied and prosperous, but because they're tired and have given up."

"Oh, I don't know," said Seldon dubiously.

"I do. And the antigrav phenomenon we've talked about is another case in point. We have a few gravitic lifts in operation, but new ones aren't being constructed. It's an unprofitable venture and there seems no interest in trying to make it profitable. The rate of technological advance has been slowing for centuries and is down to a crawl now. In some cases, it has stopped altogether. Isn't this something you've noticed? After all, you're a mathematician."

"I can't say I've given the matter any thought."

"No one does. It's accepted. Scientists are very good these days at saying that things are impossible, impractical, useless. They condemn any speculation at once. You, for instance-What do you think of psychohistory? It is theoretically interesting, but it is useless in any practical sense. Am I right?"

"Yes and no," said Seldon, annoyed. "It is useless in any practical sense, but not because my sense of adventure has decayed, I assure you. It really is useless."

"That, at least," said Hummin with a trace of sarcasm, "is your impression in this atmosphere of decay in which all the Empire lives."

"This atmosphere of decay," said Seldon angrily, "is your impression. Is it possible that you are wrong?"

Hummin stopped and for a moment appeared thoughtful. Then he said, "Yes, I might be wrong. I am speaking only from intuition, from guesses. What I need is a working technique of psychohistory. "

Seldon shrugged and did not take the bait. He said, "I don't have such a technique to give you. -But suppose you're right. Suppose the Empire is running down and will eventually stop and fall apart. The human species will still exist."

"Under what conditions, man? For nearly twelve thousand years, Trantor, under strong rulers, has largely kept the peace. There've been interruptions to that-rebellions, localized civil wars, tragedy in plenty-but, on the whole and over large areas, there has been peace. Why is Helicon so pro-Imperium? Your world, I mean. Because it is small and would be devoured by its neighbors were it not that the Empire keeps it secure."

"Are you predicting universal war and anarchy if the Empire fails?"

"Of course. I'm not fond of the Emperor or of the Imperial institutions in general, but I don't have any substitute for it. I don't know what else will keep the peace and I'm not ready to let go until I have something else in hand."

Seldon said, "You talk as though you are in control of the Galaxy. You are not ready to let go? You must have something else in hand? Who are you to talk so?"

"I'm speaking generally, figuratively," said Hummin. "I'm not worried about Chetter Hummin personally. It might be said that the Empire will last my time; it might even show signs of improvement in my time. Declines don't follow a straight-line path. It may be a thousand years before the final crash and you might well imagine I would be dead then and, certainly, I will leave no descendants. As far as women are concerned, I have nothing but the occasional casual attachment and I have no children and intend to have none. I have given no hostages to fortune. -I looked you up after your talk, Seldon. You have no children either."

"I have parents and two brothers, but no children." He smiled rather weakly. "I was very attached to a woman at one time, but it seemed to her that I was attached more to my mathematics."

"Were you?"

"It didn't seem so to me, but it seemed so to her. So she left."

"And you have had no one since?"

"No. I remember the pain too clearly as yet."

"Well then, it might seem we could both wait out the matter and leave it to other people, well after our time, to suffer. I might have been willing to accept that earlier, but no longer. For now I have a tool; I am in command."

"What's your tool?" asked Seldon, already knowing the answer.

"You!" said Hummin.

And because Seldon had known what Hummin would say, he wasted no time in being shocked or astonished. He simply shook his head and said, "You are quite wrong. I am no tool fit for use."

"Why not?"

Seldon sighed. "How often must I repeat it? Psychohistory is not a practical study. The difficulty is fundamental. All the space and time of the Universe would not suffice to work out the necessary problems."

"Are you certain of that?"

"Unfortunately, yes."

"There's no question of your working out the entire future of the Galactic Empire, you know. You needn't trace out in detail the workings of every human being or even of every world. There are merely terrain questions you must answer: Will the Galactic Empire crash and, if so, when? What will be the condition of humanity afterward? Can anything be done to prevent the crash or to ameliorate conditions afterward? These are comparatively simple questions, it seems to me."

Seldon shook his head and smiled sadly. "The history of mathematics is full of simple questions that had only the most complicated of answers-or none at all."

"Is there nothing to be done? I can see that the Empire is falling, but I can't prove it. All my conclusions are subjective and I cannot show that I am not mistaken. Because the view is a seriously unsettling one, people would prefer not to believe my subjective conclusion and nothing will be done to prevent the Fall or even to cushion it. You could prove the coming Fall or, for that matter, disprove it."

"But that is exactly what I cannot do. I can't find you proof where none exists. I can't make a mathematical system practical when it isn't. I can't find you two even numbers that will yield an odd number as a sum, no matter how vitally your all the Galaxy -may need that odd number."

Hummin said, "Well then, you're pare of the decay. You're ready to accept failure."

"What choice have I?"

"Can't you try? However useless the effort may seem to you to be, have you anything better to do with your life? Have you some worthier goal? Have you a purpose that will justify you in your own eyes to some greater extent?"

Seldon's eyes blinked rapidly. "Millions of worlds. Billions of cultures. Quadrillions of people. Decillions of interrelationships. -And you want me to reduce it to order."

"No, I want you to try. For the sake of those millions of worlds, billions of cultures, and quadrillions of people. Not for the Emperor. Not for Demerzel. For humanity."

"I will fail," said Seldon.

"Then we will be no worse off. Will you try?"

And against his will and not knowing why, Seldon heard himself say, "I will try." And the course of his life was set.

14.

The journey came to its end and the air-taxi moved into a much larger lot than the one at which they had eaten. (Seldon still remembered the taste of the sandwich and made a wry face.)

Hummin turned in his taxi and came back, placing his credit slip in a small pocket on the inner surface of his shirt. He said, "You're completely safe here from anything outright and open. This is the Streeling Sector."

"Streeling?"

"It's named for someone who first opened up the area to settlement, I imagine. Most of the sectors are named for someone or other, which means that most of the names are ugly and some are hard to pronounce. Just the same, if you try to have the inhabitants here change Streeling to Sweet-smell or something like that, you'll have a fight on your hands."

"Of course," said Seldon, sniffing loudly, "it isn't exactly Sweet-smell."

"Hardly anywhere in Trantor is, but you'll get used to it."

"I'm glad we're here," said Seldon. "Not that I like it, but I got quite tired sitting in the taxi. Getting around Trantor must be a horror. Back on Helicon, we can get from any

one place to any other by air, in far less time than it took us to travel less than two thousand kilometers here."

"We have air-jets too."

"But in that case—"

"I could arrange an air-taxi ride more or less anonymously. It would have been much more difficult with an air-jet. And regardless of how safe it is here, I'd feel better if Demerzel didn't know exactly where you were. —As a matter of fact, we're not done yet. We're going to take the Expressway for the final stage."

Seldon knew the expression. "One of those open monorails moving on an electromagnetic field, right?"

"Right."

"We don't have them on Helicon. Actually, we don't need them there. I rode on an Expressway the first day I was on Trantor. It took me from the airport to the hotel. It was rather a novelty, but if I were to use it all the time, I imagine the noise and crowds would become overpowering."

Hummin looked amused. "Did you get lost?"

"No, the signs were useful. There was trouble getting on and off, but I was helped. Everyone could tell I was an Outworlder by my clothes, I now realize. They seemed eager to help, though; I guess because it was amusing to watching me hesitate and stumble."

"As an expert in Expressway travel by now, you will neither hesitate nor stumble." Hummin said it pleasantly enough, though there was a slight twitch to the corners of his mouth. "Come on, then."

They sauntered leisurely along the walkway, which was lit to the extent one might expect of an overcast day and that brightened now and then as though the sun occasionally broke through the clouds. Automatically, Seldon looked upward to see if that were indeed the case, but the "sky" above was blankly luminous.

Hummin saw this and said, "This change in brightness seems too suit the human psyche. There are days when the street seems to be in bright sunlight and days when it is rather darker than it is now."

"But no rain or snow?"

"Or hail or sleet. No. Nor high humidity nor bitter cold. Trantor has its points, Seldon, even now."

There were people walking in both directions and there were a considerable number of young people and also some children accompanying the adults, despite what Hummin had said about the birthrate. All seemed reasonably prosperous and reputable. The two sexes were equally represented and the clothing was distinctly more subdued than it had been in the Imperial Sector. His own costume, as chosen by Hummin, fit right in. Very few were wearing hats and Seldon thankfully removed his own and swung it at his side.

There was no deep abyss separating the two sides of the walkway and as Hummin had predicted in the Imperial Sector, they were walking at what seemed to be ground level. There were no vehicles either and Seldon pointed this out to Hummin.

Hummin said, "There are quite a number of them in the Imperial Sector because they're used by officials. Elsewhere, private vehicles are rare and those that are used have separate tunnels reserved for them. Their use is not really necessary, since we have Expressways and, for shorter distances, moving corridors. For still shorter distances, we have walkways and we can use our legs."

Seldon heard occasional muted sighs and creaks and saw, some distance off, the endless passing of Expressway cars.

"There it is," he said, pointing.

"I know, but let us move on to a boarding station. There are more cars there and it is easier to get on."

Once they were safely ensconced in an Expressway car, Seldon turned to Hummin and said, "What amazes me is how quiet the Expressways are. I realize that they are mass-propelled by an electromagnetic field, but it seems quiet even for that." He listened to the occasional metallic groan as the car they were on shifted against its neighbors.

"Yes, it's a marvelous network," said Hummin, "but you don't see is at its peak. When I was younger, it was quieter than is now and there are those who say that there wasn't as much as a whisper fifty years ago though I suppose we might make allowance for the idealization of nostalgia."

"Why isn't it that way now?"

"Because it isn't maintained properly. I told you about decay."

Seldon frowned. "Surely, people don't sit around and say, 'We're decaying. Let's let the Expressways fall apart.' "

"No, they don't. It's not a purposeful thing. Bad spots are patched, decrepit coaches refurbished, magnets replaced. However, it's done in more slapdash fashion, more carelessly, and at greater intervals. There just aren't enough credits available."

"Where have the credits gone?"

"Into other things. We've had centuries of unrest. The navy is much larger and many times more expensive than it once was. The armed forces are much better-paid, in order to keep them quiet. Unrest, revolts, and minor blazes of civil war all take their toll."

"But it's been quiet under Cleon. And we've had fifty years of peace."

"Yes, but soldiers who are well-paid would resent having that pay reduced just because there is peace. Admirals resist mothballing ships and having themselves reduced in rank simply because there is less for them to do. So the credits still go-unproductively - to the armed forces and vital areas of the social good are allowed to deteriorate. That's what I call decay. Don't you? Don't you think that eventually you would fit that sort of view into your psychohistorical notions?"

Seldon stirred uneasily. Then he said, "Where are we going, by the way?"

"Streeling University."

"Ah, that's why the sector's name was familiar. I've heard of the University."

"I'm not surprised. Trantor has nearly a hundred thousand institutions of higher learning and Streeling is one of the thousand or so at the top of the heap."

"Will I be staying there?"

"For a while. University campuses are unbreathable sanctuaries, by and large. You will be safe there."

"But will I be welcome there?"

"Why not? It's hard to find a good mathematician these days. They might be able to use you. And you might be able to use them coo-tend for more than just a hiding place."

"You mean, it will be a place where I can develop my notions."

"You have promised," said Hummin gravely.

"I have promised to try," said Seldon and thought to himself that it was about like promising to try to make a rope out of sand.

15.

Conversation had run out after that and Seldon watched the structures of the Streeling Sector as they passed. Some were quite low, while some seemed to brush the "sky." Wide cross-passages broke the progression and frequent alleys could be seen.

At one point, it struck him that though the buildings rose upward they also swept downward and that perhaps they were deeper than they were high. As soon as the thought occurred to him, he was convinced it was true.

Occasionally, he saw patches of green in the background, farther back from the Expressway, and even small trees. He watched for quite a while and then became aware that the light was growing dimmer. He squinted about and turned to Hummin, who guessed the question.

"The afternoon is waning," he said, "and night is coming on."

Seldon's eyebrows raised and the corners of his mouth turned downward. "That's impressive. I have a picture of the entire planet darkening and then, some hours from now, lighting up again."

Hummin smiled his small, careful smile. "Not quite, Seldon. The planet is never turned off altogether-or turned on either. The shadow of twilight sweeps across the planet gradually, followed half a day later by the slow brightening of dawn.

In fact, the effect follows the actual day and night above the domes quite closely, so that in higher altitudes day and night change length with the seasons."

Seldon shook his head, "But why close in the planet and then mimic what would be in the open?"

"I presume because people like it better that way. Trantorians like the advantages of being enclosed, but they don't like to be reminded of it unduly, just the same. You know very little about Trantorian psychology, Seldon."

Seldon flushed slightly. He was only a Heliconian and he knew very little about the millions of worlds outside Helicon. His ignorance was not confined to Trantor. How, then, could he hope to come up with any practical applications for his theory of psychohistory? How could any number of people-all together-know enough? It reminded Seldon of a

puzzle that had been presented to him when he was young: Can you have a relatively small piece of platinum, with handholds affixed, that could not be lifted by the bare, unaided strength of any number of people, no matter how many?

The answer was yes. A cubic meter of platinum weighs 22,420 kilograms under standard gravitational pull. If it is assumed that each person could heave 120 kilograms up from the ground, then 188 people would suffice to lift the platinum. -But you could not squeeze 188 people around the cubic meter so that each one could get a grip on it. You could perhaps not squeeze more than 9 people around it. And levers or other such devices were not allowed. It had to be "bare, unaided strength."

In the same way, it could be that there was no way of getting enough people to handle the total amount of knowledge required for psychohistory, even if the facts were stored in computers rather than in individual human brains. Only so many people could gather round the knowledge, so to speak, and communicate it.

Hummin said, "You seem to be in a brown study, Seldon."

"I'm considering my own ignorance."

"A useful task. Quadrillions could profitably join you. -But it's time to get off."

Seldon looked up. "How can you tell?"

"Just as you could tell when you were on the Expressway your first day on Trantor. I go by the signs."

Seldon caught one just as it went by: STREELING UNIVERSITY-3 MINUTES.

"We get off at the next boarding station. Watch your step."

Seldon followed Hummin off the coach, noting that the sky was deep purple now and that the walkways and corridors and buildings were all lighting up, suffused with a yellow glow.

It might have been the gathering of a Heliconian night. Had he been placed here blindfolded and had the blindfold been removed, he might have been convinced that he was in some particularly well-built-up inner region of one of Helicon's larger cities.

"How long do you suppose I will remain at Streeling University, Hummin?" he asked.

Hummin said in his usual calm fashion, "That would be hard to say, Seldon. Perhaps your whole life."

"What!"

"Perhaps not. But your life stopped being your own once you gave that paper on psychohistory. The Emperor and Demerzel recognized your importance at once. So did I. For all I know, so did many others. You see, that means you don't belong to yourself anymore."

VENABILI, DORS-- . . . Historian, born in Cinna . . . Her life might well have continued on its uneventful course were it not for the face chat, after she had spent two years on the faculty of Streeling University, she became involved with the young Hari Seldon during The Flight . . .

ENCYCLOPEDIA GALACTICA

16.

The room that Hari Seldon found himself in was larger than Hummin's room in the Imperial Sector. It was a bedroom with one corner serving as a washroom and with no sign of any cooking or dining facilities. There was no window, though set in the ceiling was a grilled ventilator that made a steady sighing noise.

Seldon looked about a bit ruefully.

Hummin interpreted that look with his usual assured manner and said, "It's only for tonight, Seldon. Tomorrow morning someone will come to install you at the University and you will be more comfortable."

"Pardon me, Hummin, but how do you know that?"

"I will make arrangements. I know one or two people here"-he smiled briefly without humor-"and I have a favor or two I can ask repayment for. Now let's go into some details." He gazed steadily at Seldon and said, "Whatever you have left in your hotel room is lost. Does that include anything irreplaceable?"

"Nothing really irreplaceable. I have some personal items I value for their association with my past life, but if they are gone, they are gone. There are, of course, some notes on my paper. Some calculations. The paper itself."

"Which is now public knowledge until such time as it is removed from circulation as dangerous-which it probably will be. Still, I'll be able to get my hands on a copy, I'm sure. In any case, you can reconstruct it, can't you?"

"I can. That's why I said there was nothing really irreplaceable. Also, I've lost nearly a thousand credits, some books, clothing, my tickets back to Helicon, things like that."

"All replaceable. -Now I will arrange for you to have a credit tile in my name, charged to me. That will take care of ordinary expenses. "

"That's unusually generous of you. I can't accept it."

"It's not generous at all, since I'm hoping to save the Empire in that fashion. You must accept it."

"But how much can you afford, Hummin? I'll be using it, at best, with an uneasy conscience."

"Whatever you need for survival or reasonable comfort I can afford, Seldon. Naturally, I wouldn't want you to try to buy the University gymnasium or hand out a million credits in largess."

"You needn't worry, but with my name on record-"

"It might as well be. It is absolutely forbidden for the Imperial government to exercise any security control over the University or its members. There is complete freedom. Anything can be discussed here, anything can be said here."

"What about violent crime?"

"Then the University authorities themselves handle it, with reason and care-and there are virtually no crimes of violence. The students and faculty appreciate their freedom and understand its terms. Too much rowdiness, the beginning of riot and bloodshed, and the government may feel it has a right to break the unwritten agreement and send in the troops. No one wants that, not even the government, so a delicate balance is maintained. In other words, Demerzel himself can not have you plucked out of the University without a great deal more cause than anyone in the University has given the government in at least a century and a half. On the other hand, if you are lured off the grounds by a student-agent-"

"Are there student-agents?"

"How can I say? There may be. Any ordinary individual can be threatened or maneuvered or simply bought-and may remain thereafter in the service of Demerzel or of someone else, for that matter. So I must emphasize this: You are safe in any reasonable sense, but no one is absolutely safe. You will have to be careful. But though I give you that warning, I don't want you to cower through life. On the whole, you will be far more secure here than you would have been if you had returned to Helicon or gone to any world of the Galaxy outside Trantor."

"I hope so," said Seldon drearily.

"I know so," said Hummin, "Or I would not feel it wise to leave you. "

"Leave me?" Seldon looked up sharply. "You can't do that. You know this world. I don't."

"You will be with others who know this world, who know this part of it, in fact, even better than I do. As for myself, I must go. I have been with you all this day and I dare not abandon my own life any longer. I must not attract too much attention to myself. Remember that I have my own insecurities, just as you have yours."

Seldon blushed. "You're right. I can't expect you to endanger yourself indefinitely on my behalf. I hope you are not already ruined."

Hummin said coolly, "Who can tell? We live in dangerous times. Just remember that if anyone can make the times safe-if not for ourselves, then for those who follow after us-it is you. Let that thought be your driving force, Seldon."

17.

Sleep eluded Seldon. He tossed and turned in the dark, thinking. He had never felt quite so alone or quite so helpless as he did after Hummin had nodded, pressed his hand briefly, and left him behind. Now he was on a strange world-and in a strange part of that world. He was without the only person he could consider a friend (and that of less than a day's duration) and he had no idea of where he was going or what he would be doing, either tomorrow or at any time in the future.

None of that was conducive to sleep so, of course, at about the time he decided, hopelessly, that he would not sleep that night or, possibly, ever again, exhaustion overtook him . . .

When he woke up it was still dark-or not quite, for across the room he saw a red light flashing brightly and rapidly, accompanied by a harsh, intermittent buzz. Undoubtedly, it was that which had awakened him.

As he tried to remember where he was and to make some sort of sense out of the limited messages his senses were receiving, the flashing and buzzing ceased and he became aware of a peremptory rapping. Presumably, the rapping was at the door, but he didn't remember where the door was. Presumably, also, there was a contact that would flood the room with light, but he didn't remember where that was either.

He sat up in bed and felt along the wall to his left rather desperately while calling out, "One moment, please."

He found the necessary contact and the room suddenly bloomed with a soft light. He scrambled out of bed, blinking, still searching for the door, finding it, reaching out to open it, remembering caution at the last moment, and saying in a suddenly stern, non-nonsense voice, "Who's there?"

A rather gentle woman's voice said, "My dame is Dors Venabili and I have come to see Dr. Hari Seldon."

Even as that was said, a woman was standing just in front of the door, without that door ever having been opened. For a moment, Hari Seldon stared at her in surprise, then realized that he was wearing only a one-piece undergarment. He let out a strangled gasp and dashed for the bed and only then realized that he was staring at a holograph. It lacked the hard edge of reality and it became apparent the woman wasn't looking at him. She was merely showing herself for identification.

He paused, breathing hard, then said, raising his voice to be heard through the door, "If you'll wait, I'll be with you. Give me . . . maybe half an hour."

The woman-or the holograph, at any rate-said, "I'll wait," and disappeared.

There was no shower, so he sponged himself, making a rare mess on the tiled floor in the washroom corner. There was toothpaste but no toothbrush, so he used his finger. He had no choice but to put on the clothes he had been wearing the day before. He finally opened the door.

He realized, even as he did so, that she had not really identified herself. She had merely given a name and Hummin had not told him whom to expect, whether it was to be

this Dors Somebody or anyone else. He had felt secure because the holograph was that of a personable young woman, but for all he knew there might be half a dozen hostile young men with her.

He peered out cautiously, saw only the woman, then opened the door sufficiently to allow her to enter. He immediately closed and locked the door behind her.

"Pardon me," he said, "What time is it?"

"Nine," she said, "The day has long since begun."

As far as official time was concerned, Trantor held to Galactic Standard, since only so could sense be made out of interstellar commerce and governmental dealings. Each world, however, also had a local time system and Seldon had not yet come to the point where he felt at home with casual Trantorian references to the hour.

"Midmorning?" he said.

"Of course."

"There are no windows in this room," he said defensively.

Dors walked to his bed, reached out, and touched a small dark spot on the wall. Red numbers appeared on the ceiling just over his pillow. They read: 0903.

She smiled without superiority. "I'm sorry," she said. "But I rather assumed Chetter Hummin would have told you I'd be coming for you at nine. The trouble with him is he's so used to knowing, he sometimes forgets that others occasionally don't know. -And I shouldn't have used radio-holographic identification. I imagine you don't have it on Helicon and I'm afraid I must have alarmed you."

Seldon felt himself relax. She seemed natural and friendly and the casual reference to Hummin reassured him. He said, "You're quite wrong about Helicon, Miss-"

"Please call me Dors."

"You're still wrong about Helicon, Dors. We do have radioholography, but I've never been able to afford the equipment. Nor could anyone in my circle, so I haven't actually had the experience. But I understood what had happened soon enough."

He studied her. She was not very tall, average height for a woman, he judged. Her hair was a reddish-gold, though not very bright, and was arranged in shore curls about her head. (He had seen a number of women in Trantor with their hair so arranged. It was apparently a local fashion that would have been laughed at in Helicon.) She was not amazingly beautiful, but was quite pleasant to look at, this being helped by full lips that seemed to have a slight humorous curl to them. She was slim, well-built, and looked quite young. (Too young, he thought uneasily, to be of use perhaps.)

"Do I pass inspection?" she asked. (She seemed to have Hummin's trick of guessing his thoughts, Seldon thought, or perhaps he himself lacked the trick of hiding them.)

He said, "I'm sorry. I seem to have been staring, but I've only been trying to evaluate you. I'm in a strange place. I know no one and have no friends."

"Please, Dr. Seldon, count me as a friend. Mr. Hummin has asked me to take care of you."

Seldon smiled ruefully. "You may be a little young for the job."

"You'll find I am not."

"Well, I'll try to be as little trouble as possible. Could you please repeat your name?"

"Dors Venabili." She spelled the last name and emphasized the stress on the second syllable. "As I said, please call me Dors and if you don't object too strenuously I will call you Hari. We're quite informal here at the University and there is an almost self-conscious effort to show no signs of status, either inherited or professional."

"Please, by all means, call me Hari."

"Good. I shall remain informal then. For instance, the instinct for formality, if there is such a thing, would cause me to ask permission to sit down. Informally, however, I shall just sit." She then sat down on the one chair in the room.

Seldon cleared his throat. "Clearly, I'm not at all in possession of my ordinary faculties. I should have asked you to sit." He sat down on the edge of his crumpled bed and wished he had thought to straighten it out somewhat-but he had been caught by surprise.

She said pleasantly, "This is how it's going to work, Hari. First, we'll go to breakfast at one of the University cafes. Then I'll get you a room in one of the domiciles-, a better room than this. You'll have a window. Hummin has instructed me to get you a credit tile in his name, but it will take me a day or two to extort one out of the University bureaucracy. Until that's done, I'll be responsible for your expenses and you can pay me back later. - And we can use you. Chetter Hummin told me you're a mathematician and for some reason there's a serious lack of good ones at the University."

"Did Hummin tell you that I was a good mathematician?"

"As a matter of face, he did. He said you were a remarkable man-,,

"Well." Seldon looked down at his fingernails. "I would like to be considered so, but Hummin knew me for less than a day and, before that, he had heard me present a paper, the quality of which he has no way of judging. I think he was just being polite."

"I don't think so," said Dors. "He is a remarkable person himself and has had a great deal of experience with people. I'll go by his judgment. In any case, I imagine you'll have a chance to prove yourself. You can program computers, I suppose."

"Of course."

"I'm talking about teaching computers, you understand, and I'm asking if you can devise programs to teach various phases of contemporary mathematics."

"Yes, that's part of my profession. I'm assistant professor of mathematics at the University of Helicon."

She said, "Yes, I know. Hummin told me that. It means, of course, that everyone will know you are a non-Trantorian, but that will present no serious problems. We're mainly Trantorian here at the University, but there's a substantial minority of Outworlders from any number of different worlds and that's accepted. I won't say that you'll never hear a planetary slur but actually the Outworlders are more likely to use them than the Trantorians. I'm an Outworlder myself, by the way."

"Oh?" He hesitated and then decided it would be only polite to ask. "What world are you from?"

"I'm from Cinna. Have you ever heard of it?"

He'd be caught out if he was polite enough to lie, Seldon decided, so he said, "No."

"I'm not surprised. It's probably of even less account than Helicon is. Anyway, to get back to the programming of mathematical teaching computers, I suppose that that can be done either proficiently or poorly."

"Absolutely."

"And you would do it proficiently."

"I would like to think so."

"There you are, then. The University will pay you for that, so lee's go out and eat. Did you sleep well, by the way?"

"Surprisingly, I did."

"And are you hungry?"

"Yes, but-" He hesitated.

She said cheerfully, "But you're worried about the quality of the food, is that it? Well, don't be. Being an Outworlder myself, I can understand your feelings about the strong infusion of microfood into everything, but the University menus aren't bad. In the faculty dining room, at least. The students suffer a bit, but that serves to harden them."

She rose and turned to the door, but stopped when Seldon could not keep himself from saying, "Are you a member of the faculty?"

She turned and smiled at him impishly. "Don't I look old enough? I got my doctorate two years ago at Cinna and I've been here ever since. In two weeks, I'll be thirty."

"Sorry," said Seldon, smiling in his turn, "but you can't expect to look twenty-four and not raise doubts as to your academic status."

"Aren't you nice?" said Dors and Seldon felt a certain pleasure wash over him.

After all, he thought, you can't exchange pleasantries with an attractive woman and feel entirely like a stranger.

18.

Dors was right. Breakfast was by no means bad. There was something that was unmistakably eggy and the meat was pleasantly smoked. The chocolate drink (Trantor was strong on chocolate and Seldon did not mind that) was probably synthetic, but it was tasty and the breakfast rolls were good.

He felt it only right to say as much. "This has been a very pleasant breakfast. Food. Surroundings. Everything."

"I'm delighted you think so," said Dors.

Seldon looked about. There were a bank of windows in one wall and while actual sunlight did not enter (he wondered if, after a while, he would learn to be satisfied with diffuse daylight and would cease to look for patches of sunlight in a room), the place was light enough. In fact, it was quite bright, for the local weather computer had apparently decided it was time for a sharp, clear day.

The cables were arranged for four apiece and most were occupied by the full number, but Dors and Seldon remained alone at theirs. Dors had called over some of the men and women and had introduced them. All had been police, but none had joined them. Undoubtedly, Dors intended that to be so, but Seldon did not see how she managed to arrange it.

He said, "You haven't introduced me to any mathematicians, Dors."

"I haven't seen any that I know. Most mathematicians start the day early and have classes by eight. My own feeling is that any student so foolhardy as to take mathematics wants to get that part of the course over with as soon as possible."

"I take it you're not a mathematician yourself."

"Anything but," said Dors with a short laugh. "Anything. History is my field. I've already published some studies on the rise of Trantor-I mean the primitive kingdom, not this world. I suppose that will end up as my field of specialization-Royal Trantor."

"Wonderful," said Seldon.

"Wonderful?" Dors looked at him quizzically. "Are you interested in Royal Trantor too?"

"In a way, yes. That and other things like that. I've never really studied history and I should have."

"Should you? If you had studied history, you'd scarcely have had time to study mathematics and mathematicians are very much needed especially at this University. We're full to here with historians," she said, raising her hand to her eyebrows, "and economists and political scientists, but we're short on science and mathematics. Chetter Hummin pointed that out to me once. He called it the decline of science and seemed to think it was a general phenomenon."

Seldon said, "Of course, when I say I should have studied history, I don't mean that I should have made it a life work. I meant I should have studied enough to help me in my mathematics. My field of specialization is the mathematical analysis of social structure."

"Sounds horrible."

"In a way, it is. It's very complicated and without my knowing a great deal more about how societies evolved it's hopeless. My picture is too static, you see."

"I can't see because I know nothing about it. Chetter told me you were developing something called psychohistory and that it was important. Have I got it right? Psychohistory?"

"That's right. I should have called it 'psychsociology,' but it seemed to me that was too ugly a word. Or perhaps I knew instinctively that a knowledge of history was necessary and then didn't pay sufficient attention to my thoughts."

"Psychohistory does sound better, but I don't know what it is."

"I scarcely do myself." He brooded a few minutes, looking at the woman on the other side of the table and feeling that she might make this exile of his seem a little less like an exile. He thought of the other woman he had known a few years ago, but blocked it off with a determined effort. If he ever found another companion, it would have to be one who understood scholarship and what it demanded of a person.

To get his mind onto a new track, he said, "Chetter Hummin told me that the University is in no way troubled by the government. "

"He's right."

Seldon shook his head. "That seems rather unbelievably forbearing of the Imperial government. The educational institutions on Helicon are by no means so independent of governmental pressures."

"Nor on Cinna. Nor on any Outworld, except perhaps for one or two of the largest. Trantor is another matter."

"Yes, but why?"

"Because it's the center of the Empire. The universities here have enormous prestige. Professionals are turned out by any university anywhere, but the administrators of the Empire-the high officials, the countless millions of people who represent the tentacles of Empire reaching into every corner of the Galaxy-are educated right here on Trantor."

"I've never seen the statistics-" began Seldon.

"Take my word for it. It is important that the officials of the Empire have some common ground, some special feeling for the Empire. And they can't all be native Trantorians or else the Outworlds would grow restless. For that reason, Trantor must attract millions of Outworlders for education here. It doesn't matter where they come from or what their home accent or culture may be, as long as they pick up the Trantorian patina and identify themselves with a Trantorian educational background. That's what holds the Empire together. The Outworlds are also less restive when a noticeable portion of the administrators who represent the Imperial government are their own people by birth and upbringing."

Seldon felt embarrassed again. This was something he had never given any thought to. He wondered if anyone could be a truly great mathematician if mathematics was all he knew. He said, "Is this common knowledge?"

"I suppose it isn't," said Dors after some thought. "There's so much knowledge to be had that specialists cling to their specialties as a shield against having to know anything about anything else. They avoid being drowned."

"Yet you know it."

"But that's my specialty. I'm a historian who deals with the rise of Royal Trantor and this administrative technique was one of the ways in which Trantor spread its influence and managed the transition from Royal Trantor to Imperial Trantor."

Seldon said, almost as though muttering to himself, "How harmful overspecialization is. It cuts knowledge at a million points and leaves it bleeding."

Dors shrugged. "What can one do? -But you see, if Trantor is going to attract Outworlders to Trantorian universities, it has to give them something in return for uprooting themselves and going to a strange world with an incredibly artificial structure and unusual ways. I've been here two years and I'm still not used to it. I may never get used to it. But then, of course, I don't intend to be an administrator, so I'm not forcing myself to be a Trantorian.

"And what Trantor offers in exchange is not only the promise of a position with high status, considerable power, and money, of course, but also freedom. While students are having their -education, they are free to denounce the government, demonstrate against it peacefully, work out their own theories and points of view. They enjoy that and many come here so that they can experience the sensation of liberty."

"I imagine," said Seldon, "that it helps relieve pressure as well. They work off all their resentments, enjoy all the smug self-satisfaction a young revolutionary would have, and by the time they take their place in the Imperial hierarchy, they are ready to settle down into conformity and obedience."

Dors nodded. "You may be right. In any case, the government, for all these reasons, carefully preserves the freedom of the universities. It's not a matter of their being forbearing at all-only clever."

"And if you're not going to be an administrator, Dors, what are you going to be?"

"A historian. I'll teach, put book-films of my own into the programming."

"Not much status, perhaps."

"Not much money, Hari, which is more important. As for status, that's the sort of push and pull I'd just as soon avoid. I've seen many people with status, but I'm still looking for a happy one. Status won't sit still under you; you have to continually fight to keep from sinking. Even Emperors manage to come to bad ends most of the time. Someday I may just go back to Cinna and be a professor."

"And a Trantorian education will give you status."

Don laughed. "I suppose so, but on Cinna who would care? It's a dull world, full of farms and with lots of cattle, both four-legged and two-legged."

"Won't you find it dull after Trantor?"

"Yes, that's what I'm counting on. And if it gets too dull, I can always wangle a grant to go here or there to do a little historical research. That's the advantage of my field."

"A mathematician, on the other hand," said Seldon with a trace of bitterness at something that had never before bothered him, "is expected to sit at his computer and think. And speaking of computers--- He hesitated. Breakfast was done and it seemed to him more than likely she had some duties of her own to attend to.

But she did not seem to be in any great hurry to leave. "Yes? Speaking of computers?"

"Would I be able to get permission to use the history library?"

Now it was she who hesitated. "I think that can be arranged. If you work on mathematics programming, you'll probably be viewed as a quasimember of the faculty and I could ask for you to be given permission. Only- "Only?"

"I don't want to hurt your feelings, but you're a mathematician and you say you know nothing about history. Would you know how to make use of a history library?"

Seldon smiled. "I suppose you use computers very much like those in a mathematics library."

"We do, but the programming for each specialty has quirks of its own. You don't know the standard reference book-films, the quick methods of winnowing and skipping. You may be able to find a hyperbolic interval in the dark . . ."

"You mean hyperbolic integral," interrupted Seldon softly.

Dors ignored him. "But you probably won't know how to get the terms of the Treaty of Poldark in less than a day and a half."

"I suppose I could learn."

"If . . . if . . ." She looked a little troubled. "If you want to, I can make a suggestion. I give a week's course-one hour each day, no credit-on library use. It's for undergraduates. Would you feel it beneath your dignity to sit in on such a course-with undergraduates, I mean? It starts in three weeks."

"You could give me private lessons." Seldon felt a little surprised at the suggestive tone that had entered his voice.

She did not miss it. "I dare say I could, but I think you'd be better off with more formal instruction. We'll be using the library, you understand, and at the end of the week you will be asked to locate information on particular items of historical interest. You will be competing with the other students all through and that will help you learn. Private tutoring will be far less efficient, I assure you. However, I understand the difficulty of competing with undergraduates. If you don't do as well as they, you may feel humiliated. You must remember, though, that they have already studied elementary history and you, perhaps, may not have."

"I haven't. No 'may' about it. But I won't be afraid to compete and I won't mind any humiliation that may come along-if I manage to learn the cricks of the historical reference trade."

It was clear to Seldon that he was beginning to like this young woman and that he was gladly seizing on the chance to be educated by her. He was also aware of the fact that he had reached a turning point in his mind. He had promised Hummin to attempt to work out a practical psychohistory, but that had been a promise of the mind and not the emotions. Now he was determined to seize psychohistory by the throat if he had to-in order to make it practical. That, perhaps, was the influence of Dors Venabili. Or had Hummin counted on that? Hummin, Seldon decided, might well be a most formidable person.

19.

Cleon I had finished dinner, which, unfortunately, had been a formal state affair. It meant he had to spend time talking to various officials-not one of whom he knew or recognized-in set phrases designed to give each one his stroke and so activate his loyalty to the crown. It also meant that his food reached him but lukewarm and had cooled still further before he could eat it.

There had to be some way of avoiding chat. Bat first, perhaps, on his own or with one or two close intimates with whom he could relax and then attend a formal dinner at which he could merely be served an imported pear. He loved pears. But would that offend the guests who would take the Emperor's refusal to sac with them as a studied insult.

His wife, of course, was useless in this respect, for her presence would but further exacerbate his unhappiness. He had married her because she was a member of a powerful dissident family who could be expected to mute their dissidence as a result of the union, though Cleon devoutly hoped that she, at least, would not do so. He was perfectly content to have her live her own life in her own quarters except for the necessary efforts to initiate an heir, for, to tell the truth, he didn't like her. And now that an heir had come, he could ignore her completely.

He chewed at one of a handful of nuts he had pocketed from the table on leaving and said, "Demerzel!"

"Sire?"

Demerzel always appeared at once when Cleon called. Whether he hovered constantly in earshot at the door or he drew close because the instinct of subservience somehow alerted him to a possible call in a few minutes, he did appear and that, Cleon thought idly, was the important thing. Of course, there were those times when Demerzel had to be away on Imperial business. Cleon always hated those absences. They made him uneasy.

"What happened to that mathematician? I forget his name."

Demerzel, who surely knew the man the Emperor had in mind, but who perhaps wanted to study how much the Emperor remembered, said, "What mathematician is it that you have in mind, Sire?"

Cleon waved an impatient hand. "The fortune-teller. The one who came to see me."

"The one we sent for?"

"Well, sent for, then. He did come to see me. You were going to take care of the matter, as I recall. Have you?"

Demerzel cleared his throat. "Sire, I have cried to."

"Ah! That means you have failed, doesn't it?" In a way, Cleon felt pleased.

Demerzel was the only one of his Ministers who made no bones of failure. The others never admitted failure, and since failure was nevertheless common, it became difficult to correct. Perhaps Demerzel could afford to be more honest because he failed

so rarely. If it weren't for Demerzel, Cleon thought sadly, he might never know what honesty sounded like. Perhaps no Emperor ever knew and perhaps that was one of the reasons that the Empire--

He pulled his thoughts away and, suddenly nettled at the other's silence and wanting an admission, since he had just admired Demerzel's honesty in his mind, said sharply, "Well, you have failed, haven't you?"

Demerzel did not flinch. "Sire, I have failed in part. I felt that to have him here on Trantor where things are-difficult might present us with problems. It was easy to consider that he might be more conveniently placed on his home planet. He was planning to return to that home planet the next day, but there was always the chance of complications-of his deciding to remain on Trantor-so I arranged to have two young alley men place him on his plane that very day."

"Do you know alley men, Demerzel?" Cleon was amused.

"It is important, Sire, to be able to reach many kinds of people, for each type has its own variety of use-alley men not the least. As it happens, they did not succeed."

"And why was that?"

"Oddly enough, Seldon was able to fight them off."

"The mathematician could fight?"

"Apparently, mathematics and the martial arts are not necessarily mutually exclusive. I found out, not soon enough, that his world, Helicon, is noted for it-martial arts, not mathematics. The fact that I did not learn this earlier was indeed a failure, Sire, and I can only crave your pardon."

"But then, I suppose the mathematician left for his home planet the next day as he had planned."

"Unfortunately, the episode backfired. Taken aback by the event, he decided not to return to Helicon, but remained on Trantor. He may have been advised to this effect by a passerby who happened to be present on the occasion of the fight. That was another unlooked-for complication."

The Emperor Cleon frowned. "Then our mathematician-what is his name?"

"Seldon, Sire. Hari Seldon."

"Then this Seldon is out of reach."

"In a sense, Sire. We have traced his movements and he is now at Streeling University. While there, he is untouchable."

The Emperor scowled and reddened slightly. "I am annoyed at that word-'untouchable.' There should be nowhere in the Empire my hand cannot reach. Yet here, on my own world, you tell me someone can be untouchable. Insufferable!"

"Your hand can reach to the University, Sire. You can send in your army and pluck out this Seldon at any moment you desire. To do so, however, is . . . undesirable."

"Why don't you say 'impractical,' Demerzel. You sound like the mathematician speaking of his fortune-telling. It is possible, but impractical. I am an Emperor who finds everything possible, but very little practical. Remember, Demerzel, if reaching Seldon is not practical, reaching you is entirely so."

Eto Demerzel let this last comment pass. The 'man behind the throne' knew his importance to the Emperor, he had heard such threats before. He waited in silence while the Emperor glowered. Drumming his fingers against the arm of his chair, Cleon asked, ".Well then, what good is this mathematician to us if he is at Streeling University?"

"It may perhaps be possible, Sire, to snatch use out of adversity. At the University, he may decide to work on his psychohistory."

"Even though he insists it's impractical?"

"He may be wrong and he may find out that he is wrong. And if he finds out that he is wrong, we would find some way of getting him out of the University. It is even possible he would join us voluntarily under those circumstances."

The Emperor remained lost in thought for a while, then said, "And what if someone else plucks him out before we do?"

"Who would want to do that, Sire?" asked Demerzel softly.

"The Mayor of Wye, for one," said Cleon, suddenly shouting. "He dreams still of taking over the Empire."

"Old age has drawn his fangs, Sire."

"Don't you believe it, Demerzel."

"And we have no reason for supposing he has any interest in Seldon or even knows of him, Sire."

"Come on, Demerzel. If we heard of the paper, so could Wye. If we see the possible importance of Seldon, so could Wye."

"If that should happen," said Demerzel, "or even if there should be a reasonable chance of its happening, then we would be justified in taking strong measures."

"How strong?"

Demerzel said cautiously, "It might be argued that rather than have Seldon in Wye's hands, we might prefer to have him in no one's hands. To have him cease to exist, Sire."

"To have him killed, you mean," said Cleon.

"If you wish to put it that way, Sire," said Demerzel.

20.

Hari Seldon sat back in his chair in the alcove that had been assigned to him through Dors Venabili's intervention. He was dissatisfied.

As a matter of fact, although that was the expression he used in his mind, he knew that it was a gross underestimation of his feelings. He was not simply dissatisfied, he was furious—all the more so because he wasn't sure what it was he was furious about. Was it about the histories? The writers and compilers of histories? The worlds and people that made the histories? Whatever the target of his fury, it didn't really matter. What counted was that his notes were useless, his new knowledge was useless, everything was useless.

He had been at the University now for almost six weeks. He had managed to find a computer outlet at the very start and with it had begun work-without instruction, but using the instincts he had developed over a number of years of mathematical labors. It had been slow and halting, but there was a certain pleasure in gradually determining the routes by which he could get his questions answered.

Then came the week of instruction with Dors, which had taught him several dozen shortcuts and had brought with it two sets of embarrassments. The first set included the sidelong glances he received from the undergraduates, who seemed contemptuously aware of his greater age and who were disposed to frown a bit at Dors's constant use of the honorific "Doctor" in addressing him.

"I don't want them to think," she said, "that you're some backward perpetual student taking remedial history."

"But surely you've established the point. Surely, a mere 'Seldon' is sufficient now."

"No," Dors said and smiled suddenly. "Besides, I like to call you 'Dr. Seldon.' I like the way you look uncomfortable each time."

"You have a peculiar sense of sadistic humor."

"Would you deprive me?"

For some reason, that made him laugh. Surely, the natural reaction would have been to deny sadism. Somehow he found it pleasant that she accepted the ball of conversation and fired it back. The thought led to a natural question. "Do you play tennis here at the University?"

"We have courts, but I don't play."

"Good. I'll teach you. And when I do, I'll call you Professor Venabili. "

"That's what you call me in class anyway."

"You'll be surprised how ridiculous it will sound on the tennis court. "

"I may get to like it."

"In that case, I will try to find what else you might get to like."

"I see you have a peculiar sense of salacious humor."

She had put that ball in that spot deliberately and he said, "Would you deprive me?"

She smiled and later did surprisingly well on the tennis court. "Are you sure you never played tennis?" he said, puffing, after one session.

"Positive," she said.

The other set of embarrassments was more private. He learned the necessary techniques of historical research and then burned-in private at his earlier attempts to make use of the computer's memory. It was simply an entirely different mind-set from that used in mathematics. It was equally logical, he supposed, since it could be used, consistently and without error, to move in whatever direction he wanted to, but it was a substantially different brand of logic from that to which he was accustomed. But with or without instructions, whether he stumbled or moved in swiftly, he simply didn't get any results.

His annoyance made itself felt on the tennis court. Dors quickly reached the stage where it was no longer necessary to lob easy balls at her to give her time to judge direction and distance. That made it easy to forget that she was just a beginner and he expressed his anger in his swing, firing the ball back at her as though it were a laser beam made solid.

She came trotting up to the net and said, "I can understand your wanting to kill me, since it must annoy you to watch me miss the shots so often. How is it, though, that you managed to miss my head by about three centimeters that time? I mean, you didn't even nick me. Can't you do better than that?"

Seldon, horrified, tried to explain, but only managed to sound incoherent.

She said, "Look. I'm not going to face any other returns of yours today, so why don't we shower and then get together for some tea and whatever and you can tell me just what you were trying to kill. If it wasn't my poor head and if you don't get the real victim off your chest, you'll be entirely too dangerous on the other side of the net for me to want to serve as a target."

Over tea he said, "Dors, I've scanned history after history; just scanned, browsed. I haven't had time for deep study yet. Even so, it's become obvious. All the book-films concentrate on the same few events."

"Crucial ones. History-making ones."

"That's just an excuse. They're copying each other. There are twenty-five million worlds out there and there's significant mention of perhaps twenty-five."

Dors said, "You're reading general Galactic histories only. Look up the special histories of some of the minor worlds. On every world, however small, the children are taught local histories before they ever find out there's a great big Galaxy outside. Don't you yourself know more about Helicon, right now, than you know about the rise of Trantor or of the Great Interstellar War?"

"That sort of knowledge is limited too," said Seldon gloomily. "I know Heliconian geography and the stories of its settlement and of the malfeasance and misfeasance of the planet Jennisek—that's our traditional enemy, though our teachers carefully told us that we ought to say 'traditional rival.' But I never learned anything about the contributions of Helicon to general Galactic history."

"Maybe there weren't any."

"Don't be silly. Of course there were. There may not have been great, huge space battles involving Helicon or crucial rebellions or peace treaties. There may not have been some Imperial competitor making his base on Helicon. But there must have been subtle influences. Surely, nothing can happen anywhere without affecting everywhere else. Yet there's nothing I can find' to help me. wee here, Dors. In mathematics, all can be found in the computer; everything we know or have found out in twenty thousand years. In history, that's not so. Historians pick and choose and every one of them picks and chooses the same thing."

"But, Hari," said Dors, "mathematics is an orderly thing of human invention. One thing follows from another. There are definitions and axioms, all of which are known. It is .

. . it is . . . all one piece. History is different. It is the unconscious working out of the deeds and thoughts of quadrillions of human beings. Historians must pick and choose."

"Exactly," said Seldon, "but I must know all of history if I am to work out the laws of psychohistory."

"In that case, you won't ever formulate the laws of psychohistory."

That was yesterday. Now Seldon sat in his chair in his alcove, having spent another day of utter failure, and he could hear Dors's voice saying, "In that case, you won't ever formulate the laws of psychohistory."

It was what he had thought to begin with and if it hadn't been for Hummin's conviction to the contrary and his odd ability to fire Seldon with his own blaze of conviction, Seldon would have continued to think so.

And yet neither could he quite let go. Might there not be some way out? He couldn't think of any.

UPPERSIDE

TRANTOR- . . . It is almost never pictured as a world seen from space. It has long since captured the general mind of humanity as a world of the interior and the image is that of the human hive that existed under the domes. Yet there was an exterior as well and there are holographs that still remain that were taken from space and show varying degrees of detail (see Figures 14 and 15). Note that the surface of the domes, the interface of the vast city and the overlying atmosphere, a surface referred to in its time as "Upperside," is . . .

ENCYCLOPEDIA GALACTICA

21.

Yet the following day found Hari Seldon back in the library. For one thing, there was his promise to Hummin. He had promised to try and he couldn't very well make it a halfhearted process. For another, he owed something to himself too. He resented having to admit failure. Not yet, at least. Not while he could plausibly tell himself he was following up leads.

So he stared at the list of reference book-films he had not yet checked through and tried to decide which of the unappetizing number had the slightest chance of being useful to him. He had almost decided that the answer was "none of the above" and saw no way out but to look at samples of each when he was startled by a gentle tap against the alcove wall.

Seldon looked up and found the embarrassed face of Lisung Rands peering at him around the edge of the alcove opening. Seldon knew Randa, had been introduced to him by Dors, and had dined with him (and with others) on several occasions.

Randa, an instructor in psychology, was a little man, short and plump, with a round cheerful face and an almost perpetual smile. He had a sallow complexion and the narrowed eyes so characteristic of people on millions of worlds. Seldon knew that appearance well, for there were many of the great mathematicians who had borne it, and he had frequently seen their holograms. Yet on Helicon he had never seen one of these Easterners. (By tradition they were called that, though no one knew why; and the Easterners themselves were said to resent the term to some degree, but again no one knew why.)

"There's millions of us here on Trantor," Randa had said, smiling with no trace of self-consciousness, when Seldon, on first meeting him, had not been able to repress all trace of startled surprise. "You'll also find lot of Southerners-dark skins, tightly curled hair. Did you ever see one?"

"Not on Helicon," muttered Seldon.

"All Westerners on Helicon, eh? How dull! But it doesn't matter. Takes all kinds." (He left Seldon wondering at the fact that there were Easterners, Southerners, and Westerners, but no Northerners. He had tried finding an answer to why that might be in his reference searches and had not succeeded.)

And now Randa's good-natured face was looking at him with an almost ludicrous look of concern. He said, "Are you all right, Seldon?"

Seldon stared. "Yes, of course. Why shouldn't I be?"

"I'm just going by sounds, my friend. You were screaming."

"Screaming?" Seldon looked at him with offended disbelief.

"Not loud. Like this." Ranch gritted his teeth and emitted a strangled high-pitched sound from the back of his throat. "If I'm wrong, I apologize for this unwarranted intrusion on you. Please forgive me."

Seldon hung his head. "You're forgiven, Lisung. I do make that sound sometimes, I'm told. I assure you it's unconscious. I'm never aware of it."

"Are you aware why you make it?"

"Yes. Frustration. Frustration. "

Randa beckoned Seldon closer and lowered his voice further. "We're disturbing people. Let's come out to the lounge before we're thrown out."

In the lounge, over a pair of mild drinks, Randa said, "May I ask you, as a matter of professional interest, why you are feeling frustration?"

Seldon shrugged. "Why does one usually feel frustration? I'm tackling something in which I am making no progress."

"But you're a mathematician, Hari. Why should anything in the history library frustrate you?"

"What were you doing here?"

"Passing through as part of a shortcut to where I was going when I heard you . . . moaning. Now you see"--and he smiled--"it's no longer a shortcut, but a serious delay--one that I welcome, however."

"I wish I were just passing through the history library, but I'm trying to solve a mathematical problem that requires some knowledge of history and I'm afraid I'm not handling it well."

Randa stared at Seldon with an unusually solemn expression on his face, then he said, "Pardon me, but I must run the risk of offending you now. I've been computering you."

"Computering me.!" Seldon's eyes widened. He felt distinctly angry.

"I have offended you. But, you know, I had an uncle who was a mathematician. You might even have heard of him: Kiangtow Randa."

Seldon drew in his breath. "Are you a relative of that Randa?"

"Yes. He is my father's older brother and he was quite displeased with me for not following in his footsteps--he has no children of his own. I thought somehow that it might

please him that I had met a mathematician and I wanted to boast of you-if I could-so I checked what information the mathematics library might have."

"I see. And that's what you were really doing there. Well-fm sorry. I don't suppose you could do much boasting."

"You suppose wrong. I was impressed. I couldn't make heads or tails of the subject matter of your papers, but somehow the information seemed to be very favorable. And when I checked the news files, I found you were at the Decennial Convention earlier this year. So . . . what's 'psychohistory,' anyway? Obviously, the first two syllables stir my curiosity."

"I see you got that word out of it."

"Unless I'm totally misled, it seemed to me that you can work out the future course of history."

Seldon nodded wearily, "That, more or less, is what psychohistory is or, rather, what it is intended to be."

"But is it a serious study?" Randa was smiling. "You don't just throw sticks?"

"throw sticks?"

"That's just a reference to a game played by children on my home planet of Hopara. The game is supposed to tell the future and if you're a smart kid, you can make a good thing out of it. Tell a mother that her child will grow up beautiful and marry a rich man and it's good for a piece of cake or a half-credit piece on the spot. She isn't going to wait and see if it comes true; you are rewarded just for saying it."

"I see. No, I don't throw sticks. Psychohistory is just an abstract study. Strictly abstract. It has no practical application at all, except--"

"Now we're getting to it. Exceptions are what are interesting."

"Except that I would like to work out such an application. Perhaps if I knew more about history--"

"Ah, that is why you are reading history?"

"Yes, but it does me no good," said Seldon sadly. "There is too much history and there is too little of it that is told."

"And that's what's frustrating you?"

Seldon nodded.

Randa said, "But, Hari, you've only been here a matter of weeks."

"True, but already I can see--"

"You can't see anything in a few weeks. You may have to spend your whole lifetime making one little advance. It may take many generations of work by many mathematicians to make a real inroad on the problem."

"I know that, Lisung, but that doesn't make me feel better. I want to make some visible progress myself."

"Well, driving yourself to distraction won't help either. If it will make you feel better, I can give you an example of a subject much less complex than human history that people have been working for I don't know how long without making much progress. I

know because a group is working on it right here at the University and one of my good friends is involved. Talk about frustration! You don't know what frustration is!"

"What's the subject?" Seldon felt a small curiosity stirring within him.

"Meteorology."

"Meteorology!" Seldon felt revolted at the anticlimax.

"Don't make faces. Look. Every inhabited world has an atmosphere. Every world has its own atmospheric composition, its own temperature range, its own rotation and revolution rate, its own axial tipping, its own land-water distribution. We've got twenty five million different problems and no one has succeeded in finding a generalization."

". . . that's because atmospheric behavior easily enters a chaotic phase. Everyone knows that."

"So my friend Jenarr Leggen says. You've met him."

Seldon considered. "Tall fellow? Long nose? Doesn't speak much?"

"That's the one. -And Trantor itself is a bigger puzzle than almost any world.

According to the records, it had a fairly normal weather pattern when it was first settled. Then, as the population grew and urbanization spread, more energy was used and more heat was discharged into the atmosphere. The ice cover contracted, the cloud layer thickened, and the weather got lousier. That encouraged the movement underground and set off a vicious cycle. The worse the weather got, the more eagerly the land was dug into and the domes built and the weather got still worse. Now the planet has become a world of almost incessant cloudiness and frequent rains--or snows when it's cold enough. The only thing is that no one can work it out properly. No one has worked out an analysis that can explain why the weather has deteriorated quire as it has or how one can reasonably predict the details of its day-today changes."

Seldon shrugged. "Is that sort of thing important?"

"To a meteorologist it is. Why can't they be as frustrated over their problems as you are over yours? Don't be a project chauvinist."

Seldon remembered the cloudiness and the dank chill on the way to the Emperor's Palace. He said, "So what's being done about it?"

"Well, there's a big project on the matter here at the University and Jenarr Leggen is part of it. They feel that if they can understand the weather change on Trantor, they will learn a great deal about the basic laws of general meteorology. Leggen wants that as much as you want your laws of psychohistory. So he has set up an incredible array of instruments of all kinds Upperside . . . you know, above the domes. It hasn't helped them so far. And if there's so much work being done for many generations on the atmosphere, without results, how can you complain that you haven't gotten anything out of human history in a few weeks?"

Randa was right, Seldon thought, and he himself was being unreasonable and wrong. And yet . . . and yet . . . Hummin would say that this failure in the scientific attack on problems was another sign of the degeneration of the times.

Perhaps he was right, also, except that he was speaking of a general degeneration and average effect. Seldon felt no degeneration of ability and mentality in himself. He

said with some interest then, "You mean that people climb up out of the domes and into the open air above?"

"Yes. Upperside. It's a funny thing, though. Most native Trantorians won't do it. They don't like to go Upperside. The idea gives them vertigo or something. Most of those working on the meteorology project are Outworlders."

Seldon looked out of the window and the lawns and small garden of the University campus, brilliantly lit without shadows or oppressive heat, and said thoughtfully, "I don't know that I can blame Trantorians for liking the comfort of being within, but I should think curiosity would drive come Upperside. It would drive me."

"Do you mean that you would like to see meteorology in action?"

"I think I would. How does one get Upperside?"

"Nothing to it. An elevator rakes you up, a door opens, and there you are. I've been up there. It's . . . novel."

"It would get my mind off psychohistory for a while." Seldon sighed. "I'd welcome that."

"On the other hand," said Randy, "my uncle used to say, 'All knowledge is one,' and he may be right. You may learn something from meteorology that will help you with your psychohistory. Isn't that possible?"

Seldon smiled weakly. "A great many things are possible." And to himself he added: But not practical.

22.

Dors seemed amused. "Meteorology?"

Seldon said, "Yes. There's work scheduled for tomorrow and I'll go up with them."

"Are you tired of history?"

Seldon nodded his head somberly. "Yes, I am. I'll welcome the change. Besides, Randy says it's another problem that's too massive for mathematics to handle and it will do me good to see that my situation isn't unique."

"I hope you're not agoraphobic."

Seldon smiled. "No, I'm not, but I see why you ask. Randy says that Trantorians are frequently agoraphobic and won't go Upperside. I imagine they feel uncomfortable without a protective enclosure. . . "

Dors nodded. "You can see where that would be natural, but there are also many Trantorians who are to be found among the planets of the Galaxy-tourists, administrators, soldiers. And agoraphobia isn't particularly rare in the Outworlds either."

"That may be, Dors, but I'm not agoraphobic. I am curious and I welcome the change, so I'll be joining them tomorrow."

Does hesitated. "I should go up with you, but I have a heavy schedule tomorrow. gill, if you're not agoraphobic, you'll have no trouble and you'll probably enjoy yourself. Oh, and stay close to the meteorologists. I've heard of people getting lost up there."

"I'll be careful. It's a long time since I've gotten truly lost anywhere."

23.

Jenarr Leggen had a dark look about him. It was not so much his complexion, which was fair enough. It was not even his eyebrows, which were thick and dark enough. It was, rather, that those eyebrows were hunched over deep-set eyes and a long and rather prominent nose. He had, as a result, a most unmerry look. His eyes did not smile and when he spoke, which wasn't often, he had a deep, strong voice, surprisingly resonant for his rather thin body.

He said, "You'll need warmer clothing than that, Seldon."

Seldon said, "Oh?" and looked about.

There were two men and two women who were making ready to go up with Leggen and Seldon And, as in Leggen's own case, their rather satiny Trantorian clothing was covered by thick sweaters that, not surprisingly, were brightly colored in bold designs. No two were even faintly alike, of course.

Seldon looked down at himself and said, "Sorry, I didn't know but I don't have any suitable outer garment."

"I can give you one. I think there's a spare here somewhere. -Yes, here it is. A little threadbare, but it's better than nothing."

"Wearing sweaters like these tan make you unpleasantly warm," said Seldon.

"Here they would," said Leggen. "Other conditions exist Upperside. Cold and windy. Too bad I don't have spare leggings and boots for you too. You'll want them later."

They were taking with them a tart of instruments, which they were testing one by one with what Seldon thought was unnecessary slowness.

"Your home planet cold?" asked Leggen.

Seldon said, "Parts of it, of course. The part of Helicon I come from is mild and often rainy."

"Too bad. You won't like the weather Upperside."

"I think I can manage to endure it for the time we'll be up there."

When they were ready, the group filed into an elevator that was marked: OFFICIAL USE ONLY.

"That's because it goes Upperside," said one of the young women, "and people aren't supposed to be up there without good reason."

Seldon had not met the young woman before, but he had heard her addressed as Clowzia. He didn't know if that was a first name, a last name, or a nickname.

The elevator seemed no different from others that Seldon had been on, either here on Trantor or at home in Helicon (barring, of course, the gravitic lift he and Hummin had used), but there was something about knowing that it was going to take him out of the confines of the planet and into emptiness above that made it feel like a spaceship.

Seldon smiled internally. A foolish fantasy.

The elevator quivered slightly, which remind Seldon of Hummin's forebodings of Galactic decay. Leggen, along with the other men and one of the women, seemed frozen and waiting, as though they had suspended thought as well as activity until they could get out, but Clowzia kept glancing at him as though she found him terribly impressive.

Seldon leaned close and whispered to her (he hesitated to disturb the others), "Are we going up very high?"

"High?" she repeated. She spoke in a normal voice, apparently not feeling that the others required silence. She seemed very young and it occurred to Seldon that she was probably an undergraduate. An apprentice, perhaps.

"We're taking a long time. Upperside must be many stories high in the air."

For a moment, she looked puzzled. Then, "Oh no. Not high at all. We started very deep. The University is at a low level. We use a great deal of energy and if we're quire deep, the energy costs are lower."

Leggen said, "All right. We're here. Leis get the equipment out."

The elevator stopped with a small shudder and the wide door slid open rapidly. The temperature dropped at once and Seldon thrust his hands into his pockets and was very glad he had a sweater on. A cold wind stirred his hair and it occurred to him that he would have found a hat useful and, even as he thought that, Leggen pulled something out of a fold in his sweater, snapped it open, and put it on his head. The others did the same. Only Clowzia hesitated. She paused just before she put hers on, then offered it to Seldon.

Seldon shook his head. "I can't take your hat, Clowzia."

"Go ahead. I have long hair and it's pretty thick. Yours is short and a little . . . thin."

Seldon would have liked to deny that firmly and at another time he would have. Now, however, he took the hat and mumbled, "Thank you. If your head gets cold, I'll give it back."

Maybe she wasn't so young. It was her round face, almost a baby face. And now that she had called attention to her hair, he could see that it was a charming russet shade. He had never seen hair quite like that on Helicon.

Outside it was cloudy, as it had been the time he was taken across open country to the Palace. It was considerably colder than it had been then, but he assumed that was because they were six weeks farther into winter. The clouds were thicker than they had been on the earlier occasion and the day was distinctly darker and threatening-or was it just closer to night? Surely, they wouldn't come up to do important work without leaving themselves an ample period of daylight to do it in. Or did they expect to take very little time? He would have liked to have asked, but it occurred to him that they might not like questions at this time. All of them seemed to be in states varying from excitement to anger.

Seldon inspected his surroundings. He was standing on something that he thought might be dull metal from the sound it made when he surreptitiously thumped his foot down on it. It was not bare metal, however. When he walked, he left footprints. The

surface was clearly covered by dust or fine sand or clay. Well, why not? There could scarcely be anyone coming up here to dust the place. He bent down to pinch up some of the matter out of curiosity.

Clowzia had come up to him. She noticed what he was doing and said, with the air of a housewife caught at an embarrassing negligence, "We do sweep hereabouts for the sake of the instruments. It's much worse most places Upperside, but it really doesn't matter. It makes for insulation, you know."

Seldon grunted and continued to look about. There was no chance of understanding the instruments that looked as though they were growing out of the thin soil (if one could call it that). He hadn't the faintest idea of what they were or what they measured.

Leggen was walking toward him. He was picking up his feet and putting them down gingerly and it occurred to Seldon that he was doing so to avoid jarring the instruments. He made a mental note to walk that way himself.

"You! Seldon!"

Seldon didn't quite like the tone of voice. He replied coolly, "Yes, Dr. Leggen?"

"..Well, Dr. Seldon, then." He said it impatiently. "That little fellow Randa told me you are a mathematician."

"That's Wit. . . "

"..A good one?.. "

"I'd like to think so, but it's a hard thing to guarantee."

"And you're interested in intractable problems?"

Seldon said feelingly, "I'm stuck with one."

"I'm stuck with another. You're free to look about. If you have any questions, our intern, Clowzia, will help out. You might be able to help us."

"I would be delighted to, but I know nothing about meteorology. . . "

"That's all right, Seldon. I just want you to get a feel for this thing and then I'd like to discuss my mathematics, such as it is."

"I'm at your service."

Leggen turned away, his long scowling face looking grim. Then he turned back.

"If you get cold-too cold-the elevator door is open. You just step in and touch the spot marked; UNIVERSITY BASE. It will take you down and the elevator will then return to us automatically. Clowzia will show you-if you forget."

"I won't forget."

This time he did leave and Seldon looked after him, feeling the cold wind knife through his sweater. Clowzia came back over to him, her face slightly reddened by that wind.

Seldon said, "Dr. Leggen seems annoyed. Or is that just his ordinary outlook on life?"

She giggled. "He does look annoyed most of the time, but right now he really is."

Seldon said very naturally, "Why?"

Clowzia looked over her shoulder, her long hair swirling. Then she said, "I'm not supposed to know, but I do just the same. Dr. Leggen had it all figured out that today, just at this time, there was going to be a break in the clouds and he'd been planning to make special measurements in sunlight. Only . . . well, look at the weather."

Seldon nodded.

"We have holovision receivers up here, so he knew it was cloudy worse than usual- and I guess he was hoping there would be something wrong with the instruments so that it would be their fault and not that of his theory. So far, though, they haven't found anything out of the way."

"And that's why he looks so unhappy."

"Well, he never looks happy. "

Seldon looked about, squinting. Despite the clouds, the light was harsh. He became aware that the surface under his feet was not quite horizontal. He was standing on a shallow dome and as he looked outward there were other domes in all directions, with different widths and heights.

"Upperside seems to be irregular," he said.

"Mostly, I think. That 's the way it worked out."

"Any reason for it?"

"Not really. The way I've heard it explained-I looked around and asked, just as you did, you know-was that originally the people on Trantor domed in places, shopping malls, sports arenas, things like that, then whole towns, so that (here were lots of domes here and there, with different heights and different widths. When they all came together, it was all uneven, but by that time, people decided that's the way it ought to be."

"You mean that something quite accidental came to be viewed as a tradition?"

" I suppose so-if you want to put it that way."

(If something quite accidental can easily become viewed as a tradition and he made unbreakable or nearly so, thought Seldon, would that be a law of psychohistory? It sounded trivial, but how many other laws, equally trivial, might there be? A million? A billion? Were there a relatively few general laws from which these trivial ones could be derived as corollaries? How could he say? For a while, lost in thought, he almost forgot the biting wind.)

Clowzia was aware of that wind, however, for she shuddered and said, "It's very nasty. It's much better under the dome."

"Are you a Trantorian?" asked Seldon.

"That's right."

Seldon remembered Ranch's dismissal of Trantorians as agoraphobic and said, "Do you mind being up here?"

"I hate it," said Clowzia, "but I want my degree and my specialty and status and Dr. Leggen says I can't get it without some field work. So here I am, hating it, especially when it's so cold. When it's this cold, by the way, you wouldn't dream that vegetation actually grows on these domes, would you?"

"It does?, " He looked at Clowzia sharply, suspecting some sort of practical joke designed to make him look foolish. She looked totally innocent, but how much of that was real and how much was just her baby face?

"Oh sure. Even here, when it's warmer. You notice the soil here? We keep it swept away because of our work, as I said, but in other places it accumulates here and there and is especially deep in the low places where the domes meet. Plants grow in it."

"But where does the soil come from?"

"When the dome covered just part of the planet, the wind deposited soil on them, little by little. Then, when Trantor was all covered and the living levels were dug deeper and deeper, some of the material dug up, if suitable, would be spread over the top."

"Surely, it would break down the domes."

"Oh no. The domes are very strong and they're supported almost everywhere. The idea was, according to a book-film I viewed, that they were going to grow crops Upperside, but it turned out to be much more practical to do it inside the dome. Yeast and algae could be cultivated within the domes too, taking the pressure off the usual crops, so it was decided to let Upperside go wild. There are animals on Upperside too- butterflies, bees, mice, rabbits. Lots of them."

"Won't the plant roots damage the domes?"

"In thousands of years they haven't. The domes are treated so that they repel the roots. Most of the growth is grass, but there are trees too. You'd be able to see for yourself if this were the warm season or if we were farther south or if you were up in a spaceship." She looked at him with a sidewise flick of her eyes, "Did you see Trantor when you were coming down from space?"

"No, Clowzia, I must confess I didn't. The hypership was never well placed for viewing. Have you ever seen Trantor from space?"

She smiled weakly. "I've never been in space."

Seldon looked about. Gray everywhere. "I can't make myself believe it," he said. "About vegetation Upperside, I mean."

"It's true, though. I've heard people say-Otherworlders, like yourself, who did see Trantor from space-that the planet looks green, like a lawn, because it's mostly grass and underbrush. There are trees too, actually. There's a copse not very far from here. I've seen it. They're evergreens and they're up to six meters high."

"Where?"

"You can't see it from here. It's on the other side of a dome. It's-" The call came out thinly. (Seldon realized they had been walking while they had been talking and had moved away from the immediate vicinity of the others.)

"Clowzia. Get back here. We need you."

Clowzia said, "Uh-oh. Coming. -Sorry, Dr. Seldon, I have to go." She ran off, managing to step lightly despite her lined boors.

Had she been playing with him? Had she been filling the gullible foreigner with a mess of lies for amusement's sake? Such things had been known to happen on every

world and in every time. An air of transparent honesty was no guide either; in fact, successful Wetellers would deliberately cultivate just such an air.

So could there really be six-meter trees Upperside? Without thinking much about it, he moved in the direction of the highest dome on the horizon. He swung his arms in an attempt to warm himself. And his feet were getting cold. Clowzia hadn't pointed. She might have, to give him a hint of the direction of the trees, but she didn't. Why didn't she? To be sure, she had been called away.

The domes were broad rather than high, which was a good thing, since otherwise the going would have been considerably more difficult. On the other hand, the gentle grade meant trudging a distance before he could top a dome and look down the other side.

Eventually, he could see the other side of the dome he had climbed. He looked back to make sure he could still see the meteorologists and their instruments. They were a good way off, in a distant valley, but he could see them clearly enough. Good. He saw no copse, no trees, but there was a depression that snaked about between two domes. Along each side of that crease, the soil was thicker and there were occasional green smears of what might be moss. If he followed the crease and if it got low enough and the soil was thick enough, there might be trees.

He looked back, trying to fix landmarks in his mind, but there were just the rise and fall of domes. It made him hesitate and Dors's warning against his being lost, which had seemed a rather unnecessary piece of advice then, made more sense now. Still, it seemed clear to him that the crease was a kind of road. If he followed it for some distance, he only had to turn about and follow it back to return to this spot.

He strode off purposefully, following the rounded crease downward. There was a soft rumbling noise above, but he didn't give it any thought. He had made up his mind that he wanted to see trees and that was all that occupied him at the moment.

The moss grew thicker and spread out like a carpet and here and there grassy tufts had sprung up. Despite the desolation Upperside, the moss was bright green and it occurred to Seldon that on a cloudy, overcast planet there was likely to be considerable rain. The crease continued to curve and there, just above another dome, was a dark smudge against the gray sky and he knew he had found the trees.

Then, as though his mind, having been liberated by the sight of those trees, could turn to other things, Seldon took note of the rumble he had heard before and had, without thinking, dismissed as the sound of machinery. Now he considered that possibility: Was it, indeed, the sound of machinery?

Why not? He was standing on one of the myriad domes that covered hundreds of millions of square kilometers of the worldcity. There must be machinery of all kinds hidden under those domes-ventilation motors, for one thing. Maybe it could be heard, where and when all the other sounds of the world-city were absent. Except that it did not seem to come from the ground. He looked up at the dreary featureless sky. Nothing. He continued to scan the sky, vertical creases appearing between his eyes and then, far off It

was a small dark spot, showing up against the gray. And whatever it was it seemed to be moving about as though getting its bearings before it was obscured by the clouds again.

Then, without knowing why, he thought, They're after me. And almost before he could work out a line of action, he had taken one. He ran desperately along the crease toward the trees and then, to reach them more quickly, he turned left and hurtled up and over a low dome, treading through brown and dying fernlike overgrowth, including thorny sprigs with bright red berries.

24.

Seldon panted, facing a tree, holding it closely, embracing it. He watched for the flying object to make its appearance again so that he could back about the tree and hide on the far side, like a squirrel.

The tree was cold, its bark was rough, it gave no comfort-but it offered cover. Of course, that might be insufficient, if he was being searched for with a heat-seeker, but, on the other hand, the cold trunk of a tree might blur even that.

Below him was hard-pecked soil. Even in this moment of hiding, of attempting to see his pursuer while remaining unseen, he could not help wondering how thick the soil might be, how long it had taken to accumulate, many domes in the warmer areas of Trantor tarried forests on their back, and whether the trees were always confined to the creases between domes, leaving the higher regions to moss, grass, and underbrush.

He saw it again. It was not a hypership, nor even an ordinary air jet. It was a jet-down. He could see the faint glow of the ion trails coming out at the vertices of a hexagon, neutralizing the gravitational pull and allowing the wings to keep it aloft like a large soaring bird. It was a vehicle that could hover and explore a planetary terrain.

It was only the clouds than had saved him. Even if they were using heat-seekers, that would only indicate there were people below. The jet down would have make a tentative dive below the banked ceiling before it could hope to know how many human beings there were and whether any of them might be the particular person the patties aboard were seeking.

The jet-down was closer now, but it couldn't hide from him either. The rumble of the engine gave it away and they couldn't rum that off, not as long as they wished to continue their search. Seldon knew the jetdowns, for on Helicon or on any undomed world with skies that cleared now and then, they were common, with many in private hands.

Of what possible use would jet-downs be on Trantor, with all the human life of the world under domes, with low cloud ceilings all but perpetual-except for a few government vehicles designed for just this purpose, chat of picking up a wanted person who had been lured above the domes?

Why not? Government forces could nor enter the grounds of the University, but perhaps Seldon was no longer on the grounds. He was on top of the domes which might

be outside the jurisdiction of any local government. An Imperial vehicle might have every right to land on any part of the dome and question or remove any person found upon it. Hummin had not warned him of this, but perhaps he had merely not thought of doing so.

The jet-down was even closer now, nosing about like a blind beast sniffing out its prey. Would it occur to them to search this group of trees? Would they land and send out an armed soldier or two to beat through the copse?

And if so, what could he do? He was unarmed and all his quick twist agility would be useless against the agonizing pain of a neuronically whiplashed.

It was not attempting to land. Either they missed the significance of the trees.

Or--

A new thought suddenly hit him. What if this wasn't a pursuit vessel at all? What if it was part of the meteorological testing? Surely, meteorologists would want to test the upper reaches of the atmosphere. Was he a fool to hide from it?

The sky was getting darker. The clouds were getting thicker or, much more likely, night was falling.

And it was getting colder and would get colder still. Was he going to stay out here freezing because a perfectly harmless jetdown had made an appearance and had activated a sense of paranoia that he had never felt before? He had a strong impulse to leave the copse and get back to the meteorological station.

After all, how would the man Hummin feared so much Demerzel-know that Seldon would, at this particular time, be Upperside and ready to be taken? For a moment, that seemed conclusive and, shivering with the cold, he moved out from behind the tree.

And then he scurried back as the vessel reappeared even closer than before. He hadn't seen it do anything that would seem to be meteorological. It did nothing that might be considered sampling, measuring, or testing. Would he see such things if they took place? He did not know the precise sort of instruments the jet-down carried or how they worked. If they were doing meteorological work, he might not be able to tell. -Still, could he take the chance of coming into the open?

After all, what if Demerzel did know of his presence Upperside, simply because an agent of his, working in the University, knew about it and had reported the matter. Listing Randa, that cheerful, smiling little Easterner, had suggested he go Upperside. He had suggested it quite forcefully and the subject had not arisen naturally out of the conversation; at least, not naturally enough. Was it possible that he was a government agent and had alerted Demerzel somehow?

Then there was Leggen, who had given him the sweater. The sweater was useful, but why hadn't Leggen told him he would need one earlier so he could get his own? Was there something special about the one he was wearing? It was uniformly purple, while all the others' indulged in the Trantorian fashion of bright patterns. Anyone looking down from a height would see a moving dull blotch in among others that were bright and know immediately whom they wanted.

And Clowzia? She was supposedly Upperside to learn meteorology and help the meteorologists. How was it possible that she could come to him, talk to him at ease, and

quietly walk him away from the others and isolate him so that he could easily be picked up? For that matter, what about Dors Venabili? She knew he was going Upperside. She did not stop it. She might have gone with him, but she was conveniently busy.

It was a conspiracy. Surely, it was a conspiracy.

He had convinced himself now and there was no further thought of getting out from the shelter of the trees. (His feet felt like lumps of ice and stamping them against the ground seemed to do no good.) Would the jet-down never leave?

And even as he thought that, the pitch of the engine's rumble heightened and the jet-down rose into the clouds and faded away.

Seldon listened eagerly, alert to the smallest sound, making sure it was finally gone. And then, even after he was sure it was gone, he wondered if that was just a device to flush him out of hiding. He remained where he was while the minutes slowly crawled on and night continued to fall.

And finally, when he felt that the true alternative to taking the chance of coming out in the open was that of freezing into insensibility, he stepped out and moved cautiously beyond the shelter of the trees.

It was dusky twilight, after all. They couldn't detect him except by a hear-seeker, but, if so, he would hear the jet-down return. He waited just beyond the trees, counting to himself, ready to hide in the copse again at the smallest sound-though what good that would do him once he was spotted, he couldn't imagine.

Seldon looked about. If he could find the meteorologists, they would surely have artificial light, but except for that, there would be nothing.

He could still just make out his surroundings, but in a matter of a quarter of an hour, half an hour at the outside, he would not. With no lights and a cloudy sky above, it would be dark-completely dark.

Desperate at the prospect of being enveloped in total darkness, Seldon realized that he would have to find his way back to the crease that had brought him there as quickly as possible and retrace his steps. Folding his arms tightly around himself for warmth, he set off in what he thought was the direction of the crease between the domes.

There might, of course, be more than one crease leading away from the copse, but he dimly made out some of the sprigs of berries he had seen coming in, which now looked almost black rather than bright red. He could not delay. He had to assume he was right. He moved up the crease as fast as he might, guided by failing sight and by the vegetation underfoot.

But he couldn't stay in the crease forever. He had come over what had seemed to him to be the tallest dome in sight and had found a crease that cut at right angles across his line of approach. By his reckoning, he should now turn right, then sharp left, and that would put him on the path toward the meteorologists' dome.

Seldon made the left turn and, lifting his head, he could just make out the curve of a dome against the fractionally lighter sky. That had to be it! Or was that only wishful thinking?

He had no choice but to assume it wasn't. Keeping his eye on the peak so that he could move in a reasonably straight line, he headed for it as quickly as he could. As he got closer, he could make out the line of dome against sky with less and less certainty as it loomed larger and larger. Soon, if he was correct, he would be going up a gentle slope and when that slope became level he would be able to look down the other side and see the lights of the meteorologists.

In the inky dark, he could not tell what lay in his path. Wishing there were at least a few sorts to shed some light, he wondered if this was how it felt to be blind. He waved his arms before him as if they were antennae.

It was growing colder by the minute and he paused occasionally to blow on his hands and hold them under his armpits. He wished earnestly he could do the same for his feet. By now, he thought, if it started to precipitate, it would be snow-or, worse yet, sleet.

On . . . on. There was nothing else to do.

Eventually, it seemed to him that he was moving downward. That was either wishful thinking or he had topped the dome.

He stopped. If he had topped the dome, he should be able to see the artificial light of the meteorological station. He would see the lights carried by the meteorologists themselves, sparkling or dancing like fireflies.

Seldon closed his eyes as though to accustom them to dark and then try again, but that was a foolish effort. It was no darker with his eyes closed than with them open and when he opened them it was no lighter than when he had had them closed.

Possibly Leggen and the others were gone, had taken their lights with them and had turned off any lights on the instruments. Or possibly Seldon had climbed the wrong dome. Or he had followed a curved path along the dome so that he was now facing in the wrong direction. Or he had followed the wrong crease and had moved away from the copse in the wrong direction altogether.

What should he do?

If he was facing the wrong direction, there was a chance that light would be visible right or left-and it wasn't. If he had followed the wrong crease, there was no possible way he could return to the copse and locate a different crease.

His only chance lay in the assumption that he was facing the right direction and that the meteorological station was more or less directly ahead of him, but that the meteorologists had gone and had left it in darkness.

Move forward, then. The chances of success might be small, but it was the only chance he had.

He estimated that it had taken him half an hour to move from the meteorological station to the top of the dome, having gone partway with Clowzia and sauntering with her rather than striding. He was moving at little better than a saunter now in the daunting darkness.

Seldon continued to slog forward. It would have been nice to know the time and he had a timeband, of course, but in the dark He stopped. He wore a Trantorian timeband, which gave Galactic Standard time (as all time bands did) and which also gave

Trantorian local time. Timebands were usually visible in the dark, phosphorescing so that one could tell time in the quiet dark of a bedchamber. A Heliconian timeband certainly would; why not a Trantorian one?

He looked at his timeband with reluctant apprehension and touched the contact that would draw upon the power source for light. The timeband gleamed feebly and told him the time was 1847. For it to be nighttime already, Seldon knew that it must be the winter season. -How far past the solstice was it? What was the degree of axial tipping? How long was the year? How far from the equator was he at this moment? There was no hint of an answer to any of these things, but what counted was that the spark of light was visible.

He was not blind! Somehow the feeble glow of his timeband gave him renewed hope.

His spirits rose. He would move on in the direction he was going. He would move for half an hour. If he encountered nothing, he would move on five minutes more-no further-just five minutes. If he still encountered nothing, he would stop and think. That, however, would be thirty-five minutes from now. Till then, he would concentrate only on walking and on willing himself to feel warmer (He wiggled his toes, vigorously. He could still feel them.)

Seldon trudged onward and the half hour passed. He paused, then hesitantly, he moved on for five more minutes.

Now he had to decide. There was nothing. He might be nowhere, far removed from any opening into the dome. He might, on the other hand, be standing three meters to the left-or right-or short-of the meteorological station. He might be two arms' lengths from the opening into the dome, which would not, however, be open.

Now what?

Was there any point in shouting? He was enveloped by utter silence but for the whistling of the wind. If there were birds, beasts, or insects in among the vegetation on the domes, they were not here during this season or at this time of night or at this particular place. The wind continued to chill him.

Perhaps he should have been shouting all due way. The sound might have carried a good distance in the cold air. But would there have been anyone to hear him?

Would they hear him inside the dome? Were there instruments to detect sound or movement from above? Might there not be sentinels just inside?

That seemed ridiculous. They would have heard his footsteps, wouldn't they?

Still- He called out. "Help! Help! Can someone hear me?"

His cry was strangled, half-embarrassed. It seemed silly shouting into vast black nothingness.

But then, he felt it was even sillier to hesitate in such a situation as this.

Panic was welling up in him. He took in a deep, cold breath and screamed for as long as he could. Another breath and another scream, changing pitch. And another.

Seldon paused, breathless, turning his head every which way, even though there was nothing to see. He could not even detect an echo. There was nothing left to do but wait for the dawn. But how long was the night at this season of the year?

And how cold would it get?

He felt a tiny cold touch sting his face. After a while, another.

It was sleeting invisibly in the pitch blackness. And there was no way to find shelter.

He thought: It would have been better if that jet-down had seen me and picked me up. I would be a prisoner at this moment, perhaps, but I'd be warm and comfortable, at least.

Or, if Hummin had never interfered, I might have been back in Helicon long ago.

Under surveillance, but warm and comfortable. Right now that was all he wanted-to be warm and comfortable.

But at the moment he could only wait. He huddled down, knowing that however long the night, he dared not sleep. He slipped off his shoes and rubbed his icy feet.

Quickly, he put his shoes back on.

He knew he would have to repeat this, as well as rubbing his hands and ears all night long to keep his circulation flowing. But most important to remember was that he must not let himself fall asleep. That would mean certain death.

And, having carefully thought all this out, his eyes closed and he nodded off to sleep with the sleet coming down.

LEGGEN, JENARR- . . . His contributions to meteorology, however, although considerable, pale before what has ever since been known as the Leggen Controversy. That his actions helped to place Hari Seldon in jeopardy is undisputable, but argument rages-and has always raged--as to whether those actions were the result of unintentional circumstance or part of a deliberate conspiracy. Passions have been raised on both sides and even the most elaborate studies have come to no definite conclusions. Nevertheless, the suspicions that were raised helped poison Leggen's career and private life in the years that followed . . .

ENCYCLOPEDIA GALACTICA

25.

It was not quite the end of daylight when Dors Venabili sought out Jenarr Leggen. He answered her rather anxious greeting with a grunt and a brief nod.

"Well," she said a trifle impatiently. "How was he?"

Leggen, who was entering data into his computer, said, "How was who?"

"My library student Hari. Dr. Hari Seldon. He went up with you. Was he any help to you?"

Leggen removed his hands from the keys of his computer and swivelled about.

"That Helicomman fellow? He was of no use at all. Showed no interest whatever. He kept looking at the scenery when there was no scenery to look at. A real oddball. Why did you want to send him up?"

"It wasn't my idea. He wanted to. I can't understand it. He was very interested. - Where is he now?"

Leggen shrugged. "How would I know? Somewhere around."

"Where did he go after he came down with you? Did he say?"

"He didn't come down with us. I told you he wasn't interested."

"Then when did he come down?"

"I don't know. I wasn't watching him. I had an enormous amount of work to do. There must have been a windstorm and some sort of downpour about two days ago and neither was expected. Nothing our instruments showed offered a good explanation for it or for the fact that some sunshine we were expecting today didn't appear. Now I'm trying to make sense of it and you're bothering me."

"You mean you didn't see him go down?"

"Look. He wasn't on my mind. The idiot wasn't correctly dressed and I could see that inside of half an hour he wasn't going to be able to take the cold. I gave him a

sweater, but that wasn't going to help much for his legs and feet. So I left the elevator open for him and I told him how to use it and explained that it would take him down and then return automatically. It was all very simple and I'm sure he did get cold and he did go down and the elevator did come back and then eventually we all went down."

"But you don't know exactly when he went down?"

"No, I don't. I told you. I was busy. He certainly wasn't up there when we left, though, and by that time twilight was coming on and it looked as though it might sleet. So he had to have gone down."

"Did anyone else see him go down?"

"I don't know. Clowzia may have. She was with him for a while. Why don't you ask her?"

Dors found Clowzia in her quarters, just emerging from a hot shower.

"It was cold up there," she said.

Dors said, "Were you with Hari Seldon Upperside?"

Clowzia said, eyebrows lifting, "Yes, for a while. He wanted to wander about and ask questions about the vegetation up there. He's a sharp fellow, Dors. Everything seemed to interest him, so I told him what I could till Leggen called me back. He was in one of his knock-your-head-off tempers. The weather wasn't working and he-

Dors interrupted. "Then you didn't see Hari go down in the elevator?"

"I didn't see him at all after Leggen called me over. -But he has to be down here. He wasn't up there when we left."

"But I can't find him anywhere."

Clowzia looked perturbed. "Really?-But he's got to be somewhere down here."

"No, he doesn't have to be somewhere down here," said Dors, her anxiety growing.

"What if he's still up there?"

"That's impossible. He wasn't. Naturally, we looked about for him before we left. Leggen had shown him how to go down. He wasn't properly dressed and it was rotten weather. Leggen told him if he got cold not to wait for us. He was getting cold. I know! So what else could he do but go down?"

"But no one saw him go down. -Did anything go wrong with him up there?"

"Nothing. Not while I was with him. He was perfectly fine except that he had to be cold, of course."

Dors, by now quite unsettled, said, "Since no one saw him go down, he might still be up there. Shouldn't we go up and look?"

Clowzia said nervously, "I told you we looked around before we went down. It was still quite light and he was nowhere in sight."

"Let's look anyway."

"But I can't take you up there. I'm just an intern and I don't have the combination for the Upperside dome opening. You'll have to ask Dr. Leggen."

26.

Dors Venabili knew that Leggen would not willingly go Upperside now. He would have to be forced.

First, she checked the library and the dining areas again. Then she called Seldon's room. Finally, she went up there and signaled at the door. When Seldon did not respond, she had the floor manager open it. He wasn't there. She questioned some of those who, over the last few weeks, had come to know him. No one had seen him.

Well, then, she would make Leggen take her Upperside. By now, though, it was night. He would object strenuously and how long could she spend arguing if Hari Seldon was trapped up there on a freezing night with sleet turning to snow?

A thought occurred to her and she rushed to the small University computer, which kept track of the doings of the students, faculty, and service staff.

Her fingers flew over the keys and she soon had what she wanted.

There were three of them in another part of the campus. She signed out for a small glidecart to take her over and found the domicile she was looking for.

Surely, one of them would be available-or findable.

Fortune was with her. The first door at which she signaled was answered by a query light. She punched in her identification number, which included her department affiliation. The door opened and a plump middle-aged man stared out at her. He had obviously been washing up before dinner. His dark blond hair was askew and he was not wearing any upper garment.

He said, "Sorry. You catch me at a disadvantage. What can I do for you, Dr. Venabili?"

She said a bit breathlessly, "You're Rogen Benastra, the Chief Seismologist, aren't you?"

"Yes."

"This is an emergency. I must see the seismological records for Upperside for the last few hours."

Benastra stared at her. "Why? Nothing's happened. I'd know if it had. The seismograph would inform us."

"I'm not talking about a meteoric impact."

"Neither am I. We don't need a seismograph for that. I'm talking about gravel, pinpoint fractures. Nothing today."

"Not that either. Please. Take me to the seismograph and read it for me. This is life or death."

"I have a dinner appointment-"

"I said life or death and I mean it."

Benastra said, "I don't see-" but he faded out under Dors's glare. He wiped his face, left quick word on his message relay, and struggled into a shirt.

They half-ran (under Dors's pitiless urging) to the small squat Seismology Building. Dors, who knew nothing about seismology, said, "Down? We're going down?"

"Below the inhabited levels. Of course. The seismograph has to be fixed to bedrock and be removed from the constant clamor and vibration of the city levels."

"But how can you tell what's happening Upperside from down here?"

"The seismograph is wired to a set of pressure transducers located within the thickness of the dome. The impact of a speck of grit will send the indicator skittering off the screed. We can detect the flattening effect on the dome of a high wind. We can-

"Yes, yes," said Dors impatiently. She was not here for a lecture on the virtues and refinements of the instruments. "Can you detect human footsteps?"

"..Human footsteps?" Benastra looked confused. "That's not likely Upperside."

"Of course it's likely. There were a group of meteorologists Upperside this afternoon."

"Oh. Well, footsteps would scarcely be noticeable."

"It would be noticeable if you looked hard enough and that's what I want you to do."

Benastra might have resented the firm note of command in her voice, but, if so, he said nothing. He touched a contact and the computer screen jumped to life.

At the extreme right center, there was a fat spot of light, from which a thin horizontal line stretched to the left limit of the screen. There was a tiny wriggle to it, a random non-repetitive seder of little hiccups and these moved steadily leftward. It was almost hypnotic in its effect on Dors.

Benastra said, "..That's as quiet as it can possibly be. Anything you see is the result of changing air pressure above, raindrops maybe, the distant whirr of machinery. There's nothing up there."

"All right, but what about a few hours ago? Check on the records at fifteen hundred today, for instance. Surely, you have some recordings."

Benastra gave the computer its necessary instructions and for a second or two there was wild chaos on the screen. Then it settled down and again the horizontal line appeared.

"I'll sensitize it to maximum," muttered Benastra. There were now pronounced hiccups and as they staggered leftward they changed in pattern markedly.

"What's that?" said Dors. "Tell me."

"Since you say there were people up there, Venabili, I would guess they were footsteps-the shifting of weight, the impact of shoes. I don't know that I would have guessed it if I hadn't known about the people up there. Its what we call a benign vibration, not associated with anything we know to be dangerous."

"..Can you tell how many people are present?"

"Certainly not by eye. You see, we're getting a resultant of all the impacts."

"..You say 'not by eye.' Can the resultant be analyzed into its components by the computer?"

"I doubt it. These are minimal effects and you have to allow for the inevitable noise. The results would be untrustworthy."

"Well then. Move the time forward till the footstep indications stop. Can you make it fast-forward, so to speak?"

"If I do-the kind of fast-forward you're speaking of-then it will all just blur into a straight line with a slight haze above and below. What I can do is move it forward in fifteen-minute stages and study it quickly before moving on."

"Good. Do that!"

Both watched the screen until Benastra said, "There's nothing there now. See?" There was again a fine with nothing but tiny uneven hiccups of noise.

"..When did the footsteps stop?"

"Two hours ago. A trifle more."

"And when they stopped were there fewer than there were earlier?"

Benastra looked mildly outraged. "I couldn't tell. I don't think the finest analysis could make a certain decision."

Dors pressed her lips together. Then she said, "Are you testing a transducer-is that what you called it-near the meteorological outlet?.."

"Yes, that's where the instruments are and that's where the meteorologists would have been." Then, unbelievably, "Do you want the to try others in the vicinity? One at a time?"

"No. Stay on this one. But keep on going forward at fifteen minute intervals. One person tray have been left behind and may have made his way back to the instruments."

Benastra shook his head and muttered something under his breath. The screen shifted again and Dors said sharply, "What's that?" She was pointing.

"I don't know. Noise."

"..No. Its periodic. Could it be a single person's footsteps?"

"Sure, but it could be a dozen other things too."

"It's coming along at about the time of footsteps, isn't it?" Then, after a while, she said, "Push it forward a little."

He did and when the screen settled down she said, "Aren't those unevennesses getting bigger?"

"Possibly. We can measure them."

"We don't have to. You can see they're getting bigger. The footsteps are approaching the transducer. Go forward again. See when they stop."

After a while Benastra said, "They stopped twenty or twenty-five minutes ago."

Then cautiously, "Whatever they are."

"They're footsteps," said Dors with mountain-moving conviction. "There's a man up there and while you and I have been fooling around here, he's collapsed and he's going to freeze and die. Now don't say, 'Whatever they are!' Just call Meteorology and get me Jenarr Leggen. Life or death, I tell you. Say so!"

Benastra, lips quivering, had passed the stage where he could possibly resist anything this strange and passionate woman demanded. It took no more than three minutes to get Leggen's hologram on the message platform. He had been pulled away

from his dinner table. There was a napkin in his hand and a suspicious greasiness under his lower lip.

His long face was set in a fearful scowl. "'Life or death?' What is this? Who are you?" Then his eye caught Dors, who had moved closer to Benastra so that her image would be seen on Jenarr's screen. He said, "You again. This is simple harassment."

Dors said, "It is not. I have consulted Rogen Benastra, who is Chief Seismologist at the University. After you and your party had left Upperside, the seismograph shows clear footsteps of one person still there. It's my student Hari Seldon, who went up there in your care and who is now, quite certainly, lying in a collapsed stupor and may not live long.

"You will, therefore, take me up there right now with whatever equipment may be necessary. If you do not do so immediately, I shall proceed to University security-to the President himself, if necessary. One way or another I'll get up there and if anything has happened to Hari because you delay one minute, I will see to it that you are hauled in for negligence, incompetence-whatever I can make stick-and will have you lose all status and be thrown out of academic life. And if he's dead, of course, that's manslaughter by negligence. Or worse, since I've now warned you he's dying."

Jenarr, furious, turned to Benastra. "Did you detect-"

But Dors cut in. "He told me what he detected and I've told you. I do not intend to allow you to bulldoze him into confusion. Are you coming? Now?"

"..Has it occurred to you that you may be mistaken?.." said Jenarr, thin-lipped.

"Do you know what I can do to you if this is a mischievous false alarm? Loss of status works both ways."

"Murder doesn't," said Dors. "I'm ready to chance a trial for malicious mischief. Are you ready to chance a trial for murder?"

Jenarr reddened, perhaps more at the necessity of giving in than at the threat.

"I'll come, but I'll have no mercy on you, young woman, if your student eventually turns out to have been safe within the dome these past three hours."

27.

The three went up the elevator in an inimical silence. Leggen had eaten only part of his dinner and had left his wife at the dining area without adequate explanation. Benastra had eaten no dinner at all and had possibly disappointed some woman companion, also without adequate explanation. Dors Venabili had not eaten either and she seemed the most tense and unhappy of the three. She carried a thermal blanket and two photonic founts.

When they reached the entrance to Upperside, Leggen, jaw muscles tightening, entered his identification number and the door opened. A cold wind rushed at them and Benastra grunted. None of the three was adequately dressed, but the two men had no intention of remaining up there long.

Dors said tightly, "It's snowing."

Leggen said, "It's wet snow. The temperature's just about at the freezing point. It's not a killing frost."

"It depends on how long one remains in it, doesn't it?" said Dors. "And being soaked in melting snow won't help."

Leggen grunted. "Well, where is he?" He stared resentfully out into utter blackness, made even worse by the light from the entrance behind him.

Dors said, "Here, Dr. Benastra, hold this blanket for me. And you, Dr. Leggen, close the door behind you without locking it."

"There's no automatic lock on it. Do you think we're foolish?"

"Perhaps not, but you can lock it from the inside and leave anyone outside unable to get into the dome."

"If someone's outside, point him out. Show him to me," said Leggen.

"He could be anywhere." Dors lifted her arms with a photonic fount circling each wrist.

"We can't look everywhere," mumbled Benastra miserably.

The founts blazed into light, spraying in every direction. The snowflakes glittered like a vast mob of fireflies, making it even more difficult to see.

"The footsteps were getting steadily louder," said Dors. "Fie had to be approaching the transducer. Where would it be located?"

"I haven't any idea," snapped Leggen. "That's outside my field and my responsibility."

"Dr. Benastra?"

Benastra's reply was hesitant. "I don't really know. To tell you the truth, I've never been up here before. It was installed before my time. The computer knows, but we never thought to ask it that. -I'm cold and I don't see what use I am up here."

"You'll have to stay up here for a while," said Dom firmly. "Follow me. I'm going to circle the entrance in an outward spiral."

"We can't see much through the snow," said Leggen.

"I know that. If it wasn't snowing, we'd have seen him by now. I'm sure of it. As it is, it may take a few minutes. We can stand that." She was by no means as confident as her words made it appear.

She began to walk, swinging her arms, playing the light over as large a field as she could, straining her eyes for a dark blotch against the snow.

And, as it happened, it was Benastra who first said, "What's that?" and pointed.

Dom overlapped the two founts, making a bright cone of light in the indicated direction. She ran toward it, as did the other two.

They had found him, huddled and wet, about ten meters from the door, five from the nearest meteorological device. Dors felt for his heartbeat, but it was not necessary for, responding to her touch, Seldon stirred and whimpered.

"Give me the blanket, Dr. Benastra," said Dors in a voice that was faint with relief. She flapped it open and spread it out in the snow. "Lift him onto it carefully and I'll wrap him. Then we'll carry him down."

In the elevator, vapors were rising from the wrapped Seldon as the blanket warmed to blood temperature.

Dom said, "Once we have him in his room, Dr. Leggen, you get a doctor-a good one-and see that he comes at once. If Dr. Seldon gets through this without harm, I won't say anything, but only if he does. Remember-"

"You needn't lecture me," said Leggen coldly. "I regret this and I will do what I can, but my only fault was in allowing this man to come Upperside in the first place."

The blanket stirred and a low, weak voice made itself heard.

Benastra started, for Seldon's head was cradled in the crook of his elbow. He said, "He's trying to say something."

Dors said, "I know. He said, 'What's going on?' "

She couldn't help but laugh just a little. It seemed such a normal thing to say.

28.

The doctor was delighted.

"I've never seen a case of exposure," he explained. "One doesn't get exposed on Trantor."

"That may be," said Dors coldly, "and I'm happy you have the chance to experience this novelty, but does it mean that you do not know how to treat Dr. Seldon?"

The doctor, an elderly man with a bald head and a small gray mustache, bristled.

"Of course, I do. Exposure cases on the Outer Worlds are common enough--an everyday affair-and I've read a great deal about them."

Treatment consisted in part of an antiviral serum and the use of a microwave wrapping.

"This ought to take care of it," the doctor said. "On the Outer Worlds, they make use of much more elaborate equipment in hospitals, but we don't have that, of course, on Trantor. This is a treatment for mild cases and I'm sure it will do the job."

Dors thought later, as Seldon was recovering without particular injury, that it was perhaps because he was an Outworlder that he had survived so well. Dark, cold, even snow were not utterly strange to him. A Trantorian probably would have died in a similar case, not so much from physical trauma as from psychic shock.

She was not sure of this, of course, since she herself was not a Trantorian either. And, turning her mind away from these thoughts, she pulled up a chair near to Hari's bed and settled down to wait.

29.

On the second morning Seldon stirred awake and looked up at Dors, who sat at his bedside, viewing a book-film and taking notes.

In a voice that was almost normal, Seldon said, "Still here, Dors?"

She put down the book-film. "I can't leave you alone, tart I? And I don't trust anyone else."

"It seems to me that every time I wake up, I see you. Have you been here all the time?"

"Sleeping or waking, yes."

"But your classes?"

"I have an assistant who has taken over for a while."

Dors leaned over and grasped Hari's hand. Noticing his embarrassment (he was, after all, in bed), she removed it.

"Hari, what happened? I was so frightened."

Seldon said, "I have a confession to make."

"..fit is it, Hart'?"

"I thought perhaps you were part of a conspiracy-"

"A conspiracy?" she said vehemently.

"I mean, m maneuver me Upperside where I'd be outside University jurisdiction and therefore subject to being picked up by Imperial forces."

"But Upperside isn't outside University jurisdiction. Sector jurisdiction on Trantor is from the planetary center to the sky."

"Ah, I didn't know that. But you didn't come with me because you said you had a busy schedule and, when I was getting paranoid, I thought you were deliberately abandoning me. Please forgive me. Obviously, it was you who got me down from there. Did anyone else care?"

". . . they were busy men," said Dors carefully. "They thought you had come down earlier. I mean, it was a legitimate thought."

"Clowzia thought so too?"

"The young intern? Yes, she did."

"Well, it may still have been a conspiracy. Without you, I mean."

"No, Hari, it is my fault. I had absolutely no right to let you go Upperside alone. It was my job to protect you. I can't stop blaming myself for what happened, for you getting lost."

"Now, wait a minute," said Seldon, suddenly irritated. "I didn't get lost. What do you think I am?"

"I'd like to know what you call it. You were nowhere around when the others left and you didn't get back to the entrance-or to the neighborhood of the entrance anyway-till well after dark."

"But that's not what happened. I didn't get lost just because I wandered away and couldn't find my way back. I told you I was suspecting a conspiracy and I had cause to do so. I'm not totally paranoid."

"Well then, what did happen?"

Seldon told her. He had no trouble remembering it in full detail; he had lived with it in nightmare for most of the preceding day.

Dors listened with a frown. "But that's impossible. A jet-down? Are you sure?"

"Of course I'm sure. Do you think I was hallucinating?"

"But the Imperial forces could not have been searching for you. They could not have arrested you Upperside without creating the same ferocious rumpus they would have if they had sent in a police force to arrest you on campus."

"Then how do you explain it?"

"I'm not sure," said Dors, "but it's possible that the consequences of my failure to go Upperside with you might have been worse than they were and that Hummin will be seriously angry with me."

"Then let's not tell him," said Seldon. "It ended well."

"We must tell him," said Dors grimly. "This may not be the end."

30.

That evening Jenarr Leggen came to visit. It was after dinner and he looked from Dors to Seldon several times, as though wondering what to say. Neither offered him help, but both waited patiently.

He had not impressed either of them as being a master of small talk.

Finally he said to Seldon, "I've come to see how you are."

"Perfectly well," said Seldon, "except that I'm a little sleepy. Dr. Venabili tells me that the treatment will keep me tired for a few days, presumably so I'm sure of getting needed rest." He smiled. "Frankly, I don't mind."

Leggen breathed in deeply, let it out, hesitated, and then, almost as though he was forcing the words out of himself, said, "I won't keep you long. I perfectly understand you need to rest. I do want to say, though, that I am sorry it all happened. I should not have assumed--so casually that you had gone down by yourself. Since you were a tyro, I should have felt more responsible for you. After all, I had agreed to let you come up. I hope you can find it in your heart to . . . forgive me. That's really all I wish to say."

Seldon yawned, purring his hand over his mouth. "Pardon me. -Since it seems to have turned out well, there need be no hard feelings. In some ways, it was not your fault. I should not have wandered away and, besides, what happened was "

Dors interrupted. "Now, Hari, please, no conversation. Just relax. Now, I want to talk to Dr. Leggen just a bit before he goes. In the first place, Dr. Leggen, I quite understand you are concerned about how repercussions from this affair will affect you. I told you there would be no follow-up if Dr. Seldon recovered without ill effects. That

seems to be taking place, so you may relax-for now. I would like to ask you about something else and I hope that this time I will have your free cooperation."

"I will try, Dr. Venabili," said Leggen stiffly.

"Did anything unusual happen during your stay Upperside?"

"You know it did. I lost Dr. Seldon, something for which I have just apologized."

"Obviously I'm not referring to that. Did anything else unusual happen?..

"No, nothing. Nothing at all."

Dors looked at Seldon and Seldon frowned. It seemed to him that Dors was trying to check on his story and get an independent account. Did she think he was imagining the search vessel? He would have liked to object heatedly, but she had raised a quieting hand at him, as though she was preventing that very eventuality. He subsided, partly because of this and partly because he really wanted to sleep. He hoped that Leggen would not stay long.

"Are you certain?" said Dors. "Were there no intrusions from outside?"

"No, of course not. Oh-

"Yes, Dr. Leggen?"

"There was a jet-down."

"Did that strike you as peculiar?"

"No, of course not."

"Why not?"

"This sounds very much as though I'm being cross-examined, Dr. Venabili. I don't much like it."

"I can appreciate that, Dr. Leggen, but these questions have something to do with Dr. Seldon's misadventure. It may be that this whole affair is more complicated than I had thought."

"In what way?" A new edge entered his voice. "Do you intend to raise new questions, requiring new apologies? In that case, I tray find it necessary to withdraw."

"Not, perhaps, before you explain how it is you do not find a hovering jet-down a bit peculiar."

"Because, my dear woman, a number of meteorological stations on Trantor possess jet-downs for the direct study of clouds and the upper atmosphere. Our own meteorological station does not."

"Why not? It would be useful."

"Of course. But we're not competing and we're not keeping secrets. We will report on our findings; they will report on theirs. It makes sense, therefore, to have a scattering of differences and specializations. It would be foolish to duplicate efforts completely. The money and manpower we might spend on jet-downs can be spent on mesonic refractometers, while others will spend on the first and save on the latter. After all, there may be a great deal of competitiveness and ill feeling among the sectors, but science is one thing-- only thing-that holds us together. You know that, I presume," he added ironically.

"I do, but isn't it rather coincidental that someone should be sending a jet-down right to your station on the very day you were going to use the station?.. "

"No coincidence at all. We announced that we were going to make measurements on that day end, consequently, some other station thought, very properly, that they might make simultaneous nephelometric measurements--clouds, you know. The results, taken together, would make more sense and be more useful than either taken separately."

Seldon said suddenly in a rather blurred voice, "They were just measuring, then?" He yawned again.

"Yes" said Leggen. "What else could they possibly be doing?"

Dors blinked her eyes, as she sometimes did when she was trying to think rapidly. "That all makes sense. To which station did this particular jet-down belong?" Leggen shook his head. "Dr. Venabili, how can you possibly expect me to tell?"

"I thought that each meteorological jet-down might possibly have its station's markings on it."

"Surely, but I wasn't looking up and studying it, you know. I had my own work to do and I let them do theirs. When they report, I'll know whose jet-down it was."

"What if they don't report?"

"Then I would suppose their instruments failed. That happens sometimes." His right fist was clenched. "Is that all, then?"

"Wait a moment. Where do you suppose the jet-down might have come from?"

"It might be any station with jet-downs. On a day's notice--and they got more than that--one of those vessels can reach us handily from anyplace on the planet."

"But who most likely?"

"Hard to say: Hestelonia, Wye, Ziggoreth, North Damiano. I'd say one of these four was the most likely, but it might be any of forty others at least."

"Just one more question, then. Just one. Dr. Leggen, when you announced that your group would be Upperside, did you by any chance say that a mathematician, Dr. Hari Seldon, would be with you? A look of apparently deep and honest surprise crossed Leggen's face, a look that quickly turned contemptuous. "Why should I lie? Of what interest would that be to anyone?"

"Very well," said Dors. "The truth of the matter, then, is that Dr. Seldon saw the jet-down and it disturbed him. I am not certain why and apparently his memory is a bit fuzzy on the matter. He more or less ran away from the jet-down, got himself lost, didn't think of trying to return--or didn't dare to--till it was well into twilight, and didn't quite make it back in the dark. You can't be blamed for that, so let's forget the whole incident on both sides."

"Agreed," said Leggen. "Good-bye!" He turned on his heel and left.

When he was gone, Dors rose, pulled off Seldon's slippers gently, straightened him in his bed, and covered him. He was sleeping, of course.

Then she sat down and thought. How much of what Leggen had said was true and what might possibly exist under the cover of his words? She did not know.

MYCOGEN

MYCOGEN- . . . A sector of ancient Trantor Buried in the past of its own legends Mycogen made little impact on the planet. Self-satisfied and self-separated to a degree . . .

ENCYCLOPEDIA GALACTICA

31.

When Seldon woke, he found a new face looking at him solemnly. For a moment he frowned owlshly and then he said, "Hummin?"

Hummin smiled very slightly. "You remember me, then?"

"It was only for a day, nearly two months ago, but I remember. You were not arrested, then, or in any way "As you see, I am here, quite safe and whole, but--and he glanced at Dors, who stood to one side-'it was not very easy for me to come here."

Seldon said, "I'm glad to see you. -Do you mind, by the way?" He jerked his thumb in the direction of the bathroom.

Hummin said, "Take your time. Have breakfast."

Hummin didn't join him at breakfast. Neither did Dors. Nor did they speak. Hummin scanned a book-film with an attitude of easy absorption. Dors inspected her nails critically and then, taking out a microcomputer, began making notes with a stylus.

Seldon watched them thoughtfully and did not try to start a conversation. The silence now might be in response to some Trantorian reserve customary at a sickbed. To be sure, he now felt perfectly normal, but perhaps they did not realize that.

It was only when he was done with his last morsel and with the final drop of milk (which he was obviously getting used to, for it no longer tasted odd) that Hummin spoke.

He said, "How are you, Seldon?"

"Perfectly well, Hummin. Sufficiently well, certainly, for me to be up and about."

"I'm glad to hear it," said Hummin dryly. "Dons Venabili was much to blame in allowing this to happen."

Seldon frowned. "No. I insisted on going Upperside."

"I'm sure, but she should, at all costs, have gone with you."

"I told her I didn't want her to go with me."

Dors said, "That's not so, Hari. Don't defend me with gallant lies."

Seldon said angrily, "But don't forget that Dors also came Upperside after me, against strong resistance, and undoubtedly saved my life. That's not bending the truth at all. Have you added that to your evaluation, Hummin?"

Dors interrupted again, obviously embarrassed. "Please, Hari. Chetter Hummin is perfectly correct in feeling that I should either have kept you from going Upperside or have gone up with you. As for my subsequent actions, he has praised them."

"Nevertheless," said Hummin, "that is past and we can let it go. Let us talk about what happened Upperside, Seldon."

Seldon looked about and said guardedly, "Is it safe to do so?"

Hummin smiled slightly. "Dons has placed this room in a Distortion Field. I can be pretty sure that no Imperial agent at the University-if there is one-has the expense to penetrate it. You are a suspicious person, Seldon."

"Not by nature," said Seldon. "Listening to you in the park and afterward-You are a persuasive person, Hummin. By the time you were through, I was ready to fear that Eto Demerzel was lurking in every shadow."

"I sometimes think he might be," said Hummin gravely.

"If he was," said Seldon, "I wouldn't know it was he. What does he look like?"

"That scarcely matters. You wouldn't see him unless he wanted you to and by then it would all be over, I imagine-which is what we must prevent. Let's talk about that jet-down you saw."

Seldon said, "As I told you, Hummin, you filled me with fears of Demerzel. As soon as I saw the jet-down, I assumed he was after me, that I had foolishly stepped outside the protection of Streeling University by going Upperside, that I had been lured up there for the specific purpose of being picked up without difficulty."

Dors said, "On the other hand, Leggen-"

Seldon said quickly, "Was he here last night?"

"Yes, don't you remember?"

"Vaguely. I was dead tired. It's all a blur in my memory."

"Well, when he was here last night, Leggen said that the jetdown was merely a meteorological vessel from another station. Perfectly ordinary. Perfectly harmless."

"What?" Seldon was taken aback. "I don't believe that."

Hummin said, "Now the question is: Why don't you believe that? Was there anything about the jet-down that made you think it was dangerous? Something specific, that is, and not just a pervasive suspicion placed in your head by me."

Seldon thought back, biting his lower lip. He said, "Its actions. It seemed to push its forepart below the cloud deck, as though it were looking for something, then it would appear in another spot just the same way, then in another spot, and so on. It seemed to be searching Upperside methodically, section by section, and homing in on me."

Hummin said, "Perhaps you were personifying, Seldon. You may have been treating the jet-down as though it was a strange animal looking for you. It wasn't, of course. It was simply a jetdown and if it was a meteorological vessel, its actions were perfectly normal . . . and harmless."

Seldon said, "It didn't seem that way to me."

Hummin said, "I'm sure it didn't, but we don't actually know anything. Your conviction that you were in danger is simply an assumption. Leggen's decision that it was a meteorological vessel is also only an assumption."

Seldon said stubbornly, "I can't believe that it was an entirely innocent event."

"Well then," said Hummin, "suppose we assume the worst—that the vessel took looking for you. How would whoever sent that vessel know you would be there to seek?"

Dors interjected, "I asked Dr. Leggen if he had, in his report of the forthcoming meteorological work, included the information that Hari would be with the group. There was no reason he should in the ordinary course of events and he denied that he had, with considerable surprise at the question. I believed him."

Hummin said thoughtfully, "Don't believe him too readily. Wouldn't he deny it, in any case? Now ask yourself why he allowed Seldon to come along in the first place. We know he objected initially, but he did relent, without much fight. And that, to me, seems rather out of character for Leggen."

Dors frowned and said, "I suppose that does make it a bit more likely that he did arrange the entire affair. Perhaps he permitted Hari's company only in order to put him in the position of being taken. He might have received orders to that effect. We might further argue that he encouraged his young intern, Clowzia, to engage Hari's attention and draw him away from the group, isolating him. That would account for Leggen's odd lack of concern over Hari's absence when it came time to go below. He would insist that Hari had left earlier, something he would have laid the groundwork for, since he had carefully showed him how to go down by himself. It would also account for his reluctance to go back up in search of him, since he would not want to waste time looking for someone he assumed would not be found."

Hummin, who had listened carefully, said, "You make an interesting case against him, but I do not accept that too readily either. After all, he did come Upperside with you in the end."

"Because footsteps had been detected. The Chief Seismologist had home witness to that."

"Well, did Leggen show shock and surprise when Seldon was found? I mean, beyond that of finding someone who had been brought into extreme peril through Leggen's own negligence. Did he act as though Seldon wasn't supposed to be there? Did he behave as though he were asking himself: How is it they didn't pick him up?"

Dors thought carefully, then said, "He was obviously shocked by the sight of Hari lying there, but I couldn't possibly tell if there was anything to his feelings beyond the very natural horror of the situation."

"No, I suppose you couldn't."

But now Seldon, who had been looking from one to the other as they spoke and who had been listening intently, said, "I don't think it was Leggen."

Hummin transferred his attention to Seldon. "Why do you say that?"

"For one thing, as you noted, he was clearly unwilling to have me come along. It took a whole day of argument and I think he agreed only because he had the impression

that I was a clever mathematician who could help him out with meteorological theory. I was anxious to go up there and, if he had been under orders to see to it that I was taken Upperside, there would have been no need to be so reluctant about it."

"Is it reasonable to suppose he wanted you only for your mathematics? Did he discuss the mathematics with you? Did he make an attempt to explain his theory to you?"

"No," said Seldon, "he didn't. He did say something about going into it later on, though. The trouble was, he was totally involved with his instruments. I gathered he had expected sunshine that hadn't showed up and he was counting on his instruments having been at fault, but they were apparently working perfectly, which frustrated him. I think this was an unexpected development that both soured his temper and turned his attention away from me. As for Clowzia, the young woman who preoccupied me for a few minutes, I do not get the feeling, as I look back on it, that she deliberately led me away from the scene. The initiative was mine. I was curious about the vegetation on Upperside and it was I who drew her away, rather than vice versa. Far from Leggen encouraging her action, he called her back while I was still in sight and I moved farther away and out of sight entirely on my own."

"And yet," said Hummin, who seemed intent on objecting to every suggestion that was made, "if that ship was looking for you, those on board must have known you'd be there. How would they know-if not from Leggett?"

"The man I suspect," said Seldon, "is a young psychologist named Listing Ranch"

"Randa?" said Dors. "I can't believe that. I know him. He simply would not be working for the Emperor. He's anti-Imperialist to the core."

"He might pretend to be," said Seldon. "In fact, he would have to be openly, violently, and extremely anti-Imperialist if he was trying to mask the fact that he is an Imperial agent."

"But that's exactly what he's not like," said Dors. "He is not violent and extreme in anything. He's quiet and good-natured and his views are always expressed mildly, almost timidly. I'm convinced they're genuine."

"And yet, Dors," said Seldon earnestly, "it was he who first told me of the meteorological project, it was he who urged me to go Upperside, and it was he who persuaded Leggen to allow me to join him, rather exaggerating my mathematical prowess in the process. One must wonder why he was so anxious to get me up there, why he should labor so hard."

"For your good, perhaps. He was interested in you, Hari, and must have thought that meteorology might have been useful in psychohistory. Isn't that possible?"

Hummin said quietly, "Let's consider another point. There was a considerable lapse of time between the moment when Randa told you about the meteorology project and the moment you actually went Upperside. If Randa is innocent of anything underhanded, he would have no particular reason to keep quiet about it. If he is a friendly and gregarious person-

"He is," said Dors.

"-then he might very likely tell a number of friends about it. In that case, we couldn't really tell who the informer might be. In fact, just to make another point, suppose Randa is anti-Imperialist. That would not necessarily mean he is not an agent. We would have to ask: Whom is he an agent for? On whose behalf does he work?"

Seldon was astonished. "Who else is there to work for but the Empire? Who else but Demerzel?"

Hummin raised his hand. "You are far from understanding the whole complexity of Trantorian politics, Seldon." He turned toward Dors. "Tell me again: Which were the four sectors that Dr. Leggen named as likely sources for a meteorological vessel?"

"Hestelonia, Wye, Ziggoreth, and North Damiano."

"And you did not ask the question in any leading way? You didn't ask if a particular sector might be the source?"

"No, definitely not. I simply asked if he could speculate as to the source of the jet-down."

"And you"-Hummin turned to Seldon "may perhaps have seen some marking, some insigne, on the jet-down?"

Seldon wanted to retort heatedly that the vessel could hardly be seen through the clouds, that it emerged only briefly, that he himself was not looking for markings, but only for escape-but he held back. Surely, Hummin knew all that.

Instead, he said simply, "I'm afraid not."

Dors said, "If the jet-down was on a kidnapping mission, might not the insigne have been masked?"

"That is the rational assumption," said Hummin, "and it tray well have been, but in this Galaxy rationality does not always triumph. However, since Seldon seems to have taken no note of any details concerning the vessel, we can only speculate. What I'm thinking is: Wye."

"Why?" echoed Seldon. "I presume they wanted to take me because whoever was on the ship wanted me for my knowledge of psychohistory."

"No, no." Hummin lifted his right forefinger as if lecturing a young student.

"W-y-e. It is the name of a sector on Trantor. A very special sector. It has been ruled by a line of Mayors for some three thousand years. It has been a continuous line, a single dynasty. There was a time, some five hundred years ago, when two Emperors and an Empress of the House of Wye sat on the Imperial throne. It was a comparatively short period and none of the Wye rulers were particularly distinguished or successful, but the Mayors of Wye have never forgotten this Imperial past. "

"They have not been actively disloyal to the ruling houses that have succeeded them, but neither have they been known to volunteer much on behalf of those houses. During the occasional periods of civil war, they maintained a kind of neutrality, making moves that seemed best calculated to prolong the civil war and make it seem necessary to turn to Wye as a compromise solution. That never worked out, but they never stopped trying either. "

"The present Mayor of Wye is particularly capable. He is old now, but his ambition hasn't cooled. If anything happens to Cleon -even a natural death-the Mayor will have a chance at the succession over Cleon's own too-young son. The Galactic public will always be a little more partial toward a claimant with an Imperial past. "

"Therefore, if the Mayor of Wye has heard of you, you might serve as a useful scientific prophet on behalf of his house. There would be a traditional motive for Wye to try to arrange some convenient end for Cleon, use you to predict the inevitable succession of Wye and the coming of peace and prosperity for a thousand years after. Of course, once the Mayor of Wye is on the throne and has no further use for you, you might well follow Cleon to the grave."

Seldon broke the grim silence that followed by saying, "But we don't know that it is this Mayor of Wye who is after me."

"No, we don't. Or that anyone at all is after you, at the moment. The jet-down might, after all, have been an ordinary meteorological testing vessel as Leggen has suggested. Still, as the news concerning psychohistory and its potential spreads-and it surely must -...ore and more of the powerful and semipowerful on Trantor or, for that matter, elsewhere will want to make use of your services."

"What, then," said Dors, "shall we do?"

"That is the question, indeed." Hummin ruminated for a while, then said, "Perhaps it was a mistake to come here. For a professor, it is all too likely that the hiding place chosen would be a University. Streeling is one of many, but it is among the largest and most free, so it wouldn't be long before tendrils from here and there would begin feeling their soft, blind way toward this place. I think that as soon as possible-today, perhaps-Seldon should be moved to another and better hiding place. But-

"But?" said Seldon.

"But I don't know where."

Seldon said, "Call up a gazeteer on the computer screen and choose a place at random."

"Certainly not," said Hummin. "If we do that, we are as likely to find a place that is less secure than average, as one that is more secure. No, this must be reasoned out. - Somehow."

32.

The three remained huddled in Seldon's quarters till past lunch. During that time, Hari and Dors spoke occasionally and quietly on indifferent subjects, but Hummin maintained an almost complete silence. He sat uptight, ate little, and his grave countenance (which, Seldon thought, made him look older than his years) remained quiet and withdrawn.

Seldon imagined him to be reviewing the immense geography of Trantor in his mind, searching for a comer that would be ideal. Surely, it couldn't be easy.

Seldon's own Helicon was somewhat larger by a percent or two than Trantor was and had a smaller ocean. The Heliconian land surface was perhaps 10 percent larger than the Trantorian. But Helicon was sparsely populated, its surface only sprinkled with scattered cities; Trantor was all city. Where Helicon was divided into twenty administrative sectors; Trantor had over eight hundred and every one of those hundreds was itself a complex of subdivisions.

Finally Seldon said in some despair, "Perhaps it might be best, Hummin, choose which candidate for my supposed abilities is most nearly benign, hand me over to that one, and count on him to defend me against the rest."

Hummin looked up and said in utmost seriousness, "That is not necessary. I know the candidate who is most nearly benign and he already has you."

Seldon smiled. "Do you place yourself on the same level with the Mayor of Wye and the Emperor of all the Galaxy?"

"In point of view of position, no. But as far as the desire to control you is concerned, I rival them. They, however, and anyone else I can think of want you in order to strengthen their own wealth and power, while I have no ambitions at all, except for the good of the Galaxy."

"I suspect," said Seldon dryly, "that each of your competitors-if asked-would insist that he too was thinking only of the good of the Galaxy."

"I am sure they would," said Hummin, "but so far, the only one of my competitors, as you call them, whom you have met is the Emperor and he was interested in having you advance fictionalized predictions that might stabilize his dynasty. I do not ask you for anything like that. I ask only that you perfect your psychohistorical technique so that mathematically valid predictions, even if only statistical in nature, can be made."

"True. So far, at least," said Seldon with a half-smile.

"Therefore, I might as well ask: How are you coming along with that task? Any progress?"

Seldon was uncertain whether to laugh or rage. After a pause, he did neither, but managed to speak calmly. "Progress? In less than two months? Hummin, this is something that might easily take me my whole life and the lives of the next dozen who follow me. -And even then end in failure."

"I'm not talking about anything as final as a solution or even as hopeful as the beginning of a solution. You've said flatly a number of times that a useful psychohistory is possible but impractical. All I am asking is whether there now seems any hope that it can be made practical.'

"Frankly, no."

Dors said, "Please excuse me. I am not a mathematician, so I hope this is not a foolish question. How can you know something is both possible and impractical? I've heard you say that, in theory, you might personally meet and greet all the people in the Empire, but that it is not a practical feat because you couldn't live long enough to do it. But how can you tell that psychohistory is something of this sort?"

Seldon looked at Dors with some incredulity. "Do you want that explained."

"Yes," she said, nodding her head vigorously so that her curled hair vibrated.

"As a matter of fact," said Hummin, "so would L"

"Without mathematics?" said Seldon with just a trace of a smile.

"Please," said Hummin.

"Well-" He retired into himself to choose a method of presentation. Then he said,-
If you want to understand some aspect of the Universe, it helps if you simplify it as much as possible and include only those properties and characteristics that are essential to understanding. If you want to determine how an object drops, you don't concern yourself with whether it is new or old, is red or green, or has an odor or not. You eliminate those things and thus do not needlessly complicate matters. The simplification you can call a model or a simulation and you can present it either as an actual representation on a computer screen or as a mathematical relationship. If you consider the primitive theory of non-relativistic gravitation "

Don said at once, "You promised there would be no mathematics. Don't try to slip it in by calling it 'primitive.' .. "

"No, no. I mean 'primitive' only in that it has been known as long as our records go back, that its discovery is shrouded in the mists of antiquity as is that of fire or the wheel. In any case, the equations for such gravitational theory contain within themselves a description of the motions of a planetary system, of a double star, of tides, and of many other things. Making use of such equations, we can even set up a pictorial simulation and have a planet circling a star or two stars circling each other on a two-dimensional screen or set up more complicated systems in a three-dimensional holograph. Such simplified simulations make it far easier to grasp a phenomenon than it would be if we had to study the phenomenon itself. In fact, without the gravitational equations, our knowledge of planetary motions and of celestial mechanics generally would be sparse indeed.

"Now, as you wish to know more and more about any phenomenon or as a phenomenon becomes more complex, you need more and more elaborate equations, more and more detailed programming, and you end with a computerized simulation that is harder and harder to grasp."

"Can't you form a simulation of the simulation?" asked Hummin. "You would go down another degree."

"In that case, you would have to eliminate some characteristic of the phenomenon which you want to include and your simulation becomes useless. The LPS-that is, 'the least possible simulation gains in complexity faster than the object being simulated does and eventually the simulation catches up with the phenomenon. Thus, it was established thousands of years ago that the Universe as a whole, in its full complexity, cannot be represented by any simulation smaller than itself.

"In other words, you can't get any picture of the Universe as a whole except by studying the entire Universe. It has been shown also that if one attempts to substitute simulations of a small part of the Universe, then another small part, then another small part, and so on, intending to put them all together to form a total picture of the Universe, one would find that there are an infinite number of such part simulations. It would

therefore take an infinite time to understand the Universe in full and that is just another way of saying that it is impossible to gain all the knowledge there is."

"I understand you so far," said Dors, sounding a little surprised.

"Well then, we know that some comparatively simple things are easy to simulate and as things grow more and more complex they become harder to simulate until finally they become impossible to simulate. But at what level of complexity does simulation cease to be possible? Well, what I have shown, making use of a mathematical technique first invented in this past century and barely usable even if one employs a large and very fast computer, our Galactic society falls short of that mark. It can be represented by a simulation simpler than itself. And I went on to show that this would result in the ability to predict future events in a statistical fashion—that is, by stating the probability for alternate sets of events, rather than flatly predicting that one set will take place."

"In that case," said Hummin, "since you can profitably simulate Galactic society, it's only a matter of doing so. Why is it impractical?"

"All I have proved is that it will not take an infinite time to understand Galactic society, but if it takes a billion years it will still be impractical. That will be essentially the same as infinite time to us."

"Is that how long it would take? A billion years?"

"I haven't been able to work out how long it would take, but I strongly suspect that it will take at least a billion years, which is why I suggested that number."

"But you don't really know."

"I've been trying to work it out."

"Without success?"

"Without success."

"The University library does not help?" Hummin cast a look at Dors as he asked the question.

Seldon shook his head slowly. "Not at all."

"Dors can't help?"

Dors sighed. "I know nothing about the subject, Chetter. I can only suggest ways of looking. If Hari looks and doesn't find, I am helpless."

Hummin rose to his feet. "In that case, there is no great use in staying here at the University and I must chink of somewhere else to place you."

Seldon reached out and touched his sleeve. "Still, I have an idea."

Hummin stared at him with a faint narrowing of eyes that might have belied surprise-or suspicion. "When did you get the idea? Just now?"

"No. It's been buzzing in my head for a few days before I went Upperside. That little experience eclipsed it for a while, but asking about the library reminded me of it."

Hummin seated himself again. "Tell me your idea—if it's not something that's totally marinated in mathematics."

"No mathematics at all. It's just that reading history in the library reminded me that Galactic society was less complicated in the past. Twelve thousand years ago, when the Empire was on the way to being established, the Galaxy contained only about ten million

inhabited worlds. Twenty thousand years ago, the pre-Imperial kingdoms included only about ten thousand worlds altogether. Still deeper in the past, who knows how society shrinks down? Perhaps even to a single world as in the legends you yourself once mentioned, Hummin."

Hummin said, "And you think you might be able to work out psychohistory if you dealt with a much simpler Galactic society?"

"Yes, it seems to me that I might be able to do so."

"Then too," said Dors with sudden enthusiasm, "suppose you work out psychohistory for a smaller society of the past and suppose you can make predictions from a study of the pre-Imperial situation as to what might happen a thousand years after the formation of the Empire-you could then check the actual situation at that time and see how near the mark you were."

Hummin said coldly, "Considering that you would know in advance the situation of the year 1,000 of the Galactic Era, it would scarcely be a fair test. You would be unconsciously swayed by your prior knowledge and you would be bound to choose values for your equation in such a way as to give you what you would know to be the solution."

"I don't think so," said Dors. "We don't know the situation in 1,000 G.E. very well and we would have to dig. After all, that was eleven millennia ago."

Seldon's face turned into a picture of dismay. "What do you mean we don't know the situation in 1,000 G.B. very well? There were computers then, weren't there, Dors?"

"Of course."

"And memory storage units and recordings of ear and eye? We should have all the records of 1,000 G.E. as we have of the present year of 12,020 G.E."

"In theory, yes, but in actual practice- Well, you know, Hari, it's what you keep saying. It's possible to have full records of 1,000 G.E., but it's not practical to expect to have it."

"Yes, but what I keep saying, Dors, refers to mathematical demonstrations. I don't see the applications to historical records."

Dors said defensively, "Records don't last forever, Hari. Memory banks can be destroyed or defaced as a result of conflict or can simply deteriorate with time. Any memory bit, any record that is not referred to for a long time, eventually drowns in accumulated noise. They say that fully one third of the records in the Imperial Library are simply gibberish, but, of course, custom will not allow those records to be removed. Other libraries are less tradition-bound. In the Streeling University library, we discard worthless items every ten years."

"Naturally, records frequently referred to and frequently duplicated on various worlds and in various libraries-governmental and private remain clear enough for thousands of years, so that many of the essential points of Galactic history remain known even if they took place in pre-Imperial times. However, the farther back you go, the less there is preserved."

"I can't believe that," said Seldon. "I should think that new copies would be made of any record in danger of withering. How could you let knowledge disappear?"

"Undesired knowledge is useless knowledge," said Dors. "Can you imagine all the time, effort, and energy expended in a continual refurbishing of unused data? And that wastage would grow steadily more extreme with time."

"Surely, you would have to allow for the fact that someone at some time might need the data being so carelessly disposed of."

"A particular item might be wanted once in a thousand years. To save it all just in case of such a need isn't cost-effective. Even in science. You spoke of the primitive equations of gravitation and say it is primitive because its discovery is lost in the mists of antiquity. Why should that be? Didn't you mathematicians and scientists save all data, all information, back and back to the misty primeval time when those equations were discovered?"

Seldon groaned and made no attempt to answer. He said, "Well, Hummin, so much for my idea. As we look back into the past and as society grows smaller, a useful psychohistory becomes more likely. But knowledge dwindles even more rapidly than size, so psychohistory becomes less likely-and the less outweighs the more. "

"To be sure, there is the Mycogen Sector," said Dors, musing.

Hummin looked up quickly. "So there is and that would be the perfect place to put Seldon. I should have thought of it myself."

"Mycogen Sector," repeated Hari, looking from one to the other. "What and where is Mycogen Sector?"

"Hari, please, I'll tell you later. Right now, I have preparations to make. You'll leave tonight."

33.

Dors had urged Seldon to sleep a bit. They would be leaving halfway between lights out and lights on, under cover of "night," while the rest of the University slept. She insisted he could still use a little rest.

"And have you sleep on the floor again?" Seldon asked.

She shrugged. "The bed will only hold one and if we both try to crowd into it, neither of us will get much sleep."

He looked at her hungrily for a moment and said, "Then I'll sleep on the floor this time."

"No, you won't. I wasn't the one who lay in a coma in the sleet."

As it happened, neither slept. Though they darkened the room and though the perpetual hum of Trantor was only a drowsy sound in the relatively quiet confines of the University, Seldon found that he had to talk.

He said, "I've been so much trouble to you, Dors, here at the University. I've even been keeping you from your work. Still, I'm sorry I'll have to leave you."

Dors said, "You won't leave me. I'm coming with you. Hummin is arranging a leave of absence for me."

Seldon said, dismayed, "I can't ask you to do that."

"You're not. Hummin 's asking it. I must guard you. After all, I faded in connection with Upperside and should make up for it."

"I told you. Please don't feel guilty about that. -Still, I must admit I would feel more comfortable with you at my side. If I could only be sure I wasn't interfering with your life . . ."

Dors said softly, "You're not, Hari. Please go to sleep."

Seldon lay silent for a while, then whispered, "Are you sure Hummin can really arrange everything, Dors?"

Dors said, "He's a remarkable man. He's got influence here at the University and everywhere else, I think. If he says he can arrange for an indefinite leave for me, I'm sure he can. He is a moat persuasive man."

I know," said Seldon. "Sometimes I wonder what he really wants of me."

..fit he says," said Dors. "He's a man of strong and idealistic ideas and dreams."

"You sound as though you know him well, Dors."

"Oh yes, I know him well."

"Intimately?"

Dors made an odd noise. "I'm not sure what you're implying, Hari, but, assuming the most insolent interpretation-No, I don't know him intimately. What business would that be of yours any-way?"

"I'm sorry.. said Seldon. "I just didn't want, inadvertently, to be invading someone else's-"

"Property? That's even more insulting. I think you had better go to sleep."

"I'm sorry again, Dors, but I can't sleep. Let me at least change the subject. You haven't explained what the Mycogen Sector is. Why will it be good for me to go there? What's it like?"

"It's a small sector with a population of only about two million if I remember correctly. The thing is that the Mycogenians cling rightly to a set of traditions about early history and are supposed to have very ancient records not available to anyone else. It's just possible they would be of more use to you in your attempted examination of pre-Imperial times than orthodox historians might be. All our talk about early history brought the sector to mind."

"Have you ever seen their records?"

"No. I don't know anyone who has."

"Can you be sure that the records really exist, then?"

"Actually, I can't say. The assumption among non-Mycogenians is that they're a bunch of madcaps, but that may be quite unfair. They certainly ray they have records, so perhaps they do. In any case, we would be out of sight there. The Mycogenians keep strictly to themselves. -And now please do go to sleep."

And somehow Seldon finally did.

34.

Hari Seldon and Dors Venabili left the University grounds at 0300. Seldon realized that Dors had to be the leader. She knew Trantor better than he did—two years better. She was obviously a close friend of Hummin (how close? the question kept nagging at him) and she understood his instructions.

Both she and Seldon were swathed in light swirling docks with tight-fitting hoods. The style had been a short-lived clothing fad at the University (and among young intellectuals, generally) some years back and though right now it might provoke laughter, it had the saving grace of covering them well and of making them unrecognizable—at least at a cursory glance.

Hummin had said, "There's a possibility that the event Upperside was completely innocent and that there are no agents after you, Seldon, but let's be prepared for the worst."

Seldon had asked anxiously, "Won't you come with us?"

"I would like to," said Hummin, "but I must limit my absence from work if I am not to become a target myself. You understand?"

Seldon sighed. He understood.

They entered an Expressway car and found a seat as far as possible from the few who had already boarded. (Seldon wondered why anyone should be on the Expressways at three in the morning—and then thought that it was lucky some were or he and Dors would be entirely too conspicuous.)

Seldon fell to watching the endless panorama that passed in review as the equally endless line of coaches moved along the endless monorail on an endless electromagnetic field.

The Expressway passed row upon row of dwelling units, few of them very tall, but some, for all he knew, very deep. Still, if tens of millions of square kilometers formed an urbanized total, even forty billion people would not require very tall structures or very closely packed ones. They did pass open areas, in most of which crops seemed to be growing—but some of which were clearly park-like. And there were numerous structures whose nature he couldn't guess. Factories? Office buildings? Who knew? One large featureless cylinder struck him as though it might be a water tank. After all, Trantor had to have a fresh water supply. Did they sluice rain from Upperside, filter and treat it, then store it? It seemed inevitable that they should.

Seldon did not have very long to study the view, however.

Dors muttered, "This is about where we should be getting off." She stood up and her strong fingers gripped his arm.

They were off the Expressway now, standing on solid flooring while Dors studied the directional signs.

The signs were unobtrusive and there were many of them. Seldon's heart sank. Most of them were in pictographs and initials, which were undoubtedly understandable to native Trantorians, but which were alien to him.

"This way," said Dors.

"Which way? How do you know?"

"See that? Two wings and an arrow."

"Two wings? Oh." He had thought of it as an upside-down "w," wide and shallow, but he could see where it might be the stylized wings of a bird.

"Why don't they use words?" he said sullenly.

"Because words vary from world to world. What an 'air-jet' is here could be a 'soar' on Cinna or a 'swoop' on other worlds. The two wings and an arrow are a Galactic symbol for an air vessel and the symbol is understood everywhere. -Don't you use them on Helicon?"

"Not much. Helicon is a fairly homogeneous world, culturally speaking, and we tend to cling to our private ways firmly because we're overshadowed by our neighbors."

"See?" said Dors. "There's where your psychohistory might come in. You could show that even with different dialects the use of set symbols, Galaxy-wide, is a unifying force."

"That won't help." He was following her through empty dim alley ways and part of his mind wondered what the crime rate might be on Trantor and whether this was a high-crime area, "You can have a billion rules, each covering a single phenomenon, and you can derive no generalizations from that. That's what one means when one says that a system might be interpreted only by a model as complex as itself. -Dors, are we heading for an air-jet?"

She stopped and turned to look at him with an amused frown. "If we're following the symbols for air-jets, do you suppose we're trying to reach a golf course? -Are you afraid of air-jets in the way so many Trantorians are?"

"No, no. We fly freely on Helicon and I make use of air-jets frequently. It's just that when Hummin took me to the University, he avoided commercial air travel because he thought we would leave too clear a trail."

"That's because they knew where you were to begin with, Hari, and were after you already. Right now, it may be that they don't know where you are and we're using an obscure port and a private airjet."

"And who'll be doing the flying?"

"A friend of Hummin's, I presume."

"Can he be trusted, do you suppose?"

"If he's a friend of Hummin's, he surely can."

"You certainly think highly of Hummin," said Seldon with a twinge of discontent.

"With reason," said Dors with no attempt at coyness. "He's the best."

Seldon's discontent did not dwindle.

"There's the air-jet," she said.

It was a small one with oddly shaped wings. Standing beside it was a small man, dressed in the usual glaring Trantorian colors.

Dors said, "We're psycho."

The pilot said, "And I'm history."

They followed him into the air-jet and Seldon said, "Whose idea were the passwords?"'

"Hummin's," said Dors.

Seldon snorted. "Somehow I didn't think Hummin would have a sense of humor. He's so solemn."

Dors smiled.

SUNMASTER

SUNMASTER FOURTEEN- . . . A leader of the Mycogen Sector of ancient Trantor . . . As is true of all the leaders of this ingrown sector, little is known of him.

That he plays any role at all in history is due entirely to his interrelationship with Hari Seldon in the course of The Flight . . .

ENCYCLOPEDIA GALACTICA

35.

There were just two seats behind the compact pilot compartment and when Seldon sat down on padding that gave slowly beneath him meshed fabric came forward to encircle his legs, waist, and chest and a hood came down over his forehead and ears. He felt imprisoned and when he turned to his left with difficulty---and only slightly---he could see that Dors was similarly enclosed.

The pilot took his own seat and checked the controls. Then he said, "I'm Endor Levanian, at your service. You're enmeshed because there will be a considerable acceleration at liftoff. Once we're in the open and flying, you'll be released. You needn't tell me your names. It's none of my business."

He turned in his seat and smiled at them out of a gnome-like face that wrinkled as his lips spread outward. "Any psychological difficulties, youngsters?"

Dors said lightly, "I'm an Outworlder and I'm used to flying."

"That is also true for myself," said Seldon with a bit of hauteur.

"Excellent, youngsters. Of course, this isn't your ordinary air-jet and you may not have done any night flying, but I'll count on you to bear up. "

He was enmeshed too, but Seldon could see that his arms were entirely free.

A dull hum sounded inside the jet, growing in intensity and rising in pitch. Without actually becoming unpleasant, it threatened to do so and Seldon made a gesture as though to shake his head and get the sound out of his ears, but the attempt to do so merely seemed to stiffen the hold of the head-mesh.

The jet then sprang (it was the only verb Seldon could find to describe the event) into the air and he found himself pushed hard against the back and bottom of his seat.

Through the windshield in front of the pilot, Seldon saw, with a twinge of horror, the flat rise of a wall---and then a round opening appear in that wall. It was similar to the hole into which the air-taxi had plunged the day he and Hummin had left the Imperial Sector, but though this one was large enough for the body of the jet, it certainly did not leave room for the wings.

Seldon's head turned as far to the right as he could manage and did so just in time to see the wing on his side wither and collapse.

The jet plunged into the opening and was seized by the electromagnetic field and hurtled along a lighted tunnel. The acceleration was constant and there were occasional clicking noises that Seldon imagined might be the passing of individual magnets.

And then, in less than ten minutes, the jet was spewed out into the atmosphere, headlong into the sudden pervasive darkness of night.

The jet decelerated as it passed beyond the electromagnetic field and Seldon felt himself flung against the mesh and plastered there for a few breathless moments.

Then the pressure ceased and the mesh disappeared altogether.

"How are you, youngsters?" came the cheerful voice of the pilot.

"I'm not sure," said Seldon. He turned to Dors. "Are you all right?"

"Certainly," she answered. "I think Mr. Levanian was putting us through his paces to see if we were really Outworlders. Is that so, Mr. Levanian?"

"Some people like excitement," said Levanian. "Do you?"

"Within limits," said Dors.

Then Seldon added approvingly, "As any reasonable person would admit."

Seldon went on. "It might have seemed less humorous to you, sir, if you had ripped the wings off the jet."

"Impossible, sir. I told you this is not your ordinary air-jet. The wings are thoroughly computerized. They change their length, width, curvature, and overall shape to match the speed of the jet, the speed and direction of the wind, the temperature, and half a dozen other variables. The wings wouldn't tear off unless the jet itself was subjected to stresses that would splinter it."

There was a spatter against Seldon's window. He said, "It's raining."

"It often is," said the pilot.

Seldon peered out the window. On Helicon or on any other world, there would have been lights visible—the illuminated works of man. Only on Trantor would it be dark. - Well, not entirely. At one point he saw the flash of a beacon light. Perhaps the higher reaches of Upperside had warning lights.

As usual, Dors took note of Seldon's uneasiness. Parting his hand, she said, "I'm sure the pilot knows what he's doing, Hari."

"I'll try to be sure of it, too, Dors, but I wish he'd share some of that knowledge with us," Seldon said in a voice loud enough to be overheard.

"I don't mind sharing," said the pilot. "To begin with, we're heading up and we'll be above the cloud deck in a few minutes. Then there won't be any rain and we'll even see the stars."

He had timed the remark beautifully, for a few stars began to glitter through the feathery cloud remnants and then all the rest sprang into brightness as the pilot flicked off the lights inside the cabin. Only the dim illumination of his own instrument panel remained to compete and outside the window the sky sparkled brightly.

Dors said, "That's the first time in over two years that I've seen the stars. Aren't they marvelous? They're so bright--and there are so many of them."

The pilot said, "Trantor is nearer the center of the Galaxy than most of the Outworlds."

Since Helicon was in a sparse corner of the Galaxy and its star field was dim and unimpressive, Seldon found himself speechless.

Dors said, "How quiet this flight has become."

"..So it is," said Seldon. "What powers the jet, Mr. Levanian?"

"A microfusion motor and a thin stream of hot gas."

"I didn't know we had working microfusion air-jets. They talk about it, but--"

"..there are a few small ones like this. So far they exist only on Trantor and are used entirely by high government officials."

Seldon said, "The fees for such travel must come high."

"Very high, sir."

"How much is Mr. Hummin being charged, then?"

"There's no charge for this flight. Mr. Hummin is a good friend of the company who owns these jets."

Seldon grunted. Then he asked, "Why aren't there more of these microfusion air-jets?"

"Too expensive for one thing, sir. Those that exist fulfill all the demand."

"You could create more demand with larger jets."

"Maybe so, but the company has never managed to make microfusion engines strong enough for large air-jets."

Seldon thought of Hummin's complaint that technological innovation had declined to a low level. "Decadent," he murmured.

"..What," said Dors.

"Nothing," said Seldon. "I was just thinking of something Hummin once said to me."

He looked out at the stars and said, "Are we moving westward, Mr. Caveman?"

"Yes, we are. How did you know?"

"Because I thought that we would see the dawn by now if we were heading east to meet it."

But dawn, pursuing the planet, finally caught up with them and sunlight - real - sunlight brightened the cabin walls. It didn't last long, however, for the jet curved downward and into the clouds. Blue and gold vanished and were replaced by dingy gray and both Seldon and Dors emitted disappointed cries at being deprived of even a few more moments of true sunlight.

When they sank beneath the clouds, Upperside was immediately below them and its surface--at least at this spot--was a rolling mixture of wooded grottos and intervening grassland. It was the sort of thing Clowzia had told Seldon existed on Upperside.

Again there was little time for observation, however. An opening appeared below them, rimmed by lettering that spelled MYCOGEN. They plunged in.

They landed at a jetport that seemed deserted to Seldon's wondering eyes. The pilot, having completed his task, shook hands with both Hari and Dors and took his jet up into the air with a rush, plunging it into an opening that appeared for his benefit.

There seemed, then, nothing to do but wait. There were benches that could seat perhaps a hundred people, but Seldon and Dors Venabib were the only two people around. The port was rectangular, surrounded by walls in which there must be many tunnels that could open to receive or deliver jets, but there were no jets present after their own had departed and none arrived while they waited.

There were no people arriving or any indications of habitation; the very life hum of Trantor was muted.

Seldon felt this aloneness to be oppressive. He turned to Dors and said, "What is it that we must do here? Have you any idea?"

Dors shook her head. "Hummin told me we would be met by Sunmaster Fourteen. I don't know anything beyond that."

"Sunmaster Fourteen? What would that be?"

"A human being, I presume. From the name I can't be certain whether it would be a man or a woman."

"An odd name."

"Oddity is in the mind of the receiver. I am sometimes taken to be a man by those who have never met me."

"What fools they must be," said Seldon, smiling.

"Not at all. Judging from my name, they are justified. I'm told it is a popular masculine name on various worlds."

"I've never encountered it before."

"That's because you aren't much of a Galactic traveler. The name 'Hari' is common enough everywhere, although I once knew a woman named 'Hare,' pronounced like your name but spelled with an 'e.' In Mycogen, as I recall, particular names are confined to families--and numbered."

"But Sunmaster seems so unrestrained a name."

"What's a little braggadocio? Back on Cinna, 'Dons' is from an Old local expression meaning 'spring gift.'"

"Because you were born in the spring?"

"No. I first saw the light of day at the height of Cinna's summer, but the name struck my people as pleasant regardless of its traditional--and largely forgotten--meaning."

"In that case, perhaps Sunmaster--"

And a deep, severe voice said, "That is my name, tribesman."

Seldon, startled, looked to his left. An open ground-car had somehow drawn close. It was boxy and archaic, looking almost like a delivery wagon. In it, at the controls, was a tall old man who looked vigorous despite his age. With stately majesty, he got out of the ground-car.

He wore a long white gown with voluminous sleeves, pinched in at the wrists. Beneath the gown were soft sandals from which the big toe protruded, while his head, beautifully shaped, was completely hairless. He regarded the two calmly with his deep blue eyes.

He said, "I greet you, tribesman."

Seldon said with automatic politeness, "Greetings, sir." Then, honestly puzzled, he asked, "How did you get in?"

"Through the entrance, which closed behind me. You paid little heed."

"I suppose we didn't. But then we didn't know what to expect. Nor do we now."

"Tribesman Chetter Hummin informed the Brethren that there would be members from two of the tribes arriving. He asked that you be cared for."

"Then you know Hummin."

"We do. He has been of service to us. And because he, a worthy tribesman, has been of service to us, so must we be now to him. There are few who come to Mycogen and few who leave. I am to make you secure, give you houseroom, see that you are undisturbed. You will be safe here."

Dors bent her head. "We are grateful, Sunmaster Fourteen."

Sunmaster turned to look at her with an air of dispassionate contempt. "I am not unaware of the customs of the tribes," he said. "I know that among them a woman may well speak before being spoken to. I am therefore not offended. I would ask her to have a care among others of the Brethren who may be of lesser knowledge in the matter."

"Oh really?" said Dors, who was clearly offended, even if Sunmaster was not.

"In truth," agreed Sunmaster. "Nor is it needful to use my numerical identifier when I alone of my cohort am with you. 'Sunmaster' will be sufficient. -Now I will ask you to come with me so that we may leave this place which is of too tribal a nature to comfort me."

"Comfort is for all of us," said Seldon, perhaps a little more loudly than was necessary, "and we will not budge from this place unless we are assured that we will not be forcibly bent to your liking against our own natures. It is our custom that a woman may speak whenever she has something to say. If you have agreed to keep us secure, that security must be psychological as well as physical."

Sunmaster gazed at Seldon levelly and said, "You are bold, young tribesman. Your name?"

"I am Hari Seldon of Helicon. My companion is Dors Venabili of Cinna."

Sunmaster bowed slightly as Seldon pronounced his own name, did not move at the mention of Dors's name. He said, "I have sworn to Tribesman Hummin that we will keep you safe, so I will do what I can to protect your woman companion in this. If she wishes to exercise her impudence, I will do my best to see that she is held guiltless. -Yet in one respect you must conform."

And he pointed, with infinite scorn, first to Seldon's head and then to Dors's.

"What do you mean?" said Seldon.

"Your cephalic hair."

"What about it?"

"It must not be seen."

"Do you mean we're to shave our heads like you? Certainly not."

"My head is not shaven, Tribesman Seldon. I was depilated when I entered puberty, as are all the Brethren and their women."

"If we're talking about depilation, then more than ever the answer is no-never."

"Tribesman, we ask neither shaving nor depilation. We ask only that your hair be covered when you are among us."

"How?"

"I have brought skincaps that will mold themselves to your skulls, together with strips that will hide the superoptical patches the eyebrows. You will wear them while with us. And of course, Tribesman Seldon, you will shave daily-or oftener if that becomes necessary."

"But why must we do this?"

"Because to us, hair on the head is repulsive and obscene."

"Surely, you and all your people know that it is customary for others, in all the worlds of the Galaxy, to retain their cephalic hair."

"We know. And those among us, like myself, who must deal with tribesmen now and then, must witness this hair. We manage, but it is unfair to ask the Brethren generally to suffer the sight."

Seldon said, "Very well, then, Sunmaster-but tell me. Since you are born with cephalic hair, as all of us are and as you all retain it visibly till puberty, why is it so necessary to remove it? Is it just a matter of custom or is there some rationale behind it?"

And the old Mycogenian said proudly, "By depilation, we demonstrate to the youngster that he or she has become an adult and through depilation adults will always remember who they are and never forget that all others are but tribesmen."

He waited for no response (and, in truth, Seldon could think of none) but brought out from some hidden compartment in his robe a handful of thin bits of plastic of varying color, stared keenly at the two faces before him, holding first one strip, then another, against each face.

"The colors must thatch reasonably," he said. "No one will be fooled into thinking you are not wearing a skincap, but it must not be repulsively obvious."

Finally, Sunmaster gave a particular strip to Seldon and showed him how it could be pulled out into a cap.

"Please put it on, Tribesman Seldon" he said. "You will find the process clumsy at first, but you will grow accustomed to it."

Seldon put it on, but the first two times it slipped off when he tried to pull it backward over his hair.

"Begin just above your eyebrows," said Sunmaster. His fingers seemed to twitch, as though eager to help.

Seldon said, suppressing a smile, "Would you do it for me?"

And Sunmaster drew back, saying, almost in agitation, "I couldn't. I would be touching your hair."

Seldon managed to hook it on and followed Sunmaster's advice, in pulling it here and there until all his hair was covered. The eyebrow patches fitted on easily.

Dors, who had watched carefully, put hers on without trouble.

"How does it come off?" asked Seldon.

"You have but to find an end and it will peel off without trouble. You will find it easier both to put on and take off if you cut your hair shorter."

"I'd rather struggle a bit," said Seldon. Then, turning to Dors, he said in a low voice, "You're still pretty, Dors, but it does tend to remove some of the character from your face."

"The character is there underneath just the same," she answered. "And I dare say you'll grow accustomed to the hairless me."

In a still lower whisper, Seldon said, "I don't want to stay here long enough to get accustomed to this."

Sunmaster, who ignored, with visible haughtiness, the mumblings among mere tribesmen, said, "If you will enter my ground-car, I will now take you into Mycogen."

37.

"Frankly," whispered Dors, "I can scarcely believe I'm on Trantor."

"I take it, then, you've never seen anything like this before?" said Seldon.

"I've only been on Trantor for two years and I've spent much of my time at the University, so I'm not exactly a world traveler. Still, I've been here and there and I've heard of this and that, but I've never seen or heard of anything like this. The sameness."

Sunmaster drove along methodically and without undue haste. There were other wagon-like vehicles in the roadway, all with hairless men at the controls, their bald pates gleaming in the light.

On either side there were three-story structures, unornamented, all lines meeting at right angles, everything gray in color.

"Dreary," mouthed Dors. "So dreary."

"Egalitarian," whispered Seldon. "I suspect no Brother can lay claim to precedence of any obvious kind over any other."

There were many pedestrians on the walkways as they passed. There were no signs of any moving corridors and no sound of any nearby Expressway.

Don said, "I'm guessing the grays are women."

"It's hard to tell," said Seldon. "The gowns hide everything and one hairless head is like another."

"The grays are always in pairs or with a white. The whines tart walk alone and Sunmaster is a white."

"You may be right." Seldon raised his voice. "Sunmaster, I am curious"

"If you are, then ask what you wish, although I am by no means required to answer."

"..We seem to be passing through a residential area. There are no signs of business establishments, industrial areas-"

"We are a farming community entirely. Where are you from that you do not know this?"

"You know I am an Outworlder," Seldon said stiffly. "I have been on Trantor for only two months."

"Even so."

"But if you are a farming community, Sunmaster, how is it that we have passed no farms either?"

"On lower levels," said Sunmaster briefly.

"Is Mycogen on this level entirely residential, then?"

"And on a few others. We are what you see. Every Brother and his family lives in equivalent quarters; every cohort in its own equivalent community; all have the same ground-can and all Brothers drive their own. There are no servants and none are at ease through the labor of others. None may glory over another."

Seldon lifted his shielded eyebrows at Dors and said, "But some of the people wear white, while some wear gray."

"That is because some of the people are Brothers and some are Sisters."

"And we?"

"You are a tribesman and a guest. You and your"-he paused and then said-"companion will not be bound by all aspects of Mycogenian life.

Nevertheless, you will wear a white gown and your companion will wear a gray one and you will live in special guest quarters like our own."

"Equality for all seems a pleasant ideal, but what happens as your numbers increase? Is the pie, then, cut into smaller pieces?"

"There is no increase in numbers. That would necessitate an increase in area, which the surrounding tribesmen would not allow, or a change for the worse in our way of life."

"..But if-.. " began Seldon.

Sunmaster cut him off. "It is enough, Tribesman Seldon. As I warned you, I am not compelled to answer. Our task, which we have promised our friend Tribesman Hummin, is to keep you secure as long as you do not violate our way of life. That we will do, but there it ends. Curiosity is permitted, but it wears out our patience quickly if persisted in."

Something about his tone allowed no more to be said and Seldon chafed. Hummin, for all his help, had clearly mis-stressed the matter.

It was not security that Seldon sought. At least, not security alone. He needed information too and without that he could not and would not stay here.

38.

Seldon looked with some distress at their quarters. It had a small but individual kitchen and a small but individual bathroom. There were two narrow beds, two clothes closets, a table, and two chairs. In short there was everything that was necessary for two people who were willing to live under cramped conditions.

"We had an individual kitchen and bathroom at Cinna," said Dors with an air of resignation.

"Not I," said Seldon. "Helicon may be a small world, but I lived in a modern city. Community kitchens and bathrooms. -What a waste this is. You might expect it in a hotel, where one is compelled to make a temporary stay, but if the whole sector is like this, imagine the enormous number and duplications of kitchens and bathrooms."

"Part of the egalitarianism, I suppose," said Dors. "No fighting for favored stalls or for faster service. The same for everyone."

"No privacy either. Not that I mind terribly, Dors, but you might and I don't want to give the appearance of taking advantage. We ought to make it clear to them that we must have separate rooms--adjoining but separate."

Dors said, "I'm sure it won't work. Space is at a premium and I think they are amazed by their own generosity in giving us this much. We'll just make do, Hari. We're each old enough to manage. I'm not a blushing maiden and you'll never convince me that you're a callow youth."

"You wouldn't be here, were it not for me."

"What of it? It's an adventure."

"All right, then. Which bed will you take? Why don't you take the one nearer the bathroom?" He sat down on the other. "There's something else that bothers me. As long as we're here, we're tribespeople, you and I, as is even Hummin. We're of the other tribes, not their own cohorts, and most things are none of our business. -But most things are my business. That's what I've come here for. I want to know some of the things they know."

"Or think they know," said Dors with a historian's skepticism. "I understand they have legends that are supposed to date back to primordial times, but I can't believe they can be taken seriously."

"We can't know that until we find out what those legends are. Are there no outside records of them?"

"Not that I know of. These people are terribly ingrown. They're almost psychotic in their inward clinging. That Hummin can break down their barriers somewhat and even get them to take us in is remarkable-really remarkable."

Seldon brooded. "There has to be an opening somewhere. Sunmaster was surprised--angry, in fact--that I didn't know Mycogen was an agricultural community. That seems to be something they don't want kept a secret."

"The point is, it isn't a secret. 'Mycogen' is supposed to be from archaic words meaning 'yeast producer.' At least, that's what I've been told. I'm not a paleolinguist. In

any case, they culture all varieties of microfood-yeast, of course, along with algae, bacteria, multicellular fungi, and so on."

"That 's not uncommon," said Seldon. "Most worlds have this microculture. We have some even on Helicon."

"Not like Mycogen. It's their specialty. They use methods as archaic as the name of their section-secret fertilizing formulas, secret environmental influences. Who knows what? All is secret."

"Ingrown.. "

"..With a vengeance. What it amounts to is that they produce protein and subtle flavoring, so that their microfood isn't like any other in the world. They keep the volume comparatively low and the price is sky-high. I've never tasted any and I'm sure you haven't, but it sells in great quantities to the Imperial bureaucracy and to the upper classes on other worlds. Mycogen depends on such sales for its economic health, so they want everyone to know that they are the source of this valuable food. That, at least, is no secret.'."

"Mycogen must be rich, then."

"They're not poor, but I suspect that it's not wealth they're after. It's protection. The Imperial government protects them because, without them, there wouldn't be these microfoods that add the subtlest flavors, the tangiest spices, to every dish. That means that Mycogen can maintain its odd way of life and be haughty toward its neighbors, who probably find them insupportable."

Dors looked about. "They live an austere life. There's no holovision, I notice, and no book-films."

"I noticed one in the closet up on the shelf." Seldon reached for it, stared at the label, and then said in clear disgust, "A cookbook."

Dors held out her hand for it and manipulated the keys. It took a while, for the arrangement was not quite orthodox, but she finally managed to light the screen and inspect the pages. She said, "There are a few recipes, but for the most part this seems to consist of philosophical essays on gastronomy."

She shut it off and turned it round and about. "It seems to be a single unit. I don't see how one would eject the microcard and insert another. A one-book scanner. Now that's a waste."

"Maybe they think this one book-film is all anyone needs." He reached toward the end table that was between the two beds and picked up another object. "This could be a speaker, except that there's no screen."

"Perhaps they consider the voice sufficient."

"How does it work, I wonder?" Seldon lifted it and looked at it from different sides. "Did you ever see anything like this?"

"In a museum once-if this is the same thing. Mycogen seems to keep itself deliberately archaic. I suppose they consider that another way of separating themselves from the so-called tribesmen that surround them in overwhelming numbers. Their

archaism and odd customs make them indigestible, so to speak. There's a kind of perverse logic to all that."

Seldon, still playing with the device, said, "Whoops! It went on. Or something went on. But I don't hear anything."

Dors frowned and picked up a small felt-lined cylinder that remained behind on the end table. She put it to her ear. "There's a voice coming out of this," she said. "Here, try it." She handed it to him.

Seldon did so and said, "Ouch! It clips on." He listened and said, "Yes, it hurt my ear. You can hear me, I take it. -Yes, this is our room. No, I don't know its number. Dors, have you any idea of the number?"

Dors said, "There's a number on the speaker. Maybe that will do."

"Maybe," said Seldon doubtfully. Then he said into the speaker, "The number on this device is 6LT-3648A. Will that do? -Well, where do I find out how to use this device properly and how to use the kitchen, for that matter? -What do you mean, 'It all works the usual way?' That doesn't do me any good. wee here, I'm a . . . a tribesman, an honored guest. I don't know the usual way. -Yes, I'm sorry about my accent and I'm glad you can recognize a tribesman when you hear one. -My name is Hari Seldon."

There was a pause and Seldon looked up at Dors with a longsuffering expression on his face. "He has to look me up. And I suppose he'll tell me he can't find me. -Oh, you have me? Good! In that case, can you give me the information? -Yes. -Yes. -Yes. -And how can I call someone outside Mycogen? -Oh, then what about contacting Sunmaster Fourteen, for instance? -Well, his assistant then, his aide, whatever? -Uh-huh. -Thank you."

He put the speaker down, unhooked the hearing device from his ear with a little difficulty, turned the whole thing off, and said, "They'll arrange to have someone show us anything we need to know, but he can't promise when that might be. You can't call outside Mycogen-not on this thing anyway--so we couldn't get Hummin if we needed him. And if I want Sunmaster Fourteen, I've got to go through a tremendous rigmarole. This may be an egalitarian society, but there seem to be exceptions that I bet no one will openly admit."

He looked at his watch. "In any case, Dors, I'm not going to view a cookbook and still less am I going to view learned essays. My watch is still telling University time, so I don't know if it's officially bedtime and at the moment I don't care. We've been awake most of the night and I would like to sleep."

"That's all right with me. I'm tired too."

"Thanks. And whenever a new day starts after we've caught up on our sleep, I'm going to ask for a tour of their microfood plantations."

Dors looked startled. "Are you interested?"

"Not really, but if that's the one thing they're proud of, they should be willing to talk about it and once I get them into a talking mood then, by exerting all my charm, I may get them to talk about their legends too. Personally, I think that's a clever strategy."

"I hope so," said Dors dubiously, "but I think that the Mycogenians will not be so easily trapped."

"We'll see," said Seldon grimly. "I mean to get those legends."

39.

The next morning found Hari using the calling device again. He was angry because, for one thing, he was hungry.

His attempt to reach Sunmaster Fourteen was deflected by someone who insisted that Sunmaster could not be disturbed.

"Why not?" Seldon had asked waspishly.

"Obviously, there is no need to answer that question," came back a cold voice.

"We were not brought here to be prisoners," said Seldon with equal coldness.

"Nor to starve."

"I'm sure you have a kitchen and ample supplies of food."

"Yes, we do," said Seldon. "And I do not know how to use the kitchen devices, nor do I know how to prepare the food. Do you eat it raw, fry it, boil it, roast it . . . ?.. "

"I can't believe you are ignorant in such matters."

Dors, who had been pacing up and down during this colloquy, reached for the device and Seldon fended her off, whispering, "He'll break the connection if a woman tries to speak to him."

Then, into the device, he said more firmly than ever, "What you believe or don't believe doesn't matter to me in the least. You send someone here-someone who can do something about our situation-or when I reach Sunmaster Fourteen, as I will eventually, you will pay for this."

Nevertheless, it was two hours before someone arrived (by which time Seldon was in a state of savagery and Dors had grown rather desperate in her attempt to soothe him).

The newcomer was a young man whose bald pate was slightly freckled and who probably would have been a redhead otherwise. He was bearing several pots and he seethed about to explain them when he suddenly looked uneasy and turned his back on Seldon in alarm. "Tribesman," he said, obviously agitated. "Your skincap is not well adjusted."

Seldon, whose impatience had reached the breaking point, said, "That doesn't bother me."

Dors, however, said, "Let me adjust it, Hari. It's just a bit too high here on the left side."

Seldon then growled, "You can turn now, young man. What is your name?"

"I am Graycloud Five," said the Mycogenian uncertainly as he turned and looked cautiously at Seldon. "I am a novitiate. I have brought a meal for you." He hesitated.

"From my own kitchen, where my woman prepared it, tribesman."

He put the pots down on the table and Seldon raised one lid and sniffed the contents suspiciously. He looked up at Dors in surprise. "You know, it doesn't smell bad."

Dors nodded. "You're right. I can smell it too."

Graycloud said, "It's not as hot as it ought to be. It cooled off in transport. You must have crockery and cutlery in your kitchen."

Dors got what was needed, and after they had eaten, largely and a bit greedily, Seldon felt civilized once more.

Dors, who realized that the young man would feel unhappy at being alone with a woman and even unhappier if she spoke to him, found that, by default, it fell to her to carry the pots and dishes into the kitchen and wash them—once she deciphered the controls of the washing device.

Meanwhile, Seldon asked the local time and said, somewhat abashed, "You mean it's the middle of the night?"

"Indeed, tribesman," said Graycloud. "That's why it took a while to satisfy your need."

Seldon understood suddenly why Sunmaster could not be disturbed and thought of Graycloud's woman having to be awakened to prepare him a meal and felt his conscience gnaw at him. "I'm sorry," he said. "We are only tribespeople and we didn't know how to use the kitchen or how to prepare the food. In the morning, could you have someone arrive to instruct us properly?"

"The best I can do, tribesmen," said Graycloud placatingly, "is to have two Sisters sent in. I ask your pardon for inconveniencing you with feminine presence, but it is they who know these things."

Dors, who had emerged from the kitchen, said (before remembering her place in the masculine Mycogenian society), "That's fine, Graycloud. We'd love to meet the Sisters."

Graycloud looked at her uneasily and fleetingly, but said nothing.

Seldon, convinced that the young Mycogenian would, on principle, refuse to have heard what a woman said to him, repeated the remark. "That's fine, Graycloud. We'd love to meet the Sisters."

His expression cleared at once. "I will have them here as soon as it is day."

When Graycloud had left, Seldon said with some satisfaction, "The Sisters are likely to be exactly what we need."

"Indeed? And in what way, Hari?" asked Dors.

"Well, surely if we treat them as though they are human beings, they will be grateful enough to speak of their legends."

"If they know them," said Dors skeptically. "Somehow I have no faith that the Mycogenians bother to educate their women very well."

40.

The Sisters arrived some six hours later after Seldon and Dors had slept some more, hoping to readjust their biological clocks.

The Sisters entered the apartment shyly, almost on tiptoe. Their gowns (which, it turned out, were termed "kirtles" in the Mycogenian dialect) were soft velvety gray, each uniquely decorated by a subtle pattern of fine, darker gray webbing. The kirtles were not entirely unattractive, but they were certainly most efficient at covering up any human feature.

And, of course, their heads were bald and their faces were devoid of any ornamentation. They darted speculative glances at the touch of blue at the corners of Dors's eyes and at the slight red stain at the corners of her lips.

For a few moments, Seldon wondered how one could be certain that the Sisters were truly Sisters.

The answer came at once with the Sisters' politely formal greetings. Both twittered and chirped. Seldon, remembering the grave tones of Sunmaster and the nervous baritone of Graycloud, suspected that women, in default of obvious sexual identification, were forced to cultivate distinctive voices and social mannerisms.

"-I'm Raindrop Forty-Three," twittered one, "and this is my younger sister."

"Raindrop Forty-Five," chirped the other. "We're very strong on 'Raindrops' in our cohort." She giggled.

"I am pleased to meet you both," said Dors gravely, "but now I must know how to address you. I can't just say 'Raindrop,' can I?"

"No," said Raindrop Forty-Three. "You must use the full name if we are both here."

Seldon said, "How about just Forty-Three and Forty-Five, ladies?"

They both stole a quick glance at him, but said not a word.

Dors said softly, "I'll deal with them, Hari."

Seldon stepped back. Presumably, they were single young women and, very likely, they were not supposed to speak to men. The older one seemed the graver of the two and was perhaps the more puritanical. It was hard to tell from a few words and a quick glance, but he had the feeling and was willing to go by that.

Dors said, "The thing is, Sisters, that we tribespeople don't know how to use the kitchen."

"You mean you can't cook?" Raindrop Forty-Three looked shocked and censorious.

Raindrop Forty-Five smothered a laugh. (Seldon decided that his initial estimate of the two was correct.)

Dors said, "I once had a kitchen of my own, but it wasn't like this one and I don't know what the foods are or how to prepare them."

"It's really quite simple," said Raindrop Forty-Five. "We can show you."

"We'll make you a good nourishing lunch," said Raindrop FortyThree. "We'll make it for . . . both of you." She hesitated before adding the final words. It clearly took an effort to acknowledge the existence of a man.

"If you don't mind," said Dors, "I would Eke to be in the kitchen with you and I would appreciate it if you'd explain everything exactly. After all, Sisters, I can't expect you to come here three times a day to cook for us."

"We will show you everything," said Raindrop Forty-Three, nodding her head stiffly. "It may be difficult for a tribeswoman to learn, however. You wouldn't have the . . . feeling for it."

"I shall try," said Dors with a pleasant smile.

They disappeared into the kitchen. Seldon stared after them and tried to work out the strategy he intended to use.

MICROFARM

MYCOGEN- . . . The microfarms of Mycogen are legendary, though they survive today only in such oft-used similes as "rich as the microfarms of Mycogen" or "tasty as Mycogenian yeast." Such encomiums tend to intensify with time, to be sure, but Hari Seldon visited those microfarms in the course of The Flight and there are references in his memoirs that would tend to support the popular opinion . . .

ENCYCLOPEDIA GALACTICA

41.

"That was good." said Seldon explosively. "It was considerably better than the food Graycloud brought-"

Dors said reasonably, "You have to remember that Graycloud's woman had to prepare it on short notice in the middle of the night." She paused and said, "I wish they would say 'wife.' They make 'woman' sound like such an appendage, like 'my house' or my robe.' It is absolutely demeaning."

"I know. It's infuriating. But they might well make 'wife' sound like an appendage as well. It's the way they live and the Sisters don't seem to mind. You and I aren't going to change it by lecturing. Anyway, did you see how the Sisters did it?"

"Yes, I did and they made everything seem very simple. I doubted I could remember everything they did, but they insisted I wouldn't have to. I could get away with mere heating. I gathered the bread had some sort of microderivative added to it in the baking that both raised the dough and lent it that crunchy consistency and warm flavor. Just a hint of pepper, didn't you think?"

"I couldn't tell, but whatever it was, I didn't get enough. And the soup. Did you recognize any of the vegetables?"

"No."

"And what was the sliced meat? Could you tell?"

"I don't think it was sliced meat, actually. We did have a lamb dish back on Cinna that it reminded me of."

"It was certainly not lamb."

"I said that I doubted it was meat at all. -I don't think anyone outside Mycogen eats like this either. Not even the Emperor, I'm sure. Whatever the Mycogenians sell is, I'm willing to bet, near the bottom of the line. They save the best for themselves. We had better not stay here too long, Hari. If we get used to eating like this, we'll never be able to acclimatize ourselves to the miserable stuff they have outside." She laughed.

Seldon laughed too. He took another sip at the fruit juice, which tasted far more tantalizing than any fruit juice he had ever sipped before, and said, "listen, when Hummin took me to the University, we stopped at a roadside diner and had some food that was heavily yeasted. It tasted like-No, never mind what it tasted like, but I wouldn't have thought it conceivable, then, that microfood could taste like this. I wish the Sisters were still here. It would have been polite to thank them."

"I think they were quite aware of how we would feel. I remarked on the wonderful smell while everything was warming and they said, quite complacently, that it would taste even better."

"The older one said that, I imagine."

"Yes. The younger one giggled. -And they'll be back. They're going to bring me a kirtle, so that I can go out to see the shops with them. And they made it clear I would have to wash my face if I was to be seen in public. They will show me where to buy some good-quality kirtles of my own and where I can buy ready-made meals of all kinds. All I'll have to do is heat them up. They explained that decent Sisters wouldn't do that, but would start from scratch. In fact, some of the meal they prepared for us was simply heated and they apologized for that.

They managed to imply, though, that tribespeople couldn't be expected to appreciate true artistry in cooking, so that simply heating prepared food would do for us. -They seem to take it for granted, by the way, that I will be doing all the shopping and cooking."

"As we say at home, 'When in Trantor, do as the Trantorians do.' "

"Yes, I was sure that would be your attitude in this case."

"I'm only human," said Seldon.

"The usual excuse," said Dors with a small smile.

Seldon leaned back with a satisfactory well-filled feeling and said, "You've been on Trantor for two years, Dors, so you might understand a few things that I don't. Is it your opinion that this odd social system the Mycogenians have is part of a supernaturalistic view they have?"

"Supernaturalistic?"

"Yes. Would you have heard that this was so?"

"What do you mean by 'supernaturalistic'?"

"The obvious. A belief in entities that are independent of natural law, that are not bound by the conservation of energy, for instance, or by the existence of a constant of action."

"I see. You're asking if Mycogen is a religious community."

It was Seldon's turn. "Religious?"

"Yes. It's an archaic term, but we historians use it-our study is riddled with archaic terms. 'Religious' is not precisely equivalent to 'supernaturalistic,' though it contains richly supernaturalistic elements. I can't answer your specific question, however, because I've never made any special investigation of Mycogen. Still, from what little I've seen of the

place and from my knowledge of religions in history, I wouldn't be surprised if the Mycogenian society was religious in character."

"In that case, would it surprise you if Mycogenian legends were also religious in character?"

"No, it wouldn't."

"And therefore not based on historical matter?"

"That wouldn't necessarily follow. The core of the legends might still be authentically historic, allowing for distortion and supernaturalistic intermixture."

"Ah," said Seldon and seemed to retire into his thoughts.

Finally Dors broke the silence that followed and said, "It's not so uncommon, you know. There is a considerable religious element on many worlds. It's grown stronger in the last few centuries as the Empire has grown more turbulent. On my world of Cinna, at least a quarter of the population is tritheistic."

Seldon was again painfully and regretfully conscious of his ignorance of history. He said, "Were there times in past history when religion was more prominent than it is today?"

"Certainly. In addition, there are new varieties springing up constantly. The Mycogenian religion, whatever it might be, could be relatively new and may be restricted to Mycogen itself. I couldn't really tell without considerable study."

"But now we get to the point of it, Dors. Is it your opinion that women are more apt to be religious than men are?"

Dors Venabili raised her eyebrows. "I'm not sure if we can assume anything as simple as that." She thought a bit. "I suspect that those elements of a population that have a smaller stake in the material natural world are more apt to find solace in what you call supernaturalism—the poor, the disinherited, the downtrodden. Insofar as supernaturalism overlaps religion, they may also be more religious. There are obviously many exceptions in both directions. Many of the downtrodden may lack religion; many of the rich, powerful, and satisfied may possess it."

"But in Mycogen," said Seldon, "where the women seem to be treated as subhuman—would I be right in assuming they would be more religious than the men, more involved in the legends that the society has been preserving?"

"I wouldn't risk my life on it, Hari, but I'd be willing to risk a week's income on it."

"Good," said Seldon thoughtfully.

Dors smiled at him. "There's a bit of your psychohistory, Hari. Rule number 47,854: The downtrodden are more religious than the satisfied."

Seldon shook his head. "Don't joke about psychohistory, Dors. You know I'm not looking for tiny rules but for vast generalizations and for means of manipulation. I don't want comparative religiosity as the result of a hundred specific rules. I want something from which I can, after manipulation through some system of mathematicized logic, say, 'Aha, this group of people will tend to be more religious than that group, provided that the following criteria are met, and that, therefore, when humanity meets with these stimuli, it will react with these responses.'"

"How horrible," said Dors. "You are picturing human beings as simple mechanical devices. Press this button and you will get that twitch."

"No, because there will be many buttons pushing simultaneously to varying degrees and eliciting so many responses of different sorts that overall the predictions of the furore will be statistical in nature, so that the individual human being will remain a free agent."

"How can you know this?"

"I can't," said Seldon. "At least, I don't know it. I feel it to be so. It is what I consider to be the way things ought to be. If I can find the axioms, the fundamental Laws of Humanics, so to speak, and the necessary mathematical treatment, then I will have my psychohistory. I have proved that, in theory, this is possible-

"But impractical, right?"

"I keep saying so."

A small smile curved Dors's lips, "Is that what you are doing, Hari, looking for some sort of solution to this problem?"

"I don't know. I swear to you I don't know. But Chetter Hummin is so anxious to find a solution and, for some reason, I am anxious to please him. He is so persuasive a man."

"Yes, I know."

Seldon let that comment pass, although a small frown flitted across his face.

Seldon continued. "Hummin insists the Empire is decaying, that it will collapse, that psychohistory is the only hope for saving it-or cushioning it or ameliorating it-and that without it humanity will be destroyed or, at the very least, go through prolonged misery. He seems to place the responsibility for preventing that on me. Now, the Empire will certainly last my time, but if I'm to live at ease, I must lift that responsibility from my shoulders. I must convince myself-and even convince Hummin-that psychohistory is not a practical way out of that, despite theory, it cannot be developed. So I must follow up as many leads as I can and show that each one must fail."

"Leads? Like going back in history to a time when human society was smaller than it is now?"

"Much smaller. And far less complex."

"And showing that a solution is still impractical?"

"Yes."

"But who is going to describe the early world for you? If the Mycogenians have some coherent picture of the primordial Galaxy, Sunmaster certainly won't reveal it to a tribesman. No Mycogenian will. This is an ingrown society-how many times have we already said it?-and its members are suspicious of tribesmen to the point of paranoia. They'll tell us nothing."

"I will have to think of a way to persuade some Mycogenians to talk. Those Sisters, for instance."

"They won't even bear you, male that you are, any more than Sunmaster hears me. And even if they do talk to you, what would they know but a few catch phrases?"

"I must start somewhere."

Dors said, "Well, let me think. Hummin says I must protect you and I interpret that as meaning I must help you when I can. What do I know about religion? That's nowhere near my specialty, you know. I have always dealt with economic forces, rather than philosophic forces, but you can't split history into neat little non-overlapping divisions. For instance, religions tend to accumulate wealth when successful and that eventually tends to distort the economic development of a society. There, incidentally, is one of the numerous rules of human history that you'll have to derive from your basic Laws of Humanics or whatever you called them. But . . . "

And here, Dors's voice faded away as she lapsed into thought. Seldon watched her cautiously and Dors's eyes glazed as though she was looking deep within herself.

Finally she said, "This is not an invariable rule, but it seems to me that on many occasions, a religion has a book-or books-of significance; books that give their ritual, their view of history, their sacred poetry, and who knows what else. Usually, those books are open to all and are a means of proselytization. Sometimes they are secret."

"Do you think Mycogen has books of that sort?"

"To be truthful," said Dors thoughtfully, "I have never heard of any. I might have if they existed openly-which means they either don't exist or are kept secret. In either case, it seems to me you are not going to see them."

"At least it's a starting point," said Seldon grimly.

42.

The Sisters returned about two hours after Hari and Dors had finished lunch. They were smiling, both of them, and Raindrop FortyThree, the graver one, held up a gray kirtle for Dors's inspection.

"It is very attractive," said Dors, smiling widely and nodding her head with a certain sincerity. "I like the clever embroidery here."

"It is nothing," twittered Raindrop Forty-Five. "It is one of my old things and it won't fit very well, for you are taller than I am. But it will do for a while and we will take you out to the very best kirtlery to get a few that will fit you and your tastes perfectly. You will see."

Raindrop Forty-Three, smiling a little nervously but saying nothing and keeping her eyes fixed on the ground, handed a white kirtle to Dors. It was folded neatly. Dors did not attempt to unfold it, but passed it on to Seldon. "From the color I should say it's yours, Hari."

"Presumably," said Seldon, "but give it back. She did not give it to me."

"Oh, Hari," mouthed Dors, shaking her head slightly.

"No," said Seldon firmly. "She did not give it to me. Give it back to her and I'll wait for her to give it to me."

Dors hesitated, then made a halfhearted attempt to pass the kirtle back to Raindrop Forty-Three.

The Sister put her hands behind her back and moved away, all life seeming to drain from her face. Raindrop Forty-Five stole a glance at Seldon, a very quick one, then took a quick step toward Raindrop Forty-Three and put her arms about her.

Dors said, "Come, Hari, I'm sure that Sisters are not permitted to talk to men who are not related to them. What's the use of making her miserable? She can't help it."

"I don't believe it," said Seldon harshly. "If there is such a rule, it applies only to Brothers. I doubt very much that she's ever met a tribesman before."

Dors said to Raindrop Forty-Three in a soft voice, "Have you ever met a tribesman before, Sister, or a tribeswoman?"

A long hesitation and then a slow negative shake of the head.

Seldon threw out his arms. "Well, there you are. If there is a rule of silence, it applies only to the Brothers. Would they have sent these young women-these Sisters-to deal with us if there was any rule against speaking to tribesmen?"

"It might be, Hari, that they were meant to speak only to me and I to you."

"Nonsense. I don't believe it and I won't believe it. I am not merely a tribesman, I am an honored guest in Mycogen, asked to be treated as such by Chetter Hummin and escorted here by Sunmaster Fourteen himself. I will not be treated as though I do not exist. I will be in communication with Sunmaster Fourteen and I will complain bitterly."

Raindrop Forty-Five began to sob and Raindrop Forty-Three, retaining her comparative impassivity, nevertheless flushed faintly.

Dors made as though to appeal to Seldon once again, but he stopped her with a brief and angry outward thrust of his right arm and then stared Toweringly at Raindrop Forty-Three.

And finally she spoke and did not twitter. Rather, her voice trembled hoarsely, as though she had to force it to sound in the direction of a male being and was doing so against all her instincts and desires.

"You must not complain of us, tribesman. That would be unjust. You force me to break the custom of our people. What do you want of me?"

Seldon smiled disarmingly at once and held out his hand. "The garment you brought me. The kirtle."

Silently, she stretched out her arm and deposited the kirtle in his hand.

He bowed slightly and said in a soft warm voice, "Thank you, Sister." He then cast a very brief look in Dors's direction, as though to say: You see? But Dors looked away angrily.

The kirtle was featureless, Seldon saw as he unfolded it (embroidery and decorativeness were for women, apparently), but it came with a tasseled belt that probably had some particular way of being worn. No doubt he could work it out.

He said, "I'll step into the bathroom and put this thing on. It won't take but a minute, I suppose."

He stepped into the small chamber and found the door would not close behind him because Dors was forcing her way in as well. Only when the two of them were in the bathroom together did the door close.

"What were you doing?" Dors hissed angrily. "You were an absolute brute, Hari. Why did you treat the poor woman that way? "

Seldon said impatiently, "I had to make her talk to me. I'm counting on her for information. You know that. I'm sorry I had to be cruel, but how else could I have broken down her inhibitions?" And he motioned her out.

When he emerged, he found Dors in her kirtle too.

Dors, despite the bald head the skincap gave her and the inherent dowdiness of the kirtle, managed to look quite attractive. The stitching on the robe somehow suggested a figure without revealing it in the least. Her belt was wider than his own and was a slightly different shade of gray from her kirtle. What's more, it was held in front by two glittering blue stone snaps. (Women did manage to beautify themselves even under the greatest difficulty, Seldon thought.)

Looking over at Hari, Dors said, "You look quite the Mycogenian now. The two of us are fit to be taken to the stores by the Sisters."

"Yes," said Seldon, "but afterward I want Raindrop Forty-Three to take me on a tour of the microfarms."

Raindrop Forty-Three's eyes widened and she took a rapid step backward.

"I'd like to see them," said Seldon calmly.

Raindrop Forty-Three looked quickly at Dors. "Tribeswoman-"

Seldon said, "Perhaps you know nothing of the farms, Sister."

That seemed to touch a nerve. She lifted her chin haughtily as she still carefully addressed Dors. "I have worked on the microfarms. All Brothers and Sisters do at some point in their lives."

"Well then, take me on the tour," said Seldon, "and let's not go through the argument again. I am not a Brother to whom you are forbidden to speak and with whom you may have no dealings. I am a tribesman and an honored guest. I wear this skincap and this kirtle so as not to attract undue attention, but I am a scholar and while I am here I must learn. I cannot sit in this room and stare at the wall. I want to see the one thing you have that the rest of the Galaxy does not have . . . your microfarms. I should think you'd be proud to show them."

"We are proud," said Raindrop Forty-Three, finally facing Seldon as she spoke, "and I will show you and don't think you will learn any of our secrets if that is what you are after. I will show you the microfarms tomorrow morning. It will take time to arrange a tour."

Seldon said, "I will wait till tomorrow morning. But do you promise? Do I have your word of honor?"

Raindrop Forty-Three said with clear contempt, "I am a Sister and I will do as I say. I will keep my word, even to a tribesman."

Her voice grew icy at the last words, while her eyes widened and seemed to glitter. Seldon wondered what was passing through her mind and felt uneasy.

43.

Seldon passed a restless night. To begin with, Dors had announced that she must accompany him on the tour of the microfarm and he had objected strenuously.

"The whole purpose," he said, "is to make her talk freely, to present her with an unusual environment-alone with a male, even if a tribesman. Having broken custom so far, it will be easier to break it further. If you're along, she will talk to you and I will only get the leavings."

"And if something happens to you in my absence, as it did Upperside?"

"Nothing will happen. Please! If you want to help me, stay away. If not, I will have nothing further to do with you. I mean it, Dors. This is important to me. Much as I've grown fond of you, you cannot come ahead of this."

She agreed with enormous reluctance and said only, "Promise me you'll at least be nice to her, then."

And Seldon said, "Is it me you must protect or her? I assure you that I didn't treat her harshly for pleasure and I won't do so in the future."

The memory of this argument with Dors-their first helped keep him awake a large part of the night; that, together with the nagging thought that the two Sisters might not arrive in the morning, despite Raindrop Forty-Three's promise.

They did arrive, however, not long after Seldon had completed a spare breakfast (he was determined not to grow fat through overindulgence) and had put on a kirtle that fitted him precisely. He had carefully organized the belt so that it hung perfectly.

Raindrop Forty-Three, still with a touch of ice in her eye, said, "if you are ready, Tribesman Seldon, my sister will remain with Tribeswoman Venabili." Her voice was neither twittery nor hoarse. It was as though she had steadied herself through the night, practicing, in her mind, how to speak to one who was a male but not a Brother.

Seldon wondered if she had lost sleep and said, "I am quite ready."

Together, half an hour later, Raindrop Forty-Three and Hari Seldon were descending level upon level. Though it was daytime by the clock, the light was dusky and dimmer than it had been elsewhere on Trantor.

There was no obvious reason for this. Surely, the artificial daylight that slowly progressed around the Trantorian sphere could include the Mycogen Sector.

The Mycogenians must want it that way, Seldon thought, clinging to some primitive habit. Slowly Seldon's eyes adjusted to the dim surroundings.

Seldon tried to meet the eyes of passersby, whether Brothers or Sisters, calmly. He assumed he and Raindrop Forty-Three would be taken as a Brother and his woman and that they would be given no notice as long as he did nothing to attract attention.

Unfortunately, it seemed as if Raindrop Forty-Three wanted to be noticed. She talked to him in few words and in low tones out of a clenched mouth. It was clear that the company of an unauthorized male, even though only she knew this fact, raved her self-confidence. Seldon was quite sure that if he asked her to relax, he would merely make her that much more uneasy. (Seldon wondered what she would do if she met someone who knew her. He felt more relaxed once they reached the lower levels, where human beings were fewer.)

The descent was not by elevators either, but by moving staired ramps that existed in pairs, one going up and one going down. Raindrop FortyThree referred to them as "escalators." Seldon wasn't sure he had caught the word correctly, never having heard it before.

As they sank to lower and lower levels, Seldon's apprehension grew. Most worlds possessed microfarms and most worlds produced their own varieties of microproducts. Seldon, back on Helicon, had occasionally shopped for seasonings in the microfarms and was always aware of an unpleasant stomach-turning stench.

The people who worked at the microfarms didn't seem to mind. Even when casual visitors wrinkled their noses, they seemed to acclimate themselves to it.

Seldon, however, was always peculiarly susceptible to the smell. He suffered and he expected to suffer now. He tried soothing himself with the thought that he was nobly sacrificing his comfort to his need for information, but that didn't keep his stomach from turning itself into knots in apprehension.

After he had lost track of the number of levels they had descended, with the air still seeming reasonably fresh, he asked, "When do we get to the microfarm levels?"

"We're there now."

Seldon breathed deeply. "It doesn't smell as though we are."

"Smell? What do you mean?" Raindrop Forty-Three was Offended enough to speak quite loudly.

"There was always a putrid odor associated with microfarms, in my experience. You know, from the fertilizer that bacteria, yeast, fungi, and saprophytes generally need."

"In your experience?" Her voice lowered again. "Where was that?"

"On my home world."

The Sister twisted her face into wild repugnance. "And your people wallow in gabelle?"

Seldon had never heard the word before, but from the look and the intonation, he knew what it meant.

He said, "It doesn't smell like that, you understand, once it is ready for consumption."

"Ours doesn't smell like that at any time. Our biotechnicians have worked out perfect strains. The algae grow in the purest light and the most carefully balanced electrolyte solutions. The saprophytes are fed on beautifully combined organics. The formulas and recipes are something no tribespeople will ever know. -Come on, here we are. Sniff all you want. You'll find nothing offensive. That is one reason why our food is in

demand throughout the Galaxy and why the Emperor, we are told, eats nothing else, though it is far too good for a tribesman if you ask me, even if he calls himself Emperor."

She said it with an anger that seemed directly aimed at Seldon. Then, as though afraid he might miss that, she added, "Or even if he calls himself an honored guest."

They stepped out into a narrow corridor, on each side of which were large thick glass tanks in which roiled cloudy green water full of swirling, growing algae, moving about through the force of the gas bubbles that streamed up through it. They would be rich in carbon dioxide, he decided.

Rich, rosy light shone down into the tanks, light that was much brighter than that in the corridors. He commented thoughtfully on that.

"Of course," she said. "These algae work best at the red end of the spectrum."

"I presume," said Seldon, "that everything is automated."

She shrugged, but did not respond.

"I don't see quantities of Brothers and Sisters in evidence," Seldon said, persisting.

"Nevertheless, there is work to be done and they do it, even if you don't see them at work. The details are not for you. Don't waste your time by asking about it."

"Wait. Don't be angry with me. I don't expect to be told state secrets. Come on, dear." (The word slipped out.)

He took her arm as she seemed on the point of hurrying away. She remained in place, but he felt her shudder slightly and he released her in embarrassment.

He said, "It's just that it seems automated."

"Make what you wish of the seeming. Nevertheless, there is room here for human brains and human judgment. Every Brother and Sister has occasion to work here at some time. Some make a profession of it."

She was speaking more freely now but, to his continuing embarrassment, he noticed her left hand move stealthily toward her right arm and gently rub the spot where he had touched her, as though he had stung her.

"It goes on for kilometers and kilometers," she said, "but if we turn here there'll be a portion of the fungal section you can see."

They moved along. Seldon noted how clean everything was. The glass sparkled. The tiled floor seemed moist, though when he seized a moment to bend and touch it, it wasn't. Nor was it slippery -unless his sandals (with his big toe protruding in approved Mycogenian fashion) had non-slip soles.

Raindrop Forty-Three was right in one respect. Here and there a Brother or a Sister worked silently, studying gauges, adjusting controls, sometimes engaged in something as unskilled as polishing equipment-always absorbed in whatever they were doing.

Seldon was careful not to ask what they were doing, since he did not want to cause the Sister humiliation in having to answer that she did not know or anger in her having to remind him there were things he must not know.

They passed through a lightly swinging door and Seldon suddenly noticed the faintest touch of the odor he remembered. He looked at Raindrop Forty-Three, but she seemed unconscious of it and soon he too became used to it.

The character of the light changed suddenly. The rosiness was gone and the brightness too. All seemed to be in a twilight except where equipment was spotlighted and wherever there was a spot light there seemed to be a Brother or a Sister. Some wore lighted headbands that gleamed with a pearly glow and, in the middle distance, Seldon could see, here and there, small sparks of light moving erratically.

As they walked, he cast a quick eye on her profile. It was all he could really judge by. At all other times, he could not cease being conscious of her bulging bald head, her bare eyes, her colorless face. They drowned her individuality and seemed to make her invisible. Here in profile, however, he could see something.

Nose, chin, full lips, regularity, beauty. The dim light somehow smoothed out and softened the great upper desert.

He thought with surprise: She could be very beautiful if she grew her hair and arranged it nicely. And then he thought that she couldn't grow her hair. She would be bald her whole life. Why? Why did they have to do that to her? Sunmaster said it was so that a Mycogenian would know himself (or herself) for a Mycogenian all his (or her) life. Why was that so important that the curse of hairlessness had to be accepted as a badge or mark of identity?

And then, because he was used to arguing both sides in his mind, he thought:

Custom is second nature. Be accustomed to a bald head, sufficiently accustomed, and hair on it would seem monstrous, would evoke nausea. He himself had shaved his face every morning, removing all the facial hair, uncomfortable at the merest stubble, and yet he did not think of his face as bald or as being in any way unnatural. Of course, he could grow his facial hair at any time he wished-but he didn't wish to do so.

He knew that there were worlds on which the men did not shave; in some, they did not even clip or shape the facial hair but let it grow wild. What would they say if they could see his own bald face, his own hairless chin, cheek, and lips?

And meanwhile, he walked with Raindrop Forty-Three-endlessly, it seemed-and every once in a while she guided him by the elbow and it seemed to him that she had grown accustomed to that, for she did not withdraw her hand hastily. Sometimes it remained for nearly a minute.

She said, "Here! Come here!"

"What is that?" asked Seldon.

They were standing before a small tray filled with little spheres, each about two centimeters in diameter. A Brother who was tending the area and who had just placed the tray where it was looked up in mild inquiry.

Raindrop Forty-Three said to Seldon in a low voice, "Ask for a few."

Seldon realized she could not speak to a Brother until spoken to and said uncertainly, "May we have a few, B-brother?"

"Have a handful, Brother," said the other heartily.

Seldon plucked out one of the spheres and was on the point of handing it to Raindrop Forty-Three when he noticed that she had accepted the invitation as applying to herself and reached in for two handfuls.

The sphere felt glossy, smooth. Seldon said to Raindrop FortyThree as they moved away from the vat and from the Brother who was in attendance, "Are these supposed to be eaten?" He lifted the sphere cautiously to his nose.

"They don't smell," she said sharply.

"What are they? "

"Dainties. Raw dainties. For the outside market they're flavored in different ways, but here in Mycogen we eat them unflavored -- the only way."

She put one in her mouth and said, "I never have enough."

Seldon put his sphere into his mouth and felt it dissolve and disappear rapidly. His mouth, for a moment, ran liquid and then it slid, almost of its own accord, down his throat. He stood for a moment, amazed. It was slightly sweet and, for that matter, had an even fainter bitter aftertaste, but the train sensation eluded him.

"May I have another?" he said.

"Have half a dozen," said Raindrop Forty-Three, holding out her hand. "They never have quite the same taste twice and have practically no calories. Just taste."

She was right. He tried to have the dainty linger in his mouth; he tried licking it carefully; tried biting off a piece. However, the most careful lick destroyed it. When a bit was crunched off a piece, the rest of it disappeared at once. And each taste was undefinable and not quite like the one before.

"The only trouble is," said the Sister happily, "that every once in a while you have a very unusual one and you never forget it, but you never have it again either. I had one when I was nine-" Her expression suddenly lost its excitement and she said, "It's a good thing. It teaches you the evanescence of things of the world."

It was a signal, Seldon thought. They had wandered about aimlessly long enough. She had grown used to him and was talking to him. And now the conversation had to come to its point. Now!

44.

Seldon said, "I come from a world which lies out in the open, Sister, as all worlds do but Trantor. Rain comes or doesn't come, the rivers trickle or are in flood, temperature is high or low. That means harvests are good or bad. Here, however, the environment is truly controlled. Harvests have no choice but to be good. How fortunate Mycogen is."

He waited. There were different possible answers and his course of action would depend on which answer came.

She was speaking quite freely now and seemed to have no inhibitions concerning his masculinity, so this long tour had served its purpose. Raindrop Forty-Three said, "The environment is not that easy to control. There are, occasionally, viral infections and there are sometimes unexpected and undesirable mutations.

There are times when whole vast batches wither or are worthless."

"You astonish me. And what happens then?"

"There is usually no recourse but to destroy the spoiled batches, even those that are merely suspected of spoilage. Trays and tanks must be totally sterilized, sometimes disposed of altogether."

"It amounts to surgery, then," said Seldon. "You cut out the diseased tissue."

"Yes."

"And what do you do to prevent such things from happening?"

"What can we do? We test constantly for any mutations that may spring up, any new viruses that may appear, any accidental contamination or alteration of the environment. It rarely happens that we detect anything wrong, but if we do, we take drastic action. The result is that bad years are very few and even bad years affect only fractional bits here and there. The worst year we've ever had fell short of the average by only 12 percent-though that was enough to produce hardship. The trouble is that even the most careful forethought and the most cleverly designed computer programs can't always predict what is essentially unpredictable."

(Seldon felt an involuntary shudder go through him. It was as though she was speaking of psychohistory-but she was only speaking of the microfarm produce of a tiny fraction of humanity, while he himself was considering all the mighty Galactic Empire in every one of all its activities.)

Unavoidably disheartened, he said, "Surely, it's not all unpredictable. There are forces that guide and that care for us all."

The Sister stiffened. She turned around toward him, seeming to study him with her penetrating eyes.

But all she said was "What?"

Seldon felt uneasy. "It seems to me that in speaking of viruses and mutations, we're talking about the natural, about phenomena that are subject to natural law. That leaves out of account the supernatural, doesn't it? It leaves out that which is not subject to natural law and can, therefore, control natural law."

She continued to stare at him, as though he had suddenly begun speaking some distant, unknown dialect of Galactic Standard. Again she said, in half a whisper this time, "Wharf"

He continued, stumbling over unfamiliar words that half-embarrassed him. "You must appeal to some great essence, some great spirit, some . . . I don't know what to call it."

Raindrop Forty-Three said in a voice that rose into higher registers but remained low, "I thought so. I thought that was what you meant, but I couldn't believe it. You're accusing us of having religion. Why didn't you say so? Why didn't you use the word?"

She waited for an answer and Seldon, a little confused at the onslaught, said, "Because that's not a word I use. I call it 'supernaturalism.' "

"Call it what you will. It's religion and we don't have it. Religion is for the tribesmen, for the swarming sc-

The Sister paused to swallow as though she had come near to choking and Seldon was certain the word she had choked over was.

She was in control again. Speaking slowly and somewhat below her normal soprano, she said, "We are not a religious people. Our kingdom is of this Galaxy and always has been. If you have a religion Seldon felt trapped. Somehow he had not counted on this. He raised a hand defensively. "Not really. I'm a mathematician and my kingdom is also of this Galaxy. It's just that I thought, from the rigidity of your customs, that your kingdom-

"Don't think it, tribesman. If our customs are rigid, it is because we are mere millions surrounded by billions. Somehow we must mark ourselves off so that we precious few are not lost among your swarms and hordes. We must be marked off by our hairlessness, our clothing, our behavior, our way of life. We must know who we are and we must be sure that you tribesmen know who we are. We labor in our farms so that we can make ourselves valuable in your eyes and thus make certain that you leave us alone. That's all we ask of you . . . to leave us alone."

"I have no intention of harming you or any of your people. I seek only knowledge, here as everywhere."

"So you insult us by asking about our religion, as though we have ever called on a mysterious, insubstantial spirit to do for us what we cannot do for ourselves."

"There are many people, many worlds who believe in supernaturalism in one form or another . . . religion, if you like the word better. We may disagree with them in one way or another, but we are as likely to be wrong in our disbelief as they in their belief. In any case, there is no disgrace in such belief and my questions were not intended as insults."

But she was not reconciled. "Religion!" she said angrily. "We have no need of it."

Seldon's spirits, having sunk steadily in the course of this exchange, reached bottom. This whole thing, this expedition with Raindrop Forty-Three, had come to nothing.

But she went on to say, "We have something far better. We have history. "

And Seldon's feelings rebounded at once and he smiled.

HAND-ON-THIGH STORY-. . . An occasion cited by Hari Seldon as the first turning point in his search for a method to develop psychohistory. Unfortunately, his published writings give no indication as to what that "story" was and speculations concerning it (there have been many) are futile. It remains one of the many intriguing mysteries concerning Seldon's career.

ENCYCLOPEDIA GALACTICA

45.

Raindrop Forty-Three stared at Seldon, wild-eyed and breathing heavily.

"I can't stay here," she said.

Seldon looked about. "No one is bothering us. Even the Brother from whom we got the dainties said nothing about us. He seemed to take us as a perfectly normal pair."

"That's because there is nothing unusual about us-when the light is dim, when you keep your voice low so the tribesman accent is less noticeable, and when I seem calm. But now-" Her voice was growing hoarse.

"What of now?"

"I am nervous and tense. I am . . . in a perspiration."

"Who is to notice? Relax. Calm down."

"I can't relax here. I can't calm down while I may be noticed."

"Where are we to go, then?"

"There are little sheds for resting. I have worked here. I know about them."

She was walking rapidly now and Seldon followed. Up a small ramp, which he would not have noticed in the twilight without her, there was a line of doors, well spread apart.

"The one at the end," she muttered. "If it's free."

It was unoccupied. A small glowing rectangle said NOT IN USE and the door was ajar.

Raindrop Forty-Three looked about rapidly, motioned Seldon in, then stepped inside herself. She closed the door and, as she did so, a small ceiling light brightened the interior.

Seldon said, "Is there any way the sign on the door can indicate this shed is in use?"

"That happened automatically when the door closed and the light went on," said the Sister.

Seldon could feel air softly circulating with a small sighing sound, but where on Trantor was that ever-present sound and feel not apparent?

The room was not large, but it had a cot with a firm, efficient mattress, and what were obviously clean sheets. There was a chair and table, a small refrigerator, and something that looked like an enclosed hot plate, probably a tiny food-heater.

Raindrop Forty-Three sat down on the chair, sitting stiffly upright, visibly attempting to force herself into relaxation.

Seldon, uncertain as to what he ought to do, remained standing till she gestured-a bit impatiently-for him to sit on the cot. He did so.

Raindrop Forty-Three said softly, as though talking to herself, "If it is ever known that I have been here with a man-even if only a tribesman-I shall indeed be an outcast."

Seldon rose quickly. "Then let's not stay here."

"Sit down. I can't go out when I'm in this mood. You've been asking about religion. What are you after?"

It seemed to Seldon that she had changed completely. Gone was the passivity, the subservience. There was none of the shyness, the backwardness in the presence of a male. She was glaring at him through narrowed eyes.

"I told you. Knowledge. I'm a scholar. It is my profession and my desire to know, I want to understand people in particular, so I want to learn history. For many worlds, the ancient historical records-the truly ancient historical records-have decayed into myths and legends, often becoming part of a set of religious beliefs or of supernaturalism. But if Mycogen does not have a religion, then-

"I said we have history. "

Seldon said, "Twice you've said you have history. How old?"

"It goes back twenty thousand years."

"Truly? Let us speak frankly. Is it real history or is it something that has degenerated into legend?"

"It is real history, of course."

Seldon was on the point of asking how she could tell, but thought better of it. Was there really a chance that history might reach back twenty thousand years and be authentic? He was not a historian himself, so he would have to check with Dors.

But it seemed so likely to him that on every world the earliest histories were medleys of self-serving heroisms and minidramas that were meant as morality plays and were not to be taken literally. It was surely true of Helicon, yet you would find scarcely a Heliconian who would not swear by all the tales told and insist it was all true history. They would support, as such, even that perfectly ridiculous tale of the first exploration of Helicon and the encounters with large and dangerous flying reptiles-even though nothing like flying reptiles had been found to be native to any world explored and settled by human beings.

He said instead, "How does this history begin?"

There was a faraway look in the Sister's eyes, a look that did not focus on Seldon or on anything in the room. She said, "It begins with a world-our world."

One world."

"One world?" (Seldon remembered that Hummin had spoken of legends of a single, original world of humanity.)

"One world. There were others later, but ours was the first. One world, with space, with open air, with room for everyone, with fertile fields, with friendly homes, with warm people. For thousands of years we lived there and then we had to leave and skulk in one place or another until some of us found a corner of Trantor where we learned to grow food that brought us a little freedom. And here in Mycogen, we now have our own ways-- and our own dreams."

"And your histories give the full details concerning the original world? The one world?"

"Oh yes, it is all in a book and we all have it. Every one of us. We carry it at all times so that there is never a moment when any one of us cannot open it and read it and remember who we are and who we were and resolve that someday we will have our world back."

"Do you know where this world is and who lives on it now?"

Raindrop Forty-Three hesitated, then shook her head fiercely. "We do not, but someday we will find it."

"And you have this book in your possession now?"

"Of course."

"May I see that book?"

Now a slow smile crossed the face of the Sister. She said, "So that's what you want. I knew you wanted something when you asked to be guided through the microfarms by me alone." She seemed a little embarrassed. "I didn't think it was the Book."

"It is all I want," said Seldon earnestly. "I really did not have my mind on anything else. If you brought me here because you thought--"

She did not allow him to finish. "But here we are. Do you or don't you want the Book?"

"Are you offering to let me see it?"

"On one condition."

Seldon paused, weighing the possibility of serious trouble if he had overcome the Sister's inhibitions to a greater extent than he had ever intended. "What condition?" he said.

Raindrop Forty-Three's tongue emerged lightly and licked quickly at her lips. Then she said with a distinct tremor in her voice, "That you remove your skincap."

46.

Hari Seldon stared blankly at Raindrop Forty-Three. There was a perceptible moment in which he did not know what she was talking about. He had forgotten he was wearing a skincap.

Then he put his hand to his head and, for the first time, consciously felt the skincap he was wearing. It was smooth, but he felt the tiny resilience of the hair beneath. Not much. His hair, after all, was fine and without much body.

He said, still feeling it, "Why?"

She said, "Because I want you to. Because that's the condition if you want to see the Book."

He said, "Well, if you really want me to." His hand probed for the edge, so that he could peel it off.

But she said, "No, let me do it. I'll do it." She was looking at him hungrily.

Seldon dropped his hands to his lap. "Go ahead, then."

The Sister rose quickly and sat down next to him on the cot. Slowly, carefully, she detached the skincap from his head just in front of his ear. Again she licked her lips and she was panting as she loosened the skincap about his forehead and turned it up. Then it came away and was gone and Seldon's hair, released, seemed to stir a bit in glad freedom.

He said, troubled, "Keeping my hair under the skincap has probably made my scalp sweat. If so, my hair will be rather damp."

He raised his hand, as though to check the matter, but she caught it and held it back. "I want to do that," she said. "Its part of the condition."

Her fingers, slowly and hesitantly, touched his hair and then withdrew. She touched it again and, very gently, stroked it.

"It's dry," she said. "It feels . . . good."

"Have you ever felt cephalic hair before?"

"Only on children sometimes. This . . . is different." She was stroking again.

"In what way?" Seldon, even amid his embarrassment, found it possible to be curious.

"I can't say. Its just . . . different."

After a while he said, "Have you had enough?"

"No. Don't rush me. Can you make it lie anyway you want it to?"

"Not really. It has a natural way of falling, but I need a comb for that and I don't have one with me."

"A comb?"

"An object with prongs . . . uh, like a fork . . . but the prongs are more numerous and somewhat softer."

"Can you use your fingers?" She was running hers through his hair.

He said, "After a fashion. It doesn't work very well."

"Its bristly behind."

"The hair is shorter there."

Raindrop Forty-Three seemed to recall something. "The eyebrows," she said.

"Isn't that what they're called?" She stripped off the shields, then ran her fingers through the gentle arc of hair, against the grain.

"That's nice," she said, then laughed in a high-pitched way that was almost like her younger sister's giggle. "They're cute."

Seldon said a little impatiently, "Is there anything else that's part of the condition?"

In the rather dim light, Raindrop Forty-Three looked as though she might be considering an affirmative, but said nothing. Instead, she suddenly withdrew her hands and lifted them to her nose. Seldon wondered what she might be smelling.

"How odd," she said. "May I . . . may I do it again another time?"

Seldon said uneasily, "If you will let me have the Book long enough to study it, then perhaps."

Raindrop Forty-Three reached into her kirtle through a slit that Seldon had not noticed before and, from some hidden inner pocket, removed a book bound in some tough, flexible material. He took it, trying to control his excitement.

While Seldon readjusted his skincap to cover his hair, Raindrop Forty-Three raised her hands to her nose again and then, gently and quickly, licked one finger.

47.

"Felt your hair?" said Dors Venabili. She looked at Seldon's hair as though she was of a mind to feel it herself.

Seldon moved away slightly. "Please don't. The woman made it seem like a perversion."

"I suppose it was—from her standpoint. Did you derive no pleasure from it yourself?"

"Pleasure? It gave me gooseflesh. When she finally stopped, I was able to breathe again. I kept thinking: What other conditions will she make?"

Dors laughed. "Were you afraid that she would force sex upon you? Or hopeful?"

"I assure you I didn't dare think. I just wanted the Book."

They were in their room now and Dors turned on her field distorter to make sure they would not be overheard.

The Mycogenian night was about to begin. Seldon had removed his skincap and kirtle and had bathed, paying particular attention to his hair, which he had foamed and rinsed twice. He was now sitting on his cot, wearing a light nightgown that had been hanging in the closet.

Dors said, eyes dancing, "Did she know you have hair on your chest?"

"I was hoping earnestly she wouldn't think of that."

"Poor Hari. It was all perfectly natural, you know. I would probably have had similar trouble if I was alone with a Brother. Worse, I'm sure, since he would believe—Mycogenian society being what it is—that as a woman I would be bound to obey his orders without delay or demur."

"No, Dors. You may think it was perfectly natural, but you didn't experience it.

The poor woman was in a high state of sexual excitement. She engaged all her senses . . . smelled her fingers, licked them. If she could have heard hair grow, she would have listened avidly."

"But that's what I mean by 'natural.' Anything you make forbidden gains sexual attractiveness. Would you be particularly interested in women's breasts if you lived in a society in which they were displayed at all times?"

"I think I might."

"Wouldn't you be more interested if they were always hidden, as in most societies they are? -Listen, let me tell you something that happened to me. I was at a lake resort back home on Cinna . . . I presume you have resorts on Helicon, beaches, that sort of thing?"

"Of course," said Seldon, slightly annoyed. "What do you think Helicon is, a world of rocks and mountains, with only well water to drink?"

"No offense, Hari. I just want to make sure you'll get the point of the story.

On our beaches at Cinna, we're pretty lighthearted about what we wear . . . or don't wear."

"Nude beaches?"

"Not actually, though I suppose if someone removed all of his or her clothing it wouldn't be much remarked on. The custom is to wear a decent minimum, but I must admit that what we consider decent leaves very little to the imagination."

Seldon said, "We have somewhat higher standards of decency on Helicon."

"Yes, I could tell that by your careful treatment of me, but to each its own. In any case, I was sitting at the small beach by the lake and a young man approached to whom I had spoken earlier in the day. He was a decent fellow I found nothing particularly wrong with. He sat on the arm of my chair and placed his right hand on my left thigh, which was bare, of course, in order to steady himself.

"After we had spoken for a minute and a half or so, he said, impishly. 'Here I am. You know me hardly at all and yet it seems perfectly natural to me that I place my hand on your thigh. What's more, it seems perfectly natural to you, since you don't seem to mind that it remains there.'

"It was only then that I actually noticed that his hand was on my thigh. Bare skin in public somehow loses some of its sexual quality. As I said, its the hiding from view that is crucial.

"And the young man felt this too, for he went on to say, 'Yet if I were to meet you under more formal conditions and you were wearing a gown, you wouldn't dream of letting me lift your gown and place my hand on your thigh on the precise spot it now occupies.'

"I laughed and we continued to talk of this and that. Of course, the young man, now that my attention had been called to the position of his hand, felt it no longer appropriate to keep it there and removed it.

"That night I dressed for dinner with more than usual care and appeared in clothing that was considerably more formal than was required or than other women in the

dining room were wearing. I found the young man in question. He was sitting at one of the tables. I approached, greeted him, and said, 'Here I am in a gown, but under it my left thigh is bare. I give you permission. Just lift the gown and place your hand on my left thigh where you had it earlier.'

"He tried. I'll give him credit for that, but everyone was staring. I wouldn't have stopped him and I'm sure no one else would have stopped him either, but he couldn't bring himself to do it. It was no more public then than it had been earlier and the same people were present in both cases. It was clear that I had taken the initiative and that I had no objections, but he could not bring himself to violate the proprieties. The conditions, which had been hand-on-thigh in the afternoon, were not hand-on-thigh in the evening and that meant more than anything logic could say."

Seldon said, "I would have put my hand on your thigh."

"Are you sure?"

"Positive."

"Even though your standards of decency on the beach are higher than ours are?"

"Yes."

Dors sat down on her own cot, then lay down with her hands behind her head. "So that you're not particularly disturbed that I'm wearing a nightgown with very little underneath it."

"I'm not particularly shocked. As for being disturbed, that depends on the definition of the word. I'm certainly aware of how you're dressed."

"Well, if we're going to be cooped up here for a period of time, we'll have to learn to ignore such things."

"Or take advantage of them," said Seldon, grinning. "And I like your hair. After seeing you bald all day, I like your hair."

"Well, don't touch it. I haven't washed it yet." She half-closed her eyes. "It's interesting. You've detached the informal and formal level of respectability."

What you're saying is that Helicon is more respectable at the informal level than Cinna is and less respectable at the formal level. Is that right?"

"Actually, I'm just talking about the young man who placed his hand on your thigh and myself. How representative we are as Cinnians and Heliconians, respectively, I can't say. I can easily imagine some perfectly proper individuals on both worlds--and some madcaps too."

"We're talking about social pressures. I'm not exactly a Galactic traveler, but I've had to involve myself in a great deal of social history. On the planet of Derowd, there was a time when premarital sex was absolutely free. Multiple sex was allowed for the unmarried and public sex was frowned upon only when traffic was blocked: And yet, after marriage, monogamy was absolute and unbroken. The theory was that by working off all one's fantasies first, one could settle down to the serious business of life."

"Did it work?"

"About three hundred years ago that stopped, but some of my colleagues say it stopped through external pressure from other worlds who were losing too much tourist business to Derowd. There is such a thing as overall Galactic social pressure too."

"Or perhaps economic pressure, in this case."

"Perhaps. And being at the University, by the way, I get a chance to study social pressures, even without being a Galactic traveler. I meet people from scores of places inside and outside of Trantor and one of the pet amusements in the social science departments is the comparison of social pressures.

"Here in Mycogen, for instance, I have the impression that sex is strictly controlled and is permitted under only the most stringent rules, all the more tightly enforced because it is never discussed. In the Streeling Sector, sex is never discussed either, but it isn't condemned. In the Jennat Sector, where I spent a week once doing research, sex is discussed endlessly, but only for the purpose of condemning it. I don't suppose there are any two sectors in Trantor -or any two worlds outside Trantor -- in which attitudes toward sex are completely duplicated."

Seldon said, "You know what you make it sound like? It would appear.", Dors said, "I'll tell you how it appears. All this talk of sex makes one thing clear to me. I'm simply not going to let you out of my sight anymore."

"What?"

"Twice I let you go, the first time through my own misjudgment and the second because you bullied me into it. Both times it was clearly a mistake. You know what happened to you the first time."

Seldon said indignantly, "Yes, but nothing happened to me the second time."

"You nearly got into a lot of trouble. Suppose you had been caught indulging in sexual escapades with a Sister?"

"It wasn't a sexual-"

"You yourself said she was in a high state of sexual excitement."

"But-"

"It was wrong. Please get it through your head, Hari. From now on, you go nowhere without me."

"Look," said Seldon freezingly, "my object was to find out about Mycogenian history and as a result of the so-called sexual escapade with a Sister, I have a book-the Book."

"The Book! True, there's the Book. Let's see it."

Seldon produced it and Dors thoughtfully hefted it.

She said, "It might not do us any good, Hari. This doesn't look as though it will fit any projector I've ever encountered. That means you'll have to get a Mycogenian projector and they'll want to know why you want it. They'll then find out you have this Book and they'll take it away from you."

Seldon smiled. "If your assumptions were correct, Dors, your conclusions would be inescapable, but it happens that this is not the kind of book you think it is. It's not meant

to be projected. The material is printed on various pages and the pages are turned. Raindrop FortyThree explained that much to me."

"A print-book!" It was hard to tell whether Dors was shocked or amused. "That's from the Stone Age."

"It's certainly pre-Empire," said Seldon, "but not entirely so. Have you ever seen a print-book?"

"Considering that I'm a historian? Of course, Hari."

"Ah, but like this one?"

He handed over the Book and Dors, smiling, opened it-then turned to another page-then flipped the pages. "Its blank," she said.

"It appears to be blank. The Mycogenians are stubbornly primitivistic, but not entirely so. They will keep to the essence of the primitive, but have no objection to using modern technology to modify it for convenience's sake. Who knows?"

"Maybe so, Hari, but I don't understand what you're saying."

"The pages aren't blank, they're covered with microprint. Here, give it back. If I press this little nubbin on the inner edge of the cover- Look!"

The page to which the book lay open was suddenly covered with lines of print that rolled slowly upward.

Seldon said, "You can adjust the rate of upward movement to match your reading speed by slightly twisting the nubbin one way or the other. When the lines of print reach their upward limit when you reach the bottom line, that is-they snap downward and turn off. You turn to the next page and continue."

"Where does the energy come from that does all this?"

"It has an enclosed microfusion battery that lasts the life of the book."

"Then when it runs down-"

"You discard the book, which you may be required to do even before it runs down, given wear and tear, and get another copy. You never replace the battery."

Dors took the Book a second time and looked at it from all sides. She said, "I must admit I never heard of a book like this."

"Nor I. The Galaxy, generally, has moved into visual technology so rapidly, it skipped over this possibility."

"This is visual."

"Yes, but not with the orthodox effects. This type of book has its advantages. It holds far more than an ordinary visual book does."

Dors said, "Where's the turn-on? -Ah, let me see if I can work it." She had opened to a page at random and set the lines of print marching upward. Then she said, "I'm afraid this won't do you any good, Hari. It's pre-Galactic. I don't mean the book. I mean the print . . . the language."

"Can you read it, Dors? As a historian-"

"As a historian, I'm used to dealing with archaic language-but within limits. This is far too ancient for me. I can make out a few words here and there, but not enough to be useful."

"Good," said Seldon. "If it's really ancient, it will be useful."

"Not if you can't read it."

"I can read it," said Seldon. "It's bilingual. You don't suppose that Raindrop Forty-Three can read the ancient script, do you?"

"If she's educated properly, why not?"

"Because I suspect that women in Mycogen are not educated past household duties. Some of the more learned men can read this, but everyone else would need a translation to Galactic." He pushed another nubbin. "And this supplies it."

The lines of print changed to Galactic Standard.

"Delightful," said Dors in admiration.

"We could learn from these Mycogenians, but we don't."

"We haven't known about it."

"I can't believe that. I know about it now. And you know about it. There must be outsiders coming into Mycogen now and then, for commercial or political reasons, or there wouldn't be skincaps so ready for use. So every once in a while someone must have caught a glimpse of this sort of print-book and seen how it works, but it's probably dismissed as something curious but not worth further study, simply because it's Mycogenian."

"But is it worth study?"

"Of course. Everything is. Or should be. Hummin would probably point to this lack of concern about these books as a sign of degeneration in the Empire."

He lifted the Book and said with a gush of excitement, "But I am curious and I will read this and it may push me in the direction of psychohistory."

"I hope so," said Dors, "but if you take my advice, you'll sleep first and approach it fresh in the morning. You won't learn much if you nod over it."

Seldon hesitated, then said, "How maternal you are!"

"I'm watching over you."

"But I have a mother alive on Helicon. I would rather you were my friend."

"As for that, I have been your friend since first I met you."

She smiled at him and Seldon hesitated as though he were not certain as to the appropriate rejoinder. Finally he said, "Then I'll take your advice---as a friend-mind sleep before reading."

He made as though to put the Book on a small table between the two cots, hesitated, turned, and put it under his pillow. Dors Venabili laughed softly. "I think you're afraid I will wake during the night and read parts of the Book before you have a chance to. Is that it?"

"Well," said Seldon, trying not to look ashamed, "that may be it. Even friendship only goes so far and this is my book and it's my psychohistory."

"I agree," said Dors, "and I promise you that we won't quarrel over that. By the way, you were about to say something earlier when I interrupted you. Remember?"

Seldon thought briefly. "No."

In the dark, he thought only of the Book. He gave no thought to the hand-on-thigh story. In fact, he had already quite forgotten it, consciously at least.

48.

Venabili woke up and could tell by her timeband that the night period was only half over. Not hearing Hari's snore, she could tell that his cot was empty. If he had not left the apartment, then he was in the bathroom.

She tapped lightly on the door and said softly, "Hari?"

He said, "Come in," in an abstracted way and she did.

The toilet lid was down and Seldon, seated upon it, held the Book open on his lap. He said, quite unnecessarily, "I'm reading."

"Yes, I see that. But why?"

"I couldn't sleep. I'm sorry."

"But why read in here?"

"If I had turned on the room light, I would have woken you up."

"Are you sure the Book can't be illuminated?"

"Pretty sure. When Raindrop Forty-Three described its workings, she never mentioned illumination. Besides, I suppose that would use up so much energy that the battery wouldn't last the life of the Book." He sounded dissatisfied.

Dors said, "You can step out, then. I want to use this place, as long as I'm here."

When she emerged, she found him sitting cross-legged on his cot, still reading, with the room well lighted.

She said, "You don't look happy. Does the Book disappoint you?.. "

He looked up at her, blinking. "Yes, it does. I've sampled it here and there. Its all I've had time to do. The thing is a virtual encyclopedia and the index is almost entirely a listing of people and places that are of little use for my purposes. It has nothing to do with the Galactic Empire or the pre-Imperial Kingdoms either. It deals almost entirely with a single world and, as nearly as I can make out from what I have read, it is an endless dissertation on internal politics."

"Perhaps you underestimate its age. It may deal with a period when there was indeed only one world . . . one inhabited world."

"Yes, I know," said Seldon a little impatiently. "That's actually what I want-provided I can be sure its history, not legend. I wonder. I don't want to believe it just because I want to believe it."

Dors said, "Well, this matter of a single-world origin is much in the air these days. Human beings are a single species spread all over the Galaxy, so they must have originated somewhere. At least that's the popular view at present. You can't have independent origins producing the same species on different worlds."

"But I've never seen the inevitability of that argument," said Seldon. "If human beings arose on a number of worlds as a number of different species, why couldn't they have interbred into some single intermediate species?"

"Because species can't interbreed. That's what makes them species."

Seldon thought about it a moment, then dismissed it with a shrug. "Well, I'll leave it to the biologists."

"They're precisely the ones who are keenest on the Earth hypothesis."

"Earth? Is that what they call the supposed world of origin?"

"That's a popular name for it, though there's no way of telling what it was called, assuming there was one. And no one has any clue to what its location might be."

"Earth!" said Seldon, curling his lips. "It sounds like a belch to me. In any case, if the book deals with the original world, I didn't come across it. How do you spell the word?"

She told him and he checked the Book quickly. "There you are. The name is not listed in the index, either by that spelling or any reasonable alternative."

"Really?"

"And they do mention other worlds in passing. Names aren't given and there seems no interest in those other worlds except insofar as they directly impinge on the local world they speak of . . . at least as far as I can see from what I've read. In one place, they talked about 'The Fifty.' I don't know what they meant. Fifty leaders? Fifty cities? It seemed to me to be fifty worlds."

"Did they give a name to their own world, this world that seems to preoccupy them entirely?" asked Dors. "If they don't call it Earth, what do they call it?"

"As you'd expect, they call it 'the world' or 'the planet.' Sometimes they call it 'the Oldest' or 'the World of the Dawn,' which has a poetic significance, I presume, that isn't clear to me. I suppose one ought to read the Book entirely through and some matters will then grow to make more sense." He looked down at the Book in his hand with some distaste. "It would take a very long time, though, and I'm not sure that I'd end up any the wiser."

Dors sighed. "I'm sorry, Hari. You sound so disappointed."

"That's because I am disappointed. It's my fault, though. I should not have allowed myself to expect too much. -At one point, come to think of it, they referred to their world as 'Aurora.' "

"Aurora?" said Dors, lifting her eyebrows.

"It sounds like a proper name. It doesn't make any sense otherwise, as far as I can see. Does it mean anything to you, Dors?"

"Aurora." Dors thought about it with a slight frown on her face. "I can't say I've ever heard of a planet with that name in the course of the history of the Galactic Empire or during the period of its growth, for that matter, but I won't pretend to know the name of every one of the twenty-five million worlds. We could look it up in the University library- if we ever get back to Streeling. There's no use trying to find a library here in Mycogen."

Somehow I have a feeling that all their knowledge is in the Book. If anything isn't there, they aren't interested."

Seldon yawned and said, "I think you're right. In any case, there's no use reading any more and I doubt that I can keep my eyes open any longer. Is it all right if I put out the light?"

"I would welcome it, Hari. And let's sleep a little later in the morning."

Then, in the dark, Seldon said softly, "Of course, some of what they say is ridiculous. For instance, they refer to a life expectancy on their world of between three and four centuries."

"Centuries?"

"Yes, they count their ages by decades rather than by years. It gives you a queer feeling, because so much of what they say is perfectly matter-of-fact that when they come out with something that odd, you almost find yourself trapped into believing it."

"If you feel yourself beginning to believe that, then you should realize that many legends of primitive origins assume extended life spans for early leaders. If they're pictured as unbelievably heroic, you see, it seems natural that they have life spans to suit."

"Is that so?" said Seldon, yawning again.

"It is. And the cure for advanced gullibility is to go to sleep and consider matters again the next day."

And Seldon, pausing only long enough to think that an extended life span might well be a simple necessity for anyone trying to understand a Galaxy of people, slept.

49.

The next morning, feeling relaxed and refreshed and eager to begin his study of the Book again, Hari asked Dors, "How old would you say the Raindrop sisters are?"

"I don't know. Twenty . . . twenty-two?"

"Well, suppose they do live three or four centuries "Hari. That's ridiculous."

"I'm saying suppose. In mathematics, we say 'suppose' all the time and see if we can end up with something patently untrue or self-contradictory. An extended life span would almost surely mean an extended period of development. They might seem in their early twenties and actually be in their sixties."

"You can try asking them how old they are."

"We can assume they'd lie."

"Look up their birth certificates."

Seldon smiled wryly. "I'll bet you anything you like-a roll in the hay, if you're willing-that they'll claim they don't keep records or that, if they do, they will insist those records are closed to tribespeople."

"No bet," said Dors. "And if that's true, then it's useless trying to suppose anything about their age."

"Oh no. Think of it this way. If the Mycogenians are living extended life spans that are four or five times that of ordinary human beings, they can't very well give birth to very many children without expanding their population tremendously. You remember that Sunmaster said something about not having the population expand and bit off his remarks angrily at that time."

Dors said, "What are you getting at?"

"When I was with Raindrop Forty-Three, I saw no children."

"On the microfarms?"

'Yes.'

"Did you expect children there? I was with Raindrop Forty-Five in the shops and on the residential levels and I assure you I saw a number of children of all ages, including infants. Quite a few of them."

"Ah." Seldon looked chagrined. "Then that would mean they can't be enjoying extended life spans."

Dors said, "By your line of argument, I should say definitely not. Did you really think they did?"

"No, not really. But then you can't close your mind either and make assumptions without testing them one way or another."

"You can waste a lot of time that way too, if you stop to chew away at things that are ridiculous on the face of it."

"Some things that seem ridiculous on the face of it aren't. That's all. Which reminds me. You're the historian. In your work, have you ever come across objects or phenomena called 'robots'?"

"Ah! Now you're switching to another legend and a very popular one. There are any number of worlds that imagine the existence of machines in human form in prehistoric times. These are called 'robots.'

"The tales of robots probably originate from one master legend, for the general theme is the same. Robots were devised, then grew in numbers and abilities to the status of the almost superhuman. They threatened humanity and were destroyed. In every case, the destruction took place before the actual reliable historic records available to us today existed. The usual feeling is that the story is a symbolic picture of the risks and dangers of exploring the Galaxy, when human beings expanded outward from the world or worlds that were their original homes. There must always have been the fear of encountering other-and superior-intelligences."

"Perhaps they did at least once and that gave rise to the legend."

"Except that on no human-occupied world has there been any record or trace of any pre-human or non-human intelligence."

"But why 'robots'? Does the word have meaning?"

"Not that I know of, but it's the equivalent of the familiar 'automata.' "

"Automata! Well, why don't they say so?"

"Because people do use archaic terms for flavor when they tell an ancient legend. Why do you ask all this, by the way?"

"Because in this ancient Mycogenian book, they talk of robots. And very favorably, by the way. -Listen, Dors, aren't you going out with Raindrop Forty-Five again this afternoon?"

"Supposedly-if she shows up."

"Would you ask her some questions and try to get the answers out of her?"

"I can try. What are the questions?"

"I would like to find out, as tactfully as possible, if there is some structure in Mycogen that is particularly significant, that is tied in with the past, that has a sort of mythic value, that can-

Dors interrupted, trying not to smile. "I think that what you are trying to ask is whether Mycogen has a temple."

And, inevitably, Seldon looked blank and said, "What's a temple?"

"Another archaic term of uncertain origin. It means all the things you asked about-significance, past, myth. Very well, I'll ask. It's the sort of thing, however, that they might find difficult to speak of. To tribespeople, certainly."

"Nevertheless, do try."

SACRATORIUM

AURORA- . . . A mythical world, supposedly inhabited in primordial times, during the dawn of interstellar travel. It is thought by some to be the perhaps equally mythical "world of origin" of humanity and to be another name for "Earth." The people of the Mycogen (q.v.) Sector of ancient Trainor reportedly held themselves to be descended from the inhabitants of Aurora and made that tenet central to their system of beliefs, concerning which almost nothing else is known . . .

ENCYCLOPEDIA GALACTICA

50.

The two Raindrops arrived at midmorning. Raindrop Forty-Five seemed as cheerful as ever, but Raindrop Forty-Three paused just inside the door, looking drawn and circumspect. She kept her eyes down and did not so much as glance at Seldon.

Seldon looked uncertain and gestured to Dors, who said in a cheerful businesslike tone of voice, "One moment, Sisters. I must give instructions to my man or he won't know what to do with himself today."

They moved into the bathroom and Dors whispered, "Is something wrong?"

"Yes. Raindrop Forty-Three is obviously shattered. Please tell her that I will return the Book as soon as possible."

Dors favored Seldon with a long surprised look. "Hari," she said, "you're a sweet, caring person, but you haven't the good sense of an amoeba. If I so much as mention the Book to the poor woman, she'll be certain that you told me all about what happened yesterday and then she'll really be shattered. The only hope is to treat her exactly as I would ordinarily."

Seldon nodded his head and said dispiritedly, "I suppose you're right."

Dors returned in time for dinner and found Seldon on his cot, still leafing through the Book, but with intensified impatience.

He looked up with a scowl and said, "If we're going to be staying here any length of time, we're going to need a communication device of some sort between us. I had no idea when you'd get back and I was a little concerned."

"Well, here I am," she said, removing her skincap gingerly and looking at it with more than a little distaste. "I'm really pleased at your concern. I rather thought you'd be so lost in the Book, you wouldn't even realize I was gone."

Seldon snorted.

Dors said, "As for communications devices, I doubt that they are easy to come by in Mycogen. It would mean easing communication with tribespeople outside and I

suspect the leaders of Mycogen are bound and determined to cut down on any possible interaction with the great beyond."

"Yes," said Seldon, tossing the Book to one side, "I would expect that from what I see in the Book. Did you find out about the whatever you called it . . . the temple?"

"Yes," she said, removing her eyebrow patches. "It exists. There are a number of them over the area of the sector, but there's a central building that seems to be the important one. -Would you believe that one woman noticed my eyelashes and told me that I shouldn't let myself be seen in public? I have a feeling she intended to report me for indecent exposure."

"Never mind that," said Seldon impatiently. "Do you know where the central temple is located?"

"I have directions, but Raindrop Forty-Five warned me that women were not allowed inside except on special occasions, none of which are coming up soon. It's called the Sacratorium."

"The what."

"The Sacratorium."

"What an ugly word. What does it mean?"

Dors shook her head. "It's new to me. And neither Raindrop knew what it meant either. To them, Sacratorium isn't what the building is called, it's what it is. Asking them why they called it that probably sounded like asking them why a wall is called a wall."

"Is there anything about it they do know?"

"Of course, Hari. They know what it's for. It's a place that's devoted to something other than the life here in Mycogen. It's devoted to another world, a former and better one."

"The world they once lived on, you mean?"

"Exactly. Raindrop Forty-Five all but said so, but not quite. She couldn't bring herself to say the word."

"Aurora?"

"That's the word, but I suspect that if you were to say it out loud to a group of Mycogenians, they would be shocked and horrified. Raindrop Forty-Five, when she said, 'The Sacratorium is dedicated to-', stopped at that point and carefully wrote out the letters one by one with her finger on the palm of her hand. And she blushed, as though she was doing something obscene."

"Strange," said Seldon. "If the Book is an accurate guide, Aurora is their dearest memory, their chief point of unification, the center about which everything in Mycogen revolves. Why should its mention be considered obscene?"

-Are you sure you didn't misinterpret what the Sister meant?"

"I'm positive. And perhaps it's no mystery. Too much talk about it would get to tribespeople. The best way of keeping it secret unto themselves is to make its very mention taboo."

. . . taboo?"

"A specialized anthropological term. It's a reference to serious and effective social pressure forbidding some sort of action. The fact that women are not allowed in the Sacratorium probably has the force of a taboo. I'm sure that a Sister would be horrified if it was suggested that she invade its precincts."

"Are the directions you have good enough for me to get to the Sacratorium on my own?"

"In the first place, Hari, you're not going alone. I'm going with you. I thought we had discussed the matter and that I had made it clear that I cannot protect you at long distance-not from sleet storms and not from feral women. In the second place, it's impractical to think of walking there. Mycogen may be a small sector, as sectors go, but it simply isn't that small."

"An Expressway, then."

"There are no Expressways passing through Mycogenian territory. It would make contact between Mycogenians and tribespeople too easy. Still, there are public conveyances of the kind that are found on less developed planets. In fact, that's what Mycogen is, a piece of an undeveloped planet, embedded like a splinter in the body of Trantor, which is otherwise a patchwork of developed societies. -And Hari, finish with the Book as soon as possible. It's apparent that Rainbow FortyThree is in trouble as long as you have it and so will we be if they find out."

"Do you mean a tribesperson reading it is taboo?"

"I'm sure of it."

"Well, it would be no great loss to give it back. I should say that 95 percent of it is incredibly dull; endless in-fighting among political groups, endless justification of policies whose wisdom I cannot possibly judge, endless homilies on ethical matters which, even when enlightened, and they usually aren't, are couched with such infuriating self-righteousness as to almost enforce violation."

"You sound as though I would be doing you a great favor if I took the thing away from you."

"Except that there's always the other 5 percent that discusses the never-to-be-mentioned Aurora. I keep thinking that there may be something there and that it may be helpful to me. That's why I wanted to know about the Sacratorium. "

"Do you hope to find support for the Book's concept of Aurora in the Sacratorium?"

"In a way. And I'm also terribly caught up in what the Book has to say about automata, or robots, to use their term. I find myself attracted to the concept."

"Surely, you don't take it seriously?"

"Almost. If you accept some passages of the Book literally, then there is an implication that some robots were in human shape."

"Naturally. If you're going to construct a simulacrum of a human being, you will make it look like a human being."

"Yes, simulacrum means 'likeness,' but a likeness can be crude indeed. An artist can draw a stick figure and you might know he is representing a human being and

recognize it. A circle for the head, a stalk for the body, and four bent lines for arms and legs and you have it. But I mean robots that really look like a human being, in every detail."

"Ridiculous, Hari. Imagine the time it would take to fashion the metal of the body into perfect proportions, with the smooth curve of underlying muscles."

"Who said 'metal,' Dors? The impression I got is that such robots were organic or pseudo-organic, that they were covered with skin, that you could not easily draw a distinction between them and human beings in any way."

"Does the Book say that?"

"Not in so many words. The inference, however--"

"Is your inference, Hari. You can't take it seriously."

"Let me try. I find four things that I can deduce from what the Book says about robots--and I followed up every reference the index gave. First, as I say, they--or some of them--exactly resembled human beings; second, they had very extended life spans--if you want to call it that."

"Better say 'effectiveness,' " said Dors, "or you'll begin thinking of them as human altogether."

"Third," said Seldon, ignoring her, "that some--or, at any rate, at least one--continues to live on to this day."

"Hart', that's one of the most widespread legends we have. The ancient hero does not die but remains in suspended animation, ready to return to save his people at some time of great need. Really, Hari."

"Fourth," said Seldon, still not rising to the bait, "there are some lines that seem to indicate that the central temple--or the Sacrotorium, if that's what it is, though I haven't found that word in the Book, actually contains a robot." He paused, then said, "Do you see?"

Dors said, "No. What should I see?"

"If we combine the four points, perhaps a robot that looks exactly like a human being and that is still alive, having been alive for, say, the last twenty thousand years, is in the Sacrotorium."

"Come on, Hari, you can't believe that."

"I don't actually believe it, but I can't entirely let go either. What if it's true? What if--its only one chance out of a million, I admit it's true? Don't you see how useful he could be to me? He could remember the Galaxy as it was long before any reliable historical records existed. He might help make psychohistory possible."

"Even if it was true, do you suppose the Mycogenians would let you see and interview the robot?"

"I don't intend to ask permission. I can at least go to the Sacrotorium and see if there's something to interview first."

"Not now. Tomorrow at the earliest. And if you don't think better of it by morning, we go."

"You told me yourself they don't allow women--"

"They allow women to look at it from outside, I'm sure, and I suspect that is all we'll get to do."

And there she was adamant.

Hari Seldon was perfectly willing to let Dors take the lead. She had been out in the main roadways of Mycogen and was more at home with them than he was.

Dors Venabili, brows knitted, was less delighted with the prospect. She said, "We can easily get lost, you know."

"Not with that booklet," said Seldon.

She looked up at him impatiently. "Fix your mind on Mycogen, Hari. What I should have is a computomap, something I can ask questions of. This Mycogenian version is just a piece of folded plastic. I can't tell this thing where I am. I can't tell it by word of mouth and I can't even tell it by pushing the necessary contacts. It can't tell me anything either way. It's a print thing."

"Then read what it says."

"That's what I'm trying to do, but it's written for people who are familiar with the system to begin with. We'll have to ask."

"No, Dors. That would be a last resort. I don't want to attract attention. I would rather we take our chances and try to find our own way, even if it means making one or two wrong turns."

Dors leafed through the booklet with great attention and then said grudgingly, "Well, it gives the Sacrorium important mention. I suppose that's only natural. I presume everyone in Mycogen would want to get there at one time or another." Then, after additional concentration, she said, "I'll tell you what. There's no way of taking a conveyance from here to there."

"What?"

"Don't get excited. Apparently, there's a way of getting from here to another conveyance that will take us there. We'll have to change from one to another."

Seldon relaxed. "Well, of course. You can't take an Expressway to half the places on Trantor without changing."

Dors cast an impatient glance at Seldon. "I know that too. It's just that I'm used to having these things tell me so. When they expect you to find out for yourself, the simplest things can escape you for a while."

"All right, dear. Don't snap. If you know the way now, lead. I will follow humbly."

And follow her he did, until they came to an intersection, where they stopped. Three white-kirtled males and a pair of gray-kirtled females were at the same intersection. Seldon tried a universal and general smile in their direction, but they responded with a blank stare and looked away.

And then the conveyance came. It was an outmoded version of what Seldon, back on Helicon, would have called a gravi-bus. There were some twenty upholstered benches inside, each capable of holding four people. Each bench had its own doors on both sides of the bus. When it stopped, passengers emerged on either side. (For a moment, Seldon was concerned for those who got out on the traffic side of the gravi-bus, but then he

noticed that every vehicle approaching from either direction stopped as it neared the bus. None passed it while it was not moving.)

Dors pushed Seldon impatiently and he moved on to a bench where two adjoining seats were available. Dors followed after. (The men always got on and got off first, he noticed.)

.11.11 try. . .

"For instance," she said and pointed to a smooth boxed-off area on the back of the bench directly before each of them. As soon as the conveyance had begun to move, words lit up, naming the next stop and the notable structures or crossways that were nearby.

"Now, that will probably tell us when we're approaching the changeover we want. At least the sector isn't completely barbaric."

"Good," said Seldon. Then, after a while, leaning toward Dors, he whispered, "No one is looking at us. It seems that artificial boundaries are set up to preserve individual privacy in any crowded place. Have you noticed that?"

"I've always taken it for granted. If that's going to be a rule of your psychohistory, no one will be very impressed by it."

As Dors had guessed, the direction plaque in front of them eventually announced the approach to the changeover for the direct line to the Sacratorium.

They exited and again had to wait. Some buses ahead had already left this intersection, but another gravi-bus was already approaching. They were on a well-traveled route, which was not surprising; the Sacratorium was bound to be the center and heartbeat of the sector.

They got on the gravi-bus and Seldon whispered, "We're not paying. . . According to the map, public transportation is a free service."

Seldon thrust out his lower lip. "How civilized. I suppose that nothing is all of a piece, not backwardness, not barbarism, nothing."

But Dors nudged him and whispered, "Your rule is broken. We're being watched. The man on your right."

52.

Seldon's eyes shifted briefly. The man to his right was rather thin and seemed quite old. He had dark brown eyes and a swarthy complexion, and Seldon was sure that he would have had black hair if he had not been depilated.

He faced front again, thinking. This Brother was rather atypical. The few Brothers he had paid any attention to had been rather tall, light-skinned, and with blue or gray eyes. Of course, he had not seen enough of them to make a general rule.

Then there was a light touch on the right sleeve of his kirtle. Seldon turned hesitantly and found himself looking at a card on which was written lightly, CAREFUL,

TRIBESMAN! Seldon started and put a hand to his skincap automatically. The man next to him silently mouthed, "Hair."

Seldon's hand found it, a tiny exposure of bristles at his temple. He must have disturbed the skincap at some point or another. Quickly and as unobtrusively as possible, he tugged the skincap, then made sure that it was snug under the pretence of stroking his head.

He turned to his neighbor on his right, nodded slightly, and mouthed, "Thank you."

His neighbor smiled and said in a normal speaking voice, "Going to the Sacratorium?"

Seldon nodded. "Yes, I am."

"Easy guess. So am I. Shall we get off together?" His smile was friendly.

"I'm with my-my-"

"With your woman. Of course. All three together, then?"

Seldon was not sure how to react. A quick look in the other direction showed him that Dors's eyes were turned straight ahead. She was showing no interest in masculine conversation-an attitude appropriate for a Sister. However, Seldon felt a soft pat on his left knee, which he took (with perhaps little justification) to mean: "It's all right."

In any case, his natural sense of courtesy was on that side and he said, "Yes, certainly."

There was no further conversation until the direction plaque told them they were arriving at the Sacratorium and Seldon's Mycogenian friend was rising to get off.

The gravi-bus made a wide turn about the perimeter of a large area of the Sacratorium grounds and there was a general exodus when it came to a halt, the men sliding in front of the women to exit first. The women followed.

The Mycogenian's voice crackled a bit with age, but it was cheerful. He said, "It's a little early for lunch my . . . friends, but take my word for it that things will be crowded in not too long a time. Would you be willing to buy something simple now and eat it outside? I am very familiar with this area and I know a good place."

Seldon wondered if this was a device to maneuver innocent tribespeople into something or other disreputable or costly, yet decided to chance it.

"You're very kind," he said. "Since we are not at all familiar with the place, we will be glad to let you take the lead."

They bought lunch-sandwiches and a beverage that looked like milk at an open-air stand. Since it was a beautiful day and they were visitors, the old Mycogenian said, they would go to the Sacratorium grounds and eat out of doors, the better to become acquainted with their surroundings.

During their walk, carrying their lunch, Seldon noted that, on a very small scale, the Sacratorium resembled the Imperial Palace and that the grounds around it resembled, on a minute scale, the Imperial grounds. He could scarcely believe that the Mycogenian people admired the Imperial institution or, indeed, did anything but hate and despise it, yet the cultural attraction was apparently not to be withstood.

"It's beautiful," said the Mycogenian with obvious pride.

"Quite," said Seldon. "How it glistens in the daylight."

"The grounds around it," he said, "are constructed in imitation of the government grounds on our Dawn World . . . in miniature, to be sure."

"Did you ever see the grounds of the Imperial Palace?" asked Seldon cautiously.

The Mycogenian caught the implication and seemed in no way put out by it. "They Copied the Dawn World as best they could too."

Seldon doubted that in the extreme, but he said nothing.

They came to a semicircular seat of white stonite, sparkling in the light as the Sacratorium did.

"Good," said the Mycogenian, his dark eyes gleaming with pleasure. "No one's taken my place. I call it mine only because it's my favorite seat. It affords a beautiful view of the side wall of the Sacratorium past the trees. Please sit down. It's not cold, I assure you. And your companion. She is welcome to sit too. She is a tribeswoman, I know, and has different customs. She . . . she may speak if she wishes."

Dors gave him a hard look and sat down.

Seldon, recognizing the fact that they might remain with this old Mycogenian a while, thrust out his hand and said, "I am Hari and my female companion is Dors. We don't use numbers, I'm afraid."

"To each his . . . or her . . . own," said the other expansively. "I am Mycelium Seventy-Two. We are a large cohort."

"Mycelium?" said Seldon a bit hesitantly.

"You seem surprised," said Mycelium. "I take it, then, you've only met members of our Elder families. Names like Cloud and Sunshine and Starlight-all astronomical."

"I must admit-" began Seldon.

"Well, meet one of the lower classes. We take our names from the ground and from the micro-organisms we grow. Perfectly respectable."

"I'm quite certain," said Seldon, "and thank you again for helping me with my . . . problem in the gravi-bus."

"Listen," said Mycelium Seventy-Two, "I saved you a lot of trouble. If a Sister had seen you before I did, she would undoubtedly have screamed and the nearest Brothers would have hustled you off the bus maybe not even waiting for it to stop moving."

Dors leaned forward so as to see across Seldon. "How is it you did not act in this way yourself?"

"I? I have no animosity against tribespeople. I'm a scholar."

"A scholar?"

"First one in my cohort. I studied at the Sacratorium School and did very well. I'm learned in all the ancient arts and I have a license to enter the tribal library, where they keep book-films and books by tribespeople. I can view any book-film or read any book I wish to. We even have a computerized reference library and I can handle that too. That sort of thing broadens your mind. I don't mind a little hair showing. I've seen pictures of men with hair many a time. And women too." He glanced quickly at Dors.

They ate in silence for a while and then Seldon said, "I notice that every Brother who enters or leaves the Sacratorium is wearing a red sash."

"Oh yes," said Mycelium Seventy-Two. "Over the left shoulder and around the right side of the waist-usually very fancily embroidered."

"Why is that?"

"It's called an 'obiah.' It symbolizes the joy felt at entering the Sacratorium and the blood one would spill to preserve it."

"Blood?" said Dors, frowning.

"Just a symbol. I never actually heard of anyone spilling blood over the Sacratorium. For that matter, there isn't that much joy. It's mostly wailing and mourning and prostrating one's self over the Lost World." His voice dropped and became soft.

"Very silly."

Dors said, "You're not a . . . a believer?"

"I'm a scholar," said Mycelium with obvious pride. His face wrinkled as he grinned and took on an even more pronounced appearance of age. Seldon found himself wondering how old the man was. Several centuries? -No, they'd disposed of that. It couldn't be and yet "How old are you?" Seldon asked suddenly, involuntarily.

Mycelium Seventy-Two showed no signs of taking offense at the question, nor did he display any hesitation at answering, "Sixty-seven."

Seldon had to know. "I was told that your people believe that in very early times everyone lived for several centuries."

Mycelium Seventy-Two looked at Seldon quizzically. "Now how did you find that out? Someone must have been talking out of turn . . . but it's true. There is that belief. Only the unsophisticated believe it, but the Elders encourage it because it shows our superiority. Actually, our life expectancy is higher than elsewhere because we eat more nutritionally, but living even one century is rare."

"I take it you don't consider Mycogenians superior," said Seldon.

Mycelium Seventy-Two said, "There's nothing wrong with Mycogenians. They're certainly not inferior. Still, I think that all men are equal. -Even women," he added, looking across at Dors.

"I don't suppose," said Seldon, "that many of your people would agree with that."

"Or many of your people," said Mycelium Seventy-Two with a faint resentment. "I believe it, though. A scholar has to. I've viewed and even read all the great literature of the tribespeople. I understand your culture. I've written articles on it. I can sit here just as comfortably with you as though you were . . . tit."

Dors said a little sharply, "You sound proud of understanding tribespeople's ways. Have you ever traveled outside Mycogen?"

Mycelium Seventy-Two seemed to move away a little. "No."

"Why not? You would get to know us better."

"I wouldn't feel right. I'd have to wear a wig. I'd be ashamed."

Dors said, "Why a wig? You could stay bald."

"No," said Mycelium Seventy-Two, "I wouldn't be that kind of fool. I'd be mistreated by all the hairy ones."

"Mistreated? Why?" said Dors. "We have a great many naturally bald people everywhere on Trantor and on every other world too."

"My father is quite bald," said Seldon with a sigh, "and I presume that in the decades to come I will be bald too. My hair isn't all that thick now."

"That's not bald," said Mycelium Seventy-Two. "You keep hair around the edges and over your eyes. I mean bald-no hair at all."

"Anywhere on your body?" said Dors, interested.

And now Mycelium Seventy-Two looked offended and said nothing.

Seldon, anxious to get the conversation back on track, said, "Tell me, Mycelium Seventy-Two, can tribespeople enter the Sacratorium as spectators?"

Mycelium Seventy-Two shook his head vigorously. "Never. It's for the Sons of the Dawn only."

Dors said, "Only the Sons?"

Mycelium Seventy-Two looked shocked for a moment, then said forgivingly, "Well, you're tribespeople. Daughters of the Dawn enter only on certain days and times. That's just the way it is. I don't say I approve. If it was up to me, I'd say, 'Go in. Enjoy if you can.' Sooner others than me, in fact."

"Don't you ever go in?"

"When I was young, my parents took me, but--he shook his head--"it was just people staring at the Book and reading from it and sighing and weeping for the old days. It's very depressing. You can't talk to each other. You can't laugh. You can't even look at each other. Your mind has to be totally on the Lost World. Totally." He waved a hand in rejection. "Not for me. I'm a scholar and I want the whole world open to me."

"Good," said Seldon, seeing an opening. "We feel that way too. We are scholars also, Dors and myself."

"I know," said Mycelium Seventy-Two.

"You know? How do you know?"

"You'd have to be. The only tribespeople allowed in Mycogen are Imperial officials and diplomats, important traders, and scholars -and to me you have the look of scholars. That's what interested me in you. Scholars together." He smiled delightedly.

"So we are. I am a mathematician. Dors is a historian. And you?"

"I specialize in . . . culture. I've read all the great works of literature of the tribespeople: Lissauer, Mentone, Novigor--"

"And we have read the great works of your people. I've read the Book, for instance. -About the Lost World."

Mycelium Seventy-Two's eyes opened wide in surprise. His olive complexion seemed to fade a little. "You have? How? Where?"

"At our University we have copies that we can read if we have permission."

"Copies of the Book?"

'Yes.'

"I wonder if the Elders know this?"

Seldon said, "And I've read about robots."

"Robots?"

"Yes. That is why I would like to be able to enter the Sacratorium. I would like to see the robot." (Dors kicked lightly at Seldon's ankle, but he ignored her.)

Mycelium Seventy-Two said uneasily, "I don't believe in such things. Scholarly people don't." But he looked about as though he was afraid of being overheard.

Seldon said, "I've read that a robot still exists in the Sacratorium."

Mycelium Seventy-Two said, "I don't want to talk about such nonsense."

Seldon persisted. "Where would it be if it was in the Sacratorium?"

"Even if one was there, I couldn't tell you. I haven't been in there since I was a child."

"Would you know if there was a special place, a hidden place?"

"There's the Elders' aerie. Only Elders go there, but there's nothing there."

"Have you ever been there?"

"No, of course not."

"Then how do you know?"

"I don't know that there's no pomegranate tree there. I don't know that there's no laser-organ there. I don't know that there's no item of a million different kinds there. Does my lack of knowledge of their absence show they are all present?"

For the moment, Seldon had nothing to say.

A ghost of a smile broke through Mycelium Seventy-Two's look of concern. He said, "That's scholars' reasoning. I'm not an easy man to tackle, you see. Just the same, I wouldn't advise you to try to get up into the Elders' aerie. I don't think you'd like what would happen if they found a tribesman inside. -Well. Best of the Dawn to you." And he rose suddenly-without warning-and hurried away.

Seldon looked after him, rather surprised. "What made him rush off like that?"

"I think," said Dors, "it's because someone is approaching."

And someone was. A tall man in an elaborate white kirtle, crossed by an even more elaborate and subtly glittering red sash, glided solemnly toward them. He had the unmistakable look of a man with authority and the even more unmistakable look of one who is not pleased.

53.

Hari Seldon rose as the new Mycogenian approached. He hadn't the slightest idea whether that was the appropriate polite behavior, but he had the distinct feeling it would do no harm. Dors Venabili rose with him and carefully kept her eyes lowered.

The other stood before them. He too was an old man, but more subtly aged than Mycelium Seventy-Two. Age seemed to lend distinction to his still-handsome face.

His bald head was beautifully round and his eyes were a startling blue, contrasting sharply with the bright all-but glowing red of his sash.

The newcomer said, "I see you are tribespeople." His voice was more high-pitched than Seldon had expected, but he spoke slowly, as though conscious of the weight of authority in every word he uttered.

"So we are," said Seldon politely but firmly. He saw no reason not to defer to the other's position, but he did not intend to abandon his own.

"Your names?"

"I am Hari Seldon of Helicon. My companion is Dors Venabili of Cinna. And yours, man of Mycogen?"

The eyes narrowed in displeasure, but he too could recognize an air of authority when he felt it.

"I am Skystrip Two," he said, lifting his head higher, "an Elder of the Sacratorium. And your position, tribesman?"

"We," said Seldon, emphasizing the pronoun, "are scholars of Streeling University. I am a mathematician and my companion is a historian and we are here to study the ways of Mycogen."

"By whose authority?"

"By that of Sunmaster Fourteen, who greeted us on our arrival."

Skystrip Two fell silent for a moment and then a small smile appeared on his face and he took on an air that was almost benign. He said, "The High Elder. I know him well."

"And so you should," said Seldon blandly. "Is there anything else, Elder?"

"Yes." The Elder strove to regain the high ground. "Who was the man who was with you and who hurried away when I approached?"

Seldon shook his head, "We never saw him before, Elder, and know nothing about him. We encountered him purely by accident and asked about the Sacratorium."

"What did you ask him?"

"Two questions, Elder. We asked if that building was the Sacratorium and if tribespeople were allowed to enter it. He answered in the affirmative to the first question and in the negative to the second."

"Quite so. And what is your interest in the Sacratorium?"

"Sir, we are here to study the ways of Mycogen and is not the Sacratorium the heart and brain of Mycogen?"

"It is entirely ours and reserved for us."

"Even if an Elder-the High Elder-would arrange for permission in view of our scholarly function?"

"Have you indeed the High Elder's permission?"

Seldon hesitated the slightest moment while Dors's eyes lifted briefly to look at him sideways. He decided he could not carry off a lie of this magnitude.

"No," he said, "not yet."

"Or ever," said the Elder. "You are here in Mycogen by authority, but even the highest authority cannot exert total control over the public. We value our Sacratorium and

the populace can easily grow excited over the presence of a tribesperson anywhere in Mycogen but, most particularly, in the vicinity of the Sacratorium. It would take one excitable person to raise a cry of 'Invasion!' and a peaceful crowd such as this one would be turned into one that would be thirsting to tear you apart. I mean that quite literally. For your own good, even if the High Elder has shown you kindness, leave. Now!"

"But the Sacratorium-" said Seldon stubbornly, though Dors was pulling gently at his kirtle.

"What is there in the Sacratorium that can possibly interest you?" said the Elder. "You see it now. There is nothing for you to see in the interior."

"There is the robot," said Seldon.

The Elder stared at Seldon in shocked surprise and then, bending to bring his lips close to Seldon's ear, whispered harshly, "Leave now or I will raise the cry of 'Invasion!' myself. Nor, were it not for the High Elder, would I give you even this one chance to leave."

And Dors, with surprising strength, nearly pulled Seldon off his feet as she stepped hastily away, dragging him along until he caught his balance and stepped quickly after her.

54.

It was over breakfast the next morning, not sooner, that Dors took up the subject-- and in a way that Seldon found most wounding.

She said, "Well, that was a pretty fiasco yesterday."

Seldon, who had honestly thought he had gotten away with it without comment, looked sullen. "What made it a fiasco?"

"Driven out is what we were. And for what? What did we gain?"

"Only the knowledge that there is a robot in there."

"Mycelium Seventy-Two said there wasn't."

"Of course he said that. He's a scholar-or thinks he is--end what he doesn't know about the Sacratorium would probably fill that library he goes to. You saw the Elder's reaction."

"I certainly did."

"He would not have reacted like that if there was no robot inside. He was horrified we knew."

"That's just your guess, Hari. And even if there was, we couldn't get in."

"We could certainly try. After breakfast, we go out and buy a sash for me, one of those obiahs. I put it on, keep my eyes devoutly downward, and walk right in."

"Skincap and all? They'll spot you in a microsecond."

"No, they won't. We'll go into the library where all the tribespeople data is kept. I'd like to see it anyway. From the library, which is a Sacratorium annex, I gather, there will probably be an entrance into the Sacratorium "Where you will be picked up at once."

"Not at all. You heard what Mycelium Seventy-Two had to say. Everyone keeps his eyes down and meditates on their great Lost World, Aurora. No one looks at anyone else. It would probably be a grievous breach of discipline to do so. Then I'll find the Elders' aerie-"

"Just like that?"

"At one point, Mycelium Seventy-Two said he would advise me not to try to get up into the Elders' aerie. Up. It must be somewhere in that tower of the Sacratorium, the central tower."

Dors shook her head. "I don't recall the man's exact words and I don't think you do either. That's a terribly weak foundation to wait." She stopped suddenly and frowned.

"Well?" said Seldon.

"There is an archaic word 'aerie' that means 'a dwelling place on high.' "

"Ah! There you are. You see, we've learned some vital things as the result of what you call a fiasco. And if I can find a living robot that's twenty thousand years old and if it can tell me- "Suppose that such a thing exists, which passes belief, and that you find it, which is not very likely, how long do you think you will be able to talk to it before your presence is discovered?"

"I don't know, but if I can prove it exists and if I can find it, then I'll think of some way to talk to it. It's too late for me to back out now under any circumstances. Hummin should have left me alone when I thought there was no way of achieving psychohistory. Now that it seems there may be, I won't let anything stop me---short of being killed."

"The Mycogenians may oblige, Hari, and you can't run that risk."

"Yes, I can. I'm going to try."

"No, Hari. I must look after you and I can't let you."

"You must let me. Finding a way to work out psychohistory is more important than my safety. My safety is only important because I may work out psychohistory. Prevent me from doing so and your task loses its meaning. -Think about it."

Hari felt himself infused with a renewed sense of purpose. Psychohistory-his nebulous theory that he had, such a short while ago, despaired ever of proving-loomed larger, more real. Now he had to believe that it was possible; he could feel it in his gut. The pieces seemed to be falling together and although he couldn't see the whole pattern yet, he was sure the Sacratorium would yield another piece to the puzzle.

"Then I'll go in with you so I can pull you out, you idiot, when the time comes."

"Women can't enter."

"What makes me a woman? Only this gray kirtle. You can't see my breasts under it. I don't have a woman's style hairdo with the skincap on. I have the same washed, unmarked face a man has. The men here don't have stubble. All I need is a white kirtle and a sash and I can enter. Any Sister could do it if she wasn't held back by a taboo. I am not held back by one."

"You're held back by me. I won't let you. It's too dangerous."

"No more dangerous for me than for you."

"But I must take the risk."

"Then so must I. Why is your imperative greater than mine?"

"Because-" Seldon paused in thought.

"Just tell yourself this," said Dors, her voice hard as rock. "I won't let you go there without me. If you try, I will knock you unconscious and tie you up. If you don't like that, then give up any thought of going alone."

Seldon hesitated and muttered darkly. He gave up the argument, at least for now.

55.

The sky was almost cloudless, but it was a pale blue, as though wrapped in a high thin mist. That, thought Seldon, was a good touch, but suddenly he missed the sun itself. No one on Trantor saw the planet's sun unless he or she went Upperside and even then only when the natural cloud layer broke.

Did native Trantorians miss the sun? Did they give it any thought? When one of them visited another world where a natural sun was in view, did he or she stare, half-blinded, at it with awe?

Why, he wondered, did so many people spend their lives not trying to find answers to questions-not even thinking of questions to begin with? Was there anything more exciting in life than seeking answers?

His glance shifted to ground level. The wide roadway was lined with low buildings, most of them shops. Numerous individual ground-cars moved in both directions, each hugging the right side. They seemed like a collection of antiques, but they were electrically driven and quite soundless. Seldon wondered if "antique" was always a word to sneer at. Could it be that silence made up for slowness? Was there any particular hurry to life, after all?

There were a number of children on the walkways and Seldon's lips pressed together in annoyance. Clearly, an extended life span for the Mycogenians was impossible unless they were willing to indulge in infanticide. The children of both sexes (though it was hard to tell the boys from the girls) wore kirtles that came only a few inches below the knee, making the wild activity of childhood easier.

The children also still had hair, reduced to an inch in length at most, but even so the older ones among them had hoods attached to their kirtles and wore them raised, hiding the top of the head altogether. It was as though they were getting old enough to make the hair seem a trifle obscene--or old enough to be wishing to hide it, in longing for the day of rite of passage when they were depilated.

A thought occurred to Seldon. He said, "Dors, when you've been out shopping, who paid, you or the Raindrop women?"

"I did of course. The Raindrops never produced a credit tile. But why should they? What was being bought was for us, not for them."

"But you have a Trantorian credit tile--a tribeswoman credit tile."

"Of course, Hari, but there was no problem. The people of Mycogen may keep their own culture and ways of thought and habits of life as they wish. They can destroy their cephalic hair and wear kirtles. Nevertheless, they must use the world's credits. If they don't, that would choke off commerce and no sensible person would want to do that. The credits nerve, Hari." She held up her hand as though she was holding an invisible credit tile.

"And they accepted your credit tile?"

"Never a peep out of them. And never a word about my skincap. Credits sanitize everything."

"Well, that's good. So I can buy-"

"No, I'll do the buying. Credits may sanitize everything, but they more easily sanitize a tribeswoman. They're so used to paying women little or no attention that they automatically pay me the same. -And here's the clothing store I've been using."

"I'll wait out here. Get me a nice red sash-one that looks impressive."

"Don't pretend you've forgotten our decision. I'll get two. And another white kirtle also . . . to my measurements."

"Won't they think it odd that a woman would be buying a white kirtle?"

"Of course not. They'll assume I'm buying it for a male companion who happens to be my size. Actually, I don't think they'll bother with any assumptions at all as long as my credit tile is good."

Seldon waited, half-expecting someone to come up and greet him as a tribesman or denounce him as one-more likely-but no one did. Those who passed him did so without a glance and even those who glanced in his direction moved on seemingly untouched. He was especially nervous about the gray kirtles -- the women-walking by in pairs or, even worse, with a man. They were downtrodden, unnoticed, snubbed. How better to gain a brief notoriety than by shrieking at the sight of a tribesman? But even the women moved on.

They're not expecting to see a tribesman, Seldon thought, so they don't see one. That, he decided, augured well for their forthcoming invasion of the Sacrotorium. How much less would anyone expect to see tribespeople there and how much more effectively would they therefore fail to see them! He was in fairly good humor when Dors emerged.

"You have everything?"

"Absolutely."

"Then lets go back to the room, so you can change."

The white kirtle did not fit her quite as well as the gray one did. Obviously, she could not have tried it on or even the densest shopkeeper would have been struck with alarm.

"How do I look, Hari?" she asked.

"Exactly like a boy," said Seldon. "Now let's try the sash . . . or obiah. I had better get used to calling it that."

Dors, without her skincap, was shaking out her hair gratefully. She said sharply, "Don't put it on now. We're not going to parade through Mycogen with the sash on. The last thing we want to do is call attention to ourselves."

"No, no. I just want to see how it goes on."

"Well, not that one. This one is better quality and more elaborate."

"You're right, Dors. I've got to gather in what attention there is. I don't want them to detect you as a woman."

"I'm not thinking of that, Hari. I just want you to look pretty."

"A thousand thanks, but that's impossible, I suspect. Now, let's see, how does this work?"

Together, Hari and Dors practiced putting their obiahs on and taking them off, over and over again, until they could do it in one fluid motion. Dors taught Hari how to do it, as she had seen a man doing it the day before at the Sacratorium.

When Hari praised her for her acute observations, she blushed and said, "Its really nothing, Hari, just something I noticed."

Hari replied, "Then you're a genius for noticing."

Finally satisfied, they stood well apart, each surveying the other. Hari's obiah glittered, a bright red dragon-like design standing out against a paler field of similar hue. Dors's was a little less bold, had a simple thin line down the center, and was very light in color. "There," she said, "just enough to show good taste." She took it off.

"Now," said Seldon, "we fold it up and it goes into one of the inner pockets. I have my credit tile-Hummin's, really-and the key to this place in this one and here, on the other side, the Book."

"The Book? Should you be carrying it around?"

"I must. I'm guessing that anyone going to the Sacratorium ought to have a copy of the Book with him. They may intone passages or have readings. If necessary, we'll share the Book and maybe no one will notice. Ready?"

"I'll never be ready, but I'm going with you."

"It will be a tedious trip. Will you check my skincap and make sure no hair shows this time? And don't scratch your head."

"I won't. You look all right."

"So do you."

"You also look nervous."

And Seldon said wryly, "Guess why!"

Dors reached out impulsively and squeezed Hari's hand, then drew back as if surprised at herself. Looking down, she straightened her white kirtle. Hari, himself a trifle surprised and peculiarly pleased, cleared his throat and said, "Okay, let's go."

ROBOT- . . . A term used in the ancient legends of several worlds for what are more usually called "automata." Robots are described as generally human in shape and made of metal, although some are supposed to have been pseudoorganic in nature. Hari Seldon, in the course of The Flight, is popularly supposed to have seen an actual robot, but that story is of dubious origin. Nowhere in Seldon's voluminous writings does he mention robots at all, although . . .

ENCYCLOPEDIA GALACTICA

56.

They were not noticed.

Hari Seldon and Dors Venabili repeated the trip of the day before and this time no one gave them a second look. Hardly anyone even gave them a first look. On several occasions, they had to tuck their knees to one side to allow someone sitting on an inner seat to get past them and out. When someone got in, they quickly realized they had to move over if there was an inner empty seat.

This time they quickly grew tired of the smell of kitties that were not freshly laundered because they were not so easily diverted by what went on outside.

But eventually they were there.

"That's the library," said Seldon in a low voice.

"I suppose so," said Dors. "At least that's the building that Mycelium SeventyTwo pointed out yesterday."

They sauntered toward it leisurely.

"Take a deep breath," said Seldon. "This is the first hurdle."

The door ahead was open, the light within subdued. There were five broad stone steps leading upward. They stepped onto the lowermost one and waited several moments before they realized that their weight did not cause the steps to move upward. Dors grimaced very slightly and gestured Seldon upward.

Together they walked up the stairs, feeling embarrassed on behalf of Mycogen for its backwardness. Then, through a door, where, at a desk immediately inside was a man bent over the simplest and clumsiest computer Seldon had ever seen.

The man did not look up at them. No need, Seldon supposed. White kirtle, bald head-all Mycogenians looked so nearly the same that one's eyes slid off them and that was to the tribespeople's advantage at the moment.

The man, who still seemed to be studying something on the desk, said, "Scholars?"

"Scholars," said Seldon.

The man jerked his head toward a door. "Go in. Enjoy."

They moved inward and, as nearly as they could see, they were the only ones in this section of the library. Either the library was not a popular resort or the scholars were few or-most likely both.

Seldon whispered, "I thought surely we would have to present some sort of license or permission form and I would have to plead having forgotten it."

"He probably welcomes our presence under any terms. Did you ever see a place like this? If a place, like a person, could be dead, we would be inside a corpse."

Most of the books in this section were print-books like the Book in Seldon's inner pocket. Dors drifted along the shelves, studying them. She said, "Old books, for the most part. Part classic. Part worthless."

"Outside books? Non-Mycogen, I mean?"

"Oh yes. If they have their own books, they must be kept in another section. This one is for outside research for poor little self-styled scholars like yesterday's. -This is the reference department and here's an Imperial Encyclopedia . . . must be fifty years old if a day . . . and a computer."

She reached for the keys and Seldon stopped her. "Wait. Something could go wrong and we'll be delayed."

He pointed to a discreet sign above a free-standing set of shelves that glowed with the letters TO THE SACK TORIUM. The second A in SACRATORIUM was dead, possibly recently or possibly because no one cared. (The Empire, thought Seldon, was in decay. All parts of it. Mycogen too.)

He looked about. The poor library, so necessary to Mycogenian pride, perhaps so useful to the Elders who could use it to find crumbs to shore up their own beliefs and present them as being those of sophisticated tribespeople, seemed to be completely empty. No one had entered after them.

Seldon said, "Let's step in here, out of eyeshot of the man at the door, and put on our sashes."

And then, at the door, aware suddenly there would be no turning back if they passed this second hurdle, he said, "Dors, don't come in with me."

She frowned. "Why not?"

"It's not safe and I don't want you to be at risk."

"I am here to protect you," she said with soft firmness.

"What kind of protection can you be? I can protect myself, though you may not think it. And I'd be handicapped by having to protect you. Don't you see that?"

"You mustn't be concerned about me, Hari," said Dors. "Concern is my part." She tapped her sash where it crossed in the space between her obscured breasts.

"Because Hummin asked you to?"

"Because those are my orders."

She seized Seldon's arms just above his elbow and, as always, he was surprised by her firm grip. She said, "I'm against this, Hari, but if you feel you must go in, then I must go in too."

"All right, then. But if anything happens and you can wriggle out of it, run. Don't worry about me."

"You're wasting your breath, Hari. And you're insulting me."

Seldon touched the entrance panel and the portal slid open. Together, almost in unison, they walked through.

57.

A large room, all the larger because it was empty of anything resembling furniture. No chairs, no benches, no seats of any kind. No stage, no drapery, no decorations.

No lights, merely a uniform illumination of mild, unfocused light. The walls were not entirely blank. Periodically, arranged in spaced fashion at various heights and in no easy repetitive order, there were small, primitive, two-dimensional television screens, all of which were operating. From where Dors and Seldon stood, there was not even the illusion of a third dimension, not a breath of true holovision.

There were people present. Not many and nowhere together. They stood singly and, like the television monitors, in no easy repetitive order. All were white-kirtled, all slashed.

For the most part, there was silence. No one talked in the usual sense. Some moved their lips, murmuring softly. Those who walked did so stealthily, eyes downcast. The atmosphere was absolutely funereal.

Seldon leaned toward Dors, who instantly put a finger to her lips, then pointed to one of the television monitors. The screen showed an idyllic garden bursting with blooms, the camera panning over it slowly.

They walked toward the monitor in a fashion that imitated the others—slow steps, putting each foot down softly.

When they were within half a meter of the screen, a soft insinuating voice made itself heard: "The garden of Antennin, as reproduced from ancient guidebooks and photographs, located in the outskirts of Eos. Note the—"

Dors said in a whisper Seldon had trouble catching over the sound of the set, "It turns on when someone is close and it will turn off if we step away. If we're close enough, we can talk under cover, but don't look at me and stop speaking if anyone approaches."

Seldon, his head bent, his hands clasped before him (he had noted that this was a preferred posture), said, "Any moment I expect someone to start wailing."

"Someone might. They're mourning their Lost World," said Dors.

"I hope they change the films every once in a while. It would be deadly to always see the same ones."

"They're all different," said Dors, her eyes sliding this way and that. "They may change periodically. I don't know."

"Wait!" said Seldon just a hair's breadth too loud. He lowered his voice and said, "Come this way."

Dors frowned, failing to make out the words, but Seldon gestured slightly with his head. Again the stealthy walk, but Seldon's footsteps increased in length as he felt the need for greater speed and Dors, catching up, pulled sharply-if very briefly-at his kirtle. He slowed.

"Robots here," he said under the cover of the sound as it came on.

The picture showed the corner of a dwelling place with a rolling lawn and a line of hedges in the foreground and three of what could only be described as robots. They were metallic, apparently, and vaguely human in shape.

The recording said, "This is a view, recently constructed, of the establishment of the famous Wendome estate of the third century. The robot you see near the center was, according to tradition, named Bendar and served twenty-two years, according to the ancient records, before being replaced."

Dors said, "'Recently constructed,' so they must change views."

"Unless they've been saying 'recently constructed' for the last thousand years."

Another Mycogenian stepped into the sound pattern of the scene and said in a low voice, though not as low as the whisperings of Seldon and Dors, "Greetings, Brothers."

He did not look at Seldon and Dors as he spoke and after one involuntary and startled glance, Seldon kept his head averted. Dors had ignored it all.

Seldon hesitated. Mycelium Seventy-Two had said that there was no talking in the Sacrotorium. Perhaps he had exaggerated. Then too he had not been in the Sacrotorium since he was a child.

Desperately, Seldon decided he must speak. He said in a whisper, "And to you, Brother, greetings."

He had no idea whether that was the correct formula of reply or if there was a formula, but the Mycogenian seemed to find nothing amiss in it.

"To you in Aurora," he said.

"And to you," said Seldon and because it seemed to him that the other expected more, he added, "in Aurora," and there was an impalpable release of tension.

Seldon felt his forehead growing moist.

The Mycogenian said, "Beautiful! I haven't seen this before."

"Skillfully done," said Seldon. Then, in a burst of daring, he added, "A loss never to be forgotten."

The other seemed startled, then said, "Indeed, indeed," and moved away.

Dors hissed, "Take no chances. Don't say what you don't have to."

"It seemed natural. Anyway, this is recent. But those are disappointing robots. They are what I would expect automata to be. I want to see the organic ones-the humanoids."

"If they existed," said Dors with some hesitation, "it seems to me they wouldn't be used for gardening jobs."

"True," said Seldon. "We must find the Elders' aerie."

"If that exists. It seems to me there is nothing in this hollow cave but a hollow cave."

"Let's look."

They paced along the wall, passing from screen to screen, trying to wait at each for irregular intervals until Dors clutched Seldon's arms. Between two screens were lines marking out a faint rectangle.

"A door," Dors said. Then she weakened the assertion by adding, "Do you think?"

Seldon looked about surreptitiously. It was in the highest degree convenient that, in keeping with the mourning atmosphere, every face, when not fixed on a television monitor, was bent in sad concentration on the floor.

Seldon said, "How do you suppose it would open?"

"An entrance patch."

"I can't make out any."

"It's just not marked out, but there's a slight discoloration there. Do you see it? How many palms? How many times?"

"I'll try. Keep an eye out and kick me if anyone looks in this direction."

He held his breath casually, touched the discolored spot to no avail, and then placed his palm full upon it and pressed. The door opened silently-not a creak, not a scrape. Seldon stepped through as rapidly as he could and Dors followed him. The door closed behind them.

"The question is," said Dors, "did anyone see us?"

Seldon said, "Elders must go through this door frequently."

"Yes, but will anyone think we are Elders?"

Seldon waited, then said, "If we were observed and if anyone thought something was wrong, this door would have been flung open again within fifteen seconds of our entering."

"Possibly," said Dors dryly, "or possibly there is nothing to be seen or done on this side of the door and no one cares if we enter."

"That remains to be seen," muttered Seldon.

The rather narrow room they had entered was somewhat dark, but as they stepped farther into it, the light brightened. There were chairs, wide and comfortable, small tables, several davenports, a deep and tall refrigerator, cupboards.

"If this is the Elders' aerie," said Seldon, "the Elders seem to do themselves comfortably, despite the austerity of the Sacratorium itself."

"As would be expected," said Dors. "Asceticism among a ruling class except for public show-is very rare. Put that down in your notebook for psychohistorical aphorisms." She looked about. "And there is no robot."

Seldon said, "A aerie is a high position, remember, and this ceiling is not. There must be upper storeys and that must be the way." He pointed to a well-carpeted stairway.

He did not advance toward it, however, but looked about vaguely. Dors guessed what he was seeking. She said, "Forget about elevators. There's a cult of primitivism in Mycogen. Surely, you haven't forgotten that, have you?"

There would be no elevators and, what's more, if we place our weight at the foot of the stairs, I am quite certain it will not begin moving upward. We're going to have to climb it. Several flights, perhaps."

"Climb it?"

"It must, in the nature of things, lead to the aerie-if it leads anywhere. Do you want to see the aerie or don't you?"

Together they stepped toward the staircase and began the climb. They went up three flights and, as they did, the light level decreased perceptibly and in steady increments. Seldon took a deep breath and whispered, "I consider myself to be in pretty good shape, but I hate this."

"You're not used to this precise type of physical exertion." She showed no signs of physical distress whatever.

At the top of the third flight the stairs ended and before them was another door.

"And if it's locked?" said Seldon, more to himself than to Dors. "Do we try to break it down?"

But Dors said, "Why should it be locked when the lower door was not? If this is the Elders' aerie, I imagine there's a taboo on anyone but Elders coming here and a taboo is much stronger than any lock."

"As far as those who accept the taboo are concerned," said Seldon, but he made no move toward the door.

"There's still time to turn back, since you hesitate," said Dors. "In fact, I would advise you to run back."

"I only hesitate because I don't know what we'll find inside. If it's empty-" And then he added in a rather louder voice, "Then it's empty," and he strode forward and pushed against the entry panel.

The door retracted with silent speed and Seldon took a step back at the surprising flood of light from within.

And there, facing him, eyes alive with light, arms half-upraised, one foot slightly advanced before the other, gleaming with a faintly yellow metallic shine, was a human figure. For a few moments, it seemed to be wearing a tight-fitting tunic, but on closer inspection it became apparent that the tunic was part of the structure of the object.

"It's the robot," said Seldon in awe, "but it's metallic."

"Worse than that," said Dors, who had stepped quickly to one side and then to the other. "Its eyes don't follow me. Its arms don't as much as tremble. It's not alive-if one can speak of robots as being alive."

And a man-unmistakably a man-stepped out from behind the robot and said, "Perhaps not. But I am alive."

And almost automatically, Dors stepped forward and took her place between Seldon and the man who had suddenly appeared.

58.

Seldon pushed Dors to one side, perhaps a shade more roughly than he intended.

"I don't need protection. This is our old friend Sunmaster Fourteen."

The man who faced them, wearing a double sash that was perhaps his right as High Elder, said, "And you are Tribesman Seldon."

"Of course," said Seldon.

"And this, despite her masculine dress, is Tribeswoman Venabili."

Dors said nothing.

Sunmaster Fourteen said, "You are right, of course, tribesman. You are in no danger of physical harm from me. Please sit down. Both of you. Since you are not a Sister, tribeswoman, you need not retire. There is a seat for you which, if you value such a distinction, you will be the first woman ever to have used."

"I do not value such a distinction," said Dors, spacing her words for emphasis.

Sunmaster Fourteen nodded. "That is as you wish. I too will sit down, for I must ask you questions and I do not care to do it standing."

They were sitting now in a corner of the room. Seldon's eyes wandered to the metal robot.

Sunmaster Fourteen said, "It is a robot."

"I know," said Seldon briefly.

"I know you do," said Sunmaster Fourteen with similar curtness. "But now that we have settled that matter, why are you here?"

Seldon gazed steadily at Sunmaster Fourteen and said, "To see the robot."

"Do you know that no one but an Elder is allowed in the aerie?"

"I did not know that, but I suspected it."

"Do you know that no tribesperson is allowed in the Sacrotorium?"

"I was told that."

"And you ignored the fact, is that it?"

"As I said, we wanted to see the robot."

"Do you know that no woman, even a Sister, is allowed in the Sacrotorium except at certain stated-and rare-occasions?"

"I was told that."

"And do you know that no woman is at any time-or for any reason allowed to dress in masculine garb? That holds, within the borders of Mycogen, for tribeswomen as well as for Sisters."

"I was not told that, but I am not surprised."

"Good. I want you to understand all this. Now, why did you want to see the robot?"

Seldon said with a shrug, "Curiosity. I had never seen a robot or even known that such a thing existed."

"And how did you come to know that it did exist and, specifically, that it existed here?"

Seldon was silent, then said, "I do not wish to answer that question."

"Is that why you were brought to Mycogen by Tribesman Hummin? To investigate robots?"

"No. Tribesman Hummin brought us here that we might be secure. However, we are scholars, Dr. Venabili and I. Knowledge is our province and to gain knowledge is our purpose. Mycogen is little understood outside its borders and we wish to know more about your ways and your methods of thought. It is a natural desire and, it seems to us, a harmless-even praiseworthy-one."

"Ah, but we do not wish the outer tribes and worlds to know about us. That is our natural desire and we are the judge of what is harmless to us and what harmful. So I ask you again, tribesman: How did you know that a robot existed in Mycogen and that it existed in this room?"

"General rumor," said Seldon at length.

"Do you insist on that?"

"General rumor. I insist on it."

Sunmaster Fourteen's keen blue eyes seemed to sharpen and he said without raising his voice, "Tribesman Seldon, we have long cooperated with Tribesman Hummin. For a tribesman, he has seemed a decent and trustworthy individual. For a tribesman! When he brought you two to us and commended you to our protection, we granted it. But Tribesman Hummin, whatever his virtues, is still a tribesman and we had misgivings. We were not at all sure what your--or his--real purpose might be."

"Our purpose was knowledge," said Seldon. "Academic knowledge. Tribeswoman Venabili is a historian and I too have an interest in history. Why should we not be interested in Mycogenian history?"

"For one thing, because we do not wish you to be. -In any case, two of our trusted Sisters were sent to you. They were to cooperate with you, try to find out what it was you wanted, and-what is the expression you tribesmen use?-play along with you. Yet not in such a way that you would be too aware as to what was happening." Sunmaster Fourteen smiled, but it was a grim smile. "

"Raindrop Forty-Five," Sunmaster Fourteen went on, "went shopping with Tribeswoman Venabili, but there seemed nothing out of the way in what happened on those trips. Naturally, we had a full report. Raindrop Forty-Three showed you, Tribesman Seldon, our microfarms. You might have been suspicious of her willingness to accompany you alone, something that is utterly out of the question for us, but you reasoned that what applied to Brothers did not apply to tribesmen and you flattered yourself that that flimsy bit of reasoning won her over. She complied with your desire, though at considerable cost to her peace of mind. And, eventually, you asked for the Book. To have handed it over too easily might have roused your suspicion, so she pretended to a perverse desire only you could satisfy. Her self-sacrifice will not be forgotten. -I take it, tribesman, you still have the Book and I suspect you have it with you now. May I have it?"

Seldon sat in bitter silence.

Sunmaster Fourteen's wrinkled hand remained obtrusively outstretched and he said, "How much better it would be than to wrest it from you by force."

And Seldon handed it over. Sunmaster Fourteen leafed through its pages briefly, as though to reassure himself it was unharmed.

He said with a small sigh, "It will have to be carefully destroyed in the approved manner. Sad'. -But once you had this Book, we were, of course, not surprised when you made your way out to the Sacrotorium. You were watched at all times, for you cannot think that any Brother or Sister, not totally absorbed, would not recognize you for tribespeople at a glance. We know a skincap when we see one and there are less than seventy of them in Mycogen . . . almost all belonging to tribesmen on official business who remain entirely in secular governmental buildings during the time they are here. So you were not only seen but unmistakably identified, over and over.

"The elderly Brother who met you was careful to tell you about the library as well as about the Sacrotorium, but he was also careful to tell you what you were forbidden to do, for we did not wish to entrap you. Skystrip Two also warned you . . . and quite forcibly. Nevertheless, you did not turn away.

"The shop at which you bought the white kirtle and the two sashes informed us at once and from that we knew well what you intended. The library was kept empty, the librarian was warned to keep his eyes to himself, the Sacrotorium was kept under-utilized. The one Brother who inadvertently spoke to you almost gave it away, but hastened off when he realized with whom he was dealing. And then you came up here.

"You see, then, that it was your intention to come up here and that we in no way lured you here. You came as a result of your own action, your own desire, and what I want to ask you-yet once again-is: Why?"

It was Dors who answered this time, her voice firm, her eyes hard. "We will tell you yet once again, Mycogenian. We are scholars, who consider knowledge sacred and it is only knowledge that we seek. You did not lure us here, but you did not stop us either, as you might have done before ever we approached this building.

You smoothed our way and made it easy for us and even that might be considered a lure. And what harm have we done? We have in no way disturbed the building, or this room, or you, or that."

She pointed to the robot. "It is a dead lump of metal that you hide here and we now know that it is dead and that is all the knowledge we sought. We thought it would be more significant and we are disappointed, but now that we know it is merely what it is, we will leave-and, if you wish, we will leave Mycogen as well."

Sunmaster Fourteen listened with no trace of expression on his face, but when she was done, he addressed Seldon, saying, "This robot, as you see it, is a symbol, a symbol of all we have lost and of all we no longer have, of all that, through thousands of years, we have not forgotten and what we intend someday to return to. Because it is all that remains to us that is both material and authentic, it is dear to us-yet to your woman it is only 'a dead lump of metal.'

Do you associate yourself with that judgment, Tribesman Seldon?"

Seldon said, "We are members of societies that do not tie ourselves to a past that is thousands of years old, making no contact at all with what has existed between that past and ourselves. We live in the present, which we recognize as the product of all the past and not of one long-gone moment of time that we hug to our chests. We realize, intellectually, what the robot may mean to you and we are willing to let it continue to mean that to you. But we can only see it with our own eyes, as you can only see it with yours. To us, it is a dead lump of metal."

"And now," said Dors, "we will leave."

"You will not," said Sunmaster Fourteen. "By coming here, you have committed a crime. It is a crime only in our eyes, as you will hasten to point out"-his lips curved in a wintry smile "but this is our territory and, within it, we make the definitions. And this crime, as we define it, is punishable by death."

"And you are going to shoot us down?" said Dors haughtily.

Sunmaster Fourteen's expression was one of contempt and he continued to speak only to Seldon. "What do you think we are, Tribesman Seldon? Our culture is as old as yours, as complex, as civilized, as humane. I am not armed. You will be tried and, since you are manifestly guilty, executed according to law, quickly and painlessly."

"If you were to try to leave now, I would not stop you, but there are many Brothers below, many more than there appeared to be when you entered the Sacrorium and, in their rage at your action, they may lay rough and forceful hands on you. It has happened in our history that tribespeople have even died so and it is not a pleasant death-certainly not a painless one."

"We were warned of this," said Dors, "by Skystrip Two. So much for your complex, civilized, and humane culture."

"People can be moved to violence at moments of emotion, Tribesman Seldon," said Sunmaster Fourteen calmly, "whatever their humanity in moments of calm. This is true in every culture, as your woman, who is said to be a historian, must surely know."

Seldon said, "Let us remain reasonable, Sunmaster Fourteen. You may be the law in Mycogen over local affairs, but you are not the law over us and you know it. We are both non-Mycogenian citizens of the Empire and it is the Emperor and his designated legal officers who must remain in charge of any capital offense."

Sunmaster Fourteen said, "That may be so in statutes and on papers and on holovision screens, but we are not talking theory now. The High Elder has long had the power to punish crimes of sacrilege without interference from the Imperial throne."

"If the criminals are your own people," said Seldon "It would be quite different if they were outsiders."

"I doubt it in this case. Tribesman Hummin brought you here as fugitives and we are not so yeast-headed in Mycogen that we don't strongly suspect that you are fugitives from the Emperor's laws. Why should he object if we do his work for him?"

"Because," said Seldon, "he would. Even if we were fugitives from the Imperial authorities and even if he wanted us only to punish us, he would still want us. To allow you to kill, by whatever means and for whatever reason, non-Mycogenians without due

Imperial process would be to defy his authority and no Emperor could allow such a precedent. No matter how eager he might be to see that the microfood trade not be interrupted, he would still feel it necessary to re-establish the Imperial prerogative. Do you wish, in your eagerness to kill us, to have a division of Imperial soldiery loot your farms and your dwellings, desecrate your Sacrorium, and take liberties with the Sisters: Consider."

Sunmaster Fourteen smiled once again, but displayed no softness. "Actually, I have considered and there is an alternative. After we condemn you, we could delay your execution to allow you to appeal to the Emperor for a review of your case. The Emperor might be grateful at this evidence of our ready submission to his authority and grateful too to lay his hands on you two-for some reason of his own-and Mycogen might profit. Is that what you want, then? To appeal to the Emperor in due course and to be delivered to him?"

Seldon and Dors looked at each other briefly and were silent.

Sunmaster Fourteen said, "I feel you would rather be delivered to the Emperor than die, but why do I get the impression that the preference is only by a slight margin?"

"Actually," said a new voice, "I think neither alternative is acceptable and that we must search for a third."

59.

It was Dors who identified the newcomer first, perhaps because it was she who expected him.

"Hummin," she said, "thank goodness you found us. I got in touch with you the moment I realized I was not going to deflect Hari from"-she held up her hands in a wide gesture "this."

Hummin's smile was a small one that did not alter the natural gravity of his face. There was a subtle weariness about him.

"My dear," he said, "I was engaged in other things. I cannot always pull away at a moment's notice. And when I got here, I had, like you two, to supply myself with a kirde and sash, to say nothing of a skincap, and make my way out here. Had I been here earlier, I might have stopped this, but I believe I'm not too late."

Sunmaster Fourteen had recovered from what had seemed to be a painful shock. He said in a voice that lacked its customary severe depth, "How did you get in here, Tribesman Hummin?"

"It was not easy, High Elder, but as Tribeswoman Venabili likes to say, I am a very persuasive person. Some of the citizens here remember who I was and what I have done for Mycogen in the past, that I am even an honorary Brother. Have you forgotten, Sunmaster Fourteen?"

The Elder replied, "I have not forgotten, but even the most favorable memory can not survive certain actions. A tribesman here and a tribeswoman. There is no greater

crime. All you have done is not great enough to balance that. My people are not unmindful. We will make it up to you some other way. But these two must die or be handed over to the Emperor."

"I am also here," said Hummin calmly. "Is that not a crime as well?"

"For you," said Sunmaster Fourteen, "for you personally, as a kind of honorary Brother, I can . . . overlook it . . . once. Not these two. "

"Because you expect a reward from the Emperor? Some favor? Some concession? Have you already been in touch with him or with his Chief of Staff, Eto Demerzel, more likely?"

"That is not a subject for discussion."

"Which is itself an admission. Come on, I don't ask what the Emperor promised, but it cannot be much. He does not have much to give in these degenerate days. Let me make you an offer. Have these two told you they are scholars?"

"They have."

"And they are. They are not lying. The tribeswoman is a historian and the tribesman is a mathematician. The two together are trying to combine their talents to make a mathematics of history and they call the combined subject 'psychohistory. "

Sunmaster Fourteen said, "I know nothing about this psychohistory, nor do I care to know. Neither it nor any other facet of your tribal learning interests me."

"Nevertheless," said Hummin, "I suggest that you listen to me."

It took Hummin some fifteen minutes, speaking concisely, to describe the possibility of organizing the natural laws of society (something he always mentioned with audible quotation marks in the tone of his voice) in such a way as to make it possible to anticipate the future with a substantial degree of probability.

And when he was done, Sunmaster Fourteen, who had listened expressionlessly, said, "A highly unlikely piece of speculation, I should say."

Seldon, with a rueful expression, seemed about to speak, undoubtedly to agree, but Hummin's hand, resting lightly on the other's knee, tightened unmistakably.

Hummin said, "Possibly, High Elder, but the Emperor doesn't think so. And by the Emperor, who is himself an amiable enough personage, I really mean Demerzel, concerning whose ambitions you need no instruction. They would like very much to have these two scholars, which is why I've brought them here for safekeeping. I had little expectation that you would do Demerzel's work for him by delivering the scholars to him."

"They have committed a crime that-"

"Yes, we know, High Elder, but it is only a crime because you choose to call it so. No real harm has been done."

"It has been done to our belief, to our deepest felt-"

"But imagine what harm will be done if psychohistory falls into the hands of Demerzel. Yes, I grant that nothing may come of it, but suppose for a moment that something does and that the Imperial government has the use of it-can foretell what is to come-can take measures with that foreknowledge which no one else would have-can take

measures, in fact, designed to bring about an alternate future more to the Imperial liking."

"Well?"

"Is there any doubt, High Elder, that the alternate future more to the Imperial liking would be one of tightened centralization? For centuries now, as you very well know, the Empire has been undergoing a steady decentralization. Many worlds now acknowledge only lip service to the Emperor and virtually rule themselves. Even here on Trantor, there is decentralization. Mycogen, as only one example, is free of Imperial interference for the most part. You rule its High Elder and there is no Imperial officer at your side overseeing your actions and decisions. How long do you think that will last with men like Demerzel adjusting the future to their liking?"

"Still the flimsiest of speculation," said Sunmaster Fourteen, "but not a disturbing one, I admit."

"On the other hand, if these scholars can complete their task, an unlikely if, you might say, but an if-then they are sure to remember that you spared them when you might have chosen not to. And it would then be conceivable that they would learn to arrange a future, for instance, that would allow Mycogen to be given a world of its own, a world that could be terra-formed into a close replica of the Lost World. And even if these two forget your kindness, I will be here to remind them."

"Well-" said Sunmaster Fourteen.

"Come on," said Hummin, "it is not hard to decide what must be going through your mind. Of all tribespeople, you must trust Demerzel the least. And though the chance of psychohistory might be small (if I was not being honest with you, I would not admit that) it is not zero; and if it will bring about a restoration of the Lost World, what can you want more than that? What would you not risk for even a tiny chance of that? Come now-I promise you and my promises are not lightly given. Release these two and choose a tiny chance of your heart's desire over no chance at all."

There was silence and then Sunmaster Fourteen sighed. "I don't know how it is, Tribesman Hummin, but on every occasion that we meet, you persuade me into something I do not really want to do."

"Have I ever misled you, High Elder?"

"You have never offered me so small a chance?"

"And so high a possible reward. The one balances the other."

And Sunmaster Fourteen nodded his head. "You are right. Take these two and take them out of Mycogen and never let me see them again unless there comes a time when-But surely it will not be in my lifetime."

"Perhaps not, High Elder. But your people have been waiting patiently for nearly twenty thousand years. Would you then object to waiting another-perhaps-two hundred?"

"I would not willingly wait one moment, but my people will wait as long as they must."

And standing up, he said, "I will clear the path. Take them and go"

60.

They were finally back in a tunnel. Hummin and Seldon had traveled through one when they went from the Imperial Sector to Streeling University in the air-taxi.

Now they were in another tunnel, going from Mycogen to . . . Seldon did not know where. He hesitated to ask. Hummin's face seemed as if it was carved out of granite and it didn't welcome conversation.

Hummin sat in the front of the four-seater, with no one to his right. Seldon and Dors shared the backseat.

Seldon chanced a smile at Dors, who looked glum. "It's nice to be in real clothes again, isn't it?"

"I will never," said Dors with enormous sincerity, "wear or look at anything that resembles a kirtle. And I will never, under any circumstances, wear a skincap. In fact, I'm going to feel odd if I ever see a normally bald man."

And it was Dors who finally asked the question that Seldon had been reluctant to advance. "Chetter," she said rather petulantly, "why won't you tell us where we're going?"

Hummin hitched himself into a sideways position and he looked back at Dors and Seldon gravely. "Somewhere," he said, "where it may be difficult for you to get into trouble-although I'm not sure such a place exists."

Dors was at once crestfallen. "Actually, Chetter, it's my fault. At Streeling, I let Hari go Upperside without accompanying him. In Mycogen, I at least accompanied him, but I suppose I ought not to have let him enter the Sacratorium at all."

"I was determined," said Seldon warmly. "It was in no way Dors's fault."

Hummin made no effort to apportion blame. He simply said, "I gather you wanted to see the robot. Was there a reason for that? Can you tell me?"

Seldon could feel himself redden. "I was wrong in that respect, Hummin. I did not see what I expected to see or what I hoped to see. If I had known the content of the aerie, I would never have bothered going there. Call it a complete fiasco."

"But then, Seldon, what was it you hoped to see? Please tell me. Take your time if you wish. This is a long trip and I am willing to listen."

"The thing is, Hummin, that I had the idea that there were humaniform robots, that they were long-lived, that at least one might still be alive, and that it might be in the aerie. There was a robot there, but it was metallic, it was dead, and it was merely a symbol. Had I but known-

"Yes. Did we all but know, there would be no need for questions or for research of any kind. Where did you get your information about humaniform robots? Since no Mycogenian would have discussed that with you, I can think of only one source. The Mycogenian Book-a powered print-book in ancient Auroran and modern Galactic. Am I right?"

"Yes."

"And how did you get a copy?"

Seldon paused, then muttered, "Its somewhat embarrassing."

"I am not easily embarrassed, Seldon."

Seldon told him and Hummin allowed a very small smile to twitch across his face.

Hummin said, "Didn't it occur to you that what occurred had to be a charade? No Sister would do a thing like that-except under instruction and with a great deal of persuading."

Seldon frowned and said with asperity, "That was not at all obvious. People are perverted now and then. And its easy for you to grin. I didn't have the information you had and neither did Dors. If you did not wish me to fall into traps, you might have warned me of those that existed."

"I agree. I withdraw my remark. In any case, you don't have the Book any longer, I'm sure."

"No. Sunmaster Fourteen took it from me."

"How much of it did you read?"

"Only a small fraction. I didn't have time. It's a huge book and I must tell you, Hummin, it is dreadfully dull."

"Yes, I know that, for I think I have read more of it than you have. It is not only dull, it is totally unreliable. It is a one-sided, official Mycogenian view of history that is more intent on presenting that view than a reasoned objectivity. It is even deliberately unclear in spots so that outsiders-even if they were to read the Book-would never know entirely what they read. What was it, for instance, that you thought you read about robots that interested you?"

"I've already told you. They speak of humaniform robots, robots that could not be distinguished from human beings in outward appearance."

"How many of these would exist?" asked Hummin.

"They don't say. -At least, I didn't come across a passage in which they gave numbers. There may have been only a handful, but one of them, the Book refers to as 'Renegade.' It seems to have an unpleasant significance, but I couldn't make out what."

"You didn't tell me anything about that," interposed Dors. "If you had, I would have told you that it's not a proper name. It's another archaic word and it means, roughly, what 'traitor' would mean in Galactic. The older word has a greater aura of fear about it. A traitor, somehow, sneaks to his treason, but a renegade flaunts it. "

Hummin said, "I'll leave the fine points of archaic language to you, Dors, but, in any case, if the Renegade actually existed and if it was a humaniform robot, then, clearly, as a traitor and enemy, it would not be preserved and venerated in the Elders' aerie."

Seldon said, "I didn't know the meaning of 'Renegade,' but, as I said, I did get the impression that it was an enemy. I thought it might have been defeated and preserved as a reminder of the Mycogenian triumph."

"Was there any indication in the Book that the Renegade was defeated?"

"No, but I might have missed that portion-"

"Not likely. Any Mycogenian victory would be announced in the Book unmistakably and referred to over and over again."

"There was another point the Book made about the Renegade," said Seldon, hesitating, "but I can't be at all sure I understood it."

Hummin said, "As I told you . . . They are deliberately obscure at times."

"Nevertheless, they seemed to say that the Renegade could somehow tap human emotions . . . influence them-

"Any politician can," said Hummin with a shrug. "It's called charisma-when it works."

Seldon sighed. "Well, I wanted to believe. That was it. I would have given a great deal to find an ancient humanoid robot that was still alive and that I could question."

"For what purpose?" asked Hummin.

"To learn the details of the primordial Galactic society when it still consisted of only a handful of worlds. From so small a Galaxy psychohistory could be deduced more easily."

Hummin said, "Are you sure you could trust what you heard? After many thousands of years, would you be willing to rely on the robot's early memories? How much distortion would have entered into them?"

"That's right," said Dors suddenly. "It would be like the computerized records I told you of, Hari. Slowly, those robot memories would be discarded, lost, erased, distorted. You can only go back so far and the farther you go back, the less reliable the information becomes-no matter what you do."

Hummin nodded. "I've heard it referred to as a kind of uncertainty principle in information."

"But wouldn't it be possible," said Seldon thoughtfully, "that some information, for special reasons, would be preserved? Parts of the Mycogenian Book may well refer to events of twenty thousand years ago and yet be very largely as it had been originally. The more valued and the more carefully preserved particular information is, the more long-lasting and accurate it may be."

"The key word is 'particular.' What the Book may care to preserve may not be what you wish to have preserved and what a robot may remember best may be what you wish him to remember least."

Seldon said in despair, "In whatever direction I turn to seek a way of working out psychohistory, matters so arrange themselves as to make it impossible. Why bother trying?"

"It might seem hopeless now," said Hummin unemotionally, "but given the necessary genius, a route to psychohistory may be found that none of us would at this moment expect. Give yourself more time. -But we're coming to a rest area. Let us pull off and have dinner."

Over the lamb patties on rather tasteless bread (most unpalatable after the fare at Mycogen), Seldon said, "You seem to assume, Hummin, that I am the possessor of 'the necessary genius.' I may not be, you know."

Hummin said, "That's true. You may not be. However, I know of no alternate candidate for the post, so I must cling to you."

And Seldon sighed and said, "Well, I'll try, but I'm out of any spark of hope. Possible but not practical, I said to begin with, and I'm more convinced of that now than I ever was before."

HEATSINK

AMARYL, YUGO- . . . A mathematician who, next to Hari Seldon himself, may be considered most responsible for working out the details of psychohistory. It was he who . . .

. . . Yet the conditions under which he began life are almost more dramatic than his mathematical accomplishments. Born into the hopeless poverty of the lower classes of Dahl, a sector of ancient Trantor, he might have passed his life in utter obscurity were it not for the fact that Seldon, quite by accident, encountered him in the course of . . .

ENCYCLOPEDIA GALACTICA

61.

The Emperor of all the Galaxy felt weary-physically weary. His lips ached from the gracious smile he had had to place on his face at careful intervals. His neck was stiff from having inclined his head this way and that in a feigned show of interest. His ears pained from having to listen. His whole body throbbed from having to rise and to sit and to turn and to hold out his hand and to nod.

It was merely a state function where one had to meet Mayors and Viceroys and Ministers and their wives or husbands from here and there in Trantor and (worse) from here and there in the Galaxy. There were nearly a thousand present, all in costumes that varied from the ornate to the downright outlandish, and he had had to listen to a babble of different accents made the worse by an effort to speak the Emperor's Galactic as spoken at the Galactic University. Worst of all, the Emperor had had to remember to avoid making commitments of substance, while freely applying the lotion of words without substance.

All had been recorded, sight and sound-very discreetly-and Eto Demerzel would go over it to see if Cleon, First of that Name, had behaved himself. That, of course, was only the way that the Emperor put it to himself. Demerzel would surely say that he was merely collecting data on any unintentional self-revelation on the part of the guests. And perhaps he was.

Fortunate Demerzel! The Emperor could not leave the Palace and its extensive grounds, while Demerzel could range the Galaxy if he wished. The Emperor was always on display, always accessible, always forced to deal with visitors, from the important to the merely intrusive. Demerzel remained anonymous and never allowed himself to be seen inside the Palace grounds. He remained merely a fearsome name and an invisible (and therefore the more frightening) presence.

The Emperor was the Inside Man with all the trappings and emoluments of power. Demerzel was the Outside Man, with nothing evident, not even a formal title, but with his fingers and mind probing everywhere and asking for no reward for his tireless labors but one—the reality of power.

It amused the Emperor—in a macabre sort of way—to consider that, at any moment, without warning, with a manufactured excuse or with none at all, he could have Demerzel arrested, imprisoned, exiled, tortured, or executed. After all, in these annoying centuries of constant unrest, the Emperor might have difficulty in exerting his will over the various planets of the Empire, even over the various sectors of Trantor—with their rabble of local executives and legislatures that he was forced to deal with in a maze of interlocking decrees, protocols, commitments, treaties, and general interstellar legalities—but at least his powers remained absolute over the Palace and its grounds.

And yet Cleon knew that his dreams of power were useless. Demerzel had served his father and Cleon could not remember a time when he did not turn to Demerzel for everything. It was Demerzel who knew it all, devised it all, did it all.

More than that, it was on Demerzel that anything that went wrong could be blamed. The Emperor himself remained above criticism and had nothing to fear except, of course, palace coups and assassination by his nearest and dearest. It was to prevent this, above all, that he depended upon Demerzel.

Emperor Cleon felt a tiny shudder at the thought of trying to do without Demerzel. There had been Emperors who had ruled personally, who had had a series of Chiefs of Staff of no talent, who had had incompetents serving in the post and had kept them—and somehow they had gotten along for a time and after a fashion.

But Cleon could not. He needed Demerzel. In fact, now that the thought of assassination had come to him—and, in view of the modern history of the Empire, it was inevitable that it had come to him—he could see that getting rid of Demerzel was quite impossible. It couldn't be done. No matter how cleverly he, Cleon, would attempt to arrange it, Demerzel (he was sure) would anticipate the move somehow, would know it was on its way, and would arrange, with far superior cleverness, a palace coup. Cleon would be dead before Demerzel could possibly be taken away in chains and there would simply be another Emperor that Demerzel would serve and dominate. Or would Demerzel tire of the game and make himself Emperor?

Never! The habit of anonymity was too strong in him. If Demerzel exposed himself to the world, then his powers, his wisdom, his luck (whatever it was) would surely desert him. Cleon was convinced of that. He felt it to be beyond dispute. So while he behaved himself, Cleon was safe. With no ambitions of his own, Demerzel would serve him faithfully.

And now here was Demerzel, dressed so severely and simply that it made Cleon uneasily conscious of the useless ornamentation of his robes of state, now thankfully removed with the aid of two valets. Naturally, it would not be until he was alone and in dishabille that Demerzel would glide into view.

"Demerzel," said the Emperor of all the Galaxy, "I am tired!"

"State functions are tiring, Sire," murmured Demerzel.

"Then must I have them every evening?"

"Not every evening, but they are essential. It gratifies others to see you and to be taken note of by you. It helps keep the Empire running smoothly."

"The Empire used to be kept running smoothly by power," said the Emperor somberly. "Now it must be kept running by a smile, a wave of the hand, a murmured word, and a medal or a plaque."

"If all that keeps the peace, Sire, there is much to be said for it. And your reign proceeds well."

"You know why-because I have you at my side. My only real gift is that I am aware of your importance." He looked at Demerzel slyly. "My son need not be my heir. He is not a talented boy. What if I make you my heir?"

Demerzel said freezingly, "Sire, that is unthinkable. I would not usurp the throne. I would not steal it from your rightful heir. Besides, if I have displeased you, punish me justly. Surely, nothing I have done or could possibly do deserves the punishment of being made Emperor."

Cleon laughed. "For that true assessment of the value of the Imperial throne, Demerzel, I abandon any thought of punishing you. Come now, let us talk about something. I would sleep, but I am not yet ready for the ceremonies with which they put me to bed. Let us talk."

"About what, Sire?"

"About anything. -About that mathematician and his psychohistory. I think about him every once in a while, you know. I thought of him at dinner tonight. I wondered: What if a psychohistorical analysis would predict a method for making it possible to be an Emperor without endless ceremony?"

"I somehow think, Sire, that even the cleverest psychohistorian could not manage that."

"Well, tell me the latest. Is he still hiding among those peculiar baldheads of Mycogen? You promised you would winkle him out of there."

"So I did, Sire, and I moved in that direction, but I regret that I must say that I failed."

"Failed?" The Emperor allowed himself to frown. "I don't like that. "

"Nor 1, Sire. I planned to have the mathematician be encouraged to commit some blasphemous act-such acts are easy to commit in Mycogen, especially for an outsider-one that would call for severe punishment. The mathematician would then be forced to appeal to the Emperor and, as a result, we would get him. I planned it at the cost of insignificant concessions on our part-important to Mycogen, totally unimportant to us--and I meant to play no direct role in the arrangement. It was to be handled subtly."

"I dare say," said Cleon, "but it failed. Did the Mayor of Mycogen "He is called the High Elder, Sire."

"Do not quibble over titles. Did this High Elder refuse?"

"On the contrary, Sire, he agreed and the mathematician, Seldon, fell into the trap neatly."

"Well then?"

"He was allowed to leave unharmed."

"Why?" said Cleon indignantly.

"Of this I am not certain, Sire, but I suspect we were outbid."

"By whom? By the Mayor of Wye?"

"Possibly, Sire, but I doubt that. I have Wye under constant surveillance. If they had gained the mathematician, I would know it by now."

The Emperor was not merely frowning. He was clearly enraged. "Demerzel, this is bad. I am greatly displeased. A failure like this makes me wonder if you are perhaps not the man you once were. What measures shall we take against Mycogen for this clear defiance of the Emperor's wishes?"

Demerzel bowed low in recognition of the storm unleashed, but he said in steely tones, "It would be a mistake to move against Mycogen now, Sire. The disruption that would follow would play into the hands of Wye."

"But we must do something. "

"Perhaps not, Sire. It is not as bad as it may seem."

"How can it be not as bad as it seems?"

"You'll remember, Sire, that this mathematician was convinced that psychohistory was impractical."

"Of course I remember that, but that doesn't matter, does it? For our purposes?"

"Perhaps not. But if it were to become practical, it would serve our purposes to an infinitely great extent, Sire. And from what I have been able to find out, the mathematician is now attempting to make psychohistory practical. His blasphemous attempt in Mycogen was, I understand, part of an attempt at solving the problem of psychohistory. In that case, it may pay us, Sire, to leave him to himself. It will serve us better to pick him up when he is closer to his goal or has reached it."

"Not if Wye gets him first."

"That, I shall see to it, will not happen."

"In the same way that you succeeded in winking the mathematician out of Mycogen just now?"

"I will not make a mistake the next time, Sire," said Demerzel coldly.

The Emperor said, "Demerzel, you had better not. I will not tolerate another mistake in this respect." And then he added pettishly, "I think I shall not sleep tonight after all."

62.

Jirad Tisilver of the Dahl Sector was short. The top of his head came up only to Hari Seldon's nose. He did not seem to take that to heart, however. He had handsome,

even features, was given to smiling, and sported a thick black mustache and crisply curling black hair.

He lived, with his wife and a half-grown daughter, in an apartment of seven small rooms, kept meticulously clean, but almost bare of furnishings.

Tisilver said, "I apologize, Master Seldon and Mistress Venabili, that I cannot give you the luxury to which you must be accustomed, but Dahl is a poor sector and I am not even among the better-off among our people."

"The more reason," responded Seldon, "that we must apologize to you for placing the burden of our presence upon you."

"No burden, Master Seldon. Master Hummin has arranged to pay us generously for your use of our humble quarters and the credits would be welcome even if you were not-and you are. "

Seldon remembered Hummin's parting words when they finally arrived in Dahl.

"Seldon" he had said, "this is the third place I've arranged as sanctuary. The first two were notoriously beyond the reach of the Imperium, which might well have served to attract their attention; after all, they were logical places for you. This one is different. It is poor, unremarkable, and, as a matter of fact, unsafe in some ways. It is not a natural refuge for you, so that the Emperor and his Chief of Staff may not think to turn their eyes in this direction. Would you mind staying out of trouble this time, then?"

"I will try, Hummin," said Seldon, a little offended. "Please be aware that the trouble is not of my seeking. I am trying to learn what may well take me thirty lifetimes to learn if I am to have the slightest chance of organizing psychohistory."

"I understand," said Hummin. "Your efforts at learning brought you to Upperside in Streeling and to the Elders' aerie in Mycogen and to who can guess where in Dahl. As for you, Dr. Venabili, I know you've been trying to take care of Seldon, but you must try harder. Get it fixed in your head that he is the most important person on Trantor-or in the Galaxy, for that matter-and that he must be kept secure at any cost."

"I will continue to do my best," said Dors stiffly. "And as for your host family, they have their peculiarities, but they are essentially good people with whom I have dealt before. Try not to get them in trouble either."

But Tisilver, at least, did not seem to anticipate trouble of any kind from his new tenants and his expressed pleasure at the company he now had-quite apart from the rent credits he would be getting-seemed quite sincere.

He had never been outside Dahl and his appetite for tales of distant places was enormous. His wife too, bowing and smiling, would listen and their daughter, with a finger in her mouth, would allow one eye to peep from behind the door.

It was usually after dinner, when the entire family assembled, that Seldon and Dors were expected to talk of the outside world. The food was plentiful enough, but it was bland and often tough. So soon after the tangy food of Mycogen, it was all but inedible. The "table" was a long shelf against one wall and they ate standing up.

Gentle questioning by Seldon elicited the fact that this was the usual situation among Dahllites as a whole and was not due to unusual poverty. Of course, Mistress

Tisilver explained, there were those with high government jobs in Dahl who were prone to adopt all kinds of effete customs like chairs-she called them "body shelves"-but this was looked down upon by the solid middle class.

Much as they disapproved of unnecessary luxury, though, the Tisivers loved hearing about it, listening with a virtual storm of tongue-clicking when told of mattresses lifted on legs, of ornate chests and wardrobes, and of a superfluity of tableware.

They listened also to a description of Mycogenian customs, while Jirad Tisilver stroked his own hair complacently and made it quite obvious that he would as soon think of emasculation as of depilation. Mistress Tisilver was furious at any mention of female subservience and flatly refused to believe that the Sisters accepted it tranquilly.

They seized most, however, on Seldon's casual reference to the Imperial grounds. When, upon questioning, it turned out that Seldon had actually seen and spoken to the Emperor, a blanket of awe enveloped the family. It took a while before they dared ask questions and Seldon found that he could not satisfy them. He had not, after all, seen much of the grounds and even less of the Palace interior.

That disappointed the Tisivers and they were unremitting in their attempts to elicit more. And, having heard of Seldon's Imperial adventure, they found it hard to believe Dors's assertion that, for her part, she had never been anywhere in the Imperial grounds. Most of all, they rejected Seldon's casual comment that the Emperor had talked and behaved very much as any ordinary human being would. That seemed utterly impossible to the Tisivers.

After three evenings of this, Seldon found himself tiring. He had, at first, welcomed the chance to do nothing for a while (during the day, at least) but view some of the history book-films that Dors recommended. The Tisivers turned over their book-viewer to their guests during the day with good grace, though the little girl seemed unhappy and was sent over to a neighbor's apartment to use theirs for her homework.

"It doesn't help," Seldon said restlessly in the security of his room after he had piped in some music to discourage eavesdropping. "I can see your fascination with history, but it's all endless detail. It's a mountainous heap-no, a Galactic heap-of data in which I can't see the basic organization."

"I dare say," said Dors, "that there must have been a time when human beings saw no organization in the stars in the sky, but eventually they discovered the Galactic structure."

"And I'm sure that took generations, not weeks. There must have been a time when physics seemed a mass of unrelated observations before the central natural laws were discovered and that took generations. -And what of the Tisivers?"

"What of them? I think they're being very nice."

"They're curious."

"Of course they are. Wouldn't you be if you were in their place?"

"But is it just curiosity? They seem to be ferociously interested in my meeting with the Emperor."

Dors seemed impatient. "Again . . . its only natural. Wouldn't you be if the situation was reversed?"

"It makes me nervous."

"Hummin brought us here."

"Yes, but he's not perfect. He brought me to the University and I was maneuvered Upperside. He brought us to Sunmaster Fourteen, who entrapped us. You know he did. Twice bitten, at least once shy. I'm tired of being questioned."

"Then turn the tables, Hari. Aren't you interested in Dahl?"

"Of course. What do you know about it to begin with?"

"Nothing. It's just one of more than eight hundred sectors and I've only been on Trantor a little over two years."

"Exactly. And there are twenty-five million other worlds and I've been on this problem only a little over two months. -I tell you. I want to go back to Helicon and take up a study of the mathematics of turbulence, which was my Ph.D. problem, and forget I ever saw -or thought I saw that turbulence gave an insight into human society."

But that evening he said to Tisilver, "But you know, Master Tisilver, you've never told me what you do, the nature of your work."

"Me?" Tisilver placed his fingers on his chest, which was covered by the simple white T-shirt with nothing underneath, which seemed to be the standard male uniform in Dahl. "Nothing much. I work at the local holovision station in programming. It's very dull, but it's a living."

"And it's respectable," said Mistress Tisilver. "It means he doesn't have to work in the heatsinks."

"The heatsinks?" said Dors, lifting her light eyebrows and managing to look fascinated.

"Oh well," said Tisilver, "that's what Dahl is best known for. It isn't much, but forty billion people on Trantor need energy and we supply a lot of it. We don't get appreciated, but I'd like to see some of the fancy sectors do without it."

Seldon looked confused. "Doesn't Trantor get its energy from solar power stations in orbit?"

"Some," said Tisilver, "and some from nuclear fusion stations out on the islands and some from microfusion motors and some from wind stations Upperside, but half" -- he raised a finger in emphasis and his face looked unusually grave "half comes from the heatsinks. There are heatsinks in lots of places, but none-none- as rich as those in Dahl. Are you serious that you don't know about the heatsinks? You sit there and stare at me."

Dors said quickly, "We are Outworlders, you know." (She had almost said 'tribespeople,' but had caught herself in time.) "Especially Dr. Seldon. He's only been on Trantor a couple of months."

"Really?" said Mistress Tisilver. She was a trifle shorter than her husband, was plump without quite being fat, had her dark hair drawn tightly back into a bun, and possessed rather beautiful dark eyes. Like her husband, she appeared to be in her thirties. (After a period in Mycogen, not actually long in duration but intense, it struck Dors as odd

to have a woman enter the conversation at will. How quickly modes and manners establish themselves, she thought, and made a mental note to mention that to Seldon -- one more item for his psychohistory.)

"Oh yes," she said. "Dr. Seldon is from Helicon."

Mistress Tisilver registered polite ignorance. "And where might that be?"

Dors said, "Why, it's-" She turned to Seldon. "Where is it, Hari?"

Seldon looked abashed. "To tell you the truth, I don't think I could locate it very easily on a Galactic model without looking up the coordinates. All I can say is that it's on the other side of the central black hole from Trantor and getting there by hypership is rather a chore."

Mistress Tisilver said, "I don't think Jirad and I will ever be on a hypership."

"Someday, Casilia," said Tisilver cheerfully, "maybe we will. But tell us about Helicon, Master Seldon."

Seldon shook his head. "To me that would be dull. It's just a world, like any other. Only Trantor is different from all the rest. There are no heatsinks on Helicon-or probably anywhere else except Trantor. Tell me about them."

("Only Trantor is different from all the rest." The sentence repeated itself in Seldon's mind and for a moment he grasped at it, and for some reason Dor's hand-on-thigh story suddenly recurred to him, but Tisilver was speaking and it passed out of Seldon's mind as quickly as it had entered.)

Tisilver said, "If you really want to know about heatsinks, I can show you." He turned to his wife. "Casilia, would you mind if tomorrow evening I take Master Seldon to the heatsinks."

"And me," said Dors quickly.

"And Mistress Venabili?"

Mistress Tisilver frowned and said sharply, "I don't think it would be a good idea. Our visitors would find it dull."

"I don't think so, Mistress Tisilver," said Seldon ingratiatingly. "We would very much like to see the heatsinks. We would be delighted if you would join us too . . . and your little daughter-if she wants to come."

"To the heatsinks?" said Mistress Tisilver, stiffening. "It's no place at all for a decent woman."

Seldon felt embarrassed at his gaffe. "I meant no harm, Mistress Tisilver."

"No offense," said Tisilver. "Casilia thinks it's beneath us and so it is, but as long as I don't work there, it's no distress merely to visit and show it to guests. But it is uncomfortable and I would never get Casilia to dress properly."

They got up from their crouching positions. Dahlite "chairs" were merely molded plastic seats on small wheels and they cramped Seldon's knees terribly and seemed to wiggle at his least body movement. The Tisivers, however, had mastered the art of sitting firmly and rose without trouble and without needing to use their arms for help as Seldon had to. Dors also got up without trouble and Seldon once again marveled at her natural grace.

Before they parted to their separate rooms for the night, Seldon said to Dors, "Are you sure you know nothing about heatsinks? Mistress Tisilver makes them seem unpleasant."

"They can't be that unpleasant or Tisilver wouldn't suggest taking us on tour. Leis be content to be surprised."

63.

Tisilver said, "You'll need proper clothing." Mistress Tisilver sniffed markedly in the background.

Cautiously, Seldon, thinking of kirtles with vague distress, said, "What do you mean by proper clothing?"

"Something light, such as I wear. A T-shirt, very short sleeves, loose slacks, loose underpants, foot socks, open sandals. I have it all for you."

"Good. It doesn't sound bad."

"As for Mistress Venabili, I have the same. I hope it fits."

The clothes Tisilver supplied each of them (which were his own) fit fine-if a bit snugly. When they were ready, they bade Mistress Tisilver good-bye and she, with a resigned if still disapproving air, watched them from the doorway as they set off.

It was early evening and there was an attractive twilight glow above. It was clear that Dahl's lights would soon be winking on. The temperature was mild and there were virtually no vehicles to be seen; everyone was walking. In the distance was the ever-present hum of an Expressway and the occasional glitter of its lights could be easily seen.

The Dahlites, Seldon noted, did not seem to be walking toward any particular destination. Rather, there seemed to be a promenade going on, a walking for pleasure. Perhaps, if Dahl was an impoverished sector, as Tisilver had implied, inexpensive entertainment was at a premium and what was as pleasant-and as inexpensive--as an evening stroll?

Seldon felt himself easing automatically into the gait of an aimless stroll himself and felt the warmth of friendliness all around him. People greeted each other as they passed and exchanged a few words. Black mustaches of different shape and thickness flashed everywhere and seemed a requisite for the Dahlite male, as ubiquitous as the bald heads of the Mycogenian Brothers.

It was an evening rite, a way of making sure that another day had passed safely and that one's friends were still well and happy. And, it soon became apparent, Dors caught every eye. In the twilight glow, the ruddiness of her hair had deepened, but it stood out against the sea of black-haired heads (except for the occasional gray) like a gold coin winking its way across a pile of coal.

"This is very pleasant," said Seldon.

"It is," said Tisilver. "Ordinarily, I'd be walking with my wife and she'd be in her element. There is no one for a kilometer around whom she doesn't know by name,

occupation, and interrelationships. I can't do that. Right now, half the people who greet me . . . I couldn't tell you their names. But, in any case, we mustn't creep along too slowly. We must get to the elevator. It's a busy world on the lower levels."

They were on the elevator going down when Dors said, "I presume, Master Tisalver, that the heatsinks are places where the internal heat of Trantor is being used to produce steam that will turn turbines and produce electricity."

"Oh no. Highly efficient large-scale thermopiles produce electricity directly. Don't ask me the details, please. I'm just a holovision programmer. In fact, don't ask anyone the details down there. The whole thing is one big black box. It works, but no one knows how."

"What if something goes wrong?"

"It doesn't usually, but if it does, some expert comes over from somewhere. Someone who understands computers. The whole thing is highly computerized, of course."

The elevator came to a halt and they stepped out. A blast of heat struck them.

"It's hot," said Seldon quite unnecessarily.

"Yes, it is," said Tisalver. "That's what makes Dahl so valuable as an energy source. The magma layer is nearer the surface here than it is anywhere else in the world. So you have to work in the heat."

"How about air-conditioning?" said Dors.

"There is air-conditioning, but it's a matter of expense. We ventilate and dehumidify and cool, but if we go too far, then we're using up too much energy and the whole process becomes too expensive."

Tisalver stopped at a door at which he signaled. It opened to a blast of cooler air and he muttered, "We ought to be able to get someone to help show us around and he'll control the remarks that Mistress Venabili will otherwise be the victim of . . . at least from the men."

"Remarks won't embarrass me," said Dors.

"They will embarrass me," said Tisalver.

A young man walked out of the office and introduced himself as Hano Lindor. He resembled Tisalver quite closely, but Seldon decided that until he got used to the almost universal shortness, swarthinness, black hair, and luxuriant mustaches, he would not be able to see individual differences easily.

Lindor said, "I'll be glad to show you around for what there is to see. It's not one of your spectaculars, you know." He addressed them all, but his eyes were fixed on Dors. He said, "It's not going to be comfortable. I suggest we remove our shirts."

"It's nice and cool in here," said Seldon.

"Of course, but that's because we're executives. Rank has its privileges. Out there we can't maintain air-conditioning at this level. That's why they get paid more than I do. In fact, those are the best-paying jobs in Dahl, which is the only reason we get people to work down here. Even so, it's getting harder to get heatsinkers all the time." He took a deep breath. "Okay, out into the soup."

He removed his own shirt and tucked it into his waistband. Tisilver did the same and Seldon followed suit.

Linder glanced at Dors and said, "For your own comfort, Mistress, but it's not compulsory."

"That's all right," said Dors and removed her shirt.

Her brassiere was white, unpadded, and showed considerable cleavage.

"Mistress," said Lindor, "That's not-" He thought a moment, then shrugged and said, "All right. We'll get by."

At first, Seldon was aware only of computers and machinery, huge pipes, flickering lights, and flashing screens.

The overall light was comparatively dim, though individual sections of machinery were illuminated. Seldon looked up into the almost-darkness. He said, "Why isn't it better lit?"

"It's lit well enough . . . where it should be," said Lindor. His voice was well modulated and he spoke quickly, but a little harshly. "Overall illumination is kept low for psychological reasons. Too bright is translated, in the mind, into heat. Complaints go up when we turn up the lights, even when the temperature is made to go down."

Dors said, "It seems to be well computerized. I should think the operations could be turned over to computers altogether. This sort of environment is made for artificial intelligence."

"Perfectly right," said Lindor, "but neither can we take a chance on any failures. We need people on the spot if anything goes wrong. A malfunctioning computer can raise problems up to two thousand kilometers away."

"So can human error. Isn't that so?" said Seldon.

"Oh yes, but with both people and computers on the job, computer error can be more quickly tracked down and corrected by people and, conversely, human error can be more quickly corrected by computers. What it amounts to is that nothing serious can happen unless human error and computer error take place simultaneously. And that hardly ever happens."

"Hardly ever, but not never, eh?" said Seldon.

"Almost never, but not never. Computers aren't what they used to be and neither are people."

"That's the way it always seems," said Seldon, laughing slightly.

"No, no. I'm not talking memory. I'm not talking good old days. I'm talking statistics."

At this, Seldon recalled Hummin talking of the degeneration of the times.

"See what I mean?" said Lindor, his voice dropping. "There's a bunch of people, at the C-3 level from the looks of them, drinking. Not one of them is at his or her post."

"What are they drinking?" asked Dors.

"Special fluids for replacing electrolyte loss. Fruit juice."

"You can't blame them, can you?" said Dors indignantly. "In this dry heat, you would have to drink."

"Do you know how long a skilled C-3 can spin out a drink? And there's nothing to be done about it either. If we give them five-minute breaks for drinks and stagger them so they don't all congregate in a group, you simply stir up a rebellion."

They were approaching the group now. There were men and women (Dahl seemed to be a more or less amphisexual society) and both sexes were shirtless. The women wore devices that might be called brassieres, but they were strictly functional. They served to lift the breasts in order to improve ventilation and limit perspiration, but covered nothing.

Dors said in an aside to Seldon, "That makes sense, Hari. I'm soaking wet there."

"Take off your brassiere, then," said Seldon. "I won't lift a finger to stop you."

"Somehow," said Dors, "I guessed you wouldn't." She left her brassiere where it was.

They were approaching the congregation of people-about a dozen of them.

Dors said, "If any of them make rude remarks, I shall survive."

"Thank you," said Lindor. "I cannot promise they won't. -But I'll have to introduce you. If they get the idea that you two are inspectors and in my company, they'll become unruly. Inspectors are supposed to poke around on their own without anyone from management overseeing them."

He held up his arms. "Heatsinkers, I have two introductions to make. We have visitors from outside-two Outworlders, two scholars. They've got worlds running short on energy and they've come here to see how we do it here in Dahl. They think they may learn something."

"They'll learn how to sweat!" shouted a heatsinker and there was raucous laughter.

"She's got a sweaty chest right now," shouted a woman, "covering up like that."

Dors shouted back, "I'd take it off, but mine can't compete with yours." The laughter turned good-natured.

But one young man stepped forward, staring at Seldon with intense deep-set eyes, his face set into a humorless mask. He said, "I know you. You're the mathematician."

He ran forward, inspecting Seldon's face with eager solemnity. Automatically, Dors stepped in front of Seldon and Lindor stepped in front of her, shouting, "Back, heatsinker. Mind your manners."

Seldon said, "Wait! Let him talk to me. Why is everyone piling in front of me?"

Lindor said in a low voice, "If any of them get close, you'll find they don't smell like hothouse flowers."

"I'll endure it," said Seldon brusquely. "Young man, what is it you want?"

"My name is Amaryl. Yugo Amaryl. I've seen you on holovision."

"You might have, but what about it?"

"I don't remember your name."

"You don't have to."

"You talked about something called psychohistory."

"You don't know how I wish I hadn't."

"What?"

"Nothing. What is it you want?"

"I want to talk to you. Just for a little while. Now."

Seldon looked at Lindor, who shook his head firmly. "Not while he's on his shift."

"When does your shift begin, Mr. Amaryl?" asked Seldon.

"Sixteen hundred."

"Can you see me tomorrow at fourteen hundred?"

"Sure. Where?"

Seldon turned to Tisalver. "Would you permit me to see him in your place?"

Tisalver looked very unhappy. "It's not necessary. He's just a heatsinker."

Seldon said, "He recognized my face. He knows something about me. He can't be just an anything. I'll see him in my room." And then, as Tisalver's face didn't soften, he added, "My room, for which rent is being paid. And you'll be at work, out of the apartment."

Tisalver said in a low voice, "It's not me, Master Seldon. It's my wife, Casilia. She won't stand for it."

"I'll talk to her," said Seldon grimly. "She'll have to."

64.

Casilia Tisalver opened her eyes wide. "A heatsinker? Not in my apartment."

"Why not? Besides, he'll be coming to my room," said Seldon. "At fourteen hundred."

"I won't have it," said Mistress Tisalver. "This is what comes of going down to the heatsinks. Jirad was a fool."

"Not at all, Mistress Tisalver. We went at my request and I was fascinated. I must see this young man, since that is necessary to my scholarly work."

"I'm sorry if it is, but I won't have it."

Dors Venabili raised her hand. "Hari, let me take care of this. Mistress Tisalver, if Dr. Seldon must see someone in his room this afternoon, the additional person naturally means additional rent. We understand that. For today, then, the rent on Dr. Seldon's room will be doubled."

Mistress Tisalver thought about it. "Well, that's decent of you, but it's not only the credits. There's the neighbors to think of. A sweaty, smelly heatsinker—"

"I doubt that he'll be sweaty and smelly at fourteen hundred, Mistress Tisalver, but let me go on. Since Dr. Seldon must see him, then if he can't see him here, he'll have to see him elsewhere, but we can't run here and there. That would be too inconvenient. Therefore, what we will have to do is to get a room elsewhere. It won't be easy and we don't want to do it, but we will have to. So we will pay the rent through today and leave and of course we will have to explain to Master Hummin why we have had to change the arrangements that he so kindly made for us."

"Wait." Mistress Tisalver's face became a study of calculation. "We wouldn't like to disoblige Master Hummin . . . or you two. How long would this creature have to stay?"

"He's coming at fourteen hundred. He must be at work at sixteen hundred. He will be here for less than two hours, perhaps considerably less. We will meet him outside, the two of us, and bring him to Dr. Seldon's room. Any neighbors who see us will think he is an Outworlder friend of ours."

Mistress Tisilver nodded her head. "Then let it be as you say. Double rent for Master Seldon's room for today and the heatsinker will visit just this one time."

"Just this one time," said Dors.

But later, when Seldon and Dors were sitting in her room, Dors said, "Why do you have to see him, Hari? Is interviewing a heatsinker important to psychohistory too?"

Seldon thought he detected a small edge of sarcasm in her voice and he said tartly, "I don't have to base everything on this huge project of mine, in which I have very little faith anyway. I am also a human being with human curiosities."

"We were down in the heatsinks for hours and you saw what the working people there were like. They were obviously uneducated. They were low-level individuals-no play on words intended and yet here was one who recognized me. He must have seen me on holovision on the occasion of the Decennial Convention and he remembered the word 'psychohistory.' He strikes me as unusual--as out of place somehow -and I would like to talk to him."

"Because it pleases your vanity to have become known even to heatsinkers in Dahl?"

"Well . . . perhaps. But it also piques my curiosity."

"And how do you know he hasn't been briefed and intends to lead you into trouble as has happened before."

Seldon winced. "I won't let him run his fingers through my hair. In any case, we're more nearly prepared now, aren't we? And I'm sure you'll be with me. I mean, you let me go Upperside alone, you let me go with Raindrop Forty-Three to the microfarms alone, and you're not going to do that again, are you?"

"You can be absolutely sure I won't," said Dors.

"Well then, I'll talk to the young man and you can watch out for traps. I have every faith in you."

65.

Amaryl arrived a few minutes before 1400, looking warily about. His hair was neat and his thick mustache was combed and turned up slightly at the edges. His T-shirt was startlingly white. He did smell, but it was a fruity odor that undoubtedly came from the slightly overenthusiastic use of scent. He had a bag with him.

Seldon, who had been waiting outside for him, seized one elbow lightly, while Dors seized the other, and they moved rapidly into the elevator. Having reached the correct level, they passed through the apartment into Seldon's room.

Amaryl said in a low hangdog voice, "Nobody home, huh?"

"Everyone's busy," said Seldon neutrally. He indicated the only chair in the room, a pad directly on the floor.

"No," said Amaryl. "I don't need that. One of you two use it." He squatted on the floor with a graceful downward motion.

Dors imitated the movement, sitting on the edge of Seldon's floor-based mattress, but Seldon dropped down rather clumsily, having to make use of his hands and unable, quite, to find a comfortable position for his legs.

Seldon said, "Well, young man, why do you want to see me?"

"Because you're a mathematician. You're the first mathematician I ever saw-close up-so I could touch him, you know."

"Mathematicians feel like anyone else."

"Not to me, Dr . . . Dr. . . Seldon?"

"That's my name."

Amaryl looked pleased. "I finally remembered. -You see, I want to be a mathematician too."

"Very good. What's stopping you?"

Amaryl suddenly frowned. "Are you serious?"

"I presume something is stopping you. Yes, I'm serious."

"What's stopping me is I'm a Dahlite, a heatsinker on Dahl. I don't have the money to get an education and I can't get the credits to get an education. A real education, I mean. All they taught me was to read and cipher and use a computer and then I knew enough to be a heatsinker. But I wanted more. So I taught myself."

"In some ways, that's the best kind of teaching. How did you do that?"

"I knew a librarian. She was willing to help me. She was a very nice woman and she showed me how to use computers for learning mathematics. And she set up a software system that would connect me with other libraries. I'd come on my days off and on mornings after my shift. Sometimes she'd lock me in her private room so I wouldn't be bothered by people coming in or she would let me in when the library was closed. She didn't know mathematics herself, but she helped me all she could. She was oldish, a widow lady. Maybe she thought of me as a kind of son or something. She didn't have children of her own."

(Maybe, thought Seldon briefly, there was some other emotion involved too, but he put the thought away. None of his business.)

"I liked number theory," said Amaryl. "I worked some things out from what I learned from the computer and from the bookfilms it used to teach me mathematics. I came up with some new things that weren't in the book-films."

Seldon raised his eyebrows. "That's interesting. Like what?"

"I've brought some of them to you. I've never showed them to anyone. The people around me-" He shrugged. "They'd either laugh or be annoyed. Once I tried to tell a girl I knew, but she just said I was weird and wouldn't see me anymore. Is it all right for me to show them to you?"

"Quite all right. Believe me."

Seldon held out his hand and after a brief hesitation, Amaryl handed him the bag he was carrying. For a long time, Seldon looked over Amaryl's papers. The work was naive in the extreme, but he allowed no smile to cross his face. He followed the demonstrations, not one of which was new, of course-or even nearly new-or of any importance. But that didn't matter.

Seldon looked up. "Did you do all of this yourself?"

Amaryl, looking more than half-frightened, nodded his head.

Seldon extracted several sheets. "What made you think of this?" His finger ran down a line of mathematical reasoning.

Amaryl looked it over, frowned, and thought about it. Then he explained his line of thinking.

Seldon listened and said, "Did you ever read a book by Anat Bigell?"

"On number theory?"

"The title was Mathematical Deduction. It wasn't about number theory, particularly."

Amaryl shook his head. "I never heard of him. I'm sorry."

"He worked out this theorem of yours three hundred years ago.'

Amaryl looked stricken. "I didn't know that."

"I'm sure you didn't. You did it more cleverly, though. It's not rigorous, but-

"What do you mean, 'rigorous'?"

"It doesn't matter." Seldon put the papers back together in a sheaf, restored it to the bag, and said, "Make several copies of all this. Take one copy, have it dated by an official computer, and place it under computerized seal. My friend here, Mistress Venabili, can get you into Streeling University without tuition on some sort of scholarship. You'll have to start at the beginning and take courses in other subjects than mathematics, but-
By now Amaryl had caught his breath. "Into Streeling University? They won't take me."

"Why not? Dors, you can arrange it, can't you?"

"I'm sure I can."

"No, you can't," said Amaryl hotly. "They won't take me. I'm from Dahl."

"Well?.. "

"They won't take people from Dahl."

Seldon looked at Dors. "What's he talking about?"

Dors shook her head. "I really don't know."

Amaryl said, "You're an Outworlder, Mistress. How long have you been at Streeling?"

"A little over two years, Mr. Amaryl."

"Have you ever seen Dahlites there-short, curly black hair, big mustaches?"

"There are students with all kinds of appearances."

"But no Dahlites. Look again the next time you're there."

"Why not?" said Seldon.

"They don't like us. We look different. They don't like our mustaches."

"You can shave your-" but Seldon's voice died under the other's furious glance.

"Never. Why should I? My mustache is my manhood."

"You shave your beard. That's your manhood too."

"To my people it is the mustache."

Seldon looked at Dors again and murmured, "Bald heads, mustaches . . . madness."

"What?" said Amaryl angrily.

"Nothing. Tell me what else they don't like about Dahrites."

"They make up things not to like. They say we smell. They say we're dirty. They say we steal. They say we're violent. They say we're dumb. "

"Why do they say all this?"

"Because its easy to say it and it makes them feel good. Sure, if we work in the heatsinks, we get dirty and smelly. If we're poor and held down, some of us steal and get violent. But that isn't the way it is with all of us. How about those tall yellow-hairs in the Imperial Sector who think they own the Galaxy-no, they do own the Galaxy. Don't they ever get violent? Don't they steal sometimes?"

If they did my job, they'd smell the way I do. If they had to live the way I have to, they'd get dirty too."

"Who denies that there are people of all kinds in all places?" said Seldon.

"No one argues the matter! They just take it for granted. Master Seldon, I've got to get away from Trantor. I have no chance on Trantor, no way of earning credits, no way of getting an education, no way of becoming a mathematician, no way of becoming any thing but what they say I am . . . a worthless nothing."

This last was said in frustration-and desperation.

Seldon tried to be reasonable. "The person I'm renting this room from is a Dahrite. He has a clean job. He's educated."

"Oh sure," said Amaryl passionately. "There are some. They let a few do it so that they can say it can be done. And those few can live nicely as long as they stay in Dahl. Let them go outside and they'll see how they're treated. And while they're in here they make themselves feel good by treating the rest of us like dirt. That makes them yellow-hairs in their own eyes. What did this nice person you're renting this room from say when you told him you were bringing in a heatsinker? What did he say I would be like? They're gone now . . . wouldn't be in the same place with me."

Seldon moistened his lips. "I won't forget you. I'll see to it that you'll get off Trantor and into my own University in Helicononce I'm back there myself."

"Do you promise that? Your word of honor? Even though I'm a Dahrite?"

"The fact that you're a Dahrite is unimportant to me. The fact that you are already a mathematician is! But I still can't quite grasp what you're telling me. I find it impossible to believe that there would be such unreasoning feeling against harmless people."

Amaryl said bitterly, "That's because you've never had any occasion to interest yourself in such things. It ran all pass right under your nose and you wouldn't smell a thing because it doesn't affect you. "

Dors said, "Mr. Amaryl, Dr. Seldon is a mathematician like you and his head can sometimes be in the clouds. You must understand that. I am a historian, however. I know that it isn't unusual to have one group of people look down upon another group. There are peculiar and almost ritualistic hatreds that have no rational justification and that can have their serious historical influence. It's too bad."

Amaryl said, "Saying something is 'too bad' is easy. You say you disapprove, which makes you a nice person, and then you can go about your own business and not be interested anymore. It's a lot worse than 'too bad.' It's against everything decent and natural. We're all of us the same, yellow-hairs and black-hairs, tall and short, Easterners, Westerners, Southerners, and Outworlders. We're all of us, you and I and even the Emperor, descended from the people of Earth, aren't we?"

"Descended from what" asked Seldon. He turned to look at Dors, his eyes wide.

"From the people of Earth!" shouted Amaryl. "The one planet on which human beings originated."

"One planet? Just one planet?"

"The only planet. Sure. Earth."

"When you say Earth, you mean Aurora, don't you?"

"Aurora? What's that? -I mean Earth. Have you never heard of Earth?"

"No," said Seldon. "Actually not."

"It's a mythical world," began Dors, "that-"

"It's not mythical. It was a real planet."

Seldon sighed. "I've heard this all before. Well, let's go through it again. Is there a Dahlite book that tells of Earth?"

"What?"

"Some computer software, then?"

"I don't know what you're talking about."

"Young man, where did you hear about Earth?"

"My dad told me. Everyone knows about it."

"Is there anyone who knows about it especially? Did they teach you about it in school?"

"They never said a word about it there."

"Then how do people know about it?"

Amaryl shrugged his shoulders with an air of being uselessly badgered over nothing. "Everyone just does. If you want stories about it, there's Mother Rittah. I haven't heard that she's died yet."

"Your mother? Wouldn't you know-"

"She's not my mother. That's just what they call her. Mother Rittah. She's an old woman. She lives in Billibotton. Or used to."

"Where's that?"

"Down in that direction," said Amaryl, gesturing vaguely.

"How do I get there?"

"Get there? You don't want to get there. You'd never come back."

"Why not?"

"Believe me. You don't want to go there."

"But I'd like to see Mother Rittah."

Amaryl shook his head. "Can you use a knife?"

"For what purpose? What kind of knife?"

"A cutting knife. Like this." Amaryl reached down to the belt that held his pants tight about his waist. A section of it came away and from one end there flashed out a knife blade, thin, gleaming, and deadly.

Dors's hand immediately came down hard upon his right wrist.

Amaryl laughed. "I wasn't planning to use it. I was just showing it to you." He put the knife back in his belt. "You need one in self-defense and if you don't have one or if you have one but don't know how to use it, you'll never get out of Billibotton alive. Anyway"-he suddenly grew very grave and intent-"are you really serious, Master Seldon, about helping me get to Helicon?"

"Entirely serious. That's a promise. Write down your name and where you can be reached by hypercomputer. You have a code, I suppose."

"My shift in the heatsinks has one. Will that do?"

"Yes."

"Well then," said Amaryl, looking up earnestly at Seldon, "this means I have my whole future riding on you, Master Seldon, so please don't go to Billibotton. I can't afford to lose you now." He turned beseeching eyes on Dors and said softly, "Mistress Venabili, if he'll listen to you, don't let him go. Please. "

BILLIBOTTON

DAHL- . . . Oddly enough, the best-known aspect of this sector is Billibotton, a semi-legendary place about which innumerable tales have grown up. In fact, a whole branch of literature now exists in which heroes and adventurers (and victims) must dare the dangers of passing through Billibotton. So stylized have these stories become that the one well-known and, presumably, authentic tale involving such a passage, that of Hari Seldon and Dors Venabili, has come to seem fantastic simply by association . . .

ENCYCLOPEDIA GALACTICA

66.

When Hari Seldon and Dors Venabili were alone, Dors asked thoughtfully, "Are you really planning to see this 'Mother' woman?"

"I'm thinking about it, Dors."

"You're an odd one, Hari. You seem to go steadily from bad to worse. You went Upperside, which seemed harmless enough, for a rational purpose when you were in Streeling. Then, in Mycogen, you broke into the Elders' aerie, a much more dangerous task, for a much more foolish purpose. And now in Dahl, you want to go to this place, which that young man seems to think is simple suicide, for something altogether nonsensical."

"I'm curious about this reference to Earth-and must know if there's anything to it."

Dors said, "It's a legend and not even an interesting one. It is routine. The names differ from planet to planet, but the content is the same. There is always the tale of an original world and a golden age. There is a longing for a supposedly simple and virtuous past that is almost universal among the people of a complex and vicious society. In one way or another, this is true of all societies, since everyone imagines his or her own society to be too complex and vicious, however simple it may be. Mark that down for your psychohistory."

"Just the same," said Seldon, "I have to consider the possibility that one world did once exist. Aurora . . . Earth . . . the name doesn't matter. In fact-

He paused and finally Dors said, "Well?"

Seldon shook his head. "Do you remember the hand-on-thigh story you told me in Mycogen? It was right after I got the Book from Raindrop Forty-Three . . . Well, it popped into my head one evening recently when we were talking to the Tisalvers. I said something that reminded me, for an instant-

"Reminded you of what?"

"I don't remember. It came into my head and went out again, but somehow every time I think of the single-world notion, it seems to me I have the tips of my fingers on something and then lose it."

Dors looked at Seldon in surprise. "I don't see what it could be. The hand-on-thigh story has nothing to do with Earth or Aurora."

"I know, but this . . . thing . . . that hovers just past the edge of my mind seems to be connected with this single world anyway and I have the feeling that I must find out more about it at any cost. That . . . and robots."

"Robots too? I thought the Elders' aerie put an end to that."

"Not at all. I've been thinking about them." He stared at Dors with a troubled look on his face for a long moment, then said, "But I'm not sure."

"Sure about what, Hari?"

But Seldon merely shook his head and said nothing more.

Dors frowned, then said, "Hari, let me tell you one thing. In sober history-and, believe me, I know what I'm talking about there is no mention of one world of origin. It's a popular belief, I admit. I don't mean just among the unsophisticated followers of folklore, like the Mycogenians and the Dahlite heatsinkers, but there are biologists who insist that there must have been one world of origin for reasons that are well outside my area of expertise and there are the more mystical historians who tend to speculate about it. And among the leisure-class intellectuals, I understand such speculations are becoming fashionable. Still, scholarly history knows nothing about it."

Seldon said, "All the more reason, perhaps, to go beyond scholarly history. All I want is a device that will simplify psychohistory for me and I don't care what the device is, whether it is a mathematical trick or a historical trick or something totally imaginary. If the young man we've just talked to had had a little more formal training, I'd have set him on the problem. His thinking is marked by considerable ingenuity and originality-

Dors said, "And you're really going to help him, then?"

"Absolutely. Just as soon as I'm in a position to."

"But ought you to make promises you're not sure you'll be able to keep?"

"I want to keep it. If you're that stiff about impossible promises, consider that Hummin told Sunmaster Fourteen that I'd use psychohistory to get the Mycogenians their world back. There's just about zero chance of that. Even if I work out psychohistory, who knows if it can be used for so narrow and specialized a purpose? There's a real case of promising what one can't deliver."

But Dors said with some heat, "Chetter Hummin was trying to save our lives, to keep us out of the hands of Demerzel and the Emperor. Don't forget that. And I think he really would like to help the Mycogenians."

"And I really would like to help Yugo Amaryl and I am far more likely to be able to help him than I am the Mycogenians, so if you justify the second, please don't criticize the first. What's more, Dors"-and his eyes flashed angrily-"I really would like to find Mother Rittah and I'm prepared to go alone."

"Never!" snapped Dors. "If you go, I go."

Mistress Tisilver returned with her daughter in tow an hour after Amaryl had left on this way to his shift. She said nothing at all to either Seldon or Dors, but gave a curt nod of her head when they greeted her and gazed sharply about the room as though to verify that the heatsinker had left no trace. She then sniffed the air sharply and looked at Seldon accusingly before marching through the common room into the family bedroom.

Tisilver himself arrived home later and when Seldon and Dors came to the dinner table, Tisilver took advantage of the fact that his wife was still ordering some last-minute details in connection with the dinner to say in a low voice, "Has that person been here?"

"And gone," said Seldon solemnly. "Your wife was out at the time."

Tisilver nodded and said, "Will you have to do this again?"

"I don't think so," said Seldon.

"Good."

Dinner passed largely in silence, but afterward, when the daughter had gone to her room for the dubious pleasures of computer practice, Seldon leaned back and said, "Tell me about Billibotton."

Tisilver looked astonished and his mouth moved without any sound issuing. Casilia, however, was less easily rendered speechless.

She said, "Is that where your new friend lives? Are you going to return the visit?"

"So far," said Seldon quietly, "I have just asked about Billibotton."

Casilia said sharply, "It is a slum. The dregs live there. No one goes there, except the filth that make their homes there."

"I understand a Mother Rittah lives there."

"I never heard of her," said Casilia, her mouth closing with a snap. It was quite clear that she had no intention of knowing anyone by name who lived in Billibotton.

Tisilver, casting an uneasy look at his wife, said, "I've heard of her. She's a crazy old woman who is supposed to tell fortunes."

"And does she live in Billibotton?"

"I don't know, Master Seldon. I've never seen her. She's mentioned sometimes in the news holocausts when she makes her predictions."

"Do they come true?"

Tisilver snorted. "Do predictions ever come true? Hers don't even make sense."

"Does she ever talk about Earth?"

"I don't know. I wouldn't be surprised."

"The mention of Earth doesn't puzzle you. Do you know about Earth?"

Now Tisilver looked surprised. "Certainly, Master Seldon. It's the world all people came from . . . supposedly."

"Supposedly? Don't you believe it?"

"Me? I'm educated. But many ignorant people believe it."

"Are there book-films about Earth?"

"Children's stories sometimes mention Earth. I remember, when I was a young boy, my favorite story began, 'Once, long ago, on Earth, when Earth was the only planet-'
Remember, Casilia? You liked it too."

Casilia shrugged, unwilling to bend as yet.

"I'd like to see it sometime," said Seldon, "but I mean real bookfilms . . . uh . . . learned ones . . . or films . . . or printouts."

"I never heard of any, but the library-"

"I'll try that. -Are there any taboos about speaking of Earth?"

"What are taboos?"

"I mean, is it a strong custom that people mustn't talk of Earth or chat outsiders mustn't ask about it?"

Tisilver looked so honestly astonished that there seemed no point in waiting for an answer.

Dors put in, "Is there some rule about outsiders not going to Billibotton?"

Now Tisilver turned earnest. "No rule, but it's not a good idea for anyone to go there. I wouldn't."

Dors said, "Why not?"

"It's dangerous. Violent! Everyone is armed. -I mean, Dahl is an armed place anyway, but in Billibotton they use the weapons. Stay in this neighborhood. It's safe."

"So far," said Casilia darkly. "It would be better if we left altogether. Heatsinkers go anywhere these days." And there was another lowering look in Seldon's direction.

Seldon said, "What do you mean that Dahl is an armed place? There are strong Imperial regulations against weapons."

"I know that," said Tisilver, "and there are no stun guns here or percussives or Psychic Probes or anything like that. But there are knives." He looked embarrassed.

Dors said, "Do you carry a knife, Tisilver?"

"Me?" He looked genuinely horrified. "I am a man of peace and this is a safe neighborhood."

"We have a couple of them in the house," said Casilia, sniffing again. "We're not that certain this is a safe neighborhood."

"Does everyone carry knives?" asked Dors.

"Almost everyone, Mistress Venabili," said Tisilver. "It's customary. But that doesn't mean everyone uses them."

"But they use them in Billibotton, I suppose," said Dors.

"Sometimes. When they're excited, they have fights."

"And the government permits it? The Imperial government, I mean?"

"Sometimes they try to clean Billibotton up, but knives are too easy to hide and the custom is too strong. Besides, it's almost always Dahllites that get killed and I don't think the Imperial government gets too upset over that."

"What if it's an outsider who gets killed?"

"If it's reported, the Imperials could get excited. But what happens is that no one has seen anything and no one knows anything. The Imperials sometimes round up people

on general principles, but they can never prove anything. I suppose they decide it's the outsiders' fault for being there. -So don't go to Billibotton, even if you have a knife."

Seldon shook his head rather pettishly. "I wouldn't carry a knife. I don't know how to use one. Not skillfully."

"Then it's simple, Master Seldon. Stay out." Tisilver shook his head portentously. "Just stay out."

"I may not be able to do that either," said Seldon.

Dors glared at him, clearly annoyed, and said to Tisilver, "Where does one buy a knife? Or may we have one of yours?"

Casilia said quickly, "No one takes someone else's knife. You must buy your own."

Tisilver said, "There are knife stores all over. There aren't supposed to be. Theoretically they're illegal, you know. Any appliance store sells them, however. If you see a washing machine on display, that's a sure sign."

"And how does one get to Billibotton?" asked Seldon.

"By Expressway." Tisilver looked dubious as he looked at Dors's frowning expression.

Seldon said, "And once I reach the Expressway?"

"Get on the eastbound side and watch for the signs. But if you must go, Master Seldon"-Tisilver hesitated, then said-"you mustn't take Mistress Venabili. Women sometimes are treated . . . worse."

"She won't go," said Seldon.

"I'm afraid she will," said Dors with quiet determination.

68.

The appliance store dealer's mustache was clearly as lush as it had been in his younger days, but it was grizzled now, even though the hair on his head was still black. He touched the mustache out of sheer habit as he gazed at Dors and brushed it back on each side.

He said, "You're not a Dahlite."

"Yes, but I still want a knife."

He said, "It's against the law to sell knives."

Dors said, "I'm not a policewoman or a government agent of any soft. I'm going to Billibotton."

He stared at her thoughtfully. "Alone?"

"With my friend." She jerked her thumb over her shoulder in the direction of Seldon, who was waiting outside sullenly.

"You're buying it for him?" He stared at Seldon and it didn't take him long to decide. "He's an outsider too. Let him come in and buy it for himself"

"He's not a government agent either. And I'm buying it for myself."

The dealer shook his head. "Outsiders are crazy. But if you want to spend some credits, I'll take them from you. He reached under the counter, brought out a stub, turned it with a slight and expert motion, and the knife blade emerged.

"Is that the largest you have?"

"Best woman's knife made."

"Show me a man's knife."

"You don't want one that's too heavy. Do you know how to use one of these things?"

"I'll learn and I'm not worried about heavy. Show me a man's knife."

The dealer smiled. "Well, if you want to see one-" He moved farther down the counter and brought up a much fatter stub. He gave it a twist and what appeared to be a butcher's knife emerged. He handed it to her, handle first, still smiling.

She said, "Show me that twist of yours."

He showed her on a second knife, slowly twisting one way to make the blade appear, then the other way to make it disappear. "Twist and squeeze," he said.

"Do it again, sir."

The dealer obliged.

Dors said, "All right, close it and toss me the haft"

He did, in a slow upward loop.

She caught it, handed it back, and said, "Faster."

He raised his eyebrows and then, without warning, backhanded it to her left side. She made no attempt to bring over her right hand, but caught it with her left and the blade showed tumescently at once-then disappeared. The dealer's mouth fell open.

"And this is the largest you have?" she said.

"It is. If you try to use it, it will just tire you out."

"I'll breathe deeply. I'll take a second one too."

"For your friend?"

"No. For me."

"You plan on using two knives?"

"I've got two hands."

The dealer sighed. "Mistress, please stay out of Billibotton. You don't know what they do to women there."

"I can guess. How do I put these knives on my belt?"

"Not the one you've got on, Mistress. That's not a knife belt. I can sell you one, though."

"Will it hold two knives?"

"I might have a double belt somewhere. Not much call for them."

"I'm calling for them."

"I may not have it in your size."

"Then we'll cut it down or something."

"It will cost you a lot of credits."

"My credit tile will cover it."

When she emerged at last, Seldon said sourly, "You look ridiculous with that bulky belt."

"Really, Hari? Too ridiculous to go with you to Billibotton? Then let's both go back to the apartment."

"No. I'll go on by myself. I'll be safer by myself."

Dors said, "There is no use saying that, Hari. We both go back or we both go forward. Under no circumstances do we separate."

And somehow the firm look in her blue eyes, the set to her lips, and the manner in which her hands had dropped to the hafts at her belt, convinced Seldon she was serious.

"Very well," he said, "but if you survive and if I ever see Hummin again, my price for continuing to work on psychohistory much as I have grown fond of you-will be your removal. Do you understand?"

And suddenly Dors smiled. "Forget it. Don't practice your chivalry on me.

Nothing will remove me. Do you understand?"

69.

They got off the Expressway where the sign, flickering in the air, said: BILLIBOTTON. As perhaps an indication of what might be expected, the second I was smeared, a mere blob of fainter light.

They made their way out of the car and down to the walkway below. It was early afternoon and at first glance, Billibotton seemed much like the part of Dahl they had left.

The air, however, had a pungent aroma and the walkway was littered with crash. One could tell that auto-sweeps were not to be found in the neighborhood. And, although the walkway looked ordinary enough, the atmosphere was uncomfortable and as tense as a too-tightly coiled spring.

Perhaps it was the people. There seemed the normal number of pedestrians, but they were not like pedestrians elsewhere, Seldon thought. Ordinarily, in the press of business, pedestrians were self-absorbed and in the endless crowds on the endless thoroughfares of Trantor, people could only survive-psychologically-by ignoring each other. Eyes slid away. Brains were closed off. There was an artificial privacy with each person enclosed in a velvet fog of his or her own making. Or there was the ritualistic friendliness of an evening promenade in those neighborhoods that indulged in such things.

But here in Billibotton, there was neither friendliness nor neutral withdrawal. At least not where outsiders were concerned. Every person who passed, moving in either direction, turned to stare at Seldon and Dors. Every pair of eyes, as though attached by invisible cords to the two outsiders, followed them with ill will.

The clothing of the Billibottoners tended to be smudged, old, and sometimes corn. There was a patina of ill-washed poverty over them and Seldon felt uneasy at the slickness of his own new clothes.

He said, "Where in Billibotton does Mother Rittah live, do you suppose?"

"I don't know," said Dors. "You brought us here, so you do the supposing. I intend to confine myself to the task of protection and I think I'm going to find it necessary to do just that."

Seldon said, "I assumed it would only be necessary to ask the way of any passerby, but somehow I'm not encouraged to do so."

"I don't blame you. I don't think you'll find anyone springing w your assistance."

"On the other hand, there are such things as youngsters." He indicated one with a brief gesture of one hand. A boy who looked to be about twelve-in any case young enough to lack the universal adult male mustache had come to a full halt and was staring at them.

Dors said, "You're guessing that a boy that age has not yet developed the full Billibottonian dislike of outsiders."

"At any rate," said Seldon, "I'm guessing he is scarcely large enough to have developed the full Billibottonian penchant for violence. I suppose he might run away and shout insults from a distance if we approach him, but I doubt he'll attack us."

Seldon raised his voice. "Young man."

The boy took a step backward and continued to stare.

Seldon said, "Come here," and beckoned.

The boy said, "Wa' fox, guy?"

"So I can ask you directions. Come closer, so I don't have to shout."

The boy approached two steps closer. His face was smudged, but his eyes were bright and sharp. His sandals were of different make and there was a large patch on one leg of his trousers. He said, "Wa' kind o' directions?"

"We're trying to find Mother Rittah."

The boy's eyes flickered. "Wa' for, guy?"

"I'm a scholar. Do you know what a scholar "Ya went to school?"

"Yes. Didn't you?"

The boy spat to one side in contempt. "Nah."

"I want advice from Mother Rittah-if you'll take me to her."

"Ya want your fortune? Ya come to Billibotton, guy, with your fancy clothes, so ! can tell ya your fortune. All bad."

"What's your name, young man?"

"What's it to ya?"

"So we can speak in a more friendly fashion. And so you can take me to Mother Rittah's place. Do you know where she lives?"

"Maybe yes, maybe no. My name's Raych. What's in it for me if I take ya?"

"What would you like, Raych?"

The boy's eyes halted at Dors's belt. Raych said, "The lady got a couple o' knives. Gimme one and I'll take ya to Mother Rittah."

"Those are grown people's knives, Raych. You're too young."

"Then I guess I'm too young to know where Mother Rittah lives." And he looked up slyly through the shaggy hair that curtained his eyes.

Seldon grew uneasy. It was possible they might attract a crowd. Several men had stopped already, but had then moved on when nothing of interest seemed to be taking place. If, however, the boy grew angry and lashed out at them in word or deed, people would undoubtedly gather.

He smiled and said, "Can you read, Raych?"

Raych spat again. "Nab! Who wants to read?"

"Can you use a computer?"

"A talking computer? Sure. Anyone can."

"I'll tell you what, then. You take me to the nearest computer store and I'll buy you a little computer all your own and software that will teach you to read. A few weeks and you'll be able to read."

It seemed to Seldon that the boy's eyes sparkled at the thought, but-if so-they hardened at once. "'Nab, Knife or nothin'."

"That's the point, Raych. You learn to read and don't tell anyone and you can surprise people. After a while you can bet them you can read. Bet them five credits. You can win a few extra credits that way and you can buy a knife of your own."

The boy hesitated. "Nab! No one will bet me. No one got credits."

"If you can read, you can get a job in a knife store and you can save your wages and get a knife at a discount. How about that?"

"When ya gonna buy the talking computer?"

"Right now. I'll give it to you when I see Mother Rittah."

"You got credits?"

"I have a credit tile."

"Let's see ya buy the computer."

The transaction was carried through, but when the boy reached for it, Seldon shook his head and put it inside his pouch. "You've got to get me to Mother Rittah first, Raych. Are you sure you know where to find her?"

Raych allowed a look of contempt to cross his face. "Sure I do. I'll take ya there, only ya better hand over the computer when we get there or I'll get some guys I know after you and the lady, so ya better watch out."

"You don't have to threaten us," said Seldon. "We'll take care of our end of the deal."

Raych led them quickly along the walkway, past curious stares. Seldon was silent during the walk and so was Dors. Dors was far less lost in her own thoughts, though, for she clearly remained conscious of the surrounding people at all times. She kept meeting, with a level glare, the eyes of those passersby that turned toward them. On occasion, when there were footsteps behind them, she turned to look grimly back.

And then Raych stopped and said, "In here. She ain't homeless, ya know."

They followed him into an apartment complex and Seldon, who had had the intention of following their route with a view to retracing his steps later, was quickly lost.

He said, "How do you know your way through these alleys, Raych?"

The boy shrugged. "I been loafin' through them since I was a kid," he said.

"Besides, the apartments are numbered-where they ain't broken offend there's arrows and things. You can't get lost if you know the tricks."

Raych knew the tricks, apparently, and they wandered deeper into the complex. Hanging over it all was an air of total decay: disregarded debris, inhabitants slinking past in clear resentment of the outsiders' invasion. Unruly youngsters ran along the alleys in pursuit of some game or other. Some of them yelled, "Hey, get out o' the way!" when their levitating ball narrowly missed Dors. And finally, Raych stopped before a dark scarred door on which the number 2782 glowed feebly.

"This is it," he said and held out his hand.

"First let's see who's inside," said Seldon softly. He pushed the signal button and nothing happened.

"It don't work," said Raych. "Ya gotta bang. Loud. She don't hear too good."

Seldon pounded his fist on the door and was rewarded with the sound of movement inside. A shrill voice called out, "Who wants Mother Rittah?"

Seldon shouted, "Two scholars!"

He tossed the small computer, with its small package of software attached, to Raych, who snatched it, grinned, and took off at a rapid run. Seldon then turned to face the opening door and Mother Rittah.

70.

Mother Rittah was well into her seventies, perhaps, but had the kind of face that, at first sight, seemed to belie that. Plump cheeks, a little mouth, a small round chin slightly doubled. She was very short-not quite 1.5 meters tall-and had a thick body.

But there were fine wrinkles about her eyes and when she smiled, as she smiled at the sight of them, others broke out over her face. And she moved with difficulty.

"Come in, come in," she said in a soft high-pitched voice and peered at them as though her eyesight was beginning to fail. "Outsiders . . . Outworlders even. Am I right? You don't seem to have the Trantor smell about you."

Seldon wished she hadn't mentioned smell. The apartment, overcrowded and littered with small possessions that seemed dim and dusty, reeked with food odors that were on the edge of rancidity. The air was so thick and clinging that he was sure his clothes would smell strongly of it when they left.

He said, "You are sight, Mother Rittah. I am Hari Seldon of Helicon. My friend is Dors Venabili of Cinna."

"So," she said, looking about for an unoccupied spot on the floor where she could invite them to sit, but finding none suitable.

Dors said, "We are willing to stand, Mother."

"What?" she looked up at Dors. "You must speak briskly, my child. My hearing is not what it was when I was your age."

"Why don't you get a hearing device?" said Seldon, raising his voice.

"It wouldn't help, Master Seldon. Something seems to be wrong with the nerve and I have no money for nerve rebuilding. -You have come to learn the future from old Mother Rittah?"

"Not quite," said Seldon. "I have come to learn the past."

"Excellent. It is such a strain to decide what people want to hear."

"It must be quite an art," said Dors, smiling.

"It seems easy, but one has to be properly convincing. I earn my fees."

"If you have a credit outlet," said Seldon. "We will pay any reasonable fees if you tell us about Earth-without cleverly designing what you tell us to suit what we want to hear. We wish to hear the truth."

The old woman, who had been shuffling about the room, making adjustments here and there, as though to make it all prettier and more suitable for important visitors, stopped short. "What do you want to know about Earth?"

"What is it, to begin with?"

The old woman turned and seemed to gaze off into space. When she spoke, her voice was low and steady.

"It is a world, a very old planet. It is forgotten and lost."

Dors said, "It is not part of history. We know that much."

"It comes before history, child," said Mother Rittah solemnly. "It existed in the dawn of the Galaxy and before the dawn. It was the only world with humanity." She nodded firmly.

Seldon said, "Was another name for Earth . . . Aurora?"

And now Mother Rittah's face misted into a frown. "Where did you hear that?"

"In my wanderings. I have heard of an old forgotten world named Aurora on which humanity lived in primordial peace."

"It's a lie." She wiped her mouth as though to get the taste of what she had just heard out of it. "That name you mention must never be mentioned except as the place of Evil. It was the beginning of Evil. Earth was alone till Evil came, along with its sister worlds. Evil nearly destroyed Earth, but Earth rallied and destroyed Evil with the help of heroes."

"Earth was before this Evil. Are you sure of that?"

"Long before. Earth was alone in the Galaxy for thousands of years, millions of years."

"Millions of years? Humanity existed on it for millions of years with no other people on any other world?"

"That's true. That's true. That's true."

"But how do you know all this? Is it all in a computer program? Or a printout? Do you have anything I can read?"

Mother Rittah shook her head. "I heard the old stories from my mother, who heard it from hers, and so on far back. I have no children, so I tell the stories to others, but it may come to an end. This is a time of disbelief."

Dors said, "Not really, Mother. There are people who speculate about prehistoric times and who study some of the tales of lost worlds."

Mother Rittah made a motion of her arm as though to wipe it away. "They look at it with cold eyes. Scholarly. They try to fit it in with their notions. I could tell you stories for a year of the great hero Ba-Lee, but you would have no time to listen and I have lost the strength to tell."

Seldon said, "Have you ever heard of robots?"

The old woman shuddered and her voice was almost a scream. "Why do you ask such things? Those were artificial human beings, evil in themselves and the work of the Evil worlds. They were destroyed and should never be mentioned."

"There was one special robot, wasn't there, that the Evil worlds hated?"

Mother Rittah tottered toward Seldon and peered into his eyes. He could feel her hot breath on his face. "Have you come to mock me? You know of these things and yet you ask? Why do you ask?"

"Because I wish to know."

"There was an artificial human being who helped Earth. He was DaNee, friend of Ba-Lee. He never died and lives somewhere, waiting for his time to return. None knows when that time will be, but someday he will come and restore the great old days and remove all cruelty, injustice, and misery. That is the promise." At this, she closed her eyes and smiled, as if remembering . . .

Seldon waited a while in silence, then sighed and said, "Thank you, Mother Rittah. You have been very helpful. What is your fee?"

"So pleasant to meet Outworlders," the old woman replied. "Ten credits. May I offer you some refreshment?"

"No, thank you," said Seldon earnestly. "Please take twenty. You need only tell us how to get back to the Expressway from here. -And, Mother Rittah, if you can arrange to have some of your tales of Earth put into a computer disc, I will pay you well."

"I would need so much strength. How well?"

"It would depend on how long the story is and how well it is told. I might pay a thousand credits."

Mother Rittah licked her lips. "A thousand credits? But how will I find you when the story is told?"

"I will give you the computer code number at which I can be reached."

After Seldon gave Mother Rittah the code number, he and Dors left, thankful for the comparatively clean odor of the alley outside. They walked briskly in the direction indicated by the old woman.

Dors said, "That wasn't a very long interview, Hari."

"I know. The surroundings were terribly unpleasant and I felt I had learned enough. Amazing how these folktales tend to magnify."

"What do you mean, 'magnify'?"

"Well, the Mycogenians fill their Aurora with human beings who lived for centuries and the Dahlites fill their Earth with a humanity that lived for millions of years. And both talk of a robot that lives forever. Still, it makes one think."

"As far as millions of years go, there's room for-Where are we going?"

"Mother Rittah said we go in this direction till we reach a rest area, then follow the sign for CENTRAL WALKWAY, bearing left, and keep on following the sign. Did we pass a rest area on the way in?., "We may be leaving by a route different from the one we came in. I don't remember a rest area, but I wasn't watching the route. I was keeping my eye on the people we passed and-

Her voice died away. Up ahead the alley swelled outward on both sides.

Seldon remembered. They had passed that way. There had been a couple of ratty couch pads resting on the walkway floor on either side.

There was, however, no need for Dors to watch passersby going out as she had coming in. There were no passersby. But up ahead in the rest area they spotted a group of men, rather large-sized for Dahlites, mustaches bristling, bare upper arms muscular and glistening under the yellowish indoor light of the walkway.

Clearly, they were waiting for the Outworlders and, almost automatically, Seldon and Dors came to a halt. For a moment or two, the tableau held. Then Seldon looked behind him hastily. Two or three additional men had stepped into view.

Seldon said between his teeth, "We're trapped. I should not have let you come, Dors."

"On the contrary. This is why I'm here, but was it worth your seeing Mother Rittah?"

"If we get out of this, it was."

Seldon then said in a loud and firm voice, "May we pass?"

One of the men ahead stepped forward. He was fully Seldon's height of 1.73 meters, but broader in the shoulders and much more muscular. A bit flabby at the waist, though, Seldon noted.

"I'm Marron," he said with self-satisfied significance, as though the name ought to have meaning, "and I'm here to tell you we don't like Outworlders in our district. You want to come in, all right-but if you want to leave, you'll have to pay."

"Very well. How much?"

"All you've got. You rich Outworlders have credit tiles, right? Just hand them over."

"No."

"No point saying no. We'll just take them."

"You can't take them without killing me or hurting me and they won't work without my voiceprint. My normal voiceprint."

"That's not so, Master-see, I'm being polite-we can take them away from you without hurting you very much."

"How many of you big strong men will it take? Nine? No." Seldon counted rapidly.

"Ten."

"Just one. Me."

"With no help?"

' Just me."

"If the rest of you will clear away and give us room, I would like to see you cry it, Marron."

"You don't have a knife, Master. You want one?"

"No, use yours to make the fight even. I'll fight without one."

Marron looked about at the others and said, "Hey, this puny guy is a sport. He don't even sound scared. That's sort of nice. It would be a shame to hurt him.

-I tell you what, Master. I'll take the girl. If you want me to stop, hand over your credit tile and her tile and use your right voices to activate them. If you say no, then after I'm through with the girl . . . and that'll take some time"-he laughed-"I'll just have to hurt you."

"No," said Seldon. "Let the woman go. I've challenged you to a fight one to one, you with a knife, me without. If you want bigger odds, I'll fight two of you, but let the woman go."

"Stop, Hari!" cried out Dors. "If he wants me, let him come and get me. You stay right where you are, Hari, and don't move."

"You hear that?" said Marron, grinning broadly. "'You stay right where you are, Hari, and don't move.' I think the little lady wants me. You two, keep him still."

Each of Seldon's arms were caught in an iron grip and he felt the sharp point of a knife in his back.

"Don't move," said a harsh whisper in his ear, "and you can watch. The lady will probably like it. Marron's pretty good at this."

Dors called out again. "Don't move, Hari!" She turned to face Marron watchfully, her half-closed hands poised near her belt.

He closed in on her purposefully and she waited till he had come within arm's length, when suddenly her own arms flashed and Marron found himself facing two large knives.

For a moment, he leaned backward and then he laughed. "The little lady has two knives-knives like the big boys have. And I've only got one. But that's fair enough." His knife was swiftly out. "I hate to have to cut you, little lady, because it will be more fun for both of us if I don't. Maybe I can just knock them out of your hands, huh?"

Dors said, "I don't want to kill you. I'll do all I can to avoid doing so. Just the same, I call on all to witness, that if I do kill you, it is to protect my friend, as I am honor-bound to do."

Macron pretended to be terrified. "Oh, please don't kill me, little lady." Then he burst into laughter and was joined by the other Dahlites present.

Macron lunged with his knife, quite wide of the mark. He tried it again, then a third time, but Dors never budged. She made no attempt to fend off any motion that was not truly aimed at her.

Macron's expression darkened. He was trying to make her respond with panic, but he was only making himself seem ineffectual. The next lunge was directly at her and Dors's left-hand blade moved flashingly and caught his with a force that pushed his arm aside. Her right-hand blade flashed inward and made a diagonal slit in his T-shirt. A thin bloody line smeared the dark-haired skin beneath.

Macron looked down at himself in shock as the onlookers gasped in surprise. Seldon felt the grip on him weaken slightly as the two who held him were distracted by a duel not going quite as they had expected. He tensed himself.

Now Macron lunged again and this time his left hand shot outward to enclose Dors's right wrist. Again Dors's left-hand blade caught his knife and held it motionless, while her right hand twisted agilely and drew downward, even as Macron's left hand closed upon it. It closed on nothing but the blade and when he opened his hand there was a bloody line down the palm.

Dors sprang back and Macron, aware of the blood on his chest and hand, roared out chokingly, "Someone toss me another knife!"

There was hesitation and then one of the onlookers tossed his own knife underhanded. Macron reached for it, but Dors was quicker. Her right-hand blade struck the thrown knife and sent it flying backward, whirling as it went.

Seldon felt the grips on his arms weaken further. He lifted them suddenly, pushing up and forward, and was free. His two captors turned toward him with a sudden shout, but he quickly kned one in the groin and elbowed the other in the solar plexus and both went down.

He knelt to draw the knives of each and rose as double-armed as Dors. Unlike Dors, Seldon did not know how to handle the blades, but he knew the Dahrites would scarcely be aware of that Dor said, ' Just keep them off, Hari. Don't attack yet. -Macron, my next stroke will not be a scratch. "

Macron, totally enraged, roared incoherently and charged blindly, attempting by sheer kinetic energy to overwhelm his opponent. Dors, dipping and sidestepping, ducked under his right arm, kicked her foot against his right ankle, and down he crashed, his knife flying.

She then knelt, placed one blade against the back of his neck and the other against his throat, and said, "Yield!"

With another yell, Macron struck out against her with one arm, pushed her to one side, then scrambled to his feet.

He had not yet stood up completely when she was upon him, one knife slashing downward and hacking away a section of his mustache. This time he yowled like a large animal in agony, clapping his hand to his face. When he drew it away, it was dripping blood.

Dors shouted, "It won't grow again, Macron. Some of the lip went with it. Attack once more and you're dead meat. "

She waited, but Macron had had enough. He stumbled away, moaning, leaving a trail of blood.

Dors turned toward the others. The two that Seldon had knocked down were still lying there, unarmed and not anxious to get up. She bent down, cut their belts with one of her knives and then slit their trousers.

"This way, you'll have to hold your pants up when you walk," she said.

She stared at the seven men still on their feet, who were watching her with awestruck fascination. "And which of you threw the knife?"

There was silence.

She said, "It doesn't matter to me. Come one at a time or all together, but each time I slash, someone dies."

And with one accord, the seven turned and scurried away.

Dors lifted her eyebrows and said to Seldon "This time, at least, Hummin can't complain that I failed to protect you."

Seldon said, "I still can't believe what I saw. I didn't know you could do anything like that-or talk like that either."

Dors merely smiled. "You have your talents too. We make a good pair. Here, retract your knife blades and put them into your pouch. I think the news will spread with enormous speed and we can get out of Billibotton without fear of being stopped."

She was quite right.

UNDERCOVER

DAVAN- . . . In the unsettled times marking the final centuries of the First Galactic Empire, the typical sources of unrest arose from the fact that political and military leaders jockeyed for "supreme" power (a supremacy that grew more worthless with each decade). Only rarely was there anything that could be called a popular movement prior to the advent of psychohistory. In this connection, one intriguing example involves Davan, of whom little is actually known, but who may have met with Hari Seldon at one time when . . .

ENCYCLOPEDIA GALACTICA

72.

Both Hari Seldon and Dors Venabili had taken rather lingering baths, making use of the somewhat primitive facilities available to them in the Tisalver household. They had changed their clothing and were in Seldon's room when Jirad Tisalver returned in the evening. His signal at the door was (or seemed) rather timid. The buzz did not last long.

Seldon opened the door and said pleasantly, "Good evening, Master Tisalver. And Mistress."

She was standing right behind her husband, forehead puckered into a puzzled frown.

Tisalver said tentatively, as though he was unsure of the situation, "Are you and Mistress Venabili both well?" He nodded his head as though trying to elicit an affirmative by body language.

"Quite well. In and out of Billibotton without trouble and we're all washed and changed. There's no smell left." Seldon lifted his chin as he said it, smiling, tossing the sentence over Tisalver's shoulder to his wife.

She sniffed loudly, as though testing the matter.

Still tentatively, Tisalver said, "I understand there was a knife fight."

Seldon raised his eyebrows. "Is that the story?"

"You and the Mistress against a hundred thugs, we were cold, and you killed them all. Is that so?" There was the reluctant sound of deep respect in his voice.

"Absolutely not," Dors put in with sudden annoyance. "That's ridiculous. What do you think we are? Mass murderers? And do you think a hundred thugs would remain in place, waiting the considerable time it would take me-us-to kill them all? I mean, think about it."

"That's what they're saying," said Casilia Tisalver with shrill firmness. "We can't have that sort of thing in this house."

"In the first place," said Seldon, "it wasn't in this house. In the second, it wasn't a hundred men, it was ten. In the third, no one was killed. There was some altercation back and forth, after which they left and made way for us."

"They just made way. Do you expect me to believe that, Outworlders?" demanded Mistress Tisalver belligerently.

Seldon sighed. At the slightest stress, human beings seemed to divide themselves into antagonistic groups. He said, "Well, I grant you one of them was cut a little. Not seriously."

"And you weren't hurt at all?" said Tisalver. The admiration in his voice was more marked.

"Not a scratch," said Seldon. "Mistress Venabili handles two knives excellently well."

"I dare say," said Mistress Tisalver, her eyes dropping to Dors's belt, "and that's not what I want to have going on here."

Dors said sternly, "As long as no one attacks us here, that's what you won't have here."

"But on account of you," said Mistress Tisalver, "we have trash from the street standing at the doorway."

"My love," said Tisalver soothingly, "let us not anger-

"Why?" spat his wife with contempt. "Are you afraid of her knives? I would like to see her use them here."

"I have no intention of using them here," said Dors with a sniff as loud as any that Mistress Tisalver had produced. "What is this trash from the street you're talking about?"

Tisalver said, "What my wife means is that an urchin from Billibotton-at least, judging by his appearance-wishes to see you and we are not accustomed to that sort of thing in this neighborhood. It undermines our standing." He sounded apologetic.

Seldon said, "Well, Master Tisalver, we'll go outside, find out what it's all about, and send him on his business as quickly-

"No. Wait," said Dors, annoyed. "These are our rooms. We pay for them. We decide who visits us and who does not. If there is a young man outside from Billibotton, he is nonetheless a Dahlite. More important, he's a Trantorian. Still more important, he's a citizen of the Empire and a human being. Most important, by asking to see us, he becomes our guest. Therefore, we invite him in to see us."

Mistress Tisalver didn't move. Tisalver himself seemed uncertain.

Dors said, "Since you say I killed a hundred bullies in Billibotton, you surely do not think I am afraid of a boy or, for that matter, of you two." Her right hand dropped casually to her belt.

Tisalver said with sudden energy, "Mistress Venabili, we do not intend to offend you. Of course these rooms are yours and you can entertain whomever you wish here." He stepped back, pulling his indignant wife with him, undergoing a burst of resolution for which he might conceivably have to pay afterward.

Dors looked after them sternly.

Seldon smiled dryly. "How unlike you, Dors. I thought I was the one who quixotically got into trouble and that you were the calm and practical one whose only aim was to prevent trouble."

Dors shook her head. "I can't bear to hear a human being spoken of with contempt just because of his group identification-even by other human beings. It's these respectable people here who create those hooligans out there."

"And other respectable people," said Seldon, "who create these respectable people. These mutual animosities are as much a part of humanity-

"Then you'll have to deal with it in your psychohistory, won't you?"

"Most certainly-if there is ever a psychohistory with which to deal with anything at all. -Ah, here comes the urchin under discussion. And it's Raych, which somehow doesn't surprise me."

73.

Raych entered, looking about, clearly intimidated. The forefinger of his right hand reached for his upper lip as though wondering when he would begin to feel the first downy hairs there.

He turned to the clearly outraged Mistress Tisilver and bowed clumsily. "Thank ya, Missus. Ya got a lovely place."

Then, as the door slammed behind him, he turned to Seldon and Dors with an air of easy connoisseurship. "Nice place, guys."

"I'm glad you like it," said Seldon solemnly. "How did you know we were here?"

"Followed ya. How'd ya think? Hey, lady"-he turned to Dors ="you don't fight like no dame."

"Have you watched many dames fight?" asked Dors, amused.

Raych rubbed his nose, "No, never seen none whatever. They don't carry knives, except little ones to scare kids with. Never scared me."

"I'm sure they didn't. What do you do to make dames draw their knives?"

"Nothin'. You just kid around a little. You holler, 'Hey, lady, lemme-' "

He thought about it for a moment and said, "Nothin'."

Dors said, "Well, don't try that on me."

"Ya kiddin'? After what ya did to Marron? Hey, lady, where'd you learn to fight that way?"

"On my own world."

"Could ya teach me?"

"Is that what you came here to see me about?"

"Akchaly, no. I came to bring ya a kind of message."

"From someone who wants to fight me?"

"No one wants to fight ya, lady. Listen, lady, ya got a reputation now. Everybody knows ya. You just walk down anywhere in old Billibotton and all the guys will step aside

and let ya pass and grin and make sure they don't look cross-eyed at ya. Oh, lady, ya got it made. That's why he wants to see ya."

Seldon said, "Raych, just exactly who wants to see us?"

"Guy called Davan."

"And who is he?"

"Just a guy. He lives in Billibotton and don't carry no knife."

"And he stays alive, Raych?"

"He reads a lot and he helps the guys there when they get in trouble with the gov'ment. They kinda leave him alone. He don't need no knife."

"Why didn't he come himself, then?" said Dors. "Why did he send you?"

"He don't like this place. He says it makes him sick. He says all the people here, they lick the gov'ment' s-" He paused, looked dubiously at the two Outworlders, and said, "Anyway, he won't come here. He said they'd let me in cause I was only a kid." He grinned. "They almost didn't, did they? I mean that lady there who looked like she was smellin' somethin'?"

He stopped suddenly, abashed, and looked down at himself. "Ya don't get much chance to wash where I come from."

"It's all right," said Dors, smiling. "Where are we supposed to meet, then, if he won't come here? After all -if you don't mind- we don't feel like going to Billibotton."

"I told ya," said Raych indignantly. "Ya get free run of Billibotton, I swear. Besides, where he lives no one will bother ya."

"Where is it?" asked Seldon.

"I can take ya there. It ain't far."

"And why does he want to see us?" asked Dors.

"Dunno. But he says like this-" Raych half-closed his eyes in an effort to remember. "'Tell them I wanna see the man who talked to a Dahlite heatsinker like he was a human being and the woman who beat Marron with knives and didn't kill him when she mighta done so.' I think I got it right."

Seldon smiled. "I think you did. Is he ready for us now?"

"He's waiting."

"Then we'll come with you." He looked at Dors with a trace of doubt in his eyes.

She said, "All right. I'm willing. Perhaps it won't be a trap of some sort. Hope springs eternal-"

74.

There was a pleasant glow to the evening light when they emerged, a faint violet touch and a pinkish edge to the simulated sunset clouds that were scudding along. Dahl might have complaints of their treatment by the Imperial rulers of Trantor, but surely there was nothing wrong with the weather the computers spun out for them.

Dors said in a low voice, "We seem to be celebrities. No mistake about that."

Seldon brought his eyes down from the supposed sky and was immediately aware of a fair-sized crowd around the apartment house in which the Tisalvers lived. Everyone in the crowd stared at them intently. When it was clear that the two Outworlders had become aware of the attention, a low murmur ran through the crowd, which seemed to be on the point of breaking out into applause.

Dors said, "Now I can see where Mistress Tisalver would find this annoying. I should have been a little more sympathetic."

The crowd was, for the most part, poorly dressed and it was not hard to guess that many of the people were from Billibotton.

On impulse, Seldon smiled and raised one hand in a mild greeting that was met with applause. One voice, lost in the safe anonymity of the crowd called out, "Can the lady show us some knife tricks?"

When Dors called back, "No, I only draw in anger," there was instant laughter.

One man stepped forward. He was clearly not from Billibotton and bore no obvious mark of being a Dahlite. He had only a small mustache, for one thing, and it was brown, not black. He said, "Marlo Tanto of the 'Trantorian HV News.' Can we have you in focus for a bit for our nightly holocaust?"

"No," said Dors shortly. "No interviews."

The newsman did not budge. "I understand you were in a fight with a great many men in Billibotton-and won." He smiled. "That's news, that is."

"No," said Dors. "We met some men in Billibotton, talked to them, and then moved on. That's all there is to it and that's all you're going to get."

"What's your name? You don't sound like a Trantorian."

"I have no name."

"And your friend's name?"

"He has no name."

The newsman looked annoyed, "Look, lady. You're news and I'm just trying to do my job."

Raych pulled at Dors's sleeve. She leaned down and listened to his earnest whisper.

She nodded and straightened up again. "I don't think you're a newsman, Mr. Tanto. What I think you are is an Imperial agent trying to make trouble for Dahl. There was no fight and you're trying to manufacture news concerning one as a way of justifying an Imperial expedition into Billibotton. I wouldn't stay here if I were you. I don't think you're very popular with these people."

The crowd had begun to mutter at Dors's first words. They grew louder now and began to drift, slowly and in a menacing way, in the direction of Tanto. He looked nervously around and began to move away.

Dors raised her voice. "Let him go. Don't anyone touch him. Don't give him any excuse to report violence."

And they parted before him.

Raych said, "Aw, lady, you shoulda let them rough him up."

"Bloodthirsty boy," said Dors, "take us to this friend of yours."

75.

They met the man who called himself Davan in a room behind a dilapidated diner. Far behind. Raych led the way, once more showing himself as much at home in the burrows of Billibotton as a mole would be in tunnels underground in Helicon.

It was Dors Venabili whose caution first manifested itself. She stopped and said, "Come back, Raych. Exactly where are we going?"

"To Davan," said Raych, looking exasperated. "I told ya."

"But this is a deserted area. There's no one living here." Dors looked about with obvious distaste. The surroundings were lifeless and what light panels were there did not glower did so only dimly.

"It's the way Davan likes it," said Raych. "He's always changing around, staying here, staying there. Ya know . . . changing around."

"Why?" demanded Dors.

"It's safer, lady."

"From whom?"

"From the gov'ment"

"Why would the government want Davan?"

"I dunno, lady. Tell ya what. I'll tell ya where he is and tell ya how to go and ya go on alone-if ya don't want me to take ya."

Seldon said, "No, Raych, I'm pretty sure we'll get lost without you. In fact, you had better wait till we're through so you can lead us back."

Raych said at once, "What's in it f' me? Ya expect me to hang around when I get hungry?"

"You hang around and get hungry, Raych, and I'll buy you a big dinner. Anything you like."

"Ya say that now. Mister. How do I know?"

Dors's hand flashed and it was holding a knife, blade exposed, "You're not calling us liars, are you, Raych?"

Raych's eyes opened wide. He did not seem frightened by the threat. He said, "Hey, I didn't see that. Do it again."

"I'll do it afterward-if you're still here. Otherwise"-Dors glared at him- "we'll track you down."

"Aw, lady, come on," said Raych. "Ya ain't gonna track me down. Ya ain't that kind. But I'll be here." He struck a pose. "Ya got my word."

And he led them onward in silence, though the sound of their shoes was hollow in the empty corridors.

Davan looked up when they entered, a wild look that softened when he saw Raych. He gestured quickly toward the two others questioningly.

Raych said, "These are the guys." And, grinning, he left.

Seldon said, "I am Hari Seldon. The young lady is Dors Venabili."

He regarded Davan curiously. Davan was swarthy and had the thick black mustache of the Dahlite male, but in addition he had a stubble of beard. He was the first Dahlite whom Seldon had seen who had not been meticulously shaven. Even the bullies of Billibotton had been smooth of cheek and chin.

Seldon said, "What is your name, sir?"

"Davan. Raych must have told you."

"Your second name."

"I am only Davan. Were you followed here, Master Seldon?"

"No, I'm sure we weren't. If we had, then by sound or sight, I expect Raych would have known. And if he had not, Mistress Venabili would have."

Dors smiled slightly. "You have faith in me, Hari."

"More all the time," he said thoughtfully.

Davan stirred uneasily. "Yet you've already been found."

"Found?"

"Yes, I have heard of this supposed newsman."

"Already?" Seldon looked faintly surprised. "But I suspect he really was a newsman . . . and harmless. We tatted him an Imperial agent at Raych's suggestion, which was a good idea. The surrounding crowd grew threatening and we got rid of him."

"No," said Davan, "he was what you called him. My people know the man and he does work for the Empire. -But then you do not do as I do. You do not use a false name and change your place of abode. You go under your own names, making no effort to remain undercover. You are Hari Seldon, the mathematician."

"Yes, I am," said Seldon. "Why should I invent a false name?"

"The Empire wants you, does it not?"

Seldon shrugged. "I stay in places where the Empire cannot reach out to take me."

"Not openly, but the Empire doesn't have to work openly. I would urge you to disappear . . . really disappear."

"Like you . . . as you say," said Seldon looking about with an edge of distaste.

The room was as dead as the corridors he had walked through. It was musty through and through and it was overwhelmingly depressing.

"Yes," said Davan. "You could be useful to us."

"In what way?"

"You talked to a young man named Yugo Amaryl."

"Yes, I did."

"Amaryl tells me that you can predict the future."

Seldon sighed heavily. He was tired of standing in this empty room. Davan was sitting on a cushion and there were other cushions available, but they did not look clean. Nor did he wish to lean against the mildew-streaked wall.

He said, "Either you misunderstood Amaryl or Amaryl misunderstood me. What I have done is to prove that it is possible to choose staffing conditions from which historical

forecasting does not descend into chaotic conditions, but can become predictable within limits. However, what those starting conditions might be I do not know, nor am I sure that those conditions can be found by any one person-or by any number of people-in a finite length of time. Do you understand me?"

'No.'

Seldon sighed again. "Then let me try once more. It is possible to predict the future, but it may be impossible to find out how to take advantage of that possibility. Do you understand?"

Davan looked at Seldon darkly, then at Dors. "Then you cant predict the future."

"Now you have the point, Master Davan."

'Just call me Davan. But you may be able to learn to predict the future someday.'

"That is conceivable."

"Then that's why the Empire wants you."

"No," Seldon raised his finger didactically. "It's my idea that that is why the Empire is not making an overwhelming effort to get me. They might like to have me if I can be picked up without trouble, but they know that right now I know nothing and that it is therefore not worth upsetting the delicate peace of Trantor by interfering with the local rights of this sector or that. That's the reason I can move about under my own name with reasonable security."

For a moment, Davan buried his head in his hands and muttered, "This is madness." Then he looked up wearily and said to Dors, "Are you Master Seldon's wife?"

Dors said calmly, "I am his friend and protector."

"How well do you know him?"

"We have been together for some months."

"No more?"

"No more."

"Would it be your opinion he is speaking the truth?"

"I know he is, but what reason would you have to trust me if you do not trust him? If Hari is, for some reason, lying to you, might I not be lying to you equally in order to support him?"

Davan looked from one to the other helplessly. Then he said, "Would you, in any case, help us?"

"Who are 'us' and in what way do you need help?"

Davan said, "You see the situation here in Dahl. We are oppressed. You must know that and, from your treatment of Yugo Amaryl, I cannot believe you lack sympathy for us."

"We are fully sympathetic."

"And you must know the source of the oppression."

"You are going to tell me that it's the Imperial government, I suppose, and I dare say it plays its part. On the other hand, I notice that there is a middle class in Dahl that despises the heatsinkers and a criminal class that terrorizes the rest of the sector."

Davan's lips tightened, but he remained unmoved. "Quite true. Quite true. But the Empire encourages it as a matter of principle. Dahl has the potential for making serious

trouble. If the heatsinkers should go on strike, Trantor would experience a severe energy shortage almost at once . . . with all that that implies. However, Dahl's own upper classes will spend money to hire the hoodlums of Billibotton--and of other places--to fight the heatsinkers and break the strike.

It has happened before. The Empire allows some Dahlites to prosper--comparatively--in order to convert them into Imperialist lackeys, while it refuses to enforce the arms-control laws effectively enough to weaken the criminal element "The Imperial government does this everywhere--and not in Dahl alone. They can't exert force to impose their will, as in the old days when they ruled with brutal directness. Nowadays, Trantor has grown so complex and so easily disturbed that the Imperial forces must keep their hands off--"

"A form of degeneration," said Seldon, remembering Hummin's complaints.

"What?" said Davan.

"Nothing," said Seldon. "Go on."

"The Imperial forces must keep their hands off, but they find that they can do much even so. Each sector is encouraged to be suspicious of its neighbors. Within each sector, economic and social classes are encouraged to wage a kind of war with each other. The result is that all over Trantor it is impossible for the people to take united action. Everywhere, the people would rather fight each other than make a common stand against the central tyranny and the Empire rules without having to exert force."

"And what," said Dors, "do you think can be done about it?"

"I've been trying for years to build a feeling of solidarity among the peoples of Trantor."

"I can only suppose," said Seldon dryly, "that you are finding this an impossibly difficult and largely thankless task."

"You suppose correctly," said Davan, "but the party is growing stronger. Many of our knifers are coming to the realization that knives are best when they are not used on each other. Those who attacked you in the corridors of Billibotton are examples of the unconverted. However, those who support you now, who are ready to defend you against the agent you thought was a newsman, are my people. I live here among them. It is not an attractive way of life, but I am safe here. We have adherents in neighboring sectors and we spread daily."

"But where do we come in?" asked Dors.

"For one thing," said Davan, "both of you are Outworlders, scholars. We need people like you among our leaders. Our greatest strength is drawn from the poor and the uneducated because they suffer the most, but they can lead the least. A person like one of you two is worth a hundred of them."

"That's an odd estimate from someone who wishes to rescue the oppressed," said Seldon.

"I don't mean as people," said Davan hastily. "I mean as far as leadership is concerned. The party must have among its leaders men and women of intellectual power."

"People like us, you mean, are needed to give your party a veneer of respectability."

Davan said, "You can always put something noble in a sneering fashion if you try. But you, Master Seldon, are more than respectable, more than intellectual. Even if you won't admit to being able to penetrate the mists of the future--"

"Please, Davan," said Seldon, "don't be poetic and don't use the conditional. It's not a matter of admitting. I can't foresee the future. Those are not mists that block the view but chrome steel barriers."

"Let me finish. Even if you can't actually predict with-what do you call it?-psychohistorical accuracy, you've studied history and you may have a certain intuitive feeling for consequences. Now, isn't that so?"

Seldon shook his head. "I may have a certain intuitive understanding for mathematical likelihood, but how far I can translate that into anything of historical significance is quite uncertain. Actually, I have not studied history. I wish I had. I feel the loss keenly."

Dors said evenly, "I am the historian, Davan, and I can say a few things if you wish."

"Please do," said Davan, making it half a courtesy, half a challenge.

"For one thing, there have been many revolutions in Galactic history that have overthrown tyrannies, sometimes on individual planets, sometimes in groups of them, occasionally in the Empire itself or in the pre-Imperial regional governments. Often, this has only meant a change in tyranny. In other words, one ruling class is replaced by another sometimes by one that is more efficient and therefore still more capable of maintaining itself-while the poor and downtrodden remain poor and downtrodden or become even worse off."

Davan, listening intently, said, "I'm aware of that. We all are. Perhaps we can learn from the past and know better what to avoid. Besides, the tyranny that now exists is actual. That which may exist in the future is merely potential. If we are always to draw back from change with the thought that the change may be for the worse, then there is no hope at all of ever escaping injustice."

Dors said, "A second point you must remember is that even if you have right on your side, even if justice thunders condemnation, it is usually the tyranny in existence that has the balance of force on its side. There is nothing your knife handlers can do in the way of rioting and demonstrating that will have any permanent effect as long as, in the extremity, there is an army equipped with kinetic, chemical, and neurological weapons that is willing to use them against your people. You can get all the downtrodden and even all the respectables on your side, but you must somehow win over the security forces and the Imperial army or at least seriously weaken their loyalty to the rulers."

Davan said, "Trantor is a multi-governmental world. Each sector has its own rulers and some of them are themselves anti-Imperial. If we can have a strong sector on our side, that would change the situation, would it not? We would then not be merely ragamuffins fighting with knives and stones."

"Does that mean you do have a strong sector on your side or merely that it is your ambition to have one?"

Davan was silent.

Dors said, "I shall assume that you are thinking of the Mayor of Wye. If the Mayor is in the mood to make use of popular discontent as a way of improving the chance of toppling the Emperor, doesn't it strike you that the end the Mayor would have in view would be that of succeeding to the Imperial throne? Why should the Mayor risk his present not-inconsiderable position for anything less?"

Merely for the blessings of justice and the decent treatment of people, concerning whom he can have little interest?"

"You mean," said Davan, "that any powerful leader who is willing to help us may then betray us."

"It is a situation that is all too common in Galactic history."

"If we are ready for that, might we not betray him?"

"You mean, make use of him and then, at some crucial moment, subvert the leader of his forces-or a leader, at any race-and have him assassinated?"

"Not perhaps exactly like that, but some way of getting rid of him might exist if that should prove necessary."

"Then we have a revolutionary movement in which the principal players must be ready to betray each other, with each simply waiting for the opportunity. It sounds like a recipe for chaos."

"You will not help us, then?" said Davan.

Seldon, who had been listening to the exchange between Davan and Dors with a puzzled frown on his face, said, "We can't put it that simply. We would like to help you. We are on your side. It seems to me that no sane man wants to uphold an Imperial system that maintains itself by fostering mutual hatred and suspicions. Even when it seems to work, it can only be described as metastable; that is, as too apt to fall into instability in one direction or another. But the question is: How can we help? If I had psychohistory, if I could tell what is most likely to happen, or if I could tell what action of a number of alternative possibilities is most likely to bring on an apparently happy consequence, then I would put my abilities at your disposal. -But I don't have it. I can help you best by trying to develop psychohistory."

"And how long will that take?"

Seldon shrugged. "I cannot say."

"How can you ask us to wait indefinitely?"

"What alternative do I have, since I am useless to you as I am? But I will say this: I have until very recently been quite convinced that the development of psychohistory was absolutely impossible. Now I am not so certain of that."

"You mean you have a solution in mind?"

"No, merely an intuitive feeling that a solution might be possible. I have not been able to pin down what has occurred to make me have that feeling. It may be an illusion, but I am trying. Let me continue to try. -Perhaps we will meet again."

"Or perhaps," said Davan, "if you return to where you are now staying, you will eventually find yourself in an Imperial trap. You may think that the Empire will leave you alone while you struggle with psychohistory, but I am certain the Emperor and his toady Demerzel are in no mood to wait forever, any more than I am."

"It will do them no good to hasten," said Seldon calmly, "since I am not on their side, as I am on yours. -Come, Dors."

They turned and left Davan, sitting alone in his squalid room, and found Raych waiting for them outside.

76.

Raych was eating, licking his fingers, and crumpling the bag in which the food-whatever it was-had been. A strong smell of onions pervaded the air-different somehow, yeast-based perhaps.

Dors, recreating a little from the odor, said, "Where did you get the food from, Raych?"

"Davan's guys. They brought it to me. Davan's okay."

"Then we don't have to buy you dinner, do we?" said Seldon, conscious of his own empty stomach.

"Ya owe me somethin'" said Raych, looking greedily in Dors's direction. "How about the lady's knife? One of 'em."

"No knife," said Dors. "You get us back safely and I'll give you five credits."

"Can't get no knife for five credits," grumbled Raych.

"You're not getting anything but five credits," said Dors.

"You're a lousy dame, lady," said Raych.

"I'm a lousy dame with a quick knife, Raych, so get moving."

"All right. Don't get all perspired." Raych waved his hand. "This way."

It was back through the empty corridors, but this time Dors, looking this way and that, stopped. "Hold on, Raych. We're being followed."

Raych looked exasperated. "Ya ain't supposed to hear 'em."

Seldon said, bending his head to one side, "I don't hear anything."

"I do," said Dors. "Now, Raych, I don't want any fooling around. You tell me right now what's going on or I'll rap your head so that you won't see straight for a week. I mean it."

Raych held up one arm defensively. "You try it, you lousy dame. You try it. -It's Davan's guys. They're just taking care of us, in case any knifers come along."

"Davan's guys?"

"Yeah. They're goin' along the service corridors."

Dors's right hand shot out and seized Raych by the scruff of his upper garment. She lifted and he dangled, shouting, "Hey, lady. Hey!"

Seldon said, "Dors! Don't be hard on him."

"I'll be harder still if I think he's lying. You're my charge, Hari, not he."

"I'm not lyin'," said Raych, struggling. "I'm not."

"I'm sure he isn't," said Seldon.

"Well, we'll see. Raych, tell them to come out where we can see them." She let him drop and dusted her hands.

"You're some kind of nut, lady," said Raych aggrievedly. Then he raised his voice.

"Yay, Davan! Come out here, some of ya guys!"

There was a wait and then, from an unlit opening along the corridor, two dark-mustached men came out, one with a scar running the length of his cheek. Each held the sheath of a knife in his hand, blade withdrawn.

"How many more of you are there?" asked Dors harshly.

"A few," said one of the newcomers. "Orders. We're guarding you. Davan wants you safe."

"Thank you. Try to be even quieter. Raych, keep on moving."

Raych said sulkily, "Ya toughed me up when I was telling the truth."

"You're right," said Dors. "At least, I think you're right . . . and I apologize."

"I'm not sure I should accept," said Raych, trying to stand tall. "But awright, just this once." He moved on.

When they reached the walkway, the unseen corps of guards vanished. At least, even Dors's keen ears could hear them no more. By now, though, they were moving into the respectable part of the sector.

Dors said thoughtfully, "I don't think we have clothes that would fit you, Raych."

Raych said, "Why do ya want clothes to fit me, Missus?" (Respectability seemed to invade Raych once they were out of the corridors.) "I got clothes."

"I thought you'd like to come into our place and take a bath."

Raych said, "What for? I'll wash one o' these days. And I'll put on my other shirt." He looked up at Dors shrewdly. "You're sorry ya roughed me up. Right? Ya tryin' to make up?"

Dors smiled. "Yes. Sort of."

Raych waved a hand in lordly fashion. "That's all right. Ya didn't hurt. Listen. You're strong for a lady. Ya lifted me up like I was nothin'."

"I was annoyed, Raych. I have to be concerned about Master Seldon."

"Ya sort of his bodyguard?" Raych looked at Seldon inquiringly. "Ya got a lady for a bodyguard?"

"I can't help it," said Seldon smiling wryly. "She insists. And she certainly knows her job."

Dors said, "Think again, Raych. Are you sure you won't have a bath? A nice warm bath."

Raych said, "I got no chance. Ya think that lady is gonna let me in the house again?"

Dors looked up and saw Casilia Tisilver outside the front door of the apartment complex, staring first at the Outworld woman and then at the slum-bred boy. It would have been impossible to tell in which case her expression was angrier.

Raych said, "Well, so long, Mister and Missus. I don't know if she'll let either of ya in the house." He placed his hands in his pocket and swaggered off in a fine affectation of carefree indifference.

Seldon said, "Good evening, Mistress Tisilver. It's rather late, isn't it?"

"It's very late," she replied. "There was a near riot today outside this very complex because of that newsman you pushed the street vermin at."

"We didn't push anyone on anyone," said Dors.

"I was there," said Mistress Tisilver intransigently. "I saw it."

She stepped aside to let them enter, but delayed long enough to make her reluctance quite plain.

"She acts as though that was the last straw," said Dors as she and Seldon made their way up to their rooms.

"So? What can she do about it?" asked Seldon.

"I wonder," said Dors.

OFFICERS

RAYCH- . . . According to Hari Seldon, the original meeting with Raych was entirely accidental. He was simply a gutter urchin from whom Seldon had asked directions. But his life, from that moment on, continued to be intertwined with that of the great mathematician until .

ENCYCLOPEDIA GALACTICA

77.

The next morning, dressed from the waist down, having washed and shaved, Seldon knocked on the door that led to Dors's adjoining room and said in a moderate voice, "Open the door, Dors."

She did. The short reddish-gold curls of her hair were still wet and she too was dressed only from the waist down.

Seldon stepped back in embarrassed alarm. Dors looked down at the swell of her breasts indifferently and wrapped a towel around her head. "What is it?" she asked.

Seldon said, looking off to his right, "I was going to ask you about Wye."

Dors said very naturally, "About why in connection with what? And for goodness sake, don't make me talk to your ear. Surely, you're not a virgin."

Seldon said in a hurt tone, "I was merely trying to be polite. If you don't mind, I certainly don't. And it's not why about what. I'm asking about the Wye Sector."

"Why do you want to know? Or, if you prefer: Why Wye?"

"Look, Dors, I'm serious. Every once in a while, the Wye Sector is mentioned-the Mayor of Wye, actually. Hummin mentioned him, you did, Davan did. I don't know anything about either the sector or the Mayor."

"I'm not a native Trantorian either, Hari. I know very little, but you're welcome to what I do know. Wye is near the south pole quite large, very populous-"

"Very populous at the south pole?"

"We're not on Helicon, Hari. Or on Cinna either. This is Trantor. Everything is underground and underground at the poles or underground at the equator is pretty much the same. Of course, I imagine they keep their day-night arrangements rather extreme -- long days in their summer, long nights in their winter-almost as it would be on the surface. The extremes are just affectation; they're proud of being polar."

"But Upperside they must be cold, indeed."

"Oh yes. The Wye Upperside is snow and ice, but it doesn't lie as thickly there as you might think. If it did, it might crush the dome, but it doesn't and that is the basic reason for Wye's power."

She turned to her mirror, removed the towel from her head, and threw the dry-net over her hair, which, in a matter of five seconds, gave it a pleasant sheen. She said, "You have no idea how glad I am not to be wearing a skincap," as she put on the upper portion of her clothing.

"What has the ice layer to do with Wye's power?"

"Think about it. Forty billion people use a great deal of power and every calorie of it eventually degenerates into heat and has to be gotten rid of. It's piped to the poles, particularly to the south pole, which is the more developed of the two, and is discharged into space. It melts most of the ice in the process and I'm sure that accounts for Trantor's clouds and rains, no matter how much the meteorology boggins insist that things are more complicated than that."

"Does Wye make use of the power before discharging it?"

"They may, for all I know. I haven't the slightest idea, by the way, as to the technology involved in discharging the heat, but I'm talking about political power. If Dahl were to stop producing usable energy, that would certainly inconvenience Trantor, but there are other sectors that produce energy and can up their production and, of course, there is stored energy in one form or another. Eventually, Dahl would have to be dealt with, but there would be time. Wye, on the other hand- "

"Yes?"

"Well, Wye gets rid of at least 90 percent of all the heat developed on Trantor and there is no substitute. If Wye were to shut down its heat emission, the temperature would start going up all over Trantor."

"In Wye too."

"Ate, but since Wye is at the south pole, it can arrange an influx of cold air. It wouldn't do much good, but Wye would last longer than the rest of Trantor. The point is, then, that Wye is a very touchy problem for the Emperor and the Mayor of Wye is-or at least can be-extremely powerful."

"And what kind of a person is the present Mayor of Wye?"

"That I don't know. What I've occasionally heard would make it seem that he is very old and pretty much a recluse, but hard as a hypership hull and still cleverly maneuvering for power."

"Why, I wonder? If he's that old, he couldn't hold the power for long."

"Who knows, Hari? A lifelong obsession, I suppose. Or else it's the game . . . the maneuvering for power, without any real longing for the power itself. Probably if he had the power and took over Demerzel's place or even the Imperial throne itself, he would feel disappointed because the game would be over. Of course he might, if he was still alive, begin the subsequent game of keeping power, which might be just as difficult and just as satisfying."

Seldon shook his head. "It strikes me that no one could possibly want to be Emperor."

"No sane person would, I free, but the 'Imperial wish,' as it is frequently called, is like a disease that, when caught, drives out sanity. And the closer you get to high office, the more likely you are to catch the disease. With each ensuing promotion-

"The disease grows still more acute. Yes, I can see that. But it also seems to me that Trantor is so huge a world, so interlocking in its needs and so conflicting in its ambitions, that it makes up the major part of the inability of the Emperor to rule. Why doesn't he just leave Trantor and establish himself on some simpler world?"

Dors laughed. "You wouldn't ask that if you knew your history. Trantor is the Empire through thousands of years of custom. An Emperor who is not at the Imperial Palace is not the Emperor. He is a place, even more than a person."

Seldon sank into silence, his face rigid, and after a while Dors asked, "What's the matter, Hari?"

"I'm thinking," he said in a muffled voice. "Ever since you told me that hand-on-thigh story, I've had fugitive thoughts that-Now your remark about the Emperor being a place rather than a person seems to have struck a chord."

"What kind of chord?"

Seldon shook his head. "I'm still thinking. I may be all wrong." His glance at Dors sharpened, his eyes coming into focus. "In any case, we ought to go down and have breakfast. We're late and I don't think Mistress Tisilver is in a good enough humor to have it brought in for us."

"You optimist," said Dors. "My own feeling is that she's not in a good enough humor to want us to stay-breakfast or not. She wants us out of here."

"That may be, but we're paying her."

"Yes, but I suspect she hates us enough by now to scorn our credits."

"Perhaps her husband will feel a bit more affectionate concerning the rent."

"If he has a single word to say, Hari, the only person who would be more surprised than me to hear it would be Mistress Tisilver. -Very well, I'm ready."

And they moved down the stairs to the Tisilver portion of the apartment to find the lady in question waiting for them with less than breakfast-and with considerably more too.

78.

Casilia Tisilver stood ramrod straight with a tight smile on her round face and her dark eyes glinting. Her husband was leaning moodily against the wall. In the center of the room were two men who were standing stiffly upright, as though they had noticed the cushions on the floor but scorned them.

Both had the dark crisp hair and the chick black mustache to be expected of Dahllites. Both were thin and both were dressed in dark clothes so nearly alike that they were surely uniforms. There was thin white piping up and over the shoulders and down the sides of the tubular trouser legs. Each had, on the right side of his chest, a rather dim

Spaceship-and-Sun, the symbol of the Galactic Empire on every inhabited world of the Galaxy, with, in this case, a dark "D" in the center of the sun.

Seldon realized immediately that these were two members of the Dahlite security forces.

"What's all this?" said Seldon sternly.

One of the men stepped forward. "I am Sector Officer Lanel Russ. This is my partner, Gebore Astinwald."

Both presented glittering identification holo-tabs. Seldon didn't bother looking at them. "What is it you want?"

Russ said calmly, "Are you Hari Seldon of Helicon?"

"I am."

"And are you Dors Venabili of Cinna, Mistress?"

"I am," said Dors.

"I'm here to investigate a complaint that one Hari Seldon instigated a riot yesterday."

"I did no such thing," said Seldon.

"Our information is," said Russ, looking at the screen of a small computer pad, "that you accused a newsman of being an Imperial agent, thus instigating a riot against him."

Dors said, "It was I who said he was an Imperial agent, Officer. I had reason to think he was. It is surely no crime to express one's opinion. The Empire has freedom of speech."

"That does not cover an opinion deliberately advanced in order to instigate a riot."

"How can you say it was, Officer?"

At this point, Mistress Tisalver interposed in a shrill voice, "I can say it, Officer. She saw there was a crowd present, a crowd of gutter people who were just looking for trouble. She deliberately said he was an Imperial agent when she knew nothing of the sort and she shouted it to the crowd to stir them up. It was plain that she knew what she was doing."

"Casilia," said her husband pleadingly, but she cast one look at him and he said no more. Russ turned to Mistress Tisalver. "Did you lodge the complaint, Mistress?"

"Yes. These two have been living here for a few days and they've done nothing but make trouble. They've invited people of low reputation into my apartment, damaging my standing with my neighbors."

"Is it against the law, Officer," asked Seldon, "to invite clean, quiet citizens of Dahl into one's room? The two rooms upstairs are our rooms. We have rented them and they are paid for. Is it a crime to speak to Dahlites in Dahl, Officer?"

"No, it is not," said Russ. "That is not part of the complaint. What gave you reason, Mistress Venabili, to suppose the person you so accused was, in fact, an Imperial agent?"

Dors said, "He had a small brown mustache, from which I concluded he was not a Dahlite. I surmised he was an Imperial agent"

"You surmised? Your associate, Master Seldon, has no mustache at all. Do you surmise he is an Imperial agent?"

"In any case," said Seldon hastily, "there was no riot. We asked the crowd to take no action against the supposed newsman and I'm sure they didn't."

"You're sure, Master Seldon?" said Russ. "Our information is that you left immediately after making your accusation. How could you witness what happened after you left?"

"I couldn't," said Seldon, "but let me ask you-Is the man dead? Is the man hurt?"

"The man has been interviewed. He denies he is an Imperial agent and we have no information that he is. He also claims he was handled roughly."

"He may well be lying in both respects," said Seldon. "I would suggest a Psychic Probe."

"That cannot be done on the victim of a crime," said Russ. "The sector government is very firm on that. It might do if you two, as the criminals in this case, each underwent a Psychic Probe. Would you like us to do that?"

Seldon and Dors exchanged glances for a moment, then Seldon said, "No, of course not."

"Of course not," repeated Russ with just a tinge of sarcasm in his voice, "but you're ready enough to suggest it for someone else."

The other officer, Astinwald, who had so far not said a word, smiled at this.

Russ said, "We also have information that two days ago you engaged in a knife fight in Billibotton and badly hurt a Dahlite citizen named"-he struck a button on his computer pad and studied the new page on the screen-"Elgin Marron."

Doss said, "Does your information tell you how the fight started?"

"That is irrelevant at the moment, Mistress. Do you deny that the fight took place?"

"Of course we don't deny the fight took place," said Seldon hotly, "but we deny that we in any way instigated that. We were attacked. Mistress Venabili was seized by this Marron and it was clear he was attempting to rape her. What happened afterward was pure self-defense. Or does Dahl condone rape?"

Russ said with very little intonation in his voice, "You say you were attacked? By how many?"

"Ten men."

"And you alone-with a woman-defended yourself against ten men?"

"Mistress Venabili and I defended ourselves. Yes."

"How is it, then, that neither of you shows any damage whatever? Are either of you cut or bruised where it doesn't show right now?"

"No, Officer."

"How is it, then, that in the fight of one-plus a woman-against ten, you are in no way hurt, but that the complainant, Elgin Marron, has been hospitalized with wounds and will require a skin transplant on his upper lip?"

"We fought well," said Seldon grimly.

"Unbelievably well. What would you say if I told you that three men have testified that you and your friend attacked Marron, unprovoked?"

"I would say that it belies belief that we should. I'm sure that Marron has a record as a brawler and knifeman. I tell you that there were ten there. Obviously, six refused to swear to a lie. Do the other three explain why they did not come to the help of their friend if they witnessed him under unprovoked attack and in danger of his life? It must be clear to you that they are lying."

"Do you suggest a Psychic Probe for them?"

"Yes. And before you ask, I still refuse to consider one for us."

Russ said, "We have also received information that yesterday, after leaving the scene of the riot, you consulted with one Davan, a known subversive who is wanted by the security police. Is that true?"

"You'll have to prove that without help from us," said Seldon. "We're not answering any further questions."

Russ put away his pad. "I'm afraid I must ask you to come with us to headquarters for further interrogation."

"I don't think that's necessary, Officer," said Seldon. "We are Outworlders who have done nothing criminal. We have tried to avoid a newsman who was annoying us unduly, we tried to protect ourselves against rape and possible murder in a part of the sector known for criminal behavior, and we've spoken to various Dahrites. We see nothing there to warrant our further questioning. It would come under the heading of harassment."

"We make these decisions," said Russ. "Not you. Will you please come with us?"

"No, we will not," said Dors.

"Watch out!" cried out Mistress Tisilver. "She's got two knives."

Officer Russ sighed and said, "Thank you, Mistress, but I know she does." He turned to Dors. "Do you know it's a serious crime to carry a knife without a permit in this sector? Do you have a permit?"

"No, Officer, I don't."

"It was clearly with an illegal knife, then, that you assaulted Marron? Do you realize that that greatly increases the seriousness of the crime?"

"It was no crime, Officer," said Dors. "Understand that. Marron had a knife as well and no permit, I am certain."

"We have no evidence to that effect and while Marron has knife wounds, neither of you have any."

"Of course he had a knife, Officer. If you don't know that every man in Billibotton and most men elsewhere in Dahl carry knives for which they probably don't have permits, then you're the only man in Dahl who doesn't know. There are shops here wherever you turn that sell knives openly. Don't you know that?"

Russ said, "It doesn't matter what I know or don't know in this respect. Nor does it matter whether other people are breaking the law or how many of them do. All that matters at this moment is that Mistress Venabili is breaking the anti-knife law. I must ask

you to give up those knives to me right now, Mistress, and the two of you must then accompany me to headquarters."

Dors said, "In that case, take my knives away from me."

Russ sighed. "You must not think, Mistress, that knives are all the weapons there are in Dahl or that I need engage you in a knife fight. Both my partner and I have blasters that will destroy you in a moment, before you can drop your hands to your knife hilt—however fast you are. We won't use a blaster, of course, because we are not here to kill you. However, each of us also has a neuronic whip, which we can use on you freely. I hope you won't ask for a demonstration. It won't kill you, do you permanent harm of any kind, or leave any marks—but the pain is excruciating. My partner is holding a neuronic whip on you right now. And here is mine. —Now, let us have your knives, Mistress Venabili."

There was a moment's pause and then Seldon said, "It's no use, Dors. Give him your knives."

And at that moment, a frantic pounding sounded at the door and they all heard a voice raised in high-pitched expostulation.

79.

Raych had not entirely left the neighborhood after he had walked them back to their apartment house.

He had eaten well while waiting for the interview with Davan to be done and later had slept a bit after finding a bathroom that more or less worked. He really had no place to go now that all that was done. He had a home of sorts and a mother who was not likely to be perturbed if he stayed away for a while. She never was.

He did not know who his father was and wondered sometimes if he really had one. He had been told he had to have one and the reasons for that had been explained to him crudely enough. Sometimes he wondered if he ought to believe so peculiar a story, but he did find the details titillating.

He thought of that in connection with the lady. She was an old lady, of course, but she was pretty and she could fight like a man, better than a man. It filled him with vague notions.

And she had offered to let him take a bath. He could swim in the Billibotton pool sometimes when he had some credits he didn't need for anything else or when he could sneak in. Those were the only times he got wet all over, but it was chilly and he had to wait to get dry.

Taking a bath was different. There would be hot water, soap, towels, and warm air. He wasn't sure what it would feel like, except that it would be nice if she was there.

He was walkway-wise enough to know of places where he could park himself in an alley off a walkway that would be near a bathroom and still be near enough to where she was, yet where he probably wouldn't be found and made to run away.

He spent the night thinking strange thoughts. What if he did learn to read and write? Could he do something with that? He wasn't sure what, but maybe he could sell him. He had vague ideas of being paid money to do things he didn't know how to do now, but he didn't know what those things might be. He would have to be cold, but how do you get told?

If he stayed with the man and the lady, they might help. But why should they want him to stay with them?

He drowsed off, coming to later, not because the light was brightening, but because his sharp ears caught the heightening and deepening of sounds from the walkway as the activities of the day began.

He had learned to identify almost every variety of sound, because in the underground maze of Billibotton, if you wanted to survive with even a minimum of comfort, you had to be aware of things before you saw them. And there was something about the sound of a ground-car motor that he now heard that signaled danger to him. It had an official sound, a hostile sound.

He shook himself awake and stole quietly toward the walkway. He scarcely needed to see the Spaceship-and-Sun on the groundcar. Its lines were enough. He knew they had to be coming for the man and the lady because they had seen Davan. He did not pause to question his thoughts or to analyze them. He was off on a run, beating his way through the gathering life of the day.

He was back in less than fifteen minutes. The ground-car was still there and there were curious and cautious onlookers gazing at it from all sides and from a respectful distance. There would soon be more. He pounded his way up the stairs, trying to remember which door he should bang on. No time for the elevator.

He found the door—at least he thought he did—and he banged, shouting in a squeak, "Lady! Lady!"

He was too excited to remember her name, but he remembered part of the man's. "Hari!" he shouted. "Let me in."

The door opened and he rushed in—tried to rush in. The rough hand of an officer seized his arm. "Hold it, kid. Where do you think you're going?"

"Leggo! I ain't done nothin'." He looked about. "Hey, lady, what're they Join'?"

"Arresting us," said Dors grimly.

"What for?" said Raych, panting and struggling. "Hey, leggo, you Sunbadger. Don't go with him, lady. You don't have to go with him."

"You get out," said Russ, shaking the boy vehemently.

"No, I ain't, You ain't either, Sunbadger. My whole gang is coming. You ain't gettin' out, less'n you let these guys go."

"What whole gang?" said Russ, frowning.

"They're right outside now. Prob'ly takin' your ground-car apart. And they'll take yore apart."

Russ turned toward his partner, "Call headquarters. Have them send out a couple of trucks with Macros."

"No!" shrieked Raych, breaking loose and rushing at Astinwald. "Don't call!"

Russ leveled his neuronc whip and fired. Raych shrieked, grasped at his right shoulder, and fell down, wriggling madly. Russ had not yet turned back to Seldon, when the latter, seizing him by the wrist, pushed the neuronc whip up in the air and then around and behind, while stamping on his foot to keep him relatively motionless. Hari could feel the shoulder dislocate, even while Russ emitted a hoarse, agonized yell. Astinwald raised his blaster quickly, but Dors's left arm was around his shoulder and the knife in her right hand was at his throat.

"Don't move!" she said. "Move a millimeter, any part of you, and I cut you through your neck to the spine. -Drop the blaster. Drop it! And the neuronc whip."

Seldon picked up Raych, still moaning, and held him tightly. He turned to Tisilver and said, "There are people out there. Angry people. I'll have them in here and they'll break up everything you've got. They'll smash the walls. If you don't want that to happen, pick up those weapons and throw them into the next room. Take the weapons from the security officer on the door and do the same. Quickly! Get your wife to help. She'll think twice next time before sending in complaints against innocent people. -Dors, this one on the floor won't do anything for a while. Put the other one out of action, but don't kill him."

"Right," said Dors. Reversing her knife, she struck him hard on the skull with the haft. He went to his knees.

She made a face. "I hate doing that."

"They fired at Raych," said Seldon, trying to mask his own sick feeling at what had happened.

They left the apartment hurriedly and, once out on the walkway, found it choked with people, almost all men, who raised a shout when they saw them emerge. They pushed in close and the smell of poorly washed humanity was overpowering.

Someone shouted, "Where are the Sunbadgers?"

"Inside," called out Dors piercingly. "Leave them alone. They'll be helpless for a while, but they'll get reinforcements, so get out of here fast"

"What about you?" came from a dozen throats.

"We're getting out too. We won't be back."

"I'll take care of them," shrilled Raych, struggling out of Seldon's arms and standing on his feet. He was rubbing his right shoulder madly. "I can walk. Lemme past."

The crowd opened for him and he said, "Mister, lady, come with me. Fast!"

They were accompanied down the walkway by several dozen men and then Raych suddenly gestured at an opening and muttered, "In here, folks. I'll rake ya to a place no one will ever find ya. Even Davan prob'ly don't know it. Only thing is, we got to go through the sewer levels. No one will see us there, but it's sort of stinky . . . know what I mean?"

"I imagine we'll survive," muttered Seldon.

And down they went along a narrow spiraling ramp and up rose the mephitic odors to greet them.

Raych found them a hiding place. It had meant climbing up the metal rungs of a ladder and it had led them to a large loftlike room, the use of which Seldon could not imagine. It was filled with equipment, bulky and silent, the function of which also remained a mystery. The room was reasonably clean and free of dust and a steady draft of air wafted through that prevented the dust from settling and more important seemed to lessen the odor.

Raych seemed pleased. "Ain't this nice?" he demanded. He still rubbed his shoulder now and then and winced when he rubbed too hard.

"It could be worse," said Seldon. "Do you know what this place is used for, Raych?"

Raych shrugged or began to do so and winced. "I dunno," he said. Then he added with a touch of swagger, "Who cares?"

Dors, who had sat down on the floor after brushing it with her hand and then looking suspiciously at her palm, said, "If you want a guess, I think this is part of a complex that is involved in the detoxification and recycling of wastes. The stuff must surely end up as fertilizer."

"Then," said Seldon gloomily, "those who run the complex will be down here periodically and may come at any moment, for all we know."

"I been here before," said Raych. "I never saw no one here."

"I suppose Trantor is heavily automated wherever possible and if anything calls for automation it would be this treatment of wastes," said Dors. "We may be safe . . . for a while."

"Not for long. We'll get hungry and thirsty, Dors."

"I can get food and water for us," said Raych. "Ya got to know how to make out if you're an alley kid."

"Thank you, Raych," said Seldon absently, "but right now I'm not hungry." He sniffed. "I may never be hungry again."

"You will be," said Dors, "and even if you lose your appetite for a while, you'll get thirsty. At least elimination is no problem. We're practically living over what is clearly an open sewer."

There was silence for a while. The light was dim and Seldon wondered why the Trantorians didn't keep it dark altogether. But then it occurred to him that he had never encountered true darkness in any public area. It was probably a habit in an energy-rich society. Strange that a world of forty billion should be energy-rich, but with the internal heat of the planet to draw upon, to say nothing of solar energy and nuclear fusion plants in space, it was. In fact, come to think of it, there was no energy-poor planet in the Empire. Was there a time when technology had been so primitive that energy poverty was possible?

He leaned against a system of pipes through which -for all he knew- sewage ran. He drew away from the pipes as the thought occurred to him and he sat down next to Dors.

He said, "Is there any way we can get in touch with Chetter Hummin?"

Dors said, "As a matter of fact, I did send a message, though I hated to."

"You hated to?"

"My orders are to protect you. Each time I have to get in touch with him, it means I've failed."

Seldon regarded her out of narrowed eyes. "Do you have to be so compulsive, Dors? You can't protect me against the security officers of an entire sector."

"I suppose not. We can disable a few-"

"I know. We did. But they'll send out reinforcements . . . armored ground-cars . . . neuronic cannon . . . sleeping mist. I'm not sure what they have, but they're going to throw in their entire armory. I'm sure of it."

"You're probably right," said Dors, her mouth tightening.

"They won't find ya, lady," said Raych suddenly. His sharp eyes had moved from one to the other as they talked. "They never find Davan."

Dors smiled without joy and ruffled the boy's hair, then looked at the palm of her hand with a little dismay. She said, "I'm not sure if you ought to stay with us, Raych. I don't want them finding you. "

"They won't find me and if I leave ya, who'll get ya food and water and who'll find ya new hidin' places, so the Sunbadgers'll never know where to look?"

"No, Raych, they'll find us. They don't really look too hard for Davan. He annoys them, but I suspect they don't take him seriously. Do you know what I mean?"

"You mean he's just a pain in the . . . the neck and they figure he ain't worth chasing all over the lot."

"Yes, that's what I mean. But you see, we hurt two of the officers very badly and they're not going to let us get away with that. If it takes their whole force-if they have to sweep through every hidden or unused corridor in the sector-they'll get us."

Raych said, "That makes me feel like . . . like natin'n. If I didn't run in there and get zapped, ya wouldn't have taken out them officers and ya wouldn't be in such trouble."

"No, sooner or later, we'd have-uh-taken them out. Who knows? We may have to take out a few more."

"Well, ya did it beautiful," said Raych. "If I hadn't been aching all over, I could've watched more and enjoyed it."

Seldon said, "It wouldn't do us any good to try to fight the entire security system. The question is: What will they do to us once they have us? A prison sentence, surely."

"Oh no. If necessary, we'll have to appeal to the Emperor," put in Dors.

"The Emperor?" said Raych, wide-eyed. "You know the Emperor?"

Seldon waved at the boy. "Any Galactic citizen can appeal to the Emperor. -That strikes me as the wrong thing to do, Dors. Ever since Hummin and I left the Imperial Sector, we've been evading the Emperor."

"Not to the extent of being thrown into a Dahlite prison. The Imperial appeal will serve as a delay-in any case, a diversion-and perhaps in the course of that delay, we can think of something else."

"There's Hummin."

"Yes, there is," said Dors uneasily, "but we can't consider him the do-it-all. For one thing, even if my message reached him and even if he was able to rush to Dahl, how would he find us here? And, even if he did, what could he do against the entire Dahlite security force?"

"In that case," said Seldon. "We're going to have to think of something we can do before they find us."

Raych said, "If ya follow me, I can keep ya ahead of them. I know every place there is around here."

"You can keep us ahead of one person, but there'll be a great many, moving down any number of corridors. We'll escape one group and bump into another."

They sat in uncomfortable silence for a good while, each confronting what seemed to be a hopeless situation. Then Dors Venabili stirred and said in a tense, low whisper, "They're here. I hear them."

For a while, they strained, listening, then Raych sprang to his feet and hissed, "They comin' that way. We gotta go this way."

Seldon, confused, heard nothing at all, but would have been content to trust the others' superior hearing, but even as Raych began moving hastily and quietly away from the direction of the approaching tread, a voice rang out echoing against the sewer walls. "Don't move. Don't move."

And Raych said, "That's Davan. How'd he know we were here?"

"Davan?" said Seldon. "Are you sure?"

"Sure I'm sure. He'll help."

81.

Davan asked, "What happened?"

Seldon felt minimally relieved. Surely, the addition of Davan could scarcely count against the full force of the Dahl Sector, but, then again, he commanded a number of people who might create enough confusion. He said, "You should know, Davan. I suspect that many of the crowd who were at Tisilver's place this morning were your people."

"Yes, a number were. The story is that you were being arrested and that you manhandled a squadron of Sunbadgers. But why were you being arrested?"

"Two," said Seldon, lifting two fingers. "Two Sunbadgers. And that's bad enough. Part of the reason we were being arrested was that we had gone to see you."

"That's not enough. The Sunbadgers don't bother with me much as a general thing." He added bitterly, "They underestimate me."

"Maybe," said Seldon, "out the woman from whom we rent our rooms reported us for having started a riot . . . over the newsman we ran into on our way to you. You know about that. With your people on the scene yesterday and again this morning and with two officers badly hurt, they may well decide to clean out these corridors-and that means you will suffer. I really am sorry. I had no intention or expectation of being the cause of any of this."

But Davan shook his head. "No, you don't know the Sunbadgers. That's not enough either. They don't want to clean us up. The sector would have to do something about us if they did. They're only too happy to let us rot in Billibotton and the other slums. No, they're after you. What have you done?"

Dors said impatiently, "We've done nothing and, in any case, what does it matter? If they're not after you and they are after us, they're going to come down here to flush us out. If you get in the way, you'll be in deep trouble."

"No, not me. I have friends-powerful friends," said Davan. "I told you that last night. And they can help you as well as me. When you refused to help us openly, I got in touch with them. They know who you are, Dr. Seldon. You're a famous man. They're in a position to talk to the Mayor of Dahl and see to it that you are left alone, whatever you have done. But you'll have to be taken away out of Dahl."

Seldon smiled. Relief flooded over him. He said, "You know someone powerful, do you, Davan? Someone who responds at once, who has the ability to talk the Dahl government out of taking drastic steps, and who can take us away? Good. I'm not surprised." He turned to Dors, smiling. "It's Mycogen all over again. How does Hummin do it?"

But Dors shook her head. "Too quick. -I don't understand."

Seldon said, "I believe he can do anything."

"I know him better than you do-and longer-and I don't believe that."

Seldon smiled, "Don't underestimate him." And then, as though anxious not to linger longer on that subject, he turned to Davan. "But how did you find us?"

Raych said you knew nothing about this place."

"He don't," shrilled Raych indignantly. "This place is all mine. I found it."

"I've never been here before," said Davan, looking about. "It's an interesting place. Raych is a corridor creature, perfectly at home in this maze."

"Yes, Davan, we gathered as much ourselves. But how did you find it?"

"A heat-seeker. I have a device that detects infra-red radiation, the particular thermal pattern that is given off at thirty-seven degrees Celsius. It will react to the presence of human beings and not to other heat sources. It reacted to you three."

Dors was frowning. "What good is that on Trantor, where there are human beings everywhere? They have them on other worlds, but-

Davan said, "But not on Trantor. I know. Except that they are useful in the slums, in the forgotten, decaying corridors and alleyways."

"And where did you get it?" asked Seldon.

Davan said, "It's enough that I have it. -But we've got to get you away, Master Seldon. Too many people want you and I want my powerful friend to have you."

"Where is he, this powerful friend of yours?"

"He's approaching. At least a new thirty-seven-degree source is registering and I don't see that it can be anyone else."

Through the door strode a newcomer, but Seldon's glad exclamation died on his lips. It was not Chetter Hummin.

WYE- . . . A sector of the world-city of Trantor . . . In the latter centuries of the Galactic Empire, Wye was the strongest and stablest portion of the world-city. Its rulers had long aspired to the Imperial throne, justifying that by their descent from early Emperors. Under Mannix IV, Wye was militarized and (Imperial authorities later claimed) was planning a planet-wide coup .

ENCYCLOPEDIA GALACTICA

82.

The man who entered was tall and muscular. He had a long blond mustache that curled up at the tips and a fringe of hair that went down the sides of his face and under his chin, leaving the point of his chin and his lower lip smoothly bare and seeming a little moist. His head was so closely cropped and his hair was so tight that, for one unpleasant moment, Seldon was reminded of Mycogen.

The newcomer wore what was unmistakably a uniform. It was red and white and about his waist was a wide belt decorated with silver studs.

His voice, when he spoke, was a rolling bass and its accent was not like any that Seldon had heard before. Most unfamiliar accents sounded uncouth in Seldon's experience, but this one seemed almost musical, perhaps because of the richness of the low tones.

"I am Sergeant Emmer Thalus," he rumbled in a slow succession of syllables. "I have come seeking Dr. Hari Seldon."

Seldon said, "I am he." In an aside to Dors, he muttered, "if Hummin couldn't come himself, he certainly sent a magnificent side of beef to represent him."

The sergeant favored Seldon with a stolid and slightly prolonged look. Then he said, "Yes. You have been described to me. Please come with me, Dr. Seldon."

Seldon said, "Lead the way."

The sergeant stepped backward. Seldon and Dors Venabili stepped forward.

The sergeant stopped and raised a large hand, palm toward Dors. "I have been instructed to take Dr. Hari Seldon with me. I have not been instructed to take anyone else."

For a moment, Seldon looked at him uncomprehendingly. Then his look of surprise gave way to anger. "It's quite impossible that you have been told that, Sergeant. Dr. Dors Venabili is my associate and my companion. She must come with me."

"That is nor in accordance with my instructions, Doctor."

"I don't care about your instructions in any way, Sergeant Thalus. I do not budge without her."

"What's more," said Dors with clear irritation, "my instructions are to protect Dr. Seldon at all times. I cannot do that unless I am with him. Therefore, where he goes, I go."

The sergeant looked puzzled. "My instructions are strict that I see to it that no harm comes to you, Dr. Seldon. If you will not come voluntarily, I must carry you to my vehicle. I will try to do so gently."

He extended his two arms as though to seize Seldon by the waist and carry him off bodily.

Seldon skittered backward and out of reach. As he did so, the side of his right palm came down on the sergeant's right upper arm where the muscles were thinnest, so that he struck the bone.

The sergeant drew a sudden deep breath and seemed to shake himself a bit, but turned, face expressionless, and advanced again. Dors, watching, remained where he was, motionless, but Raych moved behind the sergeant. Seldon repeated his palm stroke a second time, then a third, but now Sergeant Thalus, anticipating the blow, lowered his shoulder to catch it on hard muscle.

Dors had drawn her knives.

"Sergeant," she said forcefully. "Turn in this direction, I want you to understand I may be forced to hurt you severely if you persist in attempting to carry Dr. Seldon off against his will."

The sergeant paused, seemed to take in the slowly waving knives solemnly, then said, "It is not in my instructions to refrain from harming anyone but Dr. Seldon."

His right hand moved with surprising speed toward the neuronics whip in the holster at his hip. Dors moved as quickly forward, knives flashing.

Neither completed the movement.

Dashing forward, Raych had pushed at the sergeant's back with his left hand and withdrew the sergeant's weapon from its holster with his right. He moved away quickly, holding the neuronics whip in both hands now and shouting, "Hands up, Sergeant, or you're gonna get it!"

The sergeant whirled and a nervous look crossed his reddening face. It was the only moment that his stolidity had weakened. "Put that down, sonny," he growled.

"You don't know how it works."

Raych howled, "I know about the safety. It's off and this thing can fire. And it will if you try to rush me."

The sergeant froze. He clearly knew how dangerous it was to have an excited twelve-year-old handling a powerful weapon.

Nor did Seldon feel much better. He said, "Careful, Raych. Don't shoot. Keep your finger off the contact."

"I ain't gonna let him rush me."

"He won't. -Sergeant, please don't move. Let's get something straight. You were told to take me away from here. Is that right?"

"That's right," said the sergeant, eyes somewhat protruding and firmly fixed on Raych (whose eyes were as firmly fixed on the sergeant).

"But you were not told to take anyone else. Is that right?"

"No, I was not, Doctor," said the sergeant firmly. Not even the threat of a neuronc whip was going to make him weasel. One could see that.

"Very well, but listen to me, Sergeant. Were you told not to take anyone else?"

"I just said- "No, no. Listen, Sergeant. There's a difference. Were your instructions simply 'Take Dr. Seldon!'? Was that the entire order, with no mention of anyone else, or were the orders more specific? Were your orders as follows: 'Take Dr. Seldon and don't take anyone else'?"

The sergeant turned that over in his head, then he said, "I was told to take you, Dr. Seldon."

"Then there was no mention of anyone else, one way or the other, was there?"

Pause. "No."

"You were not told to take Dr. Venabili, but you were not told not to take Dr. Venabili either. Is that right?"

Pause. "Yes."

"So you can either take her or not take her, whichever you please?" Long pause. "I suppose so."

"Now then, here's Raych, the young fellow who's got a neuronc whip pointing at you your neuronc whip, remember-and he is anxious to use it."

"Yay!" shouted Raych.

"Not yet, Raych," said Seldon. "And here is Dr. Venabili with two knives that she can use very expertly and there's myself, who can, if I get the chance, break your Adam's apple with one hand so that you'll never speak above a whisper again. Now then, do you want to take Dr. Venabili or don't you want to? Your orders allow you to do either."

And finally the sergeant said in a beaten voice, "I will take the woman."

"And the boy, Raych."

"And the boy."

"Good. Have I your word of honor-your word of honor as a soldier that you will do as you have just said . . . honestly?"

"You have my word of honor as a soldier," said the sergeant.

"Good. Raych, give back the whip. -Now. -Don't make me wait."

Raych, his face twisted into an unhappy grimace, looked at Dors, who hesitated and then slowly nodded her head. Her face was as unhappy as Raych's.

Raych held out the neuronc whip to the sergeant and said, "They're makin' me, ya big-" His last words were unintelligible.

Seldon said, "Put away your knives, Dors."

Dors shook her head, but put them away.

"Now, Sergeant?" said Seldon.

The sergeant looked at the neuronic whip, then at Seldon. He said, "You are an honorable man, Dr. Seldon, and my word of honor holds." With a military snap, he placed his neuronic whip in his holster.

Seldon turned to Davan and said, "Davan, please forget what you have seen here. We three are going voluntarily with Sergeant Thalus. You tell Yugo Amaryl when you see him that I will not forget him and that, once this is over and I am free to act, I will see that he gets into a University. And if there's anything reasonable I can ever do for your cause, Davan, I will. -Now, Sergeant, let's go "

83.

"Have you ever been in an air-jet before, Raych?" asked Hari Seldon.

Raych shook his head speechlessly. He was looking down at Upperside rushing beneath them with a mixture of fright and awe.

It struck Seldon again how much Trantor was a world of Expressways and tunnels. Even long trips were made underground by the general population. Air travel, however common it might be on the Outworlds, was a luxury on Trantor and an air-jet like this- How had Hummin managed it? Seldon wondered.

He looked out the window at the rise and fall of the domes, at the general green in this area of the planet, the occasional patches of what were little less than jungles, the arms of the sea they occasionally passed over, with its leaden waters taking on a sudden all-too-brief sparkle when the sun peeped out momentarily from the heavy cloud layer.

An hour or so into the flight, Dors, who was viewing a new historical novel without much in the way of apparent enjoyment, clicked it off and said, "I wish I knew where we were going."

"If you can't tell," said Seldon, "then I certainly can't. You've been on Trantor longer than I have."

"Yes, but only on the inside," said Dors. "Out here, with only Upperside below me, I'm as lost as an unborn infant would be."

"Oh well. -Presumably, Hummin knows what he's doing."

"I'm sure he does," replied Dors rather tartly, "but that may have nothing to do with the present situation. Why do you continue to assume any of this represents his initiative?"

Seldon's eyebrows lifted. "Now that you ask, I don't know. I just assumed it. Why shouldn't this be his?"

"Because whoever arranged it didn't specify that I be taken along with you. I simply don't see Hummin forgetting my existence. And because he didn't come himself, as he did at Streeling and at Mycogen."

"You can't always expect him to, Dors. He might well be occupied. The astonishing thing is not that he didn't come on this occasion but that he did come on the previous ones."

"Assuming he didn't come himself, would he send a conspicuous and lavish flying palace like this?" She gestured around her at the large luxurious jet.

"It might simply have been available. And he might have reasoned that no one would expect something as noticeable as this to be carrying fugitives who were desperately trying to avoid detection. The well-known double-double-cross."

"Too well-known, in my opinion. And would he send an idiot like Sergeant Thalus in his place?"

"The sergeant is no idiot. He's simply been trained to complete obedience. With proper instructions, he could be utterly reliable."

"There you are, Hari. We come back to that. Why didn't he get proper instructions? It's inconceivable to me that Chetter Hummin would tell him to carry you out of Dahl and not say a word about me. Inconceivable."

And to that Seldon had no answer and his spirits sank.

Another hour passed and Dors said, "It looks as if it's getting colder outside. The green of Upperside is turning brown and I believe the heaters have turned on."

"What does that signify?"

"Dahl is in the tropic zone so obviously we're going either north or south-and a considerable distance too. If I had some notion in which direction the nightline was I could tell which."

Eventually, they passed over a section of shoreline where there was a rim of ice hugging the domes where they were rimmed by the sea. And then, quite unexpectedly, the air-jet angled downward.

Raych screamed, "We're goin' to hit! We're goin' to smash up!"

Seldon's abdominal muscles tightened and he clutched the arms of his seat.

Dors seemed unaffected. She said, "The pilots up front don't seem alarmed. We'll be tunneling."

And, as she said so, the jet's wings swept backward and under it and, like a bullet, the air-jet encored a tunnel. Blackness swept back over them in an instant and a moment later the lighting system in the tunnel turned on. The walls of the tunnel snaked past the jet on either side.

"I don't suppose I'll ever be sure they know the tunnel isn't already occupied," muttered Seldon.

"I'm sure they had reassurance of a clear tunnel some dozens of kilometers earlier," said Dors. "At any rate, I presume this is the last stage of the journey and soon we'll know where we are."

She paused and then added, "And I further presume we won't like the knowledge when we have it."

The air-jet sped out of the tunnel and onto a long runway with a roof so high that it seemed closer to true daylight than anything Seldon had seen since he had left the Imperial Sector.

They came to a halt in a shorter time than Seldon would have expected, but at the price of an uncomfortable pressure forward. Raych, in particular, was crushed against the seat before him and was finding it difficult to breathe. Dors's hand on his shoulder pulled him back slightly.

Sergeant Thalus, impressive and erect, left the jet and moved to the rear, where he opened the door of the passenger compartment and helped the three out, one by one.

Seldon was last. He half-turned as he passed the sergeant, saying, "It was a pleasant trip, Sergeant."

A slow smile spread over the sergeant's large face and lifted his mustachioed upper lip. He touched the visor of his cap in what was half a salute and said, "Thank you again, Doctor."

They were then ushered into the backseat of a ground-car of lavish design and the sergeant himself pushed into the front seat and drove the vehicle with a surprisingly light touch.

They passed through wide roadways, flanked by tall, well-designed buildings, all glistening in broad daylight. As elsewhere on Trantor, they heard the distant drone of an Expressway. The walkways were crowded with what were, for the most part, well-dressed people. The surroundings were remarkably-almost excessively clean.

Seldon's sense of security sank further. Dors's misgivings concerning their destination now seemed justified after all. He leaned toward her and said, "Do you think we are back in the Imperial Sector?"

She said, "No, the buildings are more rococo in the Imperial Sector and there's less Imperial parkishness to this sector-if you know what I mean."

"Then where are we, Dors?"

"We'll have to ask, I'm afraid, Hari."

It was not a long trip and soon they rolled into a car-bay that flanked an imposing four-story structure. A frieze of imaginary animals ran along the top, decorated with strips of warm pink stone. It was an impressive facade with a rather pleasing design.

Seldon said, "That certainly looks rococo enough."

Dors shrugged uncertainly.

Raych whistled and said in a failing attempt to sound unimpressed, "Hey, look at that fancy place."

Sergeant Thalus gestured to Seldon clearly indicating that he was to follow. Seldon hung back and, also relying on the universal language of gesture, held out both arms, clearly including Dors and Raych.

The sergeant hesitated in a slightly hangdog fashion at the impressive pink doorway. His mustache almost seemed to droop.

Then he said gruffly, "All three of you, then. My word of honor holds. -Still, others may not feel obligated by my own obligation, you know."

Seldon nodded. "I hold you responsible for your own deeds only, Sergeant."

The sergeant was clearly moved and, for a moment, his face lightened as though he was considering the possibility of shaking Seldon's hand or expressing heartfelt his approval in some other way. He decided against it, however, and stepped onto the bottom step of the flight that led to the door. The stairs immediately began a stately upward movement.

Seldon and Dors stepped after him at once and kept their balance without much trouble. Raych, who was momentarily staggered in surprise, jumped onto the moving stairs after a short run, shoved both hands into his pockets, and whistled carelessly.

The door opened and two women stepped out, one on either side in symmetrical fashion. They were young and attractive. Their dresses, belted tightly about the waist and reaching nearly to their ankles, fell in crisp pleats and rustled when they walked. Both had brown hair that was coiled in thick plaits on either side of their heads. (Seldon found it attractive, but wondered how long it took them each morning to arrange it just so. He had not been aware of so elaborate a coiffure on the women they had passed in the streets.)

The two women stared at the newcomers with obvious contempt. Seldon was not surprised. After the day's events, he and Dors looked almost as disreputable as Raych.

Yet the women managed to bow decorously and then made a half-turn and gestured inward in perfect unison and with symmetry carefully maintained. (Did they rehearse these things?) It was clear that the three were to enter.

They stepped through an elaborate room, cluttered with furniture and decorative items whose use Seldon did not readily understand. The floor was light-colored, springy, and glowed with luminescence. Seldon noted with some embarrassment that their footwear left dusty marks upon it.

And then an inner door was flung open and yet another woman emerged. She was distinctly older than the first two (who sank slowly as she came in, crossing their legs symmetrically as they did so in a way that made Seldon marvel that they could keep their balance; it undoubtedly took a deal of practice).

Seldon wondered if he too was expected to display some ritualized form of respect, but since he hadn't the faintest notion of what this might consist of, he merely bowed his head slightly. Dors remained standing erect and, it seemed to Seldon, did so with disdain. Raych was staring open-mouthed in all directions and looked as though he didn't even see the woman who had just entered.

She was plump-nor fat, but comfortably padded. She wore her hair precisely as the young ladies did and her dress was in the same style, but much more richly ornamented-too much so to suit Seldon's aesthetic notions.

She was clearly middle-aged and there was a hint of gray in her hair, but the dimples in her cheeks gave her the appearance of having rather more than a dash of

youth. Her light brown eyes were merry and on the whole she looked more motherly than old.

She said, "How are you? All of you." (She showed no surprise at the presence of Dors and Raych, but included them easily in her greeting.) "I've been waiting for you for some time and almost had you on Upperside at Streeling. You are Dr. Hari Seldon, whom I've been looking forward to meeting. You, I think, must be Dr. Dors Venabili, for you had been reported to be in his company. This young man I fear I do not know, but I am pleased to see him. But we must not spend our time talking, for I'm sure you would like to rest first."

"And bathe, Madam," said Dors rather forcefully, "Each of us could use a thorough shower."

"Yes, certainly," said the woman, "and a change in clothing. Especially the young man." She looked down at Raych without any of the look of contempt and disapproval that the two young women had shown.

She said, "What is your name, young man?"

"Raych," said Raych in a rather choked and embarrassed voice. He then added experimentally, "Missus."

"What an odd coincidence," said the woman, her eyes sparkling. "An omen, perhaps. My own name is Rashelle. Isn't that odd? -But come. We shall take care of you all. Then there will be plenty of time to have dinner and to talk."

"Wait, Madam," said Dors. "May I ask where we are?"

"Wye, dear. And please call me Rashelle, as you come to feel more friendly. I am always at ease with informality."

Dors stiffened. "Are you surprised that we ask? Isn't it natural that we should want to know where we are?"

Rashelle laughed in a pleasant, tinkling manner. "Really, Dr. Venabili, something must be done about the name of this place. I was not asking a question but making a statement. You asked where you were and I did not ask you why. I told you, Wye. You are in the Wye Sector."

"In Wye?" said Seldon forcibly.

"Yes indeed, Dr. Seldon. We've wanted you from the day you addressed the Decennial Convention and we are so glad to have you now."

85.

Actually, it took a full day to rest and unstiffen, to wash and get clean, to obtain new clothes (satiny and rather loose, in the style of Wye), and to sleep a good deal.

It was during the second evening in Wye that there was the dinner that Madam Rashelle had promised.

The table was a large one-too large, considering that there were only four dining: Hari Seldon, Dors Venabili, Raych, and Rashelle. The walls and ceiling were softly

illuminated and the colors changed at a rate that caught the eye but not so rapidly as in any way to discommode the mind. The very tablecloth, which was not cloth (Seldon had not made up his mind what it might be), seemed to sparkle.

The servers were many and silent and when the door opened it seemed to Seldon that he caught a glimpse of soldiers, armed and at the ready, outside. The room was a velvet glove, but the iron fist was not far distant.

Rashelle was gracious and friendly and had clearly taken a particular liking to Raych, who, she insisted, was to sit next to her.

Raych-scrubbed, polished, and shining, all but unrecognizable in his new clothes, with his hair clipped, cleaned, and brushed -- scarcely dared to say a word. It was as though he felt his grammar no longer fit his appearance. He was pitifully ill at ease and he watched Dors carefully as she switched from utensil to utensil, trying to match her exactly in every respect.

The food was tasty but spicy-to the point where Seldon could not recognize the exact nature of the dishes.

Rashelle, her plump face made happy by her gentle smile and her fine teeth gleaming white, said, "You may think we have Mycogenian additives in the food, but we do not. It is all homegrown in Wye. There is no sector on the planet more self-sufficient than Wye. We labor hard to keep that so."

Seldon nodded gravely and said, "Everything you have given us is first-rate, Rashelle. We are much obliged to you."

And yet within himself he thought the food was not quite up to Mycogenian standards and he felt moreover, as he had earlier muttered to Dors, that he was celebrating his own defeat. Or Hummin's defeat, at any rate, and that seemed to him to be the same thing.

After all, he had been captured by Wye, the very possibility that had so concerned Hummin at the time of the incident Upperside.

Rashelle said, "Perhaps, in my role as hostess, I may be forgiven if I ask personal questions. Am I correct in assuming that you three do not represent a family; that you, Hari, and you, Dors, are not married and that Raych is not your son?"

"The three of us are not related in any way," said Seldon. "Raych was born on Trantor, I on Helicon, Dors on Cinna."

"And how did you all meet, then?"

Seldon explained briefly and with as little detail as he could manage. "There's nothing romantic or significant in the meetings," he added.

"Yet I am given to understand that you raised difficulties with my personal aide, Sergeant Thalus, when he wanted to take only you out of Dahl."

Seldon said gravely, "I had grown fond of Dors and Raych and did not wish to be separated from them."

Rashelle smiled and said, "You are a sentimental man, I see."

"Yes, I am. Sentimental. And puzzled too."

"Puzzled?"

"Why yes. And since you were so kind as to ask personal questions of us, may I ask one as well?"

"Of course, my dear Hari. Ask anything you please."

"When we first arrived, you said that Wye has wanted me from the day I addressed the Decennial Convention. For what reason might that be?"

"Surely, you are not so simple as not to know. We want you for your psychohistory."

"That much I do understand. But what makes you think that having me means you have psychohistory?"

"Surely, you have not been so careless as to lose it."

"Worse, Rashelle. I have never had it"

Rashelle's face dimpled. "But you said you had it in your talk. Not that I understood your talk. I am not a mathematician. I hate numbers. But I have in my employ mathematicians who have explained to me what it is you said."

"In that case, my dear Rashelle, you must listen more closely. I can well imagine they have told you that I have proven that psychohistorical predictions are conceivable, but surely they must also have told you that they are not practical."

"I can't believe that, Hari. The very next day, you were called into an audience with that pseudo-Emperor, Cleon."

"The pseudo-Emperor?" murmured Dors ironically.

"Why yes," said Rashelle as though she was answering a serious question.

"Pseudo-Emperor. He has no true claim to the throne."

"Rashelle," said Seldon, brushing that aside a bit impatiently, "I told Cleon exactly what I have just told you and he let me go."

Now Rashelle did not smile. A small edge crept into her voice. "Yes, he let you go the way the cat in the fable lets a mouse go. He has been pursuing you ever since-in Streeling, in Mycogen, in Dahl. He would pursue you here if he dared. But come now-our serious talk is too serious. Let us enjoy ourselves. Let us have music."

And at her words, there suddenly sounded a soft but joyous instrumental melody.

She leaned toward Raych and said softly, "My boy, if you are not at ease with the fork, use your spoon or your fingers. I won't mind."

Raych said, "Yes, mum," and swallowed hard, but Dors caught his eye and her lips silently mouthed: "Fork."

He remained with his fork.

Dors said, "The music is lovely, Madam"-she pointedly rejected the familiar form of address "but it must not be allowed to distract us. There is the thought in my mind that the pursuer in all those places might have been in the employ of the Wye Sector. Surely, you would not be so well acquainted with events if Wye were not the prime mover."

Rashelle laughed aloud. "Wye has its eyes and ears everywhere, of course, but we were not the pursuers. Had we been, you would have been picked up without fail-as you were in Dahl finally when, indeed, we were the pursuers. When, however, there is a pursuit that fails, a grasping hand that misses, you may be sure that it is Demerzel."

"Do you think so little of Demerzel?" murmured Dors.

"Yes. Does that surprise you? We have beaten him."

"You? Or the Wye Sector?"

"The sector, of course, but insofar as Wye is the victor, then I am the victor."

"How strange," said Dors. "There seems to be a prevalent opinion throughout Trantor that the inhabitants of Wye have nothing to do with victory, with defeat, or with anything else. It is felt that there is but one will and one fist in Wye and that is that of the Mayor. Surely, you-or any other Wyan-weigh nothing in comparison."

Rashelle smiled broadly. She paused to look at Raych benevolently and to pinch his cheek, then said, "If you believe that our Mayor is an autocrat and that there is but one will that sways Wye, then perhaps you are right. But, even so, I can still use the personal pronoun, for my will is of account."

"Why yours?" said Seldon. "Why not?" said Rashelle as the servers began clearing the table. "I am the Mayor of Wye."

86.

It was Raych who was the first to react to the statement. Quite forgetting the cloak of civility that sat upon him so uncomfortably, he laughed raucously and said, "Hey, lady, ya can't be Mayor. Mayors is guys."

Rashelle looked at him good-naturedly and said in a perfect imitation of his tone of voice, "Hey, kid, some Mayors is guys and some Mayors is dames. Put that under your lid and let it bubble."

Raych's eyes protruded and he seemed stunned. Finally he managed to say, "Hey, ya talk regular, lady."

"Sure thing. Regular as ya want," said Rashelle, still smiling.

Seldon cleared his throat and said, "That's quite an accent you have, Rashelle."

Rashelle tossed her head slightly. "I haven't had occasion to use it in many years, but one never forgets. I once had a friend, a good friend, who was a Dahlite-when I was very young." She sighed. "He didn't speak that way, of course-he was quite intelligent but he could do so if he wished and he taught me. It was exciting to talk so with him. It created a world that excluded our surroundings. It was wonderful. It was also impossible. My father made chat plain. And now along comes this young rascal, Raych, to remind me of those long-ago days. He has the accent, the eyes, the impudent cast of countenance, and in six years or so he will be a delight and terror to the young women. Won't you, Raych?"

Raych said, "I dunno, lady-uh, mum."

"I'm sure you will and you will come to look very much like my . . . old friend and it will be much more comfortable for me not to see you then. And now, dinner's over and it's time for you to go to your room, Raych. You can watch holovision for a while if you wish. I don't suppose you read."

Raych reddened. "I'm gonna read someday. Master Seldon says I'm gonna."

"Then I'm sure you will."

A young woman approached Raych, curtsying respectfully in Rashelle's direction. Seldon had not seen the signal that had summoned her.

Raych said, "Can't I stay with Master Seldon and Missus Venabili?"

"You'll see them later," said Rashelle gently, "but Master and Missus and I have to talk right now-so you must go."

Dors mouthed a firm "Go!" at Raych and with a grimace the boy slid out of his chair and followed the attendant.

Rashelle turned to Seldon and Dors once Raych was gone and said, "The boy will be safe, of course, and treated well. Please have no fears about that. And I will be safe too. As my woman approached just now, so will a dozen armed men-and much more rapidly-when summoned. I want you to understand that."

Seldon said evenly, "We are in no way thinking of attacking you, Rashelle-or must I now say, 'Madam Mayor'?"

"Still Rashelle. I am given to understand that you are a wrestler of sorts, Hari, and you, Dors, are very skillful with the knives we have removed from your room. I don't want you to rely uselessly on your skills, since I want Hari alive, unharmed, and friendly."

"It is quite well understood, Madam Mayor," said Dors, her lack of friendship uncompromised, "that the ruler of Wye, now and for the past forty years, is Mannix, Fourth of that Name, and that he is still alive and in full possession of his faculties. Who, then, are you really?"

"Exactly who I say I am, Dors. Mannix IV is my father. He is, as you say, still alive and in possession of his faculties. In the eyes of the Emperor and of all the Empire, he is Mayor of Wye, but he is weary of the strains of power and is willing, at last, to let them slip into my hands, which are just as willing to receive them. I am his only child and I was brought up all my life to rule. My father is therefore Mayor in law and name, but I am Mayor in fact. It is to me, now, that the armed forces of Wye have sworn allegiance and in Wye that is all that counts."

Seldon nodded. "Let it be as you say. But even so, whether it is Mayor Mannix IV or Mayor Rashelle I-it is the First, I suppose there is no purpose in your holding me. I have told you that I don't have a workable psychohistory and I do not think that either I or anyone else will ever have one. I have cold chat to the Emperor. I am of no use either to you or to him."

Rashelle said, "How naive you are. Do you know the history of the Empire?"

Seldon shook his head. "I have recently come to wish that I knew it much better."

Dors said dryly, "I know Imperial history quite well, though the pre-Imperial age is my specialty, Madam Mayor. But what does it matter whether we do or do not?"

"If you know your history, you know that the House of Wye is ancient and honorable and is descended from the Dacian dynasty."

Dors said, "The Dacians ruled five thousand years ago. The number of their descendants in the hundred and fifty generations that have lived and died since then may

number half the population of the Galaxy-if all genealogical claims, however outrageous, are accepted."

"Our genealogical claims, Dr. Venabili"-Rashelle's tone of voice was, for the first time, cold and unfriendly and her eyes flashed like steel-"are not outrageous. They are fully documented. The House of Wye has maintained itself consistently in positions of power through all those generations and there have been occasions when we have held the Imperial throne and have ruled as Emperors."

"The history book-films," said Dors, "usually refer to the Wye rulers as 'anti-Emperors,' never recognized by the bulk of the Empire."

"It depends on who writes the history book-films. In the future, we wilt, for the throne which has been ours will be ours again."

"To accomplish that, you must bring about civil war."

"There won't be much risk of that," said Rashelle. She was smiling again. "That is what I must explain to you because I want Dr. Seldon's help in preventing such a catastrophe. My father, Mannix IV, has been a man of peace all his life.

He has been loyal to whomever it might be that ruled in the Imperial Palace and he has kept Wye a prosperous and strong pillar of the Trantorian economy for the good of all the Empire."

"I don't know that the Emperor has ever trusted him any the more for all that," said Dors.

"I'm sure that is so," said Rashelle calmly, "for the Emperors that have occupied the Palace in my father's time have known themselves to be usurpers of a usurping line. Usurpers cannot afford to trust the true rulers. And yet my father has kept the peace. He has, of course, developed and trained a magnificent security force to maintain the peace, prosperity, and stability of the sector and the Imperial authorities have allowed this because they wanted Wye peaceful, prosperous, stable-and loyal."

"But is it loyal?" said Dors.

"To the true Emperor, of course," said Rashelle, "and we have now reached the stage where our strength is such that we can take over the government quickly-in a lightning stroke, in fact-and before one can say 'civil war' there will be a true Emperor-or Empress, if you prefer-and Trantor will be as peaceful as before."

Dors shook her head. "May I enlighten you? As a historian?"

"I am always willing to listen." And she inclined her head ever so slightly toward Dors.

"Whatever size your security force may be, however well-trained and well equipped, they cannot possibly equal in size and strength the Imperial forces backed by twenty-five million worlds."

"Ah, but you have put your finger on the usurper's weakness, Dr. Venabili. There are twenty-five million worlds, with the Imperial forces scattered over them.

Those forces are thinned out over incalculable space, under uncounted officers, none of them particularly ready for any action outside their own Provinces, many ready for action in their own interest rather than in the Empire's. Our forces, on the other hand, are

all here, all on Trantor. We can act and conclude before the distant generals and admirals can get it through their heads that they are needed."

"But that response will come-and with irresistible force."

"Are you certain of that?" said Rashelle. "We will be in the Palace. Trantor will be ours and at peace. Why should the Imperial forces stir when, by minding their own business, each petty military leader can have his own world to rule, his own Province?"

"But is that what you want?" asked Seldon wonderingly. "Are you telling me that you look forward to ruling over an Empire that will break up into splinters?"

Rashelle said, "That is exactly right. I would rule over Trantor, over its outlying space settlements, over the few nearby planetary systems that are part of the Trantorian Province. I would much rather be Emperor of Trantor than Emperor of the Galaxy."

"You would be satisfied with Trantor only," said Dors in tones of the deepest disbelief.

"Why not?" said Rashelle, suddenly ablaze. She leaned forward eagerly, both hands pressed palms-down on the table. "That is what my father has been planning for forty years. He is only clinging to life now to witness its fulfillment. Why do we need millions of worlds, distant worlds that mean nothing to us, that weaken us, that draw our forces far away from us into meaningless cubic parsecs of space, that drown us in administrative chaos, that ruin us with their endless quarrels and problems when they are all distant nothings as far as we are concerned? Our own populous world-our own planetary city-is Galaxy enough for us. We have all we need to support ourselves. As for the rest of the Galaxy, let it splinter. Every petty militarist can have his own splinter. They needn't fight. There will be enough for all."

"But they will fight, just the same," said Dors. "Each will refuse to be satisfied with his Province. Each will fear that his neighbor is not satisfied with his Province. Each will feel insecure and will dream of Galactic rule as the only guarantee of safety. This is certain, Madam Empress of Nothing. There will be endless wars into which you and Trantor will be inevitably drawn-to the ruin of all."

Rashelle said with clear contempt, "So it might seem, if one could see no farther than you do, if one relied on the ordinary lessons of history."

"What is there to see farther?" retorted Dors. "What is one to rely on beyond the lessons of history?"

"What lies beyond?" said Rashelle. "Why, he!"

And her arm shot outward, her index finger jabbing toward Seldon.

"Me?" said Seldon. "I have already told you that psychohistory-"

Rashelle said, "Do not repeat what you have already said, my good Dr. Seldon. We gain nothing by that. -Do you think, Dr. Venabili, that my father was never aware of the danger of endless civil war? Do you think he did not bend his powerful mind to thinking of some way to prevent that? He has been prepared at any time these last ten years to take over the Empire in a day. It needed only the assurance of security beyond victory."

"Which you can't have," said Dors.

"Which we had the moment we heard of Dr. Seldon's paper at the Decennial Convention. I saw at once that that was what we needed. My father was too old to see the significance at once. When I explained it, however, he saw it too and it was then that he formally transferred his power to me. So it is to you, Hari, that I owe my position and to you I will owe my greater position in the future."

"I keep telling you that it cannot-" began Seldon with deep annoyance.

"It is not important what can or cannot be done. What is important is what people will or will not believe can be done. They will believe you, Hari, when you tell them the psychohistoric prediction is that Trantor can rule itself and that the Provinces can become Kingdoms that will live together in peace."

"I will make no such prediction," said Seldon, "in the absence of true psychohistory. I won't play the charlatan. If you want something like that, you say it."

"Now, Hari. They won't believe me. It's you they will believe. The great mathematician. Why not oblige them?"

"As it happens," said Seldon "the Emperor also thought to use me as a source of self-serving prophecies. I refused to do it for him, so do you think I will agree to do it for you?"

Rashelle was silent for a while and when she spoke again her voice had lost its intense excitement and became almost coaxing.

"Hari," she said, "think a little of the difference between Cleon and myself. What Cleon undoubtedly wanted from you was propaganda to preserve his throne. It would be useless to give him that, for the throne can't be preserved. Don't you know that the Galactic Empire is in a state of decay, that it cannot endure for much longer? Trantor itself is slowly sliding into ruin because of the ever-increasing weight of administering twenty-five million worlds. What's ahead of us is breakup and civil war, no matter what you do for Cleon."

Seldon said, "I have heard something like this said. It may even be true, but what then?"

"Well then, help it break into fragments without any war. Help me take Trantor. Help me establish a firm government over a realm small enough to be ruled efficiently. Let me give freedom to the rest of the Galaxy, each portion to go its own way according to its own customs and cultures. The Galaxy will become a working whole again through the free agencies of trade, tourism, and communication and the fate of cracking into disaster under the present rule of force that barely holds it together will be averted. My ambition is moderate indeed; one world, not millions; peace, not war; freedom, not slavery. Think about it and help me."

Seldon said, "Why should the Galaxy believe me any more than they would believe you? They don't know me and which of our fleet commanders will be impressed by the mere word 'psychohistory'?"

"You won't be believed now, but I don't ask for action now. The House of Wye, having waited thousands of years, can wait thousands of days more. Cooperate with me and I will make your name famous. I will make the promise of psychohistory glow through

all the worlds and at the proper time, when I judge the movement to be the chosen moment, you will pronounce your prediction and we will strike. Then, in a twinkling of history, the Galaxy will exist under a New Order that will render it stable and happy for eons. Come now, Hari, can you refuse me?"

OVERTHROW

THALUS, EMMER- . . . A sergeant in the armed security forces of the Wye Sector of ancient Trantor . . .

. . . Aside from these totally unremarkable vital statistics, nothing is known of the man except that on one occasion he held the fate of the Galaxy in his fist.

ENCYCLOPEDIA GALACTICA

87.

Breakfast the next morning was served in an alcove near the rooms of the captured three and it was luxurious indeed. There certainly was a considerable variety to the food and more than enough of everything.

Seldon sat at the breakfast table with a mound of spicy sausages before him, totally ignoring Dors Venabili's gloomy predictions concerning stomachs and colic.

Raych said, "The dame . . . the Madam Mayor said when she came to see me last night-"

"She came to see you?" said Seldon.

"Yeah. She said she wanted to make sure I was comfortable. She said when she had a chance she would take me to a zoo."

"A zoo?" Seldon looked at Dors. "What kind of zoo can they have on Trantor? Cats and dogs?"

"There are some aboriginal animals," said Dors, "and I imagine they import some aboriginals from other worlds and there are also the shared animals that all the worlds have-other worlds having more than Trantor, of course. As a matter of fact, Wye has a famous zoo, probably the best on the planet after the Imperial Zoo itself."

Raych said, "She's a nice old lady."

"Not that old," said Dors, "but she's certainly feeding us well."

"There's that," admitted Seldon.

When breakfast was over, Raych left to go exploring.

Once they had retired to Dors's room, Seldon said with marked discontent, "I don't know how long we'll be left to ourselves. She's obviously plotted ways of preoccupying our time."

Dors said, "Actually, we have little to complain of at the moment. We're much more comfortable here than we were either in Mycogen or Dahl."

Seldon said, "Dors, you're not being won over by that woman, are you?"

"Me? By Rashelle? Of course not. How can you possibly think so?"

"Welt, you're comfortable. You're well-fed. It would be natural to relax and accept what fortune brings."

"Yes, very natural. And why not do that?"

"Look, you were telling me last night about what's going to happen if she wins out. I may not be much of a historian myself, but I am willing to take your word for it and, actually, it makes sense even to a non-historian. The Empire will shatter and its shards will be fighting each other for . . . for . . . indefinitely. She must be stopped."

"I agree," said Dors. "She must be. What I fail to see is how we can manage to do that little thing right at this moment." She looked at Seldon narrowly.

"Hari, you didn't sleep last night, did you?"

"Did you?" It was apparent he had not.

Dors stared at him, a troubled look clouding her face. "Have you lain awake thinking of Galactic destruction because of what I said?"

"That and some other things. Is it possible to reach Chetter Hummin?" This last was said in a whisper.

Dors said, "I tried to reach him when we first had to flee arrest in Dahl. He didn't come. I'm sure he received the message, but he didn't come. It may be that, for any of a number of reasons, he just couldn't come to us, but when he can he will."

"Do you suppose something has happened to him?"

"No," said Dors patiently. "I don't think so."

"How can you know?"

"The word would somehow get to me. I'm sure of it. And the word hasn't gotten to me."

Seldon frowned and said, "I'm not as confident as you are about all this. In fact, I'm not confident at all. Even if Hummin came, what can he do in this case? He can't fight all of Wye. If they have, as Rashelle claims, the best-organized army on Trantor, what will he be able to do against it?"

"There's no point in discussing that. Do you suppose you can convince Rashelle-bang it into her head somehow-that you don't have psychohistory?"

"I'm sure she's aware that I don't have it and that I'm not going to get it for many years-if at all. But she'll say I have psychohistory and if she does that skillfully enough, people will believe her and eventually they will act on what she says my predictions and pronouncements are--even if I don't say a word."

"Surely, that will take time. She won't build you up overnight. Or in a week. To do it properly, it might take her a year."

Seldon was pacing the length of the room, turning sharply on his heel and striding back. "That might be so, but I don't know. There would be pressure on her to do things quickly. She doesn't strike me as the kind of woman who has cultivated the habit of patience. And her old father, Mannix IV, would be even more impatient. He must feel the nearness of death and if he's worked for this all his life, he would much prefer to see it done a week before his death rather than a week after. Besides-" Here he paused and looked around the empty room.

"Besides what?"

"Well, we must have our freedom. You see, I've solved the psychohistory problem."

Dors's eyes widened. "You have it! You've worked it out."

"Not worked it out in the full sense. That might take decades . . . centuries, for all I know. But I now know it's practical, not just theoretical. I know it can be done so I must have the time, the peace, the facilities to work at it.

The Empire must be held together till I-or possibly my successors-will learn how best to keep it so or how to minimize the disaster if it does split up despite us. It was the thought of having a beginning to my task and of not being able to work at it, that kept me up last night."

88.

It was their fifth day in Wye and in the morning Dors was helping Raych into a formal costume that neither was quite familiar with.

Raych looked at himself dubiously in the holomirror and saw a reflected image that faced him with precision, imitating all his motions but without any inversion of left and right. Raych had never used a holomirror before and had been unable to keep from trying to feel it, then laughing, almost with embarrassment, when his hand passed through it while the image's hand poked ineffectually at his real body.

He said at last, "I look funny."

He studied his tunic, which was made of a very pliant material, with a thin filigreed belt, then passed his hands up a stiff collar that rose like a cup past his ears on either side.

"My head looks like a ball inside a bowl."

Dors said, "But this is the sort of thing rich children wear in Wye. Everyone who sees you will admire you and envy you."

"With my hair all stuck down?"

"Certainly. You'll wear this round little hat."

"It'll make my head more like a ball."

"Then don't let anyone kick it. Now, remember what I told you. Keep your wits about you and don't act like a kid."

"But I am a kid," he said, looking up at her with a wide-eyed innocent expression.

"I'm surprised to hear you say that," said Dors. "I'm sure you think of yourself as a twelve-year-old adult."

Raych grinned. "Okay. I'll be a good spy."

"That's not what I'm telling you to be. Don't take chances. Don't sneak behind doors to listen. If you get caught at it, you're no good to anyone-especially not to yourself."

"Aw, c'mon, Missus, what do ya think I am? A kid or somethin'?"

"You just said you were, didn't you, Raych? You just listen to everything that's said without seeming to. And remember what you hear. And tell us. That's simple enough."

"Simple enough for you to say, Missus Venabili," said Raych with a grin, "and simple enough for me to do."

"And be careful."

Raych winked. "You bet."

A flunky (as coolly impolite as only an arrogant flunky can be) came to take Raych to where Rashelle was awaiting him.

Seldon looked after them and said thoughtfully, "He probably won't see the zoo, he'll be listening so carefully. I'm not sure it's right to thrust a boy into danger like that."

"Danger? I doubt it. Raych was brought up in the slums of Billibotton, remember. I suspect he has more alley smarts than you and I put together. Besides, Rashelle is fond of him and will interpret everything he does in his favor. -Poor woman."

"Are you actually sorry for her, Dors?"

"Do you mean that she's not worth sympathy because she's a Mayor's daughter and considers herself a Mayor in her own right and because she's intent on destroying the Empire? Perhaps you're right, but even so there are some aspects of her for which one might show some sympathy. For instance, she's had an unhappy love affair. That's pretty evident. Undoubtedly, her heart was broken-for a time, at least."

Seldon said, "Have you ever had an unhappy love affair, Dors?"

Dor considered for a moment or two, then said, "Not really. I'm too involved with my work to get a broken heart."

"I thought as much."

"Then why did you ask?"

"I might have been wrong."

"How about you?"

Seldon seemed uneasy. "As a matter of fact, yes. I have spared the time for a broken heart. Badly cracked, anyway."

"I thought as much."

"Then why did you ask?"

"Not because I thought I might be wrong, I promise you. I just wanted to see if you would lie. You didn't and I'm glad."

There was a pause and then Seldon said, "Five days have passed and nothing has happened."

"Except that we are being treated well, Hari."

"If animals could think, they'd think they were being treated well when they were only being fattened for the slaughter."

"I admit she's fattening the Empire for the slaughter."

"But when?"

"I presume when she's ready."

"She boasted she could complete the coup in a day and the impression I got was that she could do that on any day."

"Even if she could, she would want to make sure that she could cripple the Imperial reaction and that might take time."

"How much time? She plans to cripple the reaction by using me, but she is making no effort to do so. There is no sign that she's trying to build up my importance. Wherever I go in Wye I'm unrecognized. There are no Wyan crowds gathering to cheer me. There's nothing on the news holocasts."

Dors smiled. "One would almost suppose that your feelings are hurt at not being made famous. You're naive, Hari. Or not a historian, which is the same thing. I think you had better be more pleased that the study of psychohistory will be bound to make a historian of you than that it may save the Empire. If all human beings understood history, they might cease making the same stupid mistakes over and over."

"In what way am I naive?" asked Seldon lifting his head and staring down his nose at her.

"Don't be offended, Hari. I think it's one of your attractive features, actually."

"I know. It arouses your maternal instincts and you have been asked to take care of me. But in what way am I naive?"

"In thinking that Rashelle would cry to propagandize the population of the Empire, generally, into accepting you as seer. She would accomplish nothing in that way. Quadrillions of people are hard to move quickly. There is social and psychological inertia, as well as physical inertia. And, by coming out into the open, she would simply alert Demerzel."

"Then what is she doing?"

"My guess is that the information about you-suitably exaggerated and glorified-is going out to a crucial few. It is going to those Viceroy's of sectors, those admirals of fleets, those people of influence she feels look kindly upon her-or grimly upon the Emperor. A hundred or so of those who might rally to her side will manage to confuse the Loyalists just long enough to allow Rashelle the First to set up her New Order firmly enough to beat off whatever resistance might develop. At least, I imagine that is how she reasons."

"And yet we haven't heard from Hummin."

"I'm sure he must be doing something just the same. This is too important to ignore."

"Has it occurred to you that he might be dead?"

"That's a possibility, but I don't think so. If he was, the news would reach me."

"Here?"

"Even here."

Seldon raised his eyebrows, but said nothing.

Raych came back in the late afternoon, happy and excited, with descriptions of monkeys and of Bakarian demoires and he dominated the conversation during dinner.

It was not until after dinner when they were in their own quarters that Dors said, "Now, tell me what happened with Madam Mayor, Raych. Tell me anything she did or said that you think we ought to know."

"One thing," said Raych, his face lighting up. "That's why she didn't show at dinner, I bet."

"What was it?"

"The zoo was closed except for us, you know. There were lots of us. Rashelle and me and all sorts of guys in uniforms and dames in fancy clothes and like that. Then this guy in a uniform-a different guy, who wasn't there to begin with-came in toward the end and he said something in a low voice and Rashelle corned to all the people and made with her hand like they shouldn't move and they didn't. And she went a little ways away with this new guy, so she could talk to him and no one could hear her. Except I kept paying no attention and kept looking at the different cages and sort of moved near to Rashelle so I could hear her. "

"She said, 'How dare they?' like she was real mad. And the guy in the uniform, he looked nervous-I just got quick looks because I was trying to make out like I was watching the animals-so mostly I just heard the words. He said somebody-I don't remember the name, but he was a general or somethin'. He said this general said the officers had sworn religious to Rashelle's old man-

"Sworn allegiance," said Dors.

"Somethin' like that and they was nervous about havin' to do what a dame says. He said they wanted the old man or else, if he was kind of sick, he should pick some guy to be Mayor, not a dame."

"Not a dame? Are you sure?"

"That's what he said. He like whispered it. He was so nervous and Rashelle was so mad she could hardly speak. She said, 'I'll have his head. They wilt all swear allegiance to me tomorrow and whoever refuses will lave cause to regret it before an hour has passed.' That's exactly what she said. She broke up the whole party and we all came back and she didn't say one word to me all the rime. Just sat there, looking kinda mean and angry."

Dors said, "Good. Don't you mention this to anyone, Raych."

"Course not. Is it what you wanted?"

"Very much what I wanted. You did well, Raych. Now, go to your room and forget the whole thing. Don't even think about it."

Once he was gone, Dors turned m Seldon and said, "This is very interesting. Daughters have succeeded fathers-or mothers, for that matter-and held Mayoralties or other high offices on any number of occasions. There have even been reigning Empresses, as you undoubtedly know, and I can't recall that there was ever in Imperial history any serious question of serving under one. It makes one wonder why such a thing should now, arise in Wye."

Seldon said, "Why not? We've only recently been in Mycogen, where women are held in a total lack of esteem and couldn't possibly hold positions of power, however minor."

"Yes, of course, but that's an exception. There are other places where women dominate. For the most part, though, government and power have been more or less

equisexual. If more men tend to hold high positions, it is usually because women tend to be more bound-biologically-to children."

"But what is the situation in Wye?"

"Equisexual, as far as I know. Rashelle didn't hesitate to assume Mayoral power and I imagine old Mannix didn't hesitate to grant it to her. And she was surprised and furious at encountering male dissent. She can't have expected it."

Seldon said, "You're clearly pleased ac this. Why?"

"Simply because it's so unnatural that it must be contrived and I imagine Hummin is doing the contriving."

Seldon said thoughtfully, "You think so?"

"I do," said Dors.

"You know," said Seldon, "so do I."

89.

It was their tenth day in Wye and in the morning Hari Seldon's door signal sounded and Raych's high-pitched voice outside was crying out, "Mister! Mister Seldom It's war!"

Seldon took a moment to swap from sleep to wakefulness and scrambled out of bed.

He was shivering slightly (the Wyans liked their domiciles on the chilly side, he had discovered quite early in his stay there) when he threw the door open.

Raych bounced in, excited and wide-eyed. "Mister Seldon, they have Mannix, the old Mayor'. They have-"

"Who have, Raych?"

"The Imperials, Their jets came in last night all over. The news holocasts are telling all about it. It's on in Missus's room. She said to let ya sleep, but I figured ya would wanner know."

"And you were quite right." Seldom pausing only tong enough to throw on a bathrobe, burst into Dors's room. She was fully dressed and was watching the bolo-sec in the alcove.

Behind the clear, small image of a desk sat a man, with the Spaceship-and Sun sharply defined on the left-front of his tunic. On either side, two soldiers, also wearing the Spaceship-and-Sun, stood armed. The officer at the desk was saying, "-is under the peaceful control of his Imperial Majesty. Mayor Mannix is safe and well and is in full possession of his Mayoral powers under the guidance of friendly Imperial troops. He will be before you soon to urge calm on all Wyans and to ask any Wyan soldiers still in arms to lay them down."

There were other news holocasts by various newsmen with unemotional voices, all wearing Imperial armbands. The news was all the same: surrender by this or chat unit of the Wyan security forces after firing a few shots for the record-and sometimes after no resistance at all. This town center and that town center were occupied-and there were

repeated views of Wyan crowds somberly watching Imperial forces marching down the streets.

Dors said, "It was perfectly executed, Hari. Surprise was complete. There was no chance of resistance and none of consequence was offered."

Then Mayor Mannix IV appeared, as had been promised. He was standing upright and, perhaps for the sake of appearances, there were no Imperials in sight, though Seldon was reasonably certain that an adequate number were present just out of camera range.

Mannix was old, but his strength, though worn, was still apparent. His eyes did not meet the holo-camera and his words were spoken as though forced upon him-but, as had been promised, they counseled Wyans to remain calm, to offer no resistance, to keep Wye from harm, and to cooperate with the Emperor who, it was hoped, would survive long on the throne.

"No mention of Rashelle," said Seldon. "It's as though his daughter doesn't exist."

"No one has mentioned her," said Dors, "and this place, which is, after all, her residence-or one of them-hasn't been attacked. Even if she manages to slip away and take refuge in some neighboring sector, I doubt she will be safe anywhere on Trantor for long."

"Perhaps not," came a voice; "but I'll be safe here for a little while."

Rashelle entered. She was properly dressed, properly calm. She was even smiling, but it was no smile of joy; it was, rather, a cold baring of teeth.

The three stared at her in surprise for a moment and Seldon wondered if she had any of her servants with her or if they had promptly deserted her at the first sign of adversity. 406 Dors said a little coldly, "I see, Madam Mayor, that your hopes for a coup can not be maintained. Apparently, you have been forestalled."

"I have not been forestalled. I have been betrayed. My officers have been tampered with and-against all history and rationality -- they have refused to fight for a woman but only for their old master. And, traitors that they are, they then let their old master be seized so that he cannot lead them in resistance."

She looked about for a chair and sat down. "And now the Empire must continue to decay and die when I was prepared to offer it new life."

"I think," said Dors, "the Empire has avoided an indefinite period of useless fighting and destruction. Console yourself with that, Madam Mayor."

It was as though Rashelle did not hear her. "So many years of preparation destroyed in a night." She sat there beaten, defeated, and seemed to have aged twenty years.

Dors said, "It could scarcely have been done in a night. The suborning of your officers-if that took place-must have taken time."

"At that, Demerzel is a master and quite obviously I underestimated him. How he did it, I don't know-threats, bribes, smooth and specious argument. He is a master at the art of stealth and betrayal-I should have known."

She went on after a pause. "If this was outright force on his part, I would have had no trouble destroying anything he sent against us. Who would think that Wye would be betrayed, that an oath of allegiance would be so lightly thrown aside?"

Seldon said with automatic rationality, "But I imagine the oath was made not to you, but to your father."

"Nonsense," said Rashelle vigorously. "When my father gave me the Mayoral office, as he was legally entitled to do, he automatically passed on to me any oaths of allegiance made to him. There is ample precedence for this. It is customary to have the oath repeated to the new ruler, but that is a ceremony only and not a legal requirement. My officers know that, though they choose to forget. They use my womanhood as an excuse because they quake in fear of Imperial vengeance that would never have come had they been staunch or tremble with greed for promised rewards they will surely never get-if I know Demerzel."

She turned sharply toward Seldon. "He wants you, you know. Demerzel struck at us for you."

Seldon started. "Why me?"

"Don't be a fool. For the same reason I wanted you . . . to use you as a tool, of course." She sighed. "At least I am not utterly betrayed. There are still loyal soldiers to be found. -Sergeant!"

Sergeant Emmer Thalus entered with a soft cautious step that seemed incongruous, considering his size. His uniform was spruce, his long blond mustache fiercely curled.

"Madam Mayor," he said, drawing himself to attention with a snap.

He was still, in appearance, the side of beef that Hari had named him-a man still following orders blindly, totally oblivious to the new and changed state of affairs.

Rashelle smiled sadly at Raych. "And how are you, little Raych? I had meant to make something of you. It seems now I won't be able to."

"Hello, Missus . . . Madam," said Raych awkwardly.

"And to have made something of you too, Dr. Seldon" said Rashelle, "and there also I must crave pardon. I cannot."

"For me, Madam, you need have no regrets."

"But I do. I cannot very well let Demerzel have you. That would be one victory too many for him and at least I can stop that."

"I would not work for him, Madam, I assure you, any more than I would have worked for you."

"It is not a matter of work. It is a matter of being used. Farewell, Dr. Seldon.

-Sergeant, blast him."

The sergeant drew his blaster at once and Dors, with a loud cry, lunged forward-but Seldon reached out for her and caught her by the elbow. He hung on desperately.

"Stay back, Dors," he shouted, "or he'll kill you. He won't kill me. You too, Raych. Stand back. Don't move."

Seldon faced the sergeant. "You hesitate, Sergeant, because you know you cannot shoot I might have killed you ten days ago, but I did not. And you gave me your word of honor at that time that you would protect me."

"What are you waiting for?" snapped Rashelle. "I said shoot him down, Sergeant."

Seldon said nothing more. He stood there while the sergeant, eyes bulging, held his blaster steady and pointed at Seldon's head.

"You have your order!" shrieked Rashelle.

"I have your word," said Seldon quietly.

And Sergeant Thalus said in a choked tone, "Dishonored either way." His hand fell and his blaster clanged to the floor.

Rashelle cried out, "Then you too betray me'."

Before Seldon could move or Dors free herself from his grip, Rashelle seized the blaster, turned it on the sergeant, and closed contact.

Seldon had never seen anyone blasted before. Somehow, from the name of the weapon perhaps, he had expected a loud noise, an explosion of flesh and blood.

This Wyan blaster, at least, did nothing of the sort. What mangling it did to the organs inside the sergeant's chest Seldon could not tell but, without a change in expression, without a wince of pain, the sergeant crumbled and fell, dead beyond any doubt or any hope. And Rashelle turned the blaster on Seldon with a firmness that put to rest any hope for his own life beyond the next second.

It was Raych, however, who jumped into action the moment the sergeant fell. Racing between Seldon and Rashelle, he waved his hands wildly.

"Missus, Missus," he called. "Don't shoot."

For a moment, Rashelle looked confused. "Out of the way, Raych. I don't want to hurt you."

That moment of hesitation was all Dors needed. Breaking loose violently, she plunged toward Rashelle with a long low dive. Rashelle went down with a cry and the blaster hit the ground a second time. Raych retrieved it.

Seldon, with a deep and shuddering breath, said, "Raych, give that to me."

But Raych backed away. "Ya ain't gonna kill her, are ya, Mister Seldon? She was nice to me."

"I won't kill anyone, Raych," said Seldon. "She killed the sergeant and would have killed me, but she didn't shoot rather than hurt you and we'll let her live for that."

He was Seldon, who now sat down, the blaster held loosely in his hand, while Dors removed the neuronics whip from the dead sergeant's other holster.

A new voice rang out. "I'll take care of her now, Seldon."

Seldon looked up and in sudden joy said, "Hummin! Finally!"

"I'm sorry it took so long, Seldon. I had a lot to do. How are you, Dr. Venabili? I take it this is Mannix's daughter, Rashelle. But who is the boy?"

"Raych is a young Dahlite friend of ours," said Seldon.

Soldiers were entering and, at a small gesture from Hummin, they lifted Rashelle respectfully.

Dors, able to suspend her intent surveillance of the other woman, brushed at her clothes with her hands and smoothed her blouse. Seldon suddenly realized that he was still in his bathrobe.

Rashelle, shaking herself loose from the soldiers with contempt, pointed to Hummin and said to Seldon, "Who is this?"

Seldon said, "It is Chetter Hummin, a friend of mine and my protector on this planet."

"Your protector." Rashelle laughed madly. "You fool! You idiot! That man is Demerzel and if you look at your Venabili woman, you will see from her face that she is perfectly aware of that. You have been trapped all along, far worse than ever you were with me!"

90.

Hummin and Seldon sat at lunch that day, quite alone, a pall of quiet between them for the most part. It was toward the end of the meal that Seldon stirred and said in a lively voice, "Well, sir, how do I address you? I think of you as 'Chester Hummin' still, but even if I accept you in your other persona, I surely cannot address you as 'Eto Demerzel.' In that capacity, you have a title and I don't know the proper usage. Instruct me."

The other said gravely, "Call me 'Hummin'-if you don't mind. Or 'Chetter.' Yes, I am Eto Demerzel, but with respect to you I am Hummin. As a matter of fact, the two are not distinct. I told you that the Empire is decaying and failing. I believe that to be true in both my capacities. I told you that I wanted psychohistory as a way of preventing that decay and failure or of bringing about a renewal and reinvigoration if the decay and failure must run its course. I believe that in both my capacities too."

"But you had me in your grip-I presume you were in the vicinity when I had my meeting with His Imperial Majesty."

"With Cleon. Yes, of course."

"And you might have spoken to me, then, exactly as you later did as Hummin."

"And accomplished what? As Demerzel, I have enormous tasks. I have to handle Cleon, a well-meaning but not very capable ruler, and prevent him, insofar as I can, from making mistakes. I have to do my bit in governing Trantor and the Empire too. And, as you see, I had to spend a great deal of time in preventing Wye from doing harm."

"Yes, I know," murmured Seldon.

"It wasn't easy and I nearly lost out. I have spent years sparring carefully with Mannix, learning to understand his chinking and planning a countermove to his every move. I did not think, at any time, that while he was still alive he would pass on his powers to his daughter. I had not studied her and I was not prepared for her utter lack of caution. Unlike her father, she has been brought up to take power for granted and had no clear idea of its limitations. So she got you and forced me to act before I was quite ready."

"You almost lost me as a result. I faced the muzzle of a blaster twice. "

"I know," said Hummin, nodding. "And we might have lost you Upperside coo-another accident I could not foresee."

"But you haven't really answered my question. Why did you send me chasing all over the face of Trantor to escape from Demerzel when you yourself were Demerzel?"

"You told Cleon that psychohistory was a purely theoretical concept, a kind of mathematical game that made no practical sense. That might indeed have been so, but if I approached you officially, I was sure you would merely have maintained your belief. Yet I was attracted to the notion of psychohistory. I wondered whether it might not be, after all, just a game. You must understand that I didn't want merely to use you, I wanted a real and practical psychohistory.

"So I sent you, as you put it, chasing all over the face of Trantor with the dreaded Demerzel close on your heels at all times. That, I felt, would concentrate your mind powerfully. It would make psychohistory something exciting and much more than a mathematical game. You would try to work it out for the sincere idealist Hummin, where you would not for the Imperial flunky Demerzel. Also, you would get a glimpse of various sides of Trantor and that too would be helpful-certainly more helpful than living in an ivory tower on a far-off planet, surrounded entirely by fellow mathematicians. Was I right? Have you made progress?"

Seldon said, "In psychohistory? Yes, I did, Hummin. I thought you knew."

"How should I know?"

"I told Dors."

"But you hadn't told me. Nevertheless, you tell me so now. That is good news."

"Not entirely," said Seldon. "I have made only the barest beginning. But it is a beginning."

"Is it the kind of beginning that can be explained to a non-mathematician?"

"I think so. You see, Hummin, from the start I have seen psychohistory as a science that depends on the interaction of twenty-five million worlds, each with an average population of four thousand million. It's too much. There's no way of handling something that complex. If I was to succeed at all, if there was to be any way of finding a useful psychohistory, I would first have to find a simpler system.

"So I thought I would go back in time and deal with a single world, a world that was the only one occupied by humanity in the dim age before the colonization of the Galaxy. In Mycogen they spoke of an original world of Aurora and in Dahl I heard word of an original world of Earth. I thought they might be the same world under different names, but they were sufficiently different in one key point, at least, to make that impossible. And it didn't matter. So little was known of either one, and that little so obscured by myth and legend, that there was no hope of making use of psychohistory in connection with them."

He paused to sip at his cold juice, keeping his eyes firmly on Hummin's face.

Hummin said, "Well? What then?"

"Meanwhile, Dors had told me something I call the hand-on-thigh story. It was of no innate significance, merely a humorous and entirely trivial tale. As a result, though, Dors mentioned the different sex mores on various worlds and in various sectors of

Trantor. It occurred to me that she treated the different Trantorian sectors as though they were separate worlds. I thought, idly, that instead of twenty-five million different worlds, I had twenty-five million plus eight hundred to deal with. It seemed a trivial difference, so I forgot it and thought no more about it.

"But as I traveled from the Imperial Sector to Streeling to Mycogen to Dahl to Wye, I observed for myself how different each was. The thought of Trantor-not as a world but as a complex of worlds-grew stronger, but still I didn't see the crucial point.

"It was only when I listened to Rashelle--you see, it was good that I was finally captured by Wye and it was good that Rashelle's rashness drove her into the grandiose schemes that she imparted to me-When I listened to Rashelle, as I said, she told me that all she wanted was Trantor and some immediately adjacent worlds. It was an Empire in itself, she said, and dismissed the outer worlds as 'distant nothings.'

"It was then that, in a moment, I saw what I must have been harboring in my hidden thoughts for a considerable time. On the one hand, Trantor possessed an extraordinarily complex social system, being a populous world made up of eight hundred smaller worlds. It was in itself a system complex enough to make psychohistory meaningful and yet it was simple enough, compared to the Empire as a whole, to make psychohistory perhaps practical.

"And the Outer Worlds, the twenty-five million of them? They were 'distant nothings.' Of course, they affected Trantor and were affected by Trantor, but these were second-order effects. If I could make psychohistory work as a first approximation for Trantor alone, then the minor effects of the Outer Worlds could be added as later modifications. Do you see what I mean? I was searching for a single world on which to establish a practical science of psychohistory and I was searching for it in the far past, when all the time the single world I wanted was under my feet now, "

Hummin said with obvious relief and pleasure, "Wonderful!"

"But it's all left to do, Hummin. I must study Trantor in sufficient detail. I must devise the necessary mathematics to deal with it. If I am lucky and live out a full lifetime, I may have the answers before I die. If not, my successors will have to follow me. Conceivably, the Empire may have fallen and splintered before psychohistory becomes a useful technique."

"I will do everything I can to help you."

"I know it," said Seldon.

"You trust me, then, despite the fact I am Demerzel?"

"Entirely. Absolutely. But I do so because you are not Demerzel."

"But I am," insisted Hummin.

"But you are not. Your persona as Demerzel is as far removed from the truth as is your persona as Hummin."

"What do you mean?" Hummin's eyes grew wide and he backed away slightly from Seldon.

"I mean that you probably chose the name 'Hummin' out of a wry sense of what was fitting. 'Hummin' is a mispronunciation of 'human,' isn't it?"

Hummin made no response. He continued to stare at Seldon.

And finally Seldon said, "Because you're not human, are you, 'Hummin/Demerzel'?
You're a robot."

SELDON, HARI- . . . h is customary to think of Hari Seldon only in connection with psychohistory, to see him only as mathematics and social change personified. There is no doubt that he himself encouraged this for at no time in his formal writings did he give any hint as to how he came to solve the various problems of psychohistory. His leaps of thought might have all been plucked from air, for all he tells us. Nor does he tell us of the blind alleys into which he crept or the wrong turnings he may have made .

. . . As for his private life, it is a blank. Concerning his parents and siblings, we know a handful of factors, no more. His only son, Raych Seldon, is known to have been adopted, but how that came about is not known. Concerning his wife, we only know that she existed. Clearly, Seldon wanted to be a cipher except where psychohistory was concerned. It is as though he felt-or wanted it to be felt-that he did not live, he merely psychohistorified.

ENCYCLOPEDIA GALACTICA

91.

Hummin sat calmly, not a muscle twitching, still looking at Hari Seldon and Seldon, for his part, waited. It was Hummin, he thought, who should speak next.

Hummin did, but said merely, "A robot? Me? -By robot, I presume you mean an artificial being such as the object you saw in the Sacratorium in Mycogen."

"Not quite like that," said Seldon.

"Not metal? Not burnished? Not a lifeless simulacrum?" Hummin said it without any evidence of amusement.

"No. To be of artificial life is not necessarily to be made of metal. I speak of a robot indistinguishable from a human being in appearance. "

"If indistinguishable, Hari, then how do you distinguish?"

"Not by appearance. "

"Explain."

"Hummin, in the course of my flight from yourself as Demerzel, I heard of two ancient worlds, as I told you-Aurora and Earth. Each seemed to be spoken of as a first world or an only world. In both cases, robots were spoken of, but with a difference."

Seldon was staring thoughtfully at the man across the table, wondering if, in any way, he would give some sign that he was less than a man-or more. He said, "Where Aurora was in question, one robot was spoken of as a renegade, a traitor, someone who deserted the cause. Where Earth was in question, one robot was spoken of as a hero, one who represented salvation. Was it too much to suppose that it was the same robot?"

"Was it?" murmured Hummin.

"This is what I thought, Hummin. I thought that Earth and Aurora were two separate worlds, co-existing in time. I don't know which one preceded the other. From the arrogance and the conscious sense of superiority of the Mycogenians, I might suppose that Aurora was the original world and that they despised the Earthmen who derived from them-or who degenerated from them.

"On the other hand, Mother Rittah, who spoke to me of Earth, was convinced that Earth was the original home of humanity and, certainly, the tiny and isolated position of the Mycogenians in a whole galaxy of quadrillions of people who lack the strange Mycogenian ethos might mean that Earth was indeed the original home and that Aurora was the aberrant offshoot. I cannot tell, but I pass on to you my thinking, so that you will understand my final conclusions."

Hummin nodded. "I see what you are doing. Please continue."

"The worlds were enemies. Mother Rittah certainly made it sound so. When I compare the Mycogenians, who seem to embody Aurora, and the Dahlites, who seem to embody Earth, I imagine that Aurora, whether first or second, was nevertheless the one that was more advanced, the one that could produce more elaborate robots, even ones indistinguishable from human beings in appearance. Such a robot was designed and devised in Aurora, then. But he was a renegade, so he deserted Aurora. To the Earthpeople he was a hero, so he must have joined Earth. Why he did this, what his motives were, I can't say."

Hummin said, "Surely, you mean why it did this, what its motives were."

"Perhaps, but with you sitting across from me," said Seldon, "I find it difficult to use the inanimate pronoun. Mother Rittah was convinced that the heroic robot-her heroic robot-still existed, that he would return when he was needed. It seemed to me that there was nothing impossible in the thought of an immortal robot or at least one who was immortal as long as the replacement of worn-out parts was not neglected."

"Even the brain?" asked Hummin.

"Even the brain. I don't really know anything about robots, but I imagine a new brain could be re-recorded from the old. -And Mother Rittah hinted of strange mental powers. -I thought: It must be so. I may, in some ways, be a romantic, but I am not so much a romantic as to think that one robot, by switching from one side to the other, can alter the course of history. A robot could not make Earth's victory sure, nor Aurora's defeat certain-unless there was something strange, something peculiar about the robot."

Hummin said, "Does it occur to you, Hari, that you are dealing with legends, legends that may have been distorted over the centuries and the millennia, even to the extent of building a veil of the supernatural over quire ordinary events?"

Can you make yourself believe in a robot that not only seems human, but that also lives forever and has mental powers? Are you not beginning to believe in the superhuman?"

"I know very well what legends are and I am not one to be taken in by them and made to believe in fairy tales. Still, when they are supported by certain odd events that I have seen-and even experienced myself-"

"Such as?"

"Hummin, I met you and trusted you from the start. Yes, you helped me against those two hoodlums when you didn't need to and that predisposed me in your favor, since I didn't realize at the time that they were your hirelings, doing what you had instructed them to do. -But never mind that."

"No," said Hummin, a hint of amusement-finally-in his voice.

"I trusted you. I was easily convinced not to go home to Helicon and to make myself a wanderer over the face of Trantor. I believed everything you told me without question. I placed myself entirely in your hands. Looking back on it now, I see myself as not myself. I am not a person to be so easily led, yet I was. More than that, I did not even think it strange that I was behaving so far out of character."

"You know yourself best, Hari,"

"It wasn't only me. How is it that Dors Venabili, a beautiful woman with a career of her own, should abandon that career in order to join me in my flight?

How is it that she should risk her life to save mine, seeming to take on, as a kind of holy duty, the task of protecting me and becoming single-minded in the process? Was it simply because you asked her to?"

"I did ask her to, Hari."

"Yet she does not strike me as the kind of person to make such a radical changeover in her life merely because someone asks her to. Nor could I believe it was because she had fallen madly in love with me at first sight and could not help herself. I somehow wish she had, but she seems quite the mistress of her emotional self, more-I am now speaking to you frankly-than I myself am with respect to her."

"She is a wonderful woman," said Hummin. "I don't blame you."

Seldon went on. "How is it, moreover, that Sunmaster Fourteen, a monster of arrogance and one who leads a people who are themselves stiff-necked in their own conceit, should be willing to take in tribespeople like Dors and myself and to treat us as well as the Mycogenians could and did? When we broke every rule, committed every sacrilege, how is it that you could still talk him into letting us go?"

"How could you talk the Tisalvers, with their petty prejudices, into taking us in? How can you be at home everywhere in the world, be friends with everyone, influence each person, regardless of their individual peculiarities? For that matter, how do you manage to manipulate Cleon too? And if he is viewed as malleable and easily molded, then how were you able to handle his father, who by all accounts was a rough and arbitrary tyrant? How could you do all this?"

"Most of all, how is it that Mannix IV of Wye could spend decades building an army without peer, one trained to be proficient in every detail, and yet have it fall apart when his daughter tries to make use of it? How could you persuade them to play the Renegade, all of them, as you have done?"

Hummin said, "Might this mean no more than that I am a tactful person used to dealing with people of different types, that I am in a position to have done favors for crucial people and am in a position to do additional favors in the future? Nothing I have done, it might seem, requires the supernatural."

"Nothing you have done? Not even the neutralization of the Wyan army?"

"They did not wish to serve a woman."

"They must have known for years that any time Mannix laid down his powers or any time he died, Rashelle would be their Mayor, yet they showed no signs of discontent-until you felt it necessary that they show it. Dors described you at one time as a very persuasive man. And so you are. More persuasive than any man could be. But you are not more persuasive than an immortal robot with strange mental powers might be. -Well, Hummin?"

Hummin said, "What is it you expect of me, Hari? Do you expect me to admit I'm a robot? That I only look like a human being? That I am immortal? That I am a mental marvel?!"

Seldon leaned toward Hummin as he sat there on the opposite side of the table.

"Yes, Hummin, I do. I expect you to tell me the truth and I strongly suspect that what you have just outlined is the truth. You, Hummin, are the robot that Mother Rittah referred to as DaNee, friend of Ba-Lee. You must admit it. You have no choice."

92.

It was as though they were sitting in a tiny Universe of their own. There, in the middle of Wye, with the Wyan army being disarmed by Imperial force, they sat quietly. There, in the midst of events that all of Trantorand perhaps all the Galaxy-was watching, there was this small bubble of utter isolation within which Seldon and Hummin were playing their game of attack and defense-Seldon trying hard to force a new reality, Hummin making no move to accept that new reality.

Seldon had no fear of interruption. He was certain that the bubble within which they sat had a boundary that could not be penetrated, that Hummin's-no, the robot's-powers would keep all at a distance till the game was over.

Hummin finally said, "You are an ingenious fellow, Hari, but I fail to see why I must admit that I am a robot and why I have no choice but to do so. Everything you say may be true as facts-your own behavior, Dors's behavior, Sunmaster's, Tisalver's, the Wyan generals'-all, all may have happened as you said, but that doesn't force your interpretation of the meaning of the events to be true.

Surely, everything that happened can have a natural explanation. You trusted me because you accepted what I said; Dors felt your safety might be important because she felt psychohistory to be crucial, herself being a historian; Sunmaster and Tisalver were beholden to me for favors you know nothing of, the Wyan generals resented being ruled by a woman, no more. Why must we flee to the supernatural?"

Seldon said, "See here, Hummin, do you really believe the Empire to be falling and do you really consider it important that it not be allowed to do so with no move made to save it or, at the least, cushion its Fall?"

"I really do." Somehow Seldon knew this statement was sincere. "And you really want me to work out the details of psychohistory and you feel that you yourself cannot do it?"

"I lack the capability."

"And you feel that only I can handle psychohistory-even if I sometimes doubt it myself?"

"Yes."

"And you must therefore feel that if you can possibly help me in any way, you must."

"I do."

"Personal feelings-selfish considerations-could play no part?"

A faint and brief smile passed over Hummin's grave face and for a moment Seldon sensed a vast and arid desert of weariness behind Hummin's quiet manner. "I have built a long career on paying no heed to personal feelings or to selfish considerations."

"Then I ask your help. I can work out psychohistory on the basis of Trantor alone, but I will run into difficulties. Those difficulties I may overcome, but how much easier it would be to do so if I knew certain key facts. For instance, was Earth or Aurora the first world of humanity or was it some other world altogether? What was the relationship between Earth and Aurora? Did either or both colonize the Galaxy? If one, why didn't the other? If both, how was the issue decided? Are there worlds descended from both or from only one? How did robots come to be abandoned? How did Trantor become the Imperial world, rather than another planet? What happened to Aurora and Earth in the meantime? There are a thousand questions I might ask right now and a hundred thousand that might arise as I go along. Would you allow me to remain ignorant, Hummin, and fail in my task when you could inform me and help me succeed?"

Hummin said, "If I were the robot, would I have room in my brain for all of twenty thousand years of history for millions of different worlds?"

"I don't know the capacity of robotic brains. I don't know the capacity of yours. But if you lack the capacity, then you must have that information which you cannot hold safely recorded in a place and in a way that would make it possible for you to call upon it. And if you have it and I need information, how can you deny and withhold it from me? And if you cannot withhold it from me, how can you deny that you are a robot-that robot the Renegade?"

Seldon sat back and took a deep breath. "So I ask you again: Are you that robot?"

If you want psychohistory, then you must admit it. If you still deny you are a robot and if you convince me you are not, then my chances at psychohistory become much, much smaller. It is up to you, then. Are you a robot? Are you Da-Nee?"

And Hummin said, as imperturbable as ever. "Your arguments are irrefutable. I am R. Daneel Olivaw. The 'R' stands for 'robot.' "

R. Daneel Olivaw still spoke quietly, but it seemed to Seldon that there was a subtle change in his voice, as though he spoke more easily now that he was no longer playing a part.

"In twenty thousand years," said Daneel, "no one has guessed I was a robot when it was not my intention to have him or her know. In part, that was because human beings abandoned robots so long ago that very few remember that they even existed at one time. And in part, it is because I do have the ability to detect and affect human emotion. The detection offers no trouble, but to affect emotion is difficult for me for reasons having to do with my robotic nature-although I can do it when I wish. I have the ability but must deal with my will not to use it. I try never to interfere except when I have no choice but to do so. And when I do interfere, it is rarely that I do more than strengthen, as little as I can, what is already there. If I can achieve my purposes without doing even so much, I avoid it.

"It was not necessary to tamper with Sunmaster Fourteen in order to have him accept you-I call it 'tampering,' you notice, because it is not a pleasant thing to do. I did not have to tamper with him because he did owe me for favors rendered and he is an honorable man, despite the peculiarities you found in him.

I did interfere the second time, when you had committed sacrilege in his eyes, but it took very little. He was not anxious to hand you over to the Imperial authorities, whom he does not like. I merely strengthened the dislike a trifle and he handed you over to my care, accepting the arguments I offered, which otherwise he might have considered specious.

"Nor did I tamper with you noticeably. You distrusted the Imperials too. Most human beings do these days, which is an important factor in the decay and deterioration of the Empire. What's more, you were proud of psychohistory as a concept, proud of having thought of it. You would not have minded having it prove to be a practical discipline. That would have further fed your pride."

Seldon frowned and said, "Pardon me, Master Robot, but I am not aware that I am quite such a monster of pride."

Daneel said mildly, "You are not a monster of pride at all. You are perfectly aware that is neither admirable nor useful to be driven by pride, so you try to subdue that drive, but you might as well disapprove of having yourself powered by your heartbeat. You cannot help either fact. Though you hide your pride from yourself for the sake of your own peace of mind, you cannot hide it from me. It is there, however carefully you mask it over. And I had but to strengthen it a touch and you were at once willing to take measures to hide from Demerzel, measures that a moment before you would have resisted. And you were eager to work at psychohistory with an intensity that a moment before you would have scorned.

"I saw no necessity to touch anything else and so you have reasoned out your robohood. Had I foreseen the possibility of that, I might have stopped it, but my

foresight and my abilities are not infinite. Nor am I sorry now that I failed, for your arguments are good ones and it is important that you know who I am and that I use what I am to help you.

"Emotions, my dear Seldon are a powerful engine of human action, far more powerful than human beings themselves realize, and you cannot know how much can be done with the merest touch and how reluctant I am to do it."

Seldon was breathing heavily, trying to see himself as a man driven by pride and not liking it. "Why reluctant?"

"Because it would be so easy to overdo. I had to stop Rashelle from converting the Empire into a feudal anarchy. I might have bent minds quickly and the result might well have been a bloody uprising. Men are men-and the Wyan generals are almost all men. It does not actually take much to rouse resentment and latent fear of women in any man. It may be a biological matter that I, as a robot, cannot fully understand.

"I had but to strengthen the feeling to produce a breakdown in her plans. If I had done it the merest millimeter too much, I would have lost what I wanted-a bloodless takeover. I wanted nothing more than to have them not resist when my soldiers arrived."

Daneel paused, as though trying to pick his words, then said, "I do not wish to go into the mathematics of my positronic brain. It is more than I can understand, though perhaps not more than you can if you give it enough thought. However, I am governed by the Three Laws of Robotics that are traditionally put into words-or once were, long ago. They are these:

"One. A robot may not injure a human being or, through inaction, allow a human being to come to harm.

" Two. A robot must obey the orders given it by human beings, except where such orders would conflict with the First Law.

" Three. A robot must protect its own existence, as long as such protection does not conflict with the First or Second Law.

"But I had a . . . a friend twenty thousand years ago. Another robot. Not like myself. He could not be mistaken for a human being, but it was he who had the mental powers and it was through him that I gained mine.

"It seemed to him that there should be a still more general rule than any of the Three Laws. He called it the Zeroth Law, since zero comes before one. It is:

"Zero. A robot may not injure humanity or, through inaction, allow humanity to come to harm.

"Then the First Law must read:

" One. A robot may not injure a human being or, through inaction, allow a human being to come to harm, except where that would conflict with the Zeroth Law.

"And the other laws must be similarly modified. Do you understand?"

Daneel paused earnestly and Seldon said, "I understand."

Daneel went on. "The trouble is, Hari, that a human being is easy to identify. I can point to one. It is easy to see what will harm a human being and what won't-relatively easy, at least. But what is humanity? To what can we point when we speak of humanity?"

And how can we define harm to humanity? When will a course of action do more good than harm to humanity as a whole and how can one tell?

The robot who first advanced the Zeroth law died-became permanently inactive-because he was forced into an action that he felt would save humanity, yet which he could not be sure would save humanity. And as he became inactivated, he left the care of the Galaxy to me.

"Since then, I have cried. I have interfered as little as possible, relying on human beings themselves to judge what was for the good. They could gamble; I could not. They could miss their goals; I did not dare. They could do harm unwittingly; I would grow inactive if I did. The Zeroth Law makes no allowance for unwitting harm.

"But at times I am forced to take action. That I am still functioning shows that my actions have been moderate and discreet. However, as the Empire began to fail and to decline, I have had to interfere more frequently and for decades now I have had to play the role of Demerzel, trying to run the government in such a way as to stave off ruin-and yet I will function, you see.

"When you made your speech to the Decennial Convention, I realized at once that in psychohistory there was a tool that might make it possible to identify what was good and bad for humanity. With it, the decisions we would make would be less blind. I would even trust to human beings to make those decisions and again reserve myself only for the greatest emergencies. So I arranged quickly to have Cleon learn of your speech and call you in. Then, when I heard your denial of the worth of psychohistory, I was forced to think of some way to make you try anyway. Do you understand, Hari?"

More than a little daunted, Seldon said, "I understand, Hummin."

"To you, I must remain Hummin on those rare occasions when I will be able to see you. I will give you what information I have if it is something you need and in my persona as Demerzel I will protect you as much as I can. As Daneel, you must never speak of me."

"I wouldn't want to," said Seldon hurriedly. "Since I need your help, it would ruin matters to have your plans impeded."

"Yes, I know you wouldn't want to." Daneel smiled wearily. "After all, you are vain enough to want full credit for psychohistory. You would not want anyone to know-ever-that you needed the help of a robot."

Seldon flushed. "I am not-"

"But you are, even if you carefully hide it from yourself. And it is important, for I am strengthening that emotion within you minimally so that you will never be able to speak of me to others. It will not even occur to you that you might do so."

Seldon said, "I suspect Dors knows-"

"She knows of me. And she too cannot speak of me to others. Now that you both know of my nature, you can speak of me to each other freely, but not to anyone else."

Daneel rose. -Hari, I have my work to do now. Before long, you and Dors will be taken back to the Imperial Sector-

"The boy Raych must come with me. I cannot abandon him. And there is a young Dahlite named Yugo Amaryl-"

"I understand. Raych will be taken too and you can do with any friend as you will. You will all be taken care of appropriately. And you will work on psychohistory. You will have a staff. You will have the necessary computers and reference material. I will interfere as little as possible and if there is resistance to your views that does not actually reach the point of endangering the mission, then you will have to deal with it yourself."

"Wait, Hummin," said Seldon urgently. "What if, despite all your help and all my endeavors, it turns out that psychohistory cannot be made into a practical device after all? What if I fail?"

Daneel rose. "In that case, I have a second plan in hand. One I have been working on a long time on a separate world in a separate way. It too is very difficult and in some ways even more radical than psychohistory. It may fail too, but there is a greater chance of success if two roads are open than if either one alone was."

"Take my advice, Hari! If the time comes when you are able to set up some device that may act to prevent the worst from happening see if you can think of two devices, so that if one fails, the other will carry on. The Empire must be steadied or rebuilt on a new foundation. Let there be two such, rather than one, if that is possible."

He rose, "Now I must return to my ordinary work and you must turn to yours. You will be taken care of."

With one final nod, he rose and left.

Seldon looked after him and said softly, "First I must speak to Dors."

94.

Dors said, "The palace is cleared. Rashelle will not be physically harmed. And you'll return to the Imperial Sector, Hari."

"And you, Dors?" said Seldon in a low tight voice.

"I presume I will go back to the University," she said. "My work is being neglected, my classes abandoned."

"No, Dors, you have a greater cask."

"What is that?"

"Psychohistory. I cannot tackle the project without you."

"Of course you can. I am a total illiterate in mathematics."

"And I in history-and we need both."

Dors laughed. "I suspect that, as a mathematician, you are one of a kind. I, as a historian, am merely adequate, certainly not outstanding. You will find any number of historians who will suit the needs of psychohistory better than I do."

"In that case, Dors, let me explain that psychohistory needs more than a mathematician and a historian. It also needs the will to tackle what will probably be a lifetime problem. Without you, Dors, I will not have that will."

"Of course you'll have it."

"Dors, if you're not with me, I don't intend to have it."

Dors looked at Seldon thoughtfully. "This is a fruitless discussion, Hari. Undoubtedly, Hummin will make the decision. If he sends me back to the University "He won't."

"How can you be sure?"

"Because I'll put it to him plainly. If he sends you back to the University, I'll go back to Helicon and the Empire can go ahead and destroy itself."

"You can't mean it."

"But I certainly do."

"Don't you realize that Hummin can arrange to have your feelings change so that you will work on psychohistory--even without me?"

Seldon shook his head. "Hummin will not make such an arbitrary decision. I've spoken to him. He dares not do much to the human mind because he is bound by what he calls the Laws of Robotics. To change my mind to the point where I will not want you with me, Dors, would mean a change of the kind he can not risk. On the other hand, if he leaves me alone and if you join me in the project, he will have what he wants-a true chance at psychohistory. Why should he not settle for that?"

Dors shook her head. "He may not agree for reasons of his own. "

"Why should he disagree? You were asked to protect me, Dors. Has Hummin canceled that request?"

"No."

"Then he wants you to continue your protection. And I want your protection."

"Against what? You now have Hummin's protection, both as Demerzel and as Daneel, and surely that is all you need."

"If I had the protection of every person and every force in the Galaxy, it would still be yours I would want."

"Then you don't want me for psychohistory. You want me for protection."

Seldon scowled. "No! Why are you twisting my words? Why are you forcing me to say what you must know? It is neither psychohistory nor protection I want you for. Those are excuses and I'll use any other I need. I want you-just you. And if you want the real reason, it is because you are you."

"You don't even know me."

"That doesn't matter. I don't care. -And yet I do know you in a way. Better than you think."

"Do you indeed?"

"Of course. You follow orders and you risk your life for without hesitation and with no apparent care for the consequences You learned how to play tennis so quickly. You learned how to use knives even more quickly and you handled yourself perfectly in the fight with Marron. Inhumanly -if I may say so. Your muscles are amazingly strong and your reaction time is amazingly fast. You can somehow tell when a room is being eavesdropped and you can be in touch with Hummin in some way that does not involve instrumentation."

Dors said, "And what do you think of all that?"

"It has occurred to me that Hummin, in his persona as R. Daneel Olivaw, has an impossible task. How can one robot try to guide the Empire? He must have helpers."

"That is obvious. Millions, I should imagine. I am a helper. You are a helper. Little Raych is a helper."

"You are a different kind of helper."

"In what way? Hari, say it. If you hear yourself say it, you will realize how crazy it is."

Seldon looked long at her and then said in a low voice, "I will not say it because . . . I don't care."

"You really don't? You wish to take me as I am?"

"I will take you as I must. You are Dors and, whatever else you are, in all the world I want nothing else."

Dors said softly, "Hari, I want what is good for you because of what I am, but I feel that if I wasn't what I am, I would still want what is good for you. And I don't think I am good for you."

"Good for me or bad, I don't care." Here Hari looked down as he paced a few steps, weighing what he would say next. "Dors, have you ever been kissed?"

"Of course, Hari. It's a social part of life and I live socially."

"No no! I mean, have you ever really kissed a man? You know, passionately?"

"Well yes, Hari, I have."

"Did you enjoy it?"

Dors hesitated. She said, "When I've kissed in that way, I enjoyed it more than I would have enjoyed disappointing a young man I liked, someone whose friendship meant something to me." At this point, Dors blushed and she turned her face away. "Please, Hari, this is difficult for me to explain."

But Hari, more determined now than ever, pressed further. "So you kissed for the wrong reasons, then, to avoid hurt feelings."

"Perhaps everyone does, in a sense."

Seldon mulled this over, then said suddenly, "Did you ever ask to be kissed?"

Dors paused, as though looking back on her life. "No."

"Or wish to be kissed again, once you had?"

"No."

"Have you ever slept with a man?" he asked softly, desperately.

"Of course. I told you. These things are a part of life."

Hari gripped her shoulders as if he was going to shake her. "But have you ever felt the desire, a need for that kind of closeness with just one special person?"

Dors, have you ever felt love."

Dors looked up slowly, almost sadly, and locked eyes with Seldon. "I'm sorry, Hari, but no."

Seldon released her, letting his arms fall dejectedly to his sides.

Then Dors placed her hand gently on his arm and said, "So you see, Hari. I'm not really what you want."

Seldon's head drooped and he stared at the floor. He weighed the matter and tried to think rationally. Then he gave up. He wanted what he wanted and he wanted it beyond thought and beyond rationality.

He looked up. "Dors, dear, even so, I don't care."

Seldon put his arms around her and brought his head close to hers slowly, as though waiting for her to pull away, all the while drawing her nearer.

Dors made no move and he kissed her-slowly, lingeringly, and then passionately-and her arms suddenly tightened around him.

When he stopped at last, she looked at him with eyes that mirrored her smile and she said:

"Kiss me again, Hari, -Please."

FOUNDATION

1951

THE STORY BEHIND THE "FOUNDATION" BY ISAAC ASIMOV

The date was August 1, 1941. World War II had been raging for two years. France had fallen, the Battle of Britain had been fought, and the Soviet Union had just been invaded by Nazi Germany. The bombing of Pearl Harbor was four months in the future.

But on that day, with Europe in flames, and the evil shadow of Adolf Hitler apparently falling over all the world, what was chiefly on my mind was a meeting toward which I was hastening.

I was 21 years old, a graduate student in chemistry at Columbia University, and I had been writing science fiction professionally for three years. In that time, I had sold five stories to John Campbell, editor of *Astounding*, and the fifth story, "Nightfall," was about to appear in the September 1941 issue of the magazine. I had an appointment to see Mr. Campbell to tell him the plot of a new story I was planning to write, and the catch was that I had no plot in mind, not the trace of one.

I therefore tried a device I sometimes use. I opened a book at random and set up free association, beginning with whatever I first saw. The book I had with me was a collection of the Gilbert and Sullivan plays. I happened to open it to the picture of the Fairy Queen of *Iolanthe* throwing herself at the feet of Private Willis. I thought of soldiers, of military empires, of the Roman Empire – of a Galactic Empire – aha!

Why shouldn't I write of the fall of the Galactic Empire and of the return of feudalism, written from the viewpoint of someone in the secure days of the Second Galactic Empire? After all, I had read Gibbon's *Decline and Fall of the Roman Empire* not once, but twice.

I was bubbling over by the time I got to Campbell's, and my enthusiasm must have been catching for Campbell blazed up as I had never seen him do. In the course of an hour we built up the notion of a vast series of connected stories that were to deal in intricate detail with the thousand-year period between the First and Second Galactic Empires. This was to be illuminated by the science of psychohistory, which Campbell and I thrashed out between us.

On August 11, 1941, therefore, I began the story of that interregnum and called it "Foundation." In it, I described how the psychohistorian, Hari Seldon, established a pair of Foundations at opposite ends of the Universe under such circumstances as to make sure that the forces of history would bring about the second Empire after one thousand years instead of the thirty thousand that would be required otherwise.

The story was submitted on September 8 and, to make sure that Campbell really meant what he said about a series, I ended "Foundation" on a cliff-hanger. Thus, it seemed to me, he would be *forced* to buy a second story.

However, when I started the second story (on October 24), I found that I had outsmarted myself. I quickly wrote myself into an impasse, and the Foundation series would have died an ignominious death had I not had a conversation with Fred Pohl on November 2 (on the Brooklyn Bridge, as it happened). I don't remember what Fred actually said, but, whatever it was, it pulled me out of the hole.

"Foundation" appeared in the May 1942 issue of *Astounding* and the succeeding story, "Bridle and Saddle," in the June 1942 issue.

After that there was only the routine trouble of writing the stories. Through the remainder of the decade, John Campbell kept my nose to the grindstone and made sure he got additional Foundation stories.

"The Big and the Little" was in the August 1944 *Astounding*, "The Wedge" in the October 1944 issue, and "Dead Hand" in the April 1945 issue. (These stories were written while I was working at the Navy Yard in Philadelphia.)

On January 26, 1945, I began "The Mule," my personal favorite among the Foundation stories, and the longest yet, for it was 50,000 words. It was printed as a two-part serial (the very first serial I was ever responsible for) in the November and December 1945 issues. By the time the second part appeared I was in the army.

After I got out of the army, I wrote "Now You See It—" which appeared in the January 1948 issue. By this time, though, I had grown tired of the Foundation stories so I tried to end them by setting up, and solving, the mystery of the location of the Second Foundation. Campbell would have none of that, however. He forced me to change the ending, and made me promise I would do one more Foundation story.

Well, Campbell was the kind of editor who could not be denied, so I wrote one more Foundation story, vowing to myself that it would be the last. I called it "—And Now You Don't," and it appeared as a three-part serial in the November 1949, December 1949, and January 1950 issues of *Astounding*.

By then, I was on the biochemistry faculty of Boston University School of Medicine, my first book had just been published, and I was determined to move on to new things. I had spent eight years on the Foundation, written nine stories with a total of about 220,000 words. My total earnings for the series came to \$3,641 and that seemed enough. The Foundation was over and done with, as far as I was concerned.

In 1950, however, hardcover science fiction was just coming into existence. I had no objection to earning a little more money by having the Foundation series reprinted in book form. I offered the series to Doubleday (which had already published a science-fiction novel by me, and which had contracted for another) and to Little-Brown, but both rejected it. In that year, though, a small publishing firm, Gnome Press, was beginning to be active, and it was prepared to do the Foundation series as three books.

The publisher of Gnome felt, however, that the series began too abruptly. He persuaded me to write a small Foundation story, one that would serve as an introductory

section to the first book (so that the first part of the Foundation series was the last written).

In 1951, the Gnome Press edition of *Foundation* was published, containing the introduction and the first four stories of the series. In 1952, *Foundation and Empire* appeared, with the fifth and sixth stories; and in 1953, *Second Foundation* appeared, with the seventh and eighth stories. The three books together came to be called *The Foundation Trilogy*.

The mere fact of the existence of the *Trilogy* pleased me, but Gnome Press did not have the financial clout or the publishing know-how to get the books distributed properly, so that few copies were sold and fewer still paid me royalties. (Nowadays, copies of first editions of those Gnome Press books sell at \$50 a copy and up—but I still get no royalties from them.)

Ace Books did put out paperback editions of *Foundation* and of *Foundation and Empire*, but they changed the titles, and used cut versions. Any money that was involved was paid to Gnome Press and I didn't see much of that. In the first decade of the existence of *The Foundation Trilogy* it may have earned something like \$1500 total.

And yet there was some foreign interest. In early 1961, Timothy Seldes, who was then my editor at Doubleday, told me that Doubleday had received a request for the Portuguese rights for the Foundation series and, since they weren't Doubleday books, he was passing them on to me. I sighed and said, "The heck with it, Tim. I don't get royalties on those books."

Seldes was horrified, and instantly set about getting the books away from Gnome Press so that Doubleday could publish them instead. He paid no attention to my loudly expressed fears that Doubleday "would lose its shirt on them." In August 1961 an agreement was reached and the Foundation books became Doubleday property. What's more, Avon Books, which had published a paperback version of *Second Foundation*, set about obtaining the rights to all three from Doubleday, and put out nice editions.

From that moment on, the Foundation books took off and began to earn increasing royalties. They have sold well and steadily, both in hardcover and softcover, for two decades so far. Increasingly, the letters I received from the readers spoke of them in high praise. They received more attention than all my other books put together.

Doubleday also published an omnibus volume, *The Foundation Trilogy*, for its Science Fiction Book Club. That omnibus volume has been continuously featured by the Book Club for over twenty years.

Matters reached a climax in 1966. The fans organizing the World Science Fiction Convention for that year (to be held in Cleveland) decided to award a Hugo for the best all-time series, where the series, to qualify, had to consist of at least three connected novels. It was the first time such a category had been set up, nor has it been repeated since. The Foundation series was nominated, and I felt that was going to have to be glory enough for me, since I was sure that Tolkien's "Lord of the Rings" would win.

It didn't. The Foundation series won, and the Hugo I received for it has been sitting on my bookcase in the living room ever since.

In among all this litany of success, both in money and in fame, there was one annoying side-effect. Readers couldn't help but notice that the books of the Foundation series covered only three hundred-plus years of the thousand-year hiatus between Empires. That meant the Foundation series "wasn't finished." I got innumerable letters from readers who asked me to finish it, from others who demanded I finish it, and still others who threatened dire vengeance if I didn't finish it. Worse yet, various editors at Doubleday over the years have pointed out that it might be wise to finish it.

It was flattering, of course, but irritating as well. Years had passed, then decades. Back in the 1940s, I had been in a Foundation-writing mood. Now I wasn't. Starting in the late 1950s, I had been in a more and more nonfiction-writing mood.

That didn't mean I was writing no fiction at all. In the 1960s and 1970s, in fact, I wrote two science-fiction novels and a mystery novel, to say nothing of well over a hundred short stories – but about eighty percent of what I wrote was nonfiction.

One of the most indefatigable nags in the matter of finishing the Foundation series was my good friend, the great science-fiction writer, Lester del Rey. He was constantly telling me I ought to finish the series and was just as constantly suggesting plot devices. He even told Larry Ashmead, then my editor at Doubleday, that if I refused to write more Foundation stories, he, Lester, would be willing to take on the task.

When Ashmead mentioned this to me in 1973, I began another Foundation novel out of sheer desperation. I called it "Lightning Rod" and managed to write fourteen pages before other tasks called me away. The fourteen pages were put away and additional years passed.

In January 1977, Cathleen Jordan, then my editor at Doubleday, suggested I do "an important book – a Foundation novel, perhaps." I said, "I'd rather do an autobiography," and I *did* – 640,000 words of it.

In January 1981, Doubleday apparently lost its temper. At least, Hugh O'Neill, then my editor there, said, "Betty Prashker wants to see you," and marched me into her office. She was then one of the senior editors, and a sweet and gentle person.

She wasted no time. "Isaac," she said, "you are going to write a novel for us and you are going to sign a contract to that effect."

"Betty," I said, "I am already working on a big science book for Doubleday and I have to revise the Biographical Encyclopedia for Doubleday and –"

"It can all wait," she said. "You are going to sign a contract to do a novel. What's more, we're going to give you a \$50,000 advance."

That was a stunner. I don't like large advances. They put me under too great an obligation. My average advance is something like \$3,000. Why not? It's all out of royalties.

I said, "That's way too much money, Betty."

"No, it isn't," she said.

"Doubleday will lose its shirt," I said.

"You keep telling us that all the time. It won't."

I said, desperately, "All right. Have the contract read that I don't get any money until I notify you in writing that I have begun the novel."

"Are you crazy?" she said. "You'll never start if that clause is in the contract. You get \$25,000 on signing the contract, and \$25,000 on delivering a completed manuscript."

"But suppose the novel is no good."

"Now you're being silly," she said, and she ended the conversation.

That night, Pat LoBrutto, the science-fiction editor at Doubleday called to express his pleasure. "And remember," he said, "that when we say 'novel' we mean 'science-fiction novel,' not anything else. And when we say 'science-fiction novel,' we mean 'Foundation novel' and not anything else."

On February 5, 1981, I signed the contract, and within the week, the Doubleday accounting system cranked out the check for \$25,000.

I moaned that I was not my own master anymore and Hugh O'Neill said, cheerfully, "That's right, and from now on, we're going to call every other week and say, 'Where's the manuscript?'" (But they didn't. They left me strictly alone, and never even asked for a progress report.)

Nearly four months passed while I took care of a vast number of things I had to do, but about the end of May, I picked up my own copy of *The Foundation Trilogy* and began reading.

I had to. For one thing, I hadn't read the *Trilogy* in thirty years and while I remembered the general plot, I did not remember the details. Besides, before beginning a new Foundation novel I had to immerse myself in the style and atmosphere of the series.

I read it with mounting uneasiness. I kept waiting for something to happen, and nothing ever did. All three volumes, all the nearly quarter of a million words, consisted of thoughts and of conversations. No action. No physical suspense.

What was all the fuss about, then? Why did everyone want more of that stuff? – To be sure, I couldn't help but notice that I was turning the pages eagerly, and that I was upset when I finished the book, and that I wanted more, but I was the *author*, for goodness' sake. You couldn't go by me.

I was on the edge of deciding it was all a terrible mistake and of insisting on giving back the money, when (quite by accident, I swear) I came across some sentences by science-fiction writer and critic, James Gunn, who, in connection with the Foundation series, said, "Action and romance have little to do with the success of the *Trilogy* – virtually all the action takes place offstage, and the romance is almost invisible – but the stories provide a detective-story fascination with the permutations and reversals of ideas."

Oh, well, if what was needed were "permutations and reversals of ideas," then that I could supply. Panic receded, and on June 10, 1981, I dug out the fourteen pages I had written more than eight years before and reread them. They sounded good to me. I didn't remember where I had been headed back then, but I had worked out what seemed to me to be a good ending now, and, starting page 15 on that day, I proceeded to work toward the new ending.

I found, to my infinite relief, that I had no trouble getting back into a "Foundation-mood," and, fresh from my rereading, I had Foundation history at my finger-tips.

There were differences, to be sure:

1) The original stories were written for a science-fiction magazine and were from 7,000 to 50,000 words long, and no more. Consequently, each book in the trilogy had at least two stories and lacked unity. I intended to make the new book a single story.

2) I had a particularly good chance for development since Hugh said, "Let the book find its own length, Isaac. We don't mind a long book." So I planned on 140,000 words, which was nearly three times the length of "The Mule," and this gave me plenty of elbow-room, and I could add all sorts of little touches.

3) The Foundation series had been written at a time when our knowledge of astronomy was primitive compared with what it is today. I could take advantage of that and at least *mention* black holes, for instance. I could also take advantage of electronic computers, which had not been invented until I was half through with the series.

The novel progressed steadily, and on January 17, 1982, I began final copy. I brought the manuscript to Hugh O'Neill in batches, and the poor fellow went half-crazy since he insisted on reading it in this broken fashion. On March 25, 1982, I brought in the last bit, and the very next day got the second half of the advance.

I had kept "Lightning Rod" as my working title all the way through, but Hugh finally said, "Is there any way of putting 'Foundation' into the title, Isaac?" I suggested *Foundations at Bay*, therefore, and that may be the title that will actually be used. (*Editor's note: The novel was published in October 1982 as *Foundation's Edge*.)

You will have noticed that I have said nothing about the plot of the new Foundation novel. Well, *naturally*. I would rather you buy and read the book.

And yet there is one thing I have to confess to you. I generally manage to tie up all the loose ends into one neat little bow-knot at the end of my stories, no matter how complicated the plot might be. In this case, however, I noticed that when I was all done, one glaring little item remained unresolved.

I am hoping no one else notices it because it clearly points the way to the continuation of the series.

It is even possible that I inadvertently gave this away for at the end of the novel, I wrote: "The End (for now)."

I very much fear that if the novel proves successful, Doubleday will be at my throat again, as Campbell used to be in the old days. And yet what can I do but hope that the novel is very successful indeed. What a quandary!

ABOUT THE AUTHOR

Isaac Asimov was born in the Soviet Union to his great surprise. He moved quickly to correct the situation. When his parents emigrated to the United States, Isaac (three

years old at the time) stowed away in their baggage. He has been an American citizen since the age of eight.

Brought up in Brooklyn, and educated in its public schools, he eventually found his way to Columbia University and, over the protests of the school administration, managed to annex a series of degrees in chemistry, up to and including a Ph.D. He then infiltrated Boston University and climbed the academic ladder, ignoring all cries of outrage, until he found himself Professor of Biochemistry.

Meanwhile, at the age of nine, he found the love of his life (in the inanimate sense) when he discovered his first science-fiction magazine. By the time he was eleven, he began to write stories, and at eighteen, he actually worked up the nerve to submit one. It was rejected. After four long months of tribulation and suffering, he sold his first story and, thereafter, he never looked back.

In 1941, when he was twenty-one years old, he wrote the classic short story "Nightfall" and his future was assured. Shortly before that he had begun writing his robot stories, and shortly after that he had begun his Foundation series.

What was left except quantity? At the present time, he has published over 260 books, distributed through every major division of the Dewey system of library classification, and shows no signs of slowing up. He remains as youthful, as lively, and as lovable as ever, and grows more handsome with each year. You can be sure that this is so since he has written this little essay himself and his devotion to absolute objectivity is notorious.

He is married to Janet Jeppson, psychiatrist and writer, has two children by a previous marriage, and lives in New York City.

PART I

THE PSYCHOHISTORIANS

1.

HARI SELDON— . . . born in the 11,988th year of the Galactic Era; died 12,069. The dates are more commonly given in terms of the current Foundational Era as – 79 to the year 1 F.E. Born to middle-class parents on Helicon, Arcturus sector (where his father, in a legend of doubtful authenticity, was a tobacco grower in the hydroponic plants of the planet), he early showed amazing ability in mathematics. Anecdotes concerning his ability are innumerable, and some are contradictory. At the age of two, he is said to have . . .

. . . Undoubtedly his greatest contributions were in the field of psychohistory. Seldon found the field little more than a set of vague axioms; he left it a profound statistical science. . . .

. . . The best existing authority we have for the details of his life is the biography written by Gaal Dornick who, as a young man, met Seldon two years before the great mathematician's death. The story of the meeting . . .

ENCYCLOPEDIA GALACTICA*

* All quotations from the Encyclopedia Galactica here reproduced are taken from the 116th Edition published in 1020 F.E. by the Encyclopedia Galactica Publishing Co., Terminus, with permission of the publishers.

His name was Gaal Dornick and he was just a country boy who had never seen Trantor before. That is, not in real life. He *had* seen it many times on the hyper-video, and occasionally in tremendous three-dimensional newscasts covering an Imperial Coronation or the opening of a Galactic Council. Even though he had lived all his life on the world of Synnax, which circled a star at the edges of the Blue Drift, he was not cut off from civilization, you see. At that time, no place in the Galaxy was.

There were nearly twenty-five million inhabited planets in the Galaxy then, and not one but owed allegiance to the Empire whose seat was on Trantor. It was the last half century in which that could be said.

To Gaal, this trip was the undoubted climax of his young, scholarly life. He had been in space before so that the trip, as a voyage and nothing more, meant little to him. To be sure, he had traveled previously only as far as Synnax's only satellite in order to get the data on the mechanics of meteor driftage which he needed for his dissertation, but space-travel was all one whether one travelled half a million miles, or as many light years.

He had steeled himself just a little for the Jump through hyper-space, a phenomenon one did not experience in simple interplanetary trips. The Jump remained, and would probably remain forever, the only practical method of travelling between the stars. Travel through ordinary space could proceed at no rate more rapid than that of ordinary light (a bit of scientific knowledge that belonged among the items known since the forgotten dawn of human history), and that would have meant years of travel between even the nearest of inhabited systems. Through hyper-space, that unimaginable region that was neither space nor time, matter nor energy, something nor nothing, one could traverse the length of the Galaxy in the interval between two neighboring instants of time.

Gaal had waited for the first of those Jumps with a little dread curled gently in his stomach, and it ended in nothing more than a trifling jar, a little internal kick which ceased an instant before he could be sure he had felt it. That was all.

And after that, there was only the ship, large and glistening; the cool production of 12,000 years of Imperial progress; and himself, with his doctorate in mathematics freshly obtained and an invitation from the great Hari Seldon to come to Trantor and join the vast and somewhat mysterious Seldon Project.

What Gaal was waiting for after the disappointment of the Jump was that first sight of Trantor. He haunted the View-room. The steel shutter-lids were rolled back at announced times and he was always there, watching the hard brilliance of the stars, enjoying the incredible hazy swarm of a star cluster, like a giant conglomeration of fire-flies caught in mid-motion and stilled forever. At one time there was the cold, blue-white smoke of a gaseous nebula within five light years of the ship, spreading over the window like distant milk, filling the room with an icy tinge, and disappearing out of sight two hours later, after another Jump.

The first sight of Trantor's sun was that of a hard, white speck all but lost in a myriad such, and recognizable only because it was pointed out by the ship's guide. The stars were thick here near the Galactic center. But with each Jump, it shone more brightly, drowning out the rest, paling them and thinning them out.

An officer came through and said, "View-room will be closed for the remainder of the trip. Prepare for landing."

Gaal had followed after, clutching at the sleeve of the white uniform with the Spaceship-and-Sun of the Empire on it.

He said, "Would it be possible to let me stay? I would like to see Trantor."

The officer smiled and Gaal flushed a bit. It occurred to him that he spoke with a provincial accent.

The officer said, "We'll be landing on Trantor by morning."

"I mean I want to see it from Space."

"Oh. Sorry, my boy. If this were a space-yacht we might manage it. But we're spinning down, sunside. You wouldn't want to be blinded, burnt, and radiation-scarred all at the same time, would you?"

Gaal started to walk away.

The officer called after him, "Trantor would only be gray blur anyway, Kid. Why don't you take a space-tour once you hit Trantor. They're cheap."

Gaal looked back, "Thank you very much."

It was childish to feel disappointed, but childishness comes almost as naturally to a man as to a child, and there was a lump in Gaal's throat. He had never seen Trantor spread out in all its incredibility, as large as life, and he hadn't expected to have to wait longer.

2.

The ship landed in a medley of noises. There was the far-off hiss of the atmosphere cutting and sliding past the metal of the ship. There was the steady drone of the conditioners fighting the heat of friction, and the slower rumble of the engines enforcing deceleration. There was the human sound of men and women gathering in the debarkation rooms and the grind of the hoists lifting baggage, mail, and freight to the long axis of the ship, from which they would be later moved along to the unloading platform.

Gaal felt the slight jar that indicated the ship no longer had an independent motion of its own. Ship's gravity had been giving way to planetary gravity for hours. Thousands of passengers had been sitting patiently in the debarkation rooms which swung easily on yielding force-fields to accommodate its orientation to the changing direction of the gravitational forces. Now they were crawling down curving ramps to the large, yawning locks.

Gaal's baggage was minor. He stood at a desk, as it was quickly and expertly taken apart and put together again. His visa was inspected and stamped. He himself paid no attention.

This was Trantor! The air seemed a little thicker here, the gravity a bit greater, than on his home planet of Synnax, but he would get used to that. He wondered if he would get used to immensity.

Debarkation Building was tremendous. The roof was almost lost in the heights. Gaal could almost imagine that clouds could form beneath its immensity. He could see no opposite wall; just men and desks and converging floor till it faded out in haze.

The man at the desk was speaking again. He sounded annoyed. He said, "Move on, Dornick." He had to open the visa, look again, before he remembered the name.

Gaal said, "Where— where—"

The man at the desk jerked a thumb, "Taxis to the right and third left."

Gaal moved, seeing the glowing twists of air suspended high in nothingness and reading, "TAXIS TO ALL POINTS."

A figure detached itself from anonymity and stopped at the desk, as Gaal left. The man at the desk looked up and nodded briefly. The figure nodded in return and followed the young immigrant.

He was in time to hear Gaal's destination.

Gaal found himself hard against a railing.

The small sign said, "Supervisor." The man to whom the sign referred did not look up. He said, "Where to?"

Gaal wasn't sure, but even a few seconds hesitation meant men queuing in line behind him.

The Supervisor looked up, "Where to?"

Gaal's funds were low, but there was only this one night and then he would have a job. He tried to sound nonchalant, "A good hotel, please."

The Supervisor was unimpressed, "They're all good. Name one."

Gaal said, desperately, "The nearest one, please."

The Supervisor touched a button. A thin line of light formed along the floor, twisting among others which brightened and dimmed in different colors and shades. A ticket was shoved into Gaal's hands. It glowed faintly.

The Supervisor said, "One point twelve."

Gaal fumbled for the coins. He said, "Where do I go?"

"Follow the light. The ticket will keep glowing as long as you're pointed in the tight direction."

Gaal looked up and began walking. There were hundreds creeping across the vast floor, following their individual trails, sifting and straining themselves through intersection points to arrive at their respective destinations.

His own trail ended. A man in glaring blue and yellow uniform, shining and new in unstainable plasto-textile, reached for his two bags.

"Direct line to the Luxor," he said.

The man who followed Gaal heard that. He also heard Gaal say, "Fine," and watched him enter the blunt-nosed vehicle.

The taxi lifted straight up. Gaal stared out the curved, transparent window, marvelling at the sensation of airflight within an enclosed structure and clutching instinctively at the back of the driver's seat. The vastness contracted and the people became ants in random distribution. The scene contracted further and began to slide backward.

There was a wall ahead. It began high in the air and extended upward out of sight. It was riddled with holes that were the mouths of tunnels. Gaal's taxi moved toward one then plunged into it. For a moment, Gaal wondered idly how his driver could pick out one among so many.

There was now only blackness, with nothing but the past-flashing of a colored signal light to relieve the gloom. The air was full of a rushing sound.

Gaal leaned forward against deceleration then and the taxi popped out of the tunnel and descended to ground-level once more.

"The Luxor Hotel," said the driver, unnecessarily. He helped Gaal with his baggage, accepted a tenth-credit tip with a businesslike air, picked up a waiting passenger, and was rising again.

In all this, from the moment of debarkation, there had been no glimpse of sky.

3.

TRANTOR—. . . At the beginning of the thirteenth millennium, this tendency reached its climax. As the center of the Imperial Government for unbroken hundreds of generations and located, as it was, toward the central regions of the Galaxy among the most densely populated and industrially advanced worlds of the system, it could scarcely help being the densest and richest clot of humanity the Race had ever seen.

Its urbanization, progressing steadily, had finally reached the ultimate. All the land surface of Trantor, 75,000,000 square miles in extent, was a single city. The population, at its height, was well in excess of forty billions. This enormous population was devoted almost entirely to the administrative necessities of Empire, and found themselves all too few for the complications of the task. (It is to be remembered that the impossibility of proper administration of the Galactic Empire under the uninspired leadership of the later Emperors was a considerable factor in the Fall.) Daily, fleets of ships in the tens of thousands brought the produce of twenty agricultural worlds to the dinner tables of Trantor. . . .

Its dependence upon the outer worlds for food and, indeed, for all necessities of life, made Trantor increasingly vulnerable to conquest by siege. In the last millennium of the Empire, the monotonously numerous revolts made Emperor after Emperor conscious of this, and Imperial policy became little more than the protection of Trantor's delicate jugular vein. . .

ENCYCLOPEDIA GALACTICA

Gaal was not certain whether the sun shone, or, for that matter, whether it was day or night. He was ashamed to ask. All the planet seemed to live beneath metal. The meal of which he had just partaken had been labelled luncheon, but there were many planets which lived a standard timescale that took no account of the perhaps inconvenient alternation of day and night. The rate of planetary turnings differed, and he did not know that of Trantor.

At first, he had eagerly followed the signs to the "Sun Room" and found it but a chamber for basking in artificial radiation. He lingered a moment or two, then returned to the Luxor's main lobby.

He said to the room clerk, "Where can I buy a ticket for a planetary tour?"

"Right here."

"When will it start?"

"You just missed it. Another one tomorrow. Buy a ticket now and we'll reserve a place for you."

"Oh." Tomorrow would be too late. He would have to be at the University tomorrow. He said, "There wouldn't be an observation tower – or something? I mean, in the open air."

"Sure! Sell you a ticket for that, if you want. Better let me check if it's raining or not." He closed a contact at his elbow and read the flowing letters that raced across a frosted screen. Gaal read with him.

The room clerk said, "Good weather. Come to think of it, I do believe it's the dry season now." He added, conversationally, "I don't bother with the outside myself. The last time I was in the open was three years ago. You see it once, you know and that's all there is to it. Here's your ticket. Special elevator in the rear. It's marked 'To the Tower.' Just take it."

The elevator was of the new sort that ran by gravitic repulsion. Gaal entered and others flowed in behind him. The operator closed a contact. For a moment, Gaal felt suspended in space as gravity switched to zero, and then he had weight again in small measure as the elevator accelerated upward. Deceleration followed and his feet left the floor. He squawked against his will.

The operator called out, "Tuck your feet under the railing. Can't you read the sign?"

The others had done so. They were smiling at him as he madly and vainly tried to clamber back down the wall. Their shoes pressed upward against the chromium of the railings that stretched across the floor in parallels set two feet apart. He had noticed those railings on entering and had ignored them.

Then a hand reached out and pulled him down.

He gasped his thanks as the elevator came to a halt.

He stepped out upon an open terrace bathed in a white brilliance that hurt his eyes. The man, whose helping hand he had just now been the recipient of, was immediately behind him.

The man said, kindly, "Plenty of seats."

Gaal closed his mouth; he had been gaping; and said, "It certainly seems so." He started for them automatically, then stopped.

He said, "If you don't mind, I'll just stop a moment at the railing. I – I want to look a bit."

The man waved him on, good-naturedly, and Gaal leaned out over the shoulder-high railing and bathed himself in all the panorama.

He could not see the ground. It was lost in the ever increasing complexities of man-made structures. He could see no horizon other than that of metal against sky, stretching out to almost uniform grayness, and he knew it was so over all the land-surface of the planet. There was scarcely any motion to be seen – a few pleasure-craft lazed against the sky-but all the busy traffic of billions of men were going on, he knew, beneath the metal skin of the world.

There was no green to be seen; no green, no soil, no life other than man. Somewhere on the world, he realized vaguely, was the Emperor's palace, set amid one

hundred square miles of natural soil, green with trees, rainbowed with flowers. It was a small island amid an ocean of steel, but it wasn't visible from where he stood. It might be ten thousand miles away. He did not know.

Before very long, he must have his tour!

He sighed noisily, and realized finally that he was on Trantor at last; on the planet which was the center of all the Galaxy and the kernel of the human race. He saw none of its weaknesses. He saw no ships of food landing. He was not aware of a jugular vein delicately connecting the forty billion of Trantor with the rest of the Galaxy. He was conscious only of the mightiest deed of man; the complete and almost contemptuously final conquest of a world.

He came away a little blank-eyed. His friend of the elevator was indicating a seat next to himself and Gaal took it.

The man smiled. "My name is Jerril. First time on Trantor?"

"Yes, Mr. Jerril."

"Thought so. Jerril's my first name. Trantor gets you if you've got the poetic temperament. Trantorians never come up here, though. They don't like it. Gives them nerves."

"Nerves! – My name's Gaal, by the way. Why should it give them nerves? It's glorious."

"Subjective matter of opinion, Gaal. If you're born in a cubicle and grow up in a corridor, and work in a cell, and vacation in a crowded sun-room, then coming up into the open with nothing but sky over you might just give you a nervous breakdown. They make the children come up here once a year, after they're five. I don't know if it does any good. They don't get enough of it, really, and the first few times they scream themselves into hysteria. They ought to start as soon as they're weaned and have the trip once a week."

He went on, "Of course, it doesn't really matter. What if they never come out at all? They're happy down there and they run the Empire. How high up do you think we are?"

He said, "Half a mile?" and wondered if that sounded naive.

It must have, for Jerril chuckled a little. He said, "No. Just five hundred feet."

"What? But the elevator took about –"

"I know. But most of the time it was just getting up to ground level. Trantor is tunneled over a mile down. It's like an iceberg. Nine-tenths of it is out of sight. It even works itself out a few miles into the sub-ocean soil at the shorelines. In fact, we're down so low that we can make use of the temperature difference between ground level and a couple of miles under to supply us with all the energy we need. Did you know that?"

"No, I thought you used atomic generators."

"Did once. But this is cheaper."

"I imagine so."

"What do you think of it all?" For a moment, the man's good nature evaporated into shrewdness. He looked almost sly.

Gaal fumbled. "Glorious," he said, again.

"Here on vacation? Traveling? Sight-seeing?"

"No exactly. At least, I've always wanted to visit Trantor but I came here primarily for a job."

"Oh?"

Gaal felt obliged to explain further, "With Dr. Seldon's project at the University of Trantor."

"Raven Seldon?"

"Why, no. The one I mean is Hari Seldon. -The psychohistorian Seldon. I don't know of any Raven Seldon."

"Hari's the one I mean. They call him Raven. Slang, you know. He keeps predicting disaster."

"He does?" Gaal was genuinely astonished.

"Surely, you must know." Jerril was not smiling. "You're coming to work for him, aren't you?"

"Well, yes, I'm a mathematician. Why does he predict disaster? What kind of disaster?"

"What kind would you think?"

"I'm afraid I wouldn't have the least idea. I've read the papers Dr. Seldon and his group have published. They're on mathematical theory."

"Yes, the ones they publish."

Gaal felt annoyed. He said, "I think I'll go to my room now. Very pleased to have met you."

Jerril waved his arm indifferently in farewell.

Gaal found a man waiting for him in his room. For a moment, he was too startled to put into words the inevitable, "What are you doing here?" that came to his lips.

The man rose. He was old and almost bald and he walked with a limp, but his eyes were very bright and blue.

He said, "I am Hari Seldon," an instant before Gaal's befuddled brain placed the face alongside the memory of the many times he had seen it in pictures.

4.

PSYCHOHISTORY— . . . Gaal Dornick, using nonmathematical concepts, has defined psychohistory to be that branch of mathematics which deals with the reactions of human conglomerates to fixed social and economic stimuli. . . .

. . . Implicit in all these definitions is the assumption that the human conglomerate being dealt with is sufficiently large for valid statistical treatment. The necessary size of such a conglomerate may be determined by Seldon's First Theorem which . . . A further necessary assumption is that the human conglomerate be itself unaware of psychohistoric analysis in order that its reactions be truly random . . .

The basis of all valid psychohistory lies in the development of the Seldon. Functions which exhibit properties congruent to those of such social and economic forces as . . .

ENCYCLOPEDIA GALACTICA

"Good afternoon, sir," said Gaal. "I- I-"

"You didn't think we were to meet before tomorrow? Ordinarily, we would not have. It is just that if we are to use your services, we must work quickly. It grows continually more difficult to obtain recruits."

"I don't understand, sir."

"You were talking to a man on the observation tower, were you not?"

"Yes. His first name is Jerril. I know no more about him. "

"His name is nothing. He is an agent of the Commission of Public Safety. He followed you from the space-port."

"But why? I am afraid I am very confused."

"Did the man on the tower say nothing about me?"

Gaal hesitated, "He referred to you as Raven Seldon."

"Did he say why?"

"He said you predict disaster."

"I do. What does Trantor mean to you?"

Everyone seemed to be asking his opinion of Trantor. Gaal felt incapable of response beyond the bare word, "Glorious."

"You say that without thinking. What of psychohistory?"

"I haven't thought of applying it to the problem."

"Before you are done with me, young man, you will learn to apply psychohistory to all problems as a matter of course. -Observe." Seldon removed his calculator pad from the pouch at his belt. Men said he kept one beneath his pillow for use in moments of wakefulness. Its gray, glossy finish was slightly worn by use. Seldon's nimble fingers, spotted now with age, played along the files and rows of buttons that filled its surface. Red symbols glowed out from the upper tier.

He said, "That represents the condition of the Empire at present."

He waited.

Gaal said finally, "Surely that is not a complete representation."

"No, not complete," said Seldon. "I am glad you do not accept my word blindly. However, this is an approximation which will serve to demonstrate the proposition. Will you accept that?"

"Subject to my later verification of the derivation of the function, yes." Gaal was carefully avoiding a possible trap.

"Good. Add to this the known probability of Imperial assassination, viceregal revolt, the contemporary recurrence of periods of economic depression, the declining rate of planetary explorations, the . . ."

He proceeded. As each item was mentioned, new symbols sprang to life at his touch, and melted into the basic function which expanded and changed.

Gaal stopped him only once. "I don't see the validity of that set-transformation."

Seldon repeated it more slowly.

Gaal said, "But that is done by way of a forbidden sociooperation."

"Good. You are quick, but not yet quick enough. It is not forbidden in this connection. Let me do it by expansions."

The procedure was much longer and at its end, Gaal said, humbly, "Yes, I see now."

Finally, Seldon stopped. "This is Trantor three centuries from now. How do you interpret that? Eh?" He put his head to one side and waited.

Gaal said, unbelievably, "Total destruction! But – but that is impossible. Trantor has never been –"

Seldon was filled with the intense excitement of a man whose body only had grown old. "Come, come. You saw how the result was arrived at. Put it into words. Forget the symbolism for a moment."

Gaal said, "As Trantor becomes more specialized, it becomes more vulnerable, less able to defend itself. Further, as it becomes more and more the administrative center of Empire, it becomes a greater prize. As the Imperial succession becomes more and more uncertain, and the feuds among the great families more rampant, social responsibility disappears. "

"Enough. And what of the numerical probability of total destruction within three centuries?"

"I couldn't tell."

"Surely you can perform a field-differentiation?"

Gaal felt himself under pressure. He was not offered the calculator pad. It was held a foot from his eyes. He calculated furiously and felt his forehead grow slick with sweat.

He said, "About 85%?"

"Not bad," said Seldon, thrusting out a lower lip, "but not good. The actual figure is 92.5%."

Gaal said, "And so you are called Raven Seldon? I have seen none of this in the journals."

"But of course not. This is unprintable. Do you suppose the Imperium could expose its shakiness in this manner. That is a very simple demonstration in psychohistory. But some of our results have leaked out among the aristocracy."

"That's bad."

"Not necessarily. All is taken into account."

"But is that why I'm being investigated?"

"Yes. Everything about my project is being investigated."

"Are you in danger, sir?"

"Oh, yes. There is probability of 1.7% that I will be executed, but of course that will not stop the project. We have taken that into account as well. Well, never mind. You will meet me, I suppose, at the University tomorrow?"

"I will," said Gaal.

5.

COMMISSION OF PUBLIC SAFETY-. . . The aristocratic coterie rose to power after the assassination of Cleon I, last of the Entuns. In the main, they formed an element of order during the centuries of instability and uncertainty in the Imperium. Usually under the control of the great families of the Chens and the Divarts, it degenerated eventually into a blind instrument for maintenance of the status quo. . . . They were not completely removed as a power in the state until after the accession of the last strong Emperor, Cleon H. The first Chief Commissioner. . . .

. . . In a way, the beginning of the Commission's decline can be traced to the trial of Hari Seldon two years before the beginning of the Foundational Era. That trial is described in Gaal Dornick's biography of Hari Seldon. . . .

ENCYCLOPEDIA GALACTICA

Gaal did not carry out his promise. He was awakened the next morning by a muted buzzer. He answered it, and the voice of the desk clerk, as muted, polite and deprecating as it well might be, informed him that he was under detention at the orders of the Commission of Public Safety.

Gaal sprang to the door and found it would no longer open. He could only dress and wait.

They came for him and took him elsewhere, but it was still detention. They asked him questions most politely. It was all very civilized. He explained that he was a provincial of Synnax; that he had attended such and such schools and obtained a Doctor of Mathematics degree on such and such a date. He had applied for a position on Dr. Seldon's staff and had been accepted. Over and over again, he gave these details; and over and over again, they returned to the question of his joining the Seldon Project. How had he heard of it; what were to be his duties; what secret instructions had he received; what was it all about?

He answered that he did not know. He had no secret instructions. He was a scholar and a mathematician. He had no interest in politics.

And finally the gentle inquisitor asked, "When will Trantor be destroyed?"

Gaal faltered, "I could not say of my own knowledge."

"Could you say of anyone's?"

"How could I speak for another?" He felt warm; overwarm.

The inquisitor said, "Has anyone told you of such destruction; set a date?" And, as the young man hesitated, he went on, "You have been followed, doctor. We were at the airport when you arrived; on the observation tower when you waited for your appointment; and, of course, we were able to overhear your conversation with Dr. Seldon."

Gaal said, "Then you know his views on the matter."

"Perhaps. But we would like to hear them from you."

"He is of the opinion that Trantor would be destroyed within three centuries."

"He proved it, – uh – mathematically?"

"Yes, he did," – defiantly.

"You maintain the – uh – mathematics to be valid, I suppose."

"If Dr. Seldon vouches for it, it is valid."

"Then we will return."

"Wait. I have a right to a lawyer. I demand my rights as an Imperial citizen."

"You shall have them."

And he did.

It was a tall man that eventually entered, a man whose face seemed all vertical lines and so thin that one could wonder whether there was room for a smile.

Gaal looked up. He felt disheveled and wilted. So much had happened, yet he had been on Trantor not more than thirty hours.

The man said, "I am Lors Avakim. Dr. Seldon has directed me to represent you."

"Is that so? Well, then, look here. I demand an instant appeal to the Emperor. I'm being held without cause. I'm innocent of anything. Of *anything*." He slashed his hands outward, palms down, "You've got to arrange a hearing with the Emperor, instantly."

Avakim was carefully emptying the contents of a flat folder onto the floor. If Gaal had had the stomach for it, he might have recognized Cellomet legal forms, metal thin and tapelike, adapted for insertion within the smallness of a personal capsule. He might also have recognized a pocket recorder.

Avakim, paying no attention to Gaal's outburst, finally looked up. He said, "The Commission will, of course, have a spy beam on our conversation. This is against the law, but they will use one nevertheless."

Gaal ground his teeth.

"However," and Avakim seated himself deliberately, "the recorder I have on the table, – which is a perfectly ordinary recorder to all appearances and performs its duties well – has the additional property of completely blanketing the spy beam. This is something they will not find out at once."

"Then I can speak."

"Of course."

"Then I want a hearing with the Emperor."

Avakim smiled frostily, and it turned out that there was room for it on his thin face after all. His cheeks wrinkled to make the room. He said, "You are from the provinces."

"I am none the less an Imperial citizen. As good a one as you or as any of this Commission of Public Safety."

"No doubt; no doubt. It is merely that, as a provincial, you do not understand life on Trantor as it is, There are no hearings before the Emperor."

"To whom else would one appeal from this Commission? Is there other procedure?"

"None. There is no recourse in a practical sense. Legalistically, you may appeal to the Emperor, but you would get no hearing. The Emperor today is not the Emperor of an Entun dynasty, you know. Trantor, I am afraid is in the hands of the aristocratic families, members of which compose the Commission of Public Safety. This is a development which is well predicted by psychohistory."

Gaal said, "Indeed? In that case, if Dr. Seldon can predict the history of Trantor three hundred years into the future –"

"He can predict it fifteen hundred years into the future."

"Let it be fifteen thousand. Why couldn't he yesterday have predicted the events of this morning and warned me. –No, I'm sorry." Gaal sat down and rested his head in one sweating palm, "I quite understand that psychohistory is a statistical science and cannot predict the future of a single man with any accuracy. You'll understand that I'm upset."

"But you are wrong. Dr. Seldon was of the opinion that you would be arrested this morning."

"What!"

"It is unfortunate, but true. The Commission has been more and more hostile to his activities. New members joining the group have been interfered with to an increasing extent. The graphs showed that for our purposes, matters might best be brought to a climax now. The Commission of itself was moving somewhat slowly so Dr. Seldon visited you yesterday for the purpose of forcing their hand. No other reason."

Gaal caught his breath, "I resent –"

"Please. It was necessary. You were not picked for any personal reasons. You must realize that Dr. Seldon's plans, which are laid out with the developed mathematics of over eighteen years include all eventualities with significant probabilities. This is one of them. I've been sent here for no other purpose than to assure you that you need not fear. It will end well; almost certainly so for the project; and with reasonable probability for you."

"What are the figures?" demanded Gaal.

"For the project, over 99.9%."

"And for myself?"

"I am instructed that this probability is 77.2%."

"Then I've got better than one chance in five of being sentenced to prison or to death."

"The last is under one per cent."

"Indeed. Calculations upon one man mean nothing. You send Dr. Seldon to me."

"Unfortunately, I cannot. Dr. Seldon is himself arrested."

The door was thrown open before the rising Gaal could do more than utter the beginning of a cry. A guard entered, walked to the table, picked up the recorder, looked upon all sides of it and put it in his pocket.

Avakim said quietly, "I will need that instrument."

"We will supply you with one, Counsellor, that does not cast a static field."

"My interview is done, in that case."

Gaal watched him leave and was alone.

6.

The trial (Gaal supposed it to be one, though it bore little resemblance legalistically to the elaborate trial techniques Gaal had read of) had not lasted long. It was in its third day. Yet already, Gaal could no longer stretch his memory back far enough to embrace its beginning.

He himself had been but little pecked at. The heavy guns were trained on Dr. Seldon himself. Hari Seldon, however, sat there unperturbed. To Gaal, he was the only spot of stability remaining in the world.

The audience was small and drawn exclusively from among the Barons of the Empire. Press and public were excluded and it was doubtful that any significant number of outsiders even knew that a trial of Seldon was being conducted. The atmosphere was one of unrelieved hostility toward the defendants.

Five of the Commission of Public Safety sat behind the raised desk. They wore scarlet and gold uniforms and the shining, close-fitting plastic caps that were the sign of their judicial function. In the center was the Chief Commissioner Linge Chen. Gaal had never before seen so great a Lord and he watched him with fascination. Chen, throughout the trial, rarely said a word. He made it quite clear that much speech was beneath his dignity.

The Commission's Advocate consulted his notes and the examination continued, with Seldon still on the stand:

Q. Let us see, Dr. Seldon. How many men are now engaged in the project of which you are head?

A. Fifty mathematicians.

Q. Including Dr. Gaal Dornick?

A. Dr. Dornick is the fifty-first,

Q. Oh, we have fifty-one then? Search your memory, Dr. Seldon. Perhaps there are fifty-two or fifty-three? Or perhaps even more?

A. Dr. Dornick has not yet formally joined my organization. When he does, the membership will be fifty-one. It is now fifty, as I have said.

Q. Not perhaps nearly a hundred thousand?

A. Mathematicians? No.

Q. I did not say mathematicians. Are there a hundred thousand in all capacities?

A. In all capacities, your figure may be correct.

Q. May be? I say it is. I say that the men in your project number ninety-eight thousand, five hundred and seventy-two.

A. I believe you are counting women and children.

Q. (raising his voice) Ninety eight thousand five hundred and seventy-two individuals is the intent of my statement. There is no need to quibble.

A. I accept the figures.

Q. (referring to his notes) Let us drop that for the moment, then, and take up another matter which we have already discussed at some length. Would you repeat, Dr. Seldon, your thoughts concerning the future of Trantor?

A. I have said, and I say again, that Trantor will lie in ruins within the next three centuries.

Q. You do not consider your statement a disloyal one?

A. No, sir. Scientific truth is beyond loyalty and disloyalty.

Q. You are sure that your statement represents scientific truth?

A. I am.

Q. On what basis?

A. On the basis of the mathematics of psychohistory.

Q. Can you prove that this mathematics is valid'?

A. Only to another mathematician.

Q. (with a smile) Your claim then is that your truth is of so esoteric a nature that it is beyond the understanding of a plain man. It seems to me that truth should be clearer than that, less mysterious, more open to the mind.

A. It presents no difficulties to some minds. The physics of energy transfer, which we know as thermodynamics, has been clear and true through all the history of man since the mythical ages, yet there may be people present who would find it impossible to design a power engine. People of high intelligence, too. I doubt if the learned Commissioners—

At this point, one of the Commissioners leaned toward the Advocate. His words were not heard but the hissing of the voice carried a certain asperity. The Advocate flushed and interrupted Seldon.

Q. We are not here to listen to speeches, Dr. Seldon. Let us assume that you have made your point. Let me suggest to you that your predictions of disaster might be intended to destroy public confidence in the Imperial Government for purposes of your own.

A. That is not so.

Q. Let me suggest that you intend to claim that a period of time preceding the so-called ruin of Trantor will be filled with unrest of various types.

A. That is correct.

Q. And that by the mere prediction thereof, you hope to bring it about, and to have then an army of a hundred thousand available.

A. In the first place, that is not so. And if it were, investigation will show you that barely ten thousand are men of military age, and none of these has training in arms.

Q. Are you acting as an agent for another?

A. I am not in the pay of any man, Mr. Advocate.

Q. You are entirely disinterested? You are serving science?

A. I am.

Q. Then let us see how. Can the future be changed, Dr. Seldon?

A. Obviously. This courtroom may explode in the next few hours, or it may not. If it did, the future would undoubtedly be changed in some minor respects.

Q. You quibble, Dr. Seldon. Can the overall history of the human race be changed?

A. Yes.

Q. Easily?

A. No. With great difficulty.

Q. Why?

A. The psychohistoric trend of a planet-full of people contains a huge inertia. To be changed it must be met with something possessing a similar inertia. Either as many people must be concerned, or if the number of people be relatively small, enormous time for change must be allowed. Do you understand?

Q. I think I do. Trantor need not be ruined, if a great many people decide to act so that it will not.

A. That is right.

Q. As many as a hundred thousand people?

A. No, sir. That is far too few.

Q. You are sure?

A. Consider that Trantor has a population of over forty billions. Consider further that the trend leading to ruin does not belong to Trantor alone but to the Empire as a whole and the Empire contains nearly a quintillion human beings.

Q. I see. Then perhaps a hundred thousand people can change the trend, if they and their descendants labor for three hundred years.

A. I'm afraid not. Three hundred years is too short a time.

Q. Ah! In that case, Dr. Seldon, we are left with this deduction to be made from your statements. You have gathered one hundred thousand people within the confines of your project. These are insufficient to change the history of Trantor within three hundred years. In other words, they cannot prevent the destruction of Trantor no matter what they do.

A. You are unfortunately correct.

Q. And on the other hand, your hundred thousand are intended for no illegal purpose.

A. Exactly.

Q. (slowly and with satisfaction) In that case, Dr. Seldon— Now attend, sir, most carefully, for we want a considered answer. What is the purpose of your hundred thousand?

The Advocate's voice had grown strident. He had sprung his trap; backed Seldon into a corner; driven him astutely from any possibility of answering.

There was a rising buzz of conversation at that which swept the ranks of the peers in the audience and invaded even the row of Commissioners. They swayed toward one another in their scarlet and gold, only the Chief remaining uncorrupted.

Hari Seldon remained unmoved. He waited for the babble to evaporate.

A. To minimize the effects of that destruction.

Q. And exactly what do you mean by that?

A. The explanation is simple. The coming destruction of Trantor is not an event in itself, isolated in the scheme of human development. It will be the climax to an intricate drama which was begun centuries ago and which is accelerating in pace continuously. I refer, gentlemen, to the developing decline and fall of the Galactic Empire.

The buzz now became a dull roar. The Advocate, unheeded, was yelling, "You are openly declaring that—" and stopped because the cries of "Treason" from the audience showed that the point had been made without any hammering.

Slowly, the Chief Commissioner raised his gavel once and let it drop. The sound was that of a mellow gong. When the reverberations ceased, the gabble of the audience also did. The Advocate took a deep breath.

Q. (theatrically) Do you realize, Dr. Seldon, that you are speaking of an Empire that has stood for twelve thousand years, through all the vicissitudes of the generations, and which has behind it the good wishes and love of a quadrillion human beings?

A. I am aware both of the present status and the past history of the Empire. Without disrespect, I must claim a far better knowledge of it than any in this room.

Q. And you predict its ruin?

A. It is a prediction which is made by mathematics. I pass no moral judgements. Personally, I regret the prospect. Even if the Empire were admitted to be a bad thing (an admission I do not make), the state of anarchy which would follow its fall would be worse. It is that state of anarchy which my project is pledged to fight. The fall of Empire, gentlemen, is a massive thing, however, and not easily fought. It is dictated by a rising bureaucracy, a receding initiative, a freezing of caste, a damming of curiosity – a hundred other factors. It has been going on, as I have said, for centuries, and it is too majestic and massive a movement to stop.

Q. Is it not obvious to anyone that the Empire is as strong as it ever was?

A. The appearance of strength is all about you. It would seem to last forever. However, Mr. Advocate, the rotten tree-trunk, until the very moment when the storm-blast breaks it in two, has all the appearance of might it ever had. The storm-blast whistles through the branches of the Empire even now. Listen with the ears of psychohistory, and you will hear the creaking.

Q. (uncertainly) We are not here, Dr. Seldon, to lis–

A. (firmly) The Empire will vanish and all its good with it. Its accumulated knowledge will decay and the order it has imposed will vanish. Interstellar wars will be

endless; interstellar trade will decay; population will decline; worlds will lose touch with the main body of the Galaxy. –And so matters will remain.

Q. (a small voice in the middle of a vast silence) Forever?

A. Psychohistory, which can predict the fall, can make statements concerning the succeeding dark ages. The Empire, gentlemen, as has just been said, has stood twelve thousand years. The dark ages to come will endure not twelve, but thirty thousand years. A Second Empire will rise, but between it and our civilization will be one thousand generations of suffering humanity. We must fight that.

Q. (recovering somewhat) You contradict yourself. You said earlier that you could not prevent the destruction of Trantor; hence, presumably, the fall; –the so-called fall of the Empire.

A. I do not say now that we can prevent the fall. But it is not yet too late to shorten the interregnum which will follow. It is possible, gentlemen, to reduce the duration of anarchy to a single millennium, if my group is allowed to act now. We are at a delicate moment in history. The huge, onrushing mass of events must be deflected just a little, – just a little – It cannot be much, but it may be enough to remove twenty-nine thousand years of misery from human history.

Q. How do you propose to do this?

A. By saving the knowledge of the race. The sum of human knowing is beyond any one man; any thousand men. With the destruction of our social fabric, science will be broken into a million pieces. Individuals will know much of exceedingly tiny facets of what there is to know. They will be helpless and useless by themselves. The bits of lore, meaningless, will not be passed on. They will be lost through the generations. But, if we now prepare a giant summary of all knowledge, it will never be lost. Coming generations will build on it, and will not have to rediscover it for themselves. One millennium will do the work of thirty thousand.

Q. All this.

A. All my project; my thirty thousand men with their wives and children, are devoting themselves to the preparation of an "Encyclopedia Galactica." They will not complete it in their lifetimes. I will not even live to see it fairly begun. But by the time Trantor falls, it will be complete and copies will exist in every major library in the Galaxy.

The Chief Commissioner's gavel rose and fell. Hari Seldon left the stand and quietly took his seat next to Gaal.

He smiled and said, "How did you like the show?"

Gaal said, "You stole it. But what will happen now?"

"They'll adjourn the trial and try to come to a private agreement with me."

"How do you know?"

Seldon said, "I'll be honest. I don't know. It depends on the Chief Commissioner. I have studied him for years. I have tried to analyze his workings, but you know how risky it is to introduce the vagaries of an individual in the psychohistoric equations. Yet I have hopes."

7.

Avakim approached, nodded to Gaal, leaned over to whisper to Seldon. The cry of adjournment rang out, and guards separated them. Gaal was led away.

The next day's hearings were entirely different. Hari Seldon and Gaal Dornick were alone with the Commission. They were seated at a table together, with scarcely a separation between the five judges and the two accused. They were even offered cigars from a box of iridescent plastic which had the appearance of water, endlessly flowing. The eyes were fooled into seeing the motion although the fingers reported it to be hard and dry.

Seldon accepted one; Gaal refused.

Seldon said, "My lawyer is not present."

A Commissioner replied, "This is no longer a trial, Dr. Seldon. We are here to discuss the safety of the State."

Linge Chen said, "I will speak," and the other Commissioners sat back in their chairs, prepared to listen. A silence formed about Chen into which he might drop his words.

Gaal held his breath. Chen, lean and hard, older in looks than in fact, was the actual Emperor of all the Galaxy. The child who bore the title itself was only a symbol manufactured by Chen, and not the first such, either.

Chen said, "Dr. Seldon, you disturb the peace of the Emperor's realm. None of the quadrillions living now among all the stars of the Galaxy will be living a century from now. Why, then, should we concern ourselves with events of three centuries distance?"

"I shall not be alive half a decade hence," said Seldon, and yet it is of overpowering concern to me. Call it idealism. Call it an identification of myself with that mystical generalization to which we refer by the term, 'humanity.'"

"I do not wish to take the trouble to understand mysticism. Can you tell me why I may not rid myself of you, and of an uncomfortable and unnecessary three-century future which I will never see by having you executed tonight?"

"A week ago," said Seldon, lightly, "you might have done so and perhaps retained a one in ten probability of yourself remaining alive at year's end. Today, the one in ten probability is scarcely one in ten thousand."

There were expired breaths in the gathering and uneasy stirrings. Gaal felt the short hairs prickle on the back of his neck. Chen's upper eyelids dropped a little.

"How so?" he said.

"The fall of Trantor," said Seldon, "cannot be stopped by any conceivable effort. It can be hastened easily, however. The tale of my interrupted trial will spread through the Galaxy. Frustration of my plans to lighten the disaster will convince people that the future holds no promise to them. Already they recall the lives of their grandfathers with envy. They will see that political revolutions and trade stagnations will increase. The feeling will pervade the Galaxy that only what a man can grasp for himself at that moment will be of any account. Ambitious men will not wait and unscrupulous men will not hang back. By

their every action they will hasten the decay of the worlds. Have me killed and Trantor will fall not within three centuries but within fifty years and you, yourself, within a single year."

Chen said, "These are words to frighten children, and yet your death is not the only answer which will satisfy us."

He lifted his slender hand from the papers on which it rested, so that only two fingers touched lightly upon the topmost sheet.

"Tell me," he said, "will your only activity be that of preparing this encyclopedia you speak of?"

"It will."

"And need that be done on Trantor?"

"Trantor, my lord, possesses the Imperial Library, as well as the scholarly resources of the University of Trantor."

"And yet if you were located elsewhere—, let us say upon a planet where the hurry and distractions of a metropolis will not interfere with scholastic musings; where your men may devote themselves entirely and single-mindedly to their work; —might not that have advantages?"

"Minor ones, perhaps."

"Such a world had been chosen, then. You may work, doctor, at your leisure, with your hundred thousand about you. The Galaxy will know that you are working and fighting the Fall. They will even be told that you will prevent the Fall." He smiled, "Since I do not believe in so many things, it is not difficult for me to disbelieve in the Fall as well, so that I am entirely convinced I will be telling the truth to the people. And meanwhile, doctor, you will not trouble Trantor and there will be no disturbance of the Emperor's peace."

"The alternative is death for yourself and for as many of your followers as will seem necessary. Your earlier threats I disregard. The opportunity for choosing between death and exile is given you over a time period stretching from this moment to one five minutes hence."

"Which is the world chosen, my lord?" said Seldon.

"It is called, I believe, Terminus," said Chen. Negligently, he turned the papers upon his desk with his fingertips so that they faced Seldon. "It is uninhabited, but quite habitable, and can be molded to suit the necessities of scholars. It is somewhat secluded—"

Seldon interrupted, "It is at the edge of the Galaxy, sir."

"As I have said, somewhat secluded. It will suit your needs for concentration. Come, you have two minutes left."

Seldon said, "We will need time to arrange such a trip. There are twenty thousand families involved."

"You will be given time."

Seldon thought a moment, and the last minute began to die. He said, "I accept exile."

Gaal's heart skipped a beat at the words. For the most part, he was filled with a tremendous joy for who would not be, to escape death. Yet in all his vast relief, he found space for a little regret that Seldon had been defeated.

8.

For a long while, they sat silently as the taxi whined through the hundreds of miles of worm-like tunnels toward the University. And then Gaal stirred. He said:

"Was what you told the Commissioner true? Would your execution have really hastened the Fall?"

Seldon said, "I never lie about psychohistoric findings. Nor would it have availed me in this case. Chen knew I spoke the truth. He is a very clever politician and politicians by the very nature of their work must have an instinctive feeling for the truths of psychohistory."

"Then need you have accepted exile," Gaal wondered, but Seldon did not answer.

When they burst out upon the University grounds, Gaal's muscles took action of their own; or rather, inaction. He had to be carried, almost, out of the taxi.

All the University was a blaze of light. Gaal had almost forgotten that a sun could exist.

The University structures lacked the hard steel-gray of the rest of Trantor. They were silvery, rather. The metallic luster was almost ivory in color.

Seldon said, "Soldiers, it seems."

"What?" Gaal brought his eyes to the prosaic ground and found a sentinel ahead of them.

They stopped before him, and a soft-spoken captain materialized from a near-by doorway.

He said, "Dr. Seldon?"

"Yes."

"We have been waiting for you. You and your men will be under martial law henceforth. I have been instructed to inform you that six months will be allowed you for preparations to leave for Terminus."

"Six months!" began Gaal, but Seldon's fingers were upon his elbow with gentle pressure.

"These are my instructions," repeated the captain.

He was gone, and Gaal turned to Seldon, "Why, what can be done in six months? This is but slower murder."

"Quietly. Quietly. Let us reach my office."

It was not a large office, but it was quite spy-proof and quite undetectably so. Spy-beams trained upon it received neither a suspicious silence nor an even more suspicious static. They received, rather, a conversation constructed at random out of a vast stock of innocuous phrases in various tones and voices.

"Now," said Seldon, at his ease, "six months will be enough."

"I don't see how."

"Because, my boy, in a plan such as ours, the actions of others are bent to our needs. Have I not said to you already that Chen's temperamental makeup has been subjected to greater scrutiny than that of any other single man in history. The trial was not allowed to begin until the time and circumstances were right for the ending of our own choosing."

"But could you have arranged—"

"—to be exiled to Terminus? Why not?" He put his fingers on a certain spot on his desk and a small section of the wall behind him slid aside. Only his own fingers could have done so, since only his particular print-pattern could have activated the scanner beneath.

"You will find several microfilms inside," said Seldon. "Take the one marked with the letter, T."

Gaal did so and waited while Seldon fixed it within the projector and handed the young man a pair of eyepieces. Gaal adjusted them, and watched the film unroll before his eyes.

He said, "But then—"

Seldon said, "What surprises you?"

"Have you been preparing to leave for two years?"

"Two and a half. Of course, we could not be certain that it would be Terminus he would choose, but we hoped it might be and we acted upon that assumption—"

"But why, Dr. Seldon? If you arranged the exile, why? Could not events be far better controlled here on Trantor?"

"Why, there are some reasons. Working on Terminus, we will have Imperial support without ever rousing fears that we would endanger Imperial safety."

Gaal said, "But you aroused those fears only to force exile. I still do not understand."

"Twenty thousand families would not travel to the end of the Galaxy of their own will perhaps."

"But why should they be forced there?" Gaal paused, "May I not know?"

Seldon said, "Not yet. It is enough for the moment that you know that a scientific refuge will be established on Terminus. And another will be established at the other end of the Galaxy, let us say," and he smiled, "at Star's End. And as for the rest, I will die soon, and you will see more than I. —No, no. Spare me your shock and good wishes. My doctors tell me that I cannot live longer than a year or two. But then, I have accomplished in life what I have intended and under what circumstances may one better die."

"And after you die, sir?"

"Why, there will be successors — perhaps even yourself. And these successors will be able to apply the final touch in the scheme and instigate the revolt on Anacreon at the right time and in the right manner. Thereafter, events may roll unheeded."

"I do not understand."

"You will." Seldon's lined face grew peaceful and tired, both at once, "Most will leave for Terminus, but some will stay. It will be easy to arrange. –But as for me," and he concluded in a whisper, so that Gaal could scarcely hear him, "I am finished."

PART II

THE ENCYCLOPEDISTS

1.

TERMINUS— . . . Its location (see map) was an odd one for the role it was called upon to play in Galactic history, and yet as many writers have never tired of pointing out, an inevitable one. Located on the very fringe of the Galactic spiral, an only planet of an isolated sun, poor in resources and negligible in economic value, it was never settled in the five centuries after its discovery, until the landing of the Encyclopedists. . . .

It was inevitable that as a new generation grew, Terminus would become something more than an appendage of the psychohistorians of Trantor. With the Anacreonian revolt and the rise to power of Salvor Hardin, first of the great line of. . .

ENCYCLOPEDIA GALACTICA

Lewis Pirenne was busily engaged at his desk in the one well-lit comer of the room. Work had to be coordinated. Effort had to be organized. Threads had to be woven into a pattern.

Fifty years now; fifty years to establish themselves and set up Encyclopedia Foundation Number One into a smoothly working unit. Fifty years to gather the raw material. Fifty years to prepare.

It had been done. Five more years would see the publication of the first volume of the most monumental work the Galaxy had ever conceived. And then at ten-year intervals – regularly – like clockwork – volume after volume. And with them there would be supplements; special articles on events of current interest, until—

Pirenne stirred uneasily, as the muted buzzer upon his desk muttered peevishly. He had almost forgotten the appointment. He shoved the door release and out of an abstracted comer of one eye saw the door open and the broad figure of Salvor Hardin enter. Pirenne did not look up.

Hardin smiled to himself. He was in a hurry, but he knew better than to take offense at Pirenne's cavalier treatment of anything or anyone that disturbed him at his work. He buried himself in the chair on the other side of the desk and waited.

Pirenne's stylus made the faintest scraping sound as it raced across paper. Otherwise, neither motion nor sound. And then Hardin withdrew a two-credit coin from his vest pocket. He flipped it and its stainless-steel surface caught flitters of light as it tumbled through the air. He caught it and-flipped it again, watching the flashing reflections lazily. Stainless steel made good medium of exchange on a planet where all metal had to be imported.

Pirrenne looked up and blinked. "Stop that!" he said querulously.

"Eh?"

"That infernal coin tossing. Stop it."

"Oh." Hardin pocketed the metal disk. "Tell me when you're ready, will you? I promised to be back at the City Council meeting before the new aqueduct project is put to a vote."

Pirrenne sighed and shoved himself away from the desk. "I'm ready. But I hope you aren't going to bother me with city affairs. Take care of that yourself, please. The Encyclopedia takes up all my time."

"Have you heard the news?" questioned Hardin, phlegmatically.

"What news?"

"The news that the Terminus City ultrawave set received two hours ago. The Royal Governor of the Prefect of Anacreon has assumed the title of king."

"Well? What of it?"

"It means," responded Hardin, "that we're cut off from the inner regions of the Empire. We've been expecting it but that doesn't make it any more comfortable. Anacreon stands square across what was our last remaining trade route to Santanni and to Trantor and to Vega itself. Where is our metal to come from? We haven't managed to get a steel or aluminum shipment through in six months and now we won't be able to get any at all, except by grace of the King of Anacreon."

Pirrenne tch-tched impatiently. "Get them through him, then."

"But can we? Listen, Pirrenne, according to the charter which established this Foundation, the Board of Trustees of the Encyclopedia Committee has been given full administrative powers. I, as Mayor of Terminus City, have just enough power to blow my own nose and perhaps to sneeze if you countersign an order giving me permission. It's up to you and your Board then. I'm asking you in the name of the City, whose prosperity depends upon uninterrupted commerce with the Galaxy, to call an emergency meeting—"

"Stop! A campaign speech is out of order. Now, Hardin, the Board of Trustees has not barred the establishment of a municipal government on Terminus. We understand one to be necessary because of the increase in population since the Foundation was established fifty years ago, and because of the increasing number of people involved in non-Encyclopedia affairs. But that does not mean that the first and only aim of the Foundation is no longer to publish the definitive Encyclopedia of all human knowledge. We are a State-supported, scientific institution, Hardin. We cannot – must not – will not interfere in local politics."

"Local politics! By the Emperor's left toe, Pirrenne, this is a matter of life and death. The planet, Terminus, by itself cannot support a mechanized civilization. It lacks metals. You know that. It hasn't a trace of iron, copper, or aluminum in the surface rocks, and precious little of anything else. What do you think will happen to the Encyclopedia if this watchmacallum King of Anacreon clamps down on us?"

"On us? Are you forgetting that we are under the direct control of the Emperor himself? We are not part of the Prefect of Anacreon or of any other prefect. Memorize

that! We are part of the Emperor's personal domain, and no one touches us. The Empire can protect its own."

"Then why didn't it prevent the Royal Governor of Anacreon from kicking over the traces? And only Anacreon?"

At least twenty of the outermost prefects of the Galaxy, the entire Periphery as a matter of fact, have begun steering things their own way. I tell you I feel damned uncertain of the Empire and its ability to protect us."

"Hokum! Royal Governors, Kings – what's the difference? The Empire is always shot through with a certain amount of politics and with different men pulling this way and that. Governors have rebelled, and, for that matter, Emperors have been deposed, or assassinated before this. But what has that to do with the Empire itself? Forget it, Hardin. It's none of our business. We are first of all and last of all—scientists. And our concern is the Encyclopedia.

Oh, yes, I'd almost forgotten. Hardin!"

"Well?"

"Do something about that paper of yours!" Pirenne's voice was angry.

"The Terminus City *Journal*? It isn't mine; it's privately owned. What's it been doing?"

"For weeks now it has been recommending that the fiftieth anniversary of the establishment of the Foundation be made the occasion for public holidays and quite inappropriate celebrations."

"And why not? The computoclock will open the Vault in three months. I would call this first opening a big occasion, wouldn't you?"

"Not for silly pageantry, Hardin. The Vault and its opening concern the Board of Trustees alone. Anything of importance will be communicated to the people. That is final and please make it plain to the *Journal*."

"I'm sorry, Pirenne, but the City Charter guarantees a certain minor matter known as freedom of the press."

"It may. But the Board of Trustees does not. I am the Emperor's representative on Terminus, Hardin, and have full powers in this respect."

Hardin's expression became that of a man counting to ten, mentally. He said, grimly: "in connection with your status as Emperor's representative, then, I have a final piece of news to give you."

"About Anacreon?" Pirenne's lips tightened. He felt annoyed.

"Yes. A special envoy will be sent to us from Anacreon. In two weeks."

"An envoy? Here? From Anacreon?" Pirenne chewed that. "What for?"

Hardin stood up, and shoved his chair back up against the desk. "I give you one guess." And he left – quite unceremoniously.

2.

Anselm haut Rodric – "haut" itself signifying noble blood -Sub-prefect of Pluema and Envoy Extraordinary of his Highness of Anacreon-plus half a dozen other titles was met by Salvor Hardin at the spaceport with all the imposing ritual of a state occasion.

With a tight smile and a low bow, the sub-prefect had flipped his blaster from its holster and presented it to Hardin butt first. Hardin returned the compliment with, a blaster specifically borrowed for the occasion. Friendship and good will were thus established, and if Hardin noted the barest bulge at Haut Rodric's shoulder, he prudently said nothing.

The ground car that received them then – preceded, flanked, and followed by the suitable cloud of minor functionaries – proceeded in a slow, ceremonious manner to Cyclopeda Square, cheered on its way by a properly enthusiastic crowd.

Sub-prefect Anselm received the cheers with the complaisant indifference of a soldier and a nobleman.

He said to Hardin, "And this city is all your world?"

Hardin raised his voice to be heard above the clamor. "We are a young world, your eminence. In our short history we have had but few members of the higher nobility visiting our poor planet. Hence, our enthusiasm."

It is certain that "higher nobility" did not recognize irony when he heard it.

He said thoughtfully: "Founded fifty years ago. Hm-m-m! You have a great deal of unexploited land here, mayor. You have never considered dividing it into estates?"

"There is no necessity as yet. We're extremely centralized; we have to be, because of the Encyclopedia. Someday, perhaps, when our population has grown–"

"A strange world! You have no peasantry?"

Hardin reflected that it didn't require a great deal of acumen to tell that his eminence was indulging in a bit of fairly clumsy pumping. He replied casually, "No – nor nobility."

Haut Rodric's eyebrows lifted. "And your leader – the man I am to meet?"

"You mean Dr. Pirenne? Yes! He is the Chairman of the Board of Trustees – and a personal representative of the Emperor."

"Doctor? No other title? A *scholar*? And he rates above the civil authority?"

"Why, certainly," replied Hardin, amiably. "We're all scholars more or less. After all, we're not so much a world as a scientific foundation – under the direct control of the Emperor."

There was a faint emphasis upon the last phrase that seemed to disconcert the sub-prefect. He remained thoughtfully silent during the rest of the slow way to Cyclopeda Square.

If Hardin found himself bored by the afternoon and evening that followed, he had at least the satisfaction of realizing that Pirenne and Haut Rodric – having met with loud and mutual protestations of esteem and regard – were detesting each other's company a good deal more.

Haut Rodric had attended with glazed eye to Pirenne's lecture during the "inspection tour" of the Encyclopedia Building. With polite and vacant smile, he had listened to the latter's rapid patter as they passed through the vast storehouses of reference films and the numerous projection rooms.

It was only after he had gone down level by level into and through the composing departments, editing departments, publishing departments, and filming departments that he made the first comprehensive statement.

"This is all very interesting," he said, "but it seems a strange occupation for grown men. What good is it?"

It was a remark, Hardin noted, for which Pirenne found no answer, though the expression of his face was most eloquent.

The dinner that evening was much the mirror image of the events of that afternoon, for Haut Rodric monopolized the conversation by describing – in minute technical detail and with incredible zest – his own exploits as battalion head during the recent war between Anacreon and the neighboring newly proclaimed Kingdom of Smyrno.

The details of the sub-prefect's account were not completed until dinner was over and one by one the minor officials had drifted away. The last bit of triumphant description of mangled spaceships came when he had accompanied Pirenne and Hardin onto the balcony and relaxed in the warm air of the summer evening.

"And now," he said, with a heavy joviality, "to serious matters."

"By all means," murmured Hardin, lighting a long cigar of Vegan tobacco – not many left, he reflected – and teetering his chair back on two legs.

The Galaxy was high in the sky and its misty lens shape stretched lazily from horizon to horizon. The few stars here at the very edge of the universe were insignificant twinkles in comparison.

"Of course," said the sub-prefect, "all the formal discussions – the paper signing and such dull technicalities, that is – will take place before the – What is it you call your Council?"

"The Board of Trustees," replied Pirenne, coldly.

"Queer name! Anyway, that's for tomorrow. We might as well clear away some of the underbrush, man to man, right now, though. Hey?"

"And this means—" prodded Hardin.

"Just this. There's been a certain change in the situation out here in the Periphery and the status of your planet has become a trifle uncertain. It would be very convenient if we succeeded in coming to an understanding as to how the matter stands. By the way, mayor, have you another one of those cigars?"

Hardin started and produced one reluctantly.

Anselm haut Rodric sniffed at it and emitted a clucking sound of pleasure. "Vegan tobacco! Where did you get it?"

"We received some last shipment. There's hardly any left. Space knows when we'll get more – if ever."

Pirrenne scowled. He didn't smoke – and, for that matter, detested the odor. "Let me understand this, your eminence. Your mission is merely one of clarification?"

Haut Rodric nodded through the smoke of his first lusty puffs.

"In that case, it is soon over. The situation with respect to the Encyclopedia Foundation is what it always has been."

"Ah! And what is it that it always has been?"

"Just this: A State-supported scientific institution and part of the personal domain of his august majesty, the Emperor."

The sub-prefect seemed unimpressed. He blew smoke rings. "That's a nice theory, Dr. Pirrenne. I imagine you've got charters with the Imperial Seal upon it – but what's the actual situation? How do you stand with respect to Smyrno? You're not fifty parsecs from Smyrno's capital. you know. And what about Konom and Daribow?"

Pirrenne said: "We have nothing to do with any prefect. As part of the Emperor's–"

"They're not prefects," reminded Haut Rodric; "they're kingdoms now."

"Kingdoms then. We have nothing to do with them. As a scientific institution–"

"Science be damned!" swore the other. "What the devil has that got to do with the fact that we're liable to see Terminus taken over by Smyrno at any time?"

"And the Emperor? He would just sit by?"

Haut Rodric calmed down and said: "Well, now, Dr. Pirrenne, you respect the Emperor's property and so does Anacreon, but Smyrno might not. Remember, we've just signed a treaty with the Emperor – I'll present a copy to that Board of yours tomorrow – which places upon us the responsibility of maintaining order within the borders of the old Prefect of Anacreon on behalf of the Emperor. Our duty is clear, then, isn't it?"

"Certainly. But Terminus is not part of the Prefect of Anacreon."

"And Smyrno–"

"Nor is it part of the Prefect of Smyrno. It's not part of any prefect."

"Does Smyrno know that?"

"I don't care what it knows."

"We do. We've just finished a war with her and she still holds two stellar systems that are ours. Terminus occupies an extremely strategic spot, between the two nations."

Hardin felt weary. He broke in: "What is your proposition, your eminence?"

The sub-prefect seemed quite ready to stop fencing in favor of more direct statements. He said briskly: "It seems perfectly obvious that, since Terminus cannot defend itself, Anacreon must take over the job for its own sake. You understand we have no desire to interfere with internal administration–"

"Uh-huh," grunted Hardin dryly.

"–but we believe that it would be best for all concerned to have Anacreon establish a military base upon the planet."

"And that is all you would want – a military base in some of the vast unoccupied territory – and let it go at that?"

"Well, of course, there would be the matter of supporting the protecting forces."

Hardin's chair came down on all four, and his elbows went forward on his knees. "Now we're getting to the nub. Let's put it into language. Terminus is to be a protectorate and to pay tribute."

"Not tribute. Taxes. We're protecting you. You pay for it."

Pirenne banged his hand on the chair with sudden violence. "Let me speak, Hardin. Your eminence, I don't care a rusty half-credit coin for Anacreon, Smyrno, or all your local politics and petty wars. I tell you this is a State-supported tax-free institution."

"State-supported? But we are the State, Dr. Pirenne, and we're not supporting."

Pirenne rose angrily. "Your eminence, I am the direct representative of—"

"—his august majesty, the Emperor," chorused Anselm haut Rodric sourly, "And I am the direct representative of the King of Anacreon. Anacreon is a lot nearer, Dr. Pirenne. "

"Let's get back to business," urged Hardin. "How would you take these so-called taxes, your eminence? Would you take them in kind: wheat, potatoes, vegetables, cattle?"

The sub-prefect stared. "What the devil? What do we need with those? We've got hefty surpluses. Gold, of course. Chromium or vanadium would be even better, incidentally, if you have it in quantity."

Hardin laughed. "Quantity! We haven't even got iron in quantity. Gold! Here, take a look at our currency." He tossed a coin to the envoy.

Haut Rodric bounced it and stared. "What is it? Steel?"

"That's right."

"I don't understand."

"Terminus is a planet practically without metals. We import it all. Consequently, we have no gold, and nothing to pay unless you want a few thousand bushels of potatoes."

"Well – manufactured goods."

"Without metal? What do we make our machines out of?"

There was a pause and Pirenne tried again. "This whole discussion is wide of the point. Terminus is not a planet, but a scientific foundation preparing a great encyclopedia. Space, man, have you no respect for science?"

"Encyclopedias don't win wars." Haut Rodric's brows furrowed. "A completely unproductive world, then – and practically unoccupied at that. Well, you might pay with land."

"What do you mean?" asked Pirenne.

"This world is just about empty and the unoccupied land is probably fertile. There are many of the nobility on Anacreon that would like an addition to their estates."

"You can't propose any such—"

"There's no necessity of looking so alarmed, Dr. Pirenne. There's plenty for all of us. If it comes to what it comes, and you co-operate, we could probably arrange it so that you lose nothing. Titles can be conferred and estates granted. You understand me, I think."

Pirenne sneered, "Thanks!"

And then Hardin said ingenuously: "Could Anacreon supply us with adequate quantities of plutonium for our nuclear-power plant? We've only a few years' supply left."

There was a gasp from Pirenne and then a dead silence for minutes. When Haut Rodric spoke it was in a voice quite different from what it had been till then:

"You have nuclear power?"

"Certainly. What's unusual in that? I imagine nuclear power is fifty thousand years old now. Why shouldn't we have it? Except that it's a little difficult to get plutonium."

"Yes . . . Yes." The envoy paused and added uncomfortably: "Well, gentlemen, we'll pursue the subject tomorrow. You'll excuse me—"

Pirenne looked after him and gritted through his teeth: "That insufferable, dull-witted donkey! That—"

Hardin broke in: "Not at all. He's merely the product of his environment. He doesn't understand much except that 'I have a gun and you haven't.'"

Pirenne whirled on him in exasperation. "What in space did you mean by the talk about military bases and tribute? Are you crazy?"

"No. I merely gave him rope and let him talk. You'll notice that he managed to stumble out with Anacreon's real intentions – that is, the parceling up of Terminus into landed estates. Of course, I don't intend to let that happen."

"You don't intend. You don't. And who are you? And may I ask what you meant by blowing off your mouth about our nuclear-power plant? Why, it's just the thing that would make us a military target."

"Yes," grinned Hardin. "A military target to stay away from. Isn't it obvious why I brought the subject up? It happened to confirm a very strong suspicion I had had."

"And that was what?"

"That Anacreon no longer has a nuclear-power economy. If they had, our friend would undoubtedly have realized that plutonium, except in ancient tradition is not used in power plants. And therefore it follows that the rest of the Periphery no longer has nuclear power either. Certainly Smyrno hasn't, or Anacreon wouldn't have won most of the battles in their recent war. Interesting, wouldn't you say?"

"Bah!" Pirenne left in fiendish humor, and Hardin smiled gently.

He threw his cigar away and looked up at the outstretched Galaxy. "Back to oil and coal, are they?" he murmured – and what the rest of his thoughts were he kept to himself.

3.

When Hardin denied owning the *Journal*, he was perhaps technically correct, but no more. Hardin had been the leading spirit in the drive to incorporate Terminus into an autonomous municipality—he had been elected its first mayor—so it was not surprising that, though not a single share of *Journal* stock was in his name, some sixty percent was controlled by him in more devious fashions.

There were ways.

Consequently, when Hardin began suggesting to Pirenne that he be allowed to attend meetings of the Board of Trustees, it was not quite coincidence that the *Journal* began a similar campaign. And the first mass meeting in the history of the Foundation was held, demanding representation of the City in the "national" government.

And, eventually, Pirenne capitulated with ill grace.

Hardin, as he sat at the foot of the table, speculated idly as to just what it was that made physical scientists such poor administrators. It might be merely that they were too used to inflexible fact and far too unused to pliable people.

In any case, there was Tomaz Sutt and Jord Fara on his left; Lundin Crast and Yate Fulham on his right; with Pirenne, himself, presiding. He knew them all, of course, but they seemed to have put on an extra-special bit of pomposity for the occasion.

Hardin had dozed through the initial formalities and then perked up when Pirenne sipped at the glass of water before him by way of preparation and said:

"I find it very gratifying to be able to inform the Board that since our last meeting, I have received word that Lord Dorwin, Chancellor of the Empire, will arrive at Terminus in two weeks. It may be taken for granted that our relations with Anacreon will be smoothed out to our complete satisfaction as soon as the Emperor is informed of the situation. "

He smiled and addressed Hardin across the length of the table. "Information to this effect has been given the *Journal*."

Hardin snickered below his breath. It seemed evident that Pirenne's desire to strut this information before him had been one reason for his admission into the sacrosanctum.

He said evenly: "Leaving vague expressions out of account, what do you expect Lord Dorwin to do?"

Tomaz Sutt replied. He had a bad habit of addressing one in the third person when in his more stately moods.

"It is quite evident," he observed, "that Mayor Hardin is a professional cynic. He can scarcely fail to realize that the Emperor would be most unlikely to allow his personal rights to be infringed."

"Why? What would he do in case they were?"

There was an annoyed stir. Pirenne said, "You are out of order," and, as an afterthought, "and are making what are near-treasonable statements, besides."

"Am I to consider myself answered?"

"Yes! If you have nothing further to say--"

"Don't jump to conclusions. I'd like to ask a question. Besides this stroke of diplomacy – which may or may not prove to mean anything – has anything concrete been done to meet the Anacreonic menace?"

Yate Fulham drew one hand along his ferocious red mustache. "You see a menace there, do you?"

"Don't you?"

"Scarcely" – this with indulgence. "The Emperor--"

"Great space!" Hardin felt annoyed. "What is this? Every once in a while someone mentions 'Emperor' or 'Empire' as if it were a magic word. The Emperor is thousands of

parsecs away, and I doubt whether he gives a damn about us. And if he does, what can he do? What there was of the imperial navy in these regions is in the hands of the four kingdoms now and Anacreon has its share. Listen, we have to fight with guns, not with words.

"Now, get this. We've had two months' grace so far, mainly because we've given Anacreon the idea that we've got nuclear weapons. Well, we all know that that's a little white lie. We've got nuclear power, but only for commercial uses, and darn little at that. They're going to find that out soon, and if you think they're going to enjoy being jollied along, you're mistaken."

"My dear sir—"

"Hold on: I'm not finished." Hardin was warming up. He liked this. "It's all very well to drag chancellors into this, but it would be much nicer to drag a few great big siege guns fitted for beautiful nuclear bombs into it. We've lost two months, gentlemen, and we may not have another two months to lose. What do you propose to do?"

Said Lundin Crast, his long nose wrinkling angrily: "If you're proposing the militarization of the Foundation, I won't hear a word of it. It would mark our open entrance into the field of politics. We, Mr. Mayor, are a scientific foundation and nothing else."

Added Sutt: "He does not realize, moreover, that building armaments would mean withdrawing men – valuable men – from the Encyclopedia. That cannot be done, come what may."

"Very true," agreed Pirenne. "The Encyclopedia first – always."

Hardin groaned in spirit. The Board seemed to suffer violently from Encyclopedia on the brain,

He said icily: "Has it ever occurred to this Board that it is barely possible that Terminus may have interests other than the Encyclopedia?"

Pirenne replied: "I do not conceive, Hardin, that the Foundation can have *any* interest other than the Encyclopedia."

"I didn't say the Foundation; I said *Terminus*. I'm afraid you don't understand the situation. There's a good million of us here on Terminus, and not more than a hundred and fifty thousand are working directly on the Encyclopedia. To the rest of us, this is *home*. We were born here. We're living here. Compared with our farms and our homes and our factories, the Encyclopedia means little to us. We want them protected—"

He was shouted down.

"The Encyclopedia first," ground out Crast. "We have a mission to fulfill."

"Mission, hell," shouted Hardin. "That might have been true fifty years ago. But this is a new generation."

"That has nothing to do with it," replied Pirenne. "We are scientists."

And Hardin leaped through the opening. "Are you, though? That's a nice hallucination, isn't it? Your bunch here is a perfect example of what's been wrong with the entire Galaxy for thousands of years. What kind of science is it to be stuck out here for centuries classifying the work of scientists of the last millennium? Have you ever thought

of working onward, extending their knowledge and improving upon it? No! You're quite happy to stagnate. The whole Galaxy is, and has been for space knows how long. That's why the Periphery is revolting; that's why communications are breaking down; that's why petty wars are becoming eternal; that's why whole systems are losing nuclear power and going back to barbarous techniques of chemical power.

"If you ask me," he cried, "*the Galactic Empire is dying!*"

He paused and dropped into his chair to catch his breath, paying no attention to the two or three that were attempting simultaneously to answer him.

Crast got the floor. "I don't know what you're trying to gain by your hysterical statements, Mr. Mayor. Certainly, you are adding nothing constructive to the discussion. I move, Mr. Chairman, that the speaker's remarks be placed out of order and the discussion be resumed from the point where it was interrupted."

Jord Fara bestirred himself for the first time. Up to this point Fara had taken no part in the argument even at its hottest. But now his ponderous voice, every bit as ponderous as his three-hundred-pound body, burst its bass way out.

"Haven't we forgotten something, gentlemen?"

"What?" asked Pirenne, peevishly.

"That in a month we celebrate our fiftieth anniversary." Fara had a trick of uttering the most obvious platitudes with great profundity.

"What of it?"

"And on that anniversary," continued Fara, placidly, "Hari Seldon's Vault will open. Have you ever considered what might be in the Vault?"

"I don't know. Routine matters. A stock Speech of congratulations, perhaps. I don't think any significance need be placed on the Vault – though the *Journal*" – and he glared at Hardin, who grinned back – "did try to make an issue of it. I put a stop to that."

"Ah," said Fara, "but perhaps you are wrong. Doesn't it strike you" – he paused and put a finger to his round little nose – "that the Vault is opening at a very convenient time?"

"Very inconvenient time, you mean," muttered Fulham. "We've got some other things to worry about."

"Other things more important than a message from Hari Seldon? I think not." Fara was growing more pontifical than ever, and Hardin eyed him thoughtfully. What was he getting at?

"In fact," said Fara, happily, "you all seem to forget that Seldon was the greatest psychologist of our time and that he was the founder of our Foundation. It seems reasonable to assume that he used his science to determine the probable course of the history of the immediate future. If he did, as seems likely, I repeat, he would certainly have managed to find a way to warn us of danger and, perhaps, to point out a solution. The Encyclopedia was very dear to his heart, you know."

An aura of puzzled doubt prevailed. Pirenne hemmed. "Well, now, I don't know. Psychology is a great science, but there are no psychologists among us at the moment, I believe. It seems to me we're on uncertain ground."

Fara turned to Hardin. "Didn't you study psychology under Alurin?"

Hardin answered, half in reverie: "Yes, I never completed my studies, though. I got tired of theory. I wanted to be a psychological engineer, but we lacked the facilities, so I did the next best thing – I went into politics. It's practically the same thing."

"Well, what do you think of the Vault?"

And Hardin replied cautiously, "I don't know."

He did not say a word for the remainder of the meeting even though it got back to the subject of the Chancellor of the Empire.

In fact, he didn't even listen. He'd been put on a new track and things were falling into place—just a little. Little angles were fitting together – one or two.

And psychology was the key. He was sure of that.

He was trying desperately to remember the psychological theory he had once learned – and from it he got one thing right at the start.

A great psychologist such as Seldon could unravel human emotions and human reactions sufficiently to be able to predict broadly the historical sweep of the future.

And what would that mean?

4.

Lord Dorwin took snuff. He also had long hair, curled intricately and, quite obviously, artificially, to which were added a pair of fluffy, blond sideburns, which he fondled affectionately. Then, too, he spoke in overprecise statements and left out all the r's.

At the moment, Hardin had no time to think of more of the reasons for the instant detestation in which he had held the noble chancellor. Oh, yes, the elegant gestures of one hand with which he accompanied his remarks and the studied condescension with which he accompanied even a simple affirmative.

But, at any rate, the problem now was to locate him. He had disappeared with Pirenne half an hour before – passed clean out of sight, blast him.

Hardin was quite sure that his own absence during the preliminary discussions would quite suit Pirenne.

But Pirenne had been seen in this wing And on this floor. It was simply a matter of trying every door. Halfway down, he said, "Ah!" and stepped into the darkened room. The profile of Lord Dorwin's intricate hair-do was unmistakable against the lighted screen.

Lord Dorwin looked up and said: "Ah, Hahdin. You ah looking foah us, no doubt?" He held out his snuffbox – overadorned and poor workmanship at that, noted Hardin and was politely refused whereat he helped himself to a pinch and smiled graciously.

Pirenne scowled and Hardin met that with an expression of blank indifference.

The only sound to break the short silence that followed was the clicking of the lid of Lord Dorwin's snuffbox. And then he put it away and said:

"A great achievement, this Encyclopedia of yoahs, Hahdin. A feat, indeed, to rank with the most majestic accomplishments of all time."

"Most of us think so, milord. It's an accomplishment not quite accomplished as yet, however."

"Fwom the little I have seen of the efficiency of yoah Foundation, I have no feahs on that scoah." And he nodded to Pirenne, who responded with a delighted bow.

Quite a love feast, thought Hardin. "I wasn't complaining about the lack of efficiency, milord, as much as of the definite excess of efficiency on the part of the Anacreonians – though in another and more destructive direction."

"Ah, yes, Anacweon." A negligent wave of the hand. "I have just come from theah. Most bahbawous planet. It is thowoughly inconceivable that human beings could live heah in the Pewiphewy. The lack of the most elementawy wequiahments of a cultuahed gentleman; the absence of the most fundamental necessities foah comfoht and convenience – the uttah desuetude into which they–"

Hardin interrupted dryly: "The Anacreonians, unfortunately, have all the elementary requirements for warfare and all the fundamental necessities for destruction."

"Quite, quite." Lord Dorwin seemed annoyed, perhaps at being stopped midway in his sentence. "But we ahn't to discuss business now, y'know. Weally, I'm othahwise concuhned. Doctah Piwenne, ahn't you going to show me the second volume? Do, please."

The lights clicked out and for the next half-hour Hardin might as well have been on Anacreon for all the attention they paid him. The book upon the screen made little sense to him, nor did he trouble to make the attempt to follow, but Lord Dorwin became quite humanly excited at times. Hardin noticed that during these moments of excitement the chancellor pronounced his r's.

When the lights went on again, Lord Dorwin said: "Mahvelous. Twuly mahvelous. You ah not, by chance, intewested in ahchaeology, ah you, Hahdin?"

"Eh?" Hardin shook himself out of an abstracted reverie. "No, milord, can't say I am. I'm a psychologist by original intention and a politician by final decision."

"Ah! No doubt intewesting studies. 1, myself, y'know" – he helped himself to a giant pinch of snuff – "dabble in ahchaeology."

"Indeed?"

"His lordship," interrupted Pirenne, "is most thoroughly acquainted with the field."

"Well, p'haps I am, p'haps I am," said his lordship complacently. "I *have* done an awful amount of wuhk in the science. Extwemely well-read, in fact. I've gone thwough all of Jawdun, Obijasi, Kwomwill . . . oh, all of them, y'know."

"I've heard of them, of course," said Hardin, "but I've never read them."

"You should some day, my deah fellow. It would amply repay you. Why, I cutainly considah it well wuhth the twip heah to the Pewiphewy to see this copy of Lameth. Would you believe it, my Libwawy totally lacks a copy. By the way, Doctah Piwenne, you have not fohgotten yoah pwomise to twansdevelop a copy foah me befoah I leave?"

"Only too pleased."

"Lameth, you must know," continued the chancellor, pontifically, "presents a new and most interesting addition to my previous knowledge of the 'Origin Question.'"

"Which question?" asked Hardin.

"The 'Origin Question.' The place of the origin of the human species, y'know. Surely you must know that it is thought that originally the human race occupied only one planetary system."

"Well, yes, I know that."

"Of course, no one knows exactly which system it is – lost in the mists of antiquity. Theah ah theawies, however. Siwius, some say. Others insist on Alpha Centauri, oah on Sol, oah on 61 Cygni – all in the Siwius sector, you see."

"And what does Lameth say?"

"Well, he goes off along a new trail completely. He tries to show that archaeological remains on the third planet of the Ahctuvian System show that humanity existed theah befoah theah wah any indications of space-travel."

"And that means it was humanity's birth planet?"

"P'haps. I must read it closely and weigh the evidence befoah I can say foah certain. One must see just how reliable his observations ah."

Hardin remained silent for a short while. Then he said, "When did Lameth write his book?"

"Oh – I should say about eight hundred years ago. Of course, he has based it largely on the previous work of Gleen."

"Then why rely on him? Why not go to Arcturus and study the remains for yourself?"

Lord Dorwin raised his eyebrows and took a pinch of snuff hurriedly. "Why, whatever for, my dear fellow?"

"To get the information firsthand, of course."

"But what's the necessity? It seems an uncommonly roundabout and hopelessly wiggamish method of getting anywhere. Look here, now, I've got the works of all the old masters – the great archaeologists of the past. I weigh them against each other – balance the disagreements – analyze the conflicting statements – decide which is probably correct – and come to a conclusion. That is the scientific method. At least" – patronizingly – "as I see it. How insufficiently crude it would be to go to Ahctuvus, oah to Sol, foah instance, and blunder about, when the old masters have covered the ground so much more effectually than we could possibly hope to do."

Hardin murmured politely, "I see."

"Come, milord," said Pirenne, "think we had better be returning."

"Ah, yes. P'haps we had."

As they left the room, Hardin said suddenly, "Milord, may I ask a question?"

Lord Dorwin smiled blandly and emphasized his answer with a gracious flutter of the hand. "Certainly, my dear fellow. Only too happy to be of service. If I can help you in any way from my poor store of knowledge—"

"It isn't exactly about archaeology, milord."

"No?"

"No. It's this: Last year we received news here in Terminus about the meltdown of a power plant on Planet V of Gamma Andromeda. We got the barest outline of the accident – no details at all. I wonder if you could tell me exactly what happened."

Pirrenne's mouth twisted. "I wonder you annoy his lordship with questions on totally irrelevant subjects."

"Not at all, Doctah Piwenne," interceded the chancellor. "It is quite all wight. Theah isn't much to say concuhning it in any case. The powah plant did undergo meltdown and it was quite a catastwophe, y'know. I believe wadiatsen damage. Weally, the govuhnment is sewiously considewing placing seveah westwictions upon the indiscwiminate use of nucleah powah – though that is not a thing for genewal publication, y'know."

"I understand," said Hardin. "But what was wrong with the plant?"

"Well, weally," replied Lord Dorwin indifferently, "who knows? It had bwoken down some yeahs pweviously and it is thought that the weplacements and wepaiah wuhk wuh most infewiah. It is so difficult these days to find men who weally undahstand the moah technical details of ouah powah systems." And he took a sorrowful pinch of snuff.

"You realize," said Hardin, "that the independent kingdoms of the Periphery had lost nuclear power altogether?"

"Have they? I'm not at all suhpwised. Bahbawous planets– Oh, but my deah fellow, don't call them independent. They ahn't, y'know. The tweaties we've made with them ah pwoof positive of that. They acknowledge the soveweignty of the Empewah. They'd have to, of cohse, oah we wouldn't tweat with them."

"That may be so, but they have considerable freedom of action."

"Yes, I suppose so. Considewable. But that scahcely mattahs. The Empiah is fah bettah off, with the Pewiphewy thwown upon its own wesoahces – as it is, moah oah less. They ahn't any good to us, y'know. Most bahbawous planets. Scahcely civilized."

"They were civilized in the past. Anacreon was one of the richest of the outlying provinces. I understand it compared favorably with Vega itself."

"Oh, but, Hahdin, that was centuwies ago. You can scahcely dwaw conclusion fwom that. Things wah diffewent in the old gweat days. We ahn't the men we used to be, y'know. But, Hahdin, come, you ah a most puhsistent chap.

I've told you I simply won't discuss business today. Doctah Piwenne did pwepayah me foah you. He told me you would twy to badgah me, but I'm fah too old a hand foah that. Leave it foah next day. And that was that.

5.

This was the second meeting of the Board that Hardin had attended, if one were to exclude the informal talks the Board members had had with the now-departed Lord

Dorwin. Yet the mayor had a perfectly definite idea that at least one other, and possibly two or three, had been held, to which he had somehow never received an invitation.

Nor, it seemed to him, would he have received notification of this one had it not been for the ultimatum.

At least, it amounted to an ultimatum, though a superficial reading of the visigraphed document would lead one to suppose that it was a friendly interchange of greetings between two potentates.

Hardin fingered it gingerly. It started off floridly with a salutation from "His Puissant Majesty, the King of Anacreon, to his friend and brother, Dr. Lewis Pirenne, Chairman of the Board of Trustees, of the Encyclopedia Foundation Number One," and it ended even more lavishly with a gigantic, multicolored seal of the most involved symbolism.

But it was an ultimatum just the same.

Hardin said: "It turned out that we didn't have much time after all – only three months. But little as it was, we threw it away unused. This thing here gives us a week. What do we do now?"

Pirenne frowned worriedly. "There must be a loophole. It is absolutely unbelievable that they would push matters to extremities in the face of what Lord Dorwin has assured us regarding the attitude of the Emperor and the Empire."

Hardin perked up. "I see. You have informed the King of Anacreon of this alleged attitude?"

"I did – after having placed the proposal to the Board for a vote and having received unanimous consent."

"And when did this vote take place?"

Pirenne climbed onto his dignity. "I do not believe I am answerable to you in any way, Mayor Hardin."

"All right. I'm not that vitally interested. It's just my opinion that it was your diplomatic transmission of Lord Dorwin's valuable contribution to the situation" – he lifted the corner of his mouth in a sour half-smile – "that was the direct cause of this friendly little note. They might have delayed longer otherwise – though I don't think the additional time would have helped Terminus any, considering the attitude of the Board."

Said Yate Fulham: "And just how do you arrive at that remarkable conclusion, Mr. Mayor?"

"In a rather simple way. It merely required the use of that much-neglected commodity – common sense. You see, there is a branch of human knowledge known as symbolic logic, which can be used to prune away all sorts of clogging deadwood that clutters up human language."

"What about it?" said Fulham.

"I applied it. Among other things, I applied it to this document here. I didn't really need to for myself because I knew what it was all about, but I think I can explain it more easily to five physical scientists by symbols rather than by words."

Hardin removed a few sheets of paper from the pad under his arm and spread them out. "I didn't do this myself, by the way," he said. "Muller Holk of the Division of Logic has his name signed to the analyses, as you can see."

Pirenne leaned over the table to get a better view and Hardin continued: "The message from Anacreon was a simple problem, naturally, for the men who wrote it were men of action rather than men of words. It boils down easily and straightforwardly to the unqualified statement, when in symbols is what you see, and which in words, roughly translated, is, 'You give us what we want in a week, or we take it by force.'"

There was silence as the five members of the Board ran down the line of symbols, and then Pirenne sat down and coughed uneasily.

Hardin said, "No loophole, is there, Dr. Pirenne?"

"Doesn't seem to be."

"All right." Hardin replaced the sheets. "Before you now you see a copy of the treaty between the Empire and Anacreon – a treaty, incidentally, which is signed on the Emperor's behalf by the same Lord Dorwin who was here last week – and with it a symbolic analysis."

The treaty ran through five pages of fine print and the analysis was scrawled out in just under half a page.

"As you see, gentlemen, something like ninety percent of the treaty boiled right out of the analysis as being meaningless, and what we end up with can be described in the following interesting manner:

"Obligations of Anacreon to the Empire: *None!*

"Powers of the Empire over Anacreon: *None!*"

Again the five followed the reasoning anxiously, checking carefully back to the treaty, and when they were finished, Pirenne said in a worried fashion, "That seems to be correct."

"You admit, then, that the treaty is nothing but a declaration of total independence on the part of Anacreon and a recognition of that status by the Empire?"

"It seems so."

"And do you suppose that Anacreon doesn't realize that, and is not anxious to emphasize the position of independence – so that it would naturally tend to resent any appearance of threats from the Empire? Particularly when it is evident that the Empire is powerless to fulfill any such threats, or it would never have allowed independence."

"But then," interposed Sutt, "how would Mayor Hardin account for Lord Dorwin's assurances of Empire support? They seemed –" He shrugged. "Well, they seemed satisfactory."

Hardin threw himself back in the chair. "You know, that's the most interesting part of the whole business. I'll admit I had thought his Lordship a most consummate donkey when I first met him – but it turned out that he was actually an accomplished diplomat and a most clever man. I took the liberty of recording all his statements."

There was a flurry, and Pirenne opened his mouth in horror.

"What of it?" demanded Hardin. "I realize it was a gross breach of hospitality and a thing no so-called gentleman would do. Also, that if his lordship had caught on, things might have been unpleasant; but he didn't, and I have the record, and that's that. I took that record, had it copied out and sent that to Holk for analysis, also."

Lundin Crast said, "And where is the analysis?"

"That," replied Hardin, "is the interesting thing. The analysis was the most difficult of the three by all odds. When Holk, after two days of steady work, succeeded in eliminating meaningless statements, vague gibberish, useless qualifications – in short, all the goo and dribble – he found he had nothing left. Everything canceled out."

"Lord Dorwin, gentlemen, in five days of discussion *didn't* say one *damned thing*, and said it so you never noticed. *There* are the assurances you had from your precious Empire."

Hardin might have placed an actively working stench bomb on the table and created no more confusion than existed after his last statement. He waited, with weary patience, for it to die down.

"So," he concluded, "when you sent threats – and that's what they were – concerning Empire action to Anacreon, you merely irritated a monarch who knew better. Naturally, his ego would demand immediate action, and the ultimatum is the result-which brings me to my original statement. We have one week left and what do we do now?"

"It seems," said Sutt, "that we have no choice but to allow Anacreon to establish military bases on Terminus."

"I agree with you there," replied Hardin, "but what do we do toward kicking them off again at the first opportunity?"

Yate Fulham's mustache twitched. "That sounds as if you have made up your mind that violence must be used against them."

"Violence," came the retort, "is the last refuge of the incompetent. But I certainly don't intend to lay down the welcome mat and brush off the best furniture for their use."

"I still don't like the way you put that," insisted Fulham. "It is a dangerous attitude; the more dangerous because we have noticed lately that a sizable section of the populace seems to respond to all your suggestions just so. I might as well tell you, Mayor Hardin, that the board is not quite blind to your recent activities."

He paused and there was general agreement. Hardin shrugged.

Fulham went on: "If you were to inflame the City into an act of violence, you would achieve elaborate suicide – and we don't intend to allow that. Our policy has but one cardinal principle, and that is the Encyclopedia. Whatever we decide to do or not to do will be so decided because it will be the measure required to keep that Encyclopedia safe."

"Then," said Hardin, "you come to the conclusion that we must continue our intensive campaign of doing nothing."

Pirenne said bitterly: "You have yourself demonstrated that the Empire cannot help us; though how and why it can be so, I don't understand. If compromise is necessary—"

Hardin had the nightmarelike sensation of running at top speed and getting nowhere. "There is no compromise! Don't you realize that this bosh about military bases is a particularly inferior grade of drivel? Haut Rodric told us what Anacreon was after – outright annexation and imposition of its own feudal system of landed estates and peasant-aristocracy economy upon us. What is left of our bluff of nuclear power may force them to move slowly, but they will move nonetheless."

He had risen indignantly, and the rest rose with him except for Jord Fara.

And then Jord Fara spoke. "Everyone will please sit down. We've gone quite far enough, I think. Come, there's no use looking so furious, Mayor Hardin; none of us have been committing treason."

"You'll have to convince me of that!"

Fara smiled gently. "You know you don't mean that. Let me speak!"

His little shrewd eyes were half closed, and the perspiration gleamed on the smooth expanse of his chin. "There seems no point in concealing that the Board has come to the decision that the real solution to the Anacreonian problem lies in what is to be revealed to us when the Vault opens six days from now."

"Is that your contribution to the matter?"

"Yes."

"We are to do nothing, is that fight, except to wait in quiet serenity and utter faith for the *deus ex machina* to pop out of the Vault?"

"Stripped of your emotional phraseology, that's the idea."

"Such unsubtle escapism! Really, Dr. Fara, such folly smacks of genius. A lesser mind would be incapable of it."

Fara smiled indulgently. "Your taste in epigrams is amusing, Hardin, but out of place. As a matter of fact, I think you remember my line of argument concerning the Vault about three weeks ago."

"Yes, I remember it. I don't deny that it was anything but a stupid idea from the standpoint of deductive logic alone. You said – stop me when I make a mistake – that Hari Seldon was the greatest psychologist in the System; that, hence, he could foresee the right and uncomfortable spot we're in now; that, hence, he established the Vault as a method of telling us the way out."

"You've got the essence of the idea."

"Would it surprise you to hear that I've given considerable thought to the matter these last weeks?"

"Very flattering. With what result?"

"With the result that pure deduction is found wanting. Again what is needed is a little sprinkling of common sense."

"For instance?"

"For instance, if he foresaw the Anacreonian mess, why not have placed us on some other planet nearer the Galactic centers? It's well known that Seldon maneuvered the Commissioners on Trantor into ordering the Foundation established on Terminus. But why should he have done so? Why put us out here at all if he could see in advance the

break in communication lines, our isolation from the Galaxy, the threat of our neighbors – and our helplessness because of the lack of metals on Terminus? That above all! Or if he foresaw all this, why not have warned the original settlers in advance that they might have had time to prepare, rather than wait, as he is doing, until one foot is over the cliff, before doing so?

"And don't forget this. Even though he could foresee the problem *then*, we can see it equally well *now*. Therefore, if he could foresee the solution *then*, we should be able to see it *now*. After all, Seldon was not a magician. There are no trick methods of escaping from a dilemma that he can see and we can't."

"But, Hardin," reminded Fara, "we can't!"

"But you haven't *tried*. You haven't tried once. First, you refused to admit that there was a menace at all! Then you reposed an absolutely blind faith in the Emperor! Now you've shifted it to Hari Seldon. Throughout you have invariably relied on authority or on the past – never on yourselves."

His fists balled spasmodically. "It amounts to a diseased attitude – a conditioned reflex that shunts aside the independence of your minds whenever it is a question of opposing authority. There seems no doubt ever in your minds that the Emperor is more powerful than you are, or Hari Seldon wiser. And that's wrong, don't you see?"

For some reason, no one cared to answer him.

Hardin continued: "It isn't just you. It's the whole Galaxy. Pirenne heard Lord Dorwin's idea of scientific research. Lord Dorwin thought the way to be a good archaeologist was to read all the books on the subject – written by men who were dead for centuries. He thought that the way to solve archaeological puzzles was to weigh the opposing authorities. And Pirenne listened and made no objections. Don't you see that there's something wrong with that?"

Again the note of near-pleading in his voice. Again no answer.

He went on: "And you men and half of Terminus as well are just as bad. We sit here, considering the Encyclopedia the all-in-all. We consider the greatest end of science is the classification of past data. It is important, but is there no further work to be done? We're receding and forgetting, don't you see? Here in the Periphery they've lost nuclear power. In Gamma Andromeda, a power plant has undergone meltdown because of poor repairs, and the Chancellor of the Empire complains that nuclear technicians are scarce. And the solution? To train new ones? Never! Instead they're to restrict nuclear power."

And for the third time: "Don't you see? It's Galaxywide. It's a worship of the past. It's a deterioration – a *stagnation!*"

He stared from one to the other and they gazed fixedly at him.

Fara was the first to recover. "Well, mystical philosophy isn't going to help us here. Let us be concrete. Do you deny that Hari Seldon could easily have worked out historical trends of the future by simple psychological technique?"

"No, of course not," cried Hardin. "But we can't rely on him for a solution. At best, he might indicate the problem, but if ever there is to be a solution, we must work it out ourselves. He can't do it for us."

Fulham spoke suddenly. "What do you mean – 'indicate the problem'? We know the problem."

Hardin whirled on him. "You think you do? You think Anacreon is all Hari Seldon is likely to be worried about. I disagree! I tell you, gentlemen, that as yet none of you has the faintest conception of what is really going on."

"And you do?" questioned Pirenne, hostilely.

"I think so!" Hardin jumped up and pushed his chair away. His eyes were cold and hard. "If there's one thing that's definite, it is that there's something smelly about the whole situation; something that is bigger than anything we've talked about yet. Just ask yourself this question: Why was it that among the original population of the Foundation not one first-class psychologist was included, except Bor Alurin? And he carefully refrained from training his pupils in more than the fundamentals."

A short silence and Fara said: "All right. Why?"

"Perhaps because a psychologist might have caught on to what this was all about – and too soon to suit Hari Seldon. As it is, we've been stumbling about, getting misty glimpses of the truth and no more. And that is what Hari Seldon wanted."

He laughed harshly. "Good day, gentlemen!"

He stalked out of the room.

6.

Mayor Hardin chewed at the end of his cigar. It had gone out but he was past noticing that. He hadn't slept the night before and he had a good idea that he wouldn't sleep this coming night. His eyes showed it.

He said wearily, "And that covers it?"

"I think so." Yohan Lee put a hand to his chin. "How does it sound?"

"Not too bad. It's got to be done, you understand, with impudence. That is, there is to be no hesitation; no time to allow them to grasp the situation. Once we are in a position to give orders, why, give them as though you were born to do so, and they'll obey out of habit. That's the essence of a coup."

"If the Board remains irresolute for even –"

"The Board? Count them out. After tomorrow, their importance as a factor in Terminus affairs won't matter a rusty half-credit."

Lee nodded slowly. "Yet it is strange that they've done nothing to stop us so far. You say they weren't entirely in the dark."

"Fara stumbles at the edges of the problem. Sometimes he makes me nervous. And Pirenne's been suspicious of me since I was elected. But, you see, they never had the capacity of really understanding what was up. Their whole training has been authoritarian. They are sure that the Emperor, just because he is the Emperor, is all-powerful. And they are sure that the Board of Trustees, simply because it is the Board of Trustees acting in

the name of the Emperor, cannot be in a position where it does not give the orders. That incapacity to recognize the possibility of revolt is our best ally."

He heaved out of his chair and went to the water cooler. "They're not bad fellows, Lee, when they stick to their Encyclopedia – and we'll see that that's where they stick in the future. They're hopelessly incompetent when it comes to ruling Terminus. Go away now and start things rolling. I want to be alone."

He sat down on the corner of his desk and stared at the cup of water.

Space! If only he were as confident as he pretended! The Anacreonians were landing in two days and what had he to go on but a set of notions and half-guesses as to what Hari Seldon had been driving at these past fifty years? He wasn't even a real, honest-to-goodness psychologist – just a fumbler with a little training trying to outguess the greatest mind of the age.

If Fara were fight; if Anacreon were all the problem Hari Seldon had foreseen; if the Encyclopedia were all he was interested in preserving – then what price *coup d'état*?

He shrugged and drank his water.

7.

The Vault was furnished with considerably more than six chairs, as though a larger company had been expected. Hardin noted that thoughtfully and seated himself wearily in a corner just as far from the other five as possible.

The Board members did not seem to object to that arrangement. They spoke among themselves in whispers, which fell off into sibilant monosyllables, and then into nothing at all. Of them all, only Jord Fara seemed even reasonably calm. He had produced a watch and was staring at it somberly.

Hardin glanced at his own watch and then at the glass cubicle – absolutely empty – that dominated half the room. It was the only unusual feature of the room, for aside from that there was no indication that somewhere a computer was splitting off instants of time toward that precise moment when a muon stream would flow, a connection be made and–

The lights went dim!

They didn't go out, but merely yellowed and sank with a suddenness that made Hardin jump. He had lifted his eyes to the ceiling lights in startled fashion, and when he brought them down the glass cubicle was no longer empty.

A figure occupied it, a figure in a wheel chair!

It said nothing for a few moments, but it closed the book upon its lap and fingered it idly. And then it smiled, and the face seemed all alive.

It said, "I am Hari Seldon." The voice was old and soft.

Hardin almost rose to acknowledge the introduction and stopped himself in the act.

The voice continued conversationally: "As you see, I am confined to this chair and cannot rise to greet you. Your grandparents left for Terminus a few months back in my time and since then I have suffered a rather inconvenient paralysis. I can't see you, you know, so I can't greet you properly. I don't even know how many of you there are, so all this must be conducted informally. If any of you are standing, please sit down; and if you care to smoke, I wouldn't mind." There was a light chuckle. "Why should I? I'm not really here."

Hardin fumbled for a cigar almost automatically, but thought better of it.

Hari Seldon put away his book – as if laying it upon a desk at his side – and when his fingers let go, it disappeared.

He said: "It is fifty years now since this Foundation was established – fifty years in which the members of the Foundation have been ignorant of what it was they were working toward. It was necessary that they be ignorant, but now the necessity is gone.

"The Encyclopedia Foundation, to begin with, is a fraud, and always has been!"

There was a sound of a scramble behind Hardin and one or two muffled exclamations, but he did not turn around.

Hari Seldon was, of course, undisturbed. He went on: "It is a fraud in the sense that neither I nor my colleagues care at all whether a single volume of the Encyclopedia is ever published. It has served its purpose, since by it we extracted an imperial charter from the Emperor, by it we attracted the hundred thousand humans necessary for our scheme, and by it we managed to keep them preoccupied while events shaped themselves, until it was too late for any of them to draw back.

"In the fifty years that you have worked on this fraudulent project – there is no use in softening phrases – your retreat has been cut off, and you have now no choice but to proceed on the infinitely more important project that was, and is, our real plan.

"To that end we have placed you on such a planet and at such a time that in fifty years you were maneuvered to the point where you no longer have freedom of action. From now on, and into the centuries, the path you must take is inevitable. You will be faced with a series of crises, as you are now faced with the first, and in each case your freedom of action will become similarly circumscribed so that you will be forced along one, and only one, path.

"It is that path which our psychology has worked out – and for a reason.

"For centuries Galactic civilization has stagnated and declined, though only a few ever realized that. But now, at last, the Periphery is breaking away and the political unity of the Empire is shattered. Somewhere in the fifty years just past is where the historians of the future will place an arbitrary line and say: 'This marks the Fall of the Galactic Empire.'

"And they will be right, though scarcely any will recognize that Fall for additional centuries.

"And after the Fall will come inevitable barbarism, a period which, our psychohistory tells us, should, under ordinary circumstances, last for thirty thousand years. We cannot stop the Fall. We do not wish to; for Imperial culture has lost whatever virility

and worth it once had. But we can shorten the period of Barbarism that must follow – down to a single thousand of years.

"The ins and outs of that shortening, we cannot tell you; just as we could not tell you the truth about the Foundation fifty years ago. Were you to discover those ins and outs, our plan might fail; as it would have, had you penetrated the fraud of the Encyclopedia earlier; for then, by knowledge, your freedom of action would be expanded and the number of additional variables introduced would become greater than our psychology could handle.

"But you won't, for there are no psychologists on Terminus, and never were, but for Alurin – and he was one of us.

"But this I can tell you: Terminus and its companion Foundation at the other end of the Galaxy are the seeds of the Renaissance and the future founders of the Second Galactic Empire. And it is the present crisis that is starting Terminus off to that climax.

"This, by the way, is a rather straightforward crisis, much simpler than many of those that are ahead. To reduce it to its fundamentals, it is this: You are a planet suddenly cut off from the still-civilized centers of the Galaxy, and threatened by your stronger neighbors. You are a small world of scientists surrounded by vast and rapidly expanding reaches of barbarism. You are an island of nuclear power in a growing ocean of more primitive energy; but are helpless despite that, because of your lack of metals.

"You see, then, that you are faced by hard necessity, and that action is forced on you. The nature of that action – that is, the solution to your dilemma – is, of course, obvious!"

The image of Hari Seldon reached into open air and the book once more appeared in his hand. He opened it and said:

"But whatever devious course your future history may take, impress it always upon your descendants that the path has been marked out, and that at its end is new and greater Empire!"

And as his eyes bent to his book, he flicked into nothingness, and the lights brightened once more.

Hardin looked up to see Pirenne facing him, eyes tragic and lips trembling.

The chairman's voice was firm but toneless. "You were right, it seems. If you will see us tonight at six, the Board will consult with you as to the next move."

They shook his hand, each one, and left, and Hardin smiled to himself. They were fundamentally sound at that; for they were scientists enough to admit that they were wrong – but for them, it was too late.

He looked at his watch. By this time, it was all over. Lee's men were in control and the Board was giving orders no longer.

The Anacreonians were landing their first spaceships tomorrow, but that was all right, too. In six months, *they* would be giving orders no longer.

In fact, as Hari Seldon had said, and as Salvor Hardin had guessed since the day that Anselm haut Rodric had first revealed to him Anacreon's lack of nuclear power – the solution to this first crisis was obvious.

Obvious as all hell!

PART III THE MAYORS

1.

THE FOUR KINGDOMS – The name given to those portions of the Province of Anacreon which broke away from the First Empire in the early years of the Foundational Era to form independent and short-lived kingdoms. The largest and most powerful of these was Anacreon itself which in area. . .

. . . Undoubtedly the most interesting aspect of the history of the Four Kingdoms involves the strange society forced temporarily upon it during the administration of Salvor Hardin. . . .

ENCYCLOPEDIA GALACTICA

A deputation!

That Salvor Hardin had seen it coming made it none the more pleasant. On the contrary, he found anticipation distinctly annoying.

Yohan Lee advocated extreme measures. "I don't see, Hardin," he said, "that we need waste any time. They can't do anything till next election – legally, anyway – and that gives us a year. Give them the brush-off."

Hardin pursed his lips. "Lee, you'll never learn. In the forty years I've known you, you've never once learned the gentle art of sneaking up from behind."

"It's not my way of fighting," grumbled Lee.

"Yes, I know that. I suppose that's why you're the one man I trust." He paused and reached for a cigar. "We've come a long way, Lee, since we engineered our coup against the Encyclopedists way back. I'm getting old. Sixty-two. Do you ever think how fast those thirty years went?"

Lee snorted. "I don't feel old, and I'm sixty-six."

"Yes, but I haven't your digestion." Hardin sucked lazily at his cigar. He had long since stopped wishing for the mild Vegan tobacco of his youth. Those days when the planet, Terminus, had trafficked with every part of the Galactic Empire belonged in the limbo to which all Good Old Days go. Toward the same limbo where the Galactic Empire was heading. He wondered who the new emperor was – or if there was a new emperor at all – or any Empire. Space! For thirty years now, since the breakup of communications here at the edge of the Galaxy, the whole universe of Terminus had consisted of itself and the four surrounding kingdoms.

How the mighty had fallen! *Kingdoms!* They were prefects in the old days, all part of the same province, which in turn had been part of a sector, which in turn had been part of a quadrant, which in turn had been part of the all-embracing Galactic Empire. And now

that the Empire had lost control over the farther reaches of the Galaxy, these little splinter groups of planets became kingdoms – with comic-opera kings and nobles, and petty, meaningless wars, and a life that went on pathetically among the ruins.

A civilization falling. Nuclear power forgotten. Science fading to mythology – until the Foundation had stepped in. The Foundation that Hari Seldon had established for just that purpose here on Terminus.

Lee was at the window and his voice broke in on Hardin's reverie. "They've come," he said, "in a late-model ground car, the young pups." He took a few uncertain steps toward the door and then looked at Hardin.

Hardin smiled, and waved him back. "I've given orders to have them brought up here."

"Here! What for? You're making them too important."

"Why go through all the ceremonies of an official mayor's audience? I'm getting too old for red tape. Besides which, flattery is useful when dealing with youngsters – particularly when it doesn't commit you to anything." He winked. "Sit down, Lee, and give me your moral backing. I'll need it with this young Sermak."

"That fellow, Sermak," said Lee, heavily, "is dangerous. He's got a following, Hardin, so don't underestimate him."

"Have I ever underestimated anybody?"

"Well, then, arrest him. You can accuse him of something or other afterward."

Hardin ignored that last bit of advice. "There they are, Lee." In response to the signal, he stepped on the pedal beneath his desk, and the door slid aside.

They filed in, the four that composed the deputation, and Hardin waved them gently to the armchairs that faced his desk in a semicircle. They bowed and waited for the mayor to speak first.

Hardin flicked open the curiously carved silver lid of the cigar box that had once belonged to Jord Fara of the old Board of Trustees in the long-dead days of the Encyclopedists. It was a genuine Empire product from Santanni, though the cigars it now contained were home-grown. One by one, with grave solemnity, the four of the deputation accepted cigars and lit up in ritualistic fashion.

Sef Sermak was second from the right, the youngest of the young group – and the most interesting with his bristly yellow mustache trimmed precisely, and his sunken eyes of uncertain color. The other three Hardin dismissed almost immediately; they were rank and file on the face of them. It was on Sermak that he concentrated, the Sermak who had already, in his first term in the City Council, turned that sedate body topsy-turvy more than once, and it was to Sermak that he said:

"I've been particularly anxious to see you, Councilman, ever since your very excellent speech last month. Your attack on the foreign policy of this government was a most capable one."

Sermak's eyes smoldered. "Your interest honors me. The attack may or may not have been capable, but it was certainly justified."

"Perhaps! Your opinions are yours, of course. Still you are rather young."

Dryly. "It is a fault that most people are guilty of at some period of their life. You became mayor of the city when you were two years younger than I am now."

Hardin smiled to himself. The yearling was a cool customer. He said, "I take it now that you have come to see me concerning this same foreign policy that annoys you so greatly in the Council Chamber. Are you speaking for your three colleagues, or must I listen to each of you separately?" There were quick mutual glances among the four young men, a slight flickering of eyelids.

Sermak said grimly, "I speak for the people of Terminus – a people who are not now truly represented in the rubberstamp body they call the Council."

"I see. Go ahead, then!"

"It comes to this, Mr. Mayor. We are dissatisfied–"

"By 'we' you mean 'the people,' don't you?"

Sermak stared hostilely, sensing a trap, and replied coldly, "I believe that my views reflect those of the majority of the voters of Terminus. Does that suit you?"

"Well, a statement like that is all the better for proof, but go on, anyway. You are dissatisfied."

"Yes, dissatisfied with the policy which for thirty years had been stripping Terminus defenseless against the inevitable attack from outside."

"I see. And therefore? Go on, go on."

"It's nice of you to anticipate. And therefore we are forming a new political party; one that will stand for the immediate needs of Terminus and not for a mystic 'manifest destiny' of future Empire. We are going to throw you and your lick-spittle clique of appeasers out of City Hall-and that soon."

"Unless? There's always an 'unless,' you know."

"Not much of one in this case: Unless you resign now. I'm not asking you to change your policies – I wouldn't trust you that far. Your promises are worth nothing. An outright resignation is all we'll take."

"I see." Hardin crossed his legs and teetered his chair back on two legs. "That's your ultimatum. Nice of you to give me warning. But, you see, I rather think I'll ignore it."

"Don't think it was a warning, Mr. Mayor. It was an announcement of principles and of action. The new party has already been formed, and it will begin its official activities tomorrow. There is neither room nor desire for compromise, and, frankly, it was only our recognition of your services to the City that induced us to offer the easy way out. I didn't think you'd take it, but my conscience is clear.

The next election will be a more forcible and quite irresistible reminder that resignation is necessary."

He rose and motioned the rest up.

Hardin lifted his arm. "Hold on! Sit down!"

Sef Sermak seated himself once more with just a shade too much alacrity and Hardin smiled behind a straight face. In spite of his words, he was waiting for an offer.

Hardin said, "In exactly what way do you want our foreign policy changed? Do you want us to attack the Four Kingdoms, now, at once, and all four simultaneously?"

"I make no such suggestion, Mr. Mayor. It is our simple proposition that all appeasement cease immediately. Throughout your administration, you have carried out a policy of scientific aid to the Kingdoms. You have given them nuclear power. You have helped rebuild power plants on their territories. You have established medical clinics, chemical laboratories and factories."

"Well? And your objection?"

"You have done this in order to keep them from attacking us. With these as bribes, you have been playing the fool in a colossal game of blackmail, in which you have allowed Terminus to be sucked dry – with the result that now we are at the mercy of these barbarians."

"In what way?"

"Because you have given them power, given them weapons, actually serviced the ships of their navies, they are infinitely stronger than they were three decades ago. Their demands are increasing, and with their new weapons, they will eventually satisfy all their demands at once by violent annexation of Terminus. Isn't that the way blackmail usually ends?"

"And your remedy?"

"Stop the bribes immediately and while you can. Spend your effort in strengthening Terminus itself – and attack first!"

Hardin watched the young fellow's little blond mustache with an almost morbid interest. Sermak felt sure of himself or he wouldn't talk so much. There was no doubt that his remarks were the reflection of a pretty huge segment of the population, pretty huge.

His voice did not betray the slightly perturbed current of his thoughts. It was almost negligent. "Are you finished?"

"For the moment."

"Well, then, do you notice the framed statement I have on the wall behind me? Read it, if you will!"

Sermak's lips twitched. "It says: 'Violence is the last refuge of the incompetent.' That's an old man's doctrine, Mr. Mayor."

"I applied it as a young man, Mr. Councilman – and successfully. You were busily being born when it happened, but perhaps you may have read something of it in school."

He eyed Sermak closely and continued in measured tones, "When Hari Seldon established the Foundation here, it was for the ostensible purpose of producing a great Encyclopedia, and for fifty years we followed that will-of-the-wisp, before discovering what he was really after. By that time, it was almost too late. When communications with the central regions of the old Empire broke down, we found ourselves a world of scientists concentrated in a single city, possessing no industries, and surrounded by newly created kingdoms, hostile and largely barbarous. We were a tiny island of nuclear power in this ocean of barbarism, and an infinitely valuable prize.

"Anacreon, then as now, the most powerful of the Four Kingdoms, demanded and later actually established a military base upon Terminus, and the then rulers of the City, the Encyclopedists, knew very well that this was only a preliminary to taking over the

entire planet. That is how matters stood when I . . . uh . . . assumed actual government. What would you have done?"

Sermak shrugged his shoulders. "That's an academic question. Of course, I know what you did."

"I'll repeat it, anyway. Perhaps you don't get the point. The temptation was great to muster what force we could and put up a fight. It's the easiest way out, and the most satisfactory to self-respect – but, nearly invariably, the stupidest. You would have done it; you and your talk of 'attack first.' What I did, instead, was to visit the three other kingdoms, one by one; point out to each that to allow the secret of nuclear power to fall into the hands of Anacreon was the quickest way of cutting their own throats; and suggest gently that they do the obvious thing. That was all. One month after the Anacreonian force had landed on Terminus, their king received a joint ultimatum from his three neighbors. In seven days, the last Anacreonian was off Terminus.

Now tell me, where was the need for violence?"

The young councilman regarded his cigar stub thoughtfully and tossed it into the incinerator chute. "I fail to see the analogy. Insulin will bring a diabetic to normal without the faintest need of a knife, but appendicitis needs an operation. You can't help that. When other courses have failed, what is left but, as you put it, the last refuge? It's your fault that we're driven to it."

"I? Oh, yes, again my policy of appeasement. You still seem to lack grasp of the fundamental necessities of our position. Our problem wasn't over with the departure of the Anacreonians. They had just begun. The Four Kingdoms were more our enemies than ever, for each wanted nuclear power-and each was kept off our throats only for fear of the other three. We are balanced on the point of a very sharp sword, and the slightest sway in any direction – If, for instance, one kingdom becomes too strong; or if two form a coalition – You understand?"

"Certainly. That was the time to begin all-out preparations for war."

"On the contrary. That was the time to begin all-out prevention of war. I played them one against the other. I helped each in turn. I offered them science, trade, education, scientific medicine. I made Terminus of more value to them as a flourishing world than as a military prize. It worked for thirty years."

"Yes, but you were forced to surround these scientific gifts with the most outrageous mummery. You've made half religion, half balderdash out of it. You've erected a hierarchy of priests and complicated, meaningless ritual."

Hardin frowned. "What of that? I don't see that it has anything to do with the argument at all. I started that way at first because the barbarians looked upon our science as a sort of magical sorcery, and it was easiest to get them to accept it on that basis. The priesthood built itself and if we help it along we are only following the line of least resistance. It is a minor matter."

"But these priests are in charge of the power plants. That is not a minor matter."

"True, but we have trained them. Their knowledge of their tools is purely empirical; and they have a firm belief in the mummery that surrounds them."

"And if one pierces through the mummery, and has the genius to brush aside empiricism, what is to prevent him from learning actual techniques, and selling out to the most satisfactory bidder? What price our value to the kingdoms, then?"

"Little chance of that, Sermak. You are being superficial. The best men on the planets of the kingdoms are sent here to the Foundation each year and educated into the priesthood. And the best of these remain here as research students. If you think that those who are left, with practically no knowledge of the elements of science, or worse, still, with the distorted knowledge the priests receive, can penetrate at a bound to nuclear power, to electronics, to the theory of the hyperwarp – you have a very romantic and very foolish idea of science. It takes lifetimes of training and an excellent brain to get that far."

Yohan Lee had risen abruptly during the foregoing speech and left the room. He had returned now and when Hardin finished speaking, he bent to his superior's ear. A whisper was exchanged and then a leaden cylinder. Then, with one short hostile look at the deputation, Lee resumed his chair.

Hardin turned the cylinder end for end in his hands, watching the deputation through his lashes. And then he opened it with a hard, sudden twist and only Sermak had the sense not to throw a rapid look at the rolled paper that fell out.

"In short, gentlemen," he said, "the Government is of the opinion that it knows what it is doing."

He read as he spoke. There were the lines of intricate, meaningless code that covered the page and the three penciled words scrawled in one corner that carried the message. He took it in at a glance and tossed it casually into the incinerator shaft.

"That," Hardin then said, "ends the interview, I'm afraid. Glad to have met you all. Thank you for coming." He shook hands with each in perfunctory fashion, and they filed out.

Hardin had almost gotten out of the habit of laughing, but after Sermak and his three silent partners were well out of earshot, he indulged in a dry chuckle and bent an amused look on Lee.

"How did you like that battle of bluffs, Lee?"

Lee snorted grumpily. "I'm not sure that *he* was bluffing. Treat him with kid gloves and he's quite liable to win the next election, just as he says."

"Oh, quite likely, quite likely – if nothing happens first."

"Make sure they don't happen in the wrong direction this time, Hardin. I tell you this Sermak has a following. What if he doesn't wait till the next election? There was a time when you and I put things through violently, in spite of your slogan about what violence is."

Hardin cocked an eyebrow. "You are pessimistic today, Lee. And singularly contrary, too, or you wouldn't speak of violence. Our own little putsch was carried through without loss of life, you remember. It was a necessary measure put through at the proper moment, and went over smoothly, painlessly, and all but effortlessly. As for Sermak, he's up against a different proposition. You and I, Lee, aren't the Encyclopedists."

We stand prepared. Order your men onto these youngsters in a nice way, old fellow. Don't let them know they're being watched – but eyes open, you understand."

Lee laughed in sour amusement. "I'd be a fine one to wait for your orders, wouldn't I, Hardin? Sermak and his men have been under surveillance for a month now."

The mayor chuckled. "Got in first, did you? All right. By the way," he observed, and added softly, "Ambassador Verisof is returning to Terminus. Temporarily, I hope."

There was a short silence, faintly horrified, and then Lee said, "Was that the message? Are things breaking already?"

"Don't know. I can't tell till I hear what Verisof has to say. They may be, though. After all, they *have* to before election. But what are you looking so dead about?"

"Because I don't know how it's going to turn out. You're too deep, Hardin, and you're playing the game too close to your chest."

"Even you?" murmured Hardin. And aloud, "Does that mean you're going to join Sermak's new party?"

Lee smiled against his will. "All right. You win. How about lunch now?"

2.

There are many epigrams attributed to Hardin – a confirmed epigrammatist – a good many of which are probably apocryphal. Nevertheless, it is reported that on a certain occasion, he said:

"It pays to be obvious, especially if you have a reputation for subtlety."

Poly Verisof had had occasion to act on that advice more than once for he was now in the fourteenth year of his double status on Anacreon – a double status the upkeep of which reminded him often and unpleasantly of a dance performed barefoot on hot metal.

To the people of Anacreon he was high priest, representative of that Foundation which, to those "barbarians," was the acme of mystery and the physical center of this religion they had created – with Hardin's help – in the last three decades. As such, he received a homage that had become horribly wearying, for from his soul he despised the ritual of which he was the center.

But to the King of Anacreon – the old one that had been, and the young grandson that was now on the throne – he was simply the ambassador of a power at once feared and coveted.

On the whole, it was an uncomfortable job, and his first trip to the Foundation in three years, despite the disturbing incident that had made it necessary, was something in the nature of a holiday.

And since it was not the first time he had had to travel in absolute secrecy, he again made use of Hardin's epigram on the uses of the obvious.

He changed into his civilian clothes – a holiday in itself – and boarded a passenger liner to the Foundation, second class. Once at Terminus, he threaded his way through the crowd at the spaceport and called up City Hall at a public visiphone.

He said, "My name is Jan Smite. I have an appointment with the mayor this afternoon."

The dead-voiced but efficient young lady at the other end made a second connection and exchanged a few rapid words, then said to Verisof in dry, mechanical tone, "Mayor Hardin will see you in half an hour, sir," and the screen went blank.

Whereupon the ambassador to Anacreon bought the latest edition of the *Terminus City Journal*, sauntered casually to City Hall Park and, sitting down on the first empty bench he came to, read the editorial page, sport section and comic sheet while waiting. At the end of half an hour, he tucked the paper under his arm, entered City Hall and presented himself in the anteroom.

In doing all this he remained safely and thoroughly unrecognized, for since he was so entirely obvious, no one gave him a second look.

Hardin looked up at him and grinned. "Have a cigar! How was the trip?"

Verisof helped himself. "Interesting. There was a priest in the next cabin on his way here to take a special course in the preparation of radioactive synthetics – for the treatment of cancer, you know –"

"Surely, he didn't call it radioactive synthetics, now?"

"I guess *not!* It was the Holy Food to him."

The mayor smiled. "Go on."

"He inveigled me into a theological discussion and did his level best to elevate me out of sordid materialism."

"And never recognized his own high priest?"

"Without my crimson robe? Besides, he was a Smyrnian. It was an interesting experience, though. It is remarkable, Hardin, how the religion of science has grabbed hold. I've written an essay on the subject – entirely for my own amusement; it wouldn't do to have it published. Treating the problem sociologically, it would seem that when the old Empire began to rot at the fringes, it could be considered that science, as science, had failed the outer worlds. To be reaccepted it would have to present itself in another guise and it has done just that. It works out beautifully."

"Interesting!" The mayor placed his arms around his neck and said suddenly, "Start talking about the situation at Anacreon!"

The ambassador frowned and withdrew the cigar from his mouth. He looked at it distastefully and put it down. "Well, it's pretty bad."

"You wouldn't be here, otherwise."

"Scarcely. Here's the position. The key man at Anacreon is the Prince Regent, Wienis. He's King Lepold's uncle."

"I know. But Lepold is coming of age next year, isn't he? I believe he'll be sixteen in February."

"Yes." Pause, and then a wry addition. "If he lives. The king's father died under suspicious circumstances. A needle bullet through the chest during a hunt. It was called an accident."

"Hmph. I seem to remember Wienis the time I was on Anacreon, when we kicked them off Terminus. It was before your time. Let's see now. If I remember, he was a dark young fellow, black hair and a squint in his right eye. He had a funny hook in his nose."

"Same fellow. The hook and the squint are still there, but his hair's gray now. He plays the game dirty. Luckily, he's the most egregious fool on the planet. Fancies himself as a shrewd devil, too, which makes his folly the more transparent."

"That's usually the way."

"His notion of cracking an egg is to shoot a nuclear blast at it. Witness the tax on Temple property he tried to impose just after the old king died two years ago. Remember?"

Hardin nodded thoughtfully, then smiled. "The priests raised a howl."

"They raised one you could hear way out to Lucreza. He's shown more caution in dealing with the priesthood since, but he still manages to do things the hard way. In a way, it's unfortunate for us; he has unlimited self-confidence."

"Probably an over-compensated inferiority complex. Younger sons of royalty get that way, you know."

"But it amounts to the same thing. He's foaming at the mouth with eagerness to attack the Foundation. He scarcely troubles to conceal it. And he's in a position to do it, too, from the standpoint of armament. The old king built up a magnificent navy, and Wienis hasn't been sleeping the last two years. In fact, the tax on Temple property was originally intended for further armament, and when that fell through he increased the income tax twice."

"Any grumbling at that?"

"None of serious importance. Obedience to appointed authority was the text of every sermon in the kingdom for weeks. Not that Wienis showed any gratitude."

"All right. I've got the background. Now what's happened?"

"Two weeks ago an Anacreonian merchant ship came across a derelict battle cruiser of the old Imperial Navy. It must have been drifting in space for at least three centuries."

Interest flickered in Hardin's eyes. He sat up. "Yes, I've heard of that. The Board of Navigation has sent me a petition asking me to obtain the ship for purposes of study. It is in good condition, I understand."

"In entirely too good condition," responded Verisof, dryly. "When Wienis received your suggestion last week that he turn the ship over to the Foundation, he almost had convulsions."

"He hasn't answered yet."

"He won't – except with guns, or so he thinks. You see, he came to me on the day I left Anacreon and requested that the Foundation put this battle cruiser into fighting order and turn it over to the Anacreonian navy. He had the infernal gall to say that your note of last week indicated a plan of the Foundation's to attack Anacreon. He said that refusal to repair the battle cruiser would confirm his suspicions; and indicated that measures for the

self-defense of Anacreon would be forced upon him. Those are his words. Forced upon him! And that's why I'm here."

Hardin laughed gently.

Verisof smiled and continued, "Of course, he expects a refusal, and it would be a perfect excuse – in his eyes – for immediate attack."

"I see that, Verisof. Well, we have at least six months to spare, so have the ship fixed up and present it with my compliments. Have it renamed the Wienis as a mark of our esteem and affection."

He laughed again.

And again Verisof responded with the faintest trace of a smile, "I suppose it's the logical step, Hardin – but I'm worried."

"What about?"

"It's a ship! They could *build* in those days. Its cubic capacity is half again that of the entire Anacreonian navy. It's got nuclear blasts capable of blowing up a planet, and a shield that could take a Q-beam without working up radiation. Too much of a good thing, Hardin –"

"Superficial, Verisof, superficial. You and I both know that the armament he now has could defeat Terminus handily, long before we could repair the cruiser for our own use. What does it matter, then, if we give him the cruiser as well? You know it won't ever come to actual war."

"I suppose so. Yes." The ambassador looked up. "But Hardin –"

"Well? Why do you stop? Go ahead."

"Look. This isn't my province. But I've been reading the paper." He placed the Journal on the desk and indicated the front page. "What's this all about?"

Hardin dropped a casual glance. "'A group of Councilmen are forming a new political party.'"

"That's what it says." Verisof fidgeted. "I know you're in better touch with internal matters than I am, but they're attacking you with everything short of physical violence. How strong are they?"

"Damned strong. They'll probably control the Council after next election."

"Not before?" Verisof looked at the mayor obliquely. "There are ways of gaining control besides elections."

"Do you take me for Wienis?"

"No. But repairing the ship will take months and an attack after that is certain. Our yielding will be taken as a sign of appalling weakness and the addition of the Imperial Cruiser will just about double the strength of Wienis' navy. He'll attack as sure as I'm a high priest. Why take chances? Do one of two things. Either reveal the plan of campaign to the Council, or force the issue with Anacreon now!"

Hardin frowned. "Force the issue now? Before the crisis comes? It's the one thing I mustn't do. There's Hari Seldon and the Plan, you know."

Verisof hesitated, then muttered, "You're absolutely sure, then, that there is a Plan?"

"There can scarcely be any doubt," came the stiff reply. "I was present at the opening of the Time Vault and Seldon's recording revealed it then."

"I didn't mean that, Hardin. I just don't see how it could be possible to chart history for a thousand years ahead. Maybe Seldon overestimated himself." He shriveled a bit at Hardin's ironical smile, and added, "Well, I'm no psychologist,"

"Exactly. None of us are. But I did receive some elementary training in my youth – enough to know what psychology is capable of, even if I can't exploit its capabilities myself. There's no doubt but that Seldon did exactly what he claims to have done. The Foundation, as he says, was established as a scientific refuge – the means by which the science and culture of the dying Empire was to be preserved through the centuries of barbarism that have begun, to be rekindled in the end into a second Empire."

Verisof nodded, a trifle doubtfully. "Everyone knows that's the way things are *supposed* to go. But can we afford to take chances? Can we risk the present for the sake of a nebulous future?"

"We must – because the future isn't nebulous. It's been calculated out by Seldon and charted. Each successive crisis in our history is mapped and each depends in a measure on the successful conclusion of the ones previous. This is only the second crisis and Space knows what effect even a trifling deviation would have in the end."

"That's rather empty speculation."

"No! Hari Seldon said in the Time Vault, that at each crisis our freedom of action would become circumscribed to the point where only one course of action was possible."

"So as to keep us on the straight and narrow?"

"So as to keep us from deviating, yes. But, conversely, as long as *more* than one course of action is possible, the crisis has not been reached. We *must* let things drift so long as we possibly can, and by space, that's what I intend doing."

Verisof didn't answer. He chewed his lower lip in a grudging silence. It had only been the year before that Hardin had first discussed the problem with him – the real problem; the problem of countering Anacreon's hostile preparations. And then only because he, Verisof, had balked at further appeasement.

Hardin seemed to follow his ambassador's thoughts. "I would much rather never to have told you anything about this."

"What makes you say that?" cried Verisof, in surprise.

"Because there are six people now – you and I, the other three ambassadors and Yohan Lee – who have a fair notion of what's ahead; and I'm damned afraid that it was Seldon's idea to have no one know."

"Why so?"

"Because even Seldon's advanced psychology was limited. It could not handle too many independent variables. He couldn't work with individuals over any length of time; any more than you could apply kinetic theory of gases to single molecules. He worked with mobs, populations of whole planets, and only *blind* mobs who do not possess foreknowledge of the results of their own actions."

"That's not plain."

"I can't help it. I'm not psychologist enough to explain it scientifically. But this you know. There are no trained psychologists on Terminus and no mathematical texts on the science. It is plain that he wanted no one on Terminus capable of working out the future in advance. Seldon wanted us to proceed blindly – and therefore correctly – according to the law of mob psychology. As I once told you, I never knew where we were heading when I first drove out the Anacreonians. My idea had been to maintain balance of power, no more than that. It was only afterward that I thought I saw a pattern in events; but I've done my level best not to act on that knowledge. Interference due to foresight would have knocked the Plan out of kilter."

Verisof nodded thoughtfully. "I've heard arguments almost as complicated in the Temples back on Anacreon. How do you expect to spot the right moment of action?"

"It's spotted already. You admit that once we repair the battle cruiser nothing will stop Wienis from attacking us. There will no longer be any alternative in that respect."

"Yes"

"All right. That accounts for the external aspect. Meanwhile, you'll further admit that the next election will see a new and hostile Council that will force action against Anacreon. There is no alternative there."

"Yes."

"And as soon as all the alternatives disappear, the crisis has come. Just the same – I get worried."

He paused, and Verisof waited. Slowly, almost reluctantly, Hardin continued, "I've got the idea – just a notion – that the external and internal pressures were planned to come to a head simultaneously. As it is, there's a few months difference. Wienis will probably attack before spring, and elections are still a year off."

"That doesn't sound important."

"I don't know. It may be due merely to unavoidable errors of calculation, or it might be due to the fact that I knew too much. I tried never to let my foresight influence my action, but how can I tell? And what effect will the discrepancy have? Anyway," he looked up, "there's one thing I've decided."

"And what's that?"

"When the crisis does begin to break, I'm going to Anacreon. I want to be on the spot . . . Oh, that's enough, Verisof. It's getting late. Let's go out and make a night of it. I want some relaxation."

"Then get it right here," said Verisof. "I don't want to be recognized, or you know what this new party your precious Councilmen are forming would say. Call for the brandy."

And Hardin did – but not for too much.

3.

In the ancient days when the Galactic Empire had embraced the Galaxy, and Anacreon had been the richest of the prefects of the Periphery, more than one emperor had visited the Viceregal Palace in state. And not one had left without at least one effort to pit his skill with air speedster and needle gun against the feathered flying fortress they call the Nyakbird.

The fame of Anacreon had withered to nothing with the decay of the times. The Viceregal Palace was a drafty mass of ruins except for the wing that Foundation workmen had restored. And no Emperor had been seen in Anacreon for two hundred years.

But Nyak hunting was still the royal sport and a good eye with the needle gun still the first requirement of Anacreon's kings.

Lepold I, King of Anacreon and – as was invariably, but untruthfully added – Lord of the Outer Dominions, though not yet sixteen had already proved his skill many times over. He had brought down his first Nyak when scarcely thirteen; had brought down his tenth the week after his accession to the throne; and was returning now from his forty-sixth.

"Fifty before I come of age," he had exulted. "Who'll take the wager?"

But Courtiers don't take wagers against the king's skill. There is the deadly danger of winning. So no one did, and the king left to change his clothes in high spirits.

"Lepold!"

The king stopped mid-step at the one voice that could cause him to do so. He turned sulkily.

Wienis stood upon the threshold of his chambers and beetled at his young nephew.

"Send them away," he motioned impatiently. "Get rid of them."

The king nodded curtly and the two chamberlains bowed and backed down the stairs. Lepold entered his uncle's room.

Wienis stared at the king's hunting suit morosely. "You'll have more important things to tend to than Nyak hunting soon enough."

He turned his back and stumped to his desk. Since he had grown too old for the rush of air, the perilous dive within wing-beat of the Nyak, the roll and climb of the speedster at the motion of a foot, he had soured upon the whole sport.

Lepold appreciated his uncle's sour-grapes attitude and it was not without malice that he began enthusiastically, "But you should have been with us today, uncle. We flushed one in the wilds of Sarnia that was a monster. And game as they come. We had it out for two hours over at least seventy square miles of ground. And then I got to Sunwards – he was motioning graphically, as though he were once more in his speedster –"and dived torque-wise. Caught him on the rise just under the left wing at quarters. It maddened him and he canted athwart. I took his dare and veered a-left, waiting for the plummet. Sure enough, down he came. He was within wing-beat before I moved and then –"

"Lepold!"

"Well!— I got him."

"I'm sure you did. Now *will* you attend?"

The king shrugged and gravitated to the end table where he nibbled at a Lera nut in quite an unregal sulk. He did not dare to meet his uncle's eyes.

Wienis said, by way of preamble, "I've been to the ship today."

"What ship?"

"There is only one ship. *The* ship. The one the Foundation is repairing for the navy. The old Imperial cruiser. Do I make myself sufficiently plain?"

"That one? You see, I told you the Foundation would repair it if we asked them to. It's all poppycock, you know, that story of yours about their wanting to attack us. Because if they did, why would they fix the ship? It doesn't make sense, you know."

"Lepold, you're a fool!"

The king, who had just discarded the shell of the Lera nut and was lifting another to his lips, flushed.

"Well now, look here," he said, with anger that scarcely rose above peevishness, "I don't think you ought to call me that. You forget yourself. I'll be of age in two months, you know."

"Yes, and you're in a fine position to assume regal responsibilities. If you spent half the time on public affairs that you do on Nyak hunting, I'd resign the regency directly with a clear conscience."

"I don't care. That has nothing to do with the case, you know. The fact is that even if you are the regent and my uncle, I'm still king and you're still my subject. You oughtn't to call me a fool and you oughtn't to sit in my presence, anyway. You haven't asked my permission. I think you ought to be careful, or I might do something about it pretty soon."

Wienis' gaze was cold. "May I refer to you as 'your majesty'?"

"Yes."

"Very well! You are a fool, your majesty!"

His dark eyes blazed from beneath his grizzled brows and the young king sat down slowly. For a moment, there was sardonic satisfaction in the regent's face, but it faded quickly. His thick lips parted in a smile and one hand fell upon the king's shoulder.

"Never mind, Lepold. I should not have spoken harshly to you. It is difficult sometimes to behave with true propriety when the pressure of events is such as – You understand?" But if the words were conciliatory, there was something in his eyes that had not softened.

Lepold said uncertainly, "Yes. Affairs of State are deuced difficult, you know." He wondered, not without apprehension, whether he were not in for a dull siege of meaningless details on the year's trade with Smyrno and the long, wrangling dispute over the sparsely settled worlds on the Red Corridor.

Wienis was speaking again. "My boy, I had thought to speak of this to you earlier, and perhaps I should have, but I know that your youthful spirits are impatient of the dry detail of statecraft."

Lepold nodded. "Well, that's all right—"

His uncle broke in firmly and continued, "However, you will come of age in two months. Moreover, in the difficult times that are coming, you will have to take a full and active part. You will be *king* henceforward, Lepold."

Again Lepold nodded, but his expression was quite blank.

"There will be war, Lepold."

"War! But there's been truce with Smyrno—"

"Not Smyrno. The Foundation itself."

"But, uncle, they've agreed to repair the ship. You said—"

His voice choked off at the twist of his uncle's lip.

"Lepold" – some of the friendliness had gone – "we are to talk man to man. There is to be war with the Foundation, whether the ship is repaired or not; all the sooner, in fact, since it is being repaired. The Foundation is the source of power and might. All the greatness of Anacreon; all its ships and its cities and its people and its commerce depend on the dribbles and leavings of power that the Foundation have given us grudgingly. I remember the time – I, myself – when the cities of Anacreon were warmed by the burning of coal and oil. But never mind that; you would have no conception of it."

"It seems," suggested the king timidly, "that we ought to be grateful—"

"Grateful?" roared Wienis. "Grateful that they begrudge us the merest dregs, while keeping space knows what for themselves – and keeping it with what purpose in mind? Why, only that they may some day rule the Galaxy."

His hand came down on his nephew's knee, and his eyes narrowed. "Lepold, you are king of Anacreon. Your children and your children's children may be kings of the universe – if you have the power that the Foundation is keeping from us!"

"There's something in that." Lepold's eyes gained a sparkle and his back straightened. "After all, what right have they to keep it to themselves? Not fair, you know. Anacreon counts for something, too."

"You see, you're beginning to understand. And now, my boy, what if Smyrno decides to attack the Foundation for its own part and thus gains all that power? How long do you suppose we could escape becoming a vassal power? How long would you hold your throne?"

Lepold grew excited. "Space, yes. You're absolutely right, you know. We must strike first. It's simply self-defense."

Wienis' smile broadened slightly. "Furthermore, once, at the very beginning of the reign of your grandfather, Anacreon actually established a military base on the Foundation's planet, Terminus – a base vitally needed for national defense. We were forced to abandon that base as a result of the machinations of the leader of that Foundation, a sly cur, a scholar, with not a drop of noble blood in his veins. You understand, Lepold? Your grandfather was humiliated by this commoner. I remember him! He was scarcely older than myself when he came to Anacreon with his devil's smile and devil's brain – and the power of the other three kingdoms behind him, combined in cowardly union against the greatness of Anacreon."

Lepold flushed and the sparkle in his eyes blazed. "By Seldon, if I had been my grandfather, I would have fought even so."

"No, Lepold. We decided to wait – to wipe out the insult at a fitter time. It had been your father's hope, before his untimely death, that he might be the one to – Well, well!" Wienis turned away for a moment. Then, as if stifling emotion, "He was my brother. And yet, if his son were–"

"Yes, uncle, I'll not fail him. I have decided. It seems only proper that Anacreon wipe out this nest of troublemakers, and that immediately."

"No, not immediately. First, we must wait for the repairs of the battle cruiser to be completed. The mere fact that they are willing to undertake these repairs proves that they fear us. The fools attempt to placate us, but we are not to be turned from our path, are we?"

And Lepold's fist slammed against his cupped palm.

"Not while I am king in Anacreon."

Wienis' lip twitched sardonically. "Besides which we must wait for Salvor Hardin to arrive."

"Salvor Hardin!" The king grew suddenly round-eyed, and the youthful contour of his beardless face lost the almost hard lines into which they had been compressed.

"Yes, Lepold, the leader of the Foundation himself is coming to Anacreon on your birthday – probably to soothe us with buttered words. But it won't help him."

"Salvor Hardin!" It was the merest murmur.

Wienis frowned. "Are you afraid of the name? It is the same Salvor Hardin, who on his previous visit, ground our noses into the dust. You're not forgetting that deadly insult to the royal house? And from a commoner. The dregs of the gutter."

"No. I guess not. No, I won't. I won't! We'll pay him back – but. . . but – I'm afraid – a little."

The regent rose. "Afraid? Of what? Of what, you young–" He choked off.

"It would be. . . uh. . . sort of blasphemous, you know, to attack the Foundation. I mean–" He paused.

"Go on."

Lepold said confusedly, "I mean, if there were really a Galactic Spirit, he. . . uh. . . it mightn't like it. Don't you think?"

"No, I don't," was the hard answer. Wienis sat down again and his lips twisted in a queer smile. "And so you really bother your head a great deal over the Galactic Spirit, do you? That's what comes of letting you run wild. You've been listening to Verisof quite a bit, I take it."

"He's explained a great deal–"

"About the Galactic Spirit?"

"Yes."

"Why, you unweaned cub, he believes in that mummary a good deal less than I do, and I don't believe in it at all. How many times have you been told that all this talk is nonsense?"

"Well, I know that. But Verisof says—"

"Pay no heed to Verisof. It's nonsense."

There was a short, rebellious silence, and then Lepold said, "Everyone believes it just the same. I mean all this talk about the Prophet Hari Seldon and how he appointed the Foundation to carry on his commandments that there might some day be a return of the Galactic Paradise: and how anyone who disobeys his commandments will be destroyed for eternity. They believe it. I've presided at festivals, and I'm sure they do."

"Yes, they do; but we don't. And you may be thankful it's so, for according to this foolishness, you are king by divine right – and are semi-divine yourself. Very handy. It eliminates all possibilities of revolts and insures absolute obedience in everything. And that is why, Lepold, you must take an active part in ordering the war against the Foundation. I am only regent, and quite human. You are king, and more than half a god – to them."

"But I suppose I'm not really," said the king reflectively.

"No, not really," came the sardonic response, "but you are to everyone but the people of the Foundation. Get that? To everyone but those of the Foundation. Once they are removed there will be no one to deny you the godhead. Think of that!"

"And after that we will ourselves be able to operate the power boxes of the temples and the ships that fly without men and the holy food that cures cancer and all the rest? Verisof said only those blessed with the Galactic Spirit could—"

"Yes, Verisof said! Verisof, next to Salvor Hardin, is your greatest enemy. Stay with me, Lepold, and don't worry about them. Together we will recreate an empire—not just the kingdom of Anacreon—but one comprising every one of the billions of suns of the Empire. Is that better than a wordy 'Galactic Paradise'?"

"Ye-es."

"Can Verisof promise more?"

"No."

"Very well." His voice became peremptory. "I suppose we may consider the matter settled." He waited for no answer. "Get along. I'll be down later. And just one thing, Lepold."

The young king turned on the threshold.

Wienis was smiling with all but his eyes. "Be careful on these Nyak hunts, my boy. Since the unfortunate accident to your father, I have had the strangest presentiments concerning you, at times. In the confusion, with needle guns thickening the air with darts, one can never tell. You will be careful, I hope. And you'll do as I say about the Foundation, won't you?"

Lepold's eyes widened and dropped away from those of his uncle. "Yes – certainly."

"Good!" He stared after his departing nephew, expressionlessly, and returned to his desk.

And Lepold's thoughts as he left were somber and not unfearful. Perhaps it would be best to defeat the Foundation and gain the power Wienis spoke of. But afterward,

when the war was over and he was secure on his throne— He became acutely conscious of the fact that Wienis and his two arrogant sons were at present next in line to the throne.

But he was king. And kings could order people executed.

Even uncles and cousins.

4.

Next to Sermak himself, Lewis Bort was the most active in rallying those dissident elements which had fused into the now-vociferous Action Party. Yet he had not been one of the deputation that had called on Salvor Hardin almost half a year previously. That this was so was not due to any lack of recognition of his efforts; quite the contrary. He was absent for the very good reason that he was on Anacreon's capital world at the time.

He visited it as a private citizen. He saw no official and he did nothing of importance. He merely watched the obscure comers of the busy planet and poked his stubby nose into dusty crannies.

He arrived home toward the end of a short winter day that had started with clouds and was finishing with snow and within an hour was seated at the octagonal table in Sermak's home.

His first words were not calculated to improve the atmosphere of a gathering already considerably depressed by the deepening snow-filled twilight outside..

"I'm afraid," he said, "that our position is what is usually termed, in melodramatic phraseology, a 'Lost Cause.'"

"You think so?" said Sermak, gloomily.

"It's gone past thought, Sermak. There's no room for any other opinion."

"Armaments—" began Doktor Walto, somewhat officiously, but Bort broke in at once.

"Forget that. That's an old story." His eyes traveled round the circle. "I'm referring to the people. I admit that it was my idea originally that we attempt to foster a palace rebellion of some sort to install as king someone more favorable to the Foundation. It was a good idea. It still is. The only trifling flaw about it is that it is impossible. The great Salvor Hardin saw to that."

Sermak said sourly, "If you'd give us the details, Bort—"

"Details! There aren't any! It isn't as simple as that. It's the whole damned situation on Anacreon. It's this religion the Foundation has established. It works!"

"Well!"

"You've got to see it work to appreciate it. All you see here is that we have a large school devoted to the training of priests, and that occasionally a special show is put on in some obscure comer of the city for the benefit of pilgrims and that's all. The whole business hardly affects us as a general thing. But on Anacreon—"

Lem Tarki smoothed his prim little Vandyke with one finger, and cleared his throat. "What kind of religion is it? Hardin's always said that it was just a fluffy flummery to get

them to accept our science without question. You remember, Sermak, he told us that day—"

"Hardin's explanations," reminded Sermak, "don't often mean much at face value. But what kind of a religion is it, Bort?"

Bort considered. "Ethically, it's fine. It scarcely varies from the various philosophies of the old Empire. High moral standards and all that. There's nothing to complain about from that viewpoint. Religion is one of the great civilizing influences of history and in that respect, it's fulfilling—"

"We know that," interrupted Sermak, impatiently. "Get to the point."

"Here it is." Bort was a trifle disconcerted, but didn't show it. "The religion – which the Foundation has fostered and encouraged, mind you – is built on strictly authoritarian lines. The priesthood has sole control of the instruments of science we have given Anacreon, but they've learned to handle these tools only empirically. They believe in this religion entirely, and in the . . . uh . . . spiritual value of the power they handle. For instance, two months ago some fool tampered with the power plant in the Thessalekian Temple – one of the large ones. He contaminated the city, of course. It was considered divine vengeance by everyone, including the priests."

"I remember. The papers had some garbled version of the story at the time. I don't see what you're driving at."

"Then, listen," said Bort, stiffly. "The priesthood forms a hierarchy at the apex of which is the king, who is regarded as a sort of minor god. He's an absolute monarch by divine right, and the people believe it, thoroughly, and the priests, too. You can't overthrow a king like that. Now do you get the point?"

"Hold on," said Walto, at this point. "What did you mean when you said Hardin's done all this? How does he come in?"

Bort glanced at his questioner bitterly. "The Foundation has fostered this delusion assiduously. We've put all our scientific backing behind the hoax. There isn't a festival at which the king does not preside surrounded by a radioactive aura shining forth all over his body and raising itself like a coronet above his head. Anyone touching him is severely burned. He can move from place to place through the air at crucial moments, supposedly by inspiration of divine spirit. He fills the temple with a pearly, internal light at a gesture. There is no end to these quite simple tricks that we perform for his benefit; but even the priests believe them, while working them personally."

"Bad!" said Sermak, biting his lip.

"I could cry – like the fountain in City Hall Park," said Bort, earnestly, "when I think of the chance we muffed. Take the situation thirty years ago, when Hardin saved the Foundation from Anacreon – At that time, the Anacreonian people had no real conception of the fact that the Empire was running down. They had been more or less running their own affairs since the Zeonian revolt, but even after communications broke down and Lepold's pirate of a grandfather made himself king, they never quite realized the Empire had gone kaput."

"If the Emperor had had the nerve to try, he could have taken over again with two cruisers and with the help of the internal revolt that would have certainly sprung to life. And we we could have done the same; but no, Hardin established monarch worship. Personally, I don't understand it. Why? Why? Why?"

"What," demanded Jaim Orsy, suddenly, "does Verisof do? There was a day when he was an advanced Actionist. What's he doing there? Is he blind, too?"

"I don't know," said Bort, curtly. "He's high priest to them. As far as I know, he does nothing but act as adviser to the priesthood on technical details. Figurehead, blast him, figurehead!"

There was silence all round and all eyes turned to Sermak. The young party leader was biting a fingernail nervously, and then said loudly, "No good. It's fishy!"

He looked around him, and added more energetically, "Is Hardin then such a fool?"

"Seems to be," shrugged Bort.

"Never! There's something wrong. To cut our own throats so thoroughly and so hopelessly would require colossal stupidity. More than Hardin could possibly have even if he were a fool, which I deny. On the one hand, to establish a religion that would wipe out all chance of internal troubles. On the other hand, to arm Anacreon with all weapons of warfare. I don't see it."

"The matter *is* a little obscure, I admit," said Bort, "but the facts are there. What else can we think?"

Walto said, jerkily, "Outright treason. He's in their pay."

But Sermak shook his head impatiently. "I don't see that, either. The whole affair is as insane and meaningless – Tell me, Bort, have you heard anything about a battle cruiser that the Foundation is supposed to have put into shape for use in the Anacreon navy?"

"Battle cruiser?"

"An old Imperial cruiser–"

"No, I haven't. But that doesn't mean much. The navy yards are religious sanctuaries completely inviolate on the part of the lay public. No one ever hears anything about the fleet.

"Well, rumors have leaked out. Some of the Party have brought the matter up in Council. Hardin never denied it, you know. His spokesmen denounced rumor mongers and let it go at that. It might have significance."

"It's of a piece with the rest," said Bort. "if true, it's absolutely crazy. But it wouldn't be worse than the rest."

"I suppose," said Orsy, "Hardin hasn't any secret weapon waiting. That might–"

"Yes," said Sermak, viciously, "a huge jack-in-the-box that will jump out at the psychological moment and scare old Wienis into fits. The Foundation may as well blow itself out of existence and save itself the agony of suspense if it has to depend on any secret weapon."

"Well," said Orsy, changing the subject hurriedly, "the question comes down to this: How much time have we left? Eli, Bort?"

"All fight. It is the question. But don't look at me; I don't know. The Anacreonian press never mentions the Foundation at all. Right now, it's full of the approaching celebrations and nothing else. Lepold is coming of age next week, you know."

"We have months then." Walto smiled for the first time that evening. "That gives us time—"

"That gives us time, my foot," ground out Bort, impatiently. "The king's a god, I tell you. Do you suppose he has to carry on a campaign of propaganda to get his people into fighting spirit? Do you suppose he has to accuse us of aggression and pull out all stops on cheap emotionalism? When the time comes to strike, Lepold gives the order and the people fight. Just like that. That's the damnedness of the system. You don't question a god. He may give the order tomorrow for all I know; and you can wrap tobacco round that and smoke it."

Everyone tried to talk at once and Sermak was slamming the table for silence, when the front door opened and Levi Norast stamped in. He bounded up the stairs, overcoat on, trailing snow.

"Look at that!" he cried, tossing a cold, snow-speckled newspaper onto the table. "The visicasters are full of it, too."

The newspaper was unfolded and five heads bent over it.

Sermak said, in a hushed voice, "Great Space, he's going to Anacreon! *Going to Anacreon!*"

"It *is* treason," squeaked Tarki, in sudden excitement. "I'll be damned if Walto isn't right. He's sold us out and now he's going there to collect his wage."

Sermak had risen. "We've no choice now. I'm going to ask the Council tomorrow that Hardin be impeached. And if *that* fails—"

5.

The snow had ceased, but it caked the ground deeply now and the sleek ground car advanced through the deserted streets with lumbering effort. The murky gray light of incipient dawn was cold not only in the poetical sense but also in a very literal way – and even in the then turbulent state of the Foundation's politics, no one, whether Actionist or pro-Hardin found his spirits sufficiently ardent to begin street activity that early.

Yohan Lee did not like that and his grumblings grew audible. "It's going to look bad, Hardin. They're going to say you sneaked away."

"Let them say it if they wish. I've got to get to Anacreon and I want to do it without trouble. Now that's enough, Lee."

Hardin leaned back into the cushioned seat and shivered slightly. It wasn't cold inside the well-heated car, but there was something frigid about a snow-covered world, even through glass, that annoyed him.

He said, reflectively, "Some day when we get around to it we ought to weather-condition Terminus. It could be done."

"I," replied Lee, "would like to see a few other things done first. For instance, what about weather-conditioning Sermak? A nice, dry cell fitted for twenty-five centigrade all year round would be just fight."

"And then I'd really *need* bodyguards," said Hardin, "and not just those two," He indicated two of Lee's bully-boys sitting up front with the driver, hard eyes on the empty streets, ready hands at their atom blasts. "You evidently want to stir up civil war."

"I do? There are other sticks in the fire and it won't require much stirring, I can tell you." He counted off on blunt fingers, "One: Sermak raised hell yesterday in the City Council and called for an impeachment."

"He had a perfect right to do so," responded Hardin, coolly. "Besides which, his motion was defeated 206 to 184."

"Certainly. A majority of twenty-two when we had counted on sixty as a minimum. Don't deny it; you know you did."

"It was close," admitted Hardin.

"All right. And two; after the vote, the fifty-nine members of the Actionist Party reared upon their hind legs and stamped out of the Council Chambers."

Hardin was silent, and Lee continued, "And three: Before leaving, Sermak howled that you were a traitor, that you were going to Anacreon to collect your payment, that the Chamber majority in refusing to vote impeachment had participated in the treason, and that the name of their party was not 'Actionist' for nothing. What does *that* sound like?"

"Trouble, I suppose."

"And now you're chasing off at daybreak, like a criminal. You ought to face them, Hardin – and if you have to, declare martial law, by space!"

"Violence is the last refuge–"

"–Of the incompetent. Bah!"

"All right. We'll see. Now listen to me carefully, Lee. Thirty years ago, the Time Vault opened, and on the fiftieth anniversary of the beginning of the Foundation, there appeared a Hari Seldon recording to give us our first idea of what was really going on."

"I remember," Lee nodded reminiscently, with a half smile. "It was the day we took over the government."

"That's right. It was the time of our first major crisis. This is our second-and three weeks from today will be the eightieth anniversary of the beginning of the Foundation. Does that strike you as in any way significant?"

"You mean he's coming again?"

"I'm not finished. Seldon never said anything about returning, you understand, but that's of a piece with his whole plan. He's always done his best to keep all foreknowledge from us. Nor is there any way of telling whether the computer is set for further openings short of dismantling the Vault – and it's probably set to destroy itself if we were to try that. I've been there every anniversary since the first appearance, just on the chance. He's never shown up, but this is the first time since then that there's really been a crisis."

"Then he'll come."

"Maybe. I don't know. However, this is the point. At today's session of the Council, just after you announce that I have left for Anacreon, you will further announce, officially, that on March 14th next, there will be another Hari Seldon recording, containing a message of the utmost importance regarding the recent successfully concluded crisis. That's very important, Lee. Don't add anything more no matter how many questions are asked."

Lee stared. "Will they believe it?"

"That doesn't matter. It will confuse them, which is all I want. Between wondering whether it is true and what I mean by it if it isn't – they'll decide to postpone action till after March 14th. I'll be back considerably before then."

Lee looked uncertain. "But that 'successfully concluded.' That's bull!"

"Highly confusing bull. Here's the airport!"

The waiting spaceship bulked somberly in the dimness. Hardin stamped through the snow toward it and at the open air lock turned about with outstretched hand.

"Good-by, Lee. I hate to leave you in the frying pan like this, but there's not another I can trust. Now please keep out of the fire."

"Don't worry. The frying pan is hot enough. I'll follow orders." He stepped back, and the air lock closed.

6.

Salvor Hardin did not travel to the planet Anacreon – from which planet the kingdom derived its name – immediately. It was only on the day before the coronation that he arrived, after having made flying visits to eight of the larger stellar systems of the kingdom, stopping only long, enough to confer with the local representatives of the Foundation.

The trip left him with an oppressive realization of the vastness of the kingdom. It was a little splinter, an insignificant fly speck compared to the inconceivable reaches of the Galactic Empire of which it had once formed so distinguished a part; but to one whose habits of thought had been built around a single planet, and a sparsely settled one at that, Anacreon's size in area and population was staggering.

Following closely the boundaries of the old Prefect of Anacreon, it embraced twenty-five stellar systems, six of which included more than one inhabited world. The population of nineteen billion, though still far less than it had been in the Empire's heyday was rising rapidly with the increasing scientific development fostered by the Foundation.

And it was only now that Hardin found himself floored by the magnitude of *that* task. Even in thirty years, only the capital world had been powered. The outer provinces still possessed immense stretches where nuclear power had not yet been re-introduced. Even the progress that had been made might have been impossible had it not been for the still workable relics left over by the ebbing tide of Empire.

When Hardin did arrive at the capital world, it was to find all normal business at an absolute standstill. In the outer provinces there had been and still were celebrations; but here on the planet Anacreon, not a person but took feverish part in the hectic religious pageantry that heralded the coming-of-age of their god-king, Lepold.

Hardin had been able to snatch only half an hour from a haggard and harried Verisof before his ambassador was forced to rush off to supervise still another temple festival. But the half-hour was a most profitable one, and Hardin prepared himself for the night's fireworks well satisfied.

In all, he acted as an observer, for he had no stomach for the religious tasks he would undoubtedly have had to undertake if his identity became known. So, when the palace's ballroom filled itself with a glittering horde of the kingdom's very highest and most exalted nobility, he found himself hugging the wall, little noticed or totally ignored.

He had been introduced to Lepold as one of a long line of introducees, and from a safe distance, for the king stood apart in lonely and impressive grandeur, surrounded by his deadly blaze of radioactive aura. And in less than an hour this same king would take his seat upon the massive throne of rhodium-iridium alloy with jewel-set gold chasings, and then, throne and all would rise maestically into the air, skim the ground slowly to hover before the great window from which the great crowds of common folk could see their king and shout themselves into near apoplexy. The throne would not have been so massive, of course, if it had not had a shielded nuclear motor built into it.

It was past eleven. Hardin fidgeted and stood on his toes to better his view. He resisted an impulse to stand on a chair. And then he saw Wienis threading through the crowd toward him and he relaxed.

Wienis' progress was slow. At almost every step, he had to pass a kindly sentence with some revered noble whose grandfather had helped Lepold's grandfather brigandize the kingdom and had received a dukedom therefor.

And then he disentangled himself from the last uniformed peer and reached Hardin. His smile crooked itself into a smirk and his black eyes peered from under grizzled brows with glints of satisfaction in them.

"My dear Hardin," he said, in a low voice, "you must expect to be bored, when you refuse to announce your identity."

"I am not bored, your highness. This is all extremely interesting. We have no comparable spectacles on Terminus, you know."

"No doubt. But would you care to step into my private chambers, where we can speak at greater length and with considerably more privacy?"

"Certainly."

With arms linked, the two ascended the staircase, and more than one dowager duchess stared after them in surprise and wondered at the identity of this insignificantly dressed and uninteresting-looking stranger on whom such signal honor was being conferred by the prince regent.

In Wienis' chambers, Hardin relaxed in perfect comfort and accepted with a murmur of gratitude the glass of liquor that had been poured out by the regent's own hand.

"Locris wine, Hardin," said Wienis, "from the royal cellars. The real thing – two centuries in age. It was laid down ten years before the Zeonian Rebellion."

"A really royal drink," agreed Hardin, politely. "To Lepold I, King of Anacreon."

They drank, and Wienis added blandly, at the pause, "And soon to be Emperor of the Periphery, and further, who knows? The Galaxy may some day be reunited."

"Undoubtedly. By Anacreon?"

"Why not? With the help of the Foundation, our scientific superiority over the rest of the Periphery would be undisputable."

Hardin set his empty glass down and said, "Well, yes, except that, of course, the Foundation is bound to help any nation that requests scientific aid of it. Due to the high idealism of our government and the great moral purpose of our founder, Hari Seldon, we are unable to play favorites. That can't be helped, your highness."

Wienis' smile broadened. "The Galactic Spirit, to use the popular cant, helps those who help themselves. I quite understand that, left to itself, the Foundation would never cooperate."

"I wouldn't say that. We repaired the Imperial cruiser for you, though my board of navigation wished it for themselves for research purposes."

The regent repeated the last words ironically. "Research purposes! Yes! Yet you would not have repaired it, had I not threatened war."

Hardin made a deprecatory gesture. "I don't know."

"I do. And that threat always stood."

"And still stands now?"

"Now it is rather too late to speak of threats." Wienis had cast a rapid glance at the clock on his desk. "Look here, Hardin, you were on Anacreon once before. You were young then; we were both young. But even then we had entirely different ways of looking at things. You're what they call a man of peace, aren't you?"

"I suppose I am. At least, I consider violence an uneconomical way of attaining an end. There are always better substitutes, though they may sometimes be a little less direct."

"Yes. I've heard of your famous remark: 'Violence is the last refuge of the incompetent.' And yet" – the regent scratched one ear gently in affected abstraction – "I wouldn't call myself exactly incompetent."

Hardin nodded politely and said nothing.

"And in spite of that," Wienis continued, "I have always believed in direct action. I have believed in carving a straight path to my objective and following that path. I have accomplished much that way, and fully expect to accomplish still more."

"I know," interrupted Hardin. "I believe you are carving a path such as you describe for yourself and your children that leads directly to the throne, considering the

late unfortunate death of the king's father – your elder brother and the king's own precarious state of health. He is in a precarious state of health, is he not?"

Wienis frowned at the shot, and his voice grew harder. "You might find it advisable, Hardin, to avoid certain subjects. You may consider yourself privileged as mayor of Terminus to make . . . uh . . . injudicious remarks, but if you do, please disabuse yourself of the notion. I am not one to be frightened at words. It has been my philosophy of life that difficulties vanish when faced boldly, and I have never turned my back upon one yet."

"I don't doubt that. What particular difficulty are you refusing to turn your back upon at the present moment?"

"The difficulty, Hardin, of persuading the Foundation to co-operate. Your policy of peace, you see, has led you into making several very serious mistakes, simply because you underestimated the boldness of your adversary. Not everyone is as afraid of direct action as you are."

"For instance?" suggested Hardin.

"For instance, you came to Anacreon alone and accompanied me to my chambers alone."

Hardin looked about him. "And what is wrong with that?"

"Nothing," said the regent, "except that outside this room are five police guards, well armed and ready to shoot. I don't think you can leave, Hardin."

The mayor's eyebrows lifted, "I have no immediate desire to leave. Do you then fear me so much?"

"I don't fear you at all. But this may serve to impress you with my determination. Shall we call it a gesture?"

"Call it what you please," said Hardin, indifferently. "I shall not discommode myself over the incident, whatever you choose to call it."

"I'm sure that attitude will change with time. But you have made another error, Hardin, a more serious one. It seems that the planet Terminus is almost wholly undefended."

"Naturally. What have we to fear? We threaten no one's interest and serve all alike."

"And while remaining helpless," Wienis went on, "you kindly helped us to arm ourselves, aiding us particularly in the development of a navy of our own, a great navy. In fact, a navy which, since your donation of the Imperial cruiser, is quite irresistible."

"Your highness, you are wasting time." Hardin made as if to rise from his seat. "If you mean to declare war, and are informing me of the fact, you will allow me to communicate with my government at once."

"Sit down, Hardin. I am not declaring war, and you are not communicating with your government at all. When the war is fought – not declared, Hardin, *fought* – the Foundation will be informed of it in due time by the nuclear blasts of the Anacreonian navy under the lead of my own son upon the flagship, Wienis, once a cruiser of the Imperial navy."

Hardin frowned. "When will all this happen?"

"If you're really interested, the ships of the fleet left Anacreon exactly fifty minutes ago, at eleven, and the first shot will be fired as soon as they sight Terminus, which should be at noon tomorrow. You may consider yourself a prisoner of war."

"That's exactly what I do consider myself, your highness," said Hardin, still frowning. "But I'm disappointed."

Wienis chuckled contemptuously. "Is that all?"

"Yes. I had thought that the moment of coronation – midnight, you know – would be the logical time to set the fleet in motion. Evidently, you wanted to start the war while you were still regent. It would have been more dramatic the other way."

The regent stared. "What in Space are you talking about?"

"Don't you understand?" said Hardin, softly. "I had set my counterstroke for midnight."

Wienis started from his chair. "You are not bluffing me. There is no counterstroke. If you are counting on the support of the other kingdoms, forget it. Their navies, combined, are no match for ours."

"I know that. I don't intend firing a shot. It is simply that the word went out a week ago that at midnight tonight, the planet Anacreon goes under the interdict."

"The interdict?"

"Yes. If you don't understand, I might explain that every priest in Anacreon is going on strike, unless I countermand the order. But I can't while I'm being held incommunicado; nor do I wish to even if I weren't!" He leaned forward and added, with sudden animation, "Do you realize, your highness, that an attack on the Foundation is nothing short of sacrilege of the highest order?"

Wienis was groping visibly for self-control. "Give me none of that, Hardin. Save it for the mob."

"My dear Wienis, whoever do you think I *am* saving it for? I imagine that for the last half hour every temple on Anacreon has been the center of a mob listening to a priest exhorting them upon that very subject. There's not a man or woman on Anacreon that doesn't know that their government has launched a vicious, unprovoked attack upon the center of their religion. But it lacks only four minutes of midnight now. You'd better go down to the ballroom to watch events. I'll be safe here with five guards outside the door." He leaned back in his chair, helped himself to another glass of Locris wine, and gazed at the ceiling with perfect indifference.

Wienis suddenly furious, rushed out of the room.

A hush had fallen over the elite in the ballroom, as a broad path was cleared for the throne. Lepold sat on it now, hands solidly on its arms, head high, face frozen. The huge chandeliers had dimmed and in the diffused multi-colored light from the tiny nucleo-bulbs that bespangled the vaulted ceiling, the royal aura shone out bravely, lifting high above his head to form a blazing coronet.

Wienis paused on the stairway. No one saw him; all eyes were on the throne. He clenched his fists and remained where he was; Hardin would *not* bluff him into action.

And then the throne stiffed. Noiselessly, it lifted upward – and drifted. Off the dais, slowly down the steps, and then horizontally, five centimetres off the floor, it worked itself toward the huge, open window.

At the sound of the deep-toned bell that signified midnight, it stopped before the window – and the king's aura died.

For a frozen split second, the king did not move, face twisted in surprise, without an aura, merely human; and then the throne wobbled and dropped to the floor with a crashing thump, just as every light in the palace went out.

Through the shrieking din and confusion, Wienis' bull voice sounded. "Get the flares! Get the flares!"

He buffeted right and left through the crowd and forced his way to the door. From without, palace guards had streamed into the darkness.

Somehow the flares were brought back to the ballroom; flares that were to have been used in the gigantic torchlight procession through the streets of the city after the coronation.

Back to the ballroom guardsmen swarmed with torches – blue, green, and red; where the strange light lit up frightened, confused faces.

"There is no harm done," shouted Wienis. "Keep your places. Power will return in a moment."

He turned to the captain of the guard who stood stiffly at attention. "What is it, Captain?"

"Your highness," was the instant response, "the palace is surrounded by the people of the city."

"What do they want?" snarled Wienis.

"A priest is at the head. He has been identified as High Priest Poly Verisof. He demands the immediate release of Mayor Salvor Hardin and cessation of the war against the Foundation." The report was made in the expressionless tones of an officer, but his eyes shifted uneasily.

Wienis cried, "if any of the rabble attempt to pass the palace gates, blast them out of existence. For the moment, nothing more. Let them howl! There will be an accounting tomorrow."

The torches had been distributed now, and the ballroom was again alight. Wienis rushed to the throne, still standing by the window, and dragged the stricken, wax-faced Lepold to his feet.

"Come with me." He cast one look out of the window. The city was pitch-black. From below there were the hoarse confused cries of the mob. Only toward the fight, where the Argolid Temple stood was there illumination. He swore angrily, and dragged the king away.

Wienis burst into his chambers, the five guardsmen at his heels. Lepold followed, wide-eyed, scared speechless.

"Hardin," said Wienis, huskily, "you are playing with forces too great for you."

The mayor ignored the speaker. In the pearly light of the pocket nucleo-bulb at his side, he remained quietly seated, a slightly ironic smile on his face.

"Good morning, your majesty," he said to Lepold. "I congratulate you on your coronation."

"Hardin," cried Wienis again, "order your priests back to their jobs."

Hardin looked up coolly. "Order them yourself, Wienis, and see who is playing with forces too great for whom. Right now, there's not a wheel turning in Anacreon. There's not a light burning, except in the temples. There's not a drop of water running, except in the temples. On the wintry half of the planet, there's not a calorie of heat, except in the temples. The hospitals are taking in no more patients. The power plants have shut down. All ships are grounded. If you don't like it, Wienis, you can order the priests back to their jobs. I don't wish to."

"By Space, Hardin, I will. If it's to be a showdown, so be it. We'll see if your priests can withstand the army. Tonight, every temple on the planet will be put under army supervision."

"Very good, but how are you going to give the orders? Every line of communication on the planet is shut down. You'll find that neither wave nor hyperwave will work. In fact, the only communicator of the planet that will work – outside of the temples, of course – is the televisor right here in this room, and I've fitted it only for reception."

Wienis struggled vainly for breath, and Hardin continued, "If you wish you can order your army into the Argolid Temple just outside the palace and then use the ultrawave sets there to contact other portions of the planet. But if you do that, I'm afraid the army contingent will be cut to pieces by the mob, and then what will protect your palace, Wienis? And your *lives*, Wienis?"

Wienis said thickly, "We can hold out, devil. We'll last the day. Let the mob howl and let the power die, but we'll hold out. And when the news comes back that the Foundation has been taken, your precious mob will find upon what vacuum their religion has been built, and they'll desert your priests and turn against them. I give you until noon tomorrow, Hardin, because you can stop the power on Anacreon but *you can't stop my fleet*." His voice croaked exultantly. "They're on their way, Hardin, with the great cruiser you yourself ordered repaired, at the head."

Hardin replied lightly. "Yes, the cruiser I myself ordered repaired – but in my own way. Tell me, Wienis, have you ever heard of a hyperwave relay? No, I see you haven't. Well, in about two minutes you'll find out what one can do."

The televisor flashed to life as he spoke, and he amended, "No, in two seconds. Sit down, Wienis. and listen."

7.

Theo Aporat was one of the very highest ranking priests of Anacreon. From the standpoint of precedence alone, he deserved his appointment as head priest- attendant upon the flagship *Wienis*.

But it was not only rank or precedence. He knew the ship. He had worked directly under the holy men from the Foundation itself in repairing the ship. He had gone over the motors under their orders. He had rewired the 'visors; revamped the communications system; replated the punctured hull; reinforced the beams. He had even been permitted to help while the wise men of the Foundation had installed a device so holy it had never been placed in any previous ship, but had been reserved only for this magnificent colossus of a vessel – a hyperwave relay.

It was no wonder that he felt heartsick over the purposes to which the glorious ship was perverted. He had never wanted to believe what Verisof had told him – that the ship was to be used for appalling wickedness; that its guns were to be turned on the great Foundation. Turned on that Foundation, where he had been trained as a youth, from which all blessedness was derived.

Yet he could not doubt now, after what the admiral had told him.

How could the king, divinely blessed, allow this abominable act? Or was it the king? Was it not, perhaps, an action of the accursed regent, *Wienis*, without the knowledge of the king at all. And it was the son of this same *Wienis* that was the admiral who five minutes before had told him:

"Attend to your souls and your blessings, priest. I will attend to my ship."

Aporat smiled crookedly. He would attend to his souls and his blessings – and also to his cursings; and Prince Lefkin would whine soon enough.

He had entered the general communications room now. His acolyte preceded him and the two officers in charge made no move to interfere. The head priest-attendant had the right of free entry anywhere on the ship.

"Close the door," Aporat ordered, and looked at the chronometer. It lacked Five minutes of twelve. He had timed it well.

With quick practiced motions, he moved the little levers that opened all communications, so that every part of the two-mile-long ship was within reach of his voice and his image.

"Soldiers of the royal flagship *Wienis*, attend! It is your priest-attendant that speaks!" The sound of his voice reverberated, he knew, from the stem atom blast in the extreme rear to the navigation tables in the prow.

"Your ship," he cried, "is engaged in sacrilege. Without your knowledge, it is performing such an act as will doom the soul of every man among you to the eternal frigidity of space! Listen! It is the intention of your commander to take this ship to the Foundation and there to bombard that source of all blessings into submission to his sinful will. And since that is his intention, I, in the name of the Galactic Spirit, remove him from his command, for there is no command where the blessing of the Galactic Spirit has been

withdrawn. The divine king himself may not maintain his kingship without the consent of the Spirit."

His voice took on a deeper tone, while the acolyte listened with veneration and the two soldiers with mounting fear. "And because this ship is upon such a devil's errand, the blessing of the Spirit is removed from it as well."

He lifted his arms solemnly, and before a thousand televisors throughout the ship, soldiers cowered, as the stately image of their priest-attendant spoke:

"In the name of the Galactic Spirit and of his prophet, Hari Seldon, and of his interpreters, the holy men of the Foundation, I curse this ship. Let the televisors of this ship, which are its eyes, become blind. Let its grapples, which are its arms, be paralyzed. Let the nuclear blasts, which are its fists, lose their function. Let the motors, which are its heart, cease to beat. Let the communications, which are its voice, become dumb. Let its ventilations, which are its breath, fade. Let its lights, which are its soul, shrivel into nothing. In the name of the Galactic Spirit, I so curse this ship."

And with his last word, at the stroke of midnight, a hand, light-years distant in the Argolid Temple, opened an ultrawave relay, which at the instantaneous speed of the ultrawave, opened another on the flagship *Wienis*.

And the ship died!

For it is the chief characteristic of the religion of science that it works, and that such curses as that of Aporat's are really deadly.

Aporat saw the darkness close down on the ship and heard the sudden ceasing of the soft, distant purring of the hyperatomic motors. He exulted and from the pocket of his long robe withdrew a self-powered nucleo-bulb that filled the room with pearly light.

He looked down at the two soldiers who, brave men though they undoubtedly were, writhed on their knees in the last extremity of mortal terror. "Save our souls, your reverence. We are poor men, ignorant of the crimes of our leaders," one whimpered.

"Follow," said Aporat, sternly. "Your soul is not yet lost."

The ship was a turmoil of darkness in which fear was so thick and palpable, it was all but a miasmatic smell. Soldiers crowded close wherever Aporat and his circle of light passed, striving to touch the hem of his robe, pleading for the tiniest scrap of mercy.

And always his answer was, "Follow me!"

He found Prince Lefkin, groping his way through the officers' quarters, cursing loudly for lights. The admiral stared at the priest-attendant with hating eyes.

"There you are!" Lefkin inherited his blue eyes from his mother, but there was that about the hook in his nose and the squint in his eye that marked him as the son of *Wienis*. "What is the meaning of your treasonable actions? Return the power to the ship. I am commander here."

"No longer," said Aporat, somberly.

Lefkin looked about wildly. "Seize that man. Arrest him, or by Space, I will send every man within reach of my voice out the air lock in the nude." He paused, and then shrieked, "It is your admiral that orders. Arrest him."

Then, as he lost his head entirely, "Are you allowing yourselves to be fooled by this mountebank, this harlequin? Do you cringe before a religion compounded of clouds and moonbeams? This man is an imposter and the Galactic Spirit he speaks of a fraud of the imagination devised to—"

Aporat interrupted furiously. "Seize the blasphemer. You listen to him at the peril of your souls."

And promptly, the noble admiral went down under the clutching hands of a score of soldiers.

"Take him with you and follow me."

Aporat turned, and with Lefkin dragged along after him, and the corridors behind black with soldiery, he returned to the communications room. There, he ordered the ex-commander before the one televisor that worked.

"Order the rest of the fleet to cease course and to prepare for the return to Anacreon."

The disheveled Lefkin, bleeding, beaten, and half stunned, did so.

"And now," continued Aporat, grimly, "we are in contact with Anacreon on the hyperwave beam. Speak as I order you."

Lefkin made a gesture of negation, and the mob in the room and the others crowding the corridor beyond, growled fearfully.

"Speak!" said Aporat. "Begin: The Anacreonian navy—"

Lefkin began.

8.

There was absolute silence in Wienis' chambers when the image of Prince Lefkin appeared at the televisor. There had been one startled gasp from the regent at the haggard face and shredded uniform of his son, and then he collapsed into a chair, face contorted with surprise and apprehension.

Hardin listened stolidly, hands clasped lightly in his lap, while the just-crowned King Lepold sat shriveled in the most shadowy comer, biting spasmodically at his goldbraided sleeve. Even the soldiers had lost the emotionless stare that is the prerogative of the military, and, from where they lined up against the door, nuclear blasts ready, peered furtively at the figure upon the televisor.

Lefkin spoke, reluctantly, with a tired voice that paused at intervals as though he were being prompted-and not gently:

"The Anacreonian navy . . . aware of the nature of its mission . . . and refusing to be a party . . . to abominable sacrilage . . . is returning to Anacreon . . . with the following ultimatum issued . . . to those blaspheming sinners . . . who would dare to use profane force . . . against the Foundation . . . source of all blessings . . . and against the Galactic Spirit. Cease at once all war against . . . the true faith . . . and guarantee in a manner suiting us of the navy . . . as represented by our . . . priest-attendant, Theo

Aporat . . . that such war will never in the future . . . be resumed, and that" – here a long pause, and then continuing – "and that the one-time prince regent, Wienis . . . be imprisoned . . . and tried before an ecclesiastical court . . . for his crimes. Otherwise the royal navy . . . upon returning to Anacreon . . . will blast the palace to the ground . . . and take whatever other measures . . . are necessary . . . to destroy the nest of sinners . . . and the den of destroyers . . . of men's souls that now prevail."

The voice ended with half a sob and the screen went blank.

Hardin's fingers passed rapidly over the nucleo-bulb and its light faded until in the dimness, the hitherto regent, the king, and the soldiers were hazy-edged shadows; and for the first time it could be seen that an aura encompassed Hardin.

It was not the blazing light that was the prerogative of kings, but one less spectacular, less impressive, and yet one more effective in its own way, and more useful.

Hardin's voice was softly ironic as he addressed the same Wienis who had one hour earlier declared him a prisoner of war and Terminus on the point of destruction, and who now was a huddled shadow, broken and silent.

"There is an old fable," said Hardin, "as old perhaps as humanity, for the oldest records containing it are merely copies of other records still older, that might interest you. It runs as follows:

"A horse having a wolf as a powerful and dangerous enemy lived in constant fear of his life. Being driven to desperation, it occurred to him to seek a strong ally. Whereupon he approached a man, and offered an alliance, pointing out that the wolf was likewise an enemy of the man. The man accepted the partnership at once and offered to kill the wolf immediately, if his new partner would only co-operate by placing his greater speed at the man's disposal. The horse was willing, and allowed the man to place bridle and saddle upon him. The man mounted, hunted down the wolf, and killed him.

"The horse, joyful and relieved, thanked the man, and said: 'Now that our enemy is dead, remove your bridle and saddle and restore my freedom.'

"Whereupon the man laughed loudly and replied, 'Never!' and applied the spurs with a will."

Silence still. The shadow that was Wienis did not stir.

Hardin continued quietly, "You see the analogy, I hope. In their anxiety to cement forever domination over their own people, the kings of the Four Kingdoms accepted the religion of science that made them divine; and that same religion of science was their bridle and saddle, for it placed the life blood of nuclear power in the hands of the priesthood who took their orders from us, be it noted, and not from you. You killed the wolf, but could not get rid of the m—"

Wienis sprang to his feet and in the shadows, his eyes were maddened hollows. His voice was thick, incoherent. "And yet I'll get you. You won't escape. You'll rot. Let them blow us up. Let them blow everything up. You'll rot! I'll get you!

"Soldiers!" he thundered, hysterically. "Shoot me down that devil. Blast him! Blast him!"

Hardin turned about in his chair to face the soldiers and smiled. One aimed his nuclear blast and then lowered it. The others never budged. Salvor Hardin, mayor of Terminus, surrounded by that soft aura, smiling so confidently, and before whom all the power of Anacreon had crumbled to powder was too much for them, despite the orders of the shrieking maniac just beyond.

Wienis shouted incoherently and staggered to the nearest soldier. Wildly, he wrested the nuclear blast from the man's hand-aimed it at Hardin, who didn't stir, shoved the lever and held it contacted.

The pale continuous beam impinged upon the force-field that surrounded the mayor of Terminus and was sucked harmlessly to neutralization. Wienis pressed harder and laughed tearfully.

Hardin still smiled and his force-field aura scarcely brightened as it absorbed the energies of the nuclear blast. From his corner Lepold covered his eyes and moaned.

And, with a yell of despair, Wienis changed his aim and shot again – and toppled to the floor with his head blown into nothingness.

Hardin winced at the sight and muttered, "A man of 'direct action' to the end. The last refuge!"

9.

The Time Vault was filled; filled far beyond the available seating capacity, and men lined the back of the room, three deep.

Salvor Hardin compared this large company with the few men attending the first appearance of Hari Seldon, thirty years earlier. There had only been six, then; the five old Encyclopedists – all dead now – and himself, the young figurehead of a mayor. It had been on that day, that he, with Yohan Lee's assistance had removed the "figurehead" stigma from his office.

It was quite different now; different in every respect. Every man of the City Council was awaiting Seldon's appearance. He, himself, was still mayor, but all-powerful now; and since the utter rout of Anacreon, all-popular. When he had returned from Anacreon with the news of the death of Wienis, and the new treaty signed with the trembling Lepold, he was greeted with a vote of confidence of shrieking unanimity. When this was followed in rapid order, by similar treaties signed with each of the other three kingdoms – treaties that gave the Foundation powers such as would forever prevent any attempts at attack similar to that of Anacreon's – torchlight processions had been held in every city street of Terminus. Not even Hari Seldon's name had been more loudly cheered.

Hardin's lips twitched. Such popularity had been his after the first crisis also.

Across the room, Sef Sermak and Lewis Bort were engaged in animated discussion, and recent events seemed to have put them out not at all. They had joined in the vote of confidence; made speeches in which they publicly admitted that they had been in the wrong, apologized handsomely for the use of certain phrases in earlier debates, excused

themselves delicately by declaring they had merely followed the dictates of their judgement and their conscience – and immediately launched a new Actionist campaign.

Yohan Lee touched Hardin's sleeve and pointed significantly to his watch.

Hardin looked up. "Hello there, Lee. Are you still sour? What's wrong now?"

"He's due in five minutes, isn't he?"

"I presume so. He appeared at noon last time."

"What if he doesn't?"

"Are you going to wear me down with your worries all your life? If he doesn't, he won't."

Lee frowned and shook his head slowly. "If this thing flops, we're in another mess. Without Seldon's backing for what we've done, Sermak will be free to start all over. He wants outright annexation of the Four Kingdoms, and immediate expansion of the Foundation – by force, if necessary. He's begun his campaign, already."

"I know. A fire eater must eat fire even if he has to kindle it himself. And you, Lee, have got to worry even if you must kill yourself to invent something to worry about."

Lee would have answered, but he lost his breath at just that moment – as the lights yellowed and went dim. He raised his arm to point to the glass cubicle that dominated half the room and then collapsed into a chair with a windy sigh.

Hardin himself straightened at the sight of the figure that now filled the cubicle – a figure in a wheel chair! He alone, of all those present could remember the day, decades ago, when that figure had appeared first. He had been young then, and the figure old. Since then, the figure had not aged a day, but he himself had in turn grown old.

The figure stared straight ahead, hands fingering a book in its lap.

It said, "I am Hari Seldon!" The voice was old and soft.

There was a breathless silence in the room and Hari Seldon continued conversationally, "This is the second time I've been here. Of course, I don't know if any of you were here the first time. In fact, I have no way of telling, by sense perception, that there is anyone here at all, but that doesn't matter. If the second crisis has been overcome safely, you are bound to be here; there is no way out. If you are not here, then the second crisis has been too much for you."

He smiled engagingly. "I doubt *that*, however, for my figures show a ninety-eight point four percent probability there is to be no significant deviation from the Plan in the first eighty years.

"According to our calculations, you have now reached domination of the barbarian kingdoms immediately surrounding the Foundation. Just as in the first crisis you held them off by use of the Balance of Power, so in the second, you gained mastery by use of the Spiritual Power as against the Temporal.

"However, I might warn you here against overconfidence. It is not my way to grant you any foreknowledge in these recordings, but it would be safe to indicate that what you have now achieved is merely a new balance-though one in which your position is considerably better. The Spiritual Power, while sufficient to ward off attacks of the Temporal is *not* sufficient to attack in turn. Because of the invariable growth of the

counteracting force known as Regionalism, or Nationalism, the Spiritual Power cannot prevail. I am telling you nothing new, I'm sure.

"You must pardon me, by the way, for speaking to you in this vague way. The terms I use are at best mere approximations, but none of you is qualified to understand the true symbology of psychohistory, and so I must do the best I can.

"In this case, the Foundation is only at the start of the path that leads to the Second Galactic Empire. The neighboring kingdoms, in manpower and resources are still overwhelmingly powerful as compared to yourselves. Outside them lies the vast tangled jungle of barbarism that extends around the entire breadth of the Galaxy. Within that rim there is still what is left of the Galactic Empire – and that, weakened and decaying though it is, is still incomparably mighty."

At this point, Hari Seldon lifted his book and opened it. His face grew solemn. "And never forget there was *another* Foundation established eighty years ago; a Foundation at the other end of the Galaxy, at Star's End. They will always be there for consideration. Gentlemen, nine hundred and twenty years of the Plan stretch ahead of you. The problem is yours!"

He dropped his eyes to his book and flicked out of existence, while the lights brightened to fullness. In the babble that followed, Lee leaned over to Hardin's ear. "He didn't say when he'd be back."

Hardin replied, "I know – but I trust he won't return until you and I are safely and cozily dead!"

PART IV THE TRADERS

1.

TRADERS— . . . and constantly in advance of the political hegemony of the Foundation were the Traders, reaching out tenuous fingerholds through the tremendous distances of the Periphery. Months or years might pass between landings on Terminus; their ships were often nothing more than patchquills of home-made repairs and improvisations; their honesty was none of the highest; their daring. . .

Through it all they forged an empire more enduring than the pseudo-religious despotism of the Four Kingdoms. . .

Tales without end are told of these massive, lonely figures who bore half-seriously, half-mockingly a motto adopted from one of Salvor Hardin's epigrams, "Never let your sense of morals prevent you from doing what is right!" It is difficult now to tell which tales are real and which apocryphal. There are none probably that have not suffered some exaggeration. . . .

ENCYCLOPEDIA GALACTICA

Limmar Ponyets was completely a-lather when the call reached his receiver – which proves that the old bromide about telemessages and the shower holds true even in the dark, hard space of the Galactic Periphery.

Luckily that part of a free-lance trade ship which is not given over to miscellaneous merchandise is extremely snug. So much so, that the shower, hot water included, is located in a two-by-four cubby, ten feet from the control panels. Ponyets heard the staccato rattle of the receiver quite plainly.

Dripping suds and a growl, he stepped out to adjust the vocal, and three hours later a second trade ship was alongside, and a grinning youngster entered through the air tube between the ships.

Ponyets rattled his best chair forward and perched himself on the pilot-swivel.

"What've you been doing, Gorm?" he asked, darkly. "Chasing me all the way from the Foundation?"

Les Gorm broke out a cigarette, and shook his head definitely, "Me? Not a chance. I'm just a sucker who happened to land on Glyptal IV the day after the mail. So they sent me out after you with this."

The tiny, gleaming sphere changed hands, and Gorm added, "It's confidential. Super-secret. Can't be trusted to the sub-ether and all that. Or so I gather. At least, it's a Personal Capsule, and won't open for anyone but you."

Ponyets regarded the capsule distastefully, "I can see that. And I never knew one of these to hold good news, either."

It opened in his hand and the thin, transparent tape unrolled stiffly. His eyes swept the message quickly, for when the last of the tape had emerged, the first was already brown and crinkled. In a minute and a half it had turned black and, molecule by molecule, fallen apart.

Ponyets grunted hollowly, "Oh, *Galaxy!*"

Les Gorm said quietly, "Can I help somehow? Or is it too secret?"

"It will bear telling, since you're of the Guild. I've got to go to Askone."

"That place? How come?"

"They've imprisoned a trader. But keep it to yourself."

Gorm's expression jolted into anger, "Imprisoned! That's against the Convention."

"So is the interference with local politics."

"Oh! Is that what he did?" Gorm meditated. "Who's the trader? Anyone I know?"

"No!" said Ponyets sharply, and Gorm accepted the implication and asked no further questions.

Ponyets was up and staring darkly out the visiplat. He mumbled strong expressions at that part of the misty lens-form that was the body of the Galaxy, then said loudly, "Damnedest mess! I'm way behind quota."

Light broke on Gorm's intellect, "Hey, friend, Askone is a closed area."

"That's right. You can't sell as much as a penknife on Askone. They won't buy nuclear gadgets of *any* sort. With my quota dead on its feet, it's murder to go there."

"Can't get out of it?"

Ponyets shook his head absently, "A know the fellow involved. Can't walk out on a friend. What of it? I am in the hands of the Galactic Spirit and walk cheerfully in the way he points out."

Gorm said blankly, "Huh?"

Ponyets looked at him, and laughed shortly, "I forgot. You never read the 'Bood of the Spirit,' did you?"

"Never heard of it," said Gorm, curtly.

"Well, you would if *you'd* had a religious training."

"Religious training? For the *priesthood*?" Gorm was profoundly shocked.

"Afraid so. It's my dark shame and secret. I was too much for the Reverend Fathers, though, They expelled me, for reasons sufficient to promote me to a secular education under the Foundation. Well, look, I'd better push off. How's your quota this year?"

Gorm crushed out his cigarette and adjusted his cap, "I've got my last cargo going now. I'll make it."

"Lucky fellow," gloomed Ponyets, and for many minutes after Les Gorm left, he sat in motionless reverie.

So Eskel Gorov was on Askone – and in prison as well!

That was bad! In fact, considerably worse than it might appear. It was one thing to tell a curious youngster a diluted version of the business to throw him off and send him about his own. It was a thing of a different sort to face the truth.

For Limmar Ponyets was one of the few people who happened to know that Master Trader Eskel Gorov was not a trader at all; but that entirely different thing, an agent of the Foundation!

2.

Two weeks gone! Two weeks wasted.

One week to reach Askone, at the extreme borders of which the vigilant warships speared out to meet him in converging numbers. Whatever their detection system was, it worked – and well.

They sidled him in slowly, without a signal, maintaining their cold distance, and pointing him harshly towards the central sun of Askone.

Ponyets could have handled them at a pinch. Those ships were holdovers from the dead-and-gone Galactic Empire – but they were sports cruisers, not warships; and without nuclear weapons, they were so many picturesque and impotent ellipsoids. But Eskel Gorov was a prisoner in their hands, and Gorov was not a hostage to lose. The Askonians must know that.

And then another week – a week to wind a weary way through the clouds of minor officials that formed the buffer between the Grand Master and the outer world. Each little sub-secretary required soothing and conciliation. Each required careful and nauseating milking for the flourishing signature that was the pathway to the next official one higher up.

For the first time, Ponyets found his trader's identification papers useless.

Now, at last, the Grand Master was on the other side of the Guard-flanked gilded door – and two weeks had gone.

Gorov was still a prisoner and Ponyets' cargo rotted useless in the holds of his ship.

The Grand Master was a small man; a small man with a balding head and very wrinkled face, whose body seemed weighed down to motionlessness by the huge, glossy fur collar about his neck.

His fingers moved on either side, and the line of armed men backed away to for a passage, along which Ponyets strode to the foot of the Chair of State.

"Don't speak," snapped the Grand Master, and Ponyets' opening lips closed tightly.

"That's right," the Askonian ruler relaxed visibly, "I can't endure useless chatter. You cannot threaten and I won't abide flattery. Nor is there room for injured complaints. I have lost count of the times you wanderers have been warned that your devil's machines are not wanted anywhere in Askone."

"Sir," said Ponyets, quietly, "there is no attempt to justify the trader in question. It is not the policy of traders to intrude where they are not wanted. But the Galaxy is great, and it has happened before that a boundary has been trespassed unwittingly. It was a deplorable mistake."

"Deplorable, certainly," squeaked the Grand Master. "But mistake? Your people on Glyptal IV have been bombarding me with pleas for negotiation since two hours after the sacrilegious wretch was seized. I have been warned by them of your own coming many times over. It seems a well-organized rescue campaign. Much seems to have been anticipated – a little too much for mistakes, deplorable or otherwise."

The Askonian's black eyes were scornful. He raged on, "And are you traders, flitting from world to world like mad little butterflies, so mad in your own right that you can land on Askone's largest world, in the center of its system, and consider it an unwitting boundary mix-up? Come, surely not."

Ponyets winced without showing it. He said, doggedly, "If the attempt to trade was deliberate, your Veneration, it was most injudicious and contrary to the strictest regulations of our Guild."

"Injudicious, yes," said the Askonian, curtly. "So much so, that your comrade is likely to lose life in payment."

Ponyets' stomach knotted. There was no irresolution there. He said, "Death, your Veneration, is so absolute and irrevocable a phenomenon that certainly there must be some alternative."

There was a pause before the guarded answer came, "I have heard that the Foundation is rich."

"Rich? Certainly. But our riches are that which you refuse to take. Our nuclear goods are worth–"

"Your goods are worthless in that they lack the ancestral blessing. Your goods are wicked and accursed in that they lie under the ancestral interdict." The sentences were intoned; the recitation of a formula.

The Grand Master's eyelids dropped, and he said with meaning, "You have nothing else of value?"

The meaning was lost on the trader, "I don't understand. What is it you want?"

The Askonian's hands spread apart, "You ask me to trade places with you, and make known to you *my* wants. I think not. Your colleague, it seems, must suffer the punishment set for sacrilege by the Askonian code. Death by gas. We are a just people. The poorest peasant, in like case, would suffer no more. I, myself, would suffer no less."

Ponyets mumbled hopelessly, "Your Veneration, would it be permitted that I speak to the prisoner?"

"Askonian law," said the Grand Master coldly, "allows no communication with a condemned man."

Mentally, Ponyets held his breath, "Your Veneration, I ask you to be merciful towards a man's soul, in the hour when his body stands forfeit. He has been separated

from spiritual consolation in all the time that his life has been in danger. Even now, he faces the prospect of going unprepared to the bosom of the Spirit that rules all."

The Grand Master said slowly and suspiciously, "You are a Tender of the Soul?"

Ponyets dropped a humble head, "I have been so trained. In the empty expanses of space, the wandering traders need men like myself to care for the spiritual side of a life so given over to commerce and worldly pursuits."

The Askonian ruler sucked thoughtfully at his lower lip. "Every man should prepare his soul for his journey to his ancestral spirits. Yet I had never thought you traders to be believers."

3.

Eskel Gorov stirred on his couch and opened one eye as Limmar Ponyets entered the heavily reinforced door. It boomed shut behind him. Gorov sputtered and came to his feet.

"Ponyets! They sent you?"

"Pure chance," said Ponyets, bitterly, "or the work of my own personal malevolent demon. Item one, you get into a mess on Askone. Item two, my sales route, as known to the Board of Trade, carries me within fifty parsecs of the system at just the time of item one. Item three, we've worked together before and the Board knows it. Isn't that a sweet, inevitable set-up? The answer just pops out of a slot."

"Be careful," said Gorov, tautly. "There'll be someone listening. Are you wearing a Field Distorter?"

Ponyets indicated the ornamented bracelet that hugged his wrist and Gorov relaxed.

Ponyets looked about him. The cell was bare, but large. It was well-lit and it lacked offensive odors. He said, "Not bad. They're treating you with kid gloves."

Gorov brushed the remark aside, "Listen, how did you get down here? I've been in strict solitary for almost two weeks."

"Ever since I came, huh? Well, it seems the old bird who's boss here has his weak points. He leans toward pious speeches, so I took a chance that worked. I'm here in the capacity of your spiritual adviser. There's something about a pious man such as he. He will cheerfully cut your throat if it suits him, but he will hesitate to endanger the welfare of your immaterial and problematical soul. It's just a piece of empirical psychology. A trader has to know a little of everything."

Gorov's smile was sardonic, "And you've been to theological school as well. You're all right, Ponyets. I'm glad they sent you. But the Grand Master doesn't love my soul exclusively. Has he mentioned a ransom?"

The trader's eyes narrowed, "He hinted – barely. And he also threatened death by gas. I played safe, and dodged; it might easily have been a trap. So it's extortion, is it? What is it he wants?"

"Gold."

"Gold!" Ponyets frowned. "The metal itself? What for?"

"It's their medium of exchange."

"Is it? And where do I get gold from?"

"Wherever you can. Listen to me; this is important. Nothing will happen to me as long as the Grand Master has the scent of gold in his nose. Promise it to him; as much as he asks for. Then go back to the Foundation, if necessary, to get it. When I'm free, we'll be escorted out of the system, and then we part company."

Ponyets stared disapprovingly, "And then you'll come back and try again."

"It's my assignment to sell nucleics to Askone."

"They'll get you before you've gone a parsec in space. You know that, I suppose."

"I don't," said Gorov. "And if I did, it wouldn't affect things."

"They'll kill you the second time."

Gorov shrugged.

Ponyets said quietly, "If I'm going to negotiate with the Grand Master again, I want to know the whole story. So far, I've been working it too blind. As it was, the few mild remarks I did make almost threw his Veneration into fits."

"It's simple enough," said Gorov. "The only way we can increase the security of the Foundation here in the Periphery is to form a religion-controlled commercial empire. We're still too weak to be able to force political control. It's all we can do to hold the Four Kingdoms."

Ponyets was nodding. "This I realize. And any system that doesn't accept nuclear gadgets can never be placed under our religious control—"

"And can therefore become a focal point for independence and hostility. Yes."

"All right, then," said Ponyets, "so much for theory. Now what exactly prevents the sale. Religion? The Grand Master implied as much."

"It's a form of ancestor worship. Their traditions tell of an evil past from which they were saved by the simple and virtuous heroes of the past generations. It amounts to a distortion of the anarchic period a century ago, when the imperial troops were driven out and an independent government was set up. Advanced science and nuclear power in particular became identified with the old imperial regime they remember with horror."

"That so? But they have nice little ships which spotted me very handily two parsecs away. That smells of nucleics to me."

Gorov shrugged. "Those ships are holdovers of the Empire, no doubt. Probably with nuclear drive. What they have, they keep. The point is that they will not innovate and their internal economy is entirely non-nuclear. That is what we must change."

"How were you going to do it?"

"By breaking the resistance at one point. To put it simply, if I could sell a penknife with a force-field blade to a nobleman, it would be to his interest to force laws that would allow him to use it. Put that baldly, it sounds silly, but it is sound, psychologically. To make strategic sales, at strategic points, would be to create a pro-nucleics faction at court."

"And they send you for that purpose, while I'm only here to ransom you and leave, while you keep on trying? Isn't that sort of tail-backward?"

"In what way?" said Gorov, guardedly.

"Listen," Ponyets was suddenly exasperated, "you're a diplomat, not a trader, and calling you a trader won't make you one. This case is for one who's made a business of selling – and I'm here with a full cargo stinking into uselessness, and a quota that won't ever be met, it looks like."

"You mean you're going to risk your life on something that isn't your business?" Gorov smiled thinly.

Ponyets said, "You mean that this is a matter of patriotism and traders aren't patriotic?"

"Notoriously not. Pioneers never are."

"All right. I'll grant that. I don't scoot about space to save the Foundation or anything like that. But I'm out to make money, and this is my chance. If it helps the Foundation at the same time, all the better. And I've risked my life on slimmer chances."

Ponyets rose, and Gorov rose with him, "What are you going to do?"

The trader smiled, "Gorov, I don't know – not yet. But if the crux of the matter is to make a sale, then I'm your man. I'm not a boaster as a general thing, but there's one thing I'll always back up. I've never *ended up* below quota yet."

The door to the cell opened almost instantly when he knocked, and two guards fell in on either side.

4.

"A show!" said the Grand Master, grimly. He settled himself well into his furs, and one thin hand grasped the iron cudgel he used as a cane.

"And gold, your Veneration."

"*And* gold," agreed the Grand Master, carelessly.

Ponyets set the box down and opened it with as fine an appearance of confidence as he could manage. He felt alone in the face of universal hostility; the way he had felt out in space his first year. The semicircle of bearded councilors who faced him down, stared unpleasantly. Among them was Pherl, the thin-faced favorite who sat next to the Grand Master in stiff hostility. Ponyets had met him once already and marked him immediately as prime enemy, and, as a consequence, prime victim.

Outside the hall, a small army awaited events. Ponyets was effectively isolated from his ship; he lacked any weapon, but his attempted bribe; and Gorov was still a hostage.

He made the final adjustments on the clumsy monstrosity that had cost him a week of ingenuity, and prayed once again that the lead-lined quartz would stand the strain.

"What is it?" asked the Grand Master.

"This," said Ponyets, stepping back, "is a small device I have constructed myself."

"That is obvious, but it is not the information I want. Is it one of the black-magic abominations of your world?"

"It is nuclear in nature, admitted Ponyets, gravely, "but none of you need touch it, or have anything to do with it. It is for myself alone, and if it contains abominations, I take the foulness of it upon myself."

The Grand Master had raised his iron cane at the machine in a threatening gesture and his lips moved rapidly and silently in a purifying invocation. The thin-faced councilor at his right leaned towards him and his straggled red mustache approached the Grand Master's ear. The ancient Askonian petulantly shrugged himself free.

"And what is the connection of your instrument of evil and the gold that may save your countryman's life?"

"With this machine," began Ponyets, as his hand dropped softly onto the central chamber and caressed its hard, round flanks, "I can turn the iron you discard into gold of the finest quality. It is the only device known to man that will take iron – the ugly iron, your Veneration, that props up the chair you sit in and the walls of this building – and change it to shining, heavy, yellow gold."

Ponyets felt himself botching it. His usual sales talk was smooth, facile and plausible; but this limped like a shot-up space wagon. But it was the content, not the form, that interested the Grand Master.

"So? Transmutation? Men have been fools who have claimed the ability. They have paid for their prying sacrilege."

"Had they succeeded?"

"No." The Grand Master seemed coldly amused. "Success at producing gold would have been a crime that carried its own antidote. It is the attempt plus the failure that is fatal. Here, what can you do with my staff?" He pounded the floor with it.

"Your Veneration will excuse me. My device is a small model, prepared by myself, and your staff is too long."

The Grand Master's small shining eye wandered and stopped, "Randel, your buckles. Come, man, they shall be replaced double if need be."

The buckles passed down the line, hand to hand. The Grand Master weighed them thoughtfully.

"Here," he said, and threw them to the floor.

Ponyets picked them up. He tugged hard before the cylinder opened, and his eyes blinked and squinted with effort as he centered the buckles carefully on the anode screen. Later, it would be easier but there must be no failures the first time.

The homemade transmuter crackled malevolently for ten minutes while the odor of ozone became faintly present. The Askonians backed away, muttering, and again Pherl whispered urgently into his ruler's ear. The Grand Master's expression was stony. He did not budge.

And the buckles were gold.

Ponyets held them out to the Grand Master with a murmured, "Your Veneration!" but the old man hesitated, then gestured them away. His stare lingered upon the transmuter.

Ponyets said rapidly, "Gentlemen, this is pure gold. Gold through and through. You may subject it to every known physical and chemical test, if you wish to prove the point. It cannot be identified from naturally-occurring gold in any way. Any iron can be so treated. Rust will not interfere, not will a moderate amount of alloying metals—"

But Ponyets spoke only to fill a vacuum. He let the buckles remain in his outstretched hand, and it was the gold that argued for him.

The Grand Master stretched out a slow hand at last, and the thin-faced Pherl was roused to open speech. "Your Veneration, the gold is from a poisoned source."

And Ponyets countered, "A rose can grow from the mud, your Veneration. In your dealings with your neighbors, you buy material of all imaginable variety, without inquiring as to where they get it, whether from an orthodox machine blessed by your benign ancestors or from some space-spawned outrage. Come, I don't offer the machine. I offer the gold."

"Your Veneration," said Pherl, "you are not responsible for the sins of foreigners who work neither with your consent nor knowledge. But to accept this strange pseudo-gold made sinfully from iron in your presence and with your consent is an affront to the living spirits of our holy ancestors."

"Yet gold is gold," said the Grand Master, doubtfully, "and is but an exchange for the heathen person of a convicted felon. Pherl, you are too critical." But he withdrew his hand.

Ponyets said, "You are wisdom, itself, your Veneration. Consider – to give up a heathen is to lose nothing for your ancestors, whereas with the gold you get in exchange you can ornament the shrines of their holy spirits. And surely, were gold evil in itself, if such, a thing could be, the evil would depart of necessity once the metal were put to such pious use."

"Now by the bones of my grandfather," said the Grand Master with surprising vehemence. His lips separated in a shrill laugh, "Pherl, what do you say of this young man? The statement is valid. It is as valid as the words of my ancestors."

Pherl said gloomily, "So it would seem. Grant that the validity does not turn out to be a device of the Malignant Spirit."

"I'll make it even better," said Ponyets, suddenly. "Hold the gold in hostage. Place it on the altars of your ancestors as an offering and hold me for thirty days. If at the end of that time, there is no evidence of displeasure – if no disasters occur – surely, it would be proof that the offering was accepted. What more can be offered?"

And when the Grand Master rose to his feet to search out disapproval, not a man in the council failed to signal his agreement. Even Pherl chewed the ragged end of his mustache and nodded curtly.

Ponyets smiled and meditated on the uses of a religious education.

5.

Another week rubbed away before the meeting with Pherl was arranged. Ponyets felt the tension, but he was used to the feeling of physical helplessness now. He had left city limits under guard. He was in Pherl's suburban villa under guard. There was nothing to do but accept it without even looking over his shoulder.

Pherl was taller and younger outside the circle of Elders. In nonformal costume, he seemed no Elder at all.

He said abruptly, "You're a peculiar man." His close-set eyes seemed to quiver. "You've done nothing this last week, and particularly these last two hours, but imply that I need gold. It seems useless labor, for who does not? Why not advance one step?"

"It is not simply gold," said Ponyets, discreetly. "Not simply gold. Not merely a coin or two. It is rather all that lies behind gold."

"Now what can lie behind gold?" prodded Pherl, with a down-curved smile. "Certainly this is not the preliminary of another clumsy demonstration."

"Clumsy?" Ponyets frowned slightly.

"Oh, definitely." Pherl folded his hands and nudged them gently with his chin. "I don't criticize you. The clumsiness was on purpose, I am sure. I might have warned his Veneration of *that*, had I been certain of the motive. Now had I been you, I would have produced the gold upon my ship, and offered it alone. The show you offered us and the antagonism you aroused would have been dispensed with."

"True," Ponyets admitted, "but since I was myself, I accepted the antagonism for the sake of attracting your attention."

"Is that it? Simply that?" Pherl made no effort to hide his contemptuous amusement. "And I imagine you suggested the thirty-day purification period that you might assure yourself time to turn the attraction into something a bit more substantial. But what if the gold turns out to be impure?"

Ponyets allowed himself a dark humor in return, "When the judgement of that impurity depends upon those who are most interested in finding it pure?"

Pherl lifted his eyes and stared narrowly at the trader. He seemed at once surprised and satisfied.

"A sensible point. Now tell me why you wished to attract me."

"This I will do. In the short time I have been here, I have observed useful facts that concern you and interest me. For instance, you are young-very young for a member of the council, and even of a relatively young family."

"You criticize my family?"

"Not at all. Your ancestors are great and holy; all will admit that. But there are those that say you are not a member of one of the Five Tribes."

Pherl leaned back, "With all respect to those involved," and he did not hide his venom, "the Five Tribes have impoverished loins and thin blood. Not fifty members of the Tribes are alive."

"Yet there are those who say the nation would not be willing to see any man outside the Tribes as Grand Master. And so young and newly-advanced a favorite of the Grand Master is bound to make powerful enemies among the great ones of the State – it is said. His Veneration is aging and his protection will not last past his death, when it is an enemy of yours who will undoubtedly be the one to interpret the words of his Spirit."

Pherl scowled, "For a foreigner you hear much. Such ears are made for cropping."

"That may be decided later."

"Let me anticipate." Pherl stirred impatiently in his seat. "You're going to offer me wealth and power in terms of those evil little machines you carry in your ship. Well?"

"Suppose it so. What would be your objection? Simply your standard of good and evil?"

Pherl shook his head. "Not at all. Look, my Outlander, your opinion of us in your heathen agnosticism is what it is – but I am not the entire slave of our mythology, though I may appear so. I am an educated man, sir, and, I hope, an enlightened one. The full depth of our religious customs, in the ritualistic rather than the ethical sense, is for the masses."

"Your objection, then?" pressed Ponyets, gently.

"Just that. The masses. I might be willing to deal with you, but your little machines must be used to be useful. How might riches come to me, if I had to use – what is it you sell?– well, a razor, for instance, only in the strictest, trembling secrecy. Even if my chin were more simply and more cleanly shaven, how would I become rich? And how would I avoid death by gas chamber or mob frightfulness if I were ever once caught using it?"

Ponyets shrugged, "You are correct. I might point out that the remedy would be to educate your own people into the use of nucleics for their convenience and your own substantial profit. It would be a gigantic piece of work; I don't deny it; but the returns would be still more gigantic. Still that is your concern, and, at the moment, not mine at all. For I offer neither razor, knife, nor mechanical garbage disposer."

"What do you offer?"

"Gold itself. Directly. You may have the machine I demonstrated last week."

And now Pherl stiffened and the skin on his forehead moved jerkily. "The transmuter?"

"Exactly. Your supply of gold will equal your supply of iron. That, I imagine, is sufficient for all needs. Sufficient for the Grand Mastership itself, despite youth and enemies. And it is safe."

"In what way?"

"In that secrecy is the essence of its use; that same secrecy you described as the only safety with regard to nucleics. You may bury the transmuter in the deepest dungeon of the strongest fortress on your furthest estate, and it will still bring you instant wealth. It is the gold you buy, not the machine, and that gold bears no trace of its manufacture, for it cannot be told from the natural creation."

"And who is to operate the machine?"

"Yourself. Five minutes teaching is all you will require. I'll set it up for you wherever you wish."

"And in return?"

"Well," Ponyets grew cautious. "I ask a price and a handsome one. It is my living. Let us say,— for it its a valuable machine — the equivalent of a cubic foot of gold in wrought iron."

Pherl laughed, and Ponyets grew red. "I point out, sir," he added, stiffly, "that you can get your price back in two hours."

"True, and in one hour, you might be gone, and my machine might suddenly turn out to be useless. I'll need a guarantee."

"You have my word."

"A very good one," Pherl bowed sardonically, "but your presence would be an even better assurance. I'll give you *my* word to pay you one week after delivery in working order."

"Impossible."

"Impossible? When you've already incurred the death penalty very handily by even offering to sell me anything. The only alternative is my word that you'll get the gas chamber tomorrow otherwise."

Ponyet's face was expressionless, but his eyes might have flickered. He said, "It is an unfair advantage. You will at least put your promise in writing?"

"And also become liable for execution? No, sir!" Pherl smiled a broad satisfaction. "No, sir! Only one of us is a fool."

The trader said in a small voice, "It is agreed, then."

6.

Gorov was released on the thirtieth day, and five hundred pounds of the yellowest gold took his place. And with him was released the quarantined and untouched abomination that was his ship.

Then, as on the journey into the Askonian system, so on the journey out, the cylinder of sleek little ships ushered them on their way.

Ponyets watched the dimly sun-lit speck that was Gorov's ship while Gorov's voice pierced through to him, clear and thin on the tight, distortion-bounded ether-beam.

He was saying, "But it isn't what's wanted, Ponyets. A transmuter won't do. Where did you get one, anyway?"

"I didn't," Ponyets answer was patient. "I juiced it up out of a food irradiation chamber. It isn't any good, really. The power consumption is prohibitive on any large scale or the Foundation would use transmutation instead of chasing all over the Galaxy for heavy metals. It's one of the standard tricks every trader uses, except that I never saw an iron-to-gold one before. But it's impressive, and it works — very temporarily."

"All right. But that particular trick is no good."

"It got you out of a nasty spot."

"That is very far from the point. Especially since I've got to go back, once we shake our solicitous escort."

"Why?"

"You yourself explained it to this politician of yours," Gorov's voice was on edge. "Your entire sales-point rested on the fact that the transmuter was a means to an end, but of no value in itself—, that he was buying the gold, not the machine. It was good psychology, since it worked, but—"

"But?" Ponyets urged blandly and obtusely.

The voice from the receiver grew shriller, "But we want to sell them a machine of value in itself, something they would want to use openly; something that would tend to force them out in favor of nuclear techniques as a matter of self-interest."

"I understand all that," said Ponyets, gently. "You once explained it. But look at what follows from my sale, will you? As long as that transmuter lasts, Pherl will coin gold; and it will last long enough to buy him the next election. The present Grand Master won't last long."

"You count on gratitude?" asked Gorov, coldly.

"No – on intelligent self-interest. The transmuter gets him an election; other mechanisms—"

"No! No! Your premise is twisted. It's not the transmuter, he'll credit – it'll be the good, old-fashioned gold. That's what I'm trying to tell you."

Ponyets grinned and shifted into a more comfortable position. All right. He'd baited the poor fellow sufficiently. Gorov was beginning to sound wild.

The trader said, "Not so fast, Gorov. I haven't finished. There are other gadgets already involved."

There was a short silence. Then, Gorov's voice sounded cautiously, "What other gadgets?"

Ponyets gestured automatically and uselessly, "You see that escort?"

"I do," said Gorov shortly. "Tell me about those gadgets."

"I will, –if you'll listen. That's Pherl's private navy escorting us; a special honor to him from the Grand Master. He managed to squeeze that out."

"So?"

"And where do you think he's taking us? To his mining estates on the outskirts of Askone, that's where. Listen!" Ponyets was suddenly fiery, "I told you I was in this to make money, not to save worlds. All right. I sold that transmuter for nothing. Nothing except the risk of the gas chamber and that doesn't count towards the quota."

"Get back to the mining estates, Ponyets. Where do they come in?"

"With the profits. We're stacking up on tin, Gorov. Tin to fill every last cubic foot this old scow can scrape up, and then some more for yours. I'm going down with Pherl to collect, old man, and you're going to cover me from upstairs with every gun you've got – just in case Pherl isn't as sporting about the matter as he lets on to be. That tin's my profit."

"For the transmuter?"

"*For my entire cargo of nucleics. At double price, plus a bonus.*" He shrugged, almost apologetically. "I admit I gouged him, but I've got to make quota, don't I?"

Gorov was evidently lost. He said, weakly, "Do you mind explaining'?"

"What's there to explain? It's obvious, Gorov. Look, the clever dog thought he had me in a foolproof trap, because his word was worth more than mine to the Grand Master. He took the transmuter. That was a capital crime in Askone. But at any time he could say that he had lured me on into a trap with the purest of patriotic motives, and denounce me as a seller of forbidden things."

"That was obvious."

"Sure, but word against simple word wasn't all there was to it. You see, Pherl had never heard nor conceived of a microfilm-recorder."

Gorov laughed suddenly.

"That's right," said Ponyets. "He had the upper hand. I was properly chastened. But when I set up the transmuter for him in my whipped-dog fashion, I incorporated the recorder into the device and removed it in the next day's overhaul. I had a perfect record of his sanctum sanctorum, his holy-of-holies, with he himself, poor Pherl, operating the transmuter for all the ergs it had and crowing over his first piece of gold as if it were an egg he had just laid."

"You showed him the results?"

"Two days later. The poor sap had never seen three-dimensional color-sound images in his life. He claims he isn't superstitious, but if I ever saw an adult look as scared as he did then, call me rookie. When I told him I had a recorder planted in the city square, set to go off at midday with a million fanatical Askonians to watch, and to tear him to pieces subsequently, he was gibbering at my knees in half a second. He was ready to make any deal I wanted."

"Did you?" Gorov's voice was suppressing laughter. "I mean, have one planted in the city square."

"No, but that didn't matter. He made the deal. He bought every gadget I had, and every one you had for as much tin as we could carry. At that moment, he believed me capable of anything. The agreement is in writing and you'll have a copy before I go down with him, just as another precaution."

"But you've damaged his ego," said Gorov. "Will he use the gadgets?"

"Why not? It's his only way of recouping his losses, and if he makes money out of it, he'll salve his pride. And he will be the next Grand Master – and the best man we could have in our favor."

"Yes," said Gorov, "it was a good sale. Yet you've certainly got an uncomfortable sales technique. No wonder you were kicked out of a seminary. Have you no sense of morals?"

"What are the odds?" said Ponyets, indifferently. "You know what Salvor Hardin said about a sense of morals."

PART V

THE MERCHANT PRINCES

1.

TRADERS-. . . With psychohistoric inevitability. economic control of the Foundation grew. The traders grew rich; and with riches came power. . .

It is sometimes forgotten that Hober Mallow began life as an ordinary trader. It is never forgotten that he ended it as the first of the Merchant Princes. . . .

ENCYCLOPEDIA GALACTICA

Jorane Sutt put the tips of carefully-manicured fingers together and said, "It's something of a puzzle. In fact – and this is in the strictest of confidence – it may be another one of Hari Seldon's crises."

The man opposite felt in the pocket of his short Smyrnian jacket for a cigarette. "Don't know about that, Sutt. As a general rule, politicians start shouting 'Seldon crisis' at every mayoralty campaign."

Sutt smiled very faintly, "I'm not campaigning, Mallow. We're facing nuclear weapons, and we don't know where they're coming from."

Hober Mallow of Smyrno, Master Trader, smoked quietly, almost indifferently. "Go on. If you have more to say, get it out." Mallow never made the mistake of being overpolite to a Foundation man. He might be an Outlander, but a man's a man for a' that.

Sutt indicated the trimensional star-map on the table. He adjusted the controls and a cluster of some half-dozen stellar systems blazed red.

"That," he said quietly, "is the Korellian Republic."

The trader nodded, "I've been there. Stinking rathole! I suppose you can call it a republic but it's always someone out of the Argo family that gets elected Commdor each time. And if you ever don't like it – *things* happen to you." He twisted his lip and repeated, "I've been there."

"But you've come back, which hasn't always happened. Three trade ships, inviolate under the Conventions, have disappeared within the territory of the Republic in the last year. And those ships were armed with all the usual nuclear explosives and force-field defenses."

"What was the last word heard from the ships?"

"Routine reports. Nothing else."

"What did Korell say?"

Sutt's eyes gleamed sardonically, "There was no way of asking. The Foundation's greatest asset throughout the Periphery is its reputation of power. Do you think we can lose three ships and ask for them?"

"Well, then, suppose you tell me what you want with me."

Jorane Sutt did not waste his time in the luxury of annoyance. As secretary to the mayor, he had held off opposition councilmen, jobseekers, reformers, and crackpots who claimed to have solved in its entirety the course of future history as worked out by Hari Seldon. With training like that, it took a good deal to disturb him.

He said methodically, "In a moment. You see, three ships lost in the same sector in the same year can't be accident, and nuclear power can be conquered only by more nuclear power. The question automatically arises: if Korell has nuclear weapons, where is it getting them?"

"And where does it?"

"Two alternatives. Either the Korellians have constructed them themselves—"

"Far-fetched!"

"Very! But the other possibility is that we are being afflicted with a case of treason."

"You think so?" Mallow's voice was cold.

The secretary said calmly, "There's nothing miraculous about the possibility. Since the Four Kingdoms accepted the Foundation Convention, we have had to deal with considerable groups of dissident populations in each nation. Each former kingdom has its pretenders and its former noblemen, who can't very well pretend to love the Foundation. Some of them are becoming active, perhaps."

Mallow was a dull red. "I see. Is there anything you want to say to me? I'm a Smyrnian."

"I know. You're a Smyrnian – born in Smyrno, one of the former Four Kingdoms. You're a Foundation man by education only. By birth, you're an Outlander and a foreigner. No doubt your grandfather was a baron at the time of the wars with Anacreon and Loris, and no doubt your family estates were taken away when Sef Sermak redistributed the land."

"No, by Black Space, no! My grandfather was a blood-poor son-of-a-spacer who died heaving coal at starving wages before the Foundation took over. I owe nothing to the old regime. But I was born in Smyrno, and I'm not ashamed of either Smyrno or Smyrnians, by the Galaxy. Your sly little hints of treason aren't going to panic me into licking Foundation spittle. And now you can either give your orders or make your accusations. I don't care which."

"My good Master Trader, I don't care an electron whether your grandfather was King of Smyrno or the greatest pauper on the planet. I recited that rigmarole about your birth and ancestry to show you that I'm not interested in them. Evidently, you missed the point. Let's go back now. You're a Smyrnian. You know the Outlanders. Also, you're a trader and one of the best. You've been to Korell and you know the Korellians. That's where you've got to go."

Mallow breathed deeply, "As a spy?"

"Not at all. As a trader – but with your eyes open. If you can find out where the power is coming from – I might remind you, since you're a Smyrnian, that two of those lost trade ships had Smyrnian crews."

"When do I start?"

"When will your ship be ready?"

"In six days."

"Then that's when you start. You'll have all the details at the Admiralty."

"Right!" The trader rose, shook hands roughly, and strode out.

Sutt waited, spreading his fingers gingerly and rubbing out the pressure; then shrugged his shoulders and stepped into the mayor's office.

The mayor deadened the visiplat and leaned back. "What do you make of it, Sutt?"

"He could be a good actor," said Sutt, and stared thoughtfully ahead.

2.

It was evening of the same day, and in Jorane Sutt's bachelor apartment on the twenty-first floor of the Hardin Building, Publis Manlio was sipping wine slowly.

It was Publis Manlio in whose slight, aging body were fulfilled two great offices of the Foundation. He was Foreign Secretary in the mayor's cabinet, and to all the outer suns, barring only the Foundation itself, he was, in addition, Primate of the Church, Purveyor of the Holy Food, Master of the Temples, and so forth almost indefinitely in confusing but sonorous syllables.

He was saying, "But he agreed to let you send out that trader. It is a point."

"But such a small one," said Sutt. "It gets us nothing immediately. The whole business is the crudest sort of stratagem, since we have no way of foreseeing it to the end. It is a mere paying out of rope on the chance that somewhere along the length of it will be a noose."

"True. And this Mallow is a capable man. What if he is not an easy prey to dupery?"

"That is a chance that must be run. If there is treachery, it is the capable men that are implicated. If not, we need a capable man to detect the truth. And Mallow will be guarded. Your glass is empty."

"No, thanks. I've had enough."

Sutt filled his own glass and patiently endured the other's uneasy reverie.

Of whatever the reverie consisted, it ended indecisively, for the primate said suddenly, almost explosively, "Sutt, what's on your mind?"

"I'll tell you, Manlio." His thin lips parted, "We're in the middle of a Seldon crisis."

Manlio stared, then said softly, "How do you know? Has Seldon appeared in the Time Vault again?"

"That much, my friend, is not necessary. Look, reason it out. Since the Galactic Empire abandoned the Periphery, and threw us on our own, we have never had an opponent who possessed nuclear power. Now, for the first time, we have one. That seems significant even if it stood by itself. And it doesn't. For the first time in over seventy years, we are facing a major domestic political crisis. I should think the synchronization of the two crises, inner and outer, puts it beyond all doubt."

Manlio's eyes narrowed, "If that's all, it's not enough. There have been two Seldon crises so far, and both times the Foundation was in danger of extermination. Nothing can be a third crisis till that danger returns."

Sutt never showed impatience, "That danger is coming. Any fool can tell a crisis when it arrives. The real service to the state is to detect it in embryo. Look, Manlio, we're proceeding along a planned history. We *know* that Hari Seldon worked out the historical probabilities of the future. We *know* that some day we're to rebuild the Galactic Empire. We *know* that it will take a thousand years or thereabouts. And we *know* that in the interval we will face certain definite crises.

"Now the first crisis came fifty years after the establishment of the Foundation, and the second, thirty years later than that. Almost seventy-five years have gone since. It's time, Manlio, it's time."

Manlio rubbed his nose uncertainly, "And you've made your plans to meet this crisis?"

Sutt nodded.

"And I," continued Manlio, "am to play a part in it?"

Sutt nodded again, "Before we can meet the foreign threat of atomic power, we've got to put our own house in order. These traders—"

"Ah!" The primate stiffened, and his eyes grew sharp.

"That's right. These traders. They are useful, but they are too strong – and too uncontrolled. They are Outlanders, educated apart from religion. On the one hand, we put knowledge into their hands, and on the other, we remove our strongest hold upon them."

"If we can prove treachery?"

"If we could, direct action would be simple and sufficient. But that doesn't signify in the least. Even if treason among them did not exist, they would form an uncertain element in our society. They wouldn't be bound to us by patriotism or common descent, or even by religious awe. Under their secular leadership, the outer provinces, which, since Hardin's time, look to us as the Holy Planet, might break away."

"I see all that, but the cure—"

"The cure must come quickly, before the Seldon Crisis becomes acute. If nuclear weapons are without and disaffection within, the odds might be too great." Sutt put down the empty glass he had been fingering, "This is obviously your job."

"Mine?"

"I can't do it. My office is appointive and has no legislative standing."

"The mayor—"

"Impossible. His personality is entirely negative. He is energetic only in evading responsibility. But if an independent party arose that might endanger re-election, he might allow himself to be led."

"But, Sutt, I lack the aptitude for practical politics."

"Leave that to me. Who knows, Manlio? Since Salvor Hardin's time, the primacy and the mayoralty have never been combined in a single person. But it might happen now – if your job were well done."

3.

And at the other end of town, in homelier surroundings, Hober Mallow kept a second appointment. He had listened long, and now he said cautiously, "Yes, I've heard of your campaigns to get trader representation in the council. But why *me*, Twer?"

Jaim Twer, who would remind you any time, asked or unasked, that he was in the first group of Outlanders to receive a lay education at the Foundation, beamed.

"I know what I'm doing," he said. "Remember when I met you first, last year."

"At the Trader's Convention."

"Right. You ran the meeting. You had those red-necked oxen planted in their seats, then put them in your shirtpocket and walked off with them. And you're all right with the Foundation masses, too. You've got *glamor* – or, at any rate, solid adventure-publicity, which is the same thing."

"Very good," said Mallow, dryly. "But why now?"

"Because now's our chance. Do you know that the Secretary of Education has handed in his resignation? It's not out in the open yet, but it will be."

"How do you know?"

"That – never mind –" He waved a disgusted hand. "It's so. The Actionist party is splitting wide open, and we can murder it right now on a straight question of equal rights for traders; or, rather, democracy, pro- and anti-."

Mallow lounged back in his chair and stared at his thick fingers, "Uh-uh. Sorry, Twer. I'm leaving next week on business. You'll have to get someone else."

Twer stared, "Business? What kind of business?"

"Very super-secret. Triple-A priority. All that, you know. Had a talk with the mayor's own secretary."

"Snake Sutt?" Jaim Twer grew excited. "A trick. The son-of-a-spacer is getting rid of you. Mallow –"

"Hold on!" Mallow's hand fell on the other's balled fist. "Don't go into a blaze. If it's a trick, I'll be back some day for the reckoning. If it isn't, your snake, Sutt, is playing into our hands. Listen, there's a Seldon crisis coming up."

Mallow waited for a reaction but it never came. Twer merely stared. "What's a Seldon crisis?"

"Galaxy!" Mallow exploded angrily at the anticlimax, "What the blue blazes did you do when you went to school? What do you mean anyway by a fool question like that?"

The elder man frowned, "If you'll explain—"

There was a long pause, then, "I'll explain." Mallow's eyebrows lowered, and he spoke slowly. "When the Galactic Empire began to die at the edges, and when the ends of the Galaxy reverted to barbarism and dropped away, Hari Seldon and his band of psychologists planted a colony, the Foundation, out here in the middle of the mess, so that we could incubate art, science, and technology, and form the nucleus of the Second Empire."

"Oh, yes, yes—"

"I'm not finished," said the trader, coldly. "The future course of the Foundation was plotted according to the science of psychohistory, then highly developed, and conditions arranged so as to bring about a series of crises that will force us most rapidly along the route to future Empire. Each crisis, each *Seldon* crisis, marks an epoch in our history. We're approaching one now – our third."

Twer shrugged. "I suppose this was mentioned in school, but I've been out of school a long time – longer than you."

"I suppose so. Forget it. What matters is that I'm being sent out into the middle of the development of this crisis. There's no telling what I'll have when I come back, and there is a council election every year."

Twer looked up, "Are you on the track of anything?"

"No."

"You have definite plans?"

"Not the faintest inkling of one."

"Well—"

"Well, nothing. Hardin once said: 'To succeed, planning alone is insufficient. One must improvise as well.' I'll improvise."

Twer shook his head uncertainly, and they stood, looking at each other.

Mallow said, quite suddenly, but quite matter-of-factly, "I tell you what, how about coming with me? Don't stare, man. You've been a trader before you decided there was more excitement in politics. Or so I've heard."

"Where are you going? Tell me that."

Towards the Whassallian Rift. I can't be more specific till we're out in space. What do you say?"

Suppose Sutt decides he wants me where he can see.

"Not likely. If he's anxious to get rid of me, why not of you as well? Besides which, no trader would hit space if he couldn't pick his own crew. I take whom I please."

There was a queer glint in the older man's eyes, "All right. I'll go." He held out his hand, "It'll be my first trip in three years."

Mallow grasped and shook the other's hand, "Good! All fired good! And now I've got to round up the boys. You know where the *Far Star* docks, don't you? Then show up tomorrow. Good-by."

4.

Korell is that frequent phenomenon in history: the republic whose ruler has every attribute of the absolute monarch but the name. It therefore enjoyed the usual despotism unrestrained even by those two moderating influences in the legitimate monarchies: regal "honor" and court etiquette.

Materially, its prosperity was low. The day of the Galactic Empire had departed, with nothing but silent memorials and broken structures to testify to it. The day of the Foundation had not yet come – and in the fierce determination of its ruler, the Commdor Asper Argo, with his strict regulation of the traders and his stricter prohibition of the missionaries, it was never coming.

The spaceport itself was decrepit and decayed, and the crew of the *Far Star* were drearily aware of that. The moldering hangars made for a moldering atmosphere and Jaim Twer itched and fretted over a game of solitaire.

Hober Mallow said thoughtfully, "Good trading material here." He was staring quietly out the viewport. So far, there was little else to be said about Korell. The trip here was uneventful. The squadron of Korellian ships that had shot out to intercept the *Far Star* had been tiny, limping relics of ancient glory or battered, clumsy hulks. They had maintained their distance fearfully, and still maintained it, and for a week now, Mallow's requests for an audience with the local go government had been unanswered.

Mallow repeated, "Good trading here. You might call this virgin territory."

Jaim Twer looked up impatiently, and threw his cards aside, "What the devil do you intend doing, Mallow? The crew's grumbling, the officers are worried, and I'm wondering–"

"Wondering? About what?"

"About the situation. And about you. What are we doing?"

"Waiting."

The old trader snorted and grew red. He growled, "You're going it blind, Mallow. There's a guard around the field and there are ships overhead. Suppose they're getting ready to blow us into a hole in the ground."

"They've had a week."

"Maybe they're waiting for reinforcements." Twer's eyes were sharp and hard.

Mallow sat down abruptly, "Yes, I'd thought of that You see, it poses a pretty problem. First, we got here without trouble. That may mean nothing, however, for only three ships out of better than three hundred went a-glimmer last year. The percentage is low. But that may mean also that the number of their ships equipped with nuclear power is small, and that they dare not expose them needlessly, until that number grows.

"But it could mean, on the other hand, that they haven't nuclear power after all. Or maybe they have and are keeping undercover, for fear we know something. It's one thing, after all, to pirate blundering, light-armed merchant ships. It's another to fool around with an accredited envoy of the Foundation when the mere fact of his presence may mean the Foundation is growing suspicious.

"Combine this—"

"Hold on, Mallow, hold on." Twer raised his hands. "You're just about drowning me with talk. What're you getting at? Never mind the in-betweens."

"You've got to have the in-betweens, or you won't understand, Twer. We're both waiting. They don't know what I'm doing here and I don't know what they've got here. But I'm in the weaker position because I'm one and they're an entire world — maybe with atomic power. I can't afford to be the one to weaken. Sure it's dangerous. Sure there may be a hole in the ground waiting for us. But we knew that from the start. What else is there to do?"

"I don't— Who's that, now?"

Mallow looked up patiently, and tuned the receiver. The visiplat glowed into the craggy face of the watch sergeant.

"Speak, sergeant."

The sergeant said, "Pardon, sir. The men have given entry to a Foundation missionary."

"A *what*?" Mallow's face grew livid.

"A missionary, sir. He's in need of hospitalization, sir—"

"There'll be more than one in need of that, sergeant, for this piece of work. Order the men to battle stations."

Crew's lounge was almost empty. Five minutes after the order, even the men on the off-shift were at their guns. It was speed that was the great virtue in the anarchic regions of the interstellar space of the Periphery, and it was in speed above all that the crew of a master trader excelled.

Mallow entered slowly, and stared the missionary up and down and around. His eye slid to Lieutenant Tinter, who shifted uneasily to one side and to Watch-Sergeant Demen, whose blank face and stolid figure flanked the other.

The Master Trader turned to Twer and paused thoughtfully, "Well, then, Twer, get the officers here quietly, except for the coordinators and the trajectorian. The men are to remain at stations till further orders."

There was a five-minute hiatus, in which Mallow kicked open the doors to the lavatories, looked behind the bar, pulled the draperies across the thick windows. For half a minute he left the room altogether, and when he returned he was humming abstractedly.

Men filed in. Twer followed, and closed the door silently.

Mallow said quietly, "First, who let this man in without orders from me?"

The watch sergeant stepped forward. Every eye shifted. "Pardon, sir. It was no definite person. It was a sort of mutual agreement. He was one of us, you might say, and these foreigners here—"

Mallow cut him short, "I sympathize with your feelings, sergeant, and understand them. These men, were they under your command?"

"Yes, sir."

"When this is over, they're to be confined to individual quarters for a week. You yourself are relieved of all supervisory duties for a similar period. Understood?"

The sergeant's face never changed, but there was the slightest droop to his shoulders. He said, crisply, "Yes, sir."

"You may leave. Get to your gun-station."

The door closed behind him and the babble rose.

Twer broke in, "Why the punishment, Mallow? You know that these Korellians kill captured missionaries."

"An action against my orders is bad in itself whatever other reasons there may be in its favor. No one was to leave or enter the ship without permission."

Lieutenant Tinter murmured rebelliously, "Seven days without action. You can't maintain discipline that way."

Mallow said icily, "I can. There's no merit in discipline under ideal circumstances. I'll have it in the face of death, or it's useless. Where's this missionary? Get him here in front of me."

The trader sat down, while the scarlet-cloaked figure was carefully brought forward.

"What's your name, reverend?"

"Eh?" The scarlet-robed figure wheeled towards Mallow, the whole body turning as a unit. His eyes were blankly open and there was a bruise on one temple. He had not spoken, nor, as far as Mallow could tell, moved during all the previous interval.

"Your name, reverend one?"

The missionary started to sudden feverish life. His arms went out in an embracing gesture. "My son – my children. May you always be in the protecting arms of the Galactic Spirit."

Twer stepped forward, eyes troubled, voice husky, "The man's sick. Take him to bed, somebody. Order him to bed, Mallow, and have him seen to. He's badly hurt."

Mallow's great arm shoved him back, "Don't interfere, Twer, or I'll have you out of the room. Your name, reverend one?"

The missionary's hands clasped in sudden supplication, "As you are enlightened men, save me from the heathen." The words tumbled out, "Save me from these brutes and darkened ones who raven after me and would afflict the Galactic Spirit with their crimes. I am Jord Parma, of the Anacreonian worlds. Educated at the Foundation; the Foundation itself, my children. I am a Priest of the Spirit educated into all the mysteries, who have come here where the inner voice called me." He was gasping. "I have suffered at the hands of the unenlightened. As you are Children of the Spirit; and in the name of that Spirit, protect me from them."

A voice broke in upon them, as the emergency alarm box clamored metallically:
"Enemy units in sight! Instruction desired!"

Every eye shot mechanically upward to the speaker.

Mallow swore violently. He clicked open the reverse and yelled, "Maintain vigil! That is all!" and turned it off.

He made his way to the thick drapes that rustled aside at a touch and stared grimly out,

Enemy units! Several thousands of them in the persons of the individual members of a Korellian mob. The rolling rabble encompassed the port from extreme end to extreme end, and in the cold, hard light of magnesium flares the foremost straggled closer.

"Tinter!" The trader never turned, but the back of his neck was red. "Get the outer speaker working and find out what they want. Ask if they have a representative of the law with them. Make no promises and no threats, or I'll kill you."

Tinter turned and left.

Mallow felt a rough hand on his shoulder and he struck it aside. It was Twer. His voice was an angry hiss in his ear, "Mallow, you're bound to hold onto this man. There's no way of maintaining decency and honor otherwise. He's of the Foundation and, after all, he – is a priest. These savages outside– Do you hear me?"

"I hear you, Twer." Mallow's voice was incisive. "I've got more to do here than guard missionaries. I'll do, sir, what I please, and, by Seldon and all the Galaxy, if you try to stop me, I'll tear out your stinking windpipe. Don't get in my way, Twer, or it will be the last of you."

He turned and strode past. "You! Revered Parma! Did you know that, by convention, no Foundation missionaries may enter the Korellian territory?"

The missionary was trembling, "I can but go where the Spirit leads, my son. If the darkened ones refuse enlightenment, is it not the greater sign of their need for it?"

"That's outside the question, reverend one. You are here against the law of both Korell and the Foundation. I cannot in law protect you."

The missionary's hands were raised again. His earlier bewilderment was gone. There was the raucous clamor of the ship's outer communication system in action, and the faint, undulating gabble of the angry horde in response. The sound made his eyes wild.

"You hear them? Why do you talk of law to me, of a law made by men? There are higher laws. Was it not the Galactic Spirit that said: Thou shalt not stand idly by to the hurl of thy fellowman. And has he not said: Even as thou dealest with the humble and defenseless, thus shalt thou be dealt with.

"Have you not guns? Have you not a ship? And behind you is there not the Foundation? And above and all-about you is there not the Spirit that rules the universe?" He paused for breath.

And then the great outer voice of the Far Star ceased and Lieutenant Tinter was back, troubled.

"Speak!" said Mallow, shortly.

"Sir, they demand the person of Jord Parma."

"If not?"

"There are various threats, sir. It is difficult to make much out. There are so many – and they seem quite mad. There is someone who says he governs the district and has police powers, but he is quite evidently not his own master."

"Master or not," shrugged Mallow, "he is the law. Tell them that if this governor, or policeman, or whatever he is, approaches the ship alone, he can have the Revered Jord Parma."

And there was suddenly a gun in his hand. He added, "I don't know what insubordination is. I have never had any experience with it. But if there's anyone here who thinks he can teach me, I'd like to teach him my antidote in return."

The gun swiveled slowly, and rested on Twer. With an effort, the old trader's face untwisted and his hands unclenched and lowered. His breath was a harsh rasp in his nostrils.

Tinter left, and in five minutes a puny figure detached itself from the crowd. It approached slowly and hesitantly, plainly drenched in fear and apprehension. Twice it turned back, and twice the patently obvious threats of the many-headed monster urged him on.

"All right," Mallow gestured with the hand-blaster, which remained unsheathed. "Grun and Upshur, take him out."

The missionary screeched. He raised his arms and rigid fingers speared upward as the voluminous sleeves fell away to reveal the thin, veined arms. There was a momentary, tiny flash of light that came and went in a breath. Mallow blinked and gestured again, contemptuously.

The missionary's voice poured out as he struggled in the two-fold grasp, "Cursed be the traitor who abandons his fellowman to evil and to death. Deafened be the ears that are deaf to the pleadings of the helpless. Blind be the eyes that are blind to innocence. Blackened forever be the soul that consorts with blackness–"

Twer clamped his hands tightly over his ears.

Mallow flipped his blaster and put it away. "Disperse," he said, evenly, "to respective stations. Maintain full vigil for six hours after dispersion of crowd. Double stations for forty-eight hours thereafter. Further instructions at that time. Twer, come with me."

They were alone in Mallow's private quarters. Mallow indicated a chair and Twer sat down. His stocky figure looked shrunken.

Mallow stared him down, sardonically. "Twer," he said, "I'm disappointed. Your three years in politics seem to have gotten you out of trader habits. Remember, I may be a democrat back at the Foundation, but there's nothing short of tyranny that can run my ship the way I want it run. I never had to pull a blaster on my men before, and I wouldn't have had to now, if you hadn't gone out of line.

"Twer, you have no official position, but you're here on my invitation, and I'll extend you every courtesy – in private. However, from now on, in the presence of my

officers or men, I'm 'sir,' and not 'Mallow.' And when I give an order, you'll jump faster than a third-class recruit just for luck, or I'll have you handcuffed in the sub-level even faster. Understand?"

The party-leader swallowed dryly. He said, reluctantly, "My apologies."

"Accepted! Will you shake?"

Twer's limp fingers were swallowed in Mallow's huge palm. Twer said, "My motives were good. It's difficult to send a man out to be lynched. That wobbly-kneed governor or whatever-he-was can't save him. It's murder."

"I can't help that. Frankly, the incident smelled too bad. Didn't you notice?"

"Notice what?"

"This spaceport is deep in the middle of a sleepy far section. Suddenly a missionary escapes. Where from? He comes here. Coincidence? A huge crowd gathers. From where? The nearest city of any size must be at least a hundred miles away. But they arrive in half an hour. How?"

"How?" echoed Twer.

"Well, what if the missionary were brought here and released as bait. Our friend, Revered Parma, was considerably confused. He seemed at no time to be in complete possession of his wits."

"Hard usage—" murmured Twer bitterly.

"Maybe! And maybe the idea was to have us go all chivalrous and gallant, into a stupid defense of the man. He was here against the laws of Korell and the Foundation. If I withhold him, it is an act of war against Korell, and the Foundation would have no legal right to defend us."

"That – that's pretty far-fetched."

The speaker blared and forestalled Mallow's answer: "Sir, official communication received."

"Submit immediately!"

The gleaming cylinder arrived in its slot with a click. Mallow opened it and shook out the silver-impregnated sheet it held. He rubbed it appreciatively between thumb and finger and said, "Teleported direct from the capital. Commdor's own stationery."

He read it in a glance and laughed shortly, "So my idea was far-fetched, was it?"

He tossed it to Twer, and added, "Half an hour after we hand back the missionary, we finally get a very polite invitation to the Commdor's august presence – after seven days of previous waiting. *I think we passed a test.*"

5.

Commdor Asper was a man of the people, by self-acclamation. His remaining back-fringe of gray hair drooped limply to his shoulders, his shirt needed laundering, and he spoke with a snuffle.

"There is no ostentation here, Trader Mallow," he said. "No false show. In me, you see merely the first citizen of the state. That's what Commdor means, and that's the only title I have."

He seemed inordinately pleased with it all, "in fact, I consider that fact one of the strongest bonds between Korell and your nation. I understand you people enjoy the republican blessings we do."

"Exactly, Commdor," said Mallow gravely, taking mental exception to the comparison, "an argument which I consider strongly in favor of continued peace and friendship between our governments."

"Peace! Ah!" The Commdor's sparse gray beard twitched to the sentimental grimaces of his face. "I don't think there is anyone in the Periphery who has so near his heart the ideal of Peace, as I have. I can truthfully say that since I succeeded my illustrious father to the leadership of the state, the reign of Peace has never been broken. Perhaps I shouldn't say it" –he coughed gently– "but I *have* been told that my people, my fellow-citizens rather, know me as Asper, the Well-Beloved."

Mallow's eyes wandered over the well-kept garden. Perhaps the tall men and the strangely-designed but openly-vicious weapons they carried just happened to be lurking in odd comers as a precaution against himself. That would be understandable. But the lofty, steel-girdered walls that circled the place had quite obviously been recently strengthened – an unfitting occupation for such a Well-Beloved Asper.

He said, "It is fortunate that I have you to deal with then, Commdor. The despots and monarchs of surrounding worlds, which haven't the benefit of enlightened administration, often lack the qualities that would make a ruler well-beloved."

"Such as?" There was a cautious note in the Commdor's voice.

"Such as a concern for the best interests of their people, You, on the other hand, would understand,"

The Commdor kept his eyes on the gravel path as they walked leisurely, His hands caressed each other behind his back.

Mallow went on smoothly, "Up to now, trade between our two nations has suffered because of the restrictions placed upon our traders by your government. Surely, it has long been evident to you that unlimited trade–"

"Free Trade!" mumbled the Commdor.

"Free Trade, then. You must see that it would be of benefit to both of us. There are things you have that we want, and things we have that you want. It asks only an exchange to bring increased prosperity. An enlightened ruler such as yourself, a friend of the people – I might say, a *member* of the people – needs no elaboration on that theme. I won't insult your intelligence by offering any."

"True! I have seen this. But what would you?" His voice was a plaintive whine. "Your people have always been so unreasonable. I am in favor of all the trade our economy can support, but not on your terms. I am not sole master here." His voice rose, "I am only the servant of public opinion. My people will not take commerce which carries with it a compulsory religion."

Mallow drew himself up, "A compulsory religion?"

"So it has always been in effect. Surely you remember the case of Askone twenty years ago. First they were sold some of your goods and then your people asked for complete freedom of missionary effort in order that the goods might be run properly; that Temples of Health be set up. There was then the establishment of religious schools; autonomous rights for all officers of the religion and with what result? Askone is now an integral member of the Foundation's system and the Grand Master cannot call his underwear his own. Oh, no! Oh, no! The dignity of an independent people could never suffer it."

"None of what you speak is at all what I suggest," interposed Mallow.

"No?"

"No. I'm a Master Trader. Money is my religion. All this mysticism and hocus-pocus of the missionaries annoy me, and I'm glad you refuse to countenance it. It makes you more my type of man."

The Commdor's laugh was high-pitched and jerky, "Well said! The Foundation should have sent a man of your caliber before this."

He laid a friendly hand upon the trader's bulking shoulder, "But man, you have told me only half. You have told me what the catch is *not*. Now tell me what it *is*."

"The only catch, Commdor, is that you're going to be burdened with an immense quantity of riches."

"Indeed?" he snuffled. "But what could I want with riches? The true wealth is the love of one's people. I have that."

"You can have both, for it is possible to gather gold with one hand and love with the other."

"Now that, my young man, would be an interesting phenomenon, if it were possible. How would you go about it?"

"Oh, in a number of ways. The difficulty is choosing among them. Let's see. Well, luxury items, for instance. This object here, now—"

Mallow drew gently out of an inner pocket a flat, linked chain of polished metal. "This, for instance."

"What is it?"

"That's got to be demonstrated. Can you get a woman? Any young female will do. *And* a mirror, full length."

"Hm-m-m. Let's get indoors, then."

The Commdor referred to his dwelling place as a house. The populace undoubtedly would call it a palace. To Mallow's straightforward eyes, it looked uncommonly like a fortress. It was built on an eminence that overlooked the capital. Its walls were thick and reinforced. Its approaches were guarded, and its architecture was shaped for defense. Just the type of dwelling, Mallow thought sourly, for Asper, the Well-Beloved.

A young girl was before them. She bent low to the Commdor, who said, "This is one of the Commdora's girls. Will she do?"

"Perfectly!"

The Commdor watched carefully while Mallow snapped the chain about the girl's waist, and stepped back.

The Commdor snuffled, "Well. Is that all?"

"Will you draw the curtain, Commdor. Young lady, there's a little knob just near the snap. Will you move it upward, please? Go ahead, it won't hurt you."

The girl did so, drew a sharp breath, looked at her hands, and gasped, "Oh!"

From her waist as a source she was drowned in a pale, streaming luminescence of shifting color that drew itself over her head in a flashing coronet of liquid fire. It was as if someone had tom the aurora borealis out of the sky and molded it into a cloak.

The girl stepped to the mirror and stared, fascinated.

"Here, take this." Mallow handed her a necklace of dull pebbles. "Put it around your neck."

The girl did so, and each pebble, as it entered the luminescent field became an individual flame that leaped and sparkled in crimson and gold.

"What do you think of it?" Mallow asked her. The girl didn't answer but there was adoration in her eyes. The Commdor gestured and reluctantly, she pushed the knob down, and the glory died. She left – with a memory.

"It's yours, Commdor," said Mallow, "for the Commdora. Consider it a small gift from the Foundation."

"Hm-m-m.' The Commdor turned the belt and necklace over in his hand as though calculating the weight. "How is it done?"

Mallow shrugged, "That's a question for our technical experts. But it will work for you without – mark you, *without* – priestly help."

"Well, it's only feminine frippery after all. What could you do with it? Where would the money come in?"

"You have balls, receptions, banquets – that sort of thing?"

"Oh, yes."

"Do you realize what women will pay for that sort of jewelry? Ten thousand credits, at least."

The Commdor seemed struck in a heap, "Ah!"

"And since the power unit of this particular item will not last longer than six months, there will be the necessity of frequent replacements. Now we can sell as many of these as you want for the equivalent in wrought iron of one thousand credits. There's nine hundred percent profit for you."

The Commdor plucked at his beard and seemed engaged in awesome mental calculations, "Galaxy, how they would fight for them. I'll keep the supply small and let them bid. Of course, it wouldn't do to let them know that I personally–"

Mallow said, "We can explain the workings of dummy corporations, if you would like. –Then, working further at random, take our complete line of household gadgets. We have collapsible stoves that will roast the toughest meats to the desired tenderness in two minutes. We've got knives that won't require sharpening. We've got the equivalent of a

complete laundry that can be packed in a small closet and will work entirely automatically. Ditto dish-washers. Ditto-ditto floor-scrubbers, furniture polishers, dust-precipitators, lighting fixtures – oh, anything you like. Think of your increased popularity, *if* you make them available to the public. Think of your increased quantity of, uh, worldly goods, if they're available as a government monopoly at nine hundred percent profit. It will be worth many times the money to them, and they needn't know what you pay for it. And, mind you, none of it will require priestly supervision. Everybody will be happy."

"Except you, it seems. What do you get out of it?"

"Just what every trader gets by Foundation law. My men and I will collect half of whatever profits we take in. Just you buy all I want to sell you, and we'll both make out quite well. *Quite* well."

The Commdor was enjoying his thoughts, "What did you say you wanted to be paid with? Iron?"

"That, and coal, and bauxite. Also tobacco, pepper, magnesium, hardwood. Nothing you haven't got enough of."

"It sounds well."

"I think so. Oh, and still another item at random, Commdor. I could retool your factories."

"Eh? How's that?"

"Well, take your steel foundries. I have handy little gadgets that could do tricks with steel that would cut production costs to one percent of previous marks. You could cut prices by half, and still split extremely fat profits with the manufacturers. I tell you, I could show you exactly what I mean, if you allowed me a demonstration. Do you have a steel foundry in this city? It wouldn't take long."

"It could be arranged, Trader Mallow. But tomorrow, tomorrow. Would you dine with us tonight?"

"My men—" began Mallow.

"Let them all come," said the Commdor, expansively. "A symbolic friendly union of our nations. It will give us a chance for further friendly discussion. But one thing," his face lengthened and grew stem, "none of your religion. Don't think that all this is an entering wedge for the missionaries."

"Commdor," said Mallow, dryly, "I give you my word that religion would cut my profits."

"Then that will do for now. You'll be escorted back to your ship."

6.

The Commdora was much younger than her husband. Her face was pale and coldly formed and her black hair was drawn smoothly and tightly back.

Her voice was tart. "You are quite finished, my gracious and noble husband? Quite, *quite* finished? I suppose I may even enter the garden if I wish, now."

"There is no need for dramatics, Licia, my dear," said the Commdor, mildly. "The young man will attend at dinner tonight, and you can speak with him all you wish and even amuse yourself by listening to all I say. Room will have to be arranged for his men somewhere about the place. The stars grant that they be few in numbers."

"Most likely they'll be great hogs of eaters who will eat meat by the quarter-animal and wine by the hogshead. And you will groan for two nights when you calculate the expense."

"Well now, perhaps I won't. Despite your opinion, the dinner is to be on the most lavish scale."

"Oh, I see." She stared at him contemptuously. "You are very friendly with these barbarians. Perhaps that is why I was not to be permitted to attend your conversation. Perhaps your little weazened soul is plotting to turn against my father."

"Not at all."

"Yes, I'd be likely to believe you, wouldn't I? If ever a poor woman was sacrificed for policy to an unsavory marriage, it was myself. I could have picked a more proper man from the alleys and mudheaps of my native world."

"Well, now, I'll tell you what, my lady. Perhaps you would enjoy returning to your native world. Except that, to retain as a souvenir that portion of you with which I am best acquainted, I could have your tongue cut out first. And," he tolled his head, calculatingly, to one side, "as a final improving touch to your beauty, your ears and the tip of your nose as well."

"You wouldn't dare, you little pug-dog. My father would pulverize your toy nation to meteoric dust. In fact, he might do it in any case, if I told him you were treating with these barbarians."

"Hm-m-m. Well, there's no need for threats. You are free to question the man yourself tonight. Meanwhile, madam, keep your wagging tongue still."

"At your orders?"

"Here, take this, then, and keep still."

The band was about her waist and the necklace around her neck. He pushed the knob himself and stepped back.

The Commdora drew in her breath and held out her hands stiffly. She fingered the necklace gingerly, and gasped again.

The Commdor rubbed his hands with satisfaction and said, "You may wear it tonight – and I'll get you more. Now keep still."

The Commdora kept still.

7.

Jaim Twer fidgeted and shuffled his feet. He said, "What's twisting *your* face?"

Hober Mallow lifted out of his brooding, "Is my face twisted? It's not meant so."

"Something must have happened yesterday, –I mean, besides that feast." With sudden conviction, "Mallow, there's trouble, isn't there?"

"Trouble? No. Quite the opposite. In fact, I'm in the position of throwing my full weight against a door and finding it ajar at the time. We're getting into this steel foundry too easily."

"You suspect a trap?"

"Oh, for Seldon's sake, don't be melodramatic." Mallow swallowed his impatience and added conversationally, "It's just that the easy entrance means there will be nothing to see."

"Nuclear power, huh?" Twer ruminated. "I'll tell you. There's just about no evidence of any nuclear power economy here in Korell. And it would be pretty hard to mask all signs of the widespread effects a fundamental technology such as nucleics would have on everything."

"Not if it was just starting up, Twer, and being applied to a war economy. You'd find it in the shipyards and the steel foundries only."

"So if we don't find it, then–"

"Then they haven't got it – or they're not showing it. Toss a coin or take a guess."

Twer shook his head, "I wish I'd been with you yesterday."

"I wish you had, too," said Mallow stonily. "I have no objection to moral support. Unfortunately, it was the Commdor who set the terms of the meeting, and not myself. And what is coming now would seem to be the royal groundcar to escort us to the foundry. Have you got the gadgets?"

"All of them."

8.

The foundry was large, and bore the odor of decay which no amount of superficial repairs could quite erase. It was empty now and in quite an unnatural state of quiet, as it played unaccustomed host to the Commdor and his court.

Mallow had swung the steel sheet onto the two supports with a careless heave. He had taken the instrument held out to him by Twer and was gripping the leather handle inside its leaden sheath.

"The instrument," he said, "is dangerous, but so is a buzz saw. You just have to keep your fingers away."

And as he spoke, he drew the muzzle-slit swiftly down the length of the steel sheet, which quietly and instantly fell in two.

There was a unanimous jump, and Mallow laughed. He picked up one of the halves and propped it against his knee, "You can adjust the cutting-length accurately to a hundredth of an inch, and a two-inch sheet will slit down the middle as easily as this thing did. If you've got the thickness exactly judged, you can place steel on a wooden table, and split the metal without scratching the wood."

And at each phrase, the nuclear shear moved and a gouged chunk of steel flew across the room.

"That," he said, "is whittling – with steel."

He passed back the shear. "Or else you have the plane. Do you want to decrease the thickness of a sheet, smooth out an irregularity, remove corrosion? Watch!"

Thin, transparent foil flew off the other half of the original sheet in six-inch swarths, then eight-inch, then twelve.

"Or drills? It's all the same principle."

They were crowded around now. It might have been a sleight-of-hand show, a comer magician, a vaudeville act made into high-pressure salesmanship. Commdor Asper fingered scraps of steel. High officials of the government tiptoed over each other's shoulders, and whispered, while Mallow punched clean, beautiful round holes through an inch of hard steel at every touch of his nuclear drill.

"Just one more demonstration. Bring two short lengths of pipe, somebody."

An Honorable Chamberlain of something-or-other sprang to obedience in the general excitement and thought-absorption, and stained his hands like any laborer.

Mallow stood them upright and shaved the ends off with a single stroke of the shear, and then joined the pipes, fresh cut to fresh cut.

And there was a single pipe! The new ends, with even atomic irregularities missing, formed one piece upon joining.

Then Mallow looked up at his audience, stumbled at his first word and stopped. There was the keen stirring of excitement in his chest, and the base of his stomach went tingly and cold.

The Commdor's own bodyguard, in the confusion, had struggled to the front line, and Mallow, for the first time, was near enough to see their unfamiliar hand-weapons in detail.

They were nuclear! There was no mistaking it; an explosive projectile weapon with a barrel like that was impossible. But that wasn't the big point. That wasn't the point at all.

The butts of those weapons had, deeply etched upon them, in worn gold plating, the *Spaceship-and-Sun!*

The same *Spaceship-and-Sun* that was stamped on every one of the great volumes of the original Encyclopedia that the Foundation had begun and not yet finished. *The same Spaceship-and-Sun that had blazoned the banner of the Galactic Empire through millennia.*

Mallow talked through and around his thoughts, "Test that pipe! It's one piece. Not perfect; naturally, the joining shouldn't be done by hand."

There was no need of further legerdemain. It had gone over. Mallow was through. He had what he wanted. There was only one thing in his mind. The golden globe with its conventionalized rays, and the oblique cigar shape that was a space vessel.

The *Spaceship-and-Sun of the Empire!*

The Empire! The words drilled! A century and a half had passed but there was still the-Empire, somewhere deeper in the Galaxy. And it was emerging again, out into the Periphery.

Mallow smiled!

9.

The *Far Star* was two days out in space, when Hober Mallow, in his private quarters with Senior Lieutenant Drawt, handed him an envelope, a roll of microfilm, and a silvery spheroid.

"As of an hour from now, Lieutenant, you're Acting Captain of the *Far Star*, until I return, –or forever."

Drawt made a motion of standing but Mallow waved him down imperiously.

"Quiet, and listen. The envelope contains the exact location of the planet to which you're to proceed. There you will wait for me for two months. If, before the two months are up, the Foundation locates you, the microfilm is my report of the trip.

"If, however," and his voice was somber, "I do *not* return at the end of two months, and Foundation vessels do not locate you, proceed to the planet, Terminus, and hand in the Time Capsule as the report. Do you understand that?"

"Yes, sir."

"At no time are you, or any of the men, to amplify in any single instance, my official report."

"If we are questioned, sir?"

"Then you know nothing."

"Yes, sir."

The interview ended, and fifty minutes later, a lifeboat kicked lightly off the side of the *Far Star*.

10.

Onum Barr was an old man, too old to be afraid. Since the last disturbances, he had lived alone on the fringes of the land with what books he had saved from the ruins. He had nothing he feared losing, least of all the worn remnant of his life, and so he faced the intruder without cringing.

"Your door was open," the stranger explained.

His accent was clipped and harsh, and Barr did not fail to notice the strange blue-steel hand-weapon at his hip. In the half gloom of the small room, Barr saw the glow of a force-shield surrounding the man.

He said, wearily, "There is no reason to keep it closed. Do you wish anything of me?"

"Yes." The stranger remained standing in the center of the room. He was large, both in height and bulk. "Yours is the only house about here."

"It is a desolate place," agreed Barr, "but there is a town to the east. I can show you the way'."

"In a while. May I sit?"

"If the chairs will hold you," said the old man, gravely. They were old, too. Relics of a better youth.

The stranger said, "My name is Hober Mallow. I come from a far province."

Barr nodded and smiled, "Your tongue convicted you of that long ago. I am Onum Barr of Siwenna – and once Patrician of the Empire."

"Then this *is* Siwenna. I had only old maps to guide me."

"They would have to be old, indeed, for star-positions to be misplaced."

Barr sat quite still, while the other's eyes drifted away into a reverie. He noticed that the nuclear force-shield had vanished from about the man and admitted dryly to himself that his person no longer seemed formidable to strangers – or even, for good or for evil, to his enemies.

He said, "My house is poor and my resources few. You may share what I have if your stomach can endure black bread and dried corn."

Mallow shook his head, "No, I have eaten, and I can't stay. All I need are the directions to the center of government."

"That is easily enough done, and poor though I am, deprives me of nothing. Do you mean the capital of the planet, or of the Imperial Sector?"

The younger man's eyes narrowed, "Aren't the two identical? Isn't this Siwenna?"

The old patrician nodded slowly, "Siwenna, yes. But Siwenna is no longer capital of the Normannic Sector. Your old map has misled you after all. The stars may not change even in centuries, but political boundaries are all too fluid."

"That's too bad. In fact, that's very bad. Is the new capital far off?"

"It's on Orsha II. Twenty parsecs off. Your map will direct you. How old is it?"

"A hundred and fifty years."

"That old?" The old man sighed. "History has been crowded since. Do you know any of it?"

Mallow shook his head slowly.

Barr said, "You're fortunate. It has been an evil time for the provinces, but for the reign of Stannell VI, and he died fifty years ago. Since that time, rebellion and ruin, ruin and rebellion." Barr wondered if he were growing garrulous. It was a lonely life out here, and he had so little chance to talk to men.

Mallow said with sudden sharpness, "Ruin, eh? You sound as if the province were impoverished."

"Perhaps not on an absolute scale. The physical resources of twenty-five first-rank planets take a long time to use up. Compared to the wealth of the last century, though, we have gone a long way downhill – and there is no sign of turning, not yet. Why are you so interested in all this, young man? You are all alive and your eyes shine!"

The trader came near enough to blushing, as the faded eyes seemed to look too deep into his and smile at what they saw.

He said, "Now look here. I'm a trader out there – out toward the rim of the Galaxy. I've located some old maps, and I'm out to open new markets. Naturally, talk of impoverished provinces disturbs me. You can't get money out of a world unless money's there to be got. Now how's Siwenna, for instance?"

The old man leaned forward, "I cannot say. It will do even yet, perhaps. But you a trader? You look more like a fighting man. You hold your hand near your gun and there is a scar on your jawbone."

Mallow jerked his head, "There isn't much law out there where I come from. Fighting and scars are part of a trader's overhead. But fighting is only useful when there's money at the end, and if I can get it without, so much the sweeter. Now will I find enough money here to make it worth the fighting? I take it I can find the fighting easily enough."

"Easily enough," agreed Barr. "You could join Wiscard's remnants in the Red Stars. I don't know, though, if you'd call that fighting or piracy. Or you could join our present gracious viceroy – gracious by right of murder, pillage, rapine, and the word of a boy Emperor, since rightfully assassinated." The patrician's thin cheeks reddened. His eyes closed and then opened, bird-bright.

"You don't sound very friendly to the viceroy, Patrician Barr," said Mallow. "What if I'm one of his spies?"

"What if you are?" said Barr, bitterly. "What can you take?" He gestured a withered arm at the bare interior of the decaying mansion.

"Your life."

"It would leave me easily enough. It has been with me five years too long. But you are *not* one of the viceroy's men. If you were, perhaps even now instinctive self-preservation would keep my mouth closed."

"How do you know?"

The old man laughed, "You seem suspicious – Come, I'll wager you think I'm trying to trap you into denouncing the government. No, no. I am past politics."

"Past politics? Is a man ever past that? The words you used to describe the viceroy – what were they? Murder, pillage, all that. You didn't sound objective. Not exactly. Not as if you were past politics."

The old man shrugged, "Memories sting when they come suddenly. Listen! Judge for yourself! When Siwenna was the provincial capital, I was a patrician and a member of the provincial senate. My family was an old and honored one. One of my great-grandfathers had been – No, never mind that. Past glories are poor feeding."

"I take it," said Mallow, "there was a civil war, or a revolution."

Barr's face darkened. "Civil wars are chronic in these degenerate days, but Siwenna had kept apart. Under Stannell VI, it had almost achieved its ancient prosperity. But weak emperors followed, and weak emperors mean strong viceroys, and our last viceroy – the same Wiscard, whose remnants still prey on the commerce among the Red

Stars – aimed at the Imperial Purple. He wasn't the first to aim. And if he had succeeded, he wouldn't have been the first to succeed.

"But he failed. For when the Emperor's Admiral approached the province at the head of a fleet, Siwenna itself rebelled against its rebel viceroy." He stopped, sadly.

Mallow found himself tense on the edge of his seat, and relaxed slowly, "Please continue, sir."

"Thank you," said Barr, wearily. "It's kind of you to humor an old man. They rebelled; or I should say, we rebelled, for I was one of the minor leaders. Wiscard left Siwenna, barely ahead of us, and the planet, and with it the province, were thrown open to the admiral with every gesture of loyalty to the Emperor. Why we did this, –I'm not sure. Maybe we felt loyal to the symbol, if not the person, of the Emperor, –a cruel and vicious child. Maybe we feared the horrors of a siege."

"Well?" urged Mallow, gently.

"Well, came the grim retort, "that didn't suit the admiral. He wanted the glory of conquering a rebellious province and his men wanted the loot such conquest would involve. So while the people were still gathered in every large city, cheering the Emperor and his admiral, he occupied all armed centers, and then ordered the population put to the nuclear blast."

"On what pretext?"

"On the pretext that they had rebelled against their viceroy, the Emperor's anointed. And the admiral became the new viceroy, by virtue of one month of massacre, pillage and complete horror. I had six sons. Five died – variously. I had a daughter. I *hope* she died, eventually. I escaped because I was old. I came here, too old to cause even our viceroy worry." He bent his gray head, "They left me nothing, because I had helped drive out a rebellious governor and deprived an admiral of his glory."

Mallow sat silent, and waited. Then, "What of your sixth son?" he asked softly.

"Eh?" Barr smiled acidly. "He is safe, for he has joined the admiral as a common soldier under an assumed name. He is a gunner in the viceroy's personal fleet. Oh, no, I see your eyes. He is not an unnatural son. He visits me when he can and gives me what he can. He keeps me alive. And some day, our great and glorious viceroy will grovel to his death, and it will be my son who will be his executioner."

"And you tell this to a stranger? You endanger your son."

"No. I help him, by introducing a new enemy. And were I a friend of the viceroy, as I am his enemy, I would tell him to string outer space with ships, clear to the rim of the Galaxy."

"There are no ships there?"

"Did you find any? Did any space-guards question your entry? With ships few enough, and the bordering provinces filled with their share of intrigue and iniquity, none can be spared to guard the barbarian outer suns. No danger ever threatened us from the broken edge of the Galaxy, –until you came."

"I? I'm no danger."

"There will be more after you."

Mallow shook his head slowly, "I'm not sure I understand you."

"Listen!" There was a feverish edge to the old man's voice. "I knew you when you entered. You have a force-shield about your body, or had when I first saw you."

Doubtful silence, then, "Yes, –I had."

"Good. That was a flaw, but you didn't know that. There are some things I know. It's out of fashion in these decaying times to be a scholar. Events race and flash past and who cannot fight the tide with nuclear-blast in hand is swept away, as I was. But I was a scholar, and I know that in all the history of nucleics, no portable force-shield was ever invented. We have force-shields – huge, lumbering powerhouses that will protect a city, or even a ship, but not one, single man."

"Ah?" Mallow's underlip thrust out. "And what do you deduce from that?"

"There have been stories percolating through space. They travel strange paths and become distorted with every parsec, –but when I was young there was a small ship of strange men, who did not know our customs and could not tell where they came from. They talked of magicians at the edge of the Galaxy; magicians who glowed in the darkness, who flew unaided through the air, and whom weapons would not touch.

"We laughed. I laughed, too. I forgot it till today. But you glow in the darkness, and I don't think my blaster, if I had one, would hurt you. Tell me, can you fly through air as you sit there now?"

Mallow said calmly, "I can make nothing of all this."

Barr smiled, "I'm content with the answer. I do not examine my guests. But if there are magicians; if you are one of them; there may some day be a great influx of them, or you. Perhaps that would be well. Maybe we need new blood." He muttered soundlessly to himself, then, slowly, "But it works the other way, too. Our new viceroy also dreams, as did our old Wiscard."

"Also after the Emperor's crown?"

Barr nodded, "My son hears tales. In the viceroy's personal entourage, one could scarcely help it. And he tells me of them. Our new viceroy would not refuse the Crown if offered, but he guards his line of retreat. There are stories that, failing Imperial heights, he plans to carve out a new Empire in the Barbarian hinterland. It is said, but I don't vouch for this, that he has already given one of his daughters as wife to a Kinglet somewhere in the uncharted Periphery."

"If one listened to every story–"

"I know. There are many more. I'm old and I babble nonsense. But what do you say?" And those sharp, old eyes peered deep.

The trader considered, "I say nothing. But I'd like to ask something. Does Siwenna have nuclear power? Now, wait, I know that it possesses the knowledge of nucleics. I mean, do they have power generators intact, or did the recent sack destroy them?"

"Destroy them? Oh, no. Half a planet would be wiped out before the smallest power station would be touched. They are irreplaceable and the suppliers of the strength of the fleet." Almost proudly, "We have the largest and best on this side of Trantor itself."

"Then what would I do first if I wanted to see these generators?"

"Nothing!" replied Barr, decisively. "You couldn't approach any military center without being shot down instantly. Neither could anyone. Siwenna is still deprived of civic rights."

"You mean all the power stations are under the military?"

"No. There are the small city stations, the ones supplying power for heating and lighting homes, powering vehicles and so forth. Those are almost as bad. They're controlled by the tech-men."

"Who are they?"

"A specialized group which supervises the power plants. The honor is hereditary, the young ones being brought up in the profession as apprentices. Strict sense of duty, honor, and all that. No one but a tech-man could enter a station."

"I see."

"I don't say, though," added Barr, "that there aren't cases where tech-men haven't been bribed. In days when we have nine emperors in fifty years and seven of these are assassinated, –when every space-captain aspires to the usurpation of a viceroyship, and every viceroy to the Imperium,

I suppose even a tech-man can fall prey to money. But it would require a good deal, and I have none. Have you?"

"Money? No. But does one always bribe with money?"

"What else, when money buys all else."

"There is quite enough that money won't buy. And now if you'll tell me the nearest city with one of the stations, and how best to get there, I'll thank you."

"Wait!" Barr held out his thin hands. "Where do you rush? You come here, but I ask no questions. In the city, where the inhabitants are still called rebels, you would be challenged by the first soldier or guard who heard your accent and saw your clothes."

He rose and from an obscure corner of an old chest brought out a booklet. "My passport, –forged. I escaped with it."

He placed it in Mallow's hand and folded the fingers over it. "The description doesn't fit, but if you flourish it, the chances are many to one they will not look closely."

"But you. You'll be left without one."

The old exile shrugged cynically, "What of it? And a further caution. Curb your tongue! Your accent is barbarous, your idioms peculiar, and every once in a while you deliver yourself of the most astounding archaisms. The less you speak, the less suspicion you will draw upon yourself. Now I'll tell you how to get to the city–"

Five minutes later, Mallow was gone.

He returned but once, for a moment, to the old patrician's house, before leaving it entirely, however. And when Onum Barr stepped into his little garden early the next morning, he found a box at his feet. It contained provisions, concentrated provisions such as one would find aboard ship, and alien in taste and preparation.

But they were good, and lasted long.

11.

The tech-man was short, and his skin glistened with well-kept plumpness. His hair was a fringe and his skull shone through pinkly. The rings on his fingers were thick and heavy, his clothes were scented, and he was the first man Mallow had met on the planet who hadn't looked hungry.

The tech-man's lips pursed peevishly, "Now, my man, quickly. I have things of great importance waiting for me. You seem a stranger—" He seemed to evaluate Mallow's definitely un-Siwennese costume and his eyelids were heavy with suspicion.

"I am not of the neighborhood," said Mallow, calmly, "but the matter is irrelevant. I have had the honor to send you a little gift yesterday—"

The tech-man's nose lifted, "I received it. An interesting gewgaw. I may have use for it on occasion."

"I have other and more interesting gifts. Quite out of the gewgaw stage."

"Oh-h?" The tech-man's voice lingered thoughtfully over the monosyllable. "I think I already see the course of the interview; it has happened before. You are going to give me some trifle or other. A few credits, perhaps a cloak, second-rate jewelry; anything your little soul may think sufficient to corrupt a tech-man." His lower lip puffed out belligerently, "And I know what you wish in exchange. There have been others and to spare with the same bright idea. You wish to be adopted into our clan. You wish to be taught the mysteries of nucleics and the care of the machines. You think because you dogs of Siwenna – and probably your strangerhood is assumed for safety's sake – are being daily punished for your rebellion that you can escape what you deserve by throwing over yourselves the privileges and protections of the tech-man's guild."

Mallow would have spoken, but the tech-man raised himself into a sudden roar. "And now leave before I report your name to the Protector of the City. Do you think that I would betray the trust? The Siwennese traitors that preceded me would have – perhaps! But you deal with a different breed now. Why, Galaxy, I marvel that I do not kill you myself at this moment with my bare hands."

Mallow smiled to himself. The entire speech was patently artificial in tone and content, so that all the dignified indignation degenerated into uninspired farce.

The trader glanced humorously at the two flabby hands that had been named as his possible executioners then and there, and said, "Your Wisdom, you are wrong on three counts. First, I am not a creature of the viceroy come to test your loyalty. Second, my gift is something the Emperor himself in all his splendor does not and will never possess. Third, what I wish in return is very little; a nothing; a mere breath."

"So you say!" He descended into heavy sarcasm. "Come, what is this imperial donation that your godlike power wishes to bestow upon me? Something the Emperor doesn't have, eh?" He broke into a sharp squawk of derision.

Mallow rose and pushed the chair aside, "I have waited three days to see you, Your Wisdom, but the display will take only three seconds. If you will just draw that blaster whose butt I see very near your hand—"

"Eh?"

"And shoot me, I will be obliged."

"What?"

"If I am killed, you can tell the police I tried to bribe you into betraying guild secrets. You'll receive high praise. If I am not killed, you may have my shield."

For the first time, the tech-man became aware of the dimly-white illumination that hovered closely about his visitor, as though he had been dipped in pearl-dust. His blaster raised to the level and with eyes a-squint in wonder and suspicion, he closed contact.

The molecules of air caught in the sudden surge of atomic disruption, tore into glowing, burning ions, and marked out the blinding thin line that struck at Mallow's heart – and splashed!

While Mallow's look of patience never changed, the nuclear forces that tore at him consumed themselves against that fragile, pearly illumination, and crashed back to die in mid-air.

The tech-man's blaster dropped to the floor with an unnoticed crash.

Mallow said, "Does the Emperor have a personal force-shield? *You* can have one."

The tech-man stuttered, "Are you a tech-man?"

"No."

"Then – then where did you get that?"

"What do you care?" Mallow was coolly contemptuous. "Do you want it?" A thin, knobbed chain fell upon the desk, "There it is."

The tech-man snatched it up and fingered it nervously, "Is this complete?"

"Complete."

"Where's the power?"

Mallow's finger fell upon the largest knob, dull in its leaden case.

The tech-man looked up, and his face was congested with blood, "Sir, I am a tech-man, senior grade. I have twenty years behind me as supervisor and I studied under the great Bier at the University of Trantor. If you have the infernal charlatantry to tell me that a small container the size of a – of a walnut, blast it, holds a nuclear generator, I'll have you before the Protector in three seconds."

"Explain it yourself then, if you can. I say it's complete."

The tech-man's flush faded slowly as he bound the chain about his waist, and, following Mallow's gesture, pushed the knob. The radiance that surrounded him shone into dim relief. His blaster lifted, then hesitated. Slowly, he adjusted it to an almost burnless minimum.

And then, convulsively, he closed circuit and the nuclear fire dashed against his hand, harmlessly.

.He whirled, "And what if I shoot you now, and keep the shield."

"Try!" said Mallow. "Do you think I gave you my only sample?" And he, too, was solidly incased in light.

The tech-man giggled nervously. The blaster clattered onto the desk. He said, "And what is this mere nothing, this breath, that you wish in return'?"

"I want to see your generators."

"You realize that that is forbidden. It would mean ejection into space for both of us—"

"I don't want to touch them or have anything to do with them. I want to see them — from a distance."

"If not?"

"If not, you have your shield, but I have other things. For one thing, a blaster especially designed to pierce that shield."

"Hm-m-m." The tech-man's eyes shifted. "Come with me."

12.

The tech-man's home was a small two-story affair on the Outskirts of the huge, cubiform, windowless affair that dominated the center of the city. Mallow passed from one to the other through an underground passage, and found himself in the silent, ozone-tinged atmosphere of the powerhouse.

For fifteen minutes, he followed his guide and said nothing. His eyes missed nothing. His fingers touched nothing. And then, the tech-man said in strangled tones, "Have you had enough? I couldn't trust my underlings in *this* case."

"Could you ever?" asked Mallow, ironically. "I've had enough."

They were back in the office and Mallow said, thoughtfully, "And all those generators are in your hands?"

"Every one," said the tech-man, with more than a touch of complacency.

"And you keep them running and in order?"

"Right!"

"And if they break down?"

The tech-man shook his head indignantly, "They don't break down. They never break down. They were built for eternity."

"Eternity is a long time. Just suppose—"

"It is unscientific to suppose meaningless cases."

"All right. Suppose I were to blast a vital part into nothingness? I suppose the machines aren't immune to nuclear forces? Suppose I fuse a vital connection, or smash a quartz D-tube?"

"Well, then," shouted the tech-man, furiously, "you would be killed."

"Yes, I know that," Mallow was shouting, too, "but what about the generator? Could you repair it?"

"Sir," the tech-man howled his words, "you have had a fair return. You've had what you asked for. Now get out! I owe you nothing more!"

Mallow bowed with a satiric respect and left.

Two days later he was back where the *Far Star* waited to return with him to the planet, Terminus.

And two days later, the tech-man's shield went dead, and for all his puzzling and cursing never glowed again.

13.

Mallow relaxed for almost the first time in six months. He was on his back in the sunroom of his new house, stripped to the skin. His great, brown arms were thrown up and out, and the muscles tautened into a stretch, then faded into repose.

The man beside him placed a cigar between Mallow's teeth and lit it. He champed on one of his own and said, "You must be overworked. Maybe you need a long rest."

"Maybe I do, Jael, but I'd rather rest in a council seat. Because I'm going to have that seat, and you're going to help me."

Ankor Jael raised his eyebrows and said, "How did I get into this?"

"You got in obviously. Firstly, you're an old dog of a politico. Secondly, you were booted out of your cabinet seat by Jorane Sutt, the same fellow who'd rather lose an eyeball than see me in the council. You don't think much of my chances, do you?"

"Not much," agreed the ex-Minister of Education. "You're a Smyrnian."

"That's no legal bar. I've had a lay education."

"Well, come now. Since when does prejudice follow any law but its own. Now, how about your own man – this Jaim Twer? What does *he* say?"

"He spoke about running me for council almost a year ago," replied Mallow easily, "but I've outgrown him. He couldn't have pulled it off in any case. Not enough depth. He's loud and forceful – but that's only an expression of nuisance value. I'm off to put over a real coup. I need *you*."

"Jorane Sutt is the cleverest politician on the planet and he'll be against you. I don't claim to be able to outsmart him. And don't think he doesn't fight hard, and dirty."

"I've got money."

"Mat helps. But it takes a lot to buy off prejudice, you dirty Smyrnian."

"I'll have a lot."

"Well, I'll look into the matter. But don't ever you crawl up on your hind legs and bleat that I encouraged you in the matter. Who's that?"

Mallow pulled the corners of his mouth down, and said, "Jorane Sutt himself, I think. He's early, and I can understand it. I've been dodging him for a month. Look, Jael, get into the next room, and turn the speaker on low. I want you to listen."

He helped the council member out of the room with a shove of his bare foot, then scrambled up and into a silk robe. The synthetic sunlight faded to normal power.

The secretary to the mayor entered stiffly, while the solemn major-domo tiptoed the door shut behind him.

Mallow fastened his belt and said, "Take your choice of chairs, Sutt."

Sutt barely cracked a flickering smile. The chair he chose was comfortable but he did not relax into it. From its edge, he said, "If you'll state your terms to begin with, we'll get down to business."

"What terms?"

"You wish to be coaxed? Well, then, what, for instance, did you do at Korell? Your report was incomplete."

"I gave it to you months ago. You were satisfied then."

Yes," Sutt rubbed his forehead thoughtfully with one finger, "but since then your activities have been significant. We know a good deal of what you're doing, Mallow. We know, exactly, how many factories you're putting up; in what a hurry you're doing it; and how much it's costing you. And there's this palace you have," he gazed about him with a cold lack of appreciation, "which set you back considerably more than my annual salary; and a swathe you've been cutting – a very considerable and expensive swathe – through the upper layers of Foundation society."

"So? Beyond proving that you employ capable spies, what does it show?"

"It shows you have money you didn't have a year ago. And that can show anything – for instance, that a good deal went on at Korell that we know nothing of. Where are you getting your money?"

"My dear Sutt, you can't really expect me to tell you."

"I don't."

"I didn't think you did. That's why I'm going to tell you. It's straight from the treasure-chests of the Commdor of Korell."

Sutt blinked.

Mallow smiled and continued. "Unfortunately for you, the money is quite legitimate. I'm a Master Trader and the money I received was a quantity of wrought iron and chromite in exchange for a number of trinkets I was able to supply him with. Fifty per cent of the profit is mine by hidebound contract with the Foundation. The other half goes to the government at the end of the year when all good citizens pay their income tax."

"There was no mention of any trade agreement in your report."

"Nor was there any mention of what I had for breakfast that day, or the name of my current mistress, or any other irrelevant detail." Mallow's smile was fading into a sneer. "I was sent – to quote yourself – to keep my eyes open. They were never shut. You wanted to find out what happened to the captured Foundation merchant ships. I never saw or heard of them. You wanted to find out if Korell had nuclear power. My report tells of nuclear blasters in the possession of the Commdor's private bodyguard. I saw no other signs. And the blasters I did see are relics of the old Empire, and may be show-pieces that do not work, for all my knowledge."

"So far, I followed orders, but beyond that I was, and still am, a free agent. According to the laws of the Foundation, a Master Trader may open whatever new markets he can, and receive therefrom his due half of the profits. What are your objections? I don't see them."

Sutt bent his eyes carefully towards the wall and spoke with a difficult lack of anger, "It is the general custom of all traders to advance the religion with their trade."

"I adhere to law, and not to custom."

"There are times when custom can be the higher law."

"Then appeal to the courts."

Sutt raised somber eyes which seemed to retreat into their sockets. "You're a Smyrnian after all. It seems naturalization and education can't wipe out the taint in the blood. Listen, and try to understand, just the same."

"This goes beyond money, or markets. We have the science of the great Hari Seldon to prove that upon us depends the future empire of the Galaxy, and from the course that leads to that Imperium we cannot turn. The religion we have is our all-important instrument towards that end. With it we have brought the Four Kingdoms under our control, even at the moment when they would have crushed us. It is the most potent device known with which to control men and worlds."

"The primary reason for the development of trade and traders was to introduce and spread this religion more quickly, and to insure that the introduction of new techniques and a new economy would be subject to our thorough and intimate control."

He paused for breath, and Mallow interjected quietly, "I know the theory. I understand it entirely."

"Do you? It is more than I expected. Then you see, of course, that your attempt at trade for its own sake; at mass production of worthless gadgets, which can only affect a world's economy superficially; at the subversion of interstellar policy to the god of profits; at the divorce of nuclear power from our controlling religion – can only end with the overthrow and complete negation of the policy that has worked successfully for a century."

"And time enough, too," said Mallow, indifferently, "for a policy outdated, dangerous and impossible. However well your religion has succeeded in the Four Kingdoms, scarcely another world in the Periphery has accepted it. At the time we seized control of the Kingdoms, there were a sufficient number of exiles, Galaxy knows, to spread the story of how Salvor Hardin used the priesthood and the superstition of the people to overthrow the independence and power of the secular monarchs. And if that wasn't enough, the case of Askone two decades back made it plain enough. There isn't a ruler in the Periphery now that wouldn't sooner cut his own throat than let a priest of the Foundation enter the territory."

"I don't propose to force Korell or any other world to accept something I know they don't want. No, Sutt. If nuclear power makes them dangerous, a sincere friendship through trade will be many times better than an insecure overlordship, based on the hated supremacy of a foreign spiritual power, which, once it weakens ever so slightly, can only fall entirely and leave nothing substantial behind except an immortal fear and hate."

Sutt said cynically, "Very nicely put. So, to get back to the original point of discussion, what are your terms? What do you require to exchange your ideas for mine?"

"You think my convictions are for sale?"

"Why not?" came the cold response. "Isn't that your business, buying and selling?"

"Only at a profit," said Mallow, unoffended. "Can you offer me more than I'm getting as is?"

"You could have three-quarters of your trade profits, rather than half."

Mallow laughed shortly, "A fine offer. The whole of the trade on your terms would fall far below – a tenth share on mine. Try harder than that."

"You could have a council seat."

"I'll have that anyway, without and despite you."

With a sudden movement, Sutt clenched his fist, "You could also save yourself a prison term. Of twenty years, if I have my way. Count the profit in that."

"No profit at all, but can you fulfill such a threat?"

"How about a trial for murder?"

"Whose murder?" asked Mallow, contemptuously.

Sutt's voice was harsh now, though no louder than before, "The murder of an Anacreonian priest, in the service of the Foundation."

"Is that so now? And what's your evidence?"

The secretary to the mayor leaned forward, "Mallow, I'm not bluffing. The preliminaries are over. I have only to sign one final paper and the case of the Foundation versus Hober Mallow, Master Trader, is begun. You abandoned a subject of the Foundation to torture and death at the hands of an alien mob, Mallow, and you have only five seconds to prevent the punishment due you. For myself, I'd rather you decided to bluff it out. You'd be safer as a destroyed enemy, than as a doubtfully-converted friend."

Mallow said solemnly, "You have your wish."

"Good!" and the secretary smiled savagely. "It was the mayor who wished the preliminary attempt at compromise, not I. Witness that I did not try too hard."

The door opened before him, and he left.

Mallow looked up as Ankor Jael re-entered the room.

Mallow said, "Did you hear him?"

The politician flopped to the floor. "I never heard him as angry as that, since I've known the snake."

"All right. What do you make of it?"

"Well, I'll tell you. A foreign policy of domination through spiritual means is his *idee fixe*, but it's my notion that his ultimate aims aren't spiritual. I was fired out of the Cabinet for arguing on the same issue, as I needn't tell you."

"You needn't. And what are those unspiritual aims according to your notion?"

Jael grew serious, "Well, he's not stupid, so he must see the bankruptcy of our religious policy, which has hardly made a single conquest for us in seventy years. He's obviously using it for purposes of his own."

"Now any dogma primarily based on faith and emotionalism, is a dangerous weapon to use on others, since it is almost impossible to guarantee that the weapon will never be turned on the user. For a hundred years now, we've supported a ritual and

mythology that is becoming more and more venerable, traditional – and immovable. In some ways, it isn't under our control any more."

"In what ways?" demanded Mallow. "Don't stop. I want your thoughts."

"Well, suppose one man, one ambitious man, uses the force of religion against us, rather than for us."

"You mean Sutt–"

"You're right. I mean Sutt. Listen, man, if he could mobilize the various hierarchies on the subject planets against the Foundation in the name of orthodoxy, what chance would we stand? By planting himself at the head of the standards of the pious, he could make war on heresy, as represented by you, for instance, and make himself king eventually. After all, it was Hardin who said: 'A nuclear blaster is a good weapon, but it can point both ways.'"

Mallow slapped his bare thigh, "All right, Jael, then get me in that council, and I'll fight him."

Jael paused, then said significantly, "Maybe not. What was all that about having a priest lynched? Is isn't true, is it?"

"It's true enough," Mallow said, carelessly.

Jael whistled, "Has he definite proof?"

"He should have." Mallow hesitated, then added, "Jaim Twer was his man from the beginning, though neither of them knew that I knew that. And Jaim Twer was an eyewitness."

Jael shook his head. "Uh-uh. That's bad."

"Bad? What's bad about it? That priest was illegally upon the planet by the Foundation's own laws. He was obviously used by the Korellian government as a bait, whether involuntary or not. By all the laws of common-sense, I had no choice but one action – and that action was strictly within the law. If he brings me to trial, he'll do nothing but make a prime fool of himself."

And Jael shook his head again, "No, Mallow, you've missed it. I told you he played dirty. He's not out to convict you; he knows he can't do that. But he *is* out to ruin your standing with the people. You heard what he said. Custom *is* higher than law, at times. You could walk out of the trial scot-free, but if the people think you threw a priest to the dogs, your popularity is gone.

"They'll admit you did the legal thing, even the sensible thing. But just the same you'll have been, in their eyes, a cowardly dog, an unfeeling brute, a hard-hearted monster. *And* you would never get elected to the council. You might even lose your rating as Master Trader by having your citizenship voted away from you. You're not native born, you know. What more do you think Sutt can want?" Mallow frowned stubbornly, "So!"

"My boy," said Jael. "I'll stand by you, but *I* can't help. You're on the spot, –dead center."

14.

The council chamber was full in a very literal sense on the fourth day of the trial of Hober Mallow, Master Trader. The only councilman absent was feebly cursing the fractured skull that had bedridden him. The galleries were filled to the aisleways and ceilings with those few of the crowd who by influence, wealth, or sheer diabolic perseverance had managed to get in. The rest filled the square outside, in swarming knots about the open-air trimensional 'visors.

Ankor Jael made his way into the chamber with the near-futile aid and exertions of the police department, and then through the scarcely smaller confusion within to Hober Mallow's seat.

Mallow turned with relief, "By Seldon, you cut it thin. Have you got it?"

"Here, take it," said Jael. "It's everything you asked for."

"Good. How are they taking it outside?"

"They're wild clear through." Jael stirred uneasily, "You should never have allowed public hearings. You could have stopped them."

"I didn't want to."

"There's lynch talk. And Publis Manlio's men on the outer planets—"

"I wanted to ask you about that, Jael. He's stirring up the Hierarchy against me, is he?"

"Is he? It's the sweetest setup you ever saw, As Foreign Secretary, he handles the prosecution in a case of interstellar law. As High Priest and Primate of the Church, he rouses the fanatic hordes—"

"Well, forget it. Do you remember that Hardin quotation you threw at me last month? We'll show them that the nuclear blaster can point both ways."

The mayor was taking his seat now and the council members were rising in respect. Mallow whispered, "It's my turn today. Sit here and watch the fun."

The day's proceedings began and fifteen minutes later, Hober Mallow stepped through a hostile whisper to the empty space before the mayor's bench. A lone beam of light centered upon him and in the public 'visors of the city, as well as on the myriads of private 'visors in almost every home of the Foundation's planets, the lonely giant figure of a man stared out defiantly.

He began easily and quietly, "To save time, I will admit the truth of every point made against me by the prosecution. The story of the priest and the mob as related by them is perfectly accurate in every detail."

There was a stirring in the chamber and a triumphant mass-snarl from the gallery. He waited patiently for silence.

"However, the picture they presented fell short of completion. I ask the privilege of supplying the completion in my own fashion. My story may seem irrelevant at first. I ask your indulgence for that."

Mallow made no reference to the notes before him.

"I begin at the same time as the prosecution did; the day of my meeting with Jorane Sutt and Jaim Twer. What went on at those meetings you know. The conversations have been described, and to that description I have nothing to add – except my own thoughts of that day.

"They were suspicious thoughts, for the events of that day were queer. Consider. Two people, neither of whom I knew more than casually, make unnatural and somewhat unbelievable propositions to me. One, the secretary to the mayor, asks me to play the part of intelligence agent to the government in a highly confidential matter, the nature and importance of which has already been explained to you. The other, self-styled leader of a political party, asks me to run for a council seat.

"Naturally I looked for the ulterior motive. Sutt's seemed evident. He didn't trust me. Perhaps he thought I was selling nuclear power to enemies and plotting rebellion. And perhaps he was forcing the issue, or thought he was. In that case, he would need a man of his own near me on my proposed mission, as a spy. The last thought, however, did not occur to me until later on, when Jaim Twer came on the scene.

"Consider again: Twer presents himself as a trader, retired into politics, yet I know of no details of his trading career, although my knowledge of the field is immense. And further, although Twer boasted of a lay education, *he had never heard of a Seldon crisis.*"

Hober Mallow waited to let the significance sink in and was rewarded with the first silence he had yet encountered, as the gallery caught its collective breath. That was for the inhabitants of Terminus itself. The men of the Outer Planets could hear only censored versions that would suit the requirements of religion. They would hear nothing of Seldon crises. But there would be further strokes they would not miss.

Mallow continued:

"Who here can honestly state that *any* man with a lay education can possibly be ignorant of the nature of a Seldon crisis? There is only one type of education upon the Foundation that excludes all mention of the planned history of Seldon and deals only with the man himself as a semi-mythical wizard–

"I knew at that instant that Jaim Twer had never been a trader. I knew then that he was in holy orders and perhaps a full-fledged priest; and, doubtless, that for the three years he had pretended to head a political party of the traders, *he had been a bought man of Jorane Sutt.*

"At the moment, I struck in the dark. I did not know Sun's purposes with regard to myself, but since he seemed to be feeding me rope liberally, I handed him a few fathoms of my own. My notion was that Twer was to be with me on my voyage as unofficial guardian on behalf of Jorane Sutt. Well, if he didn't get on, I knew well there'd be other devices waiting – and those others I might not catch in time. A known enemy is relatively safe. I invited Twer to come with me. He accepted.

"That, gentlemen of the council, explains two things. First, it tells you that Twer is not a friend of mine testifying against me reluctantly and for conscience' sake, as the prosecution would have you believe. He is a spy, performing his paid job. Secondly, it explains a certain action of mine on the occasion of the first appearance of the priest

whom I am accused of having murdered – an action as yet unmentioned, because unknown."

Now there was a disturbed whispering in the council. Mallow cleared his throat theatrically, and continued:

"I hate to describe my feelings when I first heard that we had a refugee missionary on board. I even hate to remember them. Essentially, they consisted of wild uncertainty. The event struck me at the moment as a move by Sutt, and passed beyond my comprehension or calculation. I was at sea – and completely.

"There was one thing I could do. I got rid of Twer for five minutes by sending him after my officers. In his absence, I set up a Visual Record receiver, so that whatever happened might be preserved for future study. This was in the hope, the wild but earnest hope, that what confused me at the time might become plain upon review.

"I have gone over that Visual Record some fifty times since. I have it here with me now, and will repeat the job a fifty-first time in your presence right now."

The mayor pounded monotonously for order, as the chamber lost its equilibrium and the gallery roared. In five million homes on Terminus, excited observers crowded their receiving sets more closely, and at the prosecutor's own bench, Jorane Sutt shook his head coldly at the nervous high priest, while his eyes blazed fixedly on Mallow's face.

The center of the chamber was cleared, and the lights burnt low. Ankor Jael, from his bench on the left, made the adjustments, and with a preliminary click, a holographic scene sprang to view; in color, in three-dimensions, in every attribute of life but life itself.

There was the missionary, confused and battered, standing between the lieutenant and the sergeant. Mallow's image waited silently, and then men filed in, Twer bringing up the rear.

The conversation played itself out, word for word. The sergeant was disciplined, and the missionary was questioned. The mob appeared, their growl could be heard, and the Revered Jord Parma made his wild appeal. Mallow drew his gun, and the missionary, as he was dragged away, lifted his arms in a mad, final curse and a tiny flash of light came and went.

The scene ended, with the officers frozen at the horror of the situation, while Twer clamped shaking hands over his ears, and Mallow calmly put his gun away.

The lights were on again; the empty space in the center of the floor was no longer even apparently full. Mallow, the real Mallow of the present, took up the burden of his narration:

"The incident, you see, is exactly as the prosecution has presented it – on the surface. I'll explain that shortly. Jaim Twer's emotions through the whole business shows clearly a priestly education, by the way.

"It was on that same day that I pointed out certain incongruities in the episode to Twer. I asked him where the missionary came from in the midst of the near-desolate tract we occupied at the time. I asked further where the gigantic mob had come from with the nearest sizable town a hundred miles away. The prosecution has paid no attention to such problems.

"Or to other points; for instance, the curious point of Jord Parma's blatant conspicuousness. A missionary on Korell, risking his life in defiance of both Korellian and Foundation law, parades about in a very new and very distinctive priestly costume. There's something wrong there. At the time, I suggested that the missionary was an unwitting accomplice of the Commdor, who was using him in an attempt to force us into an act of wildly illegal aggression, to justify, *in law*, his subsequent destruction of our ship and of us.

"The prosecution has anticipated this justification of my actions. They have expected me to explain that the safety of my ship, my crew, my mission itself were at stake and could not be sacrificed for one man, when that man would, in any case, have been destroyed, with us or without us. They reply by muttering about the Foundation's 'honor' and the necessity of upholding our 'dignity' in order to maintain our ascendancy.

"For some strange reason, however, the prosecution has neglected Jord Parma himself, –as an individual. They brought out no details concerning him; neither his birthplace, nor his education, nor any detail of previous history. The explanation of this will also explain the incongruities I have pointed out in the Visual Record you have just seen. The two are connected.

"The prosecution has advanced no details concerning Jord Parma because it *cannot*. That scene you saw by Visual Record seemed phoney because Jord Parma was phoney. There never was a Jord Parma. *This whole trial is the biggest farce ever cooked up over an issue that never existed.*"

Once more he had to wait for the babble to die down. He said, slowly:

"I'm going to show you the enlargement of a single still from the Visual Record. It will speak for itself. Lights again, Jael."

The chamber dimmed, and the empty air filled again with frozen figures in ghostly, waxen illusion. The officers of the *Far Star* struck their stiff, impossible attitudes. A gun pointed from Mallow's rigid hand. At his left, the Revered Jord Parma, caught in mid-shriek, stretched his claws upward, while the failing sleeves hung halfway.

And from the missionary's hand there was that little gleam that in the previous showing had flashed and gone. It was a permanent glow now.

"Keep your eye on that light on his hand," called Mallow from the shadows. "Enlarge that scene, Jael!"

The tableau bloated quickly. Outer portions fell away as the missionary drew towards the center and became a giant. Then there was only a hand and an arm, and then only a hand, which filled everything and remained there in immense, hazy tautness.

The light had become a set of fuzzy, glowing letters: K S P.

"That," Mallow's voice boomed out, "is a sample of tatooing, gentlemen. Under ordinary light it is invisible, but under ultraviolet light – with which I flooded the room in taking this Visual Record, it stands out in high relief. I'll admit it is a naive method of secret identification, but it works on Korell, where UV light is not to be found on street comers. Even in our ship, detection was accidental.

"Perhaps some of you have already guessed what K S P stands for. Jord Parma knew his priestly lingo well and did his job magnificently. Where he had learned it, and how, I cannot say, but K S P stands for 'Korellian Secret Police.'"

Mallow shouted over the tumult, roaring against the noise, "I have collateral proof in the form of documents brought from Korell, which I can present to the council if required.

"And where is now the prosecution's case? They have already made and re-made the monstrous suggestion that I should have fought for the missionary in defiance of the law, and sacrificed my mission, my ship, and myself to the 'honor' of the Foundation.

"But to do it for an impostor?"

"Should I have done it then for a Korellian secret agent tricked out in the robes and verbal gymnastics probably borrowed of an Anacreonian exile? Would Jorane Sutt and Publis Manlio have had me fall into a stupid, odious trap—"

His hoarsened voice faded into the featureless background of a shouting mob. He was being lifted onto shoulders, and carried to the mayor's bench. Out the windows, he could see a torrent of madmen swarming into the square to add to the thousands there already.

Mallow looked about for Ankor Jael, but it was impossible to find any single face in the incoherence of the mass. Slowly he became aware of a rhythmic, repeated shout, that was spreading from a small beginning, and pulsing into insanity:

"Long live Mallow – long live Mallow – long live Mallow—"

15.

Ankor Jael blinked at Mallow out of a haggard face. The last two days had been mad, sleepless ones.

"Mallow, you've put on a beautiful show, so don't spoil it by jumping too high. You can't seriously consider running for mayor. Mob enthusiasm is a powerful thing, but it's notoriously fickle."

"Exactly!" said Mallow, grimly, "so we must coddle it, and the best way to do that is to continue the show."

"Now what?"

"You're to have Publis Manlio and Jorane Sutt arrested—"

"What!"

"Just what you hear. Have the mayor arrest them! I don't care what threats you use. I control the mob, –for today, at any rate. He won't dare face them."

"But on what charge, man?"

"On the obvious one. They've been inciting the priesthood of the outer planets to take sides in the factional quarrels of the Foundation. That's illegal, by Seldon. Charge them with 'endangering the state.' And I don't care about a conviction any more than they did in my case. Just get them out of circulation until I'm mayor."

"It's half a year till election."

"Not too long!" Mallow was on his feet, and his sudden grip of Jael's arm was tight. "Listen, I'd seize the government by force if I had to – the way Salvor Hardin did a hundred years ago. There's still that Seldon crisis coming up, and when it comes I have to be mayor *and* high priest. Both!"

Jael's brow furrowed. He said, quietly, "What's it going to be? Korell, after all?"

Mallow nodded, "Of course. They'll declare war, eventually, though I'm betting it'll take another pair of years."

"With nuclear ships?"

"What do you think? Those three merchant ships we lost in their space sector weren't knocked over with compressed-air pistols. Jael, they're getting ships from the Empire itself. Don't open your mouth like a fool. I said the Empire! It's still there, you know. It may be gone here in the Periphery but in the Galactic center it's still very much alive. And one false move means that it, itself, may be on our neck. That's why I must be mayor and high priest. I'm the only man who knows how to fight the crisis."

Jael swallowed dryly, "How? What are you going to do?"

"Nothing."

Jael smiled uncertainly, "Really! All of that!"

But Mallow's answer was incisive, "When I'm boss of this Foundation, I'm going to do nothing. One hundred percent of nothing, and that is the secret of this crisis."

16.

Asper Argo, the Well-Beloved, Commdor of the Korellian Republic greeted his wife's entry by a hangdog lowering of his scanty eyebrows. To her at least, his self-adopted epithet did not apply. Even he knew that.

She said, in a voice as sleek as her hair and as cold as her eyes, "My gracious lord, I understand, has finally come to a decision upon the fate of the Foundation upstarts."

"Indeed?" said the Commdor, sourly. "And what more does your versatile understanding embrace?"

"Enough, my very noble husband. You had another of your vacillating consultations with your councilors. Fine advisors." With infinite scorn, "A herd of palsied purblind idiots hugging their sterile profits close to their sunken chests in the face of my father's displeasure."

"And who, my dear," was the mild response, "is the excellent source from which your understanding understands all this?"

The Commdora laughed shortly, "If I told you, my source would be more corpse than source."

"Well, you'll have your own way, as always." The Commdor shrugged and turned away. "And as for your father's displeasure: I much fear me it extends to a niggardly refusal to supply more ships."

"More ships!" She blazed away, hotly, "And haven't you five? Don't deny it. I know you have five; and a sixth is promised."

"Promised for the last year."

"But one – just one – can blast that Foundation into stinking rubble. Just one! One, to sweep their little pygmy boats out of space."

"I couldn't attack their planet, even with a dozen."

"And how long would their planet hold out with their trade ruined, and their cargoes of toys and trash destroyed?"

"Those toys and trash mean money," he sighed. "A good deal of money."

"But if you had the Foundation itself, would you not have all it contained? And if you had my father's respect and gratitude, would you not have more than ever the Foundation could give you? It's been three years – more – since that barbarian came with his magic sideshow. It's long enough."

"My dear!" The Commdor turned and faced her. "I am growing old. I am weary. I lack the resilience to withstand your rattling mouth. You say you know that I have decided. Well, I have. It is over, and there is war between Korell and the Foundation."

"Well!" The Commdora's figure expanded and her eyes sparkled, "You learned wisdom at last, though in your dotage. And now when you are master of this hinterland, you may be sufficiently respectable to be of some weight and importance in the Empire. For one thing, we might leave this barbarous world and attend the viceroy's court. Indeed we might."

She swept out, with a smile, and a hand on her hip. Her hair gleamed in the light.

The Commdor waited, and then said to the closed door, with malignance and hate, "And when I am master of what you call the hinterland, I may be sufficiently respectable to do without your father's arrogance and his daughter's tongue. Completely – without!"

17.

The senior lieutenant of the *Dark Nebula* stared in horror at the visiplat.

"Great Galloping Galaxies!" It should have been a howl, but it was a whisper instead, "What's that?"

It was a ship, but a whale to the *Dark Nebula's* minnow; and on its side was the Spaceship-and-Sun of the Empire. Every alarm on the ship yammered hysterically.

The orders went out, and the *Dark Nebula* prepared to run if it could, and fight if it must, –while down in the hyperwave room, a message stormed its way through hyperspace to the Foundation.

Over and over again! Partly a plea for help, but mainly a warning of danger.

18.

Hober Mallow shuffled his feet wearily as he leafed through the reports. Two years of the mayoralty had made him a bit more housebroken, a bit softer, a bit more patient, – but it had not made him learn to like government reports and the mind-breaking officialese in which they were written.

"How many ships did they get?" asked Jael.

"Four trapped on the ground. Two unreported. All others accounted for and safe." Mallow grunted, "We should have done better, but it's just a scratch."

There was no answer and Mallow looked up, "Does anything worry you?"

"I wish Sutt would get here," was the almost irrelevant answer.

"Ah, yes, and now we'll hear another lecture on the home front."

"No, we won't," snapped Jael, "but you're stubborn, Mallow. You may have worked out the foreign situation to the last detail but you've never given a care about what goes on here on the home planet."

"Well, that's your job, isn't it? What did I make you Minister of Education and Propaganda for?"

"Obviously to send me to an early and miserable grave, for all the co-operation you give me. For the last year, I've been deafening you with the rising danger of Sutt and his Religionists. What good will your plans be, if Sutt forces a special election and has you thrown out?"

"None, I admit."

"And your speech last night just about handed the election to Sutt with a smile and a pat. Was there any necessity for being so frank?"

"Isn't there such a thing as stealing Sutt's thunder?"

"No," said Jael, violently, "not the way you did it. You claim to have foreseen everything, and don't explain why you traded with Korell to their exclusive benefit for three years. Your only plan of battle is to retire without a battle. You abandon all trade with the sectors of space near Korell. You openly proclaim a stalemate. You promise no offensive, even in the future. Galaxy, Mallow, what am I supposed to do with such a mess?"

"It lacks glamor?"

"It lacks mob emotion-appeal."

"Same thing."

"Mallow, wake up. You have two alternatives. Either you present the people with a dynamic foreign policy, whatever your private plans are, or you make some sort of compromise with Sutt."

Mallow said, "All right, if I've failed the first, let's try the second. Sutt's just arrived."

Sutt and Mallow had not met personally since the day of the trial, two years back. Neither detected any change in the other, except for that subtle atmosphere about each which made it quite evident that the roles of ruler and defier had changed.

Sutt took his seat without shaking hands.

Mallow offered a cigar and said, "Mind if Jael stays? He wants a compromise earnestly. He can act as mediator if tempers rise."

Sutt shrugged, "A compromise will be well for you. Upon another occasion I once asked you to state your terms. I presume the positions are reversed now."

"You presume correctly."

"Then there are my terms. You must abandon your blundering policy of economic bribery and trade in gadgetry, and return to the tested foreign policy of our fathers."

"You mean conquest by missionary."

"Exactly."

"No compromise short of that?"

"None."

"Um-m-m." Mallow lit up very slowly and inhaled the tip of his cigar into a bright glow. "In Hardin's time, when conquest by missionary was new and radical, men like yourself opposed it. Now it is tried, tested, hallowed, –everything a Jorane Sutt would find well. But, tell me, how would you get us out of our present mess?"

"Your present mess. I had nothing to do with it."

"Consider the question suitably modified."

"A strong offensive is indicated. The stalemate you seem to be satisfied with is fatal. It would be a confession of weakness to all the worlds of the Periphery, where the appearance of strength is all-important, and there's not one vulture among them that wouldn't join the assault for its share of the corpse. You ought to understand that. You're from Smyrno, aren't you?"

Mallow passed over the significance of the remark. He said, "And if you beat Korell, what of the Empire? *That* is the real enemy."

Sutt's narrow smile tugged at the corners of his mouth, "Oh, no, your records of your visit to Siwenna were complete. The viceroy of the Normannic Sector is interested in creating dissension in the Periphery for his own benefit, but only as a side issue. He isn't going to stake everything on an expedition to the Galaxy's rim when he has fifty hostile neighbors and an emperor to rebel against. I paraphrase your own words."

"Oh, yes he might, Sutt, if he thinks we're strong enough to be dangerous. And he might think so, if we destroy Korell by the main force of frontal attack. We'd have to be considerably more subtle."

"As for instance—"

Mallow leaned back, "Sutt, I'll give you your chance. I don't need you, but I can use you. So I'll tell you what it's all about, and then you can either join me and receive a place in a coalition cabinet, or you can play the martyr and rot in jail."

"Once before you tried that last trick."

"Not very hard, Sutt. The right time has only just come. Now listen." Mallow's eyes narrowed.

"When I first landed on Korell," he began, "I bribed the Commdor with the trinkets and gadgets that form the trader's usual stock. At the start, that was meant only to get us

entrance into a steel foundry. I had no plan further than that, but in that I succeeded. I got what I wanted. But it was only after my visit to the Empire that I first realized exactly what a weapon I could build that trade into.

"This is a Seldon crisis we're facing, Sutt, and Seldon crises are not solved by individuals but by historic forces. Hari Seldon, when he planned our course of future history, did not count on brilliant heroics but on the broad sweeps of economics and sociology. So the solutions to the various crises must be achieved by the forces that become available to us at the time.

"In this case, –trade!"

Sutt raised his eyebrows skeptically and took advantage of the pause, "I hope I am not of subnormal intelligence, but the fact is that your vague lecture isn't very illuminating."

"It will become so," said Mallow. "Consider that until now the power of trade has been underestimated. It has been thought that it took a priesthood under our control to make it a powerful weapon. That is not so, and *this* is my contribution to the Galactic situation. Trade without priests! Trade alone! It is strong enough. Let us become very simple and specific. Korell is now at war with us. Consequently our trade with her has stopped. *But*, –notice that I am making this as simple as a problem in addition, –in the past three years she has based her economy more and more upon the nuclear techniques which we have introduced and which only we can continue to supply. Now what do you suppose will happen once the tiny nuclear generators begin failing, and one gadget after another goes out of commission?"

"The small household appliances go first. After a half a year of this stalemate that you abhor, a woman's nuclear knife won't work any more. Her stove begins failing. Her washer doesn't do a good job. The temperature-humidity control in her house dies on a hot summer day. What happens?"

He paused for an answer, and Sutt said calmly, "Nothing. People endure a good deal in war."

"Very true. They do. They'll send their sons out in unlimited numbers to die horribly on broken spaceships. They'll bear up under enemy bombardment, if it means they have to live on stale bread and foul water in caves half a mile deep. But it's very hard to bear up under little things when the patriotic uplift of imminent danger is not present. It's going to, be a stalemate. There will be no casualties, no bombardments, no battles.

"There will just be a knife that won't cut, and a stove that won't cook, and a house that freezes in the winter. It will be annoying, and people will grumble."

Sutt said slowly, wonderingly, "Is that what you're setting your hopes on, man? What do you expect? A housewives' rebellion? A *Jacquerie*? A sudden uprising of butchers and grocers with their cleavers and bread-knives shouting 'Give us back our Automatic Super-Kleeno Nuclear Washing Machines.'"

"No, sir," said Mallow, impatiently, "I do not. I expect, however, a general background of grumbling and dissatisfaction which will be seized on by more important figures later on."

"And what more important figures are these?"

"The manufacturers, the factory owners, the industrialists of Korell. When two years of the stalemate have gone, the machines in the factories will, one by one, begin to fail. Those industries which we have changed from first to last with our new nuclear gadgets will find themselves very suddenly ruined. The heavy industries will find themselves, *en masse* and at a stroke, the owners of nothing but scrap machinery that won't work."

"The factories ran well enough before you came there, Mallow."

"Yes, Sutt, so they did – at about one-twentieth the profits, even if you leave out of consideration the cost of reconversion to the original pre-nuclear state. With the industrialist and financier and the average man all against him, how long will the Commdor hold out?"

"As long as he pleases, as soon as it occurs to him to get new nuclear generators from the Empire."

And Mallow laughed joyously, "You've missed, Sutt, missed as badly as the Commdor himself. You've missed everything, and understood nothing. Look, man, the Empire can replace nothing. The Empire has always been a realm of colossal resources. They've calculated everything in planets, in stellar systems, in whole sectors of the Galaxy. Their generators are gigantic because they thought in gigantic fashion."

"But we, –we, our little Foundation, our single world almost without metallic resources, –have had to work with brute economy. Our generators have had to be the size of our thumb, because it was all the metal we could afford. We had to develop new techniques and new methods, –techniques and methods the Empire can't follow because they have degenerated past the stage where they can make any really vital scientific advance."

"With all their nuclear shields, large enough to protect a ship, a city, an entire world; they could never build one to protect a single man. To supply light and heat to a city, they have motors six stories high, –I saw them – where ours could fit into this room. And when I told one of their nuclear specialists that a lead container the size of a walnut contained a nuclear generator, he almost choked with indignation on the spot."

"Why, they don't even understand their own colossi any longer. The machines work from generation to generation automatically, and the caretakers are a hereditary caste who would be helpless if a single D-tube in all that vast structure burnt out."

"The whole war is a battle between those two systems, between the Empire and the Foundation; between the big and the little. To seize control of a world, they bribe with immense ships that can make war, but lack all economic significance. We, on the other hand, bribe with little things, useless in war, but vital to prosperity and profits."

"A king, or a Commdor, will take the ships and even make war. Arbitrary rulers throughout history have bartered their subjects' welfare for what they consider honor, and glory, and conquest. But it's still the little things in life that count – and Asper Argo won't stand up against the economic depression that will sweep all Korell in two or three years."

Sutt was at the window, his back to Mallow and Jael. It was early evening now, and the few stars that struggled feebly here at the very rim of the Galaxy sparked against the

background of the misty, wispy Lens that included the remnants of that Empire, still vast, that fought against them.

Sutt said, "No. You are not the man."

"You don't believe me?"

"I mean I don't trust you. You're smooth-tongued. You befooled me properly when I thought I had you under proper care on your first trip to Korell. When I thought I had you cornered at the trial, you wormed your way out of it and into the mayor's chair by demagoguery. There is nothing straight about you; no motive that hasn't another behind it; no statement that hasn't three meanings.

"Suppose you were a traitor. Suppose your visit to the Empire had brought you a subsidy and a promise of power. Your actions would be precisely what they are now. You would bring about a war after having strengthened the enemy. You would force the Foundation into inactivity. And you would advance a plausible explanation of everything, one so plausible it would convince everyone."

"You mean there'll be no compromise?" asked Mallow, gently.

"I mean you must get out, by free will or force."

"I warned you of the only alternative to co-operation."

Jorane Sutt's face congested with blood in a sudden access of emotion. "And I warn you, Hober Mallow of Smyrno, that if you arrest me, there will be no quarter. My men will stop nowhere in spreading the truth about you, and the common people of the Foundation will unite against their foreign ruler. They have a consciousness of destiny that a Smyrnian can never understand – and that consciousness will destroy you."

Hober Mallow said quietly to the two guards who had entered, "Take him away. He's under arrest."

Sutt said, "Your last chance."

Mallow stubbed out his cigar and never looked up.

And five minutes later, Jael stirred and said, wearily, "Well, now that you've made a martyr for the cause, what next?"

Mallow stopped playing with the ash tray and looked up, "That's not the Sutt I used to know. He's a blood-blind bull. Galaxy, he hates me."

"All the more dangerous then."

"More dangerous? Nonsense! He's lost all power of judgement."

Jael said grimly, "You're overconfident, Mallow. You're ignoring the possibility of a popular rebellion."

Mallow looked up, grim in his turn, "Once and for all, Jael, there is no possibility of a popular rebellion."

"You're sure of yourself!"

"I'm sure of the Seldon crisis and the historical validity of their solutions, externally *and* internally. There are some things I *didn't* tell Suit right now. He tried to control the Foundation itself by religious forces as he controlled the outer worlds, and he failed, – which is the surest sign that in the Seldon scheme, religion is played out.

"Economic control worked differently. And to paraphrase that famous Salvor Hardin quotation of yours, it's a poor nuclear blaster that won't point both ways. If Korell prospered with our trade, so did we. If Korellian factories fail without our trade; and if the prosperity of the outer worlds vanishes with commercial isolation; so will our factories fail and our prosperity vanish.

"And there isn't a factory, not a trading center. not a shipping line that isn't under my control; that I couldn't squeeze to nothing if Sutt attempts revolutionary propaganda. Where his propaganda succeeds, or even looks as though it might succeed, I will make certain that prosperity dies. Where it fails, prosperity will continue, because my factories will remain fully staffed.

"So by the same reasoning which makes me sure that the Korellians will revolt in favor of prosperity, I am sure we will not revolt against it. The game will be played out to its end."

"So then," said Jael, "you're establishing a plutocracy. You're making us a land of traders and merchant princes. Then what of the future?"

Mallow lifted his gloomy face, and exclaimed fiercely, "What business of mine is the future? No doubt Seldon has foreseen it and prepared against it. There will be other crises in the time to come when money power has become as dead a force as religion is now. Let my successors solve those new problems, as I have solved the one of today."

KORELL—. . . And so after three years of a war which was certainly the most unfought war on record, the Republic of Korell surrendered unconditionally, and Hober Mallow took his place next to Hari Seldon and Salvor Hardin in the hearts of the people of the Foundation.

ENCYCLOPEDIA GALACTICA

FOUNDATION AND EMPIRE

1952

PROLOGUE

The Galactic Empire Was Falling.

It was a colossal Empire, stretching across millions of worlds from arm-end to arm-end of the mighty multi-spiral that was the Milky Way. Its fall was colossal, too – and a long one, for it had a long way to go.

It had been falling for centuries before one man became really aware of that fall. That man was Hari Seldon, the man who represented the one spark of creative effort left among the gathering decay. He developed and brought to its highest pitch the science of psychohistory.

Psychohistory dealt not with man, but with man-masses. It was the science of mobs; mobs in their billions. It could forecast reactions to stimuli with something of the accuracy that a lesser science could bring to the forecast of a rebound of a billiard ball. The reaction of one man could be forecast by no known mathematics; the reaction of a billion is something else again.

Hari Seldon plotted the social and economic trends of the time, sighted along the curves and foresaw the continuing and accelerating fall of civilization and the gap of thirty thousand years that must elapse before a struggling new Empire could emerge from the ruins.

It was too late to stop that fall, but not too late to narrow the gap of barbarism. Seldon established two Foundations at "opposite ends of the Galaxy" and their location was so designed that in one short millennium events would knit and mesh so as to force out of them a stronger, more permanent, more benevolent Second Empire.

Foundation (Gnome Press, 1951) has told the story of one of those Foundations during the first two centuries of life.

It began as a settlement of physical scientists on Terminus, a planet at the extreme end of one of the spiral arms of the Galaxy. Separated from the turmoil of the Empire, they worked as compilers of a universal compendium of knowledge, the Encyclopedia Galactica, unaware of the deeper role planned for them by the already-dead Seldon,

As the Empire rotted, the outer regions fell into the hands of independent "kings." The Foundation was threatened by them. However, by playing one petty ruler against another, under the leadership of their first mayor, Salvor Hardin, they maintained a precarious independence. As sole possessors, of nuclear power among worlds which were losing their sciences and falling back on coal and oil, they even established an ascendancy. The Foundation became the "religious" center of the neighboring kingdoms.

Slowly, the Foundation developed a trading economy as the Encyclopedia receded into the background. Their Traders, dealing in nuclear gadgets which not even the Empire in its heyday could have duplicated for compactness, penetrated hundreds of light-years through the Periphery.

Under Hober Mallow, the first of the Foundation's Merchant Princes, they developed the techniques of economic warfare to the point of defeating the Republic of Korell, even though that world was receiving support from one of the outer provinces of what was left of the Empire.

At the end of two hundred years, the Foundation was the most powerful state in the Galaxy, except for the remains of the Empire, which, concentrated in the inner third of the Milky Way, still controlled three quarters of the population and wealth of the Universe.

It seemed inevitable that the next danger the Foundation would have to face was the final lash of the dying Empire.

The way must be cleared for the battle of Foundation and Empire.

PART I

THE GENERAL

1. SEARCH FOR MAGICIANS

BEL RIOSE In his relatively short career, Riose earned the title of "The Last of the Imperials" and earned it well. A study of his campaigns reveals him to be the equal of Peurifoy in strategic ability and his superior perhaps in his ability to handle men. That he was born in the days of the decline of Empire made it all but impossible for him to equal Peurifoy's record as a conqueror. Yet he had his chance when, the first of the Empire's generals to do so, he faced the Foundation squarely. . . .

ENCYCLOPEDIA GALACTICA*

*All quotations from the Encyclopedia Galactica here reproduced are taken from the 116th Edition published in 1020 F.E. by the Encyclopedia Galactica Publishing Co., Terminus, with permission of the publishers.

Bel Riose traveled without escort, which is not what court etiquette prescribes for the head of a fleet stationed in a yet-sullen stellar system on the Marches of the Galactic Empire.

But Bel Riose was young and energetic – energetic enough to be sent as near the end of the universe as possible by an unemotional and calculating court – and curious besides. Strange and improbable tales fancifully-repeated by hundreds and murkily-known to thousands intrigued the last faculty; the possibility of a military venture engaged the other two. The combination was overpowering.

He was out of the dowdy ground-car he had appropriated and at the door of the fading mansion that was his destination. He waited. The photonic eye that spanned the doorway was alive, but when the door opened it was by hand.

Bel Riose smiled at the old man. "I am Riose—"

"I recognize you." The old man remained stiffly and unsurprised in his place. "Your business?"

Riose withdrew a step in a gesture of submission. "One of peace. If you are Ducem Barr, I ask the favor of conversation."

Ducem Barr stepped aside and in the interior of the house the walls glowed into life, The general entered into daylight.

He touched the wall of the study, then stared at his fingertips. "You have this on Siwenna?"

Barr smiled thinly. "Not elsewhere, I believe. I keep this in repair myself as well as I can. I must apologize for your wait at the door. The automatic device registers the presence of a visitor but will no longer open the door."

"Your repairs fall short?" The general's voice was faintly mocking.

"Parts are no longer available. If you will sit, sir. You drink tea?"

"On Siwenna? My good sir, it is socially impossible not to drink it here."

The old patrician retreated noiselessly with a slow bow that was part of the ceremonious legacy left by the aristocracy of the last century's better days.

Riose looked after his host's departing figure, and his studied urbanity grew a bit uncertain at the edges. His education had been purely military; his experience likewise. He had, as the cliché, has it, faced death many times; but always death of a very familiar and tangible nature. Consequently, there is no inconsistency in the fact that the idolized lion of the Twentieth Fleet felt chilled in the suddenly musty atmosphere of an ancient room.

The general recognized the small black-ivroid boxes that lined the shelves to be books. Their titles were unfamiliar. He guessed that the large structure at one end of the room was the receiver that transmuted the books into sight-and-sound on demand. He had never seen one in operation; but he had heard of them.

Once he had been told that long before, during the golden ages when the Empire had been co-extensive with the entire Galaxy, nine houses out of every ten had such receivers – and such rows of books.

But there were borders to watch now; books were for old men. And half the stories told about the old days were mythical anyway. More than half.

The tea arrived, and Riose seated himself. Ducem Barr lifted his cup. "To your honor."

"Thank you. To yours."

Ducem Barr said deliberately, "You are said to be young. Thirty-five?"

"Near enough. Thirty-four."

"In that case," said Barr, with soft emphasis, "I could not begin better than by informing you regretfully that I am not in the possession of love charms, potions, or philtres. Nor am I in the least capable of influencing the favors of any young lady as may appeal to you."

"I have no need of artificial aids in that respect, sir." The complacency undeniably present in the general's voice was stirred with amusement. "Do you receive many requests for such commodities?"

"Enough. Unfortunately, an uninformed public tends to confuse scholarship with magicianry, and love life seems to be that factor which requires the largest quantity of magical tinkering."

"And so would seem most natural. But I differ. I connect scholarship with nothing but the means of answering difficult questions."

The Siwennian considered somberly, "You may be as wrong as they!"

"That may turn out or not." The young general set down his cup in its flaring sheath and it refilled. He dropped the offered flavor-capsule into it with a small splash. "Tell me then, patrician, who are the magicians? The real ones."

Barr seemed startled at a title long-unused. He said, "There are no magicians."

"But people speak of them. Siwenna crawls with the tales of them. There are cults being built about them. There is some strange connection between it and those groups among your countrymen who dream and drivel of ancient days and what they call liberty and autonomy. Eventually the matter might become a danger to the State."

The old man shook his head. "Why ask me? Do you smell rebellion, with myself at the head?"

Riose shrugged, "Never. Never. Oh, it is not a thought completely ridiculous. Your father was an exile in his day; you yourself a patriot and a chauvinist in yours. It is indelicate in me as a guest to mention it, but my business here requires it. And yet a conspiracy now? I doubt it. Siwenna has had the spirit beat out of it these three generations."

The old man replied with difficulty, "I shall be as indelicate a host as you a guest. I shall remind you that once a viceroy thought as you did of the spiritless Siwennians. By the orders of that viceroy my father became a fugitive pauper, my brothers martyrs, and my sister a suicide. Yet that viceroy died a death sufficiently horrible at the hands of these same slavish Siwennians."

"Ah, yes, and there you touch nearly on something I could wish to say. For three years the mysterious death of that viceroy has been no mystery to me. There was a young soldier of his personal guard whose actions were of interest. You were that soldier, but there is no need of details, I think."

Barr was quiet. "None. What do you propose?"

"That you answer my questions."

"Not under threats. I am old enough for life not to mean particularly overmuch."

"My good sir, these are hard times," said Riöse, with meaning, "and you have children and friends. You have a country for which you have mouthed phrases of love and folly in the past. Come, if I should decide to use force, my aim would not be so poor as to strike you."

Barr said coldly, "What do you want?"

Riose held the empty cup as he spoke. "Patrician, listen to me. These are days when the most successful soldiers are those whose function is to lead the dress parades that wind through the imperial palace grounds on feast days and to escort the sparkling pleasure ships that carry His Imperial Splendor to the summer planets. I . . . I am a failure. I am a failure at thirty-four, and I shall stay a failure. Because, you see, I like to fight.

"That's why they sent me here. I'm too troublesome at court. I don't fit in with the etiquette. I offend the dandies and the lord admirals, but I'm too good a leader of ships and men to be disposed of shortly by being marooned in space. So Siwenna is the substitute. It's a frontier world; a rebellious and a barren province. It is far away, far enough away to satisfy all.

"And so I moulder. There are no rebellions to stamp down, and the border viceroys do not revolt lately, at least, not since His Imperial Majesty's late father of glorious memory made an example of Mountel of Paramay."

"A strong Emperor," muttered Barr.

"Yes, and we need more of them. He is my master; remember that. These are his interests I guard."

Barr shrugged unconcernedly. "How does all this relate to the subject?"

"I'll show you in two words. The magicians I've mentioned come from beyond-out there beyond the frontier guards, where the stars are scattered thinly—"

"Where the stars are scattered thinly," quoted Barr, "And the cold of space seeps in."

"Is that poetry?" Riose frowned. Verse seemed frivolous at the moment. "In any case, they're from the Periphery – from the only quarter where I am free to fight for the glory of the Emperor."

"And thus serve His Imperial Majesty's interests and satisfy your own love of a good fight."

"Exactly. But I must know what I fight; and there you can help."

"How do you know?"

Riose nibbled casually at a cakelet. "Because for three years I have traced every rumor, every myth, every breath concerning the magicians – and of all the library of information I have gathered, only two isolated facts are unanimously agreed upon, and are hence certainly true. The first is that the magicians come from the edge of the Galaxy opposite Siwenna; the second is that your father once met a magician, alive and actual, and spoke with him."

The aged Siwennian stared unblinkingly, and Riose continued, "You had better tell me what you know—"

Barr said thoughtfully, "It would be interesting to tell you certain things. It would be a psychohistoric experiment of my own."

"What kind of experiment?"

"Psychohistoric." The old man had an unpleasant edge to his smile. Then, crisply, "You'd better have more tea. I'm going to make a bit of a speech."

He leaned far back into the soft cushions of his chair. The wall-lights had softened to a pink-ivory glow, which mellowed even the soldier's hard profile.

Ducem Barr began, "My own knowledge is the result of two accidents; the accidents of being born the son of my father, and of being born the native of my country. It begins over forty years ago, shortly after the great Massacre, when my father was a fugitive in the forests of the South, while I was a gunner in the viceroy's personal fleet. This same viceroy, by the way, who had ordered the Massacre, and who died such a cruel death thereafter."

Barr smiled grimly, and continued, "My father was a Patrician of the Empire and a Senator of Siwenna. His name was Onum Barr."

Riose interrupted impatiently, "I know the circumstances of his exile very well. You needn't elaborate upon it."

The Siwennian ignored him and proceeded without deflection. "During his exile a wanderer came upon him; a merchant from the edge of the Galaxy; a young man who spoke a strange accent, knew nothing of recent Imperial history, and who was protected by an individual force-shield."

"An individual force-shield?" Riose glared. "You speak extravagance. What generator could be powerful enough to condense a shield to the size of a single man? By the Great Galaxy, did he carry five thousand myria-tons of nuclear power-source about with him on a little wheeled gocart?"

Barr said quietly, "This is the magician of whom you hear whispers, stories and myths. The name 'magician' is not lightly earned. He carried no generator large enough to be seen, but not the heaviest weapon you can carry in your hand would have as much as creased the shield he bore."

"Is this all the story there is? Are the magicians born of maunderings of an old man broken by suffering and exile?"

"The story of the magicians antedated even my father, sir. And the proof is more concrete. After leaving my father, this merchant that men call a magician visited a Tech-man at the city to which my father had guided him, and there he left a shield-generator of the type he wore. That generator was retrieved by my father after his return from exile upon the execution of the bloody viceroy. It took a long time to find—

"The generator hangs on the wall behind you, sir. It does not work. It never worked but for the first two days; but if you'll look at it, you will see that no one in the Empire ever designed it."

Bel Riose reached for the belt of linked metal that clung to the curved wall. It came away with a little sucking noise as the tiny adhesion-field broke at the touch of his hand. The ellipsoid at the apex of the belt held his attention. It was the size of a walnut.

"This—" he said.

"Was the generator," nodded Barr. "But it was the generator. The secret of its workings are beyond discovery now. Sub-electronic investigations have shown it to be fused into a single lump of metal and not all the most careful study of the diffraction patterns have sufficed to distinguish the discrete parts that had existed before fusion."

"Then your 'proof' still lingers on the frothy border of words backed by no concrete evidence."

Barr shrugged. "You have demanded my knowledge of me and threatened its extortion by force. If you choose to meet it with skepticism, what is that to me? Do you want me to stop?"

"Go on!" said the general, harshly.

"I continued my father's researches after he died, and then the second accident I mentioned came to help me, for Siwenna was well known to Hari Seldon."

"And who is Hari Seldon?"

"Hari Seldon was a scientist of the reign of the Emperor, Daluben IV. He was a psychohistorian; the last and greatest of them all. He once visited Siwenna, when Siwenna was a great commercial center, rich in the arts and sciences."

"Hmph," muttered Riose, sourly, "where is the stagnant planet that does not claim to have been a land of overflowing wealth in older days?"

"The days I speak of are the days of two centuries ago, when the Emperor yet ruled to the uttermost star; when Siwenna was a world of the interior and not a semi-barbarian border province. In those days, Hari Seldon foresaw the decline of Imperial power and the eventual barbarization of the entire Galaxy."

Riose laughed suddenly. "He foresaw that? Then he foresaw wrong, my good scientist. I suppose you call yourself that. Why, the Empire is more powerful now than it has been in a millennium. Your old eyes are blinded by the cold bleakness of the border. Come to the inner worlds some day; come to the warmth and the wealth of the center."

The old man shook his head somberly. "Circulation ceases first at the outer edges. It will take a while yet for the decay to reach the heart. That is, the apparent, obvious-to-all decay, as distinct from the inner decay that is an old story of some fifteen centuries."

"And so this Hari Seldon foresaw a Galaxy of uniform barbarism," said Riose, good-humoredly. "And what then, eh?"

"So he established two foundations at the extreme opposing ends of the Galaxy – Foundations of the best, and the youngest, and the strongest, there to breed, grow, and develop. The worlds on which they were placed were chosen carefully; as were the times and the surroundings. All was arranged in such a way that the future as foreseen by the unalterable mathematics of psychohistory would involve their early isolation from the main body of Imperial civilization and their gradual growth into the germs of the Second Galactic Empire – cutting an inevitable barbarian interregnum from thirty thousand years to scarcely a single thousand."

"And where did you find out all this? You seem to know it in detail."

"I don't and never did," said the patrician with composure. "It is the painful result of the piecing together of certain evidence discovered by my father and a little more found by myself. The basis is flimsy and the superstructure has been romanticized into existence to fill the huge gaps. But I am convinced that it is essentially true."

"You are easily convinced."

"Am I? It has taken forty years of research."

"Hmph. Forty years! I could settle the question in forty days. In fact, I believe I ought to. It would be – different."

"And how would you do that?"

"In the obvious way. I could become an explorer. I could find this Foundation you speak of and observe with my eyes. You say there are two?"

"The records speak of two. Supporting evidence has been found only for one, which is understandable, for the other is at the extreme end of the long axis of the Galaxy."

"Well, we'll visit the near one." The general was on his feet, adjusting his belt.

"You know where to go?" asked Barr.

"In a way. In the records of the last viceroy but one, he whom you murdered so effectively, there are suspicious tales of outer barbarians. In fact, one of his daughters was given in marriage to a barbarian prince. I'll find my way."

He held out a hand. "I thank you for your hospitality."

Ducem Barr touched the hand with his fingers and bowed formally. "Your visit was a great honor."

"As for the information you gave me," continued Bel Riose, "I'll know how to thank you for that when I return."

Ducem Barr followed his guest submissively to the outer door and said quietly to the disappearing ground-car, "And *if* you return."

2. THE MAGICIANS

FOUNDATION . . . With forty years of expansion behind them, the Foundation faced the menace of Riose. The epic days of Hardin and Mallow had gone and with them were gone a certain hard daring and resolution. . . .

ENCYCLOPEDIA GALACTICA

There were four men in the room, and the room was set apart where none could approach. The four men looked at each other quickly, then lengthily at the table that separated them. There were four bottles on the table and as many full glasses, but no one had touched them.

And then the man nearest the door stretched out an arm and drummed a slow, padding rhythm on the table.

He said, "Are you going to sit and wonder forever? Does it matter who speaks first?"

"Speak you first, then," said the big man directly opposite. "You're the one who should be the most worried."

Sennett Forell chuckled with noiseless nonhumor. "Because you think I'm the richest. Well – Or is it that you expect me to continue as I have started. I don't suppose you forget that it was my own Trade Fleet that captured this scout ship of theirs."

"You had the largest fleet," said a third, "and the best pilots; which is another way of saying you are the richest. It was a fearful risk; and would have been greater for one of us."

Sennett Forell chuckled again. "There is a certain facility in risk-taking that I inherit from my father. After all, the essential point in running a risk is that the returns justify it. As to which, witness the fact that the enemy ship was isolated and captured without loss to ourselves or warning to the others."

That Forell was a distant collateral relative of the late great Hober Mallow was recognized openly throughout the Foundation. That he was Mallow's illegitimate son was accepted quietly to just as wide an extent.

The fourth man blinked his little eyes stealthily. Words crept out from between thin lips. "It is nothing to sleep over in fat triumph, this grasping of little ships. Most likely, it will but anger that young man further."

"You think he needs motives?" questioned Forell, scornfully.

"I do, and this might, or will, save him the vexation of having to manufacture one." The fourth man spoke slowly, "Hober Mallow worked otherwise. And Salvor Hardin. They let others take the uncertain paths of force, while they maneuvered surely and quietly."

Forell shrugged. "This ship has proved its value. Motives are cheap and we have sold this one at a profit." There was the satisfaction of the born Trader in that. He continued, "The young man is of the old Empire."

"We knew that," said the second man, the big one, with rumbling discontent.

"We suspected that," corrected Forell, softly. "If a man comes with ships and wealth, with overtures of friendliness, and with offers of trade, it is only sensible to refrain from antagonizing him, until we are certain that the profitable mask is not a face after all. But now—"

There was a faint whining edge to the third man's voice as he spoke. "We might have been even more careful. We might have found out first. We might have found out before allowing him to leave. It would have been the truest wisdom."

"That has been discussed and disposed of," said Forell. He waved the subject aside with a flatly final gesture.

"The government is soft," complained the third man. "The mayor is an idiot."

The fourth man looked at the other three in turn and removed the stub of a cigar from his mouth. He dropped it casually into the slot at his right where it disappeared with a silent flash of disruption.

He said sarcastically, "I trust the gentleman who last spoke is speaking through habit only. We can afford to remember here that we are the government."

There was a murmur of agreement.

The fourth man's little eyes were on the table. "Then let us leave government policy alone. This young man . . . this stranger might have been a possible customer. There have been cases. All three of you tried to butter him into an advance contract. We have an agreement – a gentleman's agreement – against it, but you tried."

"So did you," growled the second man.

I know it," said the fourth, calmly.

"Then let's forget what we should have done earlier," interrupted Forell impatiently, "and continue with what we should do now. In any case, what if we had imprisoned him, or killed him, what then? We are not certain of his intentions even yet, and at the worst, we could not destroy an Empire by snipping short one man's life. There might be navies upon navies waiting just the other side of his nonreturn."

"Exactly," approved the fourth man. "Now what did you get out of your captured ship? I'm too old for all this talking."

"It can be told in a few enough words," said Forell, grimly. "He's an Imperial general or whatever rank corresponds to that over there. He's a young man who has proved his military brilliance – so I am told – and who is the idol of his men. Quite a romantic career. The stories they tell of him are no doubt half lies, but even so it makes him out to be a type of wonder man."

"Who are the 'they'?" demanded the second man.

"The crew of the captured ship. Look, I have all their statements recorded on micro-film, which I have in a secure place. Later on, if you wish, you can see them. You can talk to the men yourselves, if you think it necessary. I've told you the essentials."

"How did you get it out of them? How do you know they're telling the truth?"

Forell frowned. "I wasn't gentle, good sir. I knocked them about, drugged them crazy, and used the Probe unmercifully. They talked. You can believe them."

"In the old days," said the third man, with sudden irrelevance, "they would have used pure psychology. Painless, you know, but very sure. No chance of deceit."

"Well, there is a good deal they had in the old days," said Forell, dryly. "These are the new days."

"But," said the fourth man, "what did he want here, this general, this romantic wonder-man?" There was a dogged, weary persistence about him.

Forell glanced at him sharply. "You think he confides the details of state policy to his crew? They didn't know. There was nothing to get out of them in that respect, and I tried, Galaxy knows."

"Which leaves us–"

"To draw our own conclusions, obviously." Forell's fingers were tapping quietly again. "The young man is a military leader of the Empire, yet he played the pretense of being a minor princeling of some scattered stars in an odd corner of the Periphery. That alone would assure us that his real motives are such as it would not benefit him to have us know. Combine the nature of his profession with the fact that the Empire has already subsidized one attack upon us in my father's time, and the possibilities become ominous. That first attack failed. I doubt that the Empire owes us love for that."

"There is nothing in your findings," questioned the fourth man guardedly, "that makes for certainty? You are withholding nothing?"

Forell answered levelly, "I can't withhold anything. From here on there can be no question of business rivalry. Unity is forced upon us."

"Patriotism?" There was a sneer in the third man's thin voice.

"Patriotism be damned," said Forell quietly. "Do you think I give two puffs of nuclear emanation for the future Second Empire? Do you think I'd risk a single Trade mission to smooth its path? But – do you suppose Imperial conquest will help my business or yours? If the Empire wins, there will be a sufficient number of yearning carrion crows to crave the rewards of battle."

"And we're the rewards," added the fourth man, dryly.

The second man broke his silence suddenly, and shifted his bulk angrily, so that the chair creaked under him. "But why talk of that. The Empire can't win, can it? There is Seldon's assurance that we will form the Second Empire in the end. This is only another crisis. There have been three before this."

"Only another crisis, yes!" Forell brooded. "But – in the case of the first two, we had Salvor Hardin to guide us; in the third, there was Hober Mallow. Whom have we now?"

He looked at the others somberly and continued, "Seldon's rules of psychohistory on which it is so comforting to rely probably have as one of the contributing variables, a certain normal initiative on the part of the people of the Foundation themselves. Seldon's laws help those who help themselves."

"The times make the man," said the third man. "There's another proverb for you."

"You can't count on that, not with absolute assurance," grunted Forell. "Now the way it seems to me is this. If this is the fourth crisis, then Seldon has foreseen it. If he has, then it can be beaten, and there should be a way of doing it."

"Now The Empire is stronger than we; it always has been. But this is the first time we are in danger of its direct attack, so that strength becomes terribly menacing. If it can be beaten, it must be once again as in all past crises by a method other than pure force. We must find the weak side of our enemy and attack it there."

"And what is that weak side?" asked the fourth man. "Do you intend advancing a theory?"

"No. That is the point I'm leading up to. Our great leaders of the past always saw the weak points of their enemies and aimed at that. But now–"

There was a helplessness in his voice, and for a moment none volunteered a comment.

Then the fourth man said, "We need spies."

Forell turned to him eagerly. "Right! I don't know when the Empire will attack. There may be time."

"Hober Mallow himself entered the Imperial dominions," suggested the second man.

But Forell shook his head. "Nothing so direct. None of us are precisely youthful; and all of us are rusty with red-tape and administrative detail. We need young men that are in the field now–"

"The independent traders?" asked the fourth man.

And Forell nodded his head and whispered, "If there is yet time–"

3. THE DEAD HAND

Bel Riose interrupted his annoyed stridings to look up hopefully when his aide entered. "Any word of the *Starlet*?"

"None. The scouting party has quartered space, but the instruments have detected nothing. Commander Yume has reported that the Fleet is ready for an immediate attack in retaliation."

The general shook his head. "No, not for a patrol ship. Not yet. Tell him to double – Wait! I'll write out the message. Have it coded and transmitted by tight beam."

He wrote as he talked and thrust the paper at the waiting officer. "Has the Siwennian arrived yet?"

"Not yet."

"Well, see to it that he is brought in here as soon as he does arrive."

The aide saluted crisply and left. Riose resumed his caged stride.

When the door opened a second time, it was Ducem Barr that stood on the threshold. Slowly, in the footsteps of the ushering aide, he stepped into the garish room whose ceiling was an ornamented holographic model of the Galaxy, and in the center of which Bel Riose stood in field uniform.

"Patrician, good day!" The general pushed forward a chair with his foot and gestured the aide away with a "That door is to stay closed till I open it."

He stood before the Siwennian, legs apart, hand grasping wrist behind his back, balancing himself slowly, thoughtfully, on the balls of his feet.

Then, harshly, "Patrician, are you a loyal subject of the Emperor?"

Barr, who had maintained an indifferent silence till then, wrinkled a noncommittal brow. "I have no cause to love Imperial rule."

"Which is a long way from saying that you would be a traitor."

"True. But the mere act of not being a traitor is also a long way from agreeing to be an active helper."

"Ordinarily also true. But to refuse your help at this point," said Riose, deliberately, "will be considered treason and treated as such."

Barr's eyebrows drew together. "Save your verbal cudgels for your subordinates. A simple statement of your needs and wants will suffice me here."

Riose sat down and crossed his legs. "Barr, we had an earlier discussion half a year ago."

"About your magicians?"

"Yes. You remember what I said I would do."

Barr nodded. His arms rested limply in his lap. "You were going to visit them in their haunts, and you've been away these four months. Did you find them?"

"Find them? That I did," cried Riose. His lips were stiff as he spoke. It seemed to require effort to refrain from grinding molars. "Patrician, they are not magicians; they are devils. It is as far from belief as the outer galaxies from here. Conceive it! It is a world the size of a handkerchief, of a fingernail; with resources so petty, power so minute, a population so microscopic as would never suffice the most backward worlds of the dusty prefects of the Dark Stars. Yet with that, a people so proud and ambitious as to dream quietly and methodically of Galactic rule."

"Why, they are so sure of themselves that they do not even hurry. They move slowly, phlegmatically; they speak of necessary centuries. They swallow worlds at leisure; creep through systems with dawdling complacency.

"And they succeed. There is no one to stop them. They have built up a filthy trading community that curls its tentacles about the systems further than their toy ships dare reach. For parsecs, their Traders – which is what their agents call themselves – penetrate."

Ducem Barr interrupted the angry flow. "How much of this information is definite; and how much is simply fury?"

The soldier caught his breath and grew calmer. "My fury does not blind me. I tell you I was in worlds nearer to Siwenna than to the Foundation, where the Empire was a myth of the distance, and where Traders were living truths. We ourselves were mistaken for Traders."

"The Foundation itself told you they aimed at Galactic dominion?"

"Told me!" Riose was violent again. "It was not a matter of telling me. The officials said nothing. They spoke business exclusively. But I spoke to ordinary men. I absorbed the ideas of the common folk; their 'manifest destiny,' their calm acceptance of a great future. It is a thing that can't be hidden; a universal optimism they don't even try to hide."

The Siwennian openly displayed a certain quiet satisfaction. "You will notice that so far it would seem to bear out quite accurately my reconstruction of events from the paltry data on the subject that I have gathered."

"It is no doubt," replied Riose with vexed sarcasm, "a tribute to your analytical powers. It is also a hearty and bumptious commentary on the growing danger to the domains of His Imperial Majesty."

Barr shrugged his unconcern, and Riose leaned forward suddenly, to seize the old man's shoulders and stare with curious gentleness into his eyes.

He said, "Now, patrician, none of that. I have no desire to be barbaric. For my part, the legacy of Siwennian hostility to the Imperium is an odious burden, and one which I would do everything in my power to wipe out. But my province is the military and interference in civil affairs is impossible. It would bring about my recall and ruin my usefulness at once. You see that? I know you see that. Between yourself and myself then, let the atrocity of forty years ago be repaid by your vengeance upon its author and so forgotten. I need your help. I frankly admit it."

There was a world of urgency in the young man's voice, but Ducem Barr's head shook gently and deliberately in a negative gesture.

Riose said pleadingly, "You don't understand, patrician, and I doubt my ability to make you. I can't argue on your ground. You're the scholar, not I. But this I can tell you. Whatever you think of the Empire, you will admit its great services. Its armed forces have committed isolated crimes, but in the main they have been a force for peace and civilization. It was the Imperial navy that created the *Pax Imperium* that ruled over all the Galaxy for thousands of years. Contrast the millennia of peace under the Sun-and-Spaceship of the Empire with the millennia of interstellar anarchy that preceded it.

Consider the wars and devastations of those old days and tell me if, with all its faults, the Empire is not worth preserving.

"Consider," he drove on forcefully, "to what the outer fringe of the Galaxy is reduced in these days of their breakaway and independence, and ask yourself if for the sake of a petty revenge you would reduce Siwenna from its position as a province under the protection of a mighty Navy to a barbarian world in a barbarian Galaxy, all immersed in its fragmentary independence and its common degradation and misery."

"Is it so bad – so soon?" murmured the Siwennian.

"No," admitted Riose. "We would be safe ourselves no doubt, were our lifetimes quadrupled. But it is for the Empire I fight; that, and a military tradition which is something for myself alone, and which I can not transfer to you. It is a military tradition built on the Imperial institution which I serve."

"You are getting mystical, and I always find it difficult to penetrate another person's mysticism."

"No matter. You understand the danger of this Foundation."

"It was I who pointed out what you call the danger before ever you headed outward from Siwenna."

"Then you realize that it must be stopped in embryo or perhaps not at all. You have known of this Foundation before anyone had heard of it. You know more about it than anyone else in the Empire. You probably know how it might best be attacked; and you can probably forewarn me of its countermeasures. Come, let us be friends."

Ducem Barr rose. He said flatly, "Such help as I could give you means nothing. So I will make you free of it in the face of your strenuous demand."

"I will be the judge of its meaning."

"No, I am serious. Not all the might of the Empire could avail to crush this pygmy world."

"Why not?" Bel Riose's eyes glistened fiercely. "No, stay where you are. I'll tell you when you may leave. Why not? If you think I underestimate this enemy I have discovered, you are wrong. Patrician," he spoke reluctantly, "I lost a ship on my return. I have no proof that it fell into the hands of the Foundation; but it has not been located since and were it merely an accident, its dead hulk should, certainly have been found along the route we took. It is not an important loss – less than the tenth part of a fleabite, but it may mean that the Foundation has already opened hostilities. Such eagerness and such disregard for consequences might mean secret forces of which I know nothing. Can you help me then by answering a specific question? What is their military power?"

"I haven't any notion."

"Then explain yourself on your own terms. Why do you say the Empire can not defeat this small enemy?"

The Siwennian seated himself once more and looked away from Riose's fixed glare. He spoke heavily, "Because I have faith in the principles of psychohistory. It is a strange science. It reached mathematical maturity with one man, Hari Seldon, and died with him, for no man since has been capable of manipulating its intricacies. But in that short period,

it proved itself the most powerful instrument ever invented for the study of humanity. Without pretending to predict the actions of individual humans, it formulated definite laws capable of mathematical analysis and extrapolation to govern and predict the mass action of human groups."

"So—"

"It was that psychohistory which Seldon and the group he worked with applied in full force to the establishment of the Foundation. The place, time, and conditions all conspire mathematically and so, inevitably, to the development of a Second Galactic Empire."

Riose's voice trembled with indignation. "You mean that this art of his predicts that I would attack the Foundation and lose such and such a battle for such and such a reason? You are trying to say that I am a silly robot following a predetermined course into destruction."

"No," replied the old patrician, sharply. "I have already said that the science had nothing to do with individual actions. It is the vaster background that has been foreseen."

"Then we stand clasped tightly in the forcing hand of the Goddess of Historical Necessity."

"Of *Psychohistorical Necessity*," prompted Barr, softly.

"And if I exercise my prerogative of freewill? If I choose to attack next year, or not to attack at all? How pliable is the Goddess? How resourceful?"

Barr shrugged. "Attack now or never; with a single ship, or all the force in the Empire; by military force or economic pressure; by candid declaration of war or by treacherous ambush. Do whatever you wish in your fullest exercise of freewill. You will still lose."

"Because of Hari Seldon's dead hand?"

"Because of the dead hand of the mathematics of human behavior that can neither be stopped, swerved, nor delayed."

The two faced each other in deadlock, until the general stepped back.

He said simply, "I'll take that challenge. It's a dead hand against a living will."

4. THE EMPEROR

CLEON II commonly called "The Great." The last strong Emperor of the First Empire, he is important for the political and artistic renaissance that took place during his long reign. He is best known to romance, however, for his connection with Bel Riose, and to the common man, he is simply "Riose's Emperor." It is important not to allow events of the last year of his reign to overshadow forty years of. . .

Cleon II was Lord of the Universe. Cleon II also suffered from a painful and undiagnosed ailment. By the queer twists of human affairs, the two statements are not mutually exclusive, nor even particularly incongruous. There have been a wearisomely large number of precedents in history.

But Cleon II cared nothing for such precedents. To meditate upon a long list of similar cases would not ameliorate personal suffering an electron's worth. It soothed him as little to think that where his great-grandfather had been the pirate ruler of a dust-speck planet, he himself slept in the pleasure palace of Ammenetik the Great, as heir of a line of Galactic rulers stretching backward into a tenuous past. It was at present no source of comfort to him that the efforts of his father had cleansed the realm of its leprous patches of rebellion and restored it to the peace and unity it had enjoyed under Stanel VI; that, as a consequence, in the twenty-five years of his reign, not one cloud of revolt had misted his burnished glory.

The Emperor of the Galaxy and the Lord of All whimpered as he lolled his head backward into the invigorating plane of force about his pillows. It yielded in a softness that did not touch, and at the pleasant tingle, Cleon relaxed a bit. He sat up with difficulty and stared morosely at the distant walls of the grand chamber. It was a bad room to be alone in. It was too big. All the rooms were too big.

But better to be alone during these crippling bouts than to endure the prinking of the courtiers, their lavish sympathy, their soft, condescending dullness. Better to be alone than to watch those insipid masks behind which spun the tortuous speculations on the chances of death and the fortunes of the succession.

His thoughts hurried him. There were his three sons; three straight-backed youths full of promise and virtue. Where did they disappear on these bad days? Waiting, no doubt. Each watching the other; and all watching him.

He stirred uneasily. And now Brodrig craved audience. The low-born, faithful Brodrig; faithful because he was hated with a unanimous and cordial hatred that was the only point of agreement between the dozen cliques that divided his court.

Brodrig – the faithful favorite, who had to be faithful, since unless he owned the fastest speed-ship in the Galaxy and took to it the day of the Emperor's death, it would be the radiation-chamber the day after.

Cleon II touched the smooth knob on the arm of his great divan, and the huge door at the end of the room dissolved to transparency.

Brodrig advanced along the crimson carpet, and knelt to kiss the Emperor's limp hand.

"Your health, sire?" asked the Privy Secretary in a low tone of becoming anxiety.

"I live," snapped the Emperor with exasperation, "if you can call it life where every scoundrel who can read a book of medicine uses me as a blank and receptive field for his feeble experiments. If there is a conceivable remedy, chemical, physical, or nuclear, which has not yet been tried, why then, some learned babblers from the far corners of the realm will arrive tomorrow to try it. And still another newly-discovered book, or forgery morelike, will be used as authority.

"By my father's memory," he rumbled savagely, "it seems there is not a biped extant who can study a disease before his eyes with those same eyes. There is not one who can count a pulse-beat without a book of the ancients before him. I'm sick and they call it 'unknown.' The fools! If in the course of millennia, human bodies learn new methods of falling askew, it remains uncovered by the studies of the ancients and incurable forevermore. The ancients should be alive now, or I then."

The Emperor ran down to a low-breathed curse while Brodrig waited dutifully. Cleon II said peevishly, "How many are waiting outside?"

He jerked his head in the direction of the door.

Brodrig said patiently, "The Great Hall holds the usual number."

"Well, let them wait. State matters occupy me. Have the Captain of the Guard announce it. Or wait, forget the state matters. Just have it announced I hold no audience, and let the Captain of the Guard look doleful. The jackals among them may betray themselves." The Emperor sneered nastily.

"There is a rumor, sire," said Brodrig, smoothly, "that it is your heart that troubles you."

The Emperor's smile was little removed from the previous sneer. "It will hurt others more than myself if any act prematurely on that rumor. But what is it you want. Let's have this over."

Brodrig rose from his kneeling posture at a gesture of permission and said, "It concerns General Bel Riose, the Military Governor of Siwenna."

"Riose?" Cleon II frowned heavily. "I don't place him. Wait, is he the one who sent that quixotic message some months back? Yes, I remember. He panted for permission to enter a career of conquest for the glory of the Empire and Emperor."

"Exactly, sire."

The Emperor laughed shortly. "Did you think I had such generals left me, Brodrig? He seems to be a curious atavism. What was the answer? I believe you took care of it."

"I did, sire. He was instructed to forward additional information and to take no steps involving naval action without further orders from the Imperium."

"Hmp. Safe enough. Who is this Riose? Was he ever at court?"

Brodrig nodded and his mouth twisted ever so little. "He began his career as a cadet in the Guards ten years back. He had part in that affair off the Lemul Cluster."

"The Lemul Cluster? You know, my memory isn't quite – Was that the time a young soldier saved two ships of the line from a head-on collision by . . . uh . . . something or other?" He waved a hand impatiently. "I don't remember the details. It was something heroic."

"Riose was that soldier. He received a promotion for it," Brodrig said dryly, "and an appointment to field duty as captain of a ship."

"And now Military Governor of a border system and still young. Capable man, Brodrig!"

"Unsafe, sire. He lives in the past. He is a dreamer of ancient times, or rather, of the myths of what ancient times used to be. Such men are harmless in themselves, but

their queer lack of realism makes them fools for others." He added, "His men, I understand, are completely under his control. He is one of your *popular* generals."

"Is he?" the Emperor mused. "Well, come, Brodrig, I would not wish to be served entirely by incompetents. They certainly set no enviable standard for faithfulness themselves."

"An incompetent traitor is no danger. It is rather the capable men who must be watched."

"You among them, Brodrig?" Cleon II laughed and then grimaced with pain.

"Well, then, you may forget the lecture for the while. What new development is there in the matter of this young conqueror? I hope you haven't come merely to reminisce."

"Another message, sire, has been received from General Riöse."

"Oh? And to what effect?"

"He has spied out the land of these barbarians and advocates an expedition in force. His arguments are long and fairly tedious. It is not worth annoying Your Imperial Majesty with it at present, during your indisposition. Particularly since it will be discussed at length during the session of the Council of Lords." He glanced sidewise at the Emperor.

Cleon II frowned. "The Lords? Is it a question for them, Brodrig? It will mean further demands for a broader interpretation of the Charter. It always comes to that."

"It can't be avoided, sire. It might have been better if your august father could have beaten down the last rebellion without granting the Charter. But since it is here, we must endure it for the while."

"You're right, I suppose. Then the Lords it must be. But why all this solemnity, man? It is, after all, a minor point. Success on a remote border with limited troops is scarcely a state affair."

Brodrig smiled narrowly. He said coolly, "It is an affair of a romantic idiot; but even a romantic idiot can be a deadly weapon when an unromantic rebel uses him as a tool. Sire, the man was popular here and is popular there. He is young. If he annexes a vagrant barbarian planet or two, he will become a conqueror. Now a young conqueror who has proven his ability to rouse the enthusiasm of pilots, miners, tradesmen and suchlike rabble is dangerous at any time. Even if he lacked the desire to do to you as your august father did to the usurper, Ricker, then one of our loyal Lords of the Domain may decide to use him as his weapon."

Cleon II moved an arm hastily and stiffened with pain. Slowly he relaxed, but his smile was weak, and his voice a whisper. "You are a valuable subject, Brodrig. You always suspect far more than is necessary, and I have but to take half your suggested precautions to be utterly safe. We'll put it up to the Lords. We shall see what they say and take our measure accordingly. The young man, I suppose, has made no hostile moves yet."

"He report none. But already he asks for reinforcements."

"Reinforcements!" The Emperor's eyes narrowed with wonder. "What force has he?"

"Ten ships of the line, sire, with a full complement of auxiliary vessels. Two of the ships are equipped with motors salvaged from the old Grand Fleet, and one has a battery of power artillery from the same source. The other ships are new ones of the last fifty years, but are serviceable, nevertheless."

"Ten ships would seem adequate for any reasonable undertaking. Why, with less than ten ships my father won his first victories against the usurper. Who are these barbarians he's fighting?"

The Privy Secretary raised a pair of supercilious eyebrows. "He refers to them as 'the Foundation.'"

"The Foundation? What is it?"

"There is no record of it, sire. I have searched the archives carefully. The area of the Galaxy indicated falls within the ancient province of Anacreon, which two centuries since gave itself up to brigandage, barbarism, and anarchy. There is no planet known as Foundation in the province, however. There was a vague reference to a group of scientists sent to that province just before its separation from our protection. They were to prepare an Encyclopedia." He smiled thinly. "I believe they called it the Encyclopedia Foundation."

"Well," the Emperor considered it somberly, "that seems a tenuous connection to advance."

"I'm not advancing it, sire. No word was ever received from that expedition after the growth of anarchy in that region. If their descendants still live and retain their name, then they have reverted to barbarism most certainly."

"And so he wants reinforcements." The Emperor bent a fierce glance at his secretary. "This is most peculiar; to propose to fight savages with ten ships and to ask for more before a blow is struck. And yet I begin to remember this Riose; he was a handsome boy of loyal family. Brodrig, there are complications in this that I don't penetrate. There may be more importance in it than would seem."

His fingers played idly with the gleaming sheet that covered his stiffened legs. He said, "I need a man out there; one with eyes, brains and loyalty. Brodrig—"

The secretary bent a submissive head. "And the ships, sire?"

"Not yet!" The Emperor moaned softly as he shifted his position in gentle stages. He pointed a feeble finger, "Not till we know more. Convene the Council of Lords for this day week. It will be a good opportunity for the new appropriation as well. I'll put *that* through or lives will end."

He leaned his aching head into the soothing tingle of the force-field pillow, "Go now, Brodrig, and send in the doctor. He's the worst bumbler of the lot."

5. THE WAR BEGINS

From the radiating point of Siwenna, the forces of the Empire reached out cautiously into the black unknown of the Periphery. Giant ships passed the vast distances

that separated the vagrant stars at the Galaxy's rim, and felt their way around the outermost edge of Foundation influence.

Worlds isolated in their new barbarism of two centuries felt the sensation once again of Imperial overlords upon their soil. Allegiance was sworn in the face of the massive artillery covering capital cities.

Garrisons were left; garrisons of men in Imperial uniform with the Spaceship-and-Sun insignia upon their shoulders. The old men took notice and remembered once again the forgotten tales of their grandfathers' fathers of the times when the universe was big, and rich, and peaceful and that same Spaceship-and-Sun ruled all.

Then the great ships passed on to weave their line of forward bases further around the Foundation. And as each world was knotted into its proper place in the fabric, the report went back to Bel Riose at the General Headquarters he had established on the rocky barrenness of a wandering sunless planet.

Now Riose relaxed and smiled grimly at Ducem Barr. "Well, what do you think, patrician?"

"I? Of what value are my thoughts? I am not a military man." He took in with one wearily distasteful glance the crowded disorder of the rock-bound room which had been carved out of the wall of a cavern of artificial air, light, and heat which marked the single bubble of life in the vastness of a bleak world.

"For the help I could give you," he muttered, "or would want to give you, you might return me to Siwenna."

"Not yet. Not yet." The general turned his chair to the corner which held the huge, brilliantly-transparent sphere that mapped the old Imperial prefect of Anacreon and its neighboring sectors. "Later, when this is over, you will go back to your books and to more. I'll see to it that the estates of your family are restored to you and to your children for the rest of time."

"Thank you," said Barr, with faint irony, "but I lack your faith in the happy outcome of all this."

Riose laughed harshly, "Don't start your prophetic croakings again. This map speaks louder than all your woeful theories." He caressed its curved invisible outline gently. "Can you read a map in radial projection? You can? Well, here, see for yourself. The stars in gold represent the Imperial territories. The red stars are those in subjection to the Foundation and the pink are those which are probably within the economic sphere of influence. Now watch—"

Riose's hand covered a rounded knob, and slowly an area of hard, white pinpoints changed into a deepening blue. Like an inverted cup they folded about the red and the pink.

"Those blue stars have been taken over by my forces," said Riose with quiet satisfaction, "and they still advance. No opposition has appeared anywhere. The barbarians are quiet. And particularly, no opposition has come from Foundation forces. They sleep peacefully and well."

"You spread your force thinly, don't you?" asked Barr.

"As a matter of fact," said Riose, "despite appearances, I don't. The key points which I garrison and fortify are relatively few, but they are carefully chosen. The result is that the force expended is small, but the strategic result great. There are many advantages, more than would ever appear to anyone who hasn't made a careful study of spatial tactics, but it is apparent to anyone, for instance, that I can base an attack from any point in an inclosing sphere, and that when I am finished it will be impossible for the Foundation to attack at flank or rear. I shall have no flank or rear with respect to them.

"This strategy of the Previous Enclosure has been tried before, notably in the campaigns of Loris VI, some two thousand years ago, but always imperfectly; always with the knowledge and attempted interference of the enemy. This is different."

"The ideal textbook case?" Barr's voice was languid and indifferent.

Riose was impatient, "You still think my forces will fail?"

"They must."

"You understand that there is no case in military history where an Enclosure has been completed that the attacking forces have not eventually won, except where an outside Navy exists in sufficient force to break the Enclosure."

"If you say so."

"And you still adhere to your faith."

"Yes."

Riose shrugged. "Then do so."

Barr allowed the angry silence to continue for a moment, then asked quietly, "Have you received an answer from the Emperor?"

Riose removed a cigarette from a wall container behind his head, placed a filter tip between his lips and puffed it aflame carefully. He said, "You mean my request for reinforcements? It came, but that's all. Just the answer."

"No ships."

"None. I half-expected that. Frankly, patrician, I should never have allowed myself to be stampeded by your theories into requesting them in the first place. It puts me in a false light."

"Does it?"

"Definitely. Ships are at a premium. The civil wars of the last two centuries have smashed up more than half of the Grand Fleet and what's left is in pretty shaky condition. You know it isn't as if the ships we build these days are worth anything. I don't think there's a man in the Galaxy today who can build a first-rate hypernuclear motor."

"I knew that," said the Siwennian. His eyes were thoughtful and introspective. "I didn't know that *you* knew it. So his Imperial Majesty can spare no ships. Psychohistory could have predicted that; in fact, it probably did. I should say that Hari Seldon's dead hand wins the opening round."

Riose answered sharply, "I have enough ships as it is. Your Seldon wins nothing. Should the situation turn more serious, then more ships *will* be available. As yet, the Emperor does not know all the story."

"Indeed? What haven't you told him?"

"Obviously – your theories." Riose looked sardonic. "The story is, with all respect to you, inherently improbable. If developments warrant; if events supply me with proof, then, but only then, would I make out the case of mortal danger.

"And in addition," Riose drove on, casually, "the story, unbolstered by fact, has a flavor of *lese majeste* that could scarcely be pleasant to His Imperial Majesty."

The old patrician smiled. "You mean that telling him his august throne is in danger of subversion by a parcel of ragged barbarians from the ends of the universe is not a warning to be believed or appreciated. Then you expect nothing from him."

"Unless you count a special envoy as something."

"And why a special envoy?"

"It's an old custom. A direct representative of the crown is present on every military campaign which is under government auspices."

"Really? Why?"

"It's a method of preserving the symbol of personal Imperial leadership in all campaigns. It's gained a secondary function of insuring the fidelity of generals. It doesn't always succeed in that respect."

"You'll find that inconvenient, general. Extraneous authority, I mean."

"I don't doubt that," Riose reddened faintly, "but it can't be helped—"

The receiver at the general's hand glowed warmly, and with an unobtrusive jar, the cylindered communication popped into its slot. Riose unrolled it, "Good! This is it!"

Ducem Barr raised a mildly questioning eyebrow.

Riose said, "You know we've captured one of these Trader people. Alive – and with his ship intact."

"I've heard talk of it."

"Well, they've just brought him in, and we'll have him here in a minute. You keep your seat, patrician. I want you here when I'm questioning him. It's why I asked you here today in the first place. You may understand him where I might miss important points."

The door signal sounded and a touch of the general's toe swung the door wide. The man who stood on the threshold was tall and bearded, wore a short coat of a soft, leathery plastic, with an attached hood shoved back on his neck. His hands were free, and if he noticed the men about him were armed, he did not trouble to indicate it.

He stepped in casually, and looked about with calculating eyes. He favored the general with a rudimentary wave of the hand and a half nod.

"Your name?" demanded Riose, crisply.

"Lathan Devers." The trader hooked his thumbs into his wide and gaudy belt. "Are you the boss here?"

"You are a trader of the Foundation?"

"That's right. Listen, if you're the boss, you'd better tell your hired men here to lay off my cargo."

The general raised his head and regarded the prisoner coldly. "Answer questions. Do not volunteer orders."

"All right. I'm agreeable. But one of your boys blasted a two-foot hole in his chest already, by sticking his fingers where he wasn't supposed to."

Riose shifted his gaze to the lieutenant in charge. "Is this man telling the truth? Your report, Vrank, had it that no lives were lost."

"None were, sir," the lieutenant spoke stiffly, apprehensively, "at the time. There was later some disposition to search the ship, there having arisen a rumor that a woman was aboard. Instead, sir, many instruments of unknown nature were located, instruments which the prisoner claims to be his stock in trade. One of them flashed on handling, and the soldier holding it died."

The general turned back to the trader. "Does your ship carry nuclear explosives?"

"Galaxy, no. What for? That fool grabbed a nuclear puncher, wrong end forward and set at maximum dispersion. You're not supposed to do that. Might as well point a neut-gun at your head. I'd have stopped him, if five men weren't sitting on my chest."

Riose gestured at the waiting guard, "You go. The captured ship is to be sealed against all intrusion. Sit down, Devers."

The trader did so, in the spot indicated, and withstood stolidly the hard scrutiny of the Imperial general and the curious glance of the Siwennian patrician.

Riose said, "You're a sensible man, Devers."

"Thank you. Are you impressed by my face, or do you want something? Tell you what, though. I'm a good business man."

"It's about the same thing. You surrendered your ship when you might have decided to waste our ammunition and have yourself blown to electron-dust. It could result in good treatment for you, if you continue that sort of outlook on life."

"Good treatment is what I mostly crave, boss."

"Good, and co-operation is what I mostly crave." Riose smiled, and said in a low aside to Ducem Barr, "I hope the word 'crave' means what I think it does. Did you ever hear such a barbarous jargon?"

Devers said blandly, "Right. I check you. But what kind of co-operation are you talking about, boss? To tell you straight, I don't know where I stand." He looked about him, "Where's this place, for instance, and – what's the idea?"

"Ah, I've neglected the other half of the introductions. I apologize." Riose was in good humor. "That gentleman is Ducem Barr, Patrician of the Empire. I am Bel Riose, Peer of the Empire, and General of the Third Class in the armed forces of His Imperial Majesty."

The trader's jaw slackened. Then, "The Empire? I mean the old Empire they taught us about at school? Huh! Funny! I always had the sort of notion that it didn't exist any more."

"Look about you. It does," said Riose grimly.

"Might have known it though," and Lathan Devers pointed his beard at the ceiling. "That was a mightily polished-looking set of craft that took my tub. No kingdom of the Periphery could have turned them out." His brow furrowed. "So what's the game, boss? Or do I call you general?"

"Me game is war."

"Empire versus Foundation, that it?"

"Right."

"Why?"

"I think you know why."

The trader stared sharply and shook his head.

Riose let the other deliberate, then said softly, "I'm sure you know why."

Lathan Devers muttered, "Warm here," and stood up to remove his hooded jacket.

Then he sat down again and stretched his legs out before him.

"You know," he said, comfortably, "I figure you're thinking I ought to jump up with a whoop and lay about me. I can catch you before you could move if I choose my time, and this old fellow who sits there and doesn't say anything couldn't do much to stop me."

"But you won't," said Riöse, confidently.

"I won't," agreed Devers, amiably. "First off, killing you wouldn't stop the war, I suppose. There are more generals where you came from."

"Very accurately calculated."

"Besides which, I'd probably be slammed down about two seconds after I got you, and killed fast, or maybe slow, depending. But I'd be killed, and I never like to count on that when I'm making plans. It doesn't pay off."

"I said you were a sensible man."

"But there's one thing I would like, boss. I'd like you to tell me what you mean when you say I know why you're jumping us. I don't; and guessing games bother me no end."

"Yes? Ever hear of Hari Seldon?"

"No. I *said* I don't like guessing games."

Riose flicked a side glance at Ducem Barr who smiled with a narrow gentleness and resumed his inwardly-dreaming expression.

Riose said with a grimace, "Don't *you* play games, Devers. There is a tradition, or a fable, or sober history – I don't care what – upon your Foundation, that eventually you will found the Second Empire. I know quite a detailed version of Hari Seldon's psychohistorical claptrap, and your eventual plans of aggression against the Empire."

"That so?" Devers nodded thoughtfully. "And who told you all that?"

"Does that matter?" said Riöse with dangerous smoothness. "You're here to question nothing. I want what you know about the Seldon Fable."

"But if it's a Fable—"

"Don't play with words, Devers."

"I'm not. In fact, I'll give it to you straight. You know all I know about it. It's silly stuff, half-baked. Every world has its yams; you can't keep it away from them. Yes, I've heard that sort of talk; Seldon, Second Empire, and so on. They put kids to sleep at night with the stuff. The young squirts curl up in the spare rooms with their pocket projectors and suck up Seldon thrillers. But it's strictly non-adult. Nonintelligent adult, anyway." The trader shook his head.

The Imperial general's eyes were dark. "Is that really so? You waste your lies, man. I've been on the planet, Terminus. I know your Foundation. I've looked it in the face."

"And you ask me? Me, when I haven't kept foot on it for two months at a piece in ten years. You are wasting your time. But go ahead with your war, if it's fables you're after."

And Barr spoke for the first time, mildly, "You are so confident then that the Foundation will win?"

The trader turned. He flushed faintly and an old scar on one temple showed whitely, "Hm-m-m, the silent partner. How'd you squeeze *that* out of what I said, doc?"

Riose nodded very slightly at Barr, and the Siwennian continued in a low voice, "Because the notion *would* bother you if you thought your world might lose this war, and suffer the bitter reappings of defeat, I know. *My* world once did, and still does."

Lathan Devers fumbled his beard, looked from one of his opponents to the other, then laughed shortly. "Does he always talk like that, boss? Listen," he grew serious, "what's defeat? I've seen wars and I've seen defeats. What if the winner does take over? Who's bothered? Me? Guys like me?" He shook his head in derision.

"Get this," the trader spoke forcefully and earnestly, "there are five or six fat slobs who usually run an average planet. They get the rabbit punch, but I'm not losing peace of mind over them. See. The people? The ordinary run of guys? Sure, some get killed, and the rest pay extra taxes for a while. But it settles itself out; it runs itself down. And then it's the old situation again with a different five or six."

Ducem Barr's nostrils flared, and the tendons of his old right hand jerked; but he said nothing.

Lathan Devers' eyes were on him. They missed nothing. He said, "Look. I spend my life in space for my five-and-dime gadgets and my beer-and-pretzel kickback from the Combines. There's fat fellows back there," his thumb jerked over his shoulder and back, "that sit home and collect my year's income every minute – out of skimings from me and more like me. Suppose *you* run the Foundation. You'll still need us. You'll need us more than ever the Combines do – because you'd not know your way around, and we could bring in the hard cash. We'd make a better deal with the Empire. Yes, we would; and I'm a man of business. If it adds up to a plus mark, I'm for it."

And he stared at the two with sardonic belligerence.

The silence remained unbroken for minutes, and then a cylinder rattled into its slot. The general flipped it open, glanced at the neat printing and in-circuited the visuals with a sweep.

"Prepare plan indicating position of each ship in action. Await orders on full-armed defensive."

He reached for his cape. As he fastened it about his shoulders, he whispered in a stiff-lipped monotone to Barr, "I'm leaving this man to you. I'll expect results. This is war and I can be cruel to failures. Remember!" He left, with a salute to both.

Lathan Devers looked after him, "Well, something's hit him where it hurts. What goes on?"

"A battle, obviously," said Barr, gruffly. "The forces of the Foundation are coming out for their first battle. You'd better come along."

There were armed soldiers in the room. Their bearing was respectful and their faces were hard. Devers followed the proud old Siwennian patriarch out of the room.

The room to which they were led was smaller, barer. It contained two beds, a visiscreen, and shower and sanitary facilities. The soldiers marched out, and the thick door boomed hollowly shut.

"Hmp?" Devers stared disapprovingly about. "This looks permanent."

"It is," said Barr, shortly. The old Siwennian turned his back.

The trader said irritably, "What's your game, doc?"

"I have no game. You're in my charge, that's all."

The trader rose and advanced. His bulk towered over the unmoving patrician. "Yes? But you're in this cell with me and when you were marched here the guns were pointed just as hard at you as at me. Listen, you were all boiled up about my notions on the subject of war and peace."

He waited fruitlessly, "All fight, let me ask you something. You said *your* country was licked once. By whom? Comet people from the outer nebulae?"

Barr looked up. "By the Empire."

"That so? Then what are you doing here?"

Barr maintained an eloquent silence.

The trader thrust out a lower lip and nodded his head slowly. He slipped off the flat-linked bracelet that hugged his fight wrist and held it out. "What do you think of that?" He wore the mate to it on his left.

The Siwennian took the ornament. He responded slowly to the trader's gesture and put it on. The odd tingling at the wrist passed away quickly.

Devers' voice changed at once. "Right, doc, you've got the action now. Just speak casually. If this room is wired, they won't get a thing. That's a Field Distorter you've got there; genuine Mallow design. Sells for twenty-five credits on any world from here to the outer rim. You get it free. Hold your lips still when you talk and take it easy. You've got to get the trick of it."

Ducem Barr was suddenly weary. The trader's boring eyes were luminous and urging. He felt unequal to their demands.

Barr said, "What do you want?" The words slurred from between unmoving lips.

"I've told you. You make mouth noises like what we call a patriot. Yet your own world has been mashed up by the Empire, and here you are playing ball with the Empire's fair-haired general. Doesn't make sense, does it?"

Barr said, "I have done my part. A conquering Imperial viceroy is dead because of me."

"That so? Recently?"

"Forty years ago."

"Forty . . . years . . . ago!" The words seemed to have meaning to the trader. He frowned, "That's a long time to live on memories. Does that young squirt in the general's uniform know about it?"

Barr nodded.

Devers' eyes were dark with thought. "You want the Empire to win?"

And the old Siwennian patrician broke out in sudden deep anger, "May the Empire and all its works perish in universal catastrophe. All Siwenna prays that daily. I had brothers once, a sister, a father. But I have children now, grandchildren. The general knows where to find them."

Devers waited.

Barr continued in a whisper, "But that would not stop me if the results in view warranted the risk. They would know how to die."

The trader said gently, "You killed a viceroy once, huh? You know, I recognize a few things. We once had a mayor, Hober Mallow his name was. He visited Siwenna; that's your world, isn't it? He met a man named Barr."

Ducem Barr stared hard, suspiciously. "What do you know of this?"

"What every trader on the Foundation knows. You might be a smart old fellow put in here to get on my right side. Sure, they'd point guns at you, and you'd hate the Empire and be all-out for its smashing. Then I'd fall all over you and pour out my heart to you, and wouldn't the general be pleased. There's not much chance of that, doc.

"But just the same I'd like to have you prove that you're the son of Onum Barr of Siwenna – the sixth and youngest who escaped the massacre."

Ducem Barr's hand shook as he opened the flat metal box in a wall recess. The metal object he withdrew clanked softly as he thrust it into the trader's hands. "Look at that," he said.

Devers stared. He held the swollen central link of the chain close to his eyes and swore softly. "That's Mallow's monogram, or I'm a space-struck rookie, and the design is fifty years old if it's a day."

He looked up and smiled.

"Shake, doc. A man-sized nuclear shield is all the proof I need," and he held out his large hand.

6. THE FAVORITE

The tiny ships had appeared out of the vacant depths and darted into the midst of the Armada. Without a shot or a burst of energy, they weaved through the ship-swollen area, then blasted on and out, while the Imperial wagons turned after them like lumbering beasts. There were two noiseless flares that pinpointed space as two of the tiny gnats shriveled in atomic disintegration, and the rest were gone.

The great ships searched, then returned to their original task, and world by world, the great web of the Enclosure continued.

Brodrig's uniform was stately; carefully tailored and as carefully worn. His walk through the gardens of the obscure planet Wanda, now temporary Imperial headquarters, was leisurely; his expression was somber.

Bel Riose walked with him, his field uniform open at the collar, and doleful in its monotonous gray-black.

Riose indicated the smooth black bench under the fragrant tree-fern whose large spatulate leaves lifted flatly against the white sun. "See that, sir. It is a relic of the Imperium. The ornamented benches, built for lovers, linger on, fresh and useful, while the factories and the palaces collapse into unremembered ruin."

He seated himself, while Cleon II's Privy Secretary stood erect before him and clipped the leaves above neatly with precise swings of his ivory staff.

Riose crossed his legs and offered a cigarette to the other. He fingered one himself as he spoke, "It is what one would expect from the enlightened wisdom of His Imperial Majesty to send so competent an observer as yourself. It relieves any anxiety I might have felt that the press of more important and more immediate business might perhaps force into the shadows a small campaign on the Periphery."

"The eyes of the Emperor are everywhere," said Brodrig, mechanically. "We do not underestimate the importance of the campaign; yet still it would seem that too great an emphasis is being placed upon its difficulty. Surely their little ships are no such barrier that we must move through the intricate preliminary maneuver of an Enclosure."

Riose flushed, but he maintained his equilibrium. "I can not risk the lives of my men, who are few enough, or the destruction of my ships which are irreplaceable, by a too-rash attack. The establishment of an Enclosure will quarter my casualties in the ultimate attack, howsoever difficult it be. The military reasons for that I took the liberty to explain yesterday."

"Well, well, I am not a military man. In this case, you assure me that what seems patently and obviously right is, in reality, wrong. We will allow that. Yet your caution shoots far beyond that. In your second communication, you requested reinforcements. And these, against an enemy poor, small, and barbarous, with whom you have had not one' skirmish at the time. To desire more forces under the circumstances would savor almost of incapacity or worse, had not your earlier career given sufficient proof of your boldness and imagination."

"I thank you," said the general, coldly, "but I would remind you that there is a difference between boldness and blindness. There is a place for a decisive gamble when you know your enemy and can calculate the risks at least roughly; but to move at all against an *unknown* enemy is boldness in itself. You might as well ask why the same man sprints safely across an obstacle course in the day, and falls over the furniture in his room at night."

Brodrig swept away the other's words with a neat flirt of the fingers. "Dramatic, but not satisfactory. You have been to this barbarian world yourself. You have in addition this enemy prisoner you coddle, this trader. Between yourself and the prisoner you are not in a night fog."

"No? I pray you to remember that a world which has developed in isolation for two centuries can not be interpreted to the point of intelligent attack by a month's visit. I am a soldier, not a cleft-chinned, barrel-chested hero of a subetheric trimensional thriller. Nor can a single prisoner, and one who is an obscure member of an economic group which has no close connection with the enemy world introduce me to all the inner secrets of enemy strategy."

"You have questioned him?"

"I have."

"Well?"

"It has been useful, but not vitally so. His ship is tiny, of no account. He sells little toys which are amusing if nothing else. I have a few of the cleverest which I intend sending to the Emperor as curiosities. Naturally, there is a good deal about the ship and its workings which I do not understand, but then I am not a tech-man."

"But you have among you those who are," pointed out Brodrig.

"I, too, am aware of that," replied the general in faintly caustic tones. "But the fools have far to go before they could meet my needs. I have already sent for clever men who can understand the workings of the odd nuclear field-circuits the ship contains. I have received no answer."

"Men of that type can not be spared, general. Surely, there must be one man of your vast province who understands nucleics."

"Were there such a one, I would have him heal the limping, invalid motors that power two of my small fleet of ships. Two ships of my meager ten that can not fight a major battle for lack of sufficient power supply. One fifth of my force condemned to the carrion activity of consolidating positions behind the lines."

The secretary's fingers fluttered impatiently. "Your position is not unique in that respect, general. The Emperor has similar troubles."

The general threw away his shredded, never-lit cigarette, lit another, and shrugged. "Well, it is beside the immediate point, this lack of first-class tech-men. Except that I might have made more progress with my prisoner were my Psychic Probe in proper order."

The secretary's eyebrows lifted. "You have a Probe?"

"An old one. A superannuated one which fails me the one time I needed it. I set it up during the prisoner's sleep, and received nothing. So much for the Probe. I have tried it on my own men and the reaction is quite proper, but again there is not one among my staff of tech-men who can tell me why it fails upon the prisoner. Ducem Barr, who is a theoretician of parts, though no mechanic, says the psychic structure of the prisoner may be unaffected by the Probe since from childhood he has been subjected to alien environments and neural stimuli. I don't know. But he may yet be useful. I save him in that hope."

Brodrig leaned on his staff. "I shall see if a specialist is available in the capital. In the meanwhile, what of this other man you just mentioned, this Siwennian? You keep too many enemies in your good graces."

"He knows the enemy. He, too, I keep for future reference and the help he may afford me."

"But he is a Siwennian and the son of a proscribed rebel."

"He is old and powerless, and his family acts as hostage."

"I see. Yet I think that I should speak to this trader, myself."

"Certainly."

"Alone," the secretary added coldly, making his point.

"Certainly," repeated Riose, blandly. "As a loyal subject of the Emperor, I accept his personal representative as my superior. However, since the trader is at the permanent base, you will have to leave the front areas at an interesting moment."

"Yes? Interesting in what way?"

"Interesting in that the Enclosure is complete today. Interesting in that within the week, the Twentieth Fleet of the Border advances inward towards the core of resistance." Riose smiled and turned away.

In a vague way, Brodrig felt punctured.

7. BRIBERY

Sergeant Mori Luk made an ideal soldier of the ranks. He came from the huge agricultural planets of the Pleiades where only army life could break the bond to the soil and the unavailing life of drudgery; and he was typical of that background. Unimaginative enough to face danger without fear, he was strong and agile enough to face it successfully. He accepted orders instantly, drove the men under him unbendingly and adored his general unswervingly.

And yet with that, he was of a sunny nature. If he killed a man in the line of duty without a scrap of hesitation, it was also without a scrap of animosity.

That Sergeant Luk should signal at the door before entering was further a sign of tact, for he would have been perfectly within his rights to enter without signaling.

The two within looked up from their evening meal and one reached out with his foot to cut off the cracked voice which rattled out of the battered pocket-transmitter with bright liveliness.

"More books?" asked Lathan Devers.

The sergeant held out the tightly-wound cylinder of film and scratched his neck. "It belongs to Engineer Orre, but he'll have to have it back. He's going to send it to his kids, you know, like what you might call a souvenir, you know."

Ducem Barr turned the cylinder in his hands with interest. "And where did the engineer get it? He hasn't a transmitter also, has he?"

The sergeant shook his head emphatically. He pointed to the knocked-about remnant at the foot of the bed. "That's the only one in the place. This fellow, Orre, now, he got that book from one of these pig-pen worlds out here we captured. They had it in a

big building by itself and he had to kill a few of the natives that tried to stop him from taking it."

He looked at it appraisingly. "It makes a good souvenir – for kids."

He paused, then said stealthily, "There's big news floating about, by the way. It's only scuttlebutt, but even so, it's too good to keep. The general did it again." And he nodded slowly, gravely.

"That so?" said Devers. "And what did he do?"

"Finished the Enclosure, that's all." The sergeant chuckled with a fatherly pride. "Isn't he the corker, though? Didn't he work it fine? One of the fellows who's strong on fancy talk, says it went as smooth and even as the music of the spheres, whatever they are."

"The big offensive starts now?" asked Barr, mildly.

"Hope so," was the boisterous response. "I want to get back on my ship now that my arm is in one piece again. I'm tired of sitting on my scupper out here."

"So am I," muttered Devers, suddenly and savagely. There was a bit of underlip caught in his teeth, and he worried it.

The sergeant looked at him doubtfully, and said, "I'd better go now. The captain's round is due and I'd just as soon he didn't catch me in here."

He paused at the door. "By the way, sir," he said with sudden, awkward shyness to the trader, "I heard from my wife. She says that little freezer you gave me to send her works fine. It doesn't cost her anything, and she just about keeps a month's supply of food froze up complete. I appreciate it."

"It's all right. Forget it."

The great door moved noiselessly shut behind the grinning sergeant.

Ducem Barr got out of his chair. "Well, he gives us a fair return for the freezer. Let's take a look at this new book. Ahh, the title is gone."

He unrolled a yard or so of the film and looked through at the light. Then he murmured, "Well, skewer me through the scupper, as the sergeant says. This is 'The Garden of Summa,' Devers."

"That so?" said the trader, without interest. He shoved aside what was left of his dinner. "Sit down, Barr. Listening to this old-time literature isn't doing me any good. You heard what the sergeant said?"

"Yes, I did. What of it?"

"The offensive will start. And we sit here!"

"Where do you want to sit?"

"You know what I mean. There's no use just waiting."

"Isn't there?" Barr was carefully removing the old film from the transmitter and installing the new. "You told me a good deal of Foundation history in the last month, and it seems that the great leaders of past crises did precious little more than sit – and wait."

"Ah, Barr, but they knew where they were going."

"Did they? I suppose they said they did when it was over, and for all I know maybe they did. But there's no proof that things would not have worked out as well or better if

they had not known where they were going. The deeper economic and sociological forces aren't directed by individual men."

Devers sneered. "No way of telling that things wouldn't have worked out worse, either. You're arguing tail-end backwards." His eyes were brooding. "You know, suppose I blasted him?"

"Whom? Riose?"

"Yes."

Barr sighed. His aging eyes were troubled with a reflection of the long past. "Assassination isn't the way out, Devers. I once tried it, under provocation, when I was twenty – but it solved nothing. I removed a villain from Siwenna, but not the Imperial yoke; and it was the Imperial yoke and not the villain that mattered."

"But Riose is not just a villain, doc. He's the whole blamed army. It would fall apart without him. They hang on him like babies. The sergeant out there slobbers every time he mentions him."

"Even so. There are other armies and other leaders. You must go deeper. There is this Brodrig, for instance – no one more than he has the ear of the Emperor. He could demand hundreds of ships where Riose must struggle with ten. I know him by reputation."

"That so? What about him?" The trader's eyes lost in frustration what they gained in sharp interest.

"You want a pocket outline? He's a low-born rascal who has by unfailing flattery tickled the whims of the Emperor. He's well-hated by the court aristocracy, vermin themselves, because he can lay claim to neither family nor humility. He is the Emperor's adviser in all things, and the Emperor's too in the worst things. He is faithless by choice but loyal by necessity. There is not a man in the Empire as subtle in villainy or as crude in his pleasures. And they say there is no way to the Emperor's favor but through him; and no way to his, but through infamy."

"Wow!" Devers pulled thoughtfully at his neatly trimmed beard. "And he's the old boy the Emperor sent out here to keep an eye on Riose. Do you know I have an idea?"

"I do now."

"Suppose this Brodrig takes a dislike to our young Army's Delight?"

"He probably has already. He's not noted for a capacity for liking."

"Suppose it gets really bad. The Emperor might hear about it, and Riose might be in trouble."

"Uh-huh. Quite likely. But how do you propose to get that to happen?"

"I don't know. I suppose he could be bribed?"

The patrician laughed gently. "Yes, in a way, but not in the manner you bribed the sergeant – not with a pocket freezer. And even if you reach his scale, it wouldn't be worth it. There's probably no one so easily bribed, but he lacks even the fundamental honesty of honorable corruption. He doesn't stay bribed; not for any sum. Think of something else."

Devers swung a leg over his knee and his toe nodded quickly and restlessly. "It's the first hint, though—"

He stopped; the door signal was flashing once again, and the sergeant was on the threshold once more. He was excited, and his broad face was red and unsmiling.

"Sir," he began, in an agitated attempt at deference, "I am very thankful for the freezer, and you have always spoken to me very fine, although I am only the son of a farmer and you are great lords."

His Pleiades accent had grown thick, almost too much so for easy comprehension; and with excitement, his lumpish peasant derivation wiped out completely the soldierly bearing so long and so painfully cultivated.

Barr said softly, "What is it, sergeant?"

"Lord Brodrig is coming to see you. Tomorrow! I know, because the captain told me to have my men ready for dress review tomorrow for . . . for him. I thought – I might warn you."

Barr said, "Thank you, sergeant, we appreciate that. But it's all right, man; no need for—"

But the look on Sergeant Luk's face was now unmistakably one of fear. He spoke in a rough whisper, "You don't hear the stories the men tell about him. He has sold himself to the space fiend. No, don't laugh. There are most terrible tales told about him. They say he has men with blast-guns who follow him everywhere, and when he wants pleasure, he just tells them to blast down anyone they meet. And they do – and he laughs. They say even the Emperor is in terror of him, and that he forces the Emperor to raise taxes and won't let him listen to the complaints of the people.

"And he hates the general, that's what they say. They say he would like to kill the general, because the general is so great and wise. But he can't because our general is a match for anyone and he knows Lord Brodrig is a bad 'un."

The sergeant blinked; smiled in a sudden incongruous shyness at his own outburst; and backed toward the door. He nodded his head, jerkily. "You mind my words. Watch him."

He ducked out.

And Devers looked up, hard-eyed. "This breaks things our way, doesn't it, doc?"

"It depends," said Barr, dryly, "on Brodrig, doesn't it?"

But Devers was thinking, not listening.

He was thinking hard.

Lord Brodrig ducked his head as he stepped into the cramped living quarters of the trading ship, and his two armed guards followed quickly, with bared guns and the professionally hard scowls of the hired bravos.

The Privy Secretary had little of the look of the lost soul about him just then. If the space fiend had bought him, he had left no visible mark of possession. Rather might Brodrig have been considered a breath of court-fashion come to enliven the hard, bare ugliness of an army base.

The stiff, tight lines of his sheened and immaculate costume gave him the illusion of height, from the very top of which his cold, emotionless eyes stared down the declivity of a long nose at the trader. The mother-of-pearl ruches at his wrists fluttered filmily as he brought his ivory stick to the ground before him and leaned upon it daintily.

"No," he said, with a little gesture, "you remain here. Forget your toys; I am not interested in them."

He drew forth a chair, dusted it carefully with the iridescent square of fabric attached to the top of his white stick, and seated himself. Devers glanced towards the mate to the chair, but Brodrig said lazily, "You will stand in the presence of a Peer of the Realm."

He smiled.

Devers shrugged. "If you're not interested in my stock in trade, what am I here for?"

The Privy Secretary waited coldly, and Devers added a slow, "Sir."

"For privacy," said the secretary. "Now is it likely that I would come two hundred parsecs through space to inspect trinkets? It's you I want to see." He extracted a small pink tablet from an engraved box and placed it delicately between his teeth. He sucked it slowly and appreciatively.

"For instance," he said, "who are you? Are you really a citizen of this barbarian world that is creating all this fury of military frenzy?"

Devers nodded gravely.

"And you were really captured by him *after* the beginning of this squabble he calls a war. I am referring to our young general."

Devers nodded again.

"So! Very well, my worthy Outlander. I see your fluency of speech is at a minimum. I shall smooth the way for you. It seems that our general here is fighting an apparently meaningless war with frightful transports of energy – and this over a forsaken fleabite of a world at the end of nowhere, which to a logical man would not seem worth a single blast of a single gun. Yet the general is not illogical. On the contrary, I would say he was extremely intelligent. Do you follow me?"

"Can't say I do, sir."

The secretary inspected his fingernails and said, "Listen further, then. The general would not waste his men and ships on a sterile feat of glory. I know he *talks* of glory and of Imperial honor, but it is quite obvious that the affectation of being one of the insufferable old demigods of the Heroic Age won't wash. There is something more than glory here and he does take queer, unnecessary care of you. Now if you were *my* prisoner and told *me* as little of use as you have our general, I would slit open your abdomen and strangle you with your own intestines."

Devers remained wooden. His eyes moved slightly, first to one of the secretary's bully-boys, and then to the other. They were ready; eagerly ready.

The secretary smiled. "Well, now, you're a silent devil. According to the general, even a Psychic Probe made no impression, and that was a mistake on his part, by the way,

for it convinced me that our young military whizz-bang was lying." He seemed in high humor.

"My honest tradesman," he said, "I have a Psychic Probe of my own, one that ought to suit you peculiarly well. You see this—"

And between thumb and forefinger, held negligently, were intricately designed, pink-and-yellow rectangles which were most definitely obvious in identity.

Devers said so. "It looks like cash," he said.

"Cash it is – and the best cash of the Empire, for it is backed by my estates, which are more extensive than the Emperor's own. A hundred thousand credits. All here! Between two fingers! Yours!"

"For what, sir? I am a good trader, but all trades go in both directions."

"For what? For the truth! What is the general after? Why is he fighting this war?"

Lathan Devers sighed, and smoothed his beard thoughtfully.

"What he's after?" His eyes were following the motions of the secretary's hands as he counted the money slowly, bill by bill. "In a word, the Empire."

"*Hmp*. How ordinary! It always comes to that in the end. But how? What is the road that leads from the Galaxy's edge to the peak of Empire so broadly and invitingly?"

"The Foundation," said Devers, bitterly, "has secrets. They have books, old books – so old that the language they are in is only known to a few of the top men. But the secrets are shrouded in ritual and religion, and none may use them. I tried and now I am here – and there is a death sentence waiting for me, there."

"I see. And these old secrets? Come, for one hundred thousand I deserve the intimate details."

"The transmutation of elements," said Devers, shortly.

The secretary's eyes narrowed and lost some of their detachment. "I have been told that practical transmutation is impossible by the laws of nucleics."

"So it is, if nuclear forces are used. But the ancients were smart boys. There are sources of power greater than the nuclei and more fundamental. If the Foundation used those sources as I suggested—"

Devers felt a soft, creeping sensation in his stomach. The bait was dangling; the fish was nosing it.

The secretary said suddenly, "Continue. The general, I am sure, is aware of a this. But what does he intend doing once he finishes this opera-bouffe affair?"

Devers kept his voice rock-steady. "With transmutation he controls the economy of the whole set-up of your Empire. Mineral holdings won't be worth a sneeze when Riose can make tungsten out of aluminum and iridium out of iron. An entire production system based on the scarcity of certain elements and the abundance of others is thrown completely out of whack. There'll be the greatest disjointment the Empire has ever seen, and only Riose will be able to stop it. *And* there is the question of this new power I mentioned, the use of which won't give Riose religious heebies.

"There's nothing that can stop him now. He's got the Foundation by the back of the neck, and once he's finished with it, he'll be Emperor in two years."

"So." Brodrig laughed lightly. "Iridium out of iron, that's what you said, isn't it? Come, I'll tell you a state secret. Do you know that the Foundation has already been in communication with the general?"

Devers' back stiffened.

"You look surprised. Why not? It seems logical now. They offered him a hundred tons of iridium a year to make peace. A hundred tons of *iron* converted to iridium in violation of their religious principles to save their necks. Fair enough, but no wonder our rigidly incorruptible general refused – when he can have the iridium and the Empire as well. And poor Cleon called him his one honest general. My bewhiskered merchant, you have earned your money."

He tossed it, and Devers scrambled after the flying bills.

Lord Brodrig stopped at the door and turned. "One reminder, trader. My playmates with the guns here have neither middle ears, tongues, education, nor intelligence. They can neither hear, speak, write, nor even make sense to a Psychic Probe. But they are very expert at interesting executions. I have bought you, man, at one hundred thousand credits. You will be good and worthy merchandise. Should you forget that you are bought at any time and attempt to . . . say . . . repeat our conversation to Riose, you will be executed. But executed my way."

And in that delicate face there were sudden hard lines of eager cruelty that changed the studied smile into a red-lipped snarl. For one fleeting second, Devers saw that space fiend who had bought his buyer, look out of his buyer's eyes.

Silently, he preceded the two thrusting blast-guns of Brodrig's "playmates" to his quarters.

And to Ducem Barr's question, he said with brooding satisfaction, "No, that's the queerest part of it. *He bribed me.*

Two months of difficult war had left their mark on Bel Riose. There was heavy-handed gravity about him; and he was short-tempered.

It was with impatience that he addressed the worshiping Sergeant Luk. "Wait outside, soldier, and conduct these men back to their quarters when I am through. No one is to enter until I call. No one at all, you understand."

The sergeant saluted himself stiffly out of the room, and Riose with muttered disgust scooped up the waiting papers on his desk, threw them into the top drawer and slammed it shut.

"Take seats," he said shortly, to the waiting two. "I haven't much time. Strictly speaking, I shouldn't be here at all, but it is necessary to see you."

He turned to Ducem Barr, whose long fingers were caressing with interest the crystal cube in which was set the simulacrum of the lined, austere face of His Imperial Majesty, Cleon II.

"In the first place, patrician," said the general, "your Seldon is losing. To be sure, he battles well, for these men of the Foundation swarm like senseless bees and fight like madmen. Every planet is defended viciously, and once taken, every planet heaves so with

rebellion it is as much trouble to hold as to conquer. But they are taken, and they are held. Your Seldon is losing."

"But he has not yet lost," murmured Barr politely.

"The Foundation itself retains less optimism. They offer me millions in order that I may not put this Seldon to the final test."

"So rumor goes."

"Ah, is rumor preceding me? Does it prate also of the latest?"

"What is the latest?"

"Why, that Lord Brodrig, the darling of the Emperor, is now second in command at his own request."

Devers spoke for the first time. "At his own request, boss? How come? Or are you growing to like the fellow?" He chuckled.

Riose said, calmly, "No, can't say I do. It's just that he bought the office at what I considered a fair and adequate price."

"Such as?"

"Such as a request to the Emperor for reinforcements."

Devers' contemptuous smile broadened. "'He has communicated with the Emperor, huh? And I take it, boss, you're just waiting for these reinforcements, but they'll come any day. Right?"

"Wrong! They have already come. Five ships of the line; smooth and strong, with a personal message of congratulations from the Emperor, and more ships on the way. What's wrong, trader?" he asked, sardonically.

Devers spoke through suddenly frozen lips. "Nothing!"

Riose strode out from behind his desk and faced the trader, hand on the butt of his blast-gun.

"I say, what's wrong, trader? The news would seem to disturb you. Surely, you have no sudden birth of interest in the Foundation."

"I haven't."

"Yes – there are queer points about you."

"That so, boss?" Devers smiled tightly, and balled the fists in his pockets. "Just you line them up and I'll knock them down for you."

"Here they are. You were caught easily. You surrendered at first blow with a burnt-out shield. You're quite ready to desert your world, and that without a price. Interesting, all this, isn't it?"

"I crave to be on the winning side, boss. I'm a sensible man; you called me that yourself."

Riose said with tight throatiness, "Granted! Yet no trader since has been captured. No trade ship but has had the speed to escape at choice. No trade ship but has had a screen that could take all the beating a light cruiser could give it, should it choose to fight. And no trader but has fought to death when occasion warranted. Traders have been traced as the leaders and instigators of the guerilla warfare on occupied planets and of the flying raids in occupied space.

"Are you the *only* sensible man then? You neither fight nor flee, but turn traitor without urging. You are unique, amazingly unique – in fact, suspiciously unique."

Devers said softly, "I take your meaning, but you have nothing on me. I've been here now six months, and I've been a good boy."

"So you have, and I have repaid you by good treatment. I have left your ship undisturbed and treated you with every consideration. Yet you fall short. Freely offered information, for instance, on your gadgets might have been helpful. The atomic principles on which they are built would seem to be used in some of the Foundation's nastiest weapons. Right?"

"I am only a trader," said Devers, "and not one of these bigwig technicians. I sell the stuff; I don't make it."

"Well, that will be seen shortly. It is what I came here for. For instance, your ship will be searched for a personal force-shield. You have never worn one; yet all soldiers of the Foundation do. It will be significant evidence that there is information you do not choose to give me. Right?"

There was no answer. He continued, "And there will be more direct evidence. I have brought with me the Psychic Probe. It failed once before, but contact with the enemy is a liberal education."

His voice was smoothly threatening and Devers felt the gun thrust hard in his midriff – the general's gun, hitherto in its holster.

The general said quietly, "You will remove your wristband and any other metal ornament you wear and give them to me. Slowly! Atomic fields can be distorted, you see, and Psychic Probes might probe only into static. That's right.. I'll take it."

The receiver on the general's desk was glowing and a message capsule clicked into the slot, near which Barr stood and still held the trimensional Imperial bust.

Riose stepped behind his desk, with his blast-gun held ready. He said to Barr, "You too, patrician. Your wristband condemns you. You have been helpful earlier, however, and I am not vindictive, but I shall judge the fate of your behostaged family by the results of the Psychic Probe."

And as Riose leaned over to take out the message capsule, Barr lifted the crystal-enveloped bust of Cleon and quietly and methodically brought it down upon the general's head.

It happened too suddenly for Devers to grasp. It was as if a sudden demon had grown into the old man.

"Out!" said Barr, in a tooth-clenched whisper. "Quickly!" He seized Riose's dropped blaster and buried it in his blouse.

Sergeant Luk turned as they emerged from the narrowest possible crack of the door.

Barr said easily, "Lead on, sergeant!"

Devers closed the door behind him.

Sergeant Luk led in silence to their quarters, and then, with the briefest pause, continued onward, for there was the nudge of a blast-gun muzzle in his ribs, and a hard voice in his ears which said, "To the trade ship."

Devers stepped forward to open the air lock, and Barr said, "Stand where you are, Luk. You've been a decent man, and we're not going to kill you."

But the sergeant recognized the monogram on the gun. He cried in choked fury, "You've killed the general."

With a wild, incoherent yell, he charged blindly upon the blasting fury of the gun and collapsed in blasted ruin.

The trade ship was rising above the dead planet before the signal lights began their eerie blink and against the creamy cobweb of the great Lens in the sky which was the Galaxy, other black forms rose.

Devers said grimly, "Hold tight, Barr – and let's see if they've got a ship that can match my speed."

He knew they hadn't!

And once in open space, the trader's voice seemed lost and dead as he said, "The line I fed Brodrig was a little too good. It seems as if he's thrown in with the general."

Swiftly they raced into the depths of the star-mass that was the Galaxy.

8. TO TRANTOR

Devers bent over the little dead globe, watching for a tiny sign of life. The directional control was slowly and thoroughly sieving space with its jabbing tight sheaf of signals.

Barr watched patiently from his seat on the low cot in the corner. He asked, "No more signs of them?"

"The Empire boys? No." The trader growled the words with evident impatience. "We lost the scuppers long ago. Space! With the blind jumps we took through hyperspace, it's lucky we didn't land up in a sun's belly. They couldn't have followed us even if they outranged us, which they didn't."

He sat back and loosened his collar with a jerk. "I don't know what those Empire boys have done here. I think some of the gaps are out of alignment."

"I take it, then, you're trying to get to the Foundation."

"I'm calling the Association – or trying to."

"The Association? Who are they?"

"Association of Independent Traders. Never heard of it, huh? Well, you're not alone. We haven't made our splash yet!"

For a while there was a silence that centered about the unresponsive Reception Indicator, and Barr said, "Are you within range?"

"I don't know. I haven't but a small notion where we are, going by dead reckoning. That's why I have to use directional control. It could take years, you know."

"Might it?"

Barr pointed; and Devers jumped and adjusted his earphones. Within the little murky sphere there was a tiny glowing whiteness.

For half an hour, Devers nursed the fragile, groping thread of communication that reached through hyperspace to connect two points that laggard light would take five hundred years to bind together.

Then he sat back, hopelessly. He looked up, and shoved the earphones back.

"Let's eat, doc. There's a needle-shower you can use if you want to, but go easy on the hot water."

He squatted before one of the cabinets that lined one wall and felt through the contents. "You're not a vegetarian, I hope?"

Barr said, "I'm omnivorous. But what about the Association. Have you lost them?"

"Looks so. It was extreme range, a little too extreme. Doesn't matter, though. I got all that counted."

He straightened, and placed the two metal containers upon the table. "Just give it five minutes, doc, then slit it open by pushing the contact. It'll be plate, food, and fork – sort of handy for when you're in a hurry, if you're not interested in such incidentals as napkins. I suppose you want to know what I got out of the Association."

"If it isn't a secret."

Devers shook his head. "Not to you. What Riose said was true."

"About the offer of tribute?"

"Uh-huh. They offered it, *and* had it refused. Things are bad. There's fighting in the outer suns of Loris."

"Loris is close to the Foundation?"

"Huh? Oh, you wouldn't know. It's one of the original Four Kingdoms. You might call it part of the inner line of defense. That's not the worst. They've been fighting large ships previously never encountered. Which means Riose wasn't giving us the works. He *has* received more ships. Brodrig *has* switched sides, and I *have* messed things up."

His eyes were bleak as he joined the food-container contact-points and watched it fall open neatly. The stewlike dish steamed its aroma through the room. Ducem Barr was already eating.

"So much," said Barr, "for improvisations, then. We can do nothing here; we can not cut through the Imperial lines to return to the Foundation; we can do nothing but that which is most sensible – to wait patiently. However, if Riose has reached the inner line I trust the wait will not be too long."

And Devers put down his fork. "Wait, is it?" he snarled, glowering. "That's all right for *you*. You've got nothing at stake."

"Haven't I?" Barr smiled thinly.

"No. In fact, I'll tell you." Devers' irritation skimmed the surface. "I'm tired of looking at this whole business as if it were an interesting something-or-other on a microscope slide. I've got friends somewhere out there, dying; and a whole world out there, my home, dying also. You're an outsider. You don't know."

"I have seen friends die." The old man's hands were limp in his lap and his eyes were closed. "Are you married?"

Devers said, "Traders don't marry."

"Well, I have two sons and a nephew. They have been warned, but – for reasons – they could take no action. Our escape means their death. My daughter and my two grandchildren have, I hope, left the planet safely before this, but even excluding them, I have already risked and lost more than you."

Devers was morosely savage. "I know. But that was a matter of choice. You might have played ball with Riose. I never asked you to–"

Barr shook his head. "It was not a matter of choice, Devers. Make your conscience free, I didn't risk my sons for you. I co-operated with Riose as long as I dared. But there was the Psychic Probe."

The Siwennian patrician opened his eyes and they were sharp with pain. "Riose came to me once; it was over a year ago. He spoke of a cult centering about the magicians, but missed the truth. It is not quite a cult. You see, it is forty years now that Siwenna has been gripped in the same unbearable vise that threatens your world. Five revolts have been ground out. Then I discovered the ancient records of Hari Seldon – and now this 'cult' waits.

"It waits for the coming of the 'magicians' and for that day it is ready. My sons are leaders of those who wait. It *is that* secret which is in my mind and which the Probe must never touch. And so they must die as hostages; for the alternative is their death as rebels and half of Siwenna with them. You see, I had no choice! And I am no outsider."

Devers' eyes fell, and Barr continued softly, "It is on a Foundation victory that Siwenna's hopes depend. It is for a Foundation victory that my sons are sacrificed. And Hari Seldon does not pre-calculate the inevitable salvation of Siwenna as he does that of the Foundation. I have no certainty for *my* people – only hope."

"But you are still satisfied to wait. Even with the Imperial Navy at Loris."

"I would wait, in perfect confidence," said Barr, simply, "if they had landed on the planet, Terminus, itself."

The trader frowned hopelessly. "I don't know. It can't really work like that; not just like magic. Psychohistory or not, they're terribly strong, and we're weak. What can Setdon do about it?"

"There's nothing to *do*. It's all already *done*. It's proceeding now. Because you don't hear the wheels turning and the gongs beating doesn't mean it's any the less certain."

"Maybe; but I wish you had cracked Riose's skull for keeps. He's more the enemy than all his army."

"Cracked his skull? With Brodrig his second in command?" Barr's face sharpened with hate. "All Siwenna would have been my hostage. Brodrig has proven his worth long since. There exists a world which five years ago lost one male in every ten – and simply for failure to meet outstanding taxes. This same Brodrig was the tax-collector. No, Riose may live. His punishments are mercy in comparison."

"But six months, *six months*, in the enemy Base, with nothing to show for it." Devers' strong hands clasped each other tautly, so that his knuckles cracked. "Nothing to show for it!"

"Well, now, wait. You remind me—" Barr fumbled in his pouch. "You might want to count this." And he tossed the small sphere of metal on the table.

Devers snatched it. "What is it?"

"The message capsule. The one that Riose received just before I jacked him. Does that count as something?"

"I don't know. Depends on what's in it!" Devers sat down and turned it over carefully in his hand.

When Barr stepped from his cold shower and, gratefully, into the mild warm current of the air dryer, he found Devers silent and absorbed at the workbench.

The Siwennian slapped his body with a sharp rhythm and spoke above the punctuating sounds. "What are you doing?"

Devers looked up. Droplets of perspiration glittered in his beard. "I'm going to open this capsule."

"Can you open it without Riose's personal characteristic?" There was mild surprise in the Siwennian's voice.

"If I can't, I'll resign from the Association and never skipper a ship for what's left of my life. I've got a three-way electronic analysis of the interior now, and I've got little jiggers that the Empire never heard of, especially made for jimmying capsules. I've been a burglar before this, y'know. A trader has to be something of everything."

He bent low over the little sphere, and a small flat instrument probed delicately and sparked redly at each fleeting contact.

He said, "This capsule is a crude job, anyway. These Imperial boys are no shakes at this small work. I can see that. Ever see a Foundation capsule? It's half the size and impervious to electronic analysis in the first place."

And then he was rigid, the shoulder muscles beneath his tunic tautening visibly. His tiny probe pressed slowly—

It was noiseless when it came, but Devers; relaxed and sighed. In his hand was the shining sphere with its message unrolled like a parchment tongue.

"It's from Brodrig," he said. Then, with contempt, "The message medium is permanent. In a Foundation capsule, the message would be oxidized to gas within the minute."

But Ducem Barr waved him silent. He read the message quickly.

FROM: AMMEL BRODRIG, ENVOY EXTRAORDINARY OF HIS IMPERIAL MAJESTY, PRIVY SECRETARY OF THE COUNCIL, AND PEER OF THE REALM.

TO: BEL RIOSE, MILITARY GOVERNOR OF SIWENNA. GENERAL OF THE IMPERIAL FORCES, AND PEER OF THE REALM. I GREET YOU.

PLANET #1120 NO LONGER RESISTS. THE PLANS OF OFFENSE AS OUTLINED CONTINUE SMOOTHLY. THE ENEMY WEAKENS VISIBLY AND THE ULTIMATE ENDS IN VIEW WILL SURELY BE GAINED.

Barr raised his head from the almost microscopic print and cried bitterly, "The fool! The forsaken blasted fop! *That* a message?"

"Huh?" said Devers. He was vaguely disappointed.

"It says nothing," ground out Barr. "Our lick-spittle courtier is playing at general now. With Riose away, he is the field commander and must sooth his paltry spirit by spewing out his pompous reports concerning military affairs he has nothing to do with. 'So-and-so planet no longer resists.' 'The offensive moves on.' 'The enemy weakens.' The vacuum-headed peacock."

"Well, now, wait a minute. Hold on—"

"Throw it away." The old man turned away in mortification. "The Galaxy knows I never expected it to be world-shakingly important, but in wartime it is reasonable to assume that even the most routine order left undelivered might hamper military movements and lead to complications later. It's why I snatched it. But this! Better to have left it. It would have wasted a minute of Riose's time that will now be put to more constructive use."

But Devers had arisen. "Will you hold on and stop throwing your weight around? For Seldon's sake—"

He held out the sliver of message before Barr's nose, "Now read that again. What does he mean by 'ultimate ends in view'?"

"The conquest of the Foundation. Well?"

"Yes? And maybe he means the conquest of the Empire. You know he *believes* that to be the ultimate end."

"And if he does?"

"If he does!" Devers' one-sided smile was lost in his beard. "Why, watch then, and I'll show you."

With one finger the lavishly monogrammed sheet of message-parchment was thrust back into its slot. With a soft twang, it disappeared and the globe was a smooth, unbroken whole again. Somewhere inside was the tiny oiled whir of the controls as they lost their setting by random movements.

"Now there is no known way of opening this capsule without knowledge of Riose's personal characteristic, is there?"

"To the Empire, no," said Barr.

"Then the evidence it contains is unknown to us and absolutely authentic."

"To the Empire, yes," said Barr.

"And the Emperor can open it, can't he? Personal Characteristics of Government officials must be on file. We keep records of *our* officials at the Foundation."

"At the Imperial capital as well," agreed Barr.

"Then when you, a Siwennian patrician and Peer of the Realm, tell this Cleon, this Emperor, that his favorite tame-parrot and his shiniest general are getting together to knock him over, and hand him the capsule as evidence, what will *he* think Brodrig's 'ultimate ends' are?"

Barr sat down weakly. "Wait, I don't follow you." He stroked one thin cheek, and said, "You're not really serious, are you?"

"I am." Devers was angrily excited. "Listen, nine out of the last ten Emperors got their throats cut, or their gizzards blasted out by one or another of their generals with bigtime notions in their heads. You told me that yourself more than once. Old man Emperor would believe us so fast it would make Riose's head swim."

Barr muttered feebly, "He *is* serious, For the Galaxy's sake, man, you can't beat a Seldon crisis by a far-fetched, impractical, storybook scheme like that. Suppose you had never got hold of the capsule. Suppose Brodrig hadn't used the word 'ultimate.' Seldon doesn't depend on wild luck."

"If wild luck comes our way, there's no law says Seldon can't take advantage of it."

"Certainly. But . . . but," Barr stopped, then spoke calmly but with visible restraint. "Look, in the first place, how will you get to the planet Trantor? You don't know its location in space, and I certainly don't remember the coordinates, to say nothing of the ephemerae. You don't even know your own position in space."

"You can't get lost in space," grinned Devers. He was at the controls already.

"Down we go to the nearest planet, and back we come with complete bearings and the best navigation charts Brodrig's hundred thousand smackers can buy."

"*And* a blaster in our belly. Our descriptions are probably in every planet in this quarter of the Empire."

"Doc," said Devers, patiently, "don't be a hick tom the sticks. Riose said my ship surrendered too easily and, brother, he wasn't kidding. This ship has enough fire-power and enough juice in its shield to hold off anything we're Rely to meet this deep inside the frontier. And we have personal shields, too. The Empire boys never found them, you know, but they weren't meant to be found."

"All fight," said Barr, "all right. Suppose yourself on Trantor. How do you see the Emperor then? You think he keeps office hours?"

"Suppose we worry about that on Trantor," said Devers.

And Barr muttered helplessly, "All right again. I've wanted to see Trantor before I die for half a century now. Have your way."

The hypernuclear motor was cut in. The lights flickered and there was the slight internal wrench that marked the shift into hyperspace.

9. ON TRANTOR

The stars were as thick as weeds in an unkempt field, and for the first time, Lathan Devers found the figures to the right of the decimal point of prime importance in calculating the cuts through the hyper-regions. There was a claustrophobic sensation about the necessity for leaps of not more than a light-year. There was a frightening harshness about a sky which glittered unbrokenly in every direction. It was being lost in a sea of radiation.

And in the center of an open cluster of ten thousand stars, whose light tore to shreds the feebly encircling darkness, there circled the huge Imperial planet, Trantor.

But it was more than a planet; it was the living pulse beat of an Empire of twenty million stellar systems. It had only one, function, administration; one purpose, government; and one manufactured product, law.

The entire world was one functional distortion. There was no living object on its surface hut man, his pets, and his parasites. No blade of grass or fragment of uncovered soil could be found outside the hundred square miles of the Imperial Palace. No fresh water outside the Palace grounds existed but in the vast underground cisterns that held the water supply of a world.

The lustrous, indestructible, incorruptible metal that was the unbroken surface of the planet was the foundation of the huge, metal structures that mazed the planet. They were structures connected by causeways; laced by corridors; cubbyholed by offices; basemented by the huge retail centers that covered square miles; penthoused by the glittering amusement world that sparkled into life each night.

One could walk around the world of Trantor and never leave that one conglomerate building, nor see the city.

A fleet of ships greater in number than all the war fleets the Empire had ever supported landed their cargoes on Trantor each day to feed the forty billions of humans who gave nothing in exchange but the fulfillment of the necessity of untangling the myriads of threads that spiraled into the central administration of the most complex government Humanity had ever known.

Twenty agricultural worlds were the granary of Trantor. A universe was its servant.

Tightly held by the huge metal arms on either side, the trade ship was gently lowered down the huge ramp that led to the hangar. Already Devers had fumed his way through the manifold complications of a world conceived in paper work and dedicated to the principle of the form-in-quadruplicate.

There had been the preliminary halt in space, where the first of what had grown into a hundred questionnaires had been filled out. There were the hundred cross-examinations, the routine administration of a simple Probe, the photographing of the ship, the Characteristic-Analysis of the two men, and the subsequent recording of the same, the search for contraband, the payment of the entry tax – and finally the question of the identity cards and visitor's visa.

Ducem Barr was a Siwennian and subject of the Emperor, but Lathan Devers was an unknown without the requisite documents. The official in charge at the moment was devastated with sorrow, but Devers could not enter. In fact, he would have to be held for official investigation.

From somewhere a hundred credits in crisp, new bills backed by the estates of Lord Brodrig made their appearance, and changed bands quietly. The official hemmed importantly and the devastation of his sorrow was assuaged. A new form made its appearance from the appropriate pigeonhole. It was filled out rapidly and efficiently, with the Devers characteristic thereto formally and properly attached.

The two men, trader and patrician, entered Siwenna.

In the hangar, the trade ship was another vessel to be cached, photographed, recorded, contents noted, identity cards of passengers facsimiled, and for which a suitable fee was paid, recorded, and receipted.

And then Devers was on a huge terrace under the bright white sun, along which women chattered, children shrieked, and men sipped drinks languidly and listened to the huge televisions blaring out the news of the Empire.

Barr paid a requisite number of iridium coins and appropriated the uppermost member of a pile of newspapers. It was the Trantor *Imperial News*, official organ of the government. In the back of the news room, there was the soft clicking noise of additional editions being printed in long-distance sympathy with the busy machines at the *Imperial News* offices ten thousand miles away by corridor – six thousand by air-machine – just as ten million sets of copies were being likewise printed at that moment in ten million other news rooms all over the planet.

Barr glanced at the headlines and said softly, "What shall we do first?"

Devers tried to shake himself out of his depression. He was in a universe far removed from his own, on a world that weighted him down with its intricacy, among people whose doings were incomprehensible and whose language was nearly so. The gleaming metallic towers that surrounded him and continued onwards in never-ending multiplicity to beyond the horizon oppressed him; the whole busy, unheeding life of a world-metropolis cast him into the horrible gloom of isolation and pygmyish unimportance.

He said, "I better leave it to you, doc."

Barr was calm, low-voice. "I tried to tell you, but it's hard to believe without seeing for yourself, I know that. Do you know how many people want to see the Emperor every day? About one million. Do you know how many he sees? About ten. We'll have to work through the civil service, and that makes it harder. But we can't afford the aristocracy."

"We have almost one hundred thousand."

"A single Peer of the Realm would cost us that, and it would take at least three or four to form an adequate bridge to the Emperor. It may take fifty chief commissioners and senior supervisors to do the same, but they would cost us only a hundred apiece perhaps. I'll do the talking. In the first place, they wouldn't understand your accent, and in the second, you don't know the etiquette of Imperial bribery. It's an art, I assure you. Ah!"

The third page of the *Imperial News* had what he wanted and he passed the paper to Devers.

Devers read slowly. The vocabulary was strange, but he understood. He looked up, and his eyes were dark with concern. He slapped the news sheet angrily with the back of his hand. "You think this can be trusted?"

"Within limits," replied Barr, calmly. "It's highly improbable that the Foundation fleet was wiped out. They've probably reported *that* several times already, if they've gone by the usual war-reporting technique of a world capital far from the actual scene of fighting. What it means, though, is that Riose has won another battle, which would be

none-too-unexpected. It says he's captured Loris. Is that the capital planet of the Kingdom of Loris?"

"Yes," brooded Devers, "or of what used to be the Kingdom of Loris. And it's not twenty parsecs from the Foundation. Doc, we've got to work fast."

Barr shrugged, "You can't go fast on Trantor. If you try, you'll end up at the point of an atom-blaster, most likely."

"How long will it take?"

"A month, if we're lucky. A month, and our hundred thousand credits – if even that will suffice. And that is providing the Emperor does not take it into his head in the meantime to travel to the Summer Planets, where he sees no petitioners at all."

"But the Foundation–"

"–Will take care of itself, as heretofore. Come, there's the question of dinner. I'm hungry. And afterwards, the evening is ours and we may as well use it. We shall never see Trantor or any world like it again, you know."

The Home Commissioner of the Outer Provinces spread his pudgy hands helplessly and peered at the petitioners with owlish nearsightedness. "But the Emperor is indisposed, gentlemen. It is really useless to take the matter to my superior. His Imperial Majesty has seen no one in a week."

"He will see us," said Barr, with an affectation of confidence. "It is but a question of seeing a member of the staff of the Privy Secretary."

"Impossible," said the commissioner emphatically. "It would be the worth of my job to attempt that. Now if you could but be more explicit concerning the nature of your business. I'm willing to help you, understand, but naturally I want something less vague, something I can present to my superior as reason for taking the matter further."

"If my business were such that it could be told to any but the highest," suggested Barr, smoothly, "it would scarcely be important enough to rate audience with His Imperial Majesty. I propose that you take a chance. I might remind you that if His Imperial Majesty attaches the importance to our business which we guarantee that he will, you will stand certain to receive the honors you will deserve for helping us now."

"Yes, but–" and the commissioner shrugged, wordlessly.

"It's a chance," agreed Barr. "Naturally, a risk should have its compensation. It is a rather great favor to ask you, but we have already been greatly obliged with your kindness in offering us this opportunity to explain our problem. But if you would *allow* us to express our gratitude just slightly by–"

Devers scowled. He had heard this speech with its slight variations twenty times in the past month. It ended, as always, in a quick shift of the half-hidden bills. But the epilogue differed here. Usually the bills vanished immediately; here they remained in plain view, while slowly the commissioner counted them, inspecting them front and back as he did so.

There was a subtle change in his voice. "Backed by the Privy Secretary, hey? Good money!"

"To get back to the subject–" urged Barr.

"No, but wait," interrupted the commissioner, "let us go back by easy stages. I really do wish to know what your business can be. This money, it is fresh and new, and you must have a good deal, for it strikes me that you have seen other officials before me. Come, now, what about it?"

Barr said, "I don't see what you are driving at."

"Why, see here, it might be proven that you are upon the planet illegally, since the Identification and Entry Cards of your silent friend are certainly inadequate. He is not a subject of the Emperor."

"I deny that."

"It doesn't matter that you do," said the commissioner, with sudden bluntness. "The official who signed his Cards for the sum of a hundred credits has confessed – under pressure – and we know more of you than you think."

"If you are hinting, sir, that the sum we have asked you to accept is inadequate in view of the risks–"

The commissioner smiled. "On the contrary, it is more than adequate." He tossed the bills aside. "To return to what I was saying, it is the Emperor himself who has become interested in your case. Is it not true, sirs, that you have recently been guests of General Riose? Is it not true that you have escaped from the midst of his army with, to put it mildly, astonishing ease? Is it not true that you possess a small fortune in bills backed by Lord Brodrig's estates? In short, is it not true that you are a pair of spies and assassins sent here to – Well, you shall tell us yourself who paid you and for what!"

"Do you know," said Barr, with silky anger, "I deny the right of a petty commissioner to accuse us of crimes. We will leave."

"You will not leave." The commissioner arose, and his eyes no longer seemed near-sighted. "You need answer no question now; that will be reserved for a later – and more forceful – time. Nor am I a commissioner; I am a Lieutenant of the Imperial Police. You are under arrest."

There was a glitteringly efficient blast-gun in his fist as he smiled. "There are greater men than you under arrest this day. It is a hornet's nest we are cleaning up."

Devers snarled and reached slowly for his own gun. The lieutenant of police smiled more broadly and squeezed the contacts. The blasting line of force struck Devers' chest in an accurate blaze of destruction – that bounced harmlessly off his personal shield in sparkling spicules of light.

Devers shot in turn, and the lieutenant's head fell from off an upper torso that had disappeared. It was still smiling as it lay in the jag of sunshine which entered through the new-made hole in the wall.

It was through the back entrance that they left.

Devers said huskily, "Quickly to the ship. They'll have the alarm out in no time." He cursed in a ferocious whisper. "It's another plan that's backfired. I could swear the space fiend himself is against me."

It was in the open that they became aware of the jabbering crowds that surrounded the huge televisions. They had no time to wait; the disconnected roaring

words that reached them, they disregarded. But Barr snatched a copy of the *Imperial News* before diving into the huge barn of the hangar, where the ship lifted hastily through a giant cavity burnt fiercely into the roof.

"Can you get away from them?" asked Barr.

Ten ships of the traffic-police wildly followed the runaway craft that had burst out of the lawful, radio-beamed Path of Leaving, and then broken every speed law in creation. Further behind still, sleek vessels of the Secret Service were lifting in pursuit of a carefully described ship manned by two thoroughly identified murderers.

"Watch me," said Devers, and savagely shifted into hyperspace two thousand miles above the surface of Trantor. The shift, so near a planetary mass, meant unconsciousness for Barr and a fearful haze of pain for Devers, but light-years further, space above them was clear.

Devers' somber pride in his ship burst to the surface. He said, "There's not an Imperial ship that could follow me anywhere."

And then, bitterly, "But there is nowhere left to run to for us, and we can't fight their weight. What's there to do? What can anyone do?"

Barr moved feebly on his cot. The effect of the hypershift had not yet worn off, and each of his muscles ached. He said, "No one has to do anything. It's all over. Here!"

He passed the copy of the *Imperial News* that he still clutched, and the headlines were enough for the trader.

"Recalled and arrested – Riose and Brodrig," Devers muttered. He stared blankly at Barr. "Why?"

"The story doesn't say, but what does it matter? The war with the Foundation is over, and at this moment, Siwenna is revolting. Read the story and see." His voice was drifting off. "We'll stop in some of the provinces and find out the later details. If you don't mind, I'll go to sleep now."

And he did.

In grasshopper jumps of increasing magnitude, the trade ship was spanning the Galaxy in its return to the Foundation.

10. THE WAR ENDS

Lathan Devers felt definitely uncomfortable, and vaguely resentful. He had received his own decoration and withstood with mute stoicism the turgid oratory of the mayor which accompanied the slip of crimson ribbon. That had ended his share of the ceremonies, but, naturally, formality forced him to remain. And it was formality, chiefly – the type that couldn't allow him to yawn noisily or to swing a foot comfortably onto a chair seat – that made him long to be in space, where he belonged.

The Siwennese delegation, with Ducem Barr a lionized member, signed the Convention, and Siwenna became the first province to pass directly from the Empire's political rule to the Foundation's economic one.

Five Imperial Ships of the Line – captured when Siwenna rebelled behind the lines of the Empire's Border Fleet – flashed overhead, huge and massive, detonating a roaring salute as they passed over the city.

Nothing but drinking, etiquette, and small talk now.

A voice called him. It was Forell; the man who, Devers realized coldly, could buy twenty of him with a morning's profits – but a Forell who now crooked a finger at him with genial condescension.

He stepped out upon the balcony into the cool night wind, and bowed properly, while scowling into his bristling beard. Barr was there, too; smiling. He said, "Devers, you'll have to come to my rescue. I'm being accused of modesty, a horrible and thoroughly unnatural crime."

"Devers," Forell removed the fat cigar from the side of his mouth when he spoke, "Lord Barr claims that your trip to Cleon's capital had nothing to do with the recall of Riose."

"Nothing at all, sir." Devers was curt. "We never saw the Emperor. The reports we picked up on our way back concerning the trial, showed it up to be the purest frameup. There was a mess of rigmarole about the general being tied up with subversive interests at the court."

"And he was innocent?"

"Riose?" interposed Barr. "Yes! By the Galaxy, yes. Brodrig was a traitor on general principles but was never guilty of the specific accusations brought against him. It was a judicial farce; but a necessary one, a predictable one, an inevitable one."

"By psychohistorical necessity, I presume." Forell rolled the phrase sonorously with the humorous ease of long familiarity.

"Exactly." Barr grew serious. "It never penetrated earlier, but once it was over and I could . . . well . . . look at the answers in the back of the book, the problem became simple. We can see, *now*, that the social background of the Empire makes wars of conquest impossible for it. Under weak Emperors, it is tom apart by generals competing for a worthless and surely death-bringing throne. Under strong Emperors, the Empire is frozen into a paralytic rigor in which disintegration apparently ceases for the moment, but only at the sacrifice of all possible growth."

Forell growled bluntly through strong puffs, "You're not clear, Lord Barr."

Barr smiled slowly. "I suppose so. It's the difficulty of not being trained in psychohistory. Words are a pretty fuzzy substitute for mathematical equations. But let's see now—"

Barr considered, while Forell relaxed, back to railing, and Devers looked into the velvet sky and thought wonderingly of Trantor.

Then Barr said, "You see, sir, you – and Devers – and everyone no doubt, had the idea that beating the Empire meant first prying apart the Emperor and his general. You, and Devers, and everyone else were right – right all the time, as far as the principle of internal disunion was concerned.

"You were wrong, however, in thinking that this internal split was something to be brought about by individual acts, by inspirations of the moment. You tried bribery and lies. You appealed to ambition and to fear. But you got nothing for all your pains. In fact, appearances were worse after each attempt.

"And through all this wild threshing up of tiny ripples, the Seldon tidal wave continued onward, quietly – but quite irresistibly."

Ducem Barr turned away, and looked over the railing at the lights of a rejoicing city. He said, "There was a dead hand pushing all of us; the mighty general and the great Emperor; my world and your world – the dead hand of Hari Seldon. He knew that a man like Riose would have to fail, since it was his success that brought failure; and the greater the success, the surer the failure."

Forell said dryly, "I can't say you're getting clearer."

"A moment," continued Barr earnestly. "Look at the situation. A weak general could never have endangered us, obviously. A strong general during the time of a weak Emperor would never have endangered us, either; for he would have turned his arms towards a much more fruitful target. Events have shown that three-fourths of the Emperors of the last two centuries were rebel generals and rebel viceroys before they were Emperors.

"So it is only the combination of strong Emperor *and* strong general that can harm the Foundation; for a strong Emperor can not be dethroned easily, and a strong general is forced to turn outwards, past the frontiers.

"*But*, what keeps the Emperor strong? What kept Cleon strong? It's obvious. He is strong, because he permits no strong subjects. A courtier who becomes too rich, or a general who becomes too popular is dangerous. All the recent history of the Empire proves that to any Emperor intelligent enough to be strong.

"Riose won victories, so the Emperor grew suspicious. All the atmosphere of the times forced him to be suspicious. Did Riose refuse a bribe? Very suspicious; ulterior motives. Did his most trusted courtier suddenly favor Riose? Very suspicious; ulterior motives. It wasn't the individual acts that were suspicious. Anything else would have done which is why our individual plots were unnecessary and rather futile. It was the *success* of Riose that was suspicious. So he was recalled, and accused, condemned, murdered. The Foundation wins again.

"Look, there is not a conceivable combination of events that does not result in the Foundation winning. It was inevitable; whatever Riose did, whatever we did."

The Foundation magnate nodded ponderously. "So! But what if the Emperor and the general had been the same person. Hey? What then? That's a case you didn't cover, so you haven't proved your point yet."

Barr shrugged. "I can't *prove* anything; I haven't the mathematics. But I appeal to your reason. With an Empire in which every aristocrat, every strong man, every pirate can aspire to the Throne – and, as history shows, often successfully – what would happen to even a strong Emperor who preoccupied himself with foreign wars at the extreme end of the Galaxy? How long would he have to remain away from the capital before somebody

raised the standards of civil war and forced him home. The social environment of the Empire would make that time short.

"I once told Riose that not all the Empire's strength could swerve the dead hand of Hari Seldon."

"Good! Good!" Forell was expansively pleased. "Then you imply the Empire can never threaten us again."

"It seems to me so," agreed Barr. "Frankly, Cleon may not live out the year, and there's going to be a disputed succession almost as a matter of course, which might mean the last civil war for the Empire."

"Then," said Forell, "there are no more enemies."

Barr was thoughtful. "There's a Second Foundation."

"At the other end of the Galaxy? Not for centuries."

Devers turned suddenly at this, and his face was dark as he faced Forell. "There are internal enemies, perhaps."

"Are there?" asked Forell, coolly. "Who, for instance?"

"People, for instance, who might like to spread the wealth a bit, and keep it from concentrating too much *out* of the hands that work for it. See what I mean?"

Slowly, Forell's gaze lost its contempt and grew one with the anger of Devers' own.

PART II

THE MULE

11. BRIDE AND GROOM

THE MULE Less is known of "The Mule" than of any character of comparable significance to Galactic history. Even the period of his greatest renown is known to us chiefly through the eyes of his antagonists and, principally, through those of a young bride. . . .

ENCYCLOPEDIA GALACTICA

Bayta's first sight of Haven was entirely the contrary of spectacular. Her husband pointed it out – a dull star lost in the emptiness of the Galaxy's edge. It was past the last sparse clusters, to where straggling points of light gleamed lonely. And even among these it was poor and inconspicuous.

Toran was quite aware that as the earliest prelude to married life, the Red Dwarf lacked impressiveness and his lips curled self-consciously. "I know, Bay – It isn't exactly a proper change, is it? I mean from the Foundation to this."

"A horrible change, Toran. I should never have married you."

And when his face looked momentarily hurt, before he caught himself, she said with her special "cozy" tone, "All right, silly. Now let your lower lip droop and give me that special dying-duck look – the one just before you're supposed to bury your head on my shoulder, while I stroke your hair full of static electricity. You were fishing for some drivel, weren't you? You were expecting me to say 'I'd be happy anywhere with you, Toran!' or 'The interstellar depths themselves would be home, my sweet, were you but with me!' Now you admit it."

She pointed a finger at him and snatched it away an instant before his teeth closed upon it.

He said, "If I surrender, and admit you're right, will you prepare dinner?"

She nodded contentedly. He smiled, and just looked at her.

She wasn't beautiful on the grand scale to others – he admitted that – even if everybody did look twice. Her hair was dark and glossy, though straight, her mouth a bit wide – but her meticulous, close-textured eyebrows separated a white, unlined forehead from the warmest mahogany eyes ever filled with smiles.

And behind a very sturdily-built and staunchly-defended facade of practical, unromantic, hard-headedness towards life, there was just that little pool of softness that would never show if you poked for it, but could be reached if you knew just how – and never let on that you were looking for it.

Toran adjusted the controls unnecessarily and decided to relax. He was one interstellar jump, and then several milli-microparsecs "on the straight" before

manipulation by hand was necessary. He leaned over backwards to look into the storeroom, where Bayta was juggling appropriate containers.

There was quite a bit of smugness about his attitude towards Bayta – the satisfied awe that marks the triumph of someone who has been hovering at the edge of an inferiority complex for three years.

After all he was a provincial – and not merely a provincial, but the son of a renegade Trader. And she was of the Foundation itself – and not merely that, but she could trace her ancestry back to Mallow.

And with all that, a tiny quiver underneath. To take her back to Haven, with its rock-world and cave-cities was bad enough. To have her face the traditional hostility of Trader for Foundation – nomad for city dweller – was worse.

Still – After supper, the last jump!

Haven was an angry crimson blaze, and the second planet was a ruddy patch of light with atmosphere-blurred rim and a half-sphere of darkness. Bayta leaned over the large view table with its spidering of crisscross lines that centered Haven II neatly.

She said gravely, "I wish I had met your father first. If he takes a dislike to me–"

"Then," said Toran matter-of-factly, "you would be the first pretty girl to inspire *that* in him. Before he lost his arm and stopped roving around the Galaxy, he – Well, if you ask him about it, he'll talk to you about it till your ears wear down to a nubbin. After a while I got to thinking that he was embroidering; because he never told the same story twice the same way–"

Haven II was rushing up at them now. The landlocked sea wheeled ponderously below them, slate-gray in the lowering dimness and lost to sight, here and there, among the wispy clouds. Mountains jutted raggedly along the coast.

The sea became wrinkled with nearness and, as it veered off past the horizon just at the end, there was one vanishing glimpse of shore-hugging ice fields.

Toran grunted under the fierce deceleration, "Is your suit locked?"

Bayta's plump face was round and ruddy in the incasing sponge-foam of the internally-heated, skin-clinging costume.

The ship lowered crunchingly on the open field just short of the lifting of the plateau.

They climbed out awkwardly into the solid darkness of the outer-galactic night, and Bayta gasped as the sudden cold bit, and the thin wind swirled emptily. Toran seized her elbow and nudged her into an awkward run over the smooth, packed ground towards the sparking of artificial light in the distance.

The advancing guards met them halfway, and after a whispered exchange of words, they were taken onward. The wind and the cold disappeared when the gate of rock opened and then closed behind them. The warm interior, white with wall-light, was filled with an incongruous humming bustle. Men looked up from their desks, and Toran produced documents.

They were waved onward after a short glance and Toran whispered to his wife, "Dad must have fixed up the preliminaries. The usual lapse here is about five hours."

They burst into the open and Bayta said suddenly, "Oh, my—"

The cave city was in daylight – the white daylight of a young sun. Not that there was a sun, of course. What should have been the sky was lost in the unfocused glow of an over-all brilliance. And the warm air was properly thick and fragrant with greenery.

Bayta said, "Why, Toran, it's beautiful."

Toran grinned with anxious delight. "Well, now, Bay, it isn't like anything on the Foundation, of course, but it's the biggest city on Haven II – twenty thousand people, you know – and you'll get to like it. No amusement palaces, I'm afraid, but no secret police either."

"Oh, Torie, it's just like a toy city. It's all white and pink – and so clean."

"Well—" Toran looked at the city with her. The houses were two stories high for the most part, and of the smooth vein rock indigenous to the region. The spires of the Foundation were missing, and the colossal community houses of the Old Kingdoms – but the smallness was there and the individuality; a relic of personal initiative in a Galaxy of mass life.

He snapped to sudden attention. "Bay – There's Dad! Right there – where I'm pointing, silly. Don't you see him?"

She did. It was just the impression of a large man, waving frantically, fingers spread wide as though groping wildly in air. The deep thunder of a drawn-out shout reached them. Bayta trailed her husband, rushing downwards over the close-cropped lawn. She caught sight of a smaller man, white-haired, almost lost to view behind the robust One-arm, who still waved and still shouted.

Toran cried over his shoulder, "It's my father's half-brother. The one who's been to the Foundation. You know."

They met in the grass, laughing and incoherent, and Toran's father let out a final whoop for sheer joy. He hitched at his short jacket and adjusted the metal-chased belt that was his one concession to luxury.

His eyes shifted from one of the youngsters to the other, and then he said, a little out of breath, "You picked a rotten day to return home, boy!"

"What? Oh, it *is* Seldon's birthday, isn't it?"

"It is. I had to rent a car to make the trip here, and dragoon Randu to drive it. Not a public vehicle to be had at gun's point."

His eyes were on Bayta now, and didn't leave. He spoke to her more softly, "I have the crystal of you right here – and it's good, but I can see the fellow who took it was an amateur."

He had the small cube of transparency out of his jacket pocket and in the light the laughing little face within sprang to vivid colored life as a miniature Bayta.

"That one!" said Bayta. "Now I wonder why Toran should send that caricature. I'm surprised you let me come near you, sir."

"Are you now? Call me Fran. I'll have none of this fancy mess. For that, I think you can take my arm, and we'll go on to the car. Till now I never did think my boy knew what he was ever up to. I think I'll change that opinion. I think I'll *have* to change that opinion."

Toran said to his half uncle softly, "How is the old man these days? Does he still hound the women?"

Randu puckered up all over his face when he smiled. "When he can, Toran, when he can. There are times when he remembers that his next birthday will be his sixtieth, and that disheartens him. But he shouts it down, this evil thought, and then he is himself. He is a Trader of the ancient type. But you, Toran. Where did you find such a pretty wife?"

The young man chuckled and linked arms. "Do you want a three years' history at a gasp, uncle?"

It was in the small living room of the home that Bayta struggled out of her traveling cloak and hood and shook her hair loose. She sat down, crossing her knees, and returned the appreciative stare of this large, ruddy man.

She said, "I know what you're trying to estimate, and I'll help you; Age, twenty-four, height, five-four, weight, one-ten, educational specialty, history." She noticed that he always crooked his stand so as to hide the missing arm. But now Fran leaned close and said, "Since you mention it – weight, one-twenty."

He laughed loudly at her flush. Then he said to the company in general, "You can always tell a woman's weight by her upper arm – with due experience, of course. Do you want a drink, Bay?"

"Among other things," she said, and they left together, while Toran busied himself at the book shelves to check for new additions.

Fran returned alone and said, "She'll be down later."

He lowered himself heavily into the large comer chair and placed his stiff-jointed left leg on the stool before it. The laughter had left his red face, and Toran turned to face him.

Fran said, "Well, you're home, boy, and I'm glad you are. I like your woman. She's no whining ninny."

"I married her," said Toran simply.

"Well, that's another thing altogether, boy." His eyes darkened. "It's a foolish way to tie up the future. In my longer life, and more experienced, I never did such a thing."

Randu interrupted from the comer where he stood quietly. "Now Fransart, what comparisons are you making? Till your crash landing six years ago you were never in one spot long enough to establish residence requirements for marriage, And since then, who would have you?"

The one-armed man jerked erect in his seat and replied hotly, "Many, you snowy dotard–"

Toran said with hasty tact, "It's largely a legal formality, Dad. The situation has its conveniences."

"Mostly for the woman," grumbled Fran.

"And even if so," agreed Randu, "it's up to the boy to decide. Marriage is an old custom among the Foundationers."

"The Foundationers are not fit models for an honest Trader," smoldered Fran.

Toran broke in again, "My wife is a Foundationer." He looked from one to the other, and then said quietly, "She's coming."

The conversation took a general turn after the evening meal, which Fran had spiced with three tales of reminiscence composed of equal parts of blood, women, profits, and embroidery. The small television was on, and some classic drama was playing itself out in an unregarded whisper. Randu had hitched himself into a more comfortable position on the low couch and gazed past the slow smoke of his long pipe to where Bayta had knelt down upon the softness of the white fur mat brought back once long ago from a trade mission and now spread out only upon the most ceremonious occasions.

"You have studied history, my girl?" he asked, pleasantly.

Bayta nodded. "I was the despair of my teachers, but I learned a bit, eventually."

"A citation for scholarship," put in Toran, smugly, "that's all!"

"And what did you learn?" proceeded Randu, smoothly.

"Everything? Now?" laughed the girl.

The old man smiled gently. "Well then, what do you think of the Galactic situation?"

"I think," said Bayta, concisely, "that a Seldon crisis is pending – and that if it isn't then away with the Seldon plan altogether. It is a failure."

("Whew," muttered Fran, from his corner. "What a way to speak of Seldon." But he said nothing aloud.)

Randu sucked at his pipe speculatively. "Indeed? Why do you say that? I was to the Foundation, you know, in my younger days, and I, too, once thought great dramatic thoughts. But, now, why do you say that?"

"Well," Bayta's eyes misted with thought as she curled her bare toes into the white softness of the rug and nestled her little chin in one plump hand, "it seems to me that the whole essence of Seldon's plan was to create a world better than the ancient one of the Galactic Empire. It was failing apart, that world, three centuries ago, when Seldon first established the Foundation – and if history speaks truly, it was falling apart of the triple disease of inertia, despotism, and maldistribution of the goods of the universe."

Randu nodded slowly, while Toran gazed with proud, luminous eyes at his wife, and Fran in the corner clucked his tongue and carefully refilled his glass.

Bayta said, "If the story of Seldon is true, he foresaw the complete collapse of the Empire through his Jaws of psychohistory, and was able to predict the necessary thirty thousand years of barbarism before the establishment of a new Second Empire to restore civilization and culture to humanity. It was the whole aim of his life-work to set up such conditions as would insure a speedier rejuvenation,"

The deep voice of Fran burst out, "And that's why he established the two Foundations, honor be to his name."

"And that's why he established the two Foundations," assented Bayta. "Our Foundation was a gathering of the scientists of the dying Empire intended to carry on the science and learning of man to new heights. And the Foundation was so situated in space and the historical environment was such that through the careful calculations of his

genius, Seldon foresaw that in one thousand years, it would become a newer, greater Empire."

There was a reverent silence.

The girl said softly, "It's an old story. You all know it. For almost three centuries every human being of the Foundation has known it. But I thought it would be appropriate to go through it – just quickly. Today is Seldon's birthday, you know, and even if I *am* of the Foundation, and you are of Haven, we have that in common–"

She lit a cigarette slowly, and watched the glowing tip absently. "The laws of history are as absolute as the laws of physics, and if the probabilities of error are greater, it is only because history does not deal with as many humans as physics does atoms, so that individual variations count for more. Seldon predicted a series of crises through the thousand years of growth, each of which would force a new turning of our history into a pre-calculated path. It is those crises which direct us – and therefore a crisis must come now.

"Now!" she repeated, forcefully. "It's almost a century since the last one, and in that century, every vice of the Empire has been repeated in the Foundation. Inertia! Our ruling class knows one law; no change. Despotism! They know one rule; force. Maldistribution! They know one desire; to hold what is theirs."

"While others starve!" roared Fran suddenly with a mighty blow of his fist upon the arm of his chair. "Girl, your words are pearls. The fat guts on their moneybags ruin the Foundation, while the brave Traders hide their poverty on dregs of worlds like Haven. It's a disgrace to Seldon, a casting of dirt in his face, a spewing in his beard." He raised his arm high, and then his face lengthened. "If I had my other arm! If – once – they had listened to me!"

"Dad," said Toran, "take it easy."

"Take it easy. Take it easy," his father mimicked savagely. "We'll live here and die here forever – and you say, take it easy."

"That's our modern Lathan Devers," said Randu, gesturing with his pipe, "this Fran of ours. Devers died in the slave mines eighty years ago with your husband's great-grandfather, because he lacked wisdom and didn't lack heart–"

"Yes, by the Galaxy, I'd do the same if I were he," swore Fran. "Devers was the greatest Trader in history – greater than the overblown windbag, Mallow, the Foundationers worship. If the cutthroats who lord the Foundation killed him because he loved justice, the greater the blood-debt owed them."

"Go on, girl," said Randu. "Go on, or, surely, he'll talk a the night and rave all the next day."

"There's nothing to go on about," she said, with a sudden gloom. "There must be a crisis, but I don't know how to make one. The progressive forces on the Foundation are oppressed fearfully. You Traders may have the will, but you are hunted and disunited. If all the forces of good will in and out of the Foundation could combine–"

Fran's laugh was a raucous jeer. "Listen to her, Randu, listen to her. In and out of the Foundation, she says. Girl, girl, there's no hope in the flab-sides of the Foundation.

Among them some hold the whip and the rest are whipped dead whipped. Not enough spunk left in the whole rotten world to outface one good Trader."

Bayta's attempted interruptions broke feebly against the overwhelming wind.

Toran leaned over and put a hand over her mouth. "Dad," he said, coldly, "you've never been on the Foundation. You know nothing about it. I tell you that the underground there is brave and daring enough. I could tell you that Bayta was one of them—"

"All right, boy, no offense. Now, where's the cause for anger?" He was genuinely perturbed.

Toran drove on fervently, "The trouble with you, Dad, is that you've got a provincial outlook. You think because some hundred thousand Traders scurry into holes on an unwanted planet at the end of nowhere, that they're a great people. Of course, any tax collector from the Foundation that gets here never leaves again, but that's cheap heroism. What would you do if the Foundation sent a fleet?"

"We'd blast them," said Fran, sharply.

"And get blasted – with the balance in their favor. You're outnumbered, outarmed, outorganized – and as soon as the Foundation thinks it worth its while, you'll realize that. So you had better seek your allies – on the Foundation itself, if you can."

"Randu, said Fran, looking at his brother like a great, helpless bull.

Randu took his pipe away from his lips, "The boy's right, Fran. When you listen to the little thoughts deep inside you, you know he is. But they're uncomfortable thoughts, so you drown them out with that roar of yours. But they're still there. Toran, I'll tell you why I brought all this up."

He puffed thoughtfully awhile, then dipped his pipe into the neck of the tray, waited for the silent flash, and withdrew it clean. Slowly, he filled it again with precise tamps of his little finger.

He said, "Your little suggestion of Foundation's interest in us, Toran, is to the point. There have been two recent visits lately – for tax purposes. The disturbing point is that the second visitor was accompanied by a light patrol ship. They landed in Gleiar City – giving us the miss for a change – and they never lifted off again, naturally. But now they'll surely be back. Your father is aware of all this, Toran, he really is.

"Look at the stubborn rakehell. He knows Haven is in trouble, and he knows we're helpless, but he repeats his formulas. It warms and protects him. But once he's had his say, and roared his defiance, and feels he's discharged his duty as a man and a Bull Trader, why he's as reasonable as any of us."

"Any of who?" asked Bayta.

He smiled at her. "We've formed a little group, Bayta – just in our city. We haven't done anything, yet. We haven't even managed to contact the other cities yet, but it's a start."

"But towards what?"

Randu shook his head. "We don't know-yet. We hope for a miracle. We have decided that, as you say, a Seldon crisis must be at hand." He gestured widely upwards.

"The Galaxy is full of the chips and splinters of the broken Empire. The generals swarm. Do you suppose the time may come when one will grow bold?"

Bayta considered, and shook her head decisively, so that the long straight hair with the single inward curl at the end swirled about her ears. "No, not a chance. There's not one of those generals who doesn't know that an attack on the Foundation is suicide. Bel Riose of the old Empire was a better man than any of them, and he attacked with the resources of a galaxy, and couldn't win against the Seldon Plan. Is there one general that doesn't know that?"

"But what if we spur them on?"

"Into where? Into an atomic furnace? With what could you possibly spur them?"

"Well, there is one – a new one. In this past year or two, there has come word of a strange man whom they call the Mule."

"The Mule?" She considered. "Ever hear of him, Torie?"

Toran shook his head. She said, "What about him?"

"I don't know. But he wins victories at, they say, impossible odds. The rumors may be exaggerated, but it would be interesting, in any case, to become acquainted with him. Not every man with sufficient ability and sufficient ambition would believe in Hari Seldon and his laws of psychohistory. We could encourage that disbelief. He might attack."

"And the Foundation would win."

"Yes – but not necessarily easily. It might be a crisis, and we could take advantage of such a crisis to force a compromise with the despots of the Foundation. At the worst, they would forget us long enough to enable us to plan farther."

"What do you think, Torie?"

Toran smiled feebly and pulled at a loose brown curl that fell over one eye. "The way he describes it, it can't hurt; but who is the Mule? What do you know of him, Randu?"

"Nothing yet. For that, we could use you, Toran. And your wife, if she's willing. We've talked of this, your father and I. We've talked of this thoroughly."

"In what way, Randu? What do you want of us?" The young man cast a quick inquisitive look at his wife.

"Have you had a honeymoon?"

"Well . . . yes . . . if you can call the trip from the Foundation a honeymoon."

"How about a better one on Kalgan? It's semitropical beaches – water sports – bird hunting – quite the vacation spot. It's about seven thousand parsecs in-not too far."

"What's on Kalgan?"

"The Mule! His men, at least. He took it last month, and without a battle, though Kalgan's warlord broadcast a threat to blow the planet to ionic dust before giving it up."

"Where's the warlord now?"

"He isn't," said Randu, with a shrug. "What do you say?"

"But what are we to do?"

"I don't know. Fran and I are old; we're provincial. The Traders of Haven are all essentially provincial. Even you say so. Our trading is of a very restricted sort, and we're not the Galaxy roamers our ancestors were, Shut up, Fran! But you two know the Galaxy.

Bayta, especially, speaks with a nice Foundation accent. We merely wish whatever you can find out. If you can make contact . . . but we wouldn't expect that. Suppose you two think it over. You can meet our entire group if you wish . . . oh, not before next week. You ought to have some time to catch your breath."

There was a pause and then Fran roared, "Who wants; another drink? I mean, besides me?"

12. CAPTAIN AND MAYOR

Captain Han Pritcher was unused to the luxury of his surroundings and by no means impressed. As a general thing, he discouraged self-analysis and all forms of philosophy and metaphysics not directly connected with his work.

It helped.

His work consisted largely of what the War Department called "intelligence," the sophisticates, "espionage," and the romanticists, "spy stuff." And, unfortunately, despite the frothy shrillness of the televisions, "intelligence," "espionage," and "spy stuff" are at best a sordid business of routine betrayal and bad faith. It is excused by society since it is in the "interest of the State," but since philosophy seemed always to lead Captain Pritcher to the conclusion that even in that holy interest, society is much more easily soothed than one's own conscience – he discouraged philosophy.

And now, in the luxury of the mayor's anteroom, his thoughts turned inward despite himself.

Men had been promoted over his head continuously, though of lesser ability – that much was admitted. He had withstood an eternal rain of black marks and official reprimands, and survived it. And stubbornly he had held to his own way in the firm belief that insubordination in that same holy "interest of the State" would yet be recognized for the service it was.

So here he was in the anteroom of the mayor-with five soldiers as a respectful guard, and probably a court-martial awaiting him.

The heavy, marble doors rolled apart smoothly, silently, revealing satiny walls, a red plastic carpeting, and two more marble doors, metal-inlaid, within. Two officials in the straight-lined costume of three centuries back, stepped out, and called:

"An audience to Captain Han Pritcher of Information."

They stepped back with a ceremonious bow as the captain started forward. His escort stopped at the outer door, and he entered the inner alone.

On the other side of the doors, in a large room strangely simple, behind a large desk strangely angular, sat a small man, almost lost in the immensity,

Mayor Indbur – successively the third of that name – was the grandson of the first Indbur, who had been brutal and capable; and who had exhibited the first quality in spectacular fashion by his manner of seizing power, and the latter by the skill with which

he put an end to the last farcical remnants of free election and the even greater skill with which he maintained a relatively peaceful rule.

Mayor Indbur was also the son of the second Indbur, who was the first Mayor of the Foundation to succeed to his post by right of birth – and who was only half his father, for he was merely brutal.

So Mayor Indbur was the third of the name and the second to succeed by right of birth, and he was the least of the three, for he was neither brutal nor capable – but merely an excellent bookkeeper born wrong.

Indbur the Third was a peculiar combination of ersatz characteristics to all but himself.

To him, a stilted geometric love of arrangement was "system," an indefatigable and feverish interest in the pettiest facets of day-to-day bureaucracy was "industry," indecision when right was "caution," and blind stubbornness when wrong, "determination."

And withal he wasted no money, killed no man needlessly, and meant extremely well.

If Captain Pritcher's gloomy thoughts ran along these lines as he remained respectfully in place before the large desk, the wooden arrangement of his features yielded no insight into the fact. He neither coughed, shifted weight, nor shuffled his feet until the thin face of the mayor lifted slowly as the busy stylus ceased in its task of marginal notations, and a sheet of close-printed paper was lifted from one neat stack and placed upon another neat stack.

Mayor Indbur clasped his hands carefully before him, deliberately refraining from disturbing the careful arrangement of desk accessories.

He said, in acknowledgment, "Captain Han Pritcher of Information."

And Captain Pritcher in strict obedience to protocol bent one knee nearly to the ground and bowed his head until he heard the words of release.

"Arise, Captain Pritcher!"

The mayor said with an air of warm sympathy, "You are here, Captain Pritcher, because of certain disciplinary action taken against yourself by your superior officer. The papers concerning such action have come, in the ordinary course of events, to my notice, and since no event in the Foundation is of disinterest to me, I took the trouble to ask for further information on your case. You are not, I hope, surprised."

Captain Pritcher said unemotionally, "Excellence, no. Your justice is proverbial."

"Is it? Is it?" His tone was pleased, and the tinted contact lenses he wore caught the light in a manner that imparted a hard, dry gleam to his eyes. Meticulously, he fanned out a series of metal-bound folders before him. The parchment sheets within crackled sharply as he turned them, his long finger following down the line as he spoke.

"I have your record here, captain – complete. You are forty-three and have been an Officer of the Armed Forces for seventeen years. You were born in Loris, of Anacreonian parents, no serious childhood diseases, an attack of myo . . . well, that's of no importance . . . education, premilitary, at the Academy of Sciences, major, hyper-

engines, academic standing . . . hm-m-m, very good, you are to be congratulated . . . entered the Army as Under-Officer on the one hundred second day of the 293rd year of the Foundation Era."

He lifted his eyes momentarily as he shifted the first folder, and opened the second.

"You see," he said, "in my administration, nothing is left to chance. Order! System!"

He lifted a pink, scented jelly-globule to his lips. It was his one vice, and but dolingly indulged in. Witness the fact that the mayor's desk lacked that almost-inevitable atom flash for the disposal of dead tobacco. For the mayor did not smoke.

Nor, as a matter of course, did his visitors.

The mayor's voice droned on, methodically, slurringly, mumblingly – now and then interspersed with whispered comments of equally mild and equally ineffectual commendation or reproof.

Slowly, he replaced the folders as originally, in a single neat pile.

"Well, captain," he said, briskly, "your record is unusual. Your ability is outstanding, it would seem, and your services valuable beyond question. I note that you have been wounded in the line of duty twice, and that you have been awarded the Order of Merit for bravery beyond the call of duty. Those are facts not lightly to be minimized."

Captain Pritcher's expressionless face did not soften. He remained stiffly erect. Protocol required that a subject honored by an audience with the mayor may not sit down – a point perhaps needlessly reinforced by the fact that only one chair existed in the room, the one underneath the mayor. Protocol further required no statements other than those needed to answer a direct question.

The mayor's eyes bore down hard upon the soldier and his voice grew pointed and heavy. "However, you have not been promoted in ten years, and your superiors report, over and over again, of the unbending stubbornness of your character. You are reported to be chronically insubordinate, incapable of maintaining a correct attitude towards superior officers, apparently uninterested in maintaining frictionless relationships with your colleagues, and an incurable troublemaker, besides. How do you explain that, captain?"

"Excellence, I do what seems right to me. My deeds on behalf of the State, and my wounds in that cause bear witness that what seems right to me is also in the interest of the State."

"A soldierly statement, captain, but a dangerous doctrine. More of that, later. Specifically, you are charged with refusing an assignment three times in the face of orders signed by my legal delegates. What have you to say to that?"

"Excellence, the assignment lacks significance in a critical time, where matters of first importance are being ignored."

"Ah, and who tells you these matters you speak of are of the first importance at all, and if they are, who tells you further that they are ignored?"

"Excellence, these things are quite evident to me. My experience and my knowledge of events – the value of neither of which my superiors deny – make it plain."

"But, my good captain, are you blind that you do not see that by arrogating to yourself the right to determine Intelligence policy, you usurp the duties of your superior?"

"Excellence, my duty is primarily to the State, and not to my superior."

"Fallacious, for your superior has his superior, and that superior is myself, and I am the State. But come, you shall have no cause to complain of this justice of mine that you say is proverbial. State in your own words the nature of the breach in discipline that has brought all this on."

"Excellence, my duty is primarily to the State, and not to my living the life of a retired merchant mariner upon the world of Kalgan. My instructions were to direct Foundation activity upon the planet, perfect an organization to act as check upon the warlord of Kalgan, particularly as regards his foreign policy."

"This is known to me. Continue!"

"Excellence, my reports have continually stressed the strategic positions of Kalgan and the systems it controls. I have reported on the ambition of the warlord, his resources, his determination to extend his domain and his essential friendliness – or, perhaps, neutrality – towards the Foundation."

"I have read your reports thoroughly. Continue!"

"Excellence, I returned two months ago. At that time, there was no sign of impending war; no sign of anything but an almost superfluity of ability to repel any conceivable attack. One month ago, an unknown soldier of fortune took Kalgan without a fight. The man who was once warlord of Kalgan is apparently no longer alive. Men do not speak of treason – they speak only of the power and genius of this strange condottiere – this Mule."

"This who?" the mayor leaned forward, and looked offended.

"Excellence, he is known as the Mule. He is spoken of little, in a factual sense, but I have gathered the scraps and fragments of knowledge and winnowed out the most probable of them. He is apparently a man of neither birth nor standing. His father, unknown. His mother, dead in childbirth. His upbringing, that of a vagabond. His education, that of the tramp worlds, and the backwash alleys of space. He has no name other than that of the Mule, a name reportedly applied by himself to himself, and signifying, by popular explanation, his immense physical strength, and stubbornness of purpose."

"What is his military strength, captain? Never mind his physique."

"Excellence, men speak of huge fleets, but in this they may be influenced by the strange fall of Kalgan. The territory he controls is not large, though its exact limits are not capable of definite determination. Nevertheless, this man must be investigated."

"Hm-m-m. So! So!" The mayor fell into a reverie, and slowly with twenty-four strokes of his stylus drew six squares in hexagonal arrangements upon the blank top sheet of a pad, which he tore off, folded neatly in three parts and slipped into the wastepaper slot at his right hand. It slid towards a clean and silent atomic disintegration.

"Now then, tell me, captain, what is the alternative? You have told me what 'must' be investigated. What have you been *ordered* to investigate?"

"Excellence, there is a rat hole in space that, it seems, does not pay its taxes."

"Ah, and is that all? You are not aware, and have not been told that these men who do not pay their taxes, are descendants of the wild Traders of our early days – anarchists, rebels, social maniacs who claim Foundation ancestry and deride Foundation culture. You are not aware, and have not been told, that this rat hole in space, is not one, but many; that these rat holes are in greater number than we know; that these rat holes conspire together, one with the other, and all with the criminal elements that still exist throughout Foundation territory. Even here, captain, even here!"

The mayor's momentary fire subsided quickly. "You are not aware, captain?"

"Excellence, I have been told all this. But as servant of the State, I must serve faithfully – and he serves most faithfully who serves Truth. Whatever the political implications of these dregs of the ancient Traders – the warlords who have inherited the splinters of the old Empire have the power. The Traders have neither arms nor resources. They have not even unity. I am not a tax collector to be sent on a child's errand."

"Captain Pritcher, you are a soldier, and count guns. It is a failing to be allowed you up to the point where it involves disobedience to myself. Take care. My justice is not simply weakness. Captain, it has already been proven that the generals of the Imperial Age and the warlords of the present age are equally impotent against us. Seldon's science which predicts the course of the Foundation is based, not on individual heroism, as you seem to believe, but on the social and economic trends of history. We have passed successfully through four crises already, have we not?"

"Excellence, we have. Yet Seldon's science is known only to Seldon. We ourselves have but faith. In the first three crises, as I have been carefully taught, the Foundation was led by wise leaders who foresaw the nature of the crises and took the proper precautions. Otherwise – who can say?"

"Yes, captain, but you omit the fourth crisis. Come, captain, we had no leadership worthy of the name then, and we faced the cleverest opponent, the heaviest armor, the strongest force of all. Yet we won by the inevitability of history."

"Excellence, that is true. But this history you mention became inevitable only after we had fought desperately for over a year. The inevitable victory we won cost us half a thousand ships and half a million men. Excellence, Seldon's plan helps those who help themselves."

Mayor Indbur frowned and grew suddenly tired of his patient exposition. It occurred to him that there was a fallacy in condescension, since it was mistaken for permission to argue eternally; to grow contentious; to wallow in dialectic. He said, stiffly, "Nevertheless, captain, Seldon guarantees victory over the warlords, and I can not, in these busy times, indulge in a dispersal of effort. These Traders you dismiss are Foundation-derived. A war with them would be a civil war. Seldon's plan makes no guarantee there for us – since they *and* we are Foundation. So they must be brought to heel. You have your orders."

"Excellence—"

"You have been asked no question, captain. You have your orders. You will obey those orders. Further argument of any sort with myself or those representing myself will be considered treason. You are excused."

Captain Han Pritcher knelt once more, then left with slow, backward steps.

Mayor Indbur, third of his name, and second mayor of Foundation history to be so by right of birth, recovered his equilibrium, and lifted another sheet of paper from the neat stack at his left. It was a report on the saving of funds due to the reduction of the quantity of metal-foam edging on the uniforms of the police force. Mayor Indbur crossed out a superfluous comma, corrected a misspelling, made three marginal notations, and placed it upon the neat stack at his right. He lifted another sheet of paper from the neat stack at his left.

Captain Han Pritcher of Information found a Personal Capsule waiting for him when he returned to barracks. It contained orders, terse and redly underlined with a stamped "URGENT" across it, and the whole initialed with a precise, capital "I".

Captain Han Pritcher was ordered to the "rebel world called Haven" in the strongest terms.

Captain Han Pritcher, alone in his light one-man speedster, set his course quietly and calmly for Kalgan. He slept that night the sleep of a successfully stubborn man.

13. LIEUTENANT AND CLOWN

If, from a distance of seven thousand parsecs, the fall of Kalgan to the armies of the Mule had produced reverberations that had excited the curiosity of an old Trader, the apprehension of a dogged captain, and the annoyance of a meticulous mayor – to those on Kalgan itself, it produced nothing and excited no one. It is the invariable lesson to humanity that distance in time, and in space as well, lends focus. It is not recorded, incidentally, that the lesson has ever been permanently learned.

Kalgan was – Kalgan. It alone of all that quadrant of the Galaxy seemed not to know that the Empire had fallen, that the Stannells no longer ruled, that greatness had departed, and peace had disappeared.

Kalgan was the luxury world. With the edifice of mankind crumbling, it maintained its integrity as a producer of pleasure, a buyer of gold and a seller of leisure.

It escaped the harsher vicissitudes of history, for what conqueror would destroy or even seriously damage a world so full of the ready cash that would buy immunity.

Yet even Kalgan had finally become the headquarters of a warlord and its softness had been tempered to the exigencies of war.

Its tamed jungles, its mildly modeled shores, and its garishly glamorous cities echoed to the march of imported mercenaries and impressed citizens. The worlds of its province had been armed and its money invested in battleships rather than bribes for the first time in its history. Its ruler proved beyond doubt that he was determined to defend

what was his and eager to seize what was others. He was a great one of the Galaxy, a war and peace maker, a builder of Empire, an establisher of dynasty.

And an unknown with a ridiculous nickname had taken him – and his arms – and his budding Empire – and had not even fought a battle.

So Kalgan was as before, and its uniformed citizens hurried back to their older life, while the foreign professionals of war merged easily into the newer bands that descended.

Again as always, there were the elaborate luxury hunts for the cultivated animal life of the jungles that never took human life; and the speedster bird-chases in the air above, that was fatal only to the Great Birds.

In the cities, the escapers of the Galaxy could take their varieties of pleasure to suit their purse, from the ethereal sky-palaces of spectacle and fantasy that opened their doors to the masses at the jingle of half a credit, to the unmarked, unnoted haunts to which only those of great wealth were of the cognoscenti.

To the vast flood, Toran and Bayta added not even a trickle. They registered their ship in the huge common hangar on the East Peninsula, and gravitated to that compromise of the middle-classes, the Inland Sea-where the pleasures were yet legal, and even respectable, and the crowds not yet beyond endurance.

Bayta wore dark glasses against the light, and a thin, white robe against the heat. Warm-tinted arms, scarcely the goldener for the sun, clasped her knees to her, and she stared with firm, abstracted gaze at the length of her husband's outstretched body – almost shimmering in the brilliance of white sun-splendor.

"Don't overdo it," she had said at first, but Toran was of a dying-red star, Despite three years of the Foundation, sunlight was a luxury, and for four days now his skin, treated beforehand for ray resistance, had not felt the harshness of clothing, except for the brief shorts.

Bayta huddled close to him on the sand and they spoke in whispers.

Toran's voice was gloomy, as it drifted upwards from a relaxed face, "No, I admit we're nowhere. But where is he? Who is he? This mad world says nothing of him. Perhaps he doesn't exist."

"He exists," replied Bayta, with lips that didn't move. "He's clever, that's all. And your uncle is right. He's a man we could use – if there's time."

A short pause. Toran whispered, "Know what I've been doing, Bay? I'm just daydreaming myself into a sun-stupor. Things figure themselves out so neatly – so sweetly." His voice nearly trailed off, then returned, "Remember the way Dr. Amann talked back at college, Bay. The Foundation can never lose, but that does not mean the *rulers* of the Foundation can't. Didn't the real history of the Foundation begin when Salvor Hardin kicked out the Encyclopedists and took over the planet Terminus as the first mayor? And then in the next century, didn't Hober Mallow gain power by methods almost as drastic? That's *twice* the rulers were defeated, so it can be done. So why not by us?"

"It's the oldest argument in the books. Torie. What a waste of good reverie."

"Is it? Follow it out. What's Haven? Isn't it part of the Foundation? If we become top dog, it's still the Foundation winning, and only the current rulers losing."

"Lots of difference between 'we can' and 'we will.' You're just jabbering."

Toran squirmed. "Nuts, Bay, you're just in one of your sour, green moods. What do you want to spoil my fun for? I'll just go to sleep if you don't mind."

But Bayta was craning her head, and suddenly – quite a *non sequitur* – she giggled, and removed her glasses to look down the beach with only her palm shading her eyes.

Toran looked up, then lifted and twisted his shoulders to follow her glance.

Apparently, she was watching a spindly figure, feet in air, who teetered on his hands for the amusement of a haphazard crowd. It was one of the swarming acrobatic beggars of the shore, whose supple joints bent and snapped for the sake of the thrown coins.

A beach guard was motioning him on his way and with a surprising one-handed balance, the clown brought a thumb to his nose in an upside-down gesture. The guard advanced threateningly and reeled backward with a foot in his stomach. The clown righted himself without interrupting the motion of the initial kick and was away, while the frothing guard was held off by a thoroughly unsympathetic crowd.

The clown made his way raggedly down the beach. He brushed past many, hesitated often, stopped nowhere. The original crowd had dispersed. The guard had departed.

"He's a queer fellow," said Bayta, with amusement, and Toran agreed indifferently. The clown was close enough now to be seen clearly. His thin face drew together in front into a nose of generous planes and fleshy tip that seemed all but prehensile. His long, lean limbs and spidery body, accentuated by his costume, moved easily and with grace, but with just a suggestion of having been thrown together at random.

To look was to smile.

The clown seemed suddenly aware of their regard, for he stopped after he had passed, and, with a sharp turn, approached. His large, brown eyes fastened upon Bayta.

She found herself disconcerted.

The clown smiled, but it only saddened his beaked face, and when he spoke it was with the soft, elaborate phrasing of the Central Sectors.

"Were I to use the wits the good Spirits gave me," he said, "then I would say this lady can not exist – for what sane man would hold a dream to be reality. Yet rather would I not be sane and lend belief to charmed, enchanted eyes."

Bayta's own eyes opened wide. She said, "Wow!"

Toran laughed, "Oh, you enchantress. Go ahead, Bay, that deserves a five-credit piece. Let him have it."

But the clown was forward with a jump. "No, my lady, mistake me not. I spoke for money not at all, but for bright eyes and sweet face."

"Well, *thanks*," then, to Toran, "Golly, you think the sun's in his eyes?"

"Yet not alone for eyes and face," babbled the clown, as his words hurled past each other in heightened frenzy, "but also for a mind, clear and sturdy – and kind as well."

Toran rose to his feet, reached for the white robe he had crooked his arm about for four days, and slipped into it.

"Now, bud," he said, "suppose you tell me what you want, and stop annoying the lady."

The clown fell back a frightened step, his meager body cringing. "Now, sure I meant no harm. I am a stranger here, and it's been said I am of addled wits; yet there is something in a face that I can read. Behind this lady's fairness, there is a heart that's kind, and that would help me in my trouble for all I speak so boldly."

"Will five credits cure your trouble?" said Toran, dryly, and held out the coin.

But the clown did not move to take it, and Bayta said, "Let me talk to him, Torie," She added swiftly, and in an undertone, "There's no use being annoyed at his silly way of talking. That's just his dialect; and our speech is probably as strange to him."

She said, "What is your trouble? You're not worried about the guard, are you? He won't bother you."

"Oh, no, not he. He's but a windlet that blows the dust about my ankles. There is another that I flee, and he is a storm that sweeps the worlds aside and throws them plunging at each other. A week ago, I ran away, have slept in city streets, and hid in city crowds. I've looked in many faces for help in need. I find it here." He repeated the last phrase in softer, anxious tones, and his large eyes were troubled, "I find it here."

"Now," said Bayta, reasonably, "I would like to help, but really, friend, I'm no protection against a world-sweeping storm. To be truthful about it, I could use—"

There was an uplifted, powerful voice that bore down upon them.

"Now, then, you mud-spawned rascal—"

It was the beach guard, with a fire-red face, and snarling mouth, that approached at a run. He pointed with his low-power stun pistol.

"Hold him, you two. Don't let him get away." His heavy hand fell upon the clown's thin shoulder, so that a whimper was squeezed out of him.

Toran said, "What's he done?"

"What's he done? What's he done? Well, now, that's good!" The guard reached inside the dangling pocket attached to his belt, and removed a purple handkerchief, with which he mopped his bare neck. He said with relish. "I'll tell you what he's done. He's run away. The word's all over Kalgan and I would have recognized him before this if he had been on his feet instead of on his hawkface top." And he rattled his prey in a fierce good humor.

Bayta said with a smile, "Now where did he escape from, sir?"

The guard raised his voice. A crowd was gathering, popeyed and jabbering, and with the increase of audience, the guard's sense of importance increased in direct ratio.

"Where did he escape from?" he declaimed in high sarcasm. "Why, I suppose you've heard of the Mule, now."

All jabbering stopped, and Bayta felt a sudden iciness trickle down into her stomach. The clown had eyes only for her—he still quivered in the guard's brawny grasp.

"And who," continued the guard heavily, "would this infernal ragged piece be, but his lordship's own court fool who's run away." He jarred his captive with a massive shake, "Do you admit it, fool?"

There was only white fear for answer, and the soundless sibilance of Bayta's voice close to Toran's ear.

Toran stepped forward to the guard in friendly fashion, "Now, my man, suppose you take your hand away for just a while. This entertainer you hold has been dancing for us and has not yet danced out his fee."

"Here!" The guard's voice rose in sudden concern. "There's a reward—"

"You'll have it, if you can prove he's the man you want. Suppose you withdraw till then. You know that you're interfering with a guest, which could be serious for you."

"But you're interfering with his lordship and that *will* be serious for you." He shook the clown once again. "Return the man's fee, carrion."
