Toran's hand moved quickly and the guard's stun pistol was wrenched away with half a finger nearly following it. The guard howled his pain and rage. Toran shoved him violently aside, and the clown, unhanded, scuttled behind him.

The crowd, whose fringes were now lost to the eye, paid little attention to the latest development. There was among them a craning of necks, and a centrifugal motion as if many had decided to increase their distance from the center of activity.

Then there was a bustle, and a rough order in the distance. A corridor formed itself and two men strode through, electric whips in careless readiness. Upon each purple blouse was designed an angular shaft of lightning with a splitting planet underneath.

A dark giant, in lieutenant's uniform, followed them; dark of skin, and hair, and scowl.

The dark man spoke with the dangerous softness that meant he had little need of shouting to enforce his whims. He said, "Are you the man who notified us?"

The guard was still holding his wrenched hand, and with a pain-distorted face mumbled, "I claim the reward, your mightiness, and I accuse that man—"

"You'll get your reward," said the lieutenant, without looking at him. He motioned curtly to his men, "Take him."

Toran felt the clown tearing at his robe with a maddened grip.

He raised his voice and kept it from shaking, "I'm sorry, lieutenant; this man is mine."

The soldiers took the statement without blinking. One raised his whip casually, but the lieutenant's snapped order brought it down.

His dark mightiness swung forward and planted his square body before Toran, "Who are you?"

And the answer rang out, "A citizen of the Foundation."

It worked—with the crowd, at any rate. The pent-up silence broke into an intense hum. The Mule's name might excite fear, but it was, after all, a new name and scarcely

stuck as deeply in the vitals as the old one of the Foundation – that had destroyed the Empire – and the fear of which ruled a quadrant of the Galaxy with ruthless despotism.

The lieutenant kept face. He said, "Are you aware of the identity of the man behind you?"

"I have been told he's a runaway from the court of your leader, but my only sure knowledge is that he is a friend of mine. You'll need firm proof of his identity to take him."

There were high-pitched sighs from the crowd, but the lieutenant let it pass. "Have you your papers of Foundation citizenship with you?"

"At my ship."

"You realize that your actions are illegal? I can have you shot."

"Undoubtedly. But then you would have shot a Foundation citizen and it is quite likely that your body would be sent to the Foundation – quartered – as part compensation. It's been done by other warlords."

The lieutenant wet his lips. The statement was true.

He said, "Your name?"

Toran followed up his advantage, "I will answer further questions at my ship. You can get the cell number at the Hangar; it is registered under the name 'Bayta'."

"You won't give up the runaway?"

"To the Mule, perhaps. Send your master!"

The conversation had degenerated to a whisper and the lieutenant turned sharply away.

"Disperse the crowd!" he said to his men, with suppressed ferocity.

The electric whips rose and fell. There were shrieks and a vast surge of separation and flight.

Toran interrupted his reverie only once on their way back to the Hangar. He said, almost to himself, "Galaxy, Bay, what a time I had! I was so scared–"

"Yes," she said, with a voice that still shook, and eyes that still showed something akin to worship, "it was quite out of character."

"Well, I still don't know what happened. I just got up there with a stun pistol that I wasn't even sure I knew how to use, and talked back to him. I don't know why I did it."

He looked across the aisle of the short-run air vessel that was carrying them out of the beach area, to the seat on which the Mule's clown scrunched up in sleep, and added distastefully, "It was the hardest thing I've ever done."

The lieutenant stood respectfully before the colonel of the garrison, and the colonel looked at him and said, "Well done. Your part's over now."

But the lieutenant did not retire immediately. He said darkly, "The Mule has lost face before a mob, sir. It will be necessary to undertake disciplinary action to restore proper atmosphere of respect."

"Those measures have already been taken."

The lieutenant half turned, then, almost with resentment, "I'm willing to agree, sir, that orders are orders, but standing before that man with his stun pistol and swallowing his insolence whole, was the hardest thing I've ever done."

14. THE MUTANT

The "hangar" on Kalgan is an institution peculiar unto itself, born of the need for the disposition of the vast number of ships brought in by the visitors from abroad, and the simultaneous and consequent vast need for living accommodations for the same. The original bright one who had thought of the obvious solution had quickly become a millionaire. His heirs – by birth or finance – were easily among the richest on Kalgan.

The "hangar" spreads fatly over square miles of territory, and "hangar" does not describe it at all sufficiently. It is essentially a hotel – for ships. The traveler pays in advance and his ship is awarded a berth from which it can take off into space at any desired moment. The visitor then lives in his ship as always. The ordinary hotel services such as the replacement of food and medical supplies at special rates, simple servicing of the ship itself, special intra-Kalgan transportation for a nominal sum are to be had, of course.

As a result, the visitor combines hangar space and hotel bill into one, at a saving. The owners sell temporary use of ground space at ample profits. The government collects huge taxes. Everyone has fun. Nobody loses. Simple!

The man who made his way down the shadow-borders of the wide corridors that connected the multitudinous wings of the "hangar" had in the past speculated on the novelty and usefulness of the system described above, but these were reflections for idle moments – distinctly unsuitable at present.

The ships hulked in their height and breadth down the long lines of carefully aligned cells, and the man discarded line after line. He was an expert at what he was doing now and if his preliminary study of the hangar registry had failed to give specific information beyond the doubtful indication of a specific wing – one containing hundreds of ships – his specialized knowledge could winnow those hundreds into one.

There was the ghost of a sigh in the silence, as the man stopped and faded down one of the lines; a crawling insect beneath the notice of the arrogant metal monsters that rested there.

Here and there the sparkling of light from a porthole would indicate the presence of an early returner from the organized pleasures to simpler – or more private – pleasures of his own.

The man halted, and would have smiled if he ever smiled. Certainly the convolutions of his brain performed the mental equivalent of a smile.

The ship he stopped at was sleek and obviously fast. The peculiarity of its design was what he wanted. It was not a usual model – and these days most of the ships of this quadrant of the Galaxy either imitated Foundation design or were built by Foundation

technicians. But this was special. This was a Foundation ship – if only because of the tiny bulges in the skin that were the nodes of the protective screen that only a Foundation ship could possess. There were other indications, too.

The man felt no hesitation.

The electronic barrier strung across the line of the ships as a concession to privacy on the part of the management was not at all important to him. It parted easily, and without activating the alarm, at the use of the very special neutralizing force he had at his disposal.

So the first knowledge within the ship of the intruder without was the casual and almost friendly signal of the muted buzzer in the ship's living room that was the result of a palm placed over the little photocell just one side of the main air lock.

And while that successful search went on, Toran and Bayta felt only the most precarious security within the steel walls of the *Bayta*. The Mule's clown who had reported that within his narrow compass of body he held the lordly name of Magnifico Giganticus, sat hunched over the table and gobbled at the food set before him.

His sad, brown eyes lifted from his meat only to follow Bayta's movements in the combined kitchen and larder where he ate.

"The thanks of a weak one are of but little value," he muttered, "but you have them, for truly, in this past week, little but scraps have come my way – and for all my body is small, yet is my appetite unseemly great."

"Well, then, eat!" said Bayta, with a smile. "Don't waste your time on thanks. Isn't there a Central Galaxy proverb about gratitude that I once heard?"

"Truly there is, my lady. For a wise man, I have been told, once said, 'Gratitude is best and most effective when it does not evaporate itself in empty phrases.' But alas, my lady, I am but a mass of empty phrases, it would seem. When my empty phrases pleased the Mule, it brought me a court dress, and a grand name – for, see you, it was originally simply Bobo, one that pleases him not – and then when my empty phrases pleased him not, it would bring upon my poor bones beatings and whippings."

Toran entered from the pilot room, "Nothing to do now but wait, Bay. I hope the Mule is capable of understanding that a Foundation ship is Foundation territory."

Magnifico Giganticus, once Bobo, opened his eyes wide and exclaimed, "How great is the Foundation before which even the cruel servants of the Mule tremble."

"Have you heard of the Foundation, too?" asked Bayta, with a little smile.

"And who has not?" Magnifico's voice was a mysterious whisper. "There are those who say it is a world of great magic, of fires that can consume planets, and secrets of mighty strength. They say that not the highest nobility of the Galaxy could achieve the honor and deference considered only the natural due of a simple man who could say 'I am a citizen of the Foundation,' – were he only a salvage miner of space, or a nothing like myself."

Bayta said, "Now, Magnifico, you'll never finish if you make speeches. Here, I'll get you a little flavored milk. It's good."

She placed a pitcher of it upon the table and motioned Toran out of the room.

"Torie, what are we going to do now – about him?" and she motioned towards the kitchen.

"How do you mean?"

"If the Mule comes, are we going to give him up?"

"Well, what else, Bay?" He sounded harassed, and the gesture with which he shoved back the moist curl upon his forehead testified to that.

He continued impatiently, "Before I came here I had a sort of vague idea that all we had to do was to ask for the Mule, and then get down to business – just business, you know, nothing definite."

"I know what you mean, Torie. I wasn't much hoping to see the Mule myself, but I did think we could pick up some firsthand knowledge of the mess, and then pass it over to people who know a little more about this interstellar intrigue. I'm no storybook spy."

"You're not behind me, Bay." He folded his arms and frowned. "What a situation! You'd never know there was a person like the Mule, except for this last queer break. Do you suppose he'll come for his clown?"

Bayta looked up at him. "I don't know that I want him to. I don't know what to say or do. Do you?"

The inner buzzer sounded with its intermittent burring noise. Bayta's lips moved wordlessly, "The Mule!"

Magnifico was in the doorway, eyes wide, his voice a whimper, "The Mule?"

Toran murmured, "I've got to let them in."

A contact opened the air lock and the outer door closed behind the newcomer. The scanner showed only a single shadowed figure.

"It's only one person," said Toran, with open relief, and his voice was almost shaky as he bent toward the signal tube, "Who are you?"

"You'd better let me in and find out, hadn't you?" The words came thinly out the receiver.

"I'll inform you that this is a Foundation ship and consequently Foundation territory by international treaty."

"I know that."

"Come with your arms free, or I'll shoot. I'm well-armed."

"Done!"

Toran opened the inner door and closed contact on his blast pistol, thumb hovering over the pressure point. There was the sound of footsteps and then the door swung open, and Magnifico cried out, "It's not the Mule. It's but a man."

The "man" bowed to the clown somberly, "Very accurate. I'm not the Mule." He held his hands apart, "I'm not armed, and I come on a peaceful errand. You might relax and put the blast pistol away. Your hand isn't steady enough for my peace of mind."

"Who are you?" asked Toran, brusquely.

"I might ask *you* that," said the stranger, coolly, "since you're the one under false pretenses, not I."

"How so?"

"You're the one who claims to be a Foundation citizen when there's not an authorized Trader on the planet."

"That's not so. How would you know?"

"Because I *am* a Foundation citizen, and have my papers to prove it. Where are yours?"

"I think you'd better get out."

"I think not. If you know anything about Foundation methods, and despite your imposture you might, you'd know that if I don't return alive to my ship at a specified time, there'll be a signal at the nearest Foundation headquarters so I doubt if your weapons will have much effect, practically speaking."

There was an irresolute silence and then Bayta said, calmly, "Put the blaster away, Toran, and take him at face value. He sounds like the real thing."

"Thank you," said the stranger.

Toran put his gun on the chair beside him, "Suppose you explain all this now."

The stranger remained standing. He was long of bone and large of limb. His face consisted of hard flat planes and it was somehow evident that he never smiled. But his eyes lacked hardness.

He said, "News travels quickly, especially when it is apparently beyond belief. I don't suppose there's a person on Kalgan who doesn't know that the Mule's men were kicked in the teeth today by two tourists from the Foundation. I knew of the important details before evening, and, as I said, there are no Foundation tourists aside from myself on the planet. We know about those things."

"Who are the 'we'?"

"'We' are – 'we'! Myself for one! I knew you were at the Hangar – you had been overheard to say so. I had my ways of checking the registry, and my ways of finding the ship."

He turned to Bayta suddenly, "You're from the Foundation – by birth, aren't you?"

"Am I?"

"You're a member of the democratic opposition – they call it 'the underground.' I don't remember your name, but I do the face. You got out only recently – and wouldn't have if you were more important."

Bayta shrugged, "You know a lot."

"I do. You escaped with a man. That one?"

"Does it matter what I say?"

"No. I merely want a thorough mutual understanding. I believe that the password during the week you left so hastily was 'Seldon, Hardin, and Freedom.' Porfirat Hart was your section leader. "

"Where'd you get that?" Bayta was suddenly fierce. "Did the police get him?" Toran held her back, but she shook herself loose and advanced.

The man from the Foundation said quietly, "Nobody has him. It's just that the underground spreads widely and in queer places. I'm Captain Han Pritcher of Information, and I'm a section leader myself – never mind under what name."

He waited, then said, "No, you don't have to believe me. In our business it is better to overdo suspicion than the opposite. But I'd better get past the preliminaries."

"Yes," said Toran, "suppose you do."

"May I sit down? Thanks." Captain Pritcher swung a long leg across his knee and let an arm swing loose over the back of the chair. "I'll start out by saying that I don't know what all this is about – from your angle. You two aren't from the Foundation, but it's not a hard guess that you're from one of the independent Trading worlds. That doesn't bother me overmuch. But out of curiosity, what do you want with that fellow, that clown you snatched to safety? You're risking your life to hold on to him."

"I can't tell you that."

"Hm-m-m. Well, I didn't think you would. But if you're waiting for the Mule himself to come behind a fanfare of horns, drums, and electric organs – relax! The Mule doesn't work that way."

"What?" It came from both Toran and Bayta, and in the corner where Magnifico lurked with ears almost visibly expanded, there was a sudden joyful start.

"That's right. I've been trying to contact him myself, and doing a rather more thorough job of it than you two amateurs can. It won't work. The man makes no personal appearance, does not allow himself to be photographed or simulated, and is seen only by his most intimate associates."

"Is that supposed to explain your interest in us, captain?" questioned Toran.

"No. That clown is the key. That clown is one of the very few that *have* seen him. I want him. He may be the proof I need – and I need something, Galaxy knows – to awaken the Foundation."

"It needs awakening?" broke in Bayta with sudden sharpness. "Against what? And in what role do you act as alarm, that of rebel democrat or of secret police and provocateur?"

The captain's face set in its hard lines. "When the entire Foundation is threatened, Madame Revolutionary, both democrats and tyrants perish. Let us save the tyrants from a greater, that we may overthrow them in their turn."

"Who's the greater tyrant you speak of?" flared Bayta.

"The Mule! I know a bit about him, enough to have been my death several times over already, if I had moved less nimbly. Send the clown out of the room. This will require privacy."

"Magnifico," said Bayta, with a gesture, and the clown left without a sound.

The captain's voice was grave and intense, and low enough so that Toran and Bayta drew close.

He said, "The Mule is a shrewd operator – far too shrewd not to realize the advantage of the magnetism and glamour of personal leadership. If he gives that up, it's for a reason. That reason must be the fact that personal contact would reveal something that is of overwhelming importance not to reveal."

He waved aside questions, and continued more quickly, "I went back to his birthplace for this, and questioned people who for their knowledge will not live long. Few

enough are still alive. They remember the baby born thirty years before – the death of his mother – his strange youth. *The Mule is not a human being!*"

And his two listeners drew back in horror at the misty implications. Neither understood, fully or clearly, but the menace of the phrase was definite.

The captain continued, "He is a mutant, and obviously from his subsequent career, a highly successful one. I don't know his powers or the exact extent to which he is what our thrillers would call a 'superman,' but the rise from nothing to the conqueror of Kalgan's warlord in two years is revealing. You see, don't you, the danger? Can a genetic accident of unpredictable biological properties be taken into account in the Seldon plan?"

Slowly, Bayta spoke, "I don't believe it. This is some sort of complicated trickery. Why didn't the Mule's men kill us when they could have, if he's a superman?"

"I told you that I don't know the extent of his mutation. He may not be ready, yet, for the Foundation, and it would be a sign of the greatest wisdom to resist provocation until ready. Now let me speak to the clown."

The captain faced the trembling Magnifico, who obviously distrusted this huge, hard man who faced him.

The captain began slowly, "Have you seen the Mule with your own eyes?"

"I have but too well, respected sir. And felt the weight of his arm with my own body as well."

"I have no doubt of that. Can you describe him?"

"It is frightening to recall him, respected sir. He is a man of mighty frame. Against him, even you would be but a spindling. His hair is of a burning crimson, and with all my strength and weight I could not pull down his arm, once extended – not a hair's thickness." Magnifico's thinness seemed to collapse upon itself in a huddle of arms and legs. "Often, to amuse his generals or to amuse only himself, he would suspend me by one finger in my belt from a fearful height, while I chattered poetry. It was only after the twentieth verse that I was withdrawn, and each improvised and each a perfect rhyme, or else start over. He is a man of overpowering might, respected sir, and cruel in the use of his power – and his eyes, respected sir, no one sees."

"What? What's that last?"

"He wears spectacles, respected sir, of a curious nature. It is said that they are opaque and that he sees by a powerful magic that far transcends human powers. I have heard," and his voice was small and mysterious, "that to see his eyes is to see death; that he kills with his eyes, respected sir."

Magnifico's eyes wheeled quickly from one watching face to another. He quavered, "It is true. As I live, it is true. "

Bayta drew a long breath, "Sounds like you're right, captain. Do you want to take over?"

"Well, let's look at the situation. You don't owe anything here? The hangar's barrier above is free?"

"I can leave any time."

"Then leave. The Mule may not wish to antagonize the Foundation, but he runs a frightful risk in letting Magnifico get away. It probably accounts for the hue and cry after the poor devil in the first place. So there may be ships waiting for you upstairs. If you're lost in space, who's to pin the crime?"

"You're right," agreed Toran, bleakly.

"However, you've got a shield and you're probably speedier than anything they've got, so as soon as you're clear of the atmosphere make the circle in neutral to the other hemisphere, then just cut a track outwards at top acceleration."

"Yes," said Bayta coldly, "and when we are back on the Foundation, what then, captain?"

"Why, you are then co-operative citizens of Kalgan, are you not? I know nothing to the contrary, do I?"

Nothing was said. Toran turned to the controls. There was an imperceptible lurch.

It was when Toran had left Kalgan sufficiently far in the rear to attempt his first interstellar jump, that Captain Pritcher's face first creased slightly – for no ship of the Mule had in any way attempted to bar their leaving.

"Looks like he's letting us carry off Magnifico," said Toran. "Not so good for your story."

"Unless," corrected the captain, "he wants us to carry him off, in which case it's not so good for the Foundation."

It was after the last jump, when within neutral-flight distance of the Foundation, that the first hyperwave news broadcast reached the ship.

And there was one news item barely mentioned. It seemed that a warlord – unidentified by the bored speaker – had made representations to the Foundation concerning the forceful abduction of a member of his court. The announcer went on to the sports news.

Captain Pritcher said icily, "He's one step ahead of us after all." Thoughtfully, he added, "He's ready for the Foundation, and he uses this as an excuse for action. It makes things more difficult for us. We will have to act before we are really ready."

15. THE PSYCHOLOGIST

There was reason to the fact that the element known as "pure science" was the freest form of life on the Foundation. In a Galaxy where the predominance – and even survival – of the Foundation still rested upon the superiority of its technology – even despite its large access of physical power in the last century and a half – a certain immunity adhered to The Scientist. He was needed, and he knew it.

Likewise, there was reason to the fact that Ebling Mis – only those who did not know him added his titles to his name – was the freest form of life in the "pure science" of the Foundation. In a world where science was respected, he was The Scientist – with capital letters and no smile. He was needed, and he knew it.

And so it happened, that when others bent their knee, he refused and added loudly that his ancestors in their time bowed no knee to any stinking mayor. And in his ancestors' time the mayor was elected anyhow, and kicked out at will, and that the only people that inherited anything by right of birth were the congenital idiots.

So it also happened, that when Ebling Mis decided to allow Indbur to honor him with an audience, he did not wait for the usual rigid line of command to pass his request up and the favored reply down, but, having thrown the less disreputable of his two formal jackets over his shoulders and pounded an odd hat of impossible design on one side of his head, and lit a forbidden cigar into the bargain, he barged past two ineffectually bleating guards and into the mayor's palace.

The first notice his excellence received of the intrusion was when from his garden he heard the gradually nearing uproar of expostulation and the answering bull-roar of inarticulate swearing.

Slowly, Indbur lay down his trowel; slowly, he stood up; and slowly, he frowned. For Indbur allowed himself a daily vacation from work, and for two hours in the early afternoon, weather permitting, he was in his garden. There in his garden, the blooms grew in squares and triangles, interlaced in a severe order of red and yellow, with little dashes of violet at the apices, and greenery bordering the whole in rigid lines. There in his garden no one disturbed him – *no one!*

Indbur peeled off his soil-stained gloves as he advanced toward the little garden door.

Inevitably, he said, "What is the meaning of this?"

It is the precise question and the precise wording thereof that has been put to the atmosphere on such occasions by an incredible variety of men since humanity was invented. It is not recorded that it has ever been asked for any purpose other than dignified effect.

But the answer was literal this time, for Mis's body came plunging through with a bellow, and a shake of a fist at the ones who were still holding tatters of his cloak.

Indbur motioned them away with a solemn, displeased frown, and Mis bent to pick up his ruin of a hat, shake about a quarter of the gathered dirt off it, thrust it under his armpit and say:

"Look here, Indbur, those unprintable minions of yours will be charged for one good cloak. Lots of good wear left in this cloak." He puffed and wiped his forehead with just a trace of theatricality.

The mayor stood stiff with displeasure, and said haughtily from the peak of his five-foot-two, "It has not been brought to my attention, Mis, that you have requested an audience. You have certainly not been assigned one."

Ebling Mis looked down at his mayor with what was apparently shocked disbelief, "Ga-LAX-y, Indbur, didn't you get my note yesterday? I handed it to a flunky in purple uniform day before. I would have handed it to you direct, but I know how you like formality."

"Formality!" Indbur turned up exasperated eyes. Then, strenuously, "Have you ever heard of proper organization? At all future times you are to submit your request for an audience, properly made out in triplicate, at the government office intended for the purpose. You are then to wait until the ordinary course of events brings you notification of the time of audience to be granted. You are then to appear, properly clothed – properly clothed, do you understand – and with proper respect, too. You may leave."

"What's wrong with my clothes?" demanded Mis, hotly. "Best cloak I had till those unprintable fiends got their claws on it. I'll leave just as soon as I deliver what I came to deliver. "Ga-LAX-y, if it didn't involve a Seldon Crisis, I would leave right now."

"Seldon crisis!" Indbur exhibited first interest. Mis was a great psychologist – a democrat, boor, and rebel certainly, but a psychologist, too. In his uncertainty, the mayor even failed to put into words the inner pang that stabbed suddenly when Mis plucked a casual bloom, held it to his nostrils expectantly, then flipped it away with a wrinkled nose.

Indbur said coldly, "Would you follow me? This garden wasn't made for serious conversation."

He felt better in his built-up chair behind his large desk from which he could look down on the few hairs that quite ineffectually hid Mis's pink scalp-skin. He felt much better when Mis cast a series of automatic glances about him for a non-existent chair and then remained standing in uneasy shifting fashion. He felt best of all when in response to a careful pressure of the correct contact, a liveried underling scurried in, bowed his way to the desk, and laid thereon a bulky, metal-bound volume.

"Now, in order," said Indbur, once more master of the situation, "to make this unauthorized interview as short as possible, make your statement in the fewest possible words."

Ebling Mis said unhurriedly, "You know what I'm doing these days?"

"I have your reports here," replied the mayor, with satisfaction, "together with authorized summaries of them. As I understand it, your investigations into the mathematics of psychohistory have been intended to duplicate Hari Seldon's work and, eventually, trace the projected course of future history, for the use of the Foundation."

"Exactly," said Mis, dryly. "When Seldon first established the Foundation, he was wise enough to include no psychologists among the scientists placed here – so that the Foundation has always worked blindly along the course of historical necessity. In the course of my researches, I have based a good deal upon hints found at the Time Vault."

"I am aware of that, Mis. It is a waste of time to repeat."

"I'm not repeating," blared Mis, "because what I'm going to tell you isn't in any of those reports."

"How do you mean, not in the reports?" said Indbur, stupidly. "How could–"

"Ga-LAX-y, Let me tell this my own way, you offensive little creature. Stop putting words into my mouth and questioning my every statement or I'll tramp out of here and let everything crumble around you. Remember, you unprintable fool, the Foundation will come through because it must, but if I walk out of here now – *you* won't."

Dashing his hat on the floor, so that clods of earth scattered, he sprang up the stairs of the dais on which the wide desk stood and shoving papers violently, sat down upon a corner of it.

Indbur thought frantically of summoning the guard, or using the built-in blasters of his desk. But Mis's face was glaring down upon him and there was nothing to do but cringe the best face upon it.

"Dr. Mis," he began, with weak formality, "you must—"

"Shut up," said Mis, ferociously, "and listen. If this thing here," and his palm came down heavily on the metal of the bound data, "is a mess of my reports – throw it out. Any report I write goes up through some twenty-odd officials, gets to you, and then sort of winds down through twenty more. That's fine if there's nothing you don't want kept secret. Well, I've got something confidential here. It's so confidential, even the boys working for me haven't got wind of it. They did the work, of course, but each just a little unconnected piece – and I put it together. You know what the Time Vault is?"

Indbur nodded his head, but Mis went on with loud enjoyment of the situation, "Well, I'll tell you anyhow because I've been sort of imagining this unprintable situation for a "Ga-LAX-y, of a long time; I can read your mind, you puny fraud. You've got your hand right near a little knob that'll call in about five hundred or so armed men to finish me off, but you're afraid of what I know – you're afraid of a Seldon Crisis. Besides which, if you touch anything on your desk, I'll knock your unprintable head off before anyone gets here. You and your bandit father and pirate grandfather have been blood-sucking the Foundation long enough anyway."

"This is treason," gabbled Indbur.

"It certainly is," gloated Mis, "but what are you going to do about it? Let me tell you about the Time Vault. That Time Vault is what Hari Seldon placed here at the beginning to help us over the rough spots. For every crisis, Seldon has prepared a personal simulacrum to help – and explain. Four crises so far – four appearances. The first time he appeared at the height of the first crisis. The second time, he appeared at the moment just after the successful evolution of the second crisis. Our ancestors were there to listen to him both times. At the third and fourth crises, he was ignored – probably because he was not needed, but recent investigations – *not* included in those reports you have – indicate that he appeared anyway, and at the proper times. Get it?"

He did not wait for any answer. His cigar, a tattered, dead ruin was finally disposed of, a new cigar groped for, and lit. The smoke puffed out violently.

He said, "Officially I've been trying to rebuild the science of psychohistory. Well, no one man is going to do *that*, and it won't get done in any one century, either. But I've made advances in the more simple elements and I've been able to use it as an excuse to meddle with the Time Vault. What I *have* done, involves the determination, to a pretty fair kind of certainty, of the exact date of the next appearance of Hari Seldon. I can give you the exact day, in other words, that the coming Seldon Crisis, the fifth, will reach its climax.

"

"How far off?" demanded Indbur, tensely.

And Mis exploded his bomb with cheerful nonchalance,

"Four months," he said. "Four unprintable months, less two days."

"Four months," said Indbur, with uncharacteristic vehemence. "Impossible."

"Impossible, my unprintable eye."

"Four months? Do you understand what that means? For a crisis to come to a head in four months would mean that it has been preparing for years."

"And why not? Is there a law of Nature that requires the process to mature in the full light of day?"

"But nothing impends. Nothing hangs over us." Indbur almost wrung his hands for anxiety. With a sudden spasmodic recrudescence of ferocity, he screamed, "*Will you get off my desk and let me put it in order? How do you expect me to think?*"

Mis, startled, lifted heavily and moved aside.

Indbur replaced objects in their appropriate niches with a feverish motion. He was speaking quickly, "You have no right to come here like this. If you had presented your theory—"

"It is not a *theory*."

"I say it *is* a theory. If you had presented it together with your evidence and arguments, in appropriate fashion, it would have gone to the Bureau of Historical Sciences. There it could have been properly treated, the resulting analyses submitted to me, and then, of course, proper action would have been taken. As it is, you've vexed me to no purpose. Ah, here it is."

He had a sheet of transparent, silvery paper in his hand which he shook at the bulbous psychologist beside him.

"This is a short summary I prepare myself – weekly – of foreign matters in progress. Listen – we have completed negotiations for a commercial treaty with Mores, continue negotiations for one with Lyonesse, sent a delegation to some celebration or other on Bonde, received some complaint or other from Kalgan and we've promised to look into it, protested some sharp trade practices in Asperta and they've promised to look into it – and so on and so on." The mayor's eyes swarmed down the list of coded notations, and then he carefully placed the sheet in its proper place in the proper folder in the proper pigeonhole.

I tell you, Mis, there's not a thing there that breathes anything but order and peace—"

The door at the far, long end opened, and, in far too dramatically coincident a fashion to suggest anything but real life, a plainly-costumed notable stepped in.

Indbur half-rose. He had the curiously swirling sensation of unreality that comes upon those days when too much happens. After Mis's intrusion and wild fumings there now came the equally improper, hence disturbing, intrusion unannounced, of his secretary, who at least knew the rules.

The secretary kneeled low.

Indbur said, sharply, "Well!"

The secretary addressed the floor, "Excellence, Captain Han Pritcher of Information, returning from Kalgan, in disobedience to your orders, has according to prior instructions – your order X20-513 – been imprisoned, and awaits execution. Those accompanying him are being held for questioning. A full report has been filed."

Indbur, in agony, said, "A full report has been received. *Well!*"

"Excellence, Captain Pritcher has reported, vaguely, dangerous designs on the part of the new warlord of Kalgan. He has been given, according to prior instructions – your order X20-651 – no formal hearing, but his remarks have been recorded and a full report filed."

Indbur screamed, "A full report has been received. *Well!*"

"Excellence, reports have within the quarter-hour been received from the Salinnian frontier. Ships identified as Kalganian have been entering Foundation territory, unauthorized. The ships are armed. Fighting has occurred."

The secretary was bent nearly double. Indbur remained standing. Ebling Mis shook himself, clumped up to the secretary, and tapped him sharply on the shoulder.

"Here, you'd better have them release this Captain Pritcher, and have him sent here. Get out."

The secretary left, and Mis turned to the mayor, "Hadn't you better get the machinery moving, Indbur? Four months, you know."

Indbur remained standing, glaze-eyed. Only one finger seemed alive – and it traced rapid jerky triangles on the smooth desk top before him.

16. CONFERENCE

When the twenty-seven independent Trading worlds, united only by their distrust of the mother planet of the Foundation, concert an assembly among themselves, and each is big with a pride grown of its smallness, hardened by its own insularity and embittered by eternal danger – there are preliminary negotiations to be overcome of a pettiness sufficiently staggering to heartsicken the most persevering.

It is not enough to fix in advance such details as methods of voting, type of representation – whether by world or by population. These are matters of involved political importance. It is not enough to fix matters of priority at the table, both council and dinner, those are matters of involved social importance.

It was the place of meeting – since that was a matter of overpowering provincialism. And in the end the devious routes of diplomacy led to the world of Radole, which some commentators had suggested at the start for logical reason of central position.

Radole was a small world – and, in military potential, perhaps the weakest of the twenty-seven. That, by the way, was another factor in the logic of the choice.

It was a ribbon world – of which the Galaxy boasts sufficient, but among which, the inhabited variety is a rarity for the physical requirements are difficult to meet. It was a

world, in other words, where the two halves face the monotonous extremes of heat and cold, while the region of possible life is the girdling ribbon of the twilight zone.

Such a world invariably sounds uninviting to those who have not tried it, but there exist spots, strategically placed – and Radole City was located in such a one.

It spread along the soft slopes of the foothills before the hacked-out mountains that backed it along the rim of the cold hemisphere and held off the frightful ice. The warm, dry air of the sun-half spilled over, and from the mountains was piped the water – and between the two, Radole City became a continuous garden, swimming in the eternal morning of an eternal June.

Each house nestled among its flower garden, open to the fangless elements. Each garden was a horticultural forcing ground, where luxury plants grew in fantastic patterns for the sake of the foreign exchange they brought – until Radole had almost become a producing world, rather than a typical Trading world.

So, in its way, Radole City was a little point of softness and luxury on a horrible planet – a tiny scrap of Eden – and that, too, was a factor in the logic of the choice.

The strangers came from each of the twenty-six other Trading worlds: delegates, wives, secretaries, newsmen, ships, and crews – and Radole's population nearly doubled and Radole's resources strained themselves to the limit. One ate at will, and drank at will, and slept not at all.

Yet there were few among the roisterers who were not intensely aware that all that volume of the Galaxy burnt slowly in a sort of quiet, slumbrous war. And of those who were aware, there were dime classes. First, there were the many who knew little and were very confident.

Such as the young space pilot who wore the Haven cockade on the clasp of his cap, and who managed, in holding his glass before his eyes, to catch those of the faintly smiling Radolian girl opposite. He was saying:

"We came fight through the war-zone to get here-on purpose. We traveled about a light-minute or so, in neutral, right past Horleggor–"

"Horleggor?" broke in a long-legged native, who was playing host to that particular gathering. "That's where the Mule got the guts beat out of him last week, wasn't it?"

"Where'd you hear that the Mule got the guts beat out of him?" demanded the pilot, loftily.

"Foundation radio."

"Yeah? Well, the Mule's got Horleggor. We almost ran into a convoy of his ships, and that's where they were coming from. It isn't a gut-beating when you stay where you fought, and the gut-beater leaves in a hurry."

Someone else said in a high, blurred voice, "Don't talk like that. Foundation always takes it on the chin for a while. You watch; just sit tight and watch. Ol' Foundation knows when to come back. And then – *pow!*" The thick voice concluded and was succeeded by a bleary grin.

"Anyway." said the pilot from Haven, after a short pause, "As I say, we saw the Mule's ships, and they looked pretty good, pretty good. I tell you what – they looked new."

"New?" said the native, thoughtfully. "They build them themselves?" He broke a leaf from an overhanging branch, sniffed delicately at it, then crunched it between his teeth, the bruised tissues bleeding greenly and diffusing a minty odor. He said, "You trying to tell me they beat Foundation ships with homebuilt jobs? Go on."

"We saw them, doc. And I can tell a ship from a comet, too, you know."

The native leaned close. "You know what I think. Listen, don't kid yourself. Wars don't just start by themselves, and we have a bunch of shrewd apples running things. They know what they're doing."

The well-unthirsted one said with sudden loudness, "You watch ol' Foundation. They wait for the last minute, then – *pow!*" He grinned with vacuously open mouth at the girl, who moved away from him.

The Radolian was saying, "For instance, old man, you think maybe that this Mule guy's running things. No-o-o." And he wagged a finger horizontally. "The way I hear it, and from pretty high up, mind you, he's our boy. We're paying him off, and we probably built those ships. Let's be realistic about it – we probably did. Sure, he can't beat the Foundation in the long run, but he can get them shaky, and when he does – *we get in.*"

The girl said, "Is that all you can talk about, Klev? The war? You make me tired."

The pilot from Haven said, in an access of gallantry,
"Change the subject. Can't make the girls tired."

The bedewed one took up the refrain and banged a mug to the rhythm. The little groups of two that had formed broke up with giggles and swagger, and a few similar groups of twos emerged from the sun-house in the background.

The conversation became more general, more varied, more meaningless.

Then there were those who knew a little more and were less confident.

Such as the one-armed Fran, whose large bulk represented Haven as official delegated, and who lived high in consequence, and cultivated new friendships – with women when he could and with men when he had to.

It was on the sun platform of the hilltop home, of one of these new friends, that he relaxed for the first of what eventually proved to be a total of two times while on Radole. The new friend was Iwo Lyon, a kindred soul of Radole. Iwo's house was apart from the general cluster, apparently alone in a sea of floral perfume and insect chatter. The sun platform was a grassy strip of lawn set at a forty-five degree angle, and upon it Fran stretched out and fairly sopped up sun.

He said, "Don't have anything like this on Haven."

Iwo replied, sleepily, "Ever seen the cold side. There's a spot twenty miles from here where the oxygen runs like water. "

"Go on.

"Fact."

"Well, I'll tell you, Iwo-In the old days before my arm was chewed off I knocked around, see – and you won't believe this, but" – The story that followed lasted considerably, and Iwo didn't believe it.

Iwo said, through yawns, "They don't make them like in the old days, that's the truth."

"No, guess they don't. Well, now," Fran fired up, "don't say that. I told you about my son, didn't I? He's one of the old school, if you like. He'll make a great Trader, blast it. He's his old man up and down. Up and down, except that he gets married."

"You mean legal contract? With a girl?"

"That's right. Don't see the sense in it myself. They went to Kalgan for their honeymoon."

"Kalgan? *Kalgan*? When the Galaxy was this?"

Fran smiled broadly, and said with slow meaning, "Just before the Mule declared war on the Foundation."

"That so?"

Fran nodded and motioned Iwo closer with his head. He said, hoarsely, "In fact, I can tell you something, if you don't let it go any further. My boy was sent to Kalgan for a purpose. Now I wouldn't like to let it out, you know, just what the purpose was, naturally, but you look at the situation now, and I suppose you can make a pretty good guess. In any case, my boy was the man for the job. We Traders needed some sort of ruckus." He smiled, craftily. "It's here. I'm not saying how we did it, but – my boy went to Kalgan, and the Mule sent out his ships. My son!"

Iwo was duly impressed. He grew confidential in his turn, "That's good. You know, they say we've got five hundred ships ready to pitch in on our own at the right time. "

Fran said authoritatively, "More than that, maybe. This is real strategy. This is the kind I like." He clawed loudly at the skin of his abdomen. "But don't you forget that the Mule is a smart boy, too. What happened at Horleggor worries me."

"I heard he lost about ten ships."

"Sure, but he had a hundred more, and the Foundation had to get out. It's all to the good to have those tyrants beaten, but not as quickly as all that." He shook his head.

"The question I ask is where does the Mule get his ships? There's a widespread rumor we're making them for him."

"We? The Traders? Haven has the biggest ship factories anywhere in the independent worlds, and we haven't made one for anyone but ourselves. Do you suppose any world is building a fleet for the Mule on its own, without taking the precaution of united action? That's a . . . a fairy tale."

"Well, where does he get them?"

And Fran shrugged, "Makes them himself, I suppose. That worries me, too."

Fran blinked at the sun and curled his toes about the smooth wood of the polished foot-rest. Slowly, he fell asleep and the soft burr of his breathing mingled with the insect sibilance.

Lastly, there were the very few who knew considerable and were not confident at all.

Such as Randu, who on the fifth day of the all-Trader convention entered the Central Hall and found the two men he had asked to be there, waiting for him. The five hundred seats were empty – and were going to stay so.

Randu said quickly, almost before he sat down, "We three represent about half the military potential of the Independent Trading Worlds."

"Yes," said Mangin of Iss, "my colleague and I have already commented upon the fact."

"I am ready," said Randu, "to speak quickly and earnestly. I am not interested in bargaining or subtlety. Our position is radically in the worse."

"As a result of—" urged Ovall Gri of Mnemon.

"Of developments of the last hour. Please! From the beginning. First, our position is not of our doing, and but doubtfully of our control. Our original dealings were not with the Mule, but with several others; notably the ex-warlord of Kalgan, whom the Mule defeated at a most inconvenient time for us."

"Yes, but this Mule is a worthy substitute," said Mangin. "I do not cavil at details."

"You may when you know *all* the details." Randu leaned forward and placed his hands upon the table palms-up in an obvious gesture.

He said, "A month ago I sent my nephew and my nephew's wife to Kalgan."

"Your nephew!" cried Ovall Gri, in surprise. "I did not know he was your nephew."

"With what purpose," asked Mangin, dryly. "This?" And his thumb drew an inclusive circle high in the air.

"No. If you mean the Mule's war on the Foundation, no. How could I aim so high? The young man knew nothing – neither of our organization nor of our aims. He was told I was a minor member of an intra-Haven patriotic society, and his function at Kalgan was nothing but that of an amateur observer. My motives were, I must admit, rather obscure. Mainly, I was curious about the Mule. He is a strange phenomenon – but that's a chewed cud; I'll not go into it. Secondly, it would make an interesting and educational training project for a man who had experience with the Foundation and the Foundation underground and showed promise of future usefulness to us. You see—"

Ovall's long face fell into vertical lines as he showed his large teeth, "You must have been surprised at the outcome, then, since there is not a world among the Traders, I believe, that does not know that this nephew of yours abducted a Mule underling in the name of the Foundation and furnished the Mule with a *casus belli*. Galaxy, Randu, you spin romances. I find it hard to believe you had no hand in that. Come, it was a skillful job."

Randu shook his white head, "Not of my doing. Nor, willfully, of my nephew's, who is now held prisoner at the Foundation, and may not live to see the completion of this so-skillful job. I have just heard from him. The Personal Capsule has been smuggled out somehow, come through the war zone, gone to Haven, and traveled from there to here. It has been a month on its travels."

"And?—"

Randu leaned a heavy hand upon the heel of his palm and said, sadly, "I'm afraid we are cast for the same role that the onetime warlord of Kalgan played. The Mule is a mutant!"

There was a momentary qualm; a faint impression of quickened heartbeats. Randu might easily have imagined it.

When Mangin spoke, the evenness of his voice was unchanged, "How do you know?"

"Only because my nephew says so, but he was on Kalgan.

"What kind of a mutant? There are all kinds, you know."

Randu forced the rising impatience down, "All kinds of mutants, yes, Mangin. All kinds! But only one kind of Mule. What kind of a mutant would start as an unknown, assemble an army, establish, they say, a five-mile asteroid as original base, capture a planet, then a system, then a region – and then attack the Foundation, and *defeat* them at Horleggor. *And all in two or three years!*"

Ovall Gri shrugged, "So you think he'll beat the Foundation?"

"I don't know. Suppose he does?"

"Sorry, I can't go that far. You *don't* beat the Foundation. Look, there's not a new fact we have to go on except for the statements of a . . . well, of an inexperienced boy. Suppose we shelve it for a while. With all the Mule's victories, we weren't worried until now, and unless he goes a good deal further than he has, I see no reason to change that. Yes?"

Randu frowned and despaired at the cobweb texture of his argument. He said to both, "Have we yet made any contact with the Mule?"

"No," both answered.

"It's true, though, that we've tried, isn't it? It's true that there's not much purpose to our meeting unless we do reach him, isn't it? It's true that so far there's been more drinking than thinking, and more wooing than doing – I quote from an editorial in today's Radole Tribune – and all because we can't reach the Mule. Gentlemen, we have nearly a thousand ships waiting to be thrown into the fight at the proper moment to seize control of the Foundation. I say we should change that. I say, throw those thousand onto the board now – *against the Mule.*"

"You mean for the Tyrant Indbur and the bloodsuckers of the Foundation?" demanded Mangin, with quiet venom.

Randu raised a weary hand, "Spare me the adjectives. Against the Mule, I say, and for I-don't-care-who."

Ovall Gri rose, "Randu, I'll have nothing to do with that, You present it to the full council tonight if you particularly hunger for political suicide."

He left without another word and Mangin followed silently, leaving Randu to drag out a lonely hour of endless, insoluble consideration.

At the full council that night, he said nothing.

But it was Ovall Gri who pushed into his room the next morning; an Ovall Gri only sketchily dressed and who had neither shaved nor combed his hair.

Randu stared at him over a yet-uncleared breakfast table with an astonishment sufficiently open and strenuous to cause him to drop his pipe.

Ovall said baldly, harshly. "Mnemon has been bombarded from space by treacherous attack."

Randu's eyes narrowed, "The Foundation?"

"The Mule!" exploded Ovall. "The Mule!" His words raced, "It was unprovoked and deliberate. Most of our fleet had joined the international flotilla. The few left as Home Squadron were insufficient and were blown out of the sky. There have been no landings yet, and there may not be, for half the attackers are reported destroyed – but it is war – and I have come to ask how Haven stands on the matter."

"Haven, I am sure, will adhere to the spirit of the Charter of Federation. But, you see? He attacks us as well."

"This Mule is a madman. Can he defeat the universe?" He faltered and sat down to seize Randu's wrist, "Our few survivors have reported the Mule's poss . . . enemy's possession of a new weapon. A nuclear-field depressor."

"A what?"

Ovall said, "Most of our ships were lost because their nuclear weapons failed them. It could not have happened by either accident or sabotage. It must have been a weapon of the Mule. It didn't work perfectly; the effect was intermittent; there were ways to neutralize – my dispatches are not detailed. But you see that such a tool would change the nature of war and, possibly, make our entire fleet obsolete."

Randu felt an old, old man. His face sagged hopelessly, "I am afraid a monster is grown that will devour all of us. Yet we must fight him."

17. THE VISI-SONOR

Ebling Mis's house in a not-so-pretentious neighborhood of Terminus City was well known to the intelligentsia, literati, and just-plain-well-read of the Foundation. Its notable characteristics depended, subjectively, upon the source material that was read. To a thoughtful biographer, it was the "symbolization of a retreat from a nonacademic reality," a society columnist gushed silkily at its "frightfully masculine atmosphere of careless disorder," a University Ph.D. called it brusquely, "bookish, but unorganized," a nonuniversity friend said, "good for a drink anytime and you can put your feet on the sofa," and a breezy newsweekly broadcast, that went in for color, spoke of the "rocky, down-to-earth, no-nonsense living quarters of blaspheming, Leftish, balding Ebling Mis."

To Bayta, who thought for no audience but herself at the moment, and who had the advantage of first-hand information, it was merely sloppy.

Except for the first few days, her imprisonment had been a light burden. Far lighter, it seemed, that this half-hour wait in the psychologist's home – under secret observation, perhaps? She had been with Toran then, at least.

Perhaps she might have grown wearier of the strain, had not Magnifico's long nose drooped in a gesture that plainly showed his own far greater tension.

Magnifico's pipe-stem legs were folded up under a pointed, sagging chin, as if he were trying to huddle himself into disappearance, and Bayta's hand went out in a gentle and automatic gesture of reassurance. Magnifico winced, then smiled.

"Surely, my lady, it would seem that even yet my body denies the knowledge of my mind and expects of others' hands a blow."

"There's no need for worry, Magnifico. I'm with you, and I won't let anyone hurt you."

The clown's eyes sidled towards her, then drew away quickly. "But they kept me away from you earlier – and from your kind husband – and, on my word, you may laugh, but I was lonely for missing friendship."

"I wouldn't laugh at that. I was, too."

The clown brightened, and he hugged his knees closer. He said, "You have not met this man who will see us?" It was a cautious question.

"No. But he is a famous man. I have seen him in the newscasts and heard quite a good deal of him. I think he's a good man, Magnifico, who means us no harm."

"Yes?" The clown stirred uneasily. "That may be, my lady, but he has questioned me before, and his manner is of an abruptness and loudness that bequivers me. He is full of strange words, so that the answers to his questions could not worm out of my throat. Almost, I might believe the romancer who once played on my ignorance with a tale that, at such moments, the heart lodged in the windpipe and prevented speech."

"But it's different now. We're two to his one, and he won't be able to frighten the both of us, will he?"

"No, my lady."

A door slammed somewhere, and the roaring of a voice entered the house. Just outside the room, it coagulated into words with a fierce, "Get the "Ga-LAX-y out of here!" and two uniformed guards were momentarily visible through the opening door, in quick retreat.

Ebling Mis entered frowning, deposited a carefully wrapped bundle on the floor, and approached to shake Bayta's hand with careless pressure. Bayta returned it vigorously, man-fashion. Mis did a double-take as he turned to the clown, and favored the girl with a longer look.

He said, "Married?"

"Yes. We went through the legal formalities."

Mis paused. Then, "Happy about it?"

"So far."

Mis shrugged, and turned again to Magnifico. He unwrapped the package, "Know what this is, boy?"

Magnifico fairly hurled himself out of his seat and caught the multi-keyed instrument. He fingered the myriad knobby contacts and threw a sudden back somersault of joy, to the imminent destruction of the nearby furniture.

He croaked, "A Visi-Sonor – and of a make to distill joy out of a dead man's heart." His long fingers caressed softly and slowly, pressing lightly on contacts with a rippling motion, resting momentarily on one key then another – and in the air before them there was a soft glowing rosiness, just inside the range of vision.

Ebling Mis said, "All right, boy, you said you could pound on one of those gadgets, and there's your chance. You'd better tune it, though. It's out of a museum." Then, in an aside to Bayta, "Near as I can make it, no one on the Foundation can make it talk right."

He leaned closer and said quickly, "The clown won't talk without you. Will you help?"

She nodded.

"Good!" he said. "His state of fear is almost fixed, and I doubt that his mental strength would possibly stand a psychic probe. If I'm to get anything out of him otherwise, he's got to feel absolutely at ease. You understand?"

She nodded again.

"This Visi-Sonor is the first step in the process. He says he can play it; and his reaction now makes it pretty certain that it's one of the great joys of his life. So whether the playing is good or bad, be interested and appreciative. Then exhibit friendliness and confidence in me. Above all, follow my lead in everything." There was a swift glance at Magnifico, huddled in a corner of the sofa, making rapid adjustments in the interior of the instrument. He was completely absorbed.

Mis said in a conversational tone to Bayta, "Ever hear a Visi-Sonor?"

"Once," said Bayta, equally casually, "at a concert of rare instruments. I wasn't impressed."

"Well, I doubt that you came across good playing. There are very few really good players. It's not so much that it requires physical coordination – a multi-bank piano requires more, for instance – as a certain type of free-wheeling mentality." In a lower voice, "That's why our living skeleton there might be better than we think. More often than not, good players are idiots otherwise. It's one of those queer setups that makes psychology interesting."

He added, in a patent effort to manufacture light conversation, "You know how the beblistered thing works? I looked it up for this purpose, and all I've made out so far is that its radiations stimulate the optic center of the brain directly, without ever touching the optic nerve. It's actually the utilization of a sense never met with in ordinary nature. Remarkable, when you come to think of it. What you hear is all right. That's ordinary. Eardrum, cochlea, all that. But – *Shh!* He's ready. Will you kick that switch. It works better in the dark."

In the darkness, Magnifico was a mere blob, Ebling Mis a heavy-breathing mass. Bayta found herself straining her eyes anxiously, and at first with no effect. There was a

thin, reedy quaver in the air, that wavered raggedly up the scale. It hovered, dropped and caught itself, gained in body, and swooped into a booming crash that had the effect of a thunderous split in a veiling curtain.

A little globe of pulsing color grew in rhythmic spurts and burst in midair into formless goutts that swirled high and came down as curving streamers in interfacing patterns. They coalesced into little spheres, no two alike in color – and Bayta began discovering things.

She noticed that closing her eyes made the color pattern all the clearer; that each little movement of color had its own little pattern of sound; that she could not identify the colors; and, lastly, that the globes were not globes but little figures.

Little figures; little shifting flames, that danced and flickered in their myriads; that dropped out of sight and returned from nowhere; that whipped about one another and coalesced then into a new color.

Incongruously, Bayta thought of the little blobs of color that come at night when you close your eyelids till they hurt, and stare patiently. There was the old familiar effect of the marching polka dots of shifting color, of the contracting concentric circles, of the shapeless masses that quiver momentarily. All that, larger, multivaried – and each little dot of color a tiny figure.

They darted at her in pairs, and she lifted her hands with a sudden gasp, but they tumbled and for an instant she was the center of a brilliant snowstorm, while cold light slipped off her shoulders and down her arm in a luminous ski-slide, shooting off her stiff fingers and meeting slowly in a shining midair focus. Beneath it all, the sound of a hundred instruments flowed in liquid streams until she could not tell it from the light.

She wondered if Ebling Mis were seeing the same thing, and if not, what he did see, The wonder passed, and then–

She was watching again. The little figures-were they little figures? –little tiny women with burning hair that turned and bent too quickly for the mind to focus? –seized one another in star-shaped groups that turned – and the music was faint laughter – girls' laughter that began inside the ear.

The stars drew together, sparked towards one another, grew slowly into structure – and from below, a palace shot upward in rapid evolution. Each brick a tiny color, each color a tiny spark, each spark a stabbing light that shifted patterns and led the eye skyward to twenty jeweled minarets.

A glittering carpet shot out and about, whirling, spinning an insubstantial web that engulfed all space, and from it luminous shoots stabbed upward and branched into trees that sang with a music all their own.

Bayta sat inclosed in it. The music welled about her in rapid, lyrical flights. She reached out to touch a fragile tree and blossoming spicules floated downwards and faded, each with its clear, tiny tinkle.

The music crashed in twenty cymbals, and before her an area flamed up in a spout and cascaded down invisible steps into Bayta's lap, where it spilled over and flowed in

rapid current, raising the fiery sparkle to her waist, while across her lap was a rainbow bridge and upon it the little figures—

A palace, and a garden, and tiny men and women on a bridge, stretching out as far as she could see, swimming through the stately swells of stringed music converging in upon her—

And then – there seemed a frightened pause, a hesitant, indrawn motion, a swift collapse. The colors fled, spun into a globe that shrank, and rose, and disappeared.

And it was merely dark again.

A heavy foot scratched for the pedal, reached it, and the light flooded in; the flat light of a prosy sun. Bayta blinked until the tears came, as though for the longing of what was gone. Ebling Mis was a podgy inertness with his eyes still round and his mouth still open.

Only Magnifico himself was alive, and he fondled his Visi-Sonor in a crooning ecstasy.

"My lady," he gasped, "it is indeed of an effect the most magical. It is of balance and response almost beyond hope in its delicacy and stability. On this, it would seem I could work wonders. How liked you my composition, my lady?"

"Was it yours?" breathed Bayta. "Your own?"

At her awe, his thin face turned a glowing red to the tip of his mighty nose. "My very own, my lady. The Mule liked it not, but often and often I have played it for my own amusement. It was once, in my youth, that I saw the palace – a gigantic place of jeweled riches that I saw from a distance at a time of high carnival. There were people of a splendor undreamed of – and magnificence more than ever I saw afterwards, even in the Mule's service. It is but a poor makeshift I have created, but my mind's poverty precludes more. I call it, 'The Memory of Heaven.'"

Now through the midst of the chatter, Mis shook himself to active life. "Here," he said, "here, Magnifico, would you like to do that same thing for others?"

For a moment, the clown drew back. "For others?" he quavered.

"For thousands," cried Mis, "in the great Halls of the Foundation. Would you like to be your own master, and honored by all, wealthy, and . . . and—" his imagination failed him. "And all that? Eh? What do you say?"

"But how may I be all that, mighty sir, for indeed I am but a poor clown ungiven to the great things of the world?"

The psychologist puffed out his lips, and passed the back of his hand across his brow. He said, "But your playing, man. The world is yours if you would play so for the mayor and his Trading Trusts. Wouldn't you like that?"

The clown glanced briefly at Bayta, "Would *she* stay with me?"

Bayta laughed, "Of course, silly. Would it be likely that I'd leave you now that you're on the point of becoming rich and famous?"

"It would all be yours," he replied earnestly, "and surely the wealth of Galaxy itself would be yours before I could repay my debt to your kindness."

"But," said Mis, casually, "if you would first help me—"

"What is that?"

The psychologist paused, and smiled, "A little surface probe that doesn't hurt. It wouldn't touch but the peel of your brain."

There was a flare of deadly fear in Magnifico's eyes. "Not a probe. I have seen it used. It drains the mind and leaves an empty skull. The Mule did use it upon traitors and let them wander mindless through the streets, until out of mercy, they were killed." He held up his hand to push Mis away.

"That was a psychic probe," explained Mis, patiently, "and even that would only harm a person when misused. This probe I have is a surface probe that wouldn't hurt a baby."

"That's right, Magnifico," urged Bayta. "It's only to help beat the Mule and keep him far away. Once that's done, you and I will be rich and famous all our lives."

Magnifico held out a trembling hand, "Will you hold my hand, then?"

Bayta took it in both her own, and the clown watched the approach of the burnished terminal plates with large eyes.

Ebling Mis rested carelessly on the too-lavish chair in Mayor Indbur's private quarters, unregenerately unthankful for the condescension shown him and watched the small mayor's fidgeting unsympathetically. He tossed away a cigar stub and spat out a shred of tobacco.

"And, incidentally, if you want something for your next concert at Mallow Hall, Indbur," he said, "you can dump out those electronic gadgeteers into the sewers they came from and have this little freak play the Visi-Sonor for you. Indbur – it's out of this world."

Indbur said peevishly, "I did not call you here to listen to your lectures on music. What of the Mule? Tell me that. What of the Mule?"

"The Mule? Well, I'll tell you – I used a surface probe and got little. Can't use the psychic probe because the freak is scared blind of it, so that his resistance will probably blow his unprintable mental fuses as soon as contact is made. But this is what I've got, if you'll just stop tapping your fingernails–

"First place, de-stress the Mule's physical strength. He's probably strong, but most of the freak's fairy tales about it are probably considerably blown up by his own fearful memory, He wears queer glasses and his eyes kill, he evidently has mental powers."

"So much we had at the start," commented the mayor, sourly.

"Then the probe confirms it, and from there on I've been working mathematically."

"So? And how long will all this take? Your word-rattling will deafen me yet."

"About a month, I should say, and I may have something for you. And I may not, of course. But what of it? If this is all outside Seldon's plans, our chances are precious little, unprintable little."

Indbur whirled on the psychologist fiercely, "Now I have you, traitor. Lie! Say you're not one of these criminal rumormongers that are spreading defeatism and panic through the Foundation, and making my work doubly hard."

"I? I?" Mis gathered anger slowly.

Indbur swore at him, "Because by the dust-clouds of space, the Foundation will win – the Foundation *must* win."

"Despite the loss at Horleggor?"

"It was not a loss. You have swallowed that spreading lie, too? We were outnumbered and betrayed—"

"By whom?" demanded Mis, contemptuously.

"By the lice-ridden democrats of the gutter," shouted Indbur back at him. "I have known for long that the fleet has been riddled by democratic cells. Most have been wiped out, but enough remain for the unexplained surrender of twenty ships in the thickest of the swarming fight. Enough to force an apparent defeat.

"For that matter, my rough-tongued, simple patriot and epitome of the primitive virtues, what are your own connections with the democrats?"

Ebling Mis shrugged it off, "You rave, do you know that? What of the retreat since, and the loss of half of Siwenna? Democrats again?"

"No. Not democrats," the little man smiled sharply. "We retreat – as the Foundation has always retreated under attack, until the inevitable march of history turns with us. Already, I see the outcome. Already, the so-called underground of the democrats has issued manifestoes swearing aid and allegiance to the Government. It could be a feint, a cover for a deeper treachery, but I make good use of it, and the propaganda distilled from it will have its effect, whatever the crawling traitors scheme. And better than that—"

"Even better than that, Indbur?"

"Judge for yourself. Two days ago, the so-called Association of Independent Traders declared war on the Mule, and the Foundation fleet is strengthened, at a stroke, by a thousand ships. You see, this Mule goes too far. He finds us divided and quarreling among ourselves and under the pressure of his attack we unite and grow strong. He *must* lose. It is inevitable – as always."

Mis still exuded skepticism, "Then you tell me that Seldon planned even for the fortuitous occurrence of a mutant."

"A mutant! I can't tell him from a human, nor could you but for the ravings of a rebel captain, some outland youngsters, and an addled juggler and clown. You forget the most conclusive evidence of all – your own."

"My own?" For just a moment, Mis was startled.

"Your own," sneered the mayor. "The Time Vault opens in nine weeks. What of that? It opens for a crisis. If this attack of the Mule is not the crisis, where is the 'real' one, the one the Vault is opening for? Answer me, you lardish ball."

The psychologist shrugged, "All tight. If it keeps you happy. Do me a favor, though. Just in case . . . just in case old Seldon makes his speech and it *does* go sour, suppose you let me attend the Grand Opening."

"All right. Get out of here. And stay out of my sight for nine weeks."

"With unprintable pleasure, you wizened horror," muttered Mis to himself as he left.

18. FALL OF THE FOUNDATION

There was an atmosphere about the Time Vault that just missed definition in several directions at once. It was not one of decay, for it was well-lit and well-conditioned, with the color scheme of the walls lively, and the rows of fixed chairs comfortable and apparently designed for eternal use. It was not even ancient, for three centuries had left no obvious mark. There was certainly no effort at the creation of awe or reverence, for the appointments were simple and everyday – next door to bareness, in fact.

Yet after all the negatives were added and the sum disposed of, something was left – and that something centered about the glass cubicle that dominated half the room with its clear emptiness. Four times in three centuries, the living simulacrum of Hari Seldon himself had sat there and spoken. Twice he had spoken to no audience.

Through three centuries and nine generations, the old man who had seen the great days of universal empire projected himself – and still he understood more of the Galaxy of his great-ultra-great-grandchildren, than did those grandchildren themselves.

Patently that empty cubicle waited.

The first to arrive was Mayor Indbur III, driving his ceremonial ground car through the hushed and anxious streets. Arriving with him was his own chair, higher than those that belonged there, and wider. It was placed before all the others, and Indbur dominated all but the empty glassiness before him.

The solemn official at his left bowed a reverent head. "Excellence, arrangements are completed for the widest possible sub-etheric spread for the official announcement by your excellence tonight."

"Good. Meanwhile, special interplanetary programs concerning the Time Vault are to continue. There will, of course, be no predictions or speculations of any sort on the subject. Does popular reaction continue satisfactory?"

"Excellence, very much so. The vicious rumors prevailing of late have decreased further. Confidence is widespread."

"Good!" He gestured the man away and adjusted his elaborate neckpiece to a nicety.

It was twenty minutes of noon!

A select group of the great props of the mayoralty – the leaders of the great Trading organizations – appeared in ones and twos with the degree of pomp appropriate to their financial status and place in mayoral favor. Each presented himself to the mayor, received a gracious word or two, took an assigned seat.

Somewhere, incongruous among the stilted ceremony of all this, Randu of Haven made his appearance and wormed his way unannounced to the mayor's seat.

"Excellence!" he muttered, and bowed.

Indbur frowned. "You have not been granted an audience. "

"Excellence, I have requested one for a week."

"I regret that the matters of State involved in the appearance of Seldon have—"

"Excellence, I regret them, too, but I must ask you to rescind your order that the ships of the Independent Traders be distributed among the fleets of the Foundation."

Indbur had flushed red at the interruption. "This is not the time for discussion."

"Excellence, it is the only time," Randu whispered urgently. "As representative of the Independent Trading Worlds, I tell you such a move can not be obeyed. It must be rescinded before Seldon solves our problem for us. Once the emergency is passed, it will be too late to conciliate and our alliance will melt away."

Indbur stared at Randu coldly. "You realize that I am head of the Foundation armed forces? Have I the right to determine military policy or have I not?"

"Excellence, you have, but some things are inexpedient."

"I recognize no inexpediency. It is dangerous to allow your people separate fleets in this emergency. Divided action plays into the hands of the enemy. We must unite, ambassador, militarily as well as politically."

Randu felt his throat muscles tighten. He omitted the courtesy of the opening title. "You feel safe now that Seldon will speak, and you move against us. A month ago you were soft and yielding, when our ships defeated the Mule at Terel. I might remind you, sir, that it is the Foundation Fleet that has been defeated in open battle five times, and that the ships of the Independent Trading Worlds have won your victories for you."

Indbur frowned dangerously, "You are no longer welcome upon Terminus, ambassador. Your return will be requested this evening. Furthermore, your connection with subversive democratic forces on Terminus will be – and has been – investigated."

Randu replied, "When I leave, our ships will go with me. I know nothing of your democrats. I know only that your Foundation's ships have surrendered to the Mule by the treason of their high officers, not their sailors, democratic or otherwise. I tell you that twenty ships of the Foundation surrendered at Horleggor at the orders of their rear admiral, when they were unharmed and unbeaten. The rear admiral was your own close associate – he presided at the trial of my nephew when he first arrived from Kalgan. It is not the only case we know of and our ships and men will not be risked under potential traitors.

Indbur said, "You will be placed under guard upon leaving here."

Randu walked away under the silent stares of the contemptuous coterie of the rulers of Terminus.

It was ten minutes of twelve!

Bayta and Toran had already arrived. They rose in their back seats and beckoned to Randu as he passed.

Randu smiled gently, "You are here after all. How did you work it?"

"Magnifico was our politician," grinned Toran. "Indbur insists upon his Visi-Sonor composition based on the Time Vault, with himself, no doubt, as hero. Magnifico refused to attend without us, and there was no arguing him out of it. Ebling Mis is with us, or was. He's wandering about somewhere." Then, with a sudden access of anxious gravity, "Why, what's wrong, uncle? You don't look well."

Randu nodded, "I suppose not. We're in for bad times, Toran. When the Mule is disposed of, our turn will come, I'm afraid. "

A straight solemn figure in white approached, and greeted them with a stiff bow.

Bayta's dark eyes smiled, as she held out her hand, "Captain Pritcher! Are you on space duty then?"

The captain took the hand and bowed lower, "Nothing like it. Dr. Mis, I understand, has been instrumental in bringing me here, but it's only temporary. Back to home guard tomorrow. What time is it?"

It was three minutes of twelve!

Magnifico was the picture of misery and heartsick depression. His body curled up, in his eternal effort at self-effacement. His long nose was pinched at the nostrils and his large, down-slanted eyes darted uneasily about.

He clutched at Bayta's hand, and when she bent down, he whispered, "Do you suppose, my lady, that all these great ones were in the audience, perhaps, when I . . . when I played the Visi-Sonor?"

"Everyone, I'm sure," Bayta assured him, and shook him gently. "And I'm sure they all think you're the most wonderful player in the Galaxy and that your concert was the greatest ever seen, so you just straighten yourself and sit correctly. We must have dignity."

He smiled feebly at her mock-frown and unfolded his long-boned limbs slowly.

It was noon – and the glass cubicle was no longer empty.

It was doubtful that anyone had witnessed the appearance. It was a clean break; one moment not there and the next moment there.

In the cubicle was a figure in a wheelchair, old and shrunken, from whose wrinkled face bright eyes shone, and whose voice, as it turned out, was the liveliest thing about him. A book lay face downward in his lap, and the voice came softly.

"I am Hari Seldon!"

He spoke through a silence, thunderous in its intensity.

"I am Hari Seldon! I do not know if anyone is here at all by mere sense-perception but that is unimportant. I have few fears as yet of a breakdown in the Plan. For the first three centuries the percentage probability of nondeviation is nine-four point two."

He paused to smile, and then said genially, "By the way, if any of you are standing, you may sit. If any would like to smoke, please do. I am not here in the flesh. I require no ceremony.

"Let us take up the problem of the moment, then. For the first time, the Foundation has been faced, or perhaps, is in the last stages of facing, civil war. Till now, the attacks from without have been adequately beaten off, and inevitably so, according to the strict laws of psychohistory. The attack at present is that of a too-undisciplined outer group of the Foundation against the too-authoritarian central government. The procedure was necessary, the result obvious."

The dignity of the high-born audience was beginning to break. Indbur was half out of his chair.

Bayta leaned forward with troubled eyes. What was the great Seldon talking about? She had missed a few of the words—

"—that the compromise worked out is necessary in two respects. The revolt of the Independent Traders introduces an element of new uncertainty in a government perhaps grown over-confident. The element of striving is restored. Although beaten, a healthy increase of democracy—"

There were raised voices now. Whispers had ascended the scale of loudness, and the edge of panic was in them.

Bayta said in Toran's ear, "Why doesn't he talk about the Mule? The Traders never revolted."

Toran shrugged his shoulders.

The seated figure spoke cheerfully across and through the increasing disorganization:

"—a new and firmer coalition government was the necessary and beneficial outcome of the logical civil war forced upon the Foundation. And now only the remnants of the old Empire stand in the way of further expansion, and in them, for the next few years, at any rate, is no problem. Of course, I can not reveal the nature of the next prob—"

In the complete uproar, Seldon's lips moved soundlessly.

Ebling Mis was next to Randu, face ruddy. He was shouting. "Seldon is off his rocker. He's got the wrong crisis. Were your Traders ever planning civil war?"

Randu said thinly, "We planned one, yes. We called it off in the face of the Mule."

"Then the Mule is an added feature, unprepared for in Seldon's psychohistory. Now what's happened?"

In the sudden, frozen silence, Bayta found the cubicle once again empty. The nuclear glow of the walls was dead, the soft current of conditioned air absent.

Somewhere the sound of a shrill siren was rising and falling in the scale and Randu formed the words with his lips, "Space raid!"

And Ebling Mis held his wrist watch to his ears and shouted suddenly, "Stopped, by the "Ga-LAX-y, is there a watch in the room that is going?" His voice was a roar.

Twenty wrists went to twenty ears. And in far less than twenty seconds, it was quite certain that none were.

"Then," said Mis, with a grim and horrible finality, "something has stopped all nuclear power in the Time Vault — and the Mule is attacking."

Indbur's wail rose high above the noise, "Take your seats! The Mule is fifty parsecs distant."

"He was," shouted back Mis, "a week ago. Right now, Terminus is being bombarded."

Bayta felt a deep depression settle softly upon her. She felt its folds tighten close and thick, until her breath forced its way only with pain past her tightened throat.

The outer noise of a gathering crowd was evident. The doors were thrown open and a harried figure entered, and spoke rapidly to Indbur, who had rushed to him.

"Excellence," he whispered, "not a vehicle is running in the city, not a communication line to the outside is open.

The Tenth Fleet is reported defeated and the Mule's ships are outside the atmosphere. The general staff—"

Indbur crumpled, and was a collapsed figure of impotence upon the floor. In all that hall, not a voice was raised now. Even the growing crowd without was fearful, but silent, and the horror of cold panic hovered dangerously.

Indbur was raised. Wine was held to his lips. His lips moved before his eyes opened, and the word they formed was, "Surrender!"

Bayta found herself near to crying – not for sorrow or humiliation, but simply and plainly out of a vast frightened despair. Ebling Mis plucked at her sleeve. "Come, young lady—"

She was pulled out of her chair, bodily.

"We're leaving," he said, "and take your musician with you." The plump scientist's lips were trembling and colorless.

"Magnifico," said Bayta, faintly. The clown shrank in horror. His eyes were glassy.

"The Mule," he shrieked. "The Mule is coming for me."

He thrashed wildly at her touch. Toran leaned over and brought his fist up sharply. Magnifico slumped into unconsciousness and Toran carried him out potato-sack fashion.

The next day, the ugly, battle-black ships of the Mule poured down upon the landing fields of the planet Terminus. The attacking general sped down the empty main street of Terminus City in a foreign-made ground car that ran where a whole city of atomic cars still stood useless.

The proclamation of occupation was made twenty-four hours to the minute after Seldon had appeared before the former mighty of the Foundation.

Of all the Foundation planets, only the Independent Traders still stood, and against them the power of the Mule – conqueror of the Foundation – now turned itself.

19. START OF THE SEARCH

The lonely planet, Haven – only planet of an only sun of a Galactic Sector that trailed raggedly off into intergalactic vacuum – was under siege.

In a strictly military sense, it was certainly under siege, since no area of space on the Galactic side further than twenty parsecs distance was outside range of the Mule's advance bases. In the four months since the shattering fall of the Foundation, Haven's communications had fallen apart like a spiderweb under the razor's edge. The ships of Haven converged inwards upon the home world, and only Haven itself was now a fighting base.

And in other respects, the siege was even closer; for the shrouds of helplessness and doom had already invaded.

Bayta plodded her way down the pink-waved aisle past the rows of milky plastic-topped tables and found her seat by blind reckoning. She eased on to the high, armless chair, answered half-heard greetings mechanically, rubbed a wearily-itching eye with the back of a weary hand, and reached for her menu.

She had time to register a violent mental reaction of distaste to the pronounced presence of various cultured-fungus dishes, which were considered high delicacies at Haven, and which her Foundation taste found highly inedible – and then she was aware of the sobbing near her and looked up.

Until then, her notice of Juddee, the plain, snub-nosed, indifferent blonde at the dining unit diagonally across had been the superficial one of the nonacquaintance. And now Juddee was crying, biting woefully at a moist handkerchief, and choking back sobs until her complexion was blotched with turgid red. Her shapeless radiation-proof costume was thrown back upon her shoulders, and her transparent face shield had tumbled forward into her dessert, and there remained.

Bayta joined the three girls who were taking turns at the eternally applied and eternally inefficacious remedies of shoulder-patting, hair-smoothing, and incoherent murmuring.

"What's the matter?" she whispered.

One turned to her and shrugged a discreet, "I don't know." Then, feeling the inadequacy of the gesture, she pulled Bayta aside.

"She's had a hard day, I guess. And she's worrying about her husband."

"Is he on space patrol?"

"Yes".

Bayta reached a friendly hand out to Juddee.

"Why don't you go home, Juddee?" Her voice was a cheerfully businesslike intrusion on the soft, flabby inanities that had preceded.

Juddee looked up half in resentment. "I've been out once this week already—"

"Then you'll be out twice. If you try to stay on, you know, you'll just be out three days next week – so going home now amounts to patriotism. Any of you girls work in her department? Well, then, suppose you take care of her card. Better go to the washroom first, Juddee, and get the peaches and cream back where it belongs. Go ahead! Shoo!"

Bayta returned to her seat and took up the menu again with a dismal relief. These moods were contagious. One weeping girl would have her entire department in a frenzy these nerve-torn days.

She made a distasteful decision, pressed the correct buttons at her elbow and put the menu back into its niche.

The tall, dark girl opposite her was saying, "Isn't much any of us can do except cry, is there?"

Her amazingly full lips scarcely moved, and Bayta noticed that their ends were carefully touched to exhibit that artificial, just-so half-smile that was the current last word in sophistication.

Bayta investigated the insinuating thrust contained in the words with lashed eyes and welcomed the diversion of the arrival of her lunch, as the tile-top of her unit moved inward and the food lifted. She tore the wrappings carefully off her cutlery and handled them gingerly till they cooled.

She said, "Can't you think of anything else to do, Hella?"

"Oh, yes," said Hella. "*I can!*" She flicked her cigarette with a casual and expert finger-motion into the little recess provided and the tiny flash caught it before it hit shallow bottom.

"For instance," and Hella clasped slender, well-kept hands under her chin, "I think we could make a very nice arrangement with the Mule and stop all this nonsense. But then I don't have the . . . uh . . . facilities to manage to get out of places quickly when the Mule takes over."

Bayta's clear forehead remained clear. Her voice was light and indifferent. "You don't happen to have a brother or husband in the fighting ships, do you?"

"No. All the more credit that I see no reason for the sacrifice of the brothers and husbands of others."

"The sacrifice will come the more surely for surrender."

"The Foundation surrendered and is at peace. Our men are away and the Galaxy is against us."

Bayta shrugged, and said sweetly, "I'm afraid it is the first of the pair that bothers you." She returned to her vegetable platter and ate it with the clammy realization of the silence about her. No one in ear-shot had cared to answer Hella's cynicism.

She left quickly, after stabbing at the button which cleared her dining unit for the next shift's occupant.

A new girl, three seats away, stage-whispered to Hella, "Who was she?"

Hella's mobile lips curled in indifference. "She's our coordinator's niece. Didn't you know that?"

"Yes?" Her eyes sought out the last glimpse of disappearing back. "What's she doing here?"

"Just an assembly girl. Don't you know it's fashionable to be patriotic? It's all so democratic, it makes me retch."

"Now, Hella," said the plump girl to her right. "She's never pulled her uncle on us yet. Why don't you lay off?"

Hella ignored her neighbor with a glazed sweep of eyes and lit another cigarette.

The new girl was listening to the chatter of the bright-eyed accountant opposite. The words were coming quickly,

"—and she's supposed to have been in the Vault — actually in the Vault, you know — when Seldon spoke — and they say the mayor was in frothing furies and there were riots, and all of that sort of thing, you know. She got away before the Mule landed, and they say she had the most tha-rilling escape — had to go through the blockade, and all — and I do wonder she doesn't write a book about it, these war books being so popular these

days, you know. And she was supposed to be on this world of the Mule's, too – Kalgan, you know – and–"

The time bell shrilled and the dining room emptied slowly. The accountant's voice buzzed on, and the new girl interrupted only with the conventional and wide-eyed, "Really-y-y-y?" at appropriate points.

The huge cave lights were being shielded group-wise in the gradual descent towards the darkness that meant sleep for the righteous and hard-working, when Bayta returned home.

Toran met her at the door, with a slice of buttered bread in his hand.

"Where've you been?" he asked, food-muffled. Then, more clearly, "I've got a dinner of sorts rassled up. If it isn't much, don't blame me."

But she was circling him, wide-eyed. "Torie! Where's your uniform? What are you doing in civvies?"

"Orders, Bay. Randu is holed up with Ebling Mis right now, and what it's all about, I don't know. So there you have everything."

"Am I going?" She moved towards him impulsively.

He kissed her before he answered, "I believe so. It will probably be dangerous."

"What isn't dangerous?"

"Exactly. Oh, yes, and I've already sent for Magnifico, so he's probably coming too."

"You mean his concert at the Engine Factory will have to be cancelled."

"Obviously."

Bayta passed into the next room and sat down to a meal that definitely bore signs of having been "rassled-up." She cut the sandwiches in two with quick efficiency and said:

"That's too bad about the concert. The girls at the factory were looking forward to it. Magnifico, too, for that matter." She shook her head. "He's such a queer thing."

"Stirs your mother-complex, Bay, that's what he does. Some day we'll have a baby, and then you'll forget Magnifico."

'Bayta answered from the depths of her sandwich, "Strikes me that you're all the stirring my mother-complex can stand."

And then she laid the sandwich down, and was gravely serious in a moment.

"Torie."

"M-m-m?"

"Torie, I was at City Hall today – at the Bureau of Production. That is why I was so late today."

"What were you doing there?"

"Well. . ." she hesitated, uncertainly. "It's been building up. I was getting so I couldn't stand it at the factory. Morale just doesn't exist. The girls go on crying jags for no particular reason. Those who don't get sick become sullen. Even the little mousie types pout. In my particular section, production isn't a quarter what it was when I came, and there isn't a day that we have a full roster of workers."

"All right," said Toran, "tie in the B. of P. What did you do there?"

"Asked a few questions. And it's so, Torie, it's so all over Haven. Dropping production, increasing sedition and disaffection. The bureau chief just shrugged his shoulders – after I had sat in the anteroom an hour to see him, and only got in because I was the coordinator's niece – and said it was beyond him. Frankly, I don't think he cared."

"Now, don't go off base, Bay."

"I don't think he did." She was strenuously fiery. "I tell you there's something wrong. It's that same horrible frustration that hit me in the Time Vault when Seldon deserted us. You felt it yourself."

"Yes, I did."

"Well, it's back," she continued savagely. "And we'll never be able to resist the Mule. Even if we had the material, we lack the heart, the spirit, the will – Torie, there's no use fighting–"

Bayta had never cried in Toran's memory, and she did not cry now. Not really. But Toran laid a light hand on her shoulder and whispered, "Suppose you forget it, baby. I know what you mean. But there's nothing–"

"Yes, there's nothing we can do! Everyone says that – and we just sit and wait for the knife to come down."

She returned to what was left of her sandwich and tea. Quietly, Toran was arranging the beds. It was quite dark outside.

Randu, as newly-appointed coordinator – in itself a wartime post – of the confederation of cities on Haven, had been assigned, at his own request, to an upper room, out of the window of which he could brood over the roof tops and greenery of the city. Now, in the fading of the cave lights, the city receded into the level lack of distinction of the shades. Randu did not care to meditate upon the symbolism.

He said to Ebling Mis – whose clear, little eyes seemed to have no further interest than the red-filled goblet in his hand – "There's a saying on Haven that when the cave lights go out, it is time for the righteous and hard-working to sleep."

"Do you sleep much lately?"

"No! Sorry to call you so late, Mis. I like the night better somehow these days. Isn't that strange? The people on Haven condition themselves pretty strictly on the lack of light meaning sleep. Myself, too. But it's different now–"

"You're hiding," said Mis, flatly. "You're surrounded by people in the waking period, and you feel their eyes and their hopes on you. You can't stand up under it. In the sleep period, you're free."

"Do you feel it, too, then? This miserable sense of defeat?"

Ebling Mis nodded slowly, "I do. It's a mass psychosis, an unprintable mob panic. "Ga-LAX-y, Randu, what do you expect? Here you have a whole culture brought up to a blind, blubbery belief that a folk hero of the past has everything all planned out and is taking care of every little piece of their unprintable lives. The thought-pattern evoked has religious characteristics, and you know what that means."

"Not a bit."

Mis was not enthusiastic about the necessity of explanation. He never was. So he growled, stared at the long cigar he rolled thoughtfully between his fingers and said, "Characterized by strong faith reactions. Beliefs can't be shaken short of a major shock, in which case, a fairly complete mental disruption results. Mild cases-hysteria, morbid sense of insecurity. Advanced cases – madness and suicide."

Randu bit at a thumbnail. "When Seldon fails us, in other words, our prop disappears, and we've been leaning upon it so long, our muscles are atrophied to where we can not stand without it."

"That's it. Sort of a clumsy metaphor, but that's it."

"And you, Ebling, what of your own muscles?"

The psychologist filtered a long draught of air through his cigar, and let the smoke laze out. "Rusty, but not atrophied. My profession has resulted in just a bit of independent thinking."

"And you see a way out?"

"No, but there must be one. Maybe Seldon made no provisions for the Mule. Maybe he didn't guarantee our victory. But, then, neither did he guarantee defeat. He's just out of the game and we're on our own. The Mule can be licked."

"How?"

"By the only way anyone can be licked – by attacking in strength at weakness. See here, Randu, the Mule isn't a superman. If he is finally defeated, everyone will see that for himself. It's just that he's an unknown, and the legends cluster quickly. He's supposed to be a mutant. Well, what of that? A mutant means a 'superman' to the ignoramuses of humanity. Nothing of the sort.

"It's been estimated that several million mutants are born in the Galaxy every day. Of the several million, all but one or two percent can be detected only by means of microscopes and chemistry. Of the one or two percent macromutants, that is, those with mutations detectable to the naked eye or naked mind, all but one or two percent are freaks, fit for the amusement centers, the laboratories, and death. Of the few macromutants whose differences are to the good, almost all are harmless curiosities, unusual in some single respect, normal – and often subnormal – in most others. You see that, Randu?"

"I do. But what of the Mule?"

"Supposing the Mule to be a mutant then, we can assume that he has some attribute, undoubtedly mental, which can be used to conquer worlds. In other respects, he undoubtedly has his shortcomings, which we must locate. He would not be so secretive, so shy of others' eyes, if these shortcomings were not apparent and fatal. *If* he's a mutant."

"Is there an alternative?"

"There might be. Evidence for mutation rests on Captain Han Pritcher of what used to be Foundation's Intelligence. He drew his conclusions from the feeble memories of those who claimed to know the Mule-or somebody who might have been the Mule – in infancy and early childhood. Pritcher worked on slim pickings there, and what evidence he

found might easily have been planted by the Mule for his own purposes, for it's certain that the Mule has been vastly aided by his reputation as a mutant-superman."

"This is interesting. How long have you thought that?"

"I never thought that, in the sense of believing it. It is merely an alternative to be considered. For instance, Randu, suppose the Mule has discovered a form of radiation capable of depressing mental energy just as he is in possession of one which depresses nuclear reactions. What then, eh? Could that explain what's hitting us now – and what did hit the Foundation?"

Randu seemed immersed in a near-wordless gloom.

He said, "What of your own researches on the Mule's clown."

And now Ebling Mis hesitated. "Useless as yet. I spoke bravely to the mayor previous to the Foundation's collapse, mainly to keep his courage up – partly to keep my own up as well. But, Randu, if my mathematical tools were up to it, then from the clown alone I could analyze the Mule completely. Then we would have him. Then we could solve the queer anomalies that have impressed me already."

"Such as?"

"Think, man. The Mule defeated the navies of the Foundation at will, but he has not once managed to force the much weaker fleets of the Independent Traders to retreat in open combat. The Foundation fell at a blow; the Independent Traders hold out against all his strength. He first used Extinguishing Field upon the nuclear weapons of the Independent Traders of Mnemon. The element of surprise lost them that battle but they countered the Field. He was never able to use it successfully against the Independents again.

"But over and over again, it worked against Foundation forces. It worked on the Foundation itself. Why? With our present knowledge, it is all illogical. So there must be factors of which we are not aware."

"Treachery?"

"That's rattle-pated nonsense, Randu. Unprintable twaddle. There wasn't a man on the Foundation who wasn't sure of victory. Who would betray a certain-to-win side."

Randu stepped to the curved window and stared unseeingly out into the unseeable. He said, "But we're certain to lose now, if the Mule had a thousand weaknesses; if he were a network of holes—"

He did not turn. It was as if the slump of his back, the nervous groping for one another of the hands behind him that spoke. He said, "We escaped easily after the Time Vault episode, Ebling. Others might have escaped as well. A few did. Most did not. The Extinguishing Field could have been counteracted. It asked ingenuity and a certain amount of labor. All the ships of the Foundation Navy could have flown to Haven or other nearby planets to continue the fight as we did. Not one percent did so. In effect, they deserted to the enemy.

"The Foundation underground, upon which most people here seem to rely so heavily, has thus far done nothing of consequence. The Mule has been politic enough to

promise to safeguard the property and profits of the great Traders and they have gone over to him."

Ebling Mis said stubbornly, "The plutocrats have always been against us."

"They always held the power, too. Listen, Ebling. We have reason to believe that the Mule or his tools have already been in contact with powerful men among the Independent Traders. At least ten of the twenty-seven Trading Worlds are known to have gone over to the Mule. Perhaps ten more waver. There are personalities on Haven itself who would not be unhappy over the Mule's domination. It's apparently an insurmountable temptation to give up endangered political power, if that will maintain your hold over economic affairs. "

"You don't think Haven can fight the Mule?"

"I don't think Haven will." And now Randu turned his troubled face full upon the psychologist. "I think Haven is waiting to surrender. It's what I called you here to tell you. I want you to leave Haven."

Ebling Mis puffed up his plump cheeks in amazement. "Already?"

Randu felt horribly tired. "Ebling, you are the Foundation's greatest psychologist. The real master-psychologists went out with Seldon, but you're the best we have. You're our only chance of defeating the Mule. You can't do that here; you'll have to go to what's left of the Empire."

"To Trantor?"

"That's right. What was once the Empire is bare bones today, but something must still be at the center. They've got the records there, Ebling. You may learn more of mathematical psychology; perhaps enough to be able to interpret the clown's mind. He will go with you, of course."

Mis responded dryly, "I doubt if he'd be willing to, even for fear of the Mule, unless your niece went with him."

"I know that. Toran and Bayta are leaving with you for that very reason. And, Ebling, there's another, greater purpose. Hari Seldon founded two Foundations three centuries ago; one at each end of the Galaxy. *You must find that Second Foundation.*"

20. CONSPIRATOR

The mayor's palace – what was once the mayor's palace – was a looming smudge in the darkness. The city was quiet under its conquest and curfew, and the hazy milk of the great Galactic Lens, with here and there a lonely star, dominated the sky of the Foundation.

In three centuries the Foundation had grown from a private project of a small group of scientists to a tentacular trade empire sprawling deep into the Galaxy and half a year had flung it from its heights to the status of another conquered province.

Captain Han Pritcher refused to grasp that.

The city's sullen nighttime quiet, the darkened palace, intruder-occupied, were symbolic enough, but Captain Han Pritcher, just within the outer gate of the palace, with the tiny nuclear bomb under his tongue, refused to understand.

A shape drifted closer – the captain bent his head.

The whisper came deathly low, "The alarm system is as it always was, captain. Proceed! It will register nothing."

Softly, the captain ducked through the low archway, and down the fountain-lined path to what had been Indbur's garden.

Four months ago had been the day in the Time Vault, the fullness of which his memory balked at. Singly and separately the impressions would come back, unwelcome, mostly at night.

Old Seldon speaking his benevolent words that were so shatteringly wrong – the jumbled confusion – Indbur, with his mayoral costume incongruously bright about his pinched, unconscious face – the frightened crowds gathering quickly, waiting noiselessly for the inevitable word of surrender – the young man, Toran, disappearing out of a side door with the Mule's clown dangling over his shoulder.

And himself, somehow out of it all afterward, with his car unworkable. Shouldering his way along and through the leaderless mob that was already leaving the city – destination unknown.

Making blindly for the various rat holes which were – which had once been – the headquarters for a democratic underground that for eighty years had been failing and dwindling. And the rat holes were empty.

The next day, black alien ships were momentarily visible in the sky, sinking gently into the clustered buildings of the nearby city. Captain Han Pritcher felt an accumulation of helplessness and despair drown him.

He started his travels in earnest. In thirty days he had covered nearly two hundred miles on foot, changed to the clothing of a worker in the hydroponic factories whose body he found newly-dead by the side of the road, grown a fierce beard of russet intensity. And found what was left of the underground.

The city was Newton, the district a residential one of one-time elegance slowly edging towards squalor, the house an undistinguished member of a row, and the man a small-eyed, big-boned whose knotted fists bulged through his pockets and whose wiry body remained unbudgingly in the narrow door opening.

The captain mumbled, "I come from Miran."

The man returned the gambit, grimly. "Miran is early this year."

The captain said, "No earlier than last year."

But the man did not step aside. He said, "Who are you?"

"Aren't you Fox?"

"Do you always answer by asking?"

The captain took an imperceptibly longer breath, and then said calmly, "I am Han Pritcher, Captain of the Fleet, and member of the Democratic Underground Party. Will you let me in?"

The Fox stepped aside. He said, "My real name is Orum Palley."

He held out his hand. The captain took it.

The room was well-kept, but not lavish. In one corner stood a decorative book-film projector, which to the captain's military eyes might easily have been a camouflaged blaster of respectable caliber. The projecting lens covered the doorway, and such could be remotely controlled.

The Fox followed his bearded guest's eyes, and smiled tightly. He said, "Yes! But only in the days of Indbur and his lackey-hearted vampires. It wouldn't do much against the Mule, eh? Nothing would help against the Mule. Are you hungry?"

The captain's jaw muscles tightened beneath his beard, and he nodded.

"It'll take a minute if you don't mind waiting." The Fox removed cans from a cupboard and placed two before Captain Pritcher. "Keep your finger on it, and break them when they're hot enough. My heat-control unit's out of whack. Things like that remind you there's a war on – or was on, eh?"

His quick words had a jovial content, but were said in anything but a jovial tone – and his eyes were coldly thoughtful. He sat down opposite the captain and said, "There'll be nothing but a burn-spot left where you're sitting, if there's anything about you I don't like. Know that?"

The captain did not answer. The cans before him opened at a pressure.

The Fox said, shortly, "Stew! Sorry, but the food situation is short."

"I know," said the captain. He ate quickly; not looking up.

The Fox said, "I once saw you. I'm trying to remember, and the beard is definitely out of the picture."

"I haven't shaved in thirty days." Then, fiercely, "What do you want? I had the correct passwords. I have identification."

The other waved a hand, "Oh, I'll grant you're Pritcher all right. But there are plenty who have the passwords, and the identifications, and the *identities* – who are with the Mule. Ever hear of Levvaw, eh?"

"Yes."

"He's with the Mule."

"What? He—"

"Yes. He was the man they called 'No Surrender.'" The Fox's lips made laughing motions, with neither sound nor humor. "Then there's Willig. With the Mule! Garre and Noth. With the Mule! Why not Pritcher as well, eh? How would I know?"

The captain merely shook his head.

"But it doesn't matter," said the Fox, softly. "They must have my name, if Noth has gone over – so if you're legitimate, you're in more new danger than I am over our acquaintanceship."

The captain had finished eating. He leaned back, "If you have no organization here, where can I find one? The Foundation may have surrendered, but I haven't."

"So! You can't wander forever, captain. Men of the Foundation must have travel permits to move from town to town these days. You know that? Also identity cards. You

have one? Also, all officers of the old Navy have been requested to report to the nearest occupation headquarters. That's you, eh?"

"Yes." The captain's voice was hard. "Do you think I run through fear. I was on Kalgan not long after *its* fall to the Mule. Within a month, not one of the old warlord's officers was at large, because they were the natural military leaders of any revolt. It's always been the underground's knowledge that no revolution can be successful without the control of at least part of the Navy. The Mule evidently knows it, too."

The Fox nodded thoughtfully, "Logical enough. The Mule is thorough."

"I discarded the uniform as soon as I could. I grew the beard. Afterwards there may be a chance that others have taken the same action."

"Are you married?"

"My wife is dead. I have no children.

"You're hostage-immune, then."

"Yes."

"You want my advice?"

"If you have any."

A don't know what the Mule's policy is or what he intends, but skilled workers have not been harmed so far. Pay rates have gone up. Production of all sorts of nuclear weapons is booming."

"Yes? Sounds like a continuing offensive."

"I don't know. The Mule's a subtle son of a drab, and he may merely be soothing the workers into submission. If Seldon couldn't figure him out with all his psychohistory, I'm not going to try. But you're wearing work clothes. That suggests something, eh?"

"I'm not a skilled worker."

"You've had a military course in nucleics, haven't you?"

"Certainly."

"That's enough. The Nuclear-Field Bearings, Inc., is located here in town. Tell them you've had experience. The stinkers who used to run the factory for Indbur are still running it – for the Mule. They won't ask questions, as long as they need more workers to make their fat hunk. They'll give you an identity card and you can apply for a room in the Corporation's housing district. You might start now."

In that manner, Captain Han Pritcher of the National Fleet became Shield-man Lo Moro of the 45 Shop of Nuclear-Field Bearings, Inc. And from an Intelligence agent, he descended the social scale to "conspirator" – a calling which led him months later to what had been Indbur's private garden,

In the garden, Captain Pritcher consulted the radometer in the palm of his hand. The inner warning field was still in operation, and he waited. Half an hour remained to the life of the nuclear bomb in his mouth. He rolled it gingerly with his tongue.

The radometer died into an ominous darkness and the captain advanced quickly. So far, matters had progressed well.

He reflected objectively that the life of the nuclear bomb was his as well; that its death was his death – and the Mule's death.

And the grand climacteric of a four-month's private war would be reached; a war that had passed from flight through a Newton factory.

For two months, Captain Pritcher wore leaden aprons and heavy face shields, till all things military had been frictioned off his outer bearing. He was a laborer, who collected his pay, spent his evenings in town, and never discussed politics.

For two months, he did not see the Fox.

And then, one day, a man stumbled past his bench, and there was a scrap of paper in his pocket. The word "Fox" was on it. He tossed it into the nuclear chamber, where it vanished in a sightless puff, sending the energy output up a millimicrovolt – and turned back to his work.

That night he was at the Fox's home, and took a hand in a game of cards with two other men he knew by reputation and one by name and face.

Over the cards and the passing and repassing tokens, they spoke.

The captain said, "It's a fundamental error. You live in the exploded past. For eighty years our organization has been waiting for the correct historical moment. We've been blinded by Seldon's psychohistory, one of the first propositions of which is that the individual does not count, does not make history, and that complex social and economic factors override him, make a puppet out of him." He adjusted his cards carefully, appraised their value and said, as he put out a token. "Why not kill the Mule?"

"Well, now, and what good would that do?" demanded the man at his left, fiercely.

"You see," said the captain, discarding two cards, "that's the attitude. What is one man – out of quadrillions. The Galaxy won't stop rotating because one man dies. But the Mule is not a man, he is a mutant. Already, he had upset Seldon's plan, and if you'll stop to analyze the implications, it means that he – one man – one mutant – upset all of Seldon's psychohistory. If he had never lived, the Foundation would not have fallen. If he ceased living, it would not remain fallen.

"Come, the democrats have fought the mayors and the traders for eighty years by connivance. Let's try assassination."

"How?" interposed the Fox, with cold common sense.

The captain said, slowly, "I've spent three months of thought on that with no solution. I came here and had it in five minutes." He glanced briefly at the man whose broad, pink melon of a face smiled from the place at his right. "You were once Mayor Indbur's chamberlain. I did not know you were of the underground,"

"Nor I, that you were."

"Well, then, in your capacity as chamberlain you periodically checked the working of the alarm system of the palace."

"I did."

"And the Mule occupies the palace now."

"So it has been announced – though he is a modest conqueror who makes no speeches, proclamations nor public appearances of any sort."

"That's an old story, and affects nothing. You, my ex-chamberlain, are all we need."

The cards were shown and the Fox collected the stakes. Slowly, he dealt a new hand.

The man who had once been chamberlain picked up his cards, singly. "Sorry, captain. I checked the alarm system, but it was routine. I know nothing about it."

"I expected that, but your mind carries an eidetic memory of the controls if it can be probed deeply enough – with a psychic probe."

The chamberlain's ruddy face paled suddenly and sagged. The cards in his hand crumpled under sudden fist-pressure, "A psychic probe?"

"You needn't worry," said the captain, sharply. "I know how to use one. It will not harm you past a few days' weakness. And if it did, it is the chance you take and the price you pay. There are some among us, no doubt, who from the controls of the alarm could determine the wavelength combinations. There are some among us who could manufacture a small bomb under time-control and I myself will carry it to the Mule."

The men gathered over the table.

The captain announced, "On a given evening, a riot will start in Terminus City in the neighborhood of the palace. No real fighting. Disturbance – then flight. As long as the palace guard is attracted . . . or, at the very least, distracted–"

From that day for a month the preparations went on, and Captain Han Pritcher of the National Fleet having become conspirator descended further in the social scale and became an "assassin."

Captain Pritcher, assassin, was in the palace itself, and found himself grimly pleased with his psychology. A thorough alarm system outside meant few guards within. In this case, it meant none at all.

The floor plan was clear in his mind. He was a blob moving noiselessly up the well-carpeted ramp. At its head, he flattened against the wall and waited.

The small closed door of a private room was before him. Behind that door must be the mutant who had beaten the unbeatable. He was early – the bomb had ten minutes of life in it.

Five of these passed, and still in all the world there was no sound. The Mule had five minutes to live – So had Captain Pritcher–

He stepped forward on sudden impulse. The plot could no longer fail. When the bomb went, the palace would go with it – all the palace. A door between – ten yards between – was nothing. But he wanted to see the Mule as they died together.

In a last, insolent gesture, he thundered upon the door.

And it opened and let out the blinding light.

Captain Pritcher staggered, then caught himself. The solemn man, standing in the center of the small room before a suspended fish bowl, looked up mildly.

His uniform was a somber black, and as he tapped the bowl in an absent gesture, it bobbed quickly and the feather-finned, orange and vermilion fish within darted wildly.

He said, "Come in, captain!"

To the captain's quivering tongue the little metal globe beneath was swelling ominously – a physical impossibility, the captain knew. But it was in its last minute of life.

The uniformed man said, "You had better spit out the foolish pellet and free yourself for speech. It won't blast."

The minute passed and with a slow, sodden motion the captain bent his head and dropped the silvery globe into his palm. With a furious force it was flung against the wall. It rebounded with a tiny, sharp clangor, gleaming harmlessly as it flew.

The uniformed man shrugged. "So much for that, then. It would have done you no good in any case, captain. I am not the Mule. You will have to be satisfied with his viceroy."

"How did you know?" muttered the captain, thickly.

"Blame it on an efficient counter-espionage system. I can name every member of your little gang, every step of their planning–"

"And you let it go this far?"

"Why not? It has been one of my great purposes here to find you and some others. Particularly you. I might have had you some months ago, while you were still a worker at the Newton Bearings Works, but this is much better. If you hadn't suggested the main outlines of the plot yourself, one of my own men would have advanced something of much the same sort for you. The result is quite dramatic, and rather grimly humorous."

The captain's eyes were hard. "I find it so, too. Is it all over now?"

"Just begun. Come, captain, sit down. Let us leave heroics for the fools who are impressed by it. Captain, you are a capable man. According to the information I have, you were the first on the Foundation to recognize the power of the Mule. Since then you have interested yourself, rather daringly, in the Mule's early life. You have been one of those who carried off his clown, who, incidentally, has not yet been found, and for which there will yet be full payment. Naturally, your ability is recognized and the Mule is not of those who fear the ability of his enemies as long as he can convert it into the ability of a new friend."

"Is that what you're hedging up to? Oh, no!"

"Oh, yes! It was the purpose of tonight's comedy. You are an intelligent man, yet your little conspiracies against the Mule fail humorously. You can scarcely dignify it with the name of conspiracy. Is it part of your military training to waste ships in hopeless actions?"

"One must first admit them to be hopeless."

"One will," the viceroy assured him, gently. "The Mule has conquered the Foundation, it is rapidly being turned into an arsenal for accomplishment of his greater aims."

"What greater aims?"

"The conquest of the entire Galaxy. The reunion of all the tom worlds into a new Empire. The fulfillment, you dull-witted patriot, of your own Seldon's dream seven hundred years before he hoped to see it. And in the fulfillment, you can help us."

"I can, undoubtedly. But I won't, undoubtedly."

"I understand," reasoned the viceroy, "that only three of the Independent Trading Worlds yet resist. They will not last much longer. It will be the last of all Foundation forces. You still hold out."

"Yes."

"Yet you won't. A voluntary recruit is the, most efficient. But the other kind will do. Unfortunately, the Mule is absent. He leads the fight, as always, against the resisting Traders. But he is in continual contact with us. You will not have to wait long."

"For what?"

"For your conversion."

"The Mule," said the captain, frigidly, "will find that beyond his ability."

"But he won't. I was not beyond it. You don't recognize me? Come, you were on Kalgan, so you have seen me. I wore a monocle, a fur-lined scarlet robe, a high-crowned hat—"

The captain stiffened in dismay. "You were the warlord of Kalgan."

"Yes. And now I am the loyal viceroy of the Mule. You see, he is persuasive."

21. INTERLUDE IN SPACE

The blockade was run successfully. In the vast volume of space, not all the navies ever in existence could keep their watch in tight proximity. Given a single ship, a skillful pilot, and a moderate degree of luck, and there are holes and to spare.

With cold-eyed calm, Toran drove a protesting vessel from the vicinity of one star to that of another. If the neighborhood of great mass made an interstellar jump erratic and difficult, it also made the enemy detection devices useless or nearly so.

And once the girdle of ships had been passed the inner sphere of dead space, through whose blockaded sub-ether no message could be driven, was passed as well. For the first time in over three months Toran felt unisolated.

A week passed before the enemy news programs dealt with anything more than the dull, self-laudatory details of growing control over the Foundation. It was a week in which Toran's armored trading ship fled inward from the Periphery in hasty jumps.

Ebling Mis called out to the pilot room and Toran rose blink-eyed from his charts.

"What's the matter?" Toran stepped down into the small central chamber which Bayta had inevitably devised into a living room.

Mis shook his head, "Bescuppered if I know. The Mule's newsmen are announcing a special bulletin. Thought you might want to get in on it."

"Might as well. Where's Bayta?"

"Setting the table in the diner and picking out a menu or some such frippery."

Toran sat down upon the cot that served as Magnifico's bed, and waited. The propaganda routine of the Mule's "special bulletins" were monotonously similar. First the martial music, and then the buttery slickness of the announcer. The minor news items

would come, following one another in patient lock step. Then the pause. Then the trumpets and the rising excitement and the climax.

Toran endured it. Mis muttered to himself.

The newscaster spilled out, in conventional war-correspondent phraseology, the unctuous words that translated into sound the molten metal and blasted flesh of a battle in space.

"Rapid cruiser squadrons under Lieutenant General Sammin hit back hard today at the task force striking out from Iss—" The carefully expressionless face of the speaker upon the screen faded into the blackness of a space cut through by the quick swaths of ships reeling across emptiness in deadly battle. The voice continued through the soundless thunder.

"The most striking action of the battle was the subsidiary combat of the heavy cruiser *Cluster* against three enemy ships of the 'Nova' class—"

The screen's view veered and closed in. A great ship sparked and one of the frantic attackers glowed angrily, twisted out of focus, swung back and rammed. The *Cluster* bowed wildly and survived the glancing blow that drove the attacker off in twisting reflection.

The newsman's smooth unimpassioned delivery continued to the last blow and the last hulk.

Then a pause, and a large similar voice-and-picture of the fight off Mnemon, to which the novelty was added of a lengthy description of a hit-and-run landing – the picture of a blasted city – huddled and weary prisoners – and off again.

Mnemon had not long to live.

The pause again – and this time the raucous sound of the expected brasses. The screen faded into the long, impressively soldier-lined corridor up which the government spokesman in councilor's uniform strode quickly.

The silence was oppressive.

The voice that came at last was solemn, slow and hard: "By order of our sovereign, it is announced that the planet, Haven, hitherto in warlike opposition to his will, has submitted to the acceptance of defeat. At this moment, the forces of our sovereign are occupying the planet. Opposition was scattered, unco-ordinated, and speedily crushed."

The scene faded out, the original newsman returned to state importantly that other developments would be transmitted as they occurred.

Then there was dance music, and Ebling Mis threw the shield that cut the power.

Toran rose and walked unsteadily away, without a word. The psychologist made no move to stop him.

When Bayta stepped out of the kitchen, Mis motioned silence.

He said, "They've taken Haven."

And Bayta said, "Already?" Her eyes were round, and sick with disbelief.

"Without a fight. Without an unprin—" He stopped and swallowed. "You'd better leave Toran alone. It's not pleasant for him. Suppose we eat without him this once."

Bayta looked once toward the pilot room, then turned hopelessly. "Very well!"

Magnifico sat unnoticed at the table. He neither spoke nor ate but stared ahead with a concentrated fear that seemed to drain all the vitality out of his thread of a body.

Ebling Mis pushed absently at his iced-fruit dessert and said, harshly, "Two Trading worlds fight. They fight, and bleed, and die and don't surrender. Only at Haven – Just as at the Foundation–"

"But why? Why?"

The psychologist shook his head. "It's of a piece with all the problem. Every queer facet is a hint at the nature of the Mule. First, the problem of how he could conquer the Foundation, with little blood, and at a single blow essentially – while the Independent Trading Worlds held out. The blanket on nuclear reactions was a puny weapon – we've discussed that back and forth till I'm sick of it – and it did not work on any but the Foundation.

"Randu suggested," and Ebling's grizzly eyebrows pulled together, "it might have been a radiant Will-Depresser. It's what might have done the work on Haven. But then why wasn't it used on Mnemon and Iss – which even now fight with such demonic intensity that it is taking half the Foundation fleet in addition to the Mule's forces to beat them down. Yes, I recognized Foundation ships in the attack."

Bayta whispered, "The Foundation, then Haven. Disaster seems to follow us, without touching. We always seem to get out by a hair. Will it last forever?"

Ebling Mis was not listening. To himself, he was making a point. "But there's another problem – another problem. Bayta, you remember the news item that the Mule's clown was not found on Terminus; that it was suspected he had fled to Haven, or been carried there by his original kidnappers. There is an importance attached to him, Bayta, that doesn't fade, and we have not located it yet. Magnifico must know something that is fatal to the Mule. I'm sure of it. "

Magnifico, white and stuttering, protested, "Sire . . . noble lord . . . indeed, I swear it is past my poor reckoning to penetrate your wants. I have told what I know to the utter limits, and with your probe, you have drawn out of my meager wit that which I knew, but knew not that I knew."

"I know . . . I know. It is something small. A hint so small that neither you nor I recognize it for what it is. Yet I must find it – for Mnemon and Iss will go soon, and when they do, we are the last remnants, the last droplets of the independent Foundation."

The stars begin to cluster closely when the core of the Galaxy is penetrated. Gravitational fields begin to overlap at intensities sufficient to introduce perturbations in an interstellar jump that can not be overlooked.

Toran became aware of that when a jump landed their ship in the full glare of a red giant which clutched viciously, and whose grip was loosed, then wrenched apart, only after twelve sleepless, soul-battering hours.

With charts limited in scope, and an experience not at all fully developed, either operationally or mathematically, Toran resigned himself to days of careful plotting between jumps.

It became a community project of a sort. Ebling Mis checked Toran's mathematics and Bayta tested possible routes, by the various generalized methods, for the presence of real solutions. Even Magnifico was put to work on the calculating machine for routine computations, a type of work, which, once explained, was a source of great amusement to him and at which he was surprisingly proficient.

So at the end of a month, or nearly, Bayta was able to survey the red line that wormed its way through the ship's trimensional model of the Galactic Lens halfway to its center, and say with Satiric relish, "You know what it looks like. It looks like a ten-foot earth-worm with a terrific case of indigestion. Eventually, you'll land us back in Haven."

"I will," growled Toran, with a fierce rustle of his chart, "if you don't shut up."

"And at that," continued Bayta, "there is probably a route fight through, straight as a meridian of longitude."

"Yeah? Well, in the first place, dimwit, it probably took five hundred ships five hundred years to work out that route by hit-and-miss, and my lousy half-credit charts don't give it. Besides, maybe those straight routes are a good thing to avoid. They're probably choked up with ships. And besides—"

"Oh, for Galaxy's sake, stop driveling and slaving so much righteous indignation." Her hands were in his hair.

He yowled, "Ouch! Let go!" seized her wrists and whipped downward, whereupon Toran, Bayta, and chair formed a tangled threesome on the floor. It degenerated into a panting wrestling match, composed mostly of choking laughter and various foul blows.

Toran broke loose at Magnifico's breathless entrance.

"What is it?"

The lines of anxiety puckered the clown's face and tightened the skin whitely over the enormous bridge of his nose. "The instruments are behaving queerly, sir. I have not, in the knowledge of my ignorance, touched anything—"

In two seconds, Toran was in the pilot room. He said quietly to Magnifico, "Wake up Ebling Mis. Have him come down here."

He said to Bayta, who was trying to get a basic order back to her hair by use of her fingers, "We've been detected, Bay."

"Detected?" And Bayta's arms dropped. "By whom?"

"Galaxy knows," muttered Toran, "but I imagine by someone with blasters already ranged and trained."

He sat down and in a low voice was already sending into the sub-ether the ship's identification code.

And when Ebling Mis entered, bathrobed and blear-eyed, Toran said with a desperate calm, "It seems we're inside the borders of a local Inner Kingdom which is called the Autarchy of Filia."

"Never heard of it," said Mis, abruptly.

"Well, neither did I," replied Toran, "but we're being stopped by a Filian ship just the same, and I don't know what it will involve."

The captain-inspector of the Filian ship crowded aboard with six armed men following him. He was short, thin-haired, thin-lipped, and dry-skinned. He coughed a sharp cough as he sat down and threw open the folio under his arm to a blank page.

"Your passports and ship's clearance, please."

"We have none," said Toran.

"None, hey?" he snatched up a microphone suspended from his belt and spoke into it quickly, "Three men and one woman. Papers not in order." He made an accompanying notation in the folio.

He said, "Where are you from?"

"Siwenna," said Toran warily.

"Where is that?"

"Thirty thousand parsecs, eighty degrees west Trantor, forty degrees—"

"Never mind, never mind!" Toran could see that his inquisitor had written down: "Point of origin – Periphery."

The Filian continued, "Where are you going?"

Toran said, "Trantor sector."

"Purpose?"

"Pleasure trip."

"Carrying any cargo?"

"No."

"Hm-m-m. We'll check on that." He nodded and two men jumped to activity. Toran made no move to interfere.

"What brings you into Filian territory?" The Filian's eyes gleamed unamiably.

"We didn't know we were. I lack a proper chart."

"You will be required to pay a hundred credits for that lack – and, of course, the usual fees required for tariff duties, et cetera."

He spoke again into the microphone – but listened more than he spoke. Then, to Toran, "Know anything about nuclear technology?"

"A little," replied Toran, guardedly.

"Yes?" The Filian closed his folio, and added, "The men of the Periphery have a knowledgeable reputation that way. Put on a suit and come with me."

Bayta stepped forward, "What are you going to do with him?"

Toran put her aside gently, and asked coldly, "Where do you want me to come?"

"Our power plant needs minor adjustments. He'll come with you." His pointing finger aimed directly at Magnifico, whose brown eyes opened wide in a blubbery dismay.

"What's he got to do with it?" demanded Toran fiercely.

The official looked up coldly. "I am informed of pirate activities in this vicinity. A description of one of the known thugs tallies roughly. It is a purely routine matter of identification. "

Toran hesitated, but six men and six blasters are eloquent arguments. He reached into the cupboard for the suits.

An hour later, he rose upright in the bowels of the Filian ship and raged, "There's not a thing wrong with the motors that I can see. The busbars are true, the L-tubes are feeding properly and the reaction analysis checks. Who's in charge here?"

The head engineer said quietly, "I am."

"Well, get me out of here—"

He was led to the officers' level and the small anteroom held only an indifferent ensign.

"Where's the man who came with me?"

"Please wait," said the ensign.

It was fifteen minutes later that Magnifico was brought in.

"What did they do to you?" asked Toran quickly.

"Nothing. Nothing at all." Magnifico's head shook a slow negative.

It took two hundred and fifty credits to fulfill the demands of Filia – fifty credits of it for instant release – and they were in free space again.

Bayta said with a forced laugh, "Don't we rate an escort? Don't we get the usual figurative boot over the border?"

And Toran replied, grimly, "That was no Filian ship – and we're not leaving for a while. Come in here."

They gathered about him.

He said, whitely, "That was a Foundation ship, and those were the Mule's men aboard."

Ebling bent to pick up the cigar he had dropped. He said, "Here? We're fifteen thousand parsecs from the Foundation. "

"And we're here. What's to prevent them from making the same trip. Galaxy, Ebling, don't you think I can tell ships apart? I saw their engines, and that's enough for me. I tell you it was a Foundation engine in a Foundation ship."

"And how did they get here?" asked Bayta, logically. "What are the chances of a random meeting of two given ships in space?"

"What's that to do with it?" demanded Toran, hotly. "It would only show we've been followed."

"Followed?" hooted Bayta. "Through hyperspace?"

Ebling Mis interposed wearily, "That can be done – given a good ship and a great pilot. But the possibility doesn't impress me."

"I haven't been masking my trail," insisted Toran. "I've been building up take-off speed on the straight. A blind man could have calculated our route."

"The blazes he could," cried Bayta. "With the cockeyed jumps you are making, observing our initial direction didn't mean a thing. We came out of the jump wrong-end forwards more than once."

"We're wasting time," blazed Toran, with gritted teeth. "It's a Foundation ship under the Mule. It's stopped us. It's searched us. It's had Magnifico – alone – with me as hostage to keep the rest of you quiet, in case you suspected. And we're going to bum it out of space right now."

"Hold on now," and Ebling Mis clutched at him. "Are you going to destroy us for one ship you think is an enemy? Think, man, would those scuppers chase us over an impossible route half through the bestinkered Galaxy, look us over, and then *let us go*?"

"They're still interested in where we're going."

"Then why stop us and put us on our guard? You can't have it both ways, you know."

"I'll have it my way. Let go of me, Ebling, or I'll knock you down."

Magnifico leaned forward from his balanced perch on his favorite chair back. His long nostrils flared with excitement. "I crave your pardon for my interruption, but my poor mind is of a sudden plagued with a queer thought."

Bayta anticipated Toran's gesture of annoyance, and added her grip to Ebling's. "Go ahead and speak, Magnifico. We will all listen faithfully."

Magnifico said, "In my stay in their ship what addled wits I have were bemazed and bemused by a chattering fear that befell men. Of a truth I have a lack of memory of most that happened. Many men staring at me, and talk I did not understand. But towards the last – as though a beam of sunlight had dashed through a cloud rift – there was a face I knew. A glimpse, the merest glimmer – and yet it glows in my memory ever stronger and brighter."

Toran said, "Who was it?"

"That captain who was with us so long a time ago, when first you saved me from slavery."

It had obviously been Magnifico's intention to create a sensation, and the delighted smile that curled broadly in the shadow of his proboscis, attested to his realization of the intention's success.

"Captain . . . Han . . . Pritcher?" demanded Mis, sternly. "You're sure of that? Certain sure now?"

"Sir, I swear," and he laid a bone-thin hand upon his narrow chest. "I would uphold the truth of it before the Mule and swear it in his teeth, though all his power were behind him to deny it."

Bayta said in pure wonder, "Then what's it all about?" The clown faced her eagerly, "My lady, I have a theory. It came upon me, ready made, as though the Galactic Spirit had gently laid it in my mind." He actually raised his voice above Toran's interrupting objection.

"My lady," he addressed himself exclusively to Bayta, "if this captain had, like us, escaped with a ship; if he, like us, were on a trip for a purpose of his own devising; if he blundered upon us – he would suspect us of following and waylaying him, as we suspect *him* of the like. What wonder he played this comedy to enter our ship?"

"Why would he want us in *his* ship, then?" demanded Toran. "That doesn't fit."

"Why, yes, it does," clamored the clown, with a flowing inspiration. "He sent an underling who knew us not, but who described us into his microphone. The listening captain would be struck at my own poor likeness – for, of a truth there are not many in

this great Galaxy who bear a resemblance to my scantiness. I was the proof of the identity of the rest of you."

"And so he leaves us?"

"What do we know of his mission, and the secrecy thereof? lie has spied us out for not an enemy and having it done so, must he needs think it wise to risk his plan by widening the knowledge thereof?"

Bayta said slowly, "Don't be stubborn, Torie. It *does* explain things."

"It could be," agreed Mis.

Toran seemed helpless in the face of united resistance. Something in the clown's fluent explanations bothered him. Something was wrong. Yet he was bewildered and, in spite of himself, his anger ebbed.

"For a while," he whispered, "I thought we might have had one of the Mule's ships."

And his eyes were dark with the pain of Haven's loss.

The others understood.

22. DEATH ON NEOTRANTOR

NEOTRANTOR The small planet of Delicass, renamed after the Great Sack, was for nearly a century, the seat of the last dynasty of the First Empire. It was a shadow world and a shadow Empire and its existence is only of legalistic importance. Under the first of the Neotrantorian dynasty. .

..

ENCYCLOPEDIA GALACTICA

Neotrantor was the name! New Trantor! And when you have said the name you have exhausted at a stroke all the resemblances of the new Trantor to the great original. Two parsecs away, the sun of Old Trantor still shone and the Galaxy's Imperial Capital of the previous century still cut through space in the silent and eternal repetition of its orbit.

Men even inhabited Old Trantor. Not many – a hundred million, perhaps, where fifty years before, forty billions had swarmed. The huge, metal world was in jagged splinters. The towering thrusts of the multi-towers from the single world-girdling base were torn and empty – still bearing the original blastholes and firegut – shards of the Great Sack of forty years earlier.

It was strange that a world which had been the center of a Galaxy for two thousand years – that had ruled limitless space and been home to legislators and rulers whose whims spanned the parsecs – could die in a month. It was strange that a world which had been untouched through the vast conquering sweeps and retreats of a millennia, and equally untouched by the civil wars and palace revolutions of other millennia – should lie dead at last. It was strange that the Glory of the Galaxy should be a rotting corpse.

And pathetic!

For centuries would yet pass before the mighty works of fifty generations of humans would decay past use. Only the declining powers of men, themselves, rendered them useless now.

The millions left after the billions had died tore up the gleaming metal base of the planet and exposed soil that had not felt the touch of sun in a thousand years.

Surrounded by the mechanical perfections of human efforts, encircled by the industrial marvels of mankind freed of the tyranny of environment – they returned to the land. In the huge traffic clearings, wheat and corn grew. In the shadow of the towers, sheep grazed.

But Neotrantor existed – an obscure village of a planet drowned in the shadow of mighty Trantor, until a heart-throttled royal family, racing before the fire and flame of the Great Sack sped to it as its last refuge – and held out there, barely, until the roaring wave of rebellion subsided. There it ruled in ghostly splendor over a cadaverous remnant of Imperium.

Twenty agricultural worlds were a Galactic Empire!

Dagobert IX, ruler of twenty worlds of refractory squires and sullen peasants, was Emperor of the Galaxy, Lord of the Universe.

Dagobert IX had been twenty-five on the bloody day he arrived with his father upon Neotrantor. His eyes and mind were still alive with the glory and the power of the Empire that was. But his son, who might one day be Dagobert X, was born on Neotrantor.

Twenty worlds were all he knew.

Jord Commason's open air car was the finest vehicle of its type on all Neotrantor – and, after all, justly so. It did not end with the fact that Commason was the largest landowner on Neotrantor. It began there. For in earlier days he had been the companion and evil genius of a young crown prince, restive in the dominating grip of a middle-aged emperor. And now he was the companion and still the evil genius of a middle-aged crown prince who hated and dominated an old emperor.

So Jord Commason, in his air car, which in mother-of-pearl finish and gold-and-lumetron ornamentation needed no coat of arms as owner's identification, surveyed the lands that were his, and the miles of rolling wheat that were his, and the huge threshers and harvesters that were his, and the tenant-farmers and machine-tenders that were his – and considered his problems cautiously.

Beside him, his bent and withered chauffeur guided the ship gently through the upper winds and smiled.

Jord Commason spoke to the wind, the air, and the sky, "You remember what I told you, Inchney?"

Inchney's thin gray hair wisped lightly in the wind. His gap-toothed smile widened in its thin-lipped fashion and the vertical wrinkles of his cheeks deepened as though he were keeping an eternal secret from himself. The whisper of his voice whistled between his teeth.

"I remember, sire, and I have thought."

"And what have you thought, Inchney?" There was an impatience about the question.

Inchney remembered that he had been young and handsome, and a lord on Old Trantor. Inchney remembered that he was a disfigured ancient on Neotrantor, who lived by grace of Squire Jord Commason, and paid for the grace by lending his subtlety on request. He sighed very softly.

He whispered again, "Visitors from the Foundation, sire, are a convenient thing to have. Especially, sire, when they come with but a single ship, and but a single fighting man. How welcome they might be."

"Welcome?" said Commason, gloomily. "Perhaps so. But those men are magicians and may be powerful."

"*Pugh*," muttered Inchney, "the mistiness of distance hides the truth. The Foundation is but a world. Its citizens are but men. If you blast them, they die."

Inchney held the ship on its course – A river was a winding sparkle below. He whispered, "And is there not a man they speak of now who stirs the worlds of the Periphery?"

Commason was suddenly suspicious. "What do you know of this?"

There was no smile on his chauffeur's face. "Nothing, sire. It was but an idle question."

The squire's hesitation was short. He said, with brutal directness, "Nothing you ask is idle, and your method of acquiring knowledge will have your scrawny neck in a vise yet. But – I have it! This man is called the Mule, and a subject of his had been here some months ago on a . . . matter of business. I await another . . . now . . . for its conclusion."

"And these newcomers? They are not the ones you want, perhaps?"

"They lack the identification they should have."

"It has been reported that the Foundation has been captured–"

"I did not tell you that."

"It has been so reported," continued Inchney, coolly, "and if that is correct, then these may be refugees from the destruction, and may be held for the Mule's man out of honest friendship."

"Yes?" Commason was uncertain.

"And, sire, since it is well-known that the friend of a conqueror is but the last victim, it would be but a measure of honest self-defense. For there are such things as psychic probes, and here we have four Foundation brains. There is much about the Foundation it would be useful to know, much even about the Mule. And then the Mule's friendship would be a trifle the less overpowering."

Commason, in the quiet of the upper air, returned with a shiver to his first thought. "But if the Foundation has not fallen. If the reports are lies. It is said that it has been foretold it can not fall."

"We are past the age of soothsayers, sire."

"And yet if it did not fall, Inchney. Think! If it did not fall. The Mule made me promises, indeed—" He had gone too far, and backtracked. "That is, he made boasts. But boasts are wind and deeds are hard."

Inchney laughed noiselessly. "Deeds are hard indeed, until begun. One could scarcely find a further fear than a Galaxy-end Foundation."

"There is still the prince," murmured Commason, almost to himself.

"He deals with the Mule also, then, sire?"

Commason could not quite choke down the complacent shift of features. "Not entirely. Not as *I* do. But he grows wilder, more uncontrollable. A demon is upon him. If I seize these people and he takes them away for his own use – for he does not lack a certain shrewdness – I am not yet ready to quarrel with him." He frowned and his heavy cheeks bent downwards with dislike.

"I saw those strangers for a few moments yesterday," said the gray chauffeur, irrelevantly, "and it is a strange woman, that dark one. she walks with the freedom of a man and she is of a startling paleness against the dark luster of hair." There was almost a warmth in the husky whisper of the withered voice, so that Commason turned toward him in sudden surprise.

Inchney continued, "The prince, I think, would not find his shrewdness proof against a reasonable compromise. You could have the rest, if you left him the girl—"

A light broke upon Commason, "A thought! Indeed a thought! Inchney, turn back! And Inchney, if all turns well, we will discuss further this matter of your freedom."

It was with an almost superstitious sense of symbolism that Commason found a Personal Capsule waiting for him in his private study when he returned. It had arrived by a wavelength known to few. Commason smiled a fat smile. The Mule's man was coming and the Foundation had indeed fallen.

Bayta's misty visions, when she had them, of an Imperial palace, did not jibe with the reality, and inside her, there was a vague sense of disappointment. The room was small, almost plain, almost ordinary. The palace did not even match the mayor's residence back at the Foundation – and Dagobert IX –

Bayta had *definite* ideas of what an emperor ought to look like. He ought *not* look like somebody's benevolent grandfather. He ought not be thin and white and faded – or serving cups of tea with his own hand in an expressed anxiety for the comfort of his visitors.

But so it was.

Dagobert IX chuckled as he poured tea into her stiffly outheld cup.

"This is a great pleasure for me, my dear. It is a moment away from ceremony and courtiers. I have not had the opportunity for welcoming visitors from my outer provinces for a time now. My son takes care of these details now that I'm older. You haven't met my son? A fine boy. Headstrong, perhaps. But then he's young. Do you care for a flavor capsule? No?"

Toran attempted an interruption, "Your imperial majesty—"

"Yes?"

"Your imperial majesty, it has not been our intention to intrude upon you—"

"Nonsense, there is no intrusion. Tonight there will be the official reception, but until then, we are free. Let's see, where did you say you were from? It seems a long time since we had an official reception. You said you were from the Province of Anacreon?"

"From the Foundation, your imperial majesty!"

"Yes, the Foundation. I remember now. I had it located. It is in the Province of Anacreon. I have never been there. My doctor forbids extensive traveling. I don't recall any recent reports from my viceroy at Anacreon. How are conditions there?" he concluded anxiously.

"Sire," mumbled Toran, "I bring no complaints."

"That is gratifying. I will commend my viceroy."

Toran looked helplessly at Ebling Mis, whose brusque voice rose. "Sire, we have been told that it will require your permission for us to visit the Imperial University Library on Trantor."

"Trantor?" questioned the emperor, mildly, "Trantor?"

Then a look of puzzled pain crossed his thin face. "Trantor?" he whispered. "I remember now. I am making plans now to return there with a flood of ships at my back. You shall come with me. Together we will destroy the rebel, Gilmer. Together we shall restore the empire!"

His bent back had straightened. His voice had strengthened. For a moment his eyes were hard. Then, he blinked and said softly, "But Gilmer is dead. I seem to remember – Yes. Yes! Gilmer is dead! Trantor is dead – For a moment, it seemed – Where was it you said you came from?"

Magnifico whispered to Bayta, "Is this really an emperor? For somehow I thought emperors were greater and wiser than ordinary men."

Bayta motioned him quiet. She said, "If your imperial majesty would but sign an order permitting us to go to Trantor, it would avail greatly the common cause."

"To Trantor?" The emperor was blank and uncomprehending.

"Sire, the Viceroy of Anacreon, in whose name we speak, sends word that Gilmer is yet alive—"

"Alive! Alive!" thundered Dagobert. "Where? It will be war!"

"Your imperial majesty, it must not yet be known. His whereabouts are uncertain. The viceroy sends us to acquaint you of the fact, and it is only on Trantor that we may find his hiding place. Once discovered—"

"Yes, yes – He must be found—" The old emperor doddered to the wall and touched the little photocell with a trembling finger. He muttered, after an ineffectual pause, "My servants do not come. I can not wait for them."

He was scribbling on a blank sheet, and ended with a flourished "D." He said, "Gilmer will yet learn the power of his emperor. Where was it you came from? Anacreon? What are the conditions there? Is the name of the emperor powerful?"

Bayta took the paper from his loose fingers, "Your imperial majesty is beloved by the people. Your love for them is widely known."

"I shall have to visit my good people of Anacreon, but my doctor says . . . I don't remember what he says, but—" He looked up, his old gray eyes sharp, "Were you saying something of Gilmer?"

"No, your imperial majesty."

"He shall not advance further. Go back and tell your people that. Trantor shall hold! My father leads the fleet now, and the rebel vermin Gilmer shall freeze in space with his regicidal rabble."

He staggered into a seat and his eyes were blank once more. "What was I saying?"

Toran rose and bowed low, "Your imperial majesty has been kind to us, but the time allotted us for an audience is over. "

For a moment, Dagobert IX looked like an emperor indeed as he rose and stood stiff-backed while, one by one, his visitors retreated backward through the door—to where twenty armed men intervened and locked a circle about them.

A hand-weapon flashed—

To Bayta, consciousness returned sluggishly, but without the "Where am I?" sensation. She remembered clearly the odd old man who called himself emperor, and the other men who waited outside. The arthritic tingle in her finger joints meant a stun pistol.

She kept her eyes closed, and listened with painful attention to the voices.

There were two of them. One was slow and cautious, with a slyness beneath the surface obsequy. The other was hoarse and thick, almost sodden, and blurted out in viscous spurts. Bayta liked neither.

The thick voice was predominant.

Bayta caught the last words, "He will live forever, that old madman. It wearies me. It annoys me. Commason, I will have it. I grow older, too."

"Your highness, let us first see of what use these people are. It may be we shall have sources of strength other than your father still provides."

The thick voice was lost in a bubbling whisper. Bayta caught only the phrase, "—the girl—" but the other, fawning voice was a nasty, low, running chuckle followed by a comradely, near-patronizing, "Dagobert, you do not age. They lie who say you are not a youth of twenty."

They laughed together, and Bayta's blood was an icy trickle. Dagobert—your highness—The old emperor had spoken of a headstrong son, and the implication of the whispers now beat dully upon her. But such things didn't happen to people in real life—

Toran's voice broke upon her in a slow, hard current of cursing.

She opened her eyes, and Toran's, which were upon her, showed open relief. He said, fiercely, "This banditry will be answered by the emperor. Release us."

It dawned upon Bayta that her wrists and ankles were fastened to wall and floor by a tight attraction field.

Thick Voice approached Toran. He was paunchy, his lower eyelids puffed darkly, and his hair was thinning out. There was a gay feather in his peaked hat, and the edging of his doublet was embroidered with silvery metal-foam.

He sneered with a heavy amusement. "The emperor? The poor, mad emperor?"

"I have his pass. No subject may hinder our freedom."

"But I am no subject, space-garbage. I am the regent and crown prince and am to be addressed as such. As for my poor silly father, it amuses him to see visitors occasionally. And we humor him. It tickles his mock-imperial fancy. But, of course, it has no other meaning."

And then he was before Bayta, and she looked up at him contemptuously. He leaned close and his breath was overpoweringly minted.

He said, "Her eyes suit well, Commason – she is even prettier with them open. I think she'll do. It will be an exotic dish for a jaded taste, eh?"

There was a futile surge upwards on Toran's part, which the crown prince ignored and Bayta felt the iciness travel outward to the skin. Ebling Mis was still out; head lolling weakly upon his chest, but, with a sensation of surprise, Bayta noted that Magnifico's eyes were open, sharply open, as though awake for many minutes. Those large brown eyes swiveled towards Bayta and stared at her out of a doughy face.

He whimpered, and nodded with his head towards the crown prince, "That one has my Visi-Sonor."

The crown prince turned sharply toward the new voice, "This is yours, monster?" He swung the instrument from his shoulder where it had hung, suspended by its green strap, unnoticed by Bayta.

He fingered it clumsily, tried to sound a chord and got nothing for his pains, "Can you play it, monster?"

Magnifico nodded once.

Toran said suddenly, "You've rifled a ship of the Foundation. If the emperor will not avenge, the Foundation will."

It was the other, Commason, who answered slowly, "*What* Foundation? Or is the Mule no longer the Mule?"

There was no answer to that. The prince's grin showed large uneven teeth. The clown's binding field was broken and he was nudged ungentle to his feet. The Visi-Sonor was thrust into his hand.

"Play for us, monster," said the prince. "Play us a serenade of love and beauty for our foreign lady here. Tell her that my father's country prison is no palace, but that I can take her to one where she can swim in rose water – and know what a prince's love is. Sing of a prince's love, monster."

He placed one thick thigh upon a marble table and swung a leg idly, while his fatuous smiling stare swept Bayta into a silent rage. Toran's sinews strained against the field, in painful, perspiring effort. Ebling Mis stirred and moaned.

Magnifico gasped, "My fingers are of useless stiffness–"

"Play, monster!" roared the prince. The lights dimmed at a gesture to Commason and in the dimness he crossed his arms and waited.

Magnifico drew his fingers in rapid, rhythmic jumps from end to end of the multikeyed instrument – and a sharp, gliding rainbow of light jumped across the room. A

low, soft tone sounded – throbbing, tearful. It lifted in sad laughter, and underneath it there sounded a dull tolling.

The darkness seemed to intensify and grow thick. Music reached Bayta through the muffled folds of invisible blankets. Gleaming light reached her from the depths as though a single candle glowed at the bottom of a pit.

Automatically, her eyes strained. The light brightened, but remained blurred. It moved fuzzily, in confused color, and the music was suddenly brassy, evil – flourishing in high crescendo. The light flickered quickly, in swift motion to the wicked rhythm. Something writhed within the light. Something with poisonous metallic scales writhed and yawned. And the music writhed and yawned with it.

Bayta struggled with a strange emotion and then caught herself in a mental gasp. Almost, it reminded her of the time in the Time Vault, of those last days on Haven. It was that horrible, cloying, clinging spiderweb of horror and despair. She shrunk beneath it oppressed.

The music dinned upon her, laughing horribly, and the writhing terror at the wrong end of the telescope in the small circle of light was lost as she turned feverishly away. Her forehead was wet and cold.

The music died. It must have lasted fifteen minutes, and a vast pleasure at its absence flooded Bayta. Light glared, and Magnifico's face was close to hers, sweaty, wild-eyed, lugubrious.

"My lady," he gasped, "how fare you?"

"Well enough," she whispered, "but why did you play like that?"

She became aware of the others in the room. Toran and Mis were limp and helpless against the wall, but her eyes skimmed over them. There was the prince, lying strangely still at the foot of the table. There was Commason, moaning wildly through an open, drooling mouth.

Commason flinched, and yelled mindlessly, as Magnifico took a step towards him.

Magnifico turned, and with a leap, turned the others loose.

Toran lunged upwards and with eager, taut fists seized the landowner by the neck, "You come with us. We'll want you – to make sure we get to our ship."

Two hours later, in the ship's kitchen, Bayta served a wallop homemade pie, and Magnifico celebrated the return to space by attacking it with a magnificent disregard of table manners.

"Good, Magnifico?"

"Um-m-m-m!"

"Magnifico?"

"Yes, my lady?"

"What was it you played back there?"

The clown writhed, "I . . . I'd rather not say. I learned it once, and the Visi-Sonor is of an effect upon the nervous system most profound. Surely, it was an evil thing, and not for your sweet innocence, my lady."

"Oh, now, come, Magnifico. I'm not as innocent as that. Don't flatter so. Did I see anything like what *they* saw?"

"I hope not. I played it for them only. If you saw, it was but the rim of it – from afar."

"And that was enough. Do you know you knocked the prince out?"

Magnifico spoke grimly through a large, muffling piece of pie. "I *killed* him, my lady."

"What?" She swallowed, painfully.

"He was dead when I stopped, or I would have continued. I cared not for Commason. His greatest threat was death or torture. But, my lady, this prince looked upon you wickedly, and—" he choked in a mixture of indignation and embarrassment.

Bayta felt strange thoughts come and repressed them sternly. "Magnifico, you've got a gallant soul."

"Oh, my lady." He bent a red nose into his pie, but, somehow did not eat.

Ebling Mis stared out the port. Trantor was near – its metallic shine fearfully bright. Toran was standing there, too.

He said with dull bitterness, "We've come for nothing, Ebling. The Mule's man precedes us."

Ebling Mis rubbed his forehead with a hand that seemed shriveled out of its former plumpness. His voice was an abstracted mutter.

Toran was annoyed. "I say those people know the Foundation has fallen. I say—"

"Eh?" Mis looked up, puzzled. Then, he placed a gentle hand upon Toran's wrist, in complete oblivion of any previous conversation, "Toran, I . . . I've been looking at Trantor. Do you know . . . I have the queerest feeling . . . ever since we arrived on Neotrantor. It's an urge, a driving urge that's pushing and pushing inside. Toran, I can do it; I know I can do it. Things are becoming clear in my mind – they have never been so clear."

Toran stared – and shrugged. The words brought him no confidence.

He said, tentatively, "Mis?"

"Yes?"

"You didn't see a ship come down on Neotrantor as we left?"

Consideration was brief. "No."

"I did. Imagination, I suppose, but it could have been that Filian ship."

"The one with Captain Han Pritcher on it?"

"The one with space knows who upon it. Magnifico's information – It followed us here, Mis."

Ebling Mis said nothing,

Toran said strenuously, "is there anything wrong with you? Aren't you well?"

Mis's eyes were thoughtful, luminous, and strange. He did not answer.

23. THE RUINS OF TRANTOR

The location of an objective upon the great world of Trantor presents a problem unique in the Galaxy. There are no continents or oceans to locate from a thousand miles distance. There are no rivers, lakes, and islands to catch sight of through the cloud rifts.

The metal-covered world was – had been – one colossal city, and only the old Imperial palace could be identified readily from outer space by a stranger. The *Bayta* circled the world at almost air-car height in repeated painful search.

From polar regions, where the icy coating of the metal spires were somber evidence of the breakdown or neglect of the weather-conditioning machinery, they worked southwards. Occasionally they could experiment with the correlations –(or presumable correlations)– between what they saw and what the inadequate map obtained at Neotrantor showed.

But it was unmistakable when it came. The gap in the metal coat of the planet was fifty miles. The unusual greenery spread over hundreds of square miles, inclosing the mighty grace of the ancient Imperial residences.

The *Bayta* hovered and slowly oriented itself. There were only the huge supercauseways to guide them. Long straight arrows on the map, smooth, gleaming ribbons there below them.

What the map indicated to be the University area was reached by dead reckoning, and upon the flat area of what once must have been a busy landing-field, the ship lowered itself.

It was only as they submerged into the welter of metal that the smooth beauty apparent from the air dissolved into the broken, twisted near-wreckage that had been left in the wake of the Sack. Spires were truncated, smooth walls gouted and twisted, and just for an instant there was the glimpse of a shaven area of earth – perhaps several hundred acres in extent – dark and plowed.

Lee Senter waited as the ship settled downward cautiously. It was a strange ship, not from Neotrantor, and inwardly he sighed. Strange ships and confused dealings with the men of outer space could mean the end of the short days of peace, a return to the old grandiose times of death and battle. Senter was leader of the group; the old books were in his charge and he had read of those old days. He did not want them.

Perhaps ten minutes spent themselves as the strange ship came down to nestle upon the flatness, but long memories telescoped themselves in that time. There was first the great farm of his childhood – that remained in his mind merely as busy crowds of people. Then there was the trek of the young families to new lands. He was ten, then; an only child, puzzled, and frightened.

Then the new buildings; the great metal slabs to be uprooted and tom aside; the exposed soil to be turned, and freshened, and invigorated; neighboring buildings to be tom down and leveled; others to be transformed to living quarters.

There were crops to be grown and harvested; peaceful relations with neighboring farms to be established–

There was growth and expansion, and the quiet efficiency of self-rule. There was the coming of a new generation of hard, little youngsters born to the soil. There was the great day when he was chosen leader of the Group and for the first time since his eighteenth birthday he did not shave and saw the first stubble of his Leader's Beard appear.

And now the Galaxy might intrude and put an end to the brief idyll of isolation—

The ship landed. He watched wordlessly as the port opened. Four emerged, cautious and watchful. There were three men, varied, old, young, thin and beaked. And a woman striding among them like an equal. His hand left the two glassy black tufts of his beard as he stepped forward.

He gave the universal gesture of peace. Both hands were before him; hard, calloused palms upward.

The young man approached two steps and duplicated the gesture. "I come in peace."

The accent was strange, but the words were understandable, and welcome. He replied, deeply, "In peace be it. You are welcome to the hospitality of the Group. Are you hungry? You shall eat. Are you thirsty? You shall drink."

Slowly, the reply came, "We thank you for your kindness, and shall bear good report of your Group when we return to our world."

A queer answer, but good. Behind him, the men of the Group were smiling, and from the recesses of the surrounding structures, the women emerged.

In his own quarters, he removed the locked, mirror-walled box from its hidden place, and offered each of the guests the long, plump cigars that were reserved for great occasions. Before the woman, he hesitated. She had taken a seat among the men. The strangers evidently allowed, even expected, such effrontery. Stiffly, he offered the box.

She accepted one with a smile, and drew in its aromatic smoke, with all the relish one could expect. Lee Senter repressed a scandalized emotion.

The stiff conversation, in advance of the meal, touched politely upon the subject of fanning on Trantor.

It was the old man who asked, "What about hydroponics? Surely, for such a world as Trantor, hydroponics would be the answer."

Senter shook his head slowly. He felt uncertain. His knowledge was the unfamiliar matter of the books he had read, "Artificial fanning in chemicals, I think? No, not on Trantor. This hydroponics requires a world of industry – for instance, a great chemical industry. And in war or disaster, when industry breaks down, the people starve. Nor can all foods be grown artificially. Some lose their food value. The soil is cheaper, still better – always more dependable."

"And your food supply is sufficient?"

"Sufficient; perhaps monotonous. We have fowl that supply eggs, and milk-yielders for our dairy products – but our meat supply rests upon our foreign trade."

"Trade." The young man seemed roused to sudden interest. "You trade then. But what do you export?"

"Metal," was the curt answer. "Look for yourself. We have an infinite supply, ready processed. They come from Neotrantor with ships, demolish an indicated area-increasing our growing space – and leave us in exchange meat, canned fruit, food concentrates, farm machinery and so on. They carry off the metal and both sides profit."

They feasted on bread and cheese, and a vegetable stew that was unreservedly delicious. It was over the dessert of frosted fruit, the only imported item on the menu, that, for the first time, the Outlanders became other than mere guests. The young man produced a map of Trantor.

Calmly, Lee Senter studied it. He listened – and said gravely, "The University Grounds are a static area. We farmers do not grow crops on it. We do not, by preference, even enter it. It is one of our few relics of another time we would keep undisturbed. "

"We are seekers after knowledge. We would disturb nothing. Our ship would be our hostage." The old man offered this – eagerly, feverishly.

"I can take you there then," said Senter.

That night the strangers slept, and that night Lee Senter sent a message to Neotrantor.

24. CONVERT

The thin life of Trantor trickled to nothing when they entered among the wide-spaced buildings of the University grounds. There was a solemn and lonely silence over it.

The strangers of the Foundation knew nothing of the swirling days and nights of the bloody Sack that had left the University untouched. They knew nothing of the time after the collapse of the Imperial power, when the students, with their borrowed weapons, and their pale-faced inexperienced bravery, formed a protective volunteer army to protect the central shrine of the science of the Galaxy. They knew nothing of the Seven Days Fight, and the armistice that kept the University free, when even the Imperial palace clanged with the boots of Gilmer and his soldiers, during the short interval of their rule.

Those of the Foundation, approaching for the first time, realized only that in a world of transition from a gutted old to a strenuous new this area was a quiet, graceful museum-piece of ancient greatness.

They were intruders in a sense. The brooding emptiness rejected them. The academic atmosphere seemed still to live and to stir angrily at the disturbance.

The library was a deceptively small building which broadened out vastly underground into a mammoth volume of silence and reverie. Ebling Mis paused before the elaborate murals of the reception room.

He whispered – one had to whisper here: "I think we passed the catalog rooms back a way. I'll stop there."

His forehead was flushed, his hand trembling, "I mustn't be disturbed, Toran. Will you bring my meals down to me?"

"Anything you say. We'll do all we can to help. Do you want us to work under you—

"

"No. I must be alone—"

"You think you will get what you want."

And Ebling Mis replied with a soft certainty, "I know I will!"

Toran and Bayta came closer to "setting up housekeeping" in normal fashion than at any time in their year of married life. It was a strange sort of "housekeeping." They lived in the middle of grandeur with an inappropriate simplicity. Their food was drawn largely from Lee Senter's farm and was paid for in the little nuclear gadgets that may be found on any Trader's ship.

Magnifico taught himself how to use the projectors in the library reading room, and sat over adventure novels and romances to the point where he was almost as forgetful of meals and sleep as was Ebling Mis.

Ebling himself was completely buried. He had insisted on a hammock being slung up for him in the Psychology Reference Room. His face grew thin and white. His vigor of speech was lost and his favorite curses had died a mild death. There were times when the recognition of either Toran or Bayta seemed a struggle.

He was more himself with Magnifico who brought him his meals and often sat watching him for hours at a time, with a queer, fascinated absorption, as the aging psychologist transcribed endless equations, cross-referred to endless book-films, scurried endlessly about in a wild mental effort towards an end he alone saw.

Toran came upon her in the darkened room, and said sharply, "Bayta!"

Bayta started guiltily. "Yes? You want me, Torie?"

"Sure I want you. What in Space are you sitting there for? You've been acting all wrong since we got to Trantor. What's the matter with you?"

"Oh, Torie, stop," she said, wearily.

And "Oh, Torie, stop!" he mimicked impatiently. Then, with sudden softness, "Won't you tell me what's wrong, Bay? Something's bothering you."

"No! Nothing is, Torie. If you keep on just nagging and nagging, you'll have me mad. I'm just — thinking."

"Thinking about what?"

"About nothing. Well, about the Mule, and Haven, and the Foundation, and everything. About Ebling Mis and whether he'll find anything about the Second Foundation, and whether it will help us when he does find it — and a million other things. Are you satisfied?" Her voice was agitated.

"If you're just brooding, do you mind stopping? It isn't pleasant and it doesn't help the situation."

Bayta got to her feet and smiled weakly. "All right. I'm happy. See, I'm smiling and jolly. "

Magnifico's voice was an agitated cry outside. "My lady—"

"What is it? Come—"

Bayta's voice choked off sharply when the opening door framed the large, hard-faced—

"Pritcher," cried Toran.

Bayta gasped, "Captain! How did you find us?"

Han Pritcher stepped inside. His voice was clear and level, and utterly dead of feeling, "My rank is colonel now – under the Mule."

"Under the . . . Mule!" Toran's voice trailed off. They formed a tableau there, the three.

Magnifico stared wildly and shrank behind Toran. Nobody stopped to notice him.

Bayta said, her hands trembling in each other's tight grasp, "You are arresting us? You have really gone over to them?"

The colonel replied quickly, "I have not come to arrest you. My instructions make no mention of you. With regard to you, I am free, and I choose to exercise our old friendship, if you will let me."

Toran's face was a twisted suppression of fury, "How did you find us? You were in the Filian ship, then? You followed us?"

The wooden lack of expression on Pritcher's face might have flickered in embarrassment. "I was on the Filian ship! I met you in the first place . . . well . . . by chance."

"It is a chance that is mathematically impossible."

"No. Simply rather improbable, so my statement will have to stand. In any case, you admitted to the. Filians – there is, of course, no such nation as Filia actually – that you were heading for the Trantor sector, and since the Mule already had his contacts upon Neotrantor, it was easy to have you detained there. Unfortunately, you got away before I arrived, but not long before. I had time to have the farms on Trantor ordered to report your arrival. It was done and I am here. May I sit down? I come in friendliness, believe me.

He sat. Toran bent his head and thought futilely. With a numbed lack of emotion, Bayta prepared tea.

Toran looked up harshly. "Well, what are you waiting for – *colonel*? What's your friendship? If it's not arrest, what is it then? Protective custody? Call in your men and give your orders."

Patently, Pritcher shook his head. "No, Toran. I come of my own will to speak to you, to persuade you of the uselessness of what you are doing. If I fail I shall leave. That is all."

"That is all? Well, then peddle your propaganda, give us your speech, and leave. I don't want any tea, Bayta."

Pritcher accepted a cup, with a grave word of thanks. He looked at Toran with a clear strength as he sipped lightly. Then he said, "The Mule *is* a mutant. He can not be beaten in the very nature of the mutation—"

"Why? What is the mutation?" asked Toran, with sour humor. "I suppose you'll tell us now, eh?"

"Yes, I will. Your knowledge won't hurt him. You see – he is capable of adjusting the emotional balance of human beings. It sounds like a little trick, but it's quite unbeatable."

Bayta broke in, "The emotional balance?" She frowned, "Won't you explain that? I don't quite understand."

"I mean that it is an easy matter for him to instill into a capable general, say, the emotion of utter loyalty to the Mule and complete belief in the Mule's victory. His generals are emotionally controlled. They can not betray him; they can not weaken – and the control is permanent. His most capable enemies become his most faithful subordinates, The warlord of Kalgan surrenders his planet and becomes his viceroy for the Foundation."

"And you," added Bayta, bitterly, "betray your cause and become Mule's envoy to Trantor. I see!"

"I haven't finished. The Mule's gift works in reverse even more effectively. Despair is an emotion! At the crucial moment, keymen on the Foundation – keymen on Haven – despaired. Their worlds fell without too much struggle."

"Do you mean to say," demanded Bayta, tensely, "that the feeling I had in the Time Vault was the Mule juggling my emotional control."

"Mine, too. Everyone's. How was it on Haven towards the end?"

Bayta turned away.

Colonel Pritcher continued earnestly, "As it works for worlds, so it works for individuals. Can you fight a force which can make you surrender willingly when it so desires; can make you a faithful servant when it so desires?"

Toran said slowly, "How do I know this is the truth?"

"Can you explain the fall of the Foundation and of Haven otherwise? Can you explain my conversion otherwise? Think, man! What have you – or I – or the whole Galaxy accomplished against the Mule in all this time? What one little thing?"

Toran felt the challenge, "By the Galaxy, I can!" With a sudden touch of fierce satisfaction, he shouted, "Your wonderful Mule had contacts with Neotrantor you say that were to have detained us, eh? Those contacts are dead or worse. We killed the crown prince and left the other a whimpering idiot. The Mule did not stop us there, and that much has been undone."

"Why, no, not at all. Those weren't our men. The crown prince was a wine-soaked mediocrity. The other man, Commason, is phenomenally stupid. He was a power on his world but that didn't prevent him from being vicious, evil, and completely incompetent. We had nothing really to do with them. They were, in a sense, merely feints—"

"It was they who detained us, or tried."

"Again, no. Commason had a personal slave – a man called Inchney. Detention was *his* policy. He is old, but will serve our temporary purpose. You would not have killed him, you see."

Bayta whirled on him. She had not touched her own tea. "But, by your very statement, your own emotions have been tampered with. You've got faith and belief in

the Mule, an unnatural, a *diseased* faith in the Mule. Of what value are your opinions? You've lost all power of objective thought."

"You are wrong." Slowly, the colonel shook his head. "Only my emotions are fixed. My reason is as it always was. It may be influenced in a certain direction by my conditioned emotions, but it is not *forced*. And there are some things I can see more clearly now that I am freed of my earlier emotional trend.

"I can see that the Mule's program is an intelligent and worthy one. In the time since I have been – converted, I have followed his career from its start seven years ago. With his mutant mental power, he began by winning over a condottiere and his band. With that – and his power – he won a planet. With that – and his power – he extended his grip until he could tackle the warlord of Kalgan. Each step followed the other logically. With Kalgan in his pocket, he had a first-class fleet, and with that – and his power – he could attack the Foundation.

"The Foundation is the key. It is the greatest area of industrial concentration in the Galaxy, and now that the nuclear techniques of the Foundation are in his hands, he is the actual master of the Galaxy. With those techniques – and his power – he can force the remnants of the Empire to acknowledge his rule, and eventually – with the death of the old emperor, who is mad and not long for this world – to crown him emperor. He will then have the name as well as the fact. With that – and his power – where is the world in the Galaxy that can oppose him?

"In these last seven years, he has established a new Empire. In seven years, in other words, he will have accomplished what all Seldon's psychohistory could not have done in less than an additional seven hundred. The Galaxy will have peace and order at last.

"And you could not stop it – any more than you could stop a planet's rush with your shoulders."

A long silence followed Pritcher's speech. What remained of his tea had grown cold. He emptied his cup, filled it again, and drained it slowly. Toran bit viciously at a thumbnail. Bayta's face was cold, and distant, and white.

Then Bayta said in a thin voice, "We are not convinced. If the Mule wishes us to be, let him come here and condition us himself. You fought him until the last moment of your conversion, I imagine, didn't you?"

"I did," said Colonel Pritcher, solemnly.

"Then allow us the same privilege."

Colonel Pritcher arose. With a crisp air of finality, he said, "Then I leave. As I said earlier, my mission at present concerns you in no way. Therefore, I don't think it will be necessary to report your presence here. That is not too great a kindness. If the Mule wishes you stopped, he no doubt has other men assigned to the job, and you will be stopped. But, for what it is worth, I shall not contribute more than my requirement."

"Thank you," said Bayta faintly.

"As for Magnifico. Where is he? Come out, Magnifico, I won't hurt you–"

"What about him?" demanded Bayta, with sudden animation.

"Nothing. My instructions make no mention of him, either. I have heard that he is searched for, but the Mule will find him when the time suits him. I shall say nothing. Will you shake hands?"

Bayta shook her head. Toran glared his frustrated contempt.

There was the slightest lowering of the colonel's iron shoulders. He strode to the door, turned and said:

"One last thing. Don't think I am not aware of the source of your stubbornness. It is known that you search for the Second Foundation. The Mule, in his time, will take his measures. Nothing will help you – But I knew you in other times; perhaps there is something in my conscience that urged me to this; at any rate, I tried to help you and remove you from the final danger before it was too late. Good-by."

He saluted sharply – and was gone.

Bayta turned to a silent Toran, and whispered, "They even know about the Second Foundation."

In the recesses of the library, Ebling Mis, unaware of all, crouched under the one spark of light amid the murky spaces and mumbled triumphantly to himself.

25. DEATH OF A PSYCHOLOGIST

After that there were only two weeks left to the life of Ebling Mis.

And in those two weeks, Bayta was with him three times. The first time was on the night after the evening upon which they saw Colonel Pritcher. The second was one week later. And the third was again a week later – on the last day – the day Mis died.

First, there was the night of Colonel Pritcher's evening, the first hour of which was spent by a stricken pair in a brooding, unmerry merry-go-round.

Bayta said, "Torie, let's tell Ebling."

Toran said dully, "Think he can help?"

"We're only two. We've got to take some of the weight off. Maybe he *can* help."

Toran said, "He's changed. He's lost weight. He's a little feathery; a little woolly." His fingers groped in air, metaphorically. "Sometimes, I don't think he'll help us muchever. Sometimes, I don't think anything will help."

"Don't!" Bayta's voice caught and escaped a break, "Torie, don't! When you say that, I think the Mule's getting us. Let's tell Ebling, Torie – now!"

Ebling Mis raised his head from the long desk, and bleared at them as they approached. His thinning hair was scuffed up, his lips made sleepy, smacking sounds.

"Eh?" he said. "Someone want me?"

Bayta bent to her knees, "Did we wake you? Shall we leave?"

"Leave? Who is it? Bayta? No, no, stay! Aren't there chairs? I saw them—" His finger pointed vaguely.

Toran pushed two ahead of him. Bayta sat down and took one of the psychologist's flaccid hands in hers. "May we talk to you, Doctor?" She rarely used the title.

"Is something wrong?" A little sparkle returned to his abstracted eyes. His sagging cheeks regained a touch of color. "Is something wrong?"

Bayta said, "Captain Pritcher has been here. Let *me* talk, Torie. You remember Captain Pritcher, Doctor?"

"Yes— Yes—" His fingers pinched his lips and released them. "Tall man. Democrat."

"Yes, he. He's discovered the Mule's mutation. He was here, Doctor, and told us."

"But that is nothing new. The Mule's mutation is straightened out." In honest astonishment, "Haven't I told you? Have I forgotten to tell you?"

"Forgotten to tell us what?" put in Toran, quickly.

"About the Mule's mutation, of course. He tampers with emotions. Emotional control! I haven't told you? Now what made me forget?" Slowly, he sucked in his under lip and considered.

Then, slowly, life crept into his voice and his eyelids lifted wide, as though his sluggish brain had slid onto a well-greased single track. He spoke in a dream, looking between the two listeners rather than at them. "It is really so simple. It requires no specialized knowledge. In the mathematics of psychohistory, of course, it works out promptly, in a third-level equation involving no more – Never mind that. It can be put into ordinary words – roughly – and have it make sense, which isn't usual with psychohistorical phenomena.

"Ask yourselves – What can upset Hari Seldon's careful scheme of history, eh?" He peered from one to the other with a mild, questioning anxiety. "What were Seldon's original assumptions? First, that there would be no fundamental change in human society over the next thousand years.

"For instance, suppose there were a major change in the Galaxy's technology, such as finding a new principle for the utilization of energy, or perfecting the study of electronic neurobiology. Social changes would render Seldon's original equations obsolete. But that hasn't happened, has it now?"

"Or suppose that a new weapon were to be invented by forces outside the Foundation, capable of withstanding all the Foundation's armaments. *That* might cause a ruinous deviation, though less certainly. But even that hasn't happened. The Mule's Nuclear Field-Depressor was a clumsy weapon and could be countered. And that was the only novelty he presented, poor as it was.

"But there was a second assumption, a more subtle one! Seldon assumed that human reaction to stimuli would remain constant. Granted that the first assumption held true, *then the second must have broken down!* Some factor must be twisting and distorting the emotional responses of human beings or Seldon couldn't have failed and the Foundation couldn't have fallen. And what factor but the Mule?"

"Am I right? Is there a flaw in the reasoning?"

Bayta's plump hand patted his gently. "No flaw, Ebling."

Mis was joyful, like a child. "This and more comes so easily. I tell you I wonder sometimes what is going on inside me. I seem to recall the time when so much was a mystery to me and now things are so clear. Problems are absent. I come across what might be one, and somehow, inside me, I see and understand. And my guesses, my theories seem always to be borne out. There's a drive in me . . . always onward . . . so that I can't stop . . . and I don't want to eat or sleep . . . but always go on . . . and on . . . and on—"

His voice was a whisper; his wasted, blue-veined hand rested tremblingly upon his forehead. There was a frenzy in his eyes that faded and went out.

He said more quietly, "Then I never told you about the Mule's mutant powers, did I? But then . . . did you say you knew about it?"

"It was Captain Pritcher, Ebling," said Bayta. "Remember?"

"He told you?" There was a tinge of outrage in his tone. "But how did he find out?"

"He's been conditioned by the Mule. He's a colonel now, a Mule's man. He came to advise us to surrender to the Mule, and he told us – what you told us."

"Then the Mule knows we're here? I must hurry – Where's Magnifico? Isn't he with you?"

"Magnifico's sleeping," said Toran, impatiently. "It's past midnight, you know."

"It is? Then – Was I sleeping when you came in?"

"You were," said Bayta decisively, "and you're not going back to work, either. You're getting into bed. Come on, Torie, help me. And you stop pushing at me, Ebling, because it's just your luck I don't shove you under a shower first. Pull off his shoes, Torie, and tomorrow you come down here and drag him out into the open air before he fades completely away. Look at you, Ebling, you'll be growing cobwebs. Are you hungry?"

Ebling Mis shook his head and looked up from his cot in a peevish confusion. "I want you to send Magnifico down tomorrow," he muttered.

Bayta tucked the sheet around his neck. "You'll have *me* down tomorrow, with washed clothes. You're going to take a good bath, and then get out and visit the farm and feel a little sun on you."

"I won't do it," said Mis weakly. "You hear me? I'm too busy."

His sparse hair spread out on the pillow like a silver fringe about his head. His voice was a confidential whisper. "You want that Second Foundation, don't you?"

Toran turned quickly and squatted down on the cot beside him. "What about the Second Foundation, Ebling?"

The psychologist freed an arm from beneath the sheet and his tired fingers clutched at Toran's sleeve. "The Foundations were established at a great Psychological Convention presided over by Hari Seldon. Toran, I have located the published minutes of that Convention. Twenty-five fat films. I have already looked through various summaries."

"Well?"

"Well, do you know that it is very easy to find from them the exact location of the First Foundation, if you know anything at all about psychohistory. It is frequently referred

to, when you understand the equations. But Toran, nobody mentions the Second Foundation, There has been no reference to it anywhere."

Toran's eyebrows pulled into a frown. "It doesn't exist?"

"Of course it exists," cried Mis, angrily, "who said it didn't? But there's less talk of it. Its significance – and all about it – are better hidden, better obscured. Don't you see? It's the more important of the two. It's the critical one; *the one that counts!* And I've got the minutes of the Seldon Convention. The Mule hasn't won yet–"

Quietly, Bayta turned the lights down. "Go to sleep!"

Without speaking, Toran and Bayta made their way up to their own quarters.

The next day, Ebling Mis bathed and dressed himself, saw the sun of Trantor and felt the wind of Trantor for the last time. At the end of the day he was once again submerged in the gigantic recesses of the library, and never emerged thereafter.

In the week that followed, life settled again into its groove. The sun of Neotrantor was a calm, bright star in Trantor's night sky. The farm was busy with its spring planting. The University grounds were silent in their desertion. The Galaxy seemed empty. The Mule might never have existed.

Bayta was thinking that as she watched Toran light his cigar carefully and look up at the sections of blue sky visible between the swarming metal spires that encircled the horizon.

"It's a nice day," he said.

"Yes, it is. Have you everything mentioned on the list, Torie?"

"Sure. Half pound butter, dozen eggs, string beans – Got it all down here, Bay. I'll have it right."

"Good. And make sure the vegetables are of the last harvest and not museum relics. Did you see Magnifico anywhere, by the way?"

"Not since breakfast. Guess he's down with Ebling, watching a book-film."

"All right. Don't waste any time, because I'll need the eggs for dinner."

Toran left with a backward smile and a wave of the hand.

Bayta turned away as Toran slid out of sight among the maze of metal. She hesitated before the kitchen door, about-faced slowly, and entered the colonnade leading to the elevator that burrowed down into the recesses.

Ebling Mis was there, head bent down over the eyepieces of the projector, motionless, a frozen, questing body. Near him sat Magnifico, screwed up into a chair, eyes sharp and watching – a bundle of slatty limbs with a nose emphasizing his scrawny face.

Bayta said softly, "Magnifico–"

Magnifico scrambled to his feet. His voice was an eager whisper. "My lady!"

"Magnifico," said Bayta, "Toran has left for the farm and won't be back for a while. Would you be a good boy and go out after him with a message that I'll write for you?"

"Gladly, my lady. My small services are but too eagerly yours, for the tiny uses you can put them to."

She was alone with Ebling Mis, who had not moved. Firmly, she placed her hand upon his shoulder. "Ebling—"

The psychologist started, with a peevisish cry, "What is it?" He wrinkled his eyes. "Is it you, Bayta? Where's Magnifico?"

"I sent him away. I want to be alone with you for a while." She enunciated her words with exaggerated distinctness. "I want to talk to you, Ebling."

The psychologist made a move to return to his projector, but her hand on his shoulder was firm. She felt the bone under the sleeve clearly. The flesh seemed to have fairly melted away since their arrival on Trantor. His face was thin, yellowish, and bore a half-week stubble. His shoulders were visibly stooped, even in a sitting position.

Bayta said, "Magnifico isn't bothering you, is he, Ebling? He seems to be down here night and day."

"No, no, no! Not at all. Why, I don't mind him. He is silent and never disturbs me. Sometimes he carries the films back and forth for me; seems to know what I want without my speaking. Just let him be."

"Very well – but, Ebling, doesn't he make you wonder? Do you hear me, Ebling? Doesn't he make you wonder?"

She jerked a chair close to his and stared at him as though to pull the answer out of his eyes.

Ebling Mis shook his head. "No. What do you mean?"

"I mean that Colonel Pritcher and you both say the Mule can condition the emotions of human beings. But are you sure of it? Isn't Magnifico himself a flaw in the theory?"

There was silence.

Bayta repressed a strong desire to shake the psychologist. "What's wrong with you, Ebling? Magnifico was the Mule's clown. Why wasn't he conditioned to love and faith? Why should he, of all those in contact with the Mule, hate him so.

"But . . . but he was conditioned. Certainly, Bay!" He seemed to gather certainty as he spoke. "Do you suppose that the Mule treats his clown the way he treats his generals? He needs faith and loyalty in the latter, but in his clown he needs only fear. Didn't you ever notice that Magnifico's continual state of panic is pathological in nature? Do you suppose it is natural for a human being to be as frightened as that all the time? Fear to such an extent becomes comic. It was probably comic to the Mule – and helpful, too, since it obscured what help we might have gotten earlier from Magnifico."

Bayta said, "You mean Magnifico's information about the Mule was false?"

"It was misleading. It was colored by pathological fear. The Mule is not the physical giant Magnifico thinks. He is more probably an ordinary man outside his mental powers. But if it amused him to appear a superman to poor Magnifico—" The psychologist shrugged. "In any case, Magnifico's information is no longer of importance."

"What is, then?"

But Mis shook himself loose and returned to his projector.

"What is, then?" she repeated. "The Second Foundation?"

The psychologist's eyes jerked towards her. "Have I told you anything about that? I don't remember telling you anything. I'm not ready yet. What have I told you?"

"Nothing," said Bayta, intensely. "Oh, Galaxy, you've told me nothing, but I wish you would because I'm deathly tired. When will it be over?"

Ebling Mis peered at her, vaguely rueful, "Well, now, my . . . my dear, I did not mean to hurt you. I forget sometimes . . . who my friends are. Sometimes it seems to me that I must not talk of all this. There's a need for secrecy – but from the Mule, not from you, my dear." He patted her shoulder with a weak amiability.

She said, "What about the Second Foundation?"

His voice was automatically a whisper, thin and sibilant. "Do you know the thoroughness with which Seldon covered his traces? The proceedings of the Seldon Convention would have been of no use to me at a as little as a month ago, before this strange insight came. Even now, it seems – tenuous. The papers put out by the Convention are often apparently unrelated; always obscure. More than once I wondered if the members of the Convention, themselves, knew all that was in Seldon's mind. Sometimes I think he used the Convention only as a gigantic front, and single-handed erected the structure–"

"Of the Foundations?" urged Bayta.

"Of the Second Foundation! Our Foundation was simple. But the Second Foundation was only a name. It was mentioned, but if there was any elaboration, it was hidden deep in the mathematics. There is still much I don't even begin to understand, but for seven days, the bits have been clumping together into a vague picture.

"Foundation Number One was a world of physical scientists. It represented a concentration of the dying science of the Galaxy under the conditions necessary to make it live again. No psychologists were included. It was a peculiar distortion, and must have had a purpose. The usual explanation was that Seldon's psychohistory worked best where the individual working units – human beings – had no knowledge of what was coming, and could therefore react naturally to all situations. Do you follow me, my dear–"

"Yes, doctor."

"Then listen carefully. Foundation Number Two was a world of mental scientists. It was the mirror image of our world. Psychology, not physics, was king." Triumphantly.

"You see?"

"I don't."

"But think, Bayta, use your head. Hari Seldon knew that his psychohistory could predict only probabilities, and not certainties. There was always a margin of error, and as time passed that margin increases in geometric progression. Seldon would naturally guard as well as he could against it. Our Foundation was scientifically vigorous. It could conquer armies and weapons. It could pit force against force. But what of the mental attack of a mutant such as the Mule?"

"That would be for the psychologists of the Second Foundation!" Bayta felt excitement rising within her.

"Yes, yes, yes! Certainly!"

"But they have done nothing so far."

"How do you know they haven't?"

Bayta considered that, "I don't. Do you have evidence that they have?"

"No. There are many factors I know nothing of. The Second Foundation could not have been established full-grown, any more than we were. We developed slowly and grew in strength; they must have also. The stars know at what stage their strength is now. Are they strong enough to fight the Mule? Are they aware of the danger in the first place? Have they capable leaders?"

"But if they follow Seldon's plan, then the Mule *must* be beaten by the Second Foundation."

"Ah," and Ebling Mis's thin face wrinkled thoughtfully, "is it that again? But the Second Foundation was a more difficult job than the First. Its complexity is hugely greater; and consequently so is its possibility of error. And if the Second Foundation should not beat the Mule, it is bad – ultimately bad. It is the end, may be, of the human race as we know it."

"No."

"Yes. If the Mule's descendants inherit his mental powers – You see? Homo sapiens could not compete. There would be a new dominant race – a new aristocracy – with homo sapiens demoted to slave labor as an inferior race. Isn't that so?"

"Yes, that is so."

"And even if by some chance the Mule did not establish a dynasty, he would still establish a distorted new Empire upheld by his personal power only. It would die with his death; the Galaxy would be left where it was before he came, except that there would no longer be Foundations around which a real and healthy Second Empire could coalesce. It would mean thousands of years of barbarism. It would mean no end in sight."

"What can we do? Can we warn the Second Foundation?"

"We must, or they may go under through ignorance, which we can not risk. But there is no way of warning them."

"No way?"

"I don't know where they are located. They are 'at the other end of the Galaxy' but that is all, and there are millions of worlds to choose from."

"But, Ebling, don't they say?" She pointed vaguely at the films that covered the table.

"No, they don't. Not where I can find it – yet. The secrecy must mean something. There must be a reason—" A puzzled expression returned to his eyes. "But I wish you'd leave. I have wasted enough time, and it's growing short – it's growing short."

He tore away, petulant and frowning.

Magnifico's soft step approached. "Your husband is home, my lady."

Ebling Mis did not greet the clown. He was back at his projector.

That evening Toran, having listened, spoke, "And you think he's really right, Bay? You think he isn't—" He hesitated.

"He is right, Torie. He's sick, I know that. The change that's come over him, the loss in weight, the way he speaks – he's sick. But as soon as the subject of the Mule or the Second Foundation, or anything he is working on, comes up, listen to him. He is lucid and clear as the sky of outer space. He knows what he's talking about. I believe him."

"Then there's hope." It was half a question.

"I . . . I haven't worked it out. Maybe! Maybe not! I'm carrying a blaster from now on." The shiny-barreled weapon was in her hand as she spoke. "Just in case, Torie, just in case."

"In case what?"

Bayta laughed with a touch of hysteria, "Never mind. Maybe I'm a little crazy, too – like Ebling Mis."

Ebling Mis at that time had seven days to live, and the seven days slipped by, one after the other, quietly.

To Toran, there was a quality of stupor about them. The warming days and the dull silence covered him with lethargy. All life seemed to have lost its quality of action, and changed into an infinite sea of hibernation.

Mis was a hidden entity whose burrowing work produced nothing and did not make itself known. He had barricaded himself. Neither Toran nor Bayta could see him. Only Magnifico's go-between characteristics were evidence of his existence. Magnifico, grown silent and thoughtful, with his tiptoed trays of food and his still, watchful witness in the gloom.

Bayta was more and more a creature of herself. The vivacity died, the self-assured competence wavered. She, too, sought her own worried, absorbed company, and once Toran had come upon her, fingering her blaster. She had put it away quickly, forced a smile.

"What are you doing with it, Bay?"

"Holding it. Is that a crime?"

"You'll blow your fool head off."

"Then I'll blow it off. Small loss!"

Married life had taught Toran the futility of arguing with a female in a dark-brown mood. He shrugged, and left her.

On the last day, Magnifico scampered breathless into their presence. He clutched at them, frightened. "The learned doctor calls for you. He is not well."

And he wasn't well. He was in bed, his eyes unnaturally large, unnaturally bright. He was dirty, unrecognizable.

"Ebling!" cried Bayta.

"Let me speak," croaked the psychologist, lifting his weight to a thin elbow with an effort. "Let me speak. I am finished; the work I pass on to you. I have kept no notes; the scrap-figures I have destroyed. No other must know. All must remain in your minds."

"Magnifico," said Bayta, with rough directness. "Go upstairs!"

Reluctantly, the clown rose and took a backward step. His sad eyes were on Mis.

Mis gestured weakly, "He won't matter; let him stay. Stay, Magnifico."

The clown sat down quickly. Bayta gazed at the floor.

Slowly, slowly, her lower lip caught in her teeth.

Mis said, in a hoarse whisper, "I am convinced the Second Foundation can win, if it is not caught prematurely by the Mule. It has kept itself secret; the secrecy must be upheld; it has a purpose. You must go there; your information is vital . . . may make all the difference. Do you hear me?"

Toran cried in near-agony, "Yes, yes! Tell us how to get there, Ebling? Where is it?"

"I can tell you," said the faint voice.

He never did.

Bayta, face frozen white, lifted her blaster and shot, with an echoing clap of noise. From the waist upward, Mis was not, and a ragged hole was in the wall behind. From numb fingers, Bayta's blaster dropped to the floor.

26. END OF THE SEARCH

There was not a word to be said. The echoes of the blast rolled away into the outer rooms and rumbled downward into a hoarse, dying whisper. Before its death, it had muffled the sharp clamor of Bayta's falling blaster, smothered Magnifico's high-pitched cry, drowned out Toran's inarticulate roar.

There was a silence of agony.

Bayta's head was bent into obscurity. A droplet caught the light as it fell. Bayta had never wept since her childhood.

Toran's muscles almost cracked in their spasm, but he did not relax – he felt as if he would never unclench his teeth again. Magnifico's face was a faded, lifeless mask.

Finally, from between teeth still tight, Toran choked out in an unrecognizable voice, "You're a Mule's woman, then. He got to you!"

Bayta looked up, and her mouth twisted with a painful merriment, "I, a Mule's woman? That's ironic."

She smiled – a brittle effort – and tossed her hair back. Slowly, her voice verged back to the normal, or something near it. "It's over, Toran; I can talk now. How much I will survive, I don't know. But I can start talking–"

Toran's tension had broken of its own weight and faded into a flaccid dullness, "Talk about what, Bay? What's there to talk about?"

"About the calamity that's followed us. We've remarked about it before, Torie. Don't you remember? How defeat has always bitten at our heels and never actually managed to nip us? We were on the Foundation, and it collapsed while the Independent Traders still fought – but we got out in time to go to Haven. We were on Haven, and it collapsed while the others still fought – and again we got out in time. We went to Neotrantor, and by now it's undoubtedly joined the Mule."

Toran listened and shook his head, "I don't understand."

"Torie, such things don't happen in real life. You and I are insignificant people; we don't fall from one vortex of politics into another continuously for the space of a year – unless we carry the vortex with us. *Unless we carry the source of infection with us!* Now do you see?"

Toran's lips tightened. His glance fixed horribly upon the bloody remnants of what had once been a human, and his eyes sickened.

"Let's get out of here, Bay. Let's get out into the open."

It was cloudy outside. The wind scudded about them in drab spurts and disordered Bayta's hair. Magnifico had crept after them and now he hovered at the edge of their conversation.

Toran said tightly, "You killed Ebling Mis because you believed *him* to be the focus of infection?" Something in her eyes struck him. He whispered, "He was the Mule?" He did not – could not – believe the implications of his own words.

Bayta laughed sharply, "Poor Ebling the Mule? Galaxy, no! I couldn't have killed him if he were the Mule. He would have detected the emotion accompanying the move and changed it for me to love, devotion, adoration, terror, whatever he pleased. No, I killed Ebling because he was *not* the Mule. I killed him because he knew where the Second Foundation was, and in two seconds would have told the Mule the secret."

"Would have told the Mule the secret," Toran repeated stupidly. "Told the Mule–"

And then he emitted a sharp cry, and turned to stare in horror at the clown, who might have been crouching unconscious there for the apparent understanding he had of what he heard.

"Not Magnifico?" Toran whispered the question.

"Listen!" said Bayta. "Do you remember what happened on Neotrantor? Oh, think for yourself, Torie–"

But he shook his head and mumbled at her.

She went on, wearily, "A man died on Neotrantor. A man died with no one touching him. Isn't that true? Magnifico played on his Visi-Sonor and when he was finished, the crown prince was dead. Now isn't that strange? Isn't it queer that a creature afraid of everything, apparently helpless with terror, has the capacity to kill at will."

"The music and the light-effects," said Toran, "have a profound emotional effect–"

"Yes, an *emotional* effect. A pretty big one. Emotional effects happen to be the Mule's specialty. That, I suppose, can be considered a coincidence. And a creature who can kill by suggestion is so full of fright. Well, the Mule tampered with his mind, supposedly, so that can be explained. But, Toran, I caught a little of that Visi-Sonor selection that killed the crown prince. Just a little – but it was enough to give me that same feeling of despair I had in the Time Vault and on Haven. Toran, I can't mistake that particular feeling."

Toran's face was darkening. "I . . . felt it, too. I forgot. I never thought–"

"It was then that it first occurred to me. It was just a vague feeling – intuition, if you like. I had nothing to go on. And then Pritcher told us of the Mule and his mutation, and it was clear in a moment. It was the Mule who had created the despair in the Time Vault; it

was Magnifico who had created the despair on Neotrantor. It was the same emotion. Therefore, the Mule and Magnifico were the same person. Doesn't it work out nicely, Torie? Isn't it just like an axiom in geometry – things equal to the same thing are equal to each other?"

She was at the edge of hysteria, but dragged herself back to sobriety by main force. She continued, "The discovery scared me to death. If Magnifico were the Mule, he could know my emotions – and cure them for his own purposes. I dared not let him know. I avoided him. Luckily, he avoided me also; he was too interested in Ebling Mis. I planned killing Mis before he could talk. I planned it secretly – as secretly as I could – so secretly I didn't dare tell it to myself.

"If I could have killed the Mule himself – But I couldn't take the chance. He would have noticed, and I would have lost everything."

She seemed drained of emotion.

Toran said harshly and with finality, "It's impossible. Look at the miserable creature. *He* the Mule? He doesn't even hear what we're saying."

But when his eyes followed his pointing finger, Magnifico was erect and alert, his eyes sharp and darkly bright. His voice was without a trace of an accent, "I hear her, my friend. It is merely that I have been sitting here and brooding on the fact that with all my cleverness and forethought I could make a mistake, and lose so much."

Toran stumbled backward as if afraid the clown might touch him or that his breath might contaminate him.

Magnifico nodded, and answered the unspoken question. "I am the Mule."

He seemed no longer a grotesque; his pipestem limbs, his beak of a nose lost their humor-compelling qualities. His fear was gone; his bearing was firm.

He was in command of the situation with an ease born of usage.

He said, tolerantly, "Seat yourselves. Go ahead; you might as well sprawl out and make yourselves comfortable. The game's over, and I'd like to tell you a story. It's a weakness of mine – I want people to understand me."

And his eyes as he looked at Bayta were still the old, soft sad brown ones of Magnifico, the clown.

"There is nothing really to my childhood," he began, plunging bodily into quick, impatient speech, "that I care to remember. Perhaps you can understand that. My meagerness is glandular; my nose I was born with. It was not possible for me to lead a normal childhood. My mother died before she saw me. I do not know my father. I grew up haphazard, wounded and tortured in mind, full of self-pity and hatred of others. I was known then as a queer child. All avoided me; most out of dislike; some out of fear. Queer incidents occurred – Well, never mind! Enough happened to enable Captain Pritcher, in his investigation of my childhood to realize that I was a mutant, which was more than I ever realized until I was in my twenties."

Toran and Bayta listened distantly. The wash of his voice broke over them, seated on the ground as they were, unheeded almost. The clown – or the Mule – paced before them with little steps, speaking downward to his own folded arms.

"The whole notion of my unusual power seems to have broken on me so slowly, in such sluggish steps. Even toward the end, I couldn't believe it. To me, men's minds are dials, with pointers that indicate the prevailing emotion. It is a poor picture, but how else can I explain it? Slowly, I learned that I could reach into those minds and turn the pointer to the spot I wished, that I could nail it there forever. And then it took even longer to realize that others couldn't.

"But the consciousness of power came, and with it, the desire to make up for the miserable position of my earlier life. Maybe you can understand it. Maybe you can try to understand it. It isn't easy to be a freak – to have a mind and an understanding and be a freak. Laughter and cruelty! To be different! To be an outsider!

"You've never been through it!"

Magnifico looked up to the sky and teetered on the balls of his feet and reminisced stonily, "But I eventually did learn, and I decided that the Galaxy and I could take turns. Come, they had had their innings, and I had been patient about it – for twenty-two years. My turn! It would be up to the rest of you to take it! And the odds would be fair enough for the Galaxy. One of me! Quadrillions of them!"

He paused to glance at Bayta swiftly. "But I had a weakness. I was nothing in myself. If I could gain power, it could only be by means of others. Success came to me through middlemen. Always! It was as Pritcher said. Through a pirate, I obtained my first asteroidal base of operations. Through an industrialist I got my first foothold on a planet. Through a variety of others ending with the warlord of Kalgan, I won Kalgan itself and got a navy. After that, it was the Foundation – and you two come into the story.

"The Foundation," he said, softly, "was the most difficult task I had met. To beat it, I would have to win over, break down, or render useless an extraordinary proportion of its ruling class. I could have done it from scratch – but a short cut was possible, and I looked for it. After all, if a strong man can lift five hundred pounds, it does not mean that he is eager to do so continuously. My emotional control is not an easy task, I prefer not to use it, where not fully necessary. So I accepted allies in my first attack upon the Foundation.

"As my clown, I looked for the agent, or agents, of the Foundation that must inevitably have been sent to Kalgan to investigate my humble self. I know now it was Han Pritcher I was looking for. By a stroke of fortune, I found you instead. I *am* a telepath, but not a complete one, and, my lady, you were from the Foundation. I was led astray by that. It was not fatal for Pritcher joined us afterward, but it was the starting point of an error that was fatal."

Toran stirred for the first time. He spoke in an outraged tone, "Hold on, now. You mean that when I outfaced that lieutenant on Kalgan with only a stun pistol, and rescued you – that you had emotionally-controlled me into it." He was spluttering. "You mean I've been tampered with all along."

A thin smile played on Magnifico's face. "Why not? You don't think it's likely? Ask yourself then – Would you have risked death for a strange grotesque you had never seen before, if you had been in your right mind? I imagine you were surprised at events in cold after-blood."

"Yes," said Bayta, distantly, "he was. It's quite plain."

"As it was," continued the Mule, "Toran was in no danger. The lieutenant had his own strict instructions to let us go. So the three of us and Pritcher went to the Foundation – and see how my campaign shaped itself instantly. When Pritcher was court-martialed and we were present, I was busy. The military judges of that trial later commanded their squadrons in the war. They surrendered rather easily, and my Navy won the battle of Horleggor, and other lesser affairs.

"Through Pritcher, I met Dr. Mis, who brought me a Visi-Sonor, entirely of his own accord, and simplified my task immensely. Only it wasn't *entirely* of his own accord."

Bayta interrupted, "Those concerts! I've been trying to fit them in. Now I see."

"Yes," said Magnifico, "the Visi-Sonor acts as a focusing device. In a way, it is a primitive device for emotional control in itself. With it, I can handle people in quantity and single people more intensively. The concerts I gave on Terminus before it fell and Haven before *it* fell contributed to the general defeatism. I might have made the crown prince of Neotrantor very sick without the Visi-Sonor, but I could not have killed him. You see?

"But it was Ebling Mis who was my most important find. He might have been—" Magnifico said it with chagrin, then hurried on, "There is a special facet to emotional control you do not know about. Intuition or insight or hunch-tendency, whatever you wish to call it, can be treated as an emotion. At least, I can treat it so. You don't understand it, do you?"

He waited for no negative, "The human mind works at low efficiency. Twenty percent is the figure usually given. When, momentarily, there is a flash of greater power it is termed a hunch, or insight, or intuition. I found early that I could induce a continual use of high brain-efficiency. It is a killing process for the person affected, but it is useful. The nuclear field-depressor which I used in the war against the Foundation was the result of high-pressuring a Kalgan technician. Again I work through others.

"Ebling Mis was the bull's-eye. His potentialities were high, and I needed him. Even before my war with the Foundation had opened, I had already sent delegates to negotiate with the Empire. It was at that time I began my search for the Second Foundation. Naturally, I didn't find it. Naturally, I knew that I must find it – and Ebling Mis was the answer. With his mind at high efficiency, he might possibly have duplicated the work of Hari Seldon.

"Partly, he did. I drove him to the utter limit. The process was ruthless, but had to be completed. He was dying at the end, but he lived—" Again, his chagrin interrupted him. "He *would* have lived long enough. Together, we three could have gone onward to the Second Foundation. It would have been the last battle – but for my mistake."

Toran stirred his voice to hardness, "Why do you stretch it out so? What was your mistake, and . . . and have done with your speech."

"Why, your wife was the mistake. Your wife was an unusual person. I had never met her like before in my life. I . . . I—" Quite suddenly, Magnifico's voice broke. He recovered with difficulty. There was a grimness about him as he continued. "She liked me without

my having to juggle her emotions. She was neither repelled by me nor amused by me. She *liked* me!

"Don't you understand? Can't you see what that would mean to me? Never before had anyone – Well, I . . . cherished that. My own emotions played me false, though I was master of all others. I stayed out of her mind, you see; I did not tamper with it. I cherished the *natural* feeling too greatly. It was my mistake – the first.

"You, Toran, were under control. You never suspected me; never questioned me; never saw anything peculiar or strange about me. As for instance, when the 'Filian' ship stopped us. They knew our location, by the way, because I was in communication with them, as I've remained in communication with my generals at all times. When they stopped us, I was taken aboard to adjust Han Pritcher, who was on it as a prisoner. When I left, he was a colonel, a Mule's man, and in command. The whole procedure was too open even for you, Toran. Yet you accepted my explanation of the matter, which was full of fallacies. See what I mean?"

Toran grimaced, and challenged him, "How did you retain communications with your generals?"

"There was no difficulty to it. Hyperwave transmitters are easy to handle and eminently portable. Nor could I be detected in a real sense! Anyone who did catch me in the act would leave me with a slice gapped out of his memory. It happened, on occasion.

"On Neotrantor, my own foolish emotions betrayed me again. Bayta was not under my control, but even so might never have suspected me if I had kept my head about the crown prince. His intentions towards Bayta – annoyed me.

"I killed him. It was a foolish gesture. An unobtrusive flight would have served as well.

"And still your suspicions would not have been certainties, if I had stopped Pritcher in his well-intentioned babbling, or paid less attention to Mis and more to you—" He shrugged.

"That's the end of it?" asked Bayta.

"That's the end."

"What now, then?"

"I'll continue with my program. That I'll find another as adequately brained and trained as Ebling Mis in these degenerate days, I doubt. I shall have to search for the Second Foundation otherwise. In a sense you have defeated me."

And now Bayta was upon her feet, triumphant. "In a sense? Only in a sense? We have defeated you *entirely!* All your victories outside the Foundation count for nothing, since the Galaxy is a barbarian vacuum now. The Foundation itself is only a minor victory, since it wasn't meant to stop *your* variety of crisis. It's the Second Foundation you must beat – *the Second Foundation* – and it's the Second Foundation that will defeat you. Your only chance was to locate it and strike it before it was prepared. You won't do that now. Every minute from now on, they will be readier for you. At this moment, *at this moment*, the machinery may have started. You'll know – when it strikes you, and your short term of

power will be over, and you'll be just another strutting conqueror, flashing quickly and meanly across the bloody face of history."

She was breathing hard, nearly gasping in her vehemence, "And we've defeated you, Toran and I. I am satisfied to die."

But the Mule's sad, brown eyes were the sad, brown, loving eyes of Magnifico. "I won't kill you or your husband. It is, after all, impossible for you two to hurt me further; and killing you won't bring back Ebling Mis. My mistakes were my own, and I take responsibility for them. Your husband and yourself may leave! Go in peace, for the sake of what I call – friendship."

Then, with a sudden touch of pride, "And meanwhile I am still the Mule, the most powerful man in the Galaxy. I shall *still* defeat the Second Foundation."

And Bayta shot her last arrow with a firm, calm certitude, "You won't! I have faith in the wisdom of Seldon yet. You shall be the last ruler of your dynasty, as well as the first."

Something caught Magnifico. "Of my dynasty? Yes, I had thought of that, often. That I might establish a dynasty. That I might have a suitable consort."

Bayta suddenly caught the meaning of the look in his eyes and froze horribly.

Magnifico shook his head. "I sense your revulsion, but that's silly. If things were otherwise, I could make you happy very easily. It would be an artificial ecstasy, but there would be no difference between it and the genuine emotion. But things are not otherwise. I call myself the Mule – but not because of my strength – obviously–"

He left them, never looking back.

SECOND FOUNDATION

1953

PROLOGUE

The First Galactic Empire had endured for tens of thousands of years. It had included all the planets of the Galaxy in a centralized rule, sometimes tyrannical, sometimes benevolent, always orderly. Human beings had forgotten that any other form of existence could be.

All except Hari Seldon.

Hari Seldon was the last great scientist of the First Empire. It was he who brought the science of psycho-history to its full development. Psycho-history was the quintessence of sociology, it was the science of human behavior reduced to mathematical equations.

The individual human being is unpredictable, but the reactions of human mobs, Seldon found, could be treated statistically. The larger the mob, the greater the accuracy that could be achieved. And the size of the human masses that Seldon worked with was no less than the population of the Galaxy which in his time was numbered in the quintillions.

It was Seldon, then, who foresaw, against all common sense and popular belief, that the brilliant Empire which seemed so strong was in a state of irremediable decay and decline. He foresaw (or he solved his equations and interpreted its symbols, which amounts to the same thing) that left to itself, the Galaxy would pass through a thirty thousand year period of misery and anarchy before a unified government would rise once more.

He set about to remedy the situation, to bring about a state of affairs that would restore peace and civilization in a single thousand of years. Carefully, he set up two colonies of scientists that he called "Foundations." With deliberate intention, he set them up "at opposite ends of the Galaxy." One Foundation was set up in the full daylight of publicity. The existence of the other, the Second Foundation, was drowned in silence.

In *Foundation* (Gnome, 1951) and *Foundation and Empire* (Gnome, 1952) are told the first three centuries of the history of the First Foundation. It began as a small community of Encyclopedists lost in the emptiness of the outer periphery of the Galaxy. Periodically, it faced a crisis in which the variables of human intercourse, of the social and economic currents of the time constricted about it. Its freedom to move lay along only one certain line and when it moved in that direction, a new horizon of development opened before it. All had been planned by Hari Seldon, long dead now.

The First Foundation, with its superior science, took over the barbarized planets that surrounded it. It faced the anarchic Warlords that broke away from the dying Empire and beat them. It faced the remnant of the Empire itself under its last strong Emperor and its last strong General and beat it.

Then it faced something which Hari Seldon could not foresee, the overwhelming power of a single human being, a Mutant. The creature known as the Mule was born with the ability to mold men's emotions and to shape their minds. His bitterest opponents

were made into his devoted servants. Armies could not, *would* not fight him. Before him, the First Foundation fell and Seldon's schemes lay partly in ruins.

There was left the mysterious Second Foundation, the goal of all searches. The Mule must find it to make his conquest of the Galaxy complete. The faithful of what was left of the First Foundation must find it for quite another reason. But where was it? That no one knew.

This, then, is the story of the search for the Second Foundation!

PART I

SEARCH BY THE MULE

1. TWO MEN AND THE MULE

THE MULE It was after the fall of the First Foundation that the constructive aspects of the Mule's regime took shape. After the definite break-up at the first Galactic Empire, it was he who first presented history with a unified volume at space truly imperial in scope. The earlier commercial empire at the fallen Foundation had been diverse and loosely knit, despite the impalpable backing at the predictions of psycho-history. It was not to be compared with the tightly controlled 'Union of Worlds' under the Mule, comprising as it did, one-tenth the volume of the Galaxy and one-fifteenth of its population. Particularly during the era of the so-called Search. . . .

ENCYCLOPEDIA GALACTICA *

* All quotations from the Encyclopedia Galactica here reproduced are taken from the 116th Edition published in 1020 F.E. by the Encyclopedia Galactica Publishing Co., Terminus, with permission of the publishers.

There is much more that the Encyclopedia has to say on the subject of the Mule and his Empire but almost all of it is not germane to the issue at immediate hand, and most of it is considerably too dry for our purposes in any case. Mainly, the article concerns itself at this point with the economic conditions that led to the rise of the "First Citizen of the Union" – the Mule's official title – and with the economic consequences thereof.

If, at any time, the writer of the article is mildly astonished at the colossal haste with which the Mule rose from nothing to vast dominion in five years, he conceals it. If he is further surprised at the sudden cessation of expansion in favor of a five-year consolidation of territory, he hides the fact.

We therefore abandon the Encyclopedia and continue on our own path for our own purposes and take up the history of the Great Interregnum – between the First and Second Galactic Empires – at the end of that five years of consolidation.

Politically, the Union is quiet. Economically, it is prosperous. Few would care to exchange the peace of the Mule's steady grip for the chaos that had preceded, On the worlds that five years previously had known the Foundation, there might be a nostalgic regret, but no more. The Foundation's leaders were dead, where useless; and Converted, where useful.

And of the Converted, the most useful was Han Pritcher, now lieutenant general.

In the days of the Foundation, Han Pritcher had been a captain and a member of the underground Democratic Opposition. When the Foundation fell to the Mule without a fight, Pritcher fought the Mule. Until, that is, he was Converted.

The Conversion was not the ordinary one brought on by the power of superior reason. Han Pritcher knew that well enough. He had been changed because the Mule was a mutant with mental powers quite capable of adjusting the conditions of ordinary humans to suit himself. But that satisfied him completely. That was as it should be. The very contentment with the Conversion was a prime symptom of it, but Han Pritcher was no longer even curious about the matter.

And now that he was returning from his fifth major expedition into the boundlessness of the Galaxy outside the Union, it was with something approaching artless joy that the veteran spaceman and Intelligence agent considered his approaching audience with the "First Citizen." His hard face, gouged out of a dark, grainless wood that did not seem to be capable of smiling without cracking, didn't show it – but the outward indications were unnecessary. The Mule could see the emotions within, down to the smallest, much as an ordinary man could see the twitch of an eyebrow.

Pritcher left his air car at the old vice-regal hangars and entered the palace grounds on foot as was required. He walked one mile along the arrowed highway – which was empty and silent. Pritcher knew that over the square miles of Palace grounds, there was not one guard, not one soldier, not one armed man.

The Mule had need of no protection.

The Mule was his own best, all-powerful protector.

Pritcher's footsteps beat softly in his own cars, as the palace reared its gleaming, incredibly light and incredibly strong metallic walls before him in the daring, overblown, near-hectic arches that characterized the architecture of the Late Empire. It brooded strongly over the empty grounds, over the crowded city on the horizon.

Within the palace was that one man – by himself – on whose inhuman mental attributes depended the new aristocracy, and the whole structure of the Union.

The huge, smooth door swung massively open at the general's approach, and he entered. He stepped on to the wide, sweeping ramp that moved upward under him. He rose swiftly in the noiseless elevator. He stood before the small plain door of the Mule's own room in the highest glitter of the palace spires.

It opened–

Bail Channis was young, and Bail Channis was Unconverted. That is, in plainer language, his emotional make-up had been unadjusted by the Mule. It remained exactly as it had been formed by the original shape of its heredity and the subsequent modifications of his environment. And that satisfied him, too.

At not quite thirty, he was in marvelously good odor in the capital. He was handsome and quick-witted – therefore successful in society. He was intelligent and self-possessed – therefore successful with the Mule. And he was thoroughly pleased at both successes.

And now, for the first time, the Mule had summoned him to personal audience.

His legs carried him down the long, glittering highway that led tautly to the sponge-aluminum spires that had been once the residence of the viceroy of Kalgan, who ruled under the old emperors; and that had been later the residence of the independent Princes of Kalgan, who ruled in their own name; and that was now the residence of the First Citizen of the Union, who ruled over an empire of his own.

Channis hummed softly to himself. He did not doubt what this was all about. The Second Foundation, naturally! That all-embracing bogey, the mere consideration of which had thrown the Mule back from his policy of limitless expansion into static caution. The official term was – "consolidation."

Now there were rumors – you couldn't stop rumors. The Mule was to begin the offensive once more. The Mule had discovered the whereabouts of the Second Foundation, and would attack. The Mule had come to an agreement with the Second Foundation and divided the Galaxy. The Mule had decided the Second Foundation did not exist and would take over all the Galaxy.

No use listing all the varieties one heard in the anterooms. It was not even the first time such rumors had circulated. But now they seemed to have more body in them, and all the free, expansive Souls Who thrived on war, military adventure, and political chaos and withered in times of stability and stagnant peace were joyful.

Bail Channis was one of these. He did not fear the mysterious Second Foundation. For that matter, he did not fear the Mule, and boasted of it. Some, perhaps, who disapproved of one at once so young and so well-off, waited darkly for the reckoning with the gay ladies' man who employed his wit openly at the expense of the Mule's physical appearance and sequestered life. None dared join him and few dared laugh, but when nothing happened to him, his reputation rose accordingly.

Channis was improvising words to the tune he was humming. Nonsense words with the recurrent refrain: "Second Foundation threatens the Nation and all of Creation."

He was at the palace.

The huge, smooth door swung massively open at his approach and he entered. He stepped on to the wide, sweeping ramp that moved upward under him. He rose swiftly in the noiseless elevator. He stood before the small plain door of the Mule's own room in the highest glitter of the palace spires.

It opened–

The man who had no name other than the Mule, and no title other than First Citizen looked out through the one-way transparency of the wall to the light and lofty city on the horizon.

In the darkening twilight, the stars were emerging, and not one but owed allegiance to him.

He smiled with fleeting bitterness at the thought. The allegiance they owed was to a personality few had ever seen.

He was not a man to look at, the Mule – not a man to look at without derision. Not more than one hundred and twenty pounds was stretched out into his five-foot-eight length. His limbs were bony stalks that jutted out of his scrawniness in graceless

angularity. And his thin face was nearly drowned out in the prominence of a fleshy beak that thrust three inches outward.

Only his eyes played false with the general farce that was the Mule. In their softness – a strange softness for the Galaxy's greatest conqueror – sadness was never entirely subdued.

In the city was to be found all the gaiety of a luxurious capital on a luxurious world. He might have established his capital on the Foundation, the strongest of his now-conquered enemies, but it was far out on the very rim of the Galaxy. Kalgan, more centrally located, with a long tradition as aristocracy's playground, suited him better – strategically.

But in its traditional gaiety, enhanced by unheard-of prosperity, he found no peace.

They feared him and obeyed him and, perhaps, even respected him – from a goodly distance. But who could look at him without contempt? Only those he had Converted. And of what value was their artificial loyalty? It lacked flavor. He might have adopted titles, and enforced ritual and invented elaborations, but even that would have changed nothing. Better – or at least, no worse – to be simply the First Citizen – and to hide himself.

There was a sudden surge of rebellion within him – strong and brutal. Not a portion of the Galaxy must be denied him, For five years he had remained silent and buried here on Kalgan because of the eternal, misty, space-ridden menace of the unseen, unheard, unknown Second Foundation. He was thirty-two. Not old – but he felt old. His body, whatever its mutant mental powers, was physically weak.

Every star! Every star he could see – and every star he couldn't see. It must all be his!

Revenge on all. On a humanity of which he wasn't a part. On a Galaxy in which he didn't fit.

The cool, overhead warning light flickered. He could follow the progress of the man who had entered the palace, and simultaneously, as though his mutant sense had been enhanced and sensitized in the lonely twilight, he felt the wash of emotional content touch the fibers of his brain.

He recognized the identity without an effort. It was Pritcher.

Captain Pritcher of the one-time Foundation. The Captain Pritcher who had been ignored and passed over by the bureaucrats of that decaying government. The Captain Pritcher whose job as petty spy he had wiped out and whom he had lifted from its slime. The Captain Pritcher whom he had made first colonel and then general; whose scope of activity he had made Galaxywide.

The now-General Pritcher who was, iron rebel though he began, completely loyal. And yet with all that, not loyal because of benefits gained, not loyal out of gratitude, not loyal as a fair return – but loyal only through the artifice of Conversion.

The Mule was conscious of that strong unalterable surface layer of loyalty and love that colored every swirl and eddy of the emotionality of Han Pritcher – the layer he had

himself implanted five years before. Far underneath there were the original traces of stubborn individuality, impatience of rule, idealism – but even he, himself, could scarcely detect them any longer.

The door behind him opened, and he turned. The transparency of the wall faded to opacity, and the purple evening light gave way to the whitely blazing glow of atomic power.

Han Pritcher took the seat indicated. There was neither bowing, nor kneeling nor the use of honorifics in private audiences with the Mule. The Mule was merely "First Citizen." He was addressed as "sir." You sat in his presence, and you could turn your back on him if it so happened that you did.

To Han Pritcher this was all evidence of the sure and confident power of the man. He was warmly satisfied with it.

The Mule said: "Your final report reached me yesterday. I can't deny that I find it somewhat depressing, Pritcher."

The general's eyebrows closed upon each other: "Yes, I imagine so – but I don't see to what other conclusions I could have come. There just isn't any Second Foundation, sir."

Arid the Mule considered and then slowly shook his head, as he had done many a time before: "There's the evidence of Ebling Mis. There is always the evidence of Ebling Mis."

It was not a new story. Pritcher said without qualification: "Mis may have been the greatest psychologist of the Foundation, but he was a baby compared to Hari Seldon. At the time he was investigating Seldon's works, he was under the artificial stimulation of your own brain control. You may have pushed him too far. He might have been wrong. Sir, he *must* have been wrong."

The Mule sighed, his lugubrious face thrust forward on its thin stalk of a neck. "If only he had lived another minute. He was on the point of telling me where the Second Foundation was. He *knew*, I'm telling you. I need not have retreated. I need not have waited and waited. So much time lost. Five years gone for nothing."

Pritcher could not have been censorious over the weak longing of his ruler; his controlled mental make-up forbade that. He was disturbed instead; vaguely uneasy. He said: "But what alternative explanation can there possibly be, sir? Five times I've gone out. You yourself have plotted the routes. And I've left no asteroid unturned. It was three hundred years ago that Hari Seldon of the old Empire supposedly established two Foundations to act as nuclei of a new Empire to replace the dying old one. One hundred years after Seldon, the First Foundation – the one we know so well – was known through all the Periphery. One hundred fifty years after Seldon – at the time of the last battle with the old Empire – it was known throughout the Galaxy. And now it's three hundred years – and where should this mysterious Second be? In no eddy of the Galactic stream has it been heard of."

"Ebling Mis said it kept itself secret. Only secrecy can turn its weakness to strength."

"Secrecy as deep as this is past possibility without nonexistence as well."

The Mule looked up, large eyes sharp and wary. "No. It *does* exist." A bony finger pointed sharply. "There is going to be a slight change in tactics."

Pritcher frowned. "You plan to leave yourself? I would scarcely advise it."

"No, of course not. You will have to go out once again – one last time. But with another in joint command."

There was a silence, and Pritcher's voice was hard, "Who, Sir?"

"There's a young man here in Kalgan. Bail Channis."

"I've never heard of him, Sir."

"No, I imagine not. But he's got an agile mind, he's ambitious – and he's *not* Converted."

Pritcher's long jaw trembled for a bare instant, "I fail to see the advantage in that."

"There is one, Pritcher. You're a resourceful and experienced man. You have given me good service. But you are Converted. Your motivation is simply an enforced and helpless loyalty to myself. When you lost your native motivations, you lost something, some subtle drive, that I cannot possibly replace."

"I don't feel that, Sir," said Pritcher grimly. "I recall myself quite well as I was in the days when I was an enemy of yours. I feel none the inferior."

"Naturally not," and the Mule's mouth twitched into a smile. "Your judgment in this matter is scarcely objective. This Channis, now, is ambitious – for himself. He is completely trustworthy – out of no loyalty but to himself. He knows that it is on my coattails that he rides and he would do anything to increase my power that the ride might be long and far and that the destination might be glorious. If he goes with you, there is just that added push behind *his* seeking – that push for himself."

"Then," said Pritcher, still insistent, "why not remove my own Conversion, if you think that will improve me. I can scarcely be mistrusted, now."

"That never, Pritcher. While you are within arm's reach, or blaster reach, of myself, you will remain firmly held in Conversion. If I were to release you this minute, I would be dead the next."

The general's nostrils flared. "I am hurt that you should think so."

"I don't mean to hurt you, but it is impossible for you to realize what your feelings would be if free to form themselves along the lines of your natural motivation. The human mind resents control. The ordinary human hypnotist cannot hypnotize a person against his will for that reason. I can, because I'm not a hypnotist, and, believe me, Pritcher, the resentment that you cannot show and do not even know you possess is something I wouldn't want to face."

Pritcher's head bowed. Futility wrenched him and left him gray and haggard inside. He said with an effort, "But how can you trust this man. I mean, completely – as you can trust me in my Conversion."

"Well, I suppose I can't entirely. That is why you must go with him. You see, Pritcher," and the Mule buried himself in the large armchair against the soft back of which he looked like an angularly animated toothpick, "if he *should* stumble on the Second

Foundation – if it *should* occur to him that an arrangement with them might be more profitable than with me – You understand?"

A profoundly satisfied light blazed in Pritcher's eyes. "That is better, Sir."

"Exactly. But remember, he must have a free rein as far as possible."

"Certainly."

"And . . . uh . . . Pritcher. The young man is handsome, pleasant and extremely charming. Don't let him fool you. He's a dangerous and unscrupulous character. Don't get in his way unless you're prepared to meet him properly. That's all."

The Mule was alone again. He let the lights die and the wall before him kicked to transparency again. The sky was purple now, and the city was a smudge of light on the horizon.

What was it all for? And if he were the master of all there was – what then? Would it really stop men like Pritcher. from being straight and tall, self-confident, strong? Would Bail Channis lose his looks? Would he himself be other than he was?

He cursed his doubts. What was he really after?

The cool, overhead warning light flickered. He could follow the progress of the man who had entered the palace and, almost against his will, he felt the soft wash of emotional content touch the fibers of his brain.

He recognized the identity without an effort. It was Channis. Here the Mule saw no uniformity, but the primitive diversity of a strong mind, untouched and unmolded except by the manifold disorganizations of the Universe. It writhed in floods and waves. There was caution on the surface, a thin, smoothing effect, but with touches of cynical ribaldry in the hidden eddies of it. And underneath there was the strong flow of self-interest and self-love, with a gush of cruel humor here and there, and a deep, still pool of ambition underlying all.

The Mule felt that he could reach out and dam the current, wrench the pool from its basin and turn it in another course, dry up one flow and begin another. But what of it? If he could bend Channis' curly head in the profoundest adoration, would that change his own grotesquerie that made him shun the day and love the night, that made him a recluse inside an empire that was unconditionally big?

The door behind him opened, and he turned. The transparency of the wall faded to opacity, and the darkness gave way to the whitely blazing artifice of atomic power.

Bail Channis sat down lightly and said: "This is a not-quite-unexpected honor, sir."

The Mule rubbed his proboscis with all four fingers at once and sounded a bit irritable in his response. "Why so, young man?"

"A hunch, I suppose. Unless I want to admit that I've been listening to rumors."

"Rumors? Which one of the several dozen varieties are you referring to?"

"Those that say a renewal of the Galactic Offensive is being planned. It is a hope with me that such is true and that I might play an appropriate part."

"Then you think there is a Second Foundation?"

"Why not? It would make things so much more interesting."

"And you find interest in it as well?"

"Certainly. In the very mystery of it! What better subject could you find for conjecture? The newspaper supplements are full of nothing else lately – which is probably significant. The *Cosmos* had one of its feature writers compose a weirdie about a world consisting of beings of pure mind – the Second Foundation, you see – who had developed mental force to energies large enough to compete with any known to physical science. Spaceships could be blasted light-years away, planets could be turned out of their orbits--"

"Interesting. Yes. But do you have any notions on the subject? Do you subscribe to this mind-power notion?"

"Galaxy, no! Do you think creatures like that would stay on their own planet? No, sir. I think the Second Foundation remains hidden because it is weaker than we think."

"In that case, I can explain myself very easily. How would you like to head an expedition to locate the Second Foundation?"

For a moment Channis seemed caught up by the sudden rush of events at just a little greater speed than he was prepared for. His tongue had apparently skidded to a halt in a lengthening silence.

The Mule said dryly: "Well?"

Channis corrugated his forehead. "Certainly. But where am I to go? Have you any information available?"

"General Pritcher will be with you--"

"Then I'm not to head it?"

"Judge for yourself when I'm done. Listen, you're not of the Foundation. You're a native of Kalgan, aren't you? Yes. Well, then, your knowledge of the Seldon plan may be vague. When the first Galactic Empire was falling, Hari Seldon and a group of psychohistorians, analyzing the future course of history by mathematical tools no longer available in these degenerate times, set up two Foundations, one at each end of the Galaxy, in such a way that the economic and sociological forces that were slowly evolving, would make them serve as foci for the Second Empire. Hari Seldon planned on a thousand years to accomplish that – and it would have taken thirty thousand without the Foundations. But he couldn't count on *me*. I am a mutant and I am unpredictable by psychohistory which can only deal with the average reactions of numbers. Do you understand?"

"Perfectly, sir. But how does that involve me?"

"You'll understand shortly. I intend to unite the Galaxy now – and reach Seldon's thousand-year goal in three hundred. One Foundation – the world of physical scientists – is still flourishing, under me. Under the prosperity and order of the Union, the atomic weapons they have developed are capable of dealing with anything in the Galaxy – except perhaps the Second Foundation. So I must know more about it. General Pritcher is of the definite opinion that it does not exist at all. I know otherwise."

Channis said delicately: "How do you know, sir?"

And the Mule's words were suddenly liquid indignation: "Because minds under my control have been interfered with. Delicately! Subtly! But not so subtly that I couldn't

notice. And these interferences are increasing, and hitting valuable men at important times. Do you wonder now that a certain discretion has kept me motionless these years?

"That is your importance. General Pritcher is the best man left me, so he is no longer safe. Of course, he does not know that. But you are Unconverted and therefore not instantly detectable as a Mule's man. You may fool the Second Foundation longer than one of my own men would – perhaps just sufficiently longer. Do you understand?"

"Um-m-m. Yes. But pardon me, sir, if I question you. How are these men of yours disturbed, so that I might detect change in General Pritcher, in case any occurs. Are they Unconverted again? Do they become disloyal?"

"No. I told you it was subtle. It's more disturbing than that, because its harder to detect and sometimes I have to wait before acting, uncertain whether a key man is being normally erratic or has been tampered with. Their loyalty is left intact, but initiative and ingenuity are rubbed out. I'm left with a perfectly normal person, apparently, but one completely useless. In the last year, six have been so treated. Six of my best." A corner of his mouth lifted. "They're in charge of training bases now – and my most earnest wishes go with them that no emergencies come up for them to decide upon."

"Suppose, sir . . . suppose it were not the Second Foundation. What if it were another, such as yourself – another mutant?"

"The planning is too careful, too long range. A single man would be in a greater hurry. No, it is a world, and you are to be my weapon against it."

Channis' eyes shone as he said: "I'm delighted at the chance."

But the Mule caught the sudden emotional upwelling. He said: "Yes, apparently it occurs to you, that you will perform a unique service, worthy of a unique reward – perhaps even that of being my successor. Quite so. But there are unique punishments, too, you know. My emotional gymnastics are not confined to the creation of loyalty alone."

And the little smile on his thin lips was grim, as Channis leaped out of his seat in horror.

For just an instant, just one, flashing instant, Channis had felt the pang of an overwhelming grief close over him. It had slammed down with a physical pain that had blackened his mind unbearably, and then lifted. Now nothing was left but the strong wash of anger.

The Mule said: "Anger won't help . . . yes, you're covering it up now, aren't you? But I can see it. So just remember – *that* sort of business can be made more intense and kept up. I've killed men by emotional control, and there's no death crueller."

He paused: "That's all!"

The Mule was alone again. He let the lights die and the wall before him kicked to transparency again. The sky was black, and the rising body of the Galactic Lens was spreading its bespanglement across the velvet depths of space.

All that haze of nebula was a mass of stars so numerous that they melted one into the other and left nothing but a cloud of light.

And all to be his–

And now but one last arrangement to make, and he could sleep.

FIRST INTERLUDE

The Executive Council of the Second Foundation was in session. To us they are merely voices. Neither the exact scene of the meeting nor the identity of those present are essential at the point.

Nor, strictly speaking, can we even consider an exact reproduction of any part of the session – unless we wish to sacrifice completely even the minimum comprehensibility we have a right to expect.

We deal here with psychologists – and not merely psychologists. Let us say, rather, scientists with a psychological orientation. That is, men whose fundamental conception of scientific philosophy is pointed in an entirely different direction from all of the orientations we know. The "psychology" of scientists brought up among the axioms deduced from the observational habits of physical science has only the vaguest relationship to PSYCHOLOGY.

Which is about as far as I can go in explaining color to a blind man – with myself as blind as the audience.

The point being made is that the minds assembled understood thoroughly the workings of each other, not only by general theory but by the specific application over a long period of these theories to particular individuals. Speech as known to us was unnecessary. A fragment of a sentence amounted almost to long-winded redundancy. A gesture, a grunt, the curve of a facial line – even a significantly timed pause yielded informational juice.

The liberty is taken, therefore, of freely translating a small portion of the conference into the extremely specific word-combinations necessary to minds oriented from childhood to a physical science philosophy, even at the risk of losing the more delicate nuances.

There was one "voice" predominant, and that belonged to the individual known simply as the First Speaker.

He said: "It is apparently quite definite now as to what stopped the Mule in his first mad rush. I can't say that the matter reflects credit upon . . . well, upon the organization of the situation. Apparently, he almost located us, by means of the artificially heightened brain-energy of what they call a 'psychologist' on the First Foundation. This psychologist was killed just before he could communicate his discovery to the Mule. The events leading to that killing were completely fortuitous for all calculations below Phase Three. Suppose you take over."

It was the Fifth Speaker who was indicated by an inflection of the voice. He said, in grim nuances: "It is certain that the situation was mishandled. We are, of course, highly vulnerable under mass attack, particularly an attack led by such a mental phenomenon as the Mule. Shortly after he first achieved Galactic eminence with the conquest of the First Foundation, half a year after to be exact, he was on Trantor. Within another half year he

would have been here and the odds would have been stupendously against us – 96.3 plus or minus 0.05% to be exact. We have spent considerable time analyzing the forces that stopped him. We know, of course, what was driving him on so in the first place. The internal ramifications of his physical deformity and mental uniqueness are obvious to all of us. However, it was only through penetration to Phase Three that we could determine – *after the fact* – the possibility of his anomalous action in the presence of another human being who had an honest affection for him.

"And since such an anomalous action would depend upon the presence of such another human being at the appropriate time, to that extent the whole affair was fortuitous. Our agents are certain that it was a girl that killed the Mule's psychologist – a girl for whom the Mule felt trust out of sentiment, and whom he, therefore, did not control mentally – simply because she liked him.

"Since that event – and for those who want the details, a mathematical treatment of the subject has been drawn up for the Central Library – which warned us, we have held the Mule off by unorthodox methods with which we daily risk Seldon's entire scheme of history. That is all."

The First Speaker paused an instant to allow the individuals assembled to absorb the full implications. He said: "The situation is then highly unstable. With Seldon's original scheme bent to the fracture point – and I must emphasize that we have blundered badly in this whole matter, in our horrible lack of foresight – we are faced with an irreversible breakdown of the Plan. Time is passing us by. I think there is only one solution left us – and even that is risky.

"We must allow the Mule to find us – in a sense."

Another pause, in which he gathered the reactions, then: "I repeat – in a sense!"

2. TWO MEN WITHOUT THE MULE

The ship was in near-readiness. Nothing lacked, but the destination. The Mule had suggested a return to Trantor – the world that was the bulk of an incomparable Galactic metropolis of the hugest Empire mankind had ever known – the dead world that had been capital of all the stars.

Pritcher disapproved. It was an old path – sucked dry.

He found Bail Channis in the ship's navigation room. The young man's curly hair was just sufficiently disheveled to allow a single curl to droop over the forehead – as if it had been carefully placed there – and even teeth showed in a smile that matched it. Vaguely, the stiff officer felt himself harden against the other.

Channis' excitement was evident, "Pritcher, it's too far a coincidence."

The general said coldly: "I'm not aware of the subject of conversation."

"Oh– Well, then drag up a chair, old man, and let's get into it. I've been going over your notes. I find them excellent."

"How . . . pleasant that you do."

"But I'm wondering if you've come to the conclusions I have. Have you ever tried analyzing the problem deductively? I mean, it's all very well to comb the stars at random, and to have done all you did in five expeditions is quite a bit of star-hopping. That's obvious. But have you calculated how long it would take to go through every known world at this rate?"

"Yes. Several times," Pritcher felt no urge to meet the young man halfway, but there was the importance of filching the other's mind – the other's uncontrolled, and hence, unpredictable, mind.

"Well, then, suppose we're analytical about it and try to decide just what we're looking for?"

"The Second Foundation," said Pritcher, grimly.

"A Foundation of psychologists," corrected Channis, "who are is weak in physical science as the First Foundation was weak in psychology. Well, you're from the First Foundation, which I'm not. The implications are probably obvious to you. We must find a world which rules by virtue of mental skills, and yet which is very backwards scientifically."

"Is that necessarily so?" questioned Pritcher, quietly. "Our own 'Union of Worlds' isn't backwards scientifically, even though our ruler owes his strength to his mental powers."

"Because he has the skills of the First Foundation to draw upon," came the slightly impatient answer, "and that is the only such reservoir of knowledge in the Galaxy. The Second Foundation must live among the dry crumbs of the broken Galactic Empire. There are no pickings there."

"So then you postulate mental power sufficient to establish their rule over a group of worlds and physical helplessness as well?"

"*Comparative* physical helplessness. Against the decadent neighboring areas, they are competent to defend themselves. Against the resurgent forces of the Mule, with his background of a mature atomic economy, they cannot stand. Else, why is their location so well-hidden, both at the start by the founder, Hari Seldon, and now by themselves. Your own First Foundation made no secret of its existence and did not have it made for them, when they were an undefended single city on a lonely planet three hundred years ago."

The smooth lines of Pritcher's dark face twitched sardonically. 'And now that you've finished your deep analysis, would you like a list of all the kingdoms, republics, planet states and dictatorships of one sort or another in that political wilderness out there that correspond to your description and to several factors besides?"

"All this has been considered then?" Channis lost none of his brashness.

"You won't find it here, naturally, but we have a completely worked out guide to the political units of the Opposing Periphery. Really, did you suppose the Mule would work entirely hit-and-miss?"

"Well, then" and the young man's voice rose in a burst of energy, "what of the Oligarchy of Tazenda?"

Pritcher touched his ear thoughtfully, "Tazenda? Oh, I think I know it. They're not in the Periphery, are they? It seems to me they're fully a third of the way towards the center of the Galaxy."

"Yes. What of that?"

"The records we have place the Second Foundation at the other end of the Galaxy. Space knows it's the only thing we have to go on. Why talk of Tazenda anyway? Its angular deviation from the First Foundation radian is only about one hundred ten to one hundred twenty degrees anyway. Nowhere near one hundred eighty."

"There's another point in the records. The Second Foundation was established at 'Star's End.'"

"No such region in the Galaxy has ever been located."

"Because it was a local name, suppressed later for greater secrecy. Or maybe one invented for the purpose by Seldon and his group. Yet there's some relationship between 'Star's End' and 'Tazenda,' don't you think?"

"A vague similarity in sound? Insufficient."

"Have you ever been there?"

"No."

"Yet it is mentioned in your records."

"Where? Oh, yes, but that was merely to take on food and water. There was certainly nothing remarkable about the world."

"Did you land at the ruling planet? The center of government?"

"I couldn't possibly say."

Channis brooded about it under the other's cold gaze. Then, "Would you look at the Lens with me for a moment?"

"Certainly."

The Lens was perhaps the newest feature of the interstellar cruisers of the day. Actually, it was a complicated calculating machine which could throw on a screen a reproduction of the night sky as seen from any given point of the Galaxy.

Channis adjusted the coordinate points and the wall lights of the pilot room were extinguished. In the dim red light at the control board of the Lens, Channis' face glowed ruddily. Pritcher sat in the pilot seat, long legs crossed, face lost in the gloom.

Slowly, as the induction period passed, the points of light brightened on the screen. And then they were thick and bright with the generously populated star-groupings of the Galaxy's center.

"This," explained Channis, "is the winter night-sky as seen from Trantor. That is the important point that, as far as I know, has been neglected so far in your search. All intelligent orientation must start from Trantor as zero point. Trantor was the capital of the Galactic Empire. Even more so scientifically and culturally, than politically. And, therefore, the significance of any descriptive name should stem, nine times out of ten, from a Trantorian orientation. You'll remember in this connection that, although Seldon was from Helicon, towards the Periphery, his group worked on Trantor itself."

"What is it you're trying to show me?" Pritcher's level voice plunged icily into the gathering enthusiasm of the other.

"The map will explain it. Do you see the dark nebula?" The shadow of his arm fell upon the screen, which took on the bespanglement of the Galaxy. The pointing finger ended on a tiny patch of black that seemed a hole in the speckled fabric of light. "The stellagraphical records call it Pelot's Nebula. Watch it. I'm going to expand the image."

Pritcher had watched the phenomenon of Lens Image expansion before but he still caught his breath. It was like being at the visiplat of a spaceship storming through a horribly crowded Galaxy without entering hyperspace. The stars diverged towards them from a common center, flared outwards and tumbled off the edge of the screen. Single points became double, then globular. Hazy patches dissolved into myriad points. And always that illusion of motion.

Channis spoke through it all, "You'll notice that we are moving along the direct line from Trantor to Pelot's Nebula, so that in effect we are still looking at a stellar orientation equivalent to that of Trantor. There is probably a slight error because of the gravitic deviation of light that I haven't the math to calculate for, but I'm sure it can't be significant."

The darkness was spreading over the screen. As the rate of magnification slowed, the stars slipped off the four ends of the screen in a regretful leave-taking. At the rims of the growing nebula, the brilliant universe of stars shone abruptly in token for that light which was merely hidden behind the swirling unradiating atom fragments of sodium and calcium that filled cubic parsecs of space.

And Channis pointed again, "This has been called 'The Mouth' by the inhabitants of that region of space. And that is significant because it is only from the Trantorian orientation that it looks like a mouth." What he indicated was a rift in the body of the Nebula, shaped like a ragged, grinning mouth in profile, outlined by the glazing glory of the starlight with which it was filled.

"Follow The Mouth." said Channis. "Follow 'The Mouth' towards the gullet as it narrows down to a thin, splintering line of light.

Again the screen expanded a trifle, until the Nebula stretched away from "The Mouth" to block off all the screen but that narrow trickle and Channis' finger silently followed it down, to where it straggled to a halt, and then, as his finger continued moving onward, to a spot where one single star sparked lonesomely; and there his finger halted, for beyond that was blackness, unrelieved.

"Star's End," said the young man, simply. "The fabric of the Nebula is thin there and the light of that one star finds its way through in just that one direction – to shine on Trantor."

"You're trying to tell me that—" the voice of the Mule's general died in suspicion.

"I'm not trying. That *is* Tazenda – Star's End."

The lights went on. The Lens flicked off. Pritcher reached Channis in three long strides, "What made you think of this?"

And Channis leaned back in his chair with a queerly puzzled expression on his face. "It was accidental. I'd like to take intellectual credit for this, but it was only accidental. In any case, however it happens, it fits. According to our references, Tazenda is an oligarchy. It rules twenty-seven inhabited planets. It is not advanced scientifically. And most of all, it is an obscure world that has adhered to a strict neutrality in the local politics of that stellar region, and is not expansionist. I think we ought to see it."

"Have you informed the Mule of this?"

"No. Nor shall we. We're in space now, about to make the first hop."

Pritcher, in sudden horror, sprang to the visiplat. Cold space met his eyes when he adjusted it. He gazed fixedly at the view, then turned. Automatically, his hand reached for the hard, comfortable curve of the butt of his blaster.

"By whose order?"

"By my order, general"—it was the first time Channis had ever used the other's title—"while I was engaging you here. You probably felt no acceleration, because it came at the moment I was expanding the field of the Lens and you undoubtedly imagined it to be an illusion of the apparent star motion."

"Why? Just what are you doing? What was the point of your nonsense about Tazenda, then?"

"That was no nonsense. I was completely serious. We're going there. We left today because we were scheduled to leave three days from now. General, you don't believe there is a Second Foundation, and I do. *You* are merely following the Mule's orders without faith; I recognize a serious danger. The Second Foundation has now had five years to prepare. How they've prepared, I don't know, but what if they have agents on Kalgan. If I carry about in my mind the knowledge of the whereabouts of the Second Foundation, they may discover that. My life might be no longer safe, and I have a great affection for my life. Even on a thin and remote possibility such as that, I would rather play safe. So no one knows of Tazenda but you, and you found out only after we were out in space. And even so, there is the question of the crew." Channis was smiling again, ironically, in obviously complete control of the situation.

Pritcher's hand fell away from his blaster, and for a moment a vague discomfort pierced him. What kept *him* from action? What deadened *him*? There was a time when he was a rebellious and unpromoted captain of the First Foundation's commercial empire, when it would have been *himself* rather than Channis who would have taken prompt and daring action such as that. Was the Mule right? Was his controlled mind so concerned with obedience as to lose initiative? He felt a thickening despondency drive him down into a strange lassitude.

He said, "Well done! However, you will consult me in the future before making decisions of this nature."

The flickering signal caught his attention.

"That's the engine room," said Channis, casually. "They warmed up on five minutes' notice and I asked them to let me know if there was any trouble. Want to hold the fort?"

Pritcher nodded mutely, and cogitated in the sudden loneliness on the evils of approaching fifty. The visiplane was sparsely starred. The main body of the Galaxy misted one end. What if he were free of the Mule's influence—

But he recoiled in horror at the thought.

Chief Engineer Huxlani looked sharply at the young, ununiformed man who carried himself with the assurance of a Fleet officer and seemed to be in a position of authority. Huxlani, as a regular Fleet man from the days his chin had dripped milk, generally confused authority with specific insignia.

But the Mule had appointed this man, and the Mule was, of course, the last word. The only word for that matter. Not even subconsciously did he question that. Emotional control went deep.

He handed Channis the little oval object without a word.

Channis hefted it, and smiled engagingly.

"You're a Foundation man, aren't you, chief?"

"Yes, sir. I served in the Foundation Fleet eighteen years before the First Citizen took over."

"Foundation training in engineering?"

"Qualified Technician, First Class – Central School on Anacreon."

"Good enough. And you found this on the communication circuit, where I asked you to look?"

"Yes, Sir."

"Does it belong there?"

"No, Sir."

"Then what is it?"

"A hypertracer, sir."

"That's not enough. I'm not a Foundation man. What is it?"

"It's a device to allow the ship to be traced through hyperspace."

"In other words we can be followed anywhere."

"Yes, Sir."

"All right. It's a recent invention, isn't it? It was developed by one of the Research Institutes set up by the First Citizen, wasn't it?"

"I believe so, Sir."

"And its workings are a government secret. Right?"

"I, believe so, Sir."

"Yet here it is. Intriguing."

Channis tossed the hypertracer methodically from hand to hand for a few seconds. Then, sharply, he held it out, "Take it, then, and put it back exactly where you found it and exactly how you found it. Understand? And then forget this incident. Entirely!"

The chief choked down his near-automatic salute, turned sharply and left.

The ship bounded through the Galaxy, its path a wide-spaced dotted line through the stars. The dots, referred to, were the scant stretches of ten to sixty light-seconds

spent in normal space and between them stretched the hundred-and-up light-year gaps that represented the "hops" through hyperspace.

Bail Channis sat at the control panel of the Lens and felt again the involuntary surge of near-worship at the contemplation of it.

He was not a Foundation man and the interplay of forces at the twist of a knob or the breaking of a contact was not second nature to him.

Not that the Lens ought quite to bore even a Foundation man. Within its unbelievably compact body were enough electronic circuits to pin-point accurately a hundred million separate stars in exact relationship to each other. And as if that were not a feat in itself, it was further capable of translating any given portion of the Galactic Field along any of the three spatial axes or to rotate any portion of the Field about a center.

It was because of that, that the Lens had performed a near-revolution in interstellar travel. In the younger days of interstellar travel, the calculation of each "hop" through hyperspace meant any amount of work from a day to a week – and the larger portion of such work was the more or less precise calculation of "Ship's Position" on the Galactic scale of reference. Essentially that meant the accurate observation of at least three widely-spaced stars, the position of which, with reference to the arbitrary Galactic triple-zero, were known.

And it is the word "known," that is the catch. To any who know the star field well from one certain reference point, stars are as individual as people. Jump ten parsecs, however, and not even your own sun is recognizable. It may not even be visible.

The answer was, of course, spectroscopic analysis. For centuries, the main object of interstellar engineering was the analysis of the "light signature" of more and more stars in greater and greater detail. With this, and the growing precision of the "hop" itself, standard routes of travel through the Galaxy were adopted and interstellar travel became less of an art and more of a science.

And yet, even under the Foundation with improved calculating machines and a new method of mechanically scanning the star field for a known "light signature," it sometimes took days to locate three stars and then calculate position in regions not previously familiar to the pilot.

It was the Lens that changed all that. For one thing it required only a single known star. For another, even a space tyro such as Channis could operate it.

The nearest sizable star at the moment was Vincetori, according to "hop" calculations, and on the visiplat now, a bright star was centered. Channis hoped that it was Vincetori.

The field screen of the Lens was thrown directly next that of the visiplat and with careful fingers, Channis punched out the coordinates of Vincetori. He closed a relay, and the star field sprang to bright view. In it, too, a bright star was centered, but otherwise there seemed no relationship. He adjusted the Lens along the Z-Axis and expanded the Field to where the photometer showed both centered stars to be of equal brightness.

Channis looked for a second star, sizably bright, on the visiplat and found one on the field screen to correspond. Slowly, he rotated the screen to similar angular deflection.

He twisted his mouth and rejected the result with a grimace. Again he rotated and another bright star was brought into position, and a third. And then he grinned. That did it. Perhaps a specialist with trained relationship perception might have clicked first try, but he'd settle for three.

That was the adjustment. In the final step, the two fields overlapped and merged into a sea of not-quite-rightness. Most of the stars were close doubles. But the fine adjustment did not take long. The double stars melted together, one field remained, and the "Ship's Position" could now be read directly off the dials. The entire procedure had taken less than half an hour.

Channis found Han Pritcher in his private quarters. The general was quite apparently preparing for bed. He looked up.

"News?"

"Not particularly. We'll be at Tazenda in another hop."

"I know."

"I don't want to bother you if you're turning in, but have you looked through the film we picked up in Cil?"

Han Pritcher cast a disparaging look at the article in question, where it lay in its black case upon his low bookshelf, "Yes."

"And what do you think?"

"I think that if there was ever any science to History, it has been quite lost in this region of the Galaxy."

Channis grinned broadly, "I know what you mean. Rather barren, isn't it?"

"Not if you enjoy personal chronicles of rulers. Probably unreachable, I should say, in both directions. Where history concerns mainly personalities, the drawings become either black or white according to the interests of the writer. I find it all remarkably useless."

"But there is talk about Tazenda. That's the point I tried to make when I gave you the film. It's the only one I could find that even mentioned them."

"All right. They have good rulers and bad. They've conquered a few planets, won some battles, lost a few. There is nothing distinctive about them. I don't think much of your theory, Channis."

"But you've missed a few points. Didn't you notice that they never formed coalitions? They always remained completely outside the politics of this corner of the star swarm. As you say, they conquered a few planets, but then they stopped – and that without any startling defeat of consequence. It's just as if they spread out enough to protect themselves, but not enough to attract attention."

"Very well," came the unemotional response. "I have no objection to landing. At the worst – a little lost time."

"Oh, no. At the worst – complete defeat. If it is the Second Foundation. Remember it would be a world of space-knows-how-many Mules."

"What do you plan to do?"

"Land on some minor subject planet. Find out as much as we can about Tazenda first, then improvise from that."

"All right. No objection. If you don't mind now, I *would* like the light out."

Channis left with a wave of his hand.

And in the darkness of a tiny room in an island of driving metal lost in the vastness of space, General Han Pritcher remained awake, following the thoughts that led him through such fantastic reaches.

If everything he had so painfully decided were true – and how all the facts were beginning to fit – then Tazenda was the Second Foundation. There was no way out. But how? How?

Could it be Tazenda? An ordinary world? One without distinction? A slum lost amid the wreckage of an Empire? A splinter among the fragments? He remembered, as from a distance, the Mule's shriveled face and his thin voice as he used to speak of the old Foundation psychologist, Ebling Mis, the one man who had – maybe – learned the secret of the Second Foundation.

Pritcher recalled the tension of the Mule's words: "It was as if astonishment had overwhelmed Mis. It was as though something about the Second Foundation had surpassed all his expectations, had driven in a direction completely different from what he might have assumed. If I could only have read his thoughts rather than his emotions. Yet the emotions were plain – and above everything else was this vast surprise."

Surprise was the keynote. Something supremely astonishing! And now came this boy, this grinning youngster, glibly joyful about Tazenda and its undistinguished subnormality. And he had to be right. He *had* to. Otherwise, nothing made sense.

Pritcher's last conscious thought had a touch of grimness. That hypertracer along the Etheric tube was still there. He had checked it one hour back, with Channis well out of the way.

SECOND INTERLUDE

It was a casual meeting in the anteroom of the Council Chamber – just a few moments before passing into the Chamber to take up the business of the day – and the few thoughts flashed back and forth quickly.

"So the Mule is on his way."

"That's what I hear, too. Risky! Mighty risky!"

"Not if affairs adhere to the functions set up."

"The Mule is not an ordinary man – and it is difficult to manipulate his chosen instruments without detection by him. The controlled minds are difficult to touch. They say he's caught on to a few cases."

"Yes, I don't see how that can be avoided."

"Uncontrolled minds are easier. But so few are in positions of authority under him–

"

They entered the Chamber. Others of the Second Foundation followed them.

3. TWO MEN AND A PEASANT

Rossem is one of those marginal worlds usually neglected in Galactic history and scarcely ever obtruding itself upon the notice of men of the myriad happier planets.

In the latter days of the Galactic Empire, a few political prisoners had inhabited its wastes, while an observatory and a small Naval garrison served to keep it from complete desertion. Later, in the evil days of strife, even before the time of Hari Seldon, the weaker sort of men, tired of the periodic decades of insecurity and danger; weary of sacked planets and a ghostly succession of ephemeral emperors making their way to the Purple for a few wicked, fruitless years – these men fled the populated centers and sought shelter in the barren nooks of the Galaxy.

Along the chilly wastes of Rossem, villages huddled. Its sun was a small ruddy niggard that clutched its dribble of heat to itself, while snow beat thinly down for nine months of the year. The tough native grain lay dormant in the soil those snow-filled months, then grew and ripened in almost panic speed, when the sun's reluctant radiation brought the temperature to nearly fifty.

Small, goatlike animals cropped the grasslands, kicking the thin snow aside with tiny, tri-hooved feet.

The men of Rossem had, thus, their bread and their milk – and when they could spare an animal – even their meat. The darkly ominous forests that gnarled their way over half of the equatorial region of the planet supplied a tough, fine-grained wood for housing. This wood, together with certain furs and minerals, was even worth exporting, and the ships of the Empire came at times and brought in exchange farm machinery, atomic heaters, even television sets. The last was not really incongruous, for the long winter imposed a lonely hibernation upon the peasant.

Imperial history flowed past the peasants of Rossem. The trading ships might bring news in impatient spurts; occasionally new fugitives would arrive – at one time, a relatively large group arrived in a body and remained – and these usually had news of the Galaxy.

It was then that the Rossemites learned of sweeping battles and decimated populations or of tyrannical emperors and rebellious viceroys. And they would sigh and shake their heads, and draw their fur collars closer about their bearded faces as they sat about the village square in the weak sun and philosophized on the evil of men.

Then after a while, no trading ships arrived at all, and life grew harder. Supplies of foreign, soft food, of tobacco, of machinery stopped. Vague word from scraps gathered on the television brought increasingly disturbing news. And finally it spread that Trantor had been sacked. The great capital world of all the Galaxy, the splendid, storied, unapproachable and incomparable home of the emperors had been despoiled and ruined and brought to utter destruction.

It was something inconceivable, and to many of the peasants of Rossem, scratching away at their fields, it might well seem that the end of the Galaxy was at hand.

And then one day not unlike other days a ship arrived again. The old men of each village nodded wisely and lifted their old eyelids to whisper that thus it had been in their father's time – but it wasn't, quite.

This ship was not an Imperial ship. The glowing Spaceship-and-Sun of the Empire was missing from its prow. It was a stubby affair made of scraps of older ships – and the men within called themselves soldiers of Tazenda.

The peasants were confused. They had not heard of Tazenda, but they greeted the soldiers nevertheless in the traditional fashion of hospitality. The newcomers inquired closely as to the nature of the planet, the number of its inhabitants, the number of its cities – a word mistaken by the peasants to mean "villages" to the confusion of all concerned – its type of economy and so on.

Other ships came and proclamations were issued all over the world that Tazenda was now the ruling world, that tax-collecting stations would be established girdling the equator – the inhabited region – that percentages of grain and furs according to certain numerical formulae would be collected annually.

The Rossemites had blinked solemnly, uncertain of the word "taxes." When collection time came, many had paid, or had stood by in confusion while the uniformed, other-wordlings loaded the harvested corn and the pelts on to the broad ground-cars.

Here and there indignant peasants banded together and brought out ancient hunting weapons – but of this nothing ever came. Grumblingly they had disbanded when the men of Tazenda came and with dismay watched their hard struggle for existence become harder.

But a new equilibrium was reached. The Tazendian governor lived dourly in the village of Gentry, from which all Rossemites were barred. He and the officials under him were dim otherworld beings that rarely impinged on the Rossemite ken. The tax-farmers, Rossemites in the employ of Tazenda, came periodically, but they were creatures of custom now – and the peasant had learned how to hide his grain and drive his cattle into the forest, and refrain from having his hut appear too ostentatiously prosperous. Then with a dull, uncomprehending expression he would greet all sharp questioning as to his assets by merely pointing at what they could see.

Even that grew less, and taxes decreased, almost as if Tazenda wearied of extorting pennies from such a world.

Trading sprang up and perhaps Tazenda found that more profitable. The men of Rossem no longer received in exchange the polished creations of the Empire, but even Tazendian machines and Tazendian food was better than the native stuff. And there were clothes for the women of other than gray home-spun, which was a very important thing.

So once again, Galactic history glided past peacefully enough, and the peasants scabbled life out of the hard soil.

Narovi blew into his beard as he stepped out of his cottage.

The first snows were sifting across the hard ground and the sky was a dull, overcast pink. He squinted carefully upward and decided that no real storm was in sight. He could

travel to Gentry without much trouble and get rid of his surplus grain in return for enough canned foods to last the winter.

He roared back through the door, which he opened a crack for the purpose: "Has the car been fed its fuel, yunker?"

A voice shouted from within, and then Narovi's oldest son, his short, red beard not yet completely outgrown its boyish sparseness, joined him.

"The car," he said, sullenly, "is fueled and rides well, but for the bad condition of the axles. For that I am of no blame. I have told you it needs expert repairs."

The old man stepped back and surveyed his son through lowering eyebrows, then thrust his hairy chin outward: "And is the fault mine? Where and in what manner may I achieve expert repairs? Has the harvest then been anything but scanty for five years? Have my herds escaped the pest? Have the pelts climbed of themselves—"

"Narovi!" The well-known voice from within stopped him in mid-word. He grumbled, "Well, well – and now your mother must insert herself into the affairs of a father and his son. Bring out the car, and see to it that the storage trailers are securely attached."

He pounded his gloved hands together, and looked upward again. The dimly-ruddy clouds were gathering and the gray sky that showed in the rifts bore no warmth. The sun was hidden.

He was at the point of looking away, when his dropping eyes caught and his finger almost automatically rose on high while his mouth fell open in a shout, in complete disregard of the cold air.

"Wife," he called vigorously, "Old woman – come here."

An indignant head appeared at a window. The woman's eyes followed his finger, gaped. With a cry, she dashed down the wooden stairs, snatching up an old wrap and a square of linen as she went. She emerged with the linen wrapped insecurely over her head and ears, and the wrap dangling from her shoulders.

She snuffled: "It is a ship from outer space."

And Narovi remarked impatiently: "And what else could it be? We have visitors, old woman, visitors!"

The ship was sinking slowly to a landing on the bare frozen field in the northern portions of Narovi's farm.

"But what shall we do?" gasped the woman. "Can we offer these people hospitality? Is the dirt floor of our hovel to be theirs and the pickings of last week's hoecake?"

"Shall they then go to our neighbors?" Narovi purpled past the crimson induced by the cold and his arms in their sleek fur covering lunged out and seized the woman's brawny shoulders.

"Wife of my soul," he purred, "you will take the two chairs from our room downstairs; you will see that a fat youngling is slaughtered and roasted with tubers; you will bake a fresh hoecake. I go now to greet these men of power from outer space . . ."

and . . . and—" He paused, placed his great cap awry, and scratched hesitantly. "Yes, I shall bring my jug of brewed grain as well. Hearty drink is pleasant."

The woman's mouth had flapped idly during this speech. Nothing came out. And when that stage passed, it was only a discordant screech that issued.

Narovi lifted a finger, "Old woman, what was it the village Elders said a se'nnight since? Eh? Stir your memory. The Elders went from farm to farm – themselves! Imagine the importance of it! – to ask us that should any ships from outer space land, they were to be informed immediately on *the orders of the governor*."

"And now shall I not seize the opportunity to win into the good graces of those in power? Regard that ship. Have you ever seen its like? These men from the outer worlds are rich, great. The governor himself sends such urgent messages concerning them that the Elders walk from farm to farm in the cooling weather. Perhaps the message is sent throughout all Rossem that these men are greatly desired by the Lords of Tazenda – and it is on my farm that they are landing."

He fairly hopped for anxiety, "The proper hospitality now – the mention of my name to the governor – and what may not be ours?"

His wife was suddenly aware of the cold biting through her thin house-clothing. She leaped towards the door, shouting over her shoulders, "Leave then quickly."

But she was speaking to a man who was even then racing towards the segment of the horizon against which the ship sank.

Neither the cold of the world, nor its bleak, empty spaces worried General Han Pritcher. Nor the poverty of their surroundings, nor the perspiring peasant himself.

What did bother him was the question of the wisdom of their tactics? He and Channis were alone here.

The ship, left in space, could take care of itself in ordinary circumstances, but still, he felt unsafe. It was Channis, of course, who was responsible for this move. He looked across at the young man and caught him winking cheerfully at the gap in the furred partition, in which a woman's peeping eyes and gaping mouth momentarily appeared.

Channis, at least, seemed completely at ease. That fact Pritcher savored with a vinegary satisfaction. His game had not much longer to proceed exactly as he wished it. Yet, meanwhile their wrist ultrawave sender-receivers were their only connection with the ship.

And then the peasant host smiled enormously and bobbed his head several times and said in a voice oily with respect, "Noble Lords, I crave leave to tell you that my eldest son – a good, worthy lad whom my poverty prevents from educating as his wisdom deserves – has informed me that the Elders will arrive soon. I trust your stay here has been as pleasant as my humble means – for I am poverty-stricken, though a hard-working, honest, and humble farmer, as anyone here will tell you – could afford."

"Elders?" said Channis, lightly. "The chief men of the region here?"

"So they are, Noble Lords, and honest, worthy men all of them, for our entire village is known throughout Rossem as a just and righteous spot – though living is hard and the returns of the fields and forests meager. Perhaps you will mention to the Elders,

Noble Lords, of my respect and honor for travelers and it may happen that they will request a new motor wagon for our household as the old one can scarcely creep and upon the remnant of it depends our livelihood."

He looked humbly eager and Han Pritcher nodded with the proper aloof condescension required of the role of "Noble, Lords" bestowed upon them.

"A report of your hospitality shall reach the ears of your Elders."

Pritcher seized the next moments of isolation to speak to the apparently half-sleeping Channis.

"I am not particularly fond of this meeting of the Elders," he said. "Have you any thoughts on the subject?"

Channis seemed surprised. "No. What worries you?"

"It seems we have better things to do than to become conspicuous here."

Channis spoke hastily, in a low monotoned voice: "It may be necessary to risk becoming conspicuous in our next moves. We won't find the type of men we want, Pritcher, by simply reaching out a hand into a dark bag and groping. Men who rule by tricks of the mind need not necessarily be men in obvious power. In the first place, the psychologists of the Second Foundation are probably a very small minority of the total population, just as on your own First Foundation, the technicians and scientists formed a minority. The ordinary inhabitants are probably just that – very ordinary. The psychologists may even be well hidden, and the men in the apparently ruling position, may honestly think they are the true masters. Our solution to that problem may be found here on this frozen lump of a planet."

"I don't follow that at all."

"Why, see here, it's obvious enough. Tazenda is probably a huge world of millions or hundreds of millions. How could we identify the psychologists among them and be able to report truly to the Mule that we have located the Second Foundation? But here, on this tiny peasant world and subject planet, the Tazendian rulers, our host informs us, are concentrated in their chief village of Genti. There may be only a few hundred of them there, Pritcher, and among them *must* be one or more of the men of the Second Foundation. We will go there eventually, but let us see the Elders first – it's a logical step on the way."

They drew apart easily, as their black-bearded host tumbled into the room again, obviously agitated.

"Noble Lords, the Elders are arriving. I crave leave to beg you once more to mention a word, perhaps, on my behalf—" He almost bent double in a paroxysm of fawning.

"We shall certainly remember you," said Channis. "Are these your Elders?"

They apparently were. There were three.

One approached. He bowed with a dignified respect and said: "We are honored. Transportation has been provided, Respected sirs, and we hope for the pleasure of your company at our Meeting Hall."

THIRD INTERLUDE

The First Speaker gazed wistfully at the night sky. Wispy clouds scudded across the faint stargleams. Space looked actively hostile. It was cold and awful at best but now it contained that strange creature, the Mule, and the very content seemed to darken and thicken it into ominous threat.

The meeting was over. It had not been long. There had been the doubts and questionings inspired by the difficult mathematical problem of dealing with a mental mutant of uncertain makeup. All the extreme permutations had had to be considered.

Were they even yet certain? Somewhere in this region of space – within reaching distance as Galactic spaces go – was the Mule. What would he do?

It was easy enough to handle his men. They reacted – and were reacting – according to plan.

But what of the Mule himself?

4. TWO MEN AND THE ELDERS

The Elders of this particular region of Rossem were not exactly what one might have expected. They were not a mere extrapolation of the peasantry; older, more authoritative, less friendly.

Not at all.

The dignity that had marked them at first meeting had grown in impression till it had reached the mark of being their predominant characteristic.

They sat about their oval table like so many grave and slow-moving thinkers. Most were a trifle past their physical prime, though the few who possessed beards wore them short and neatly arranged. Still, enough appeared younger than forty to make it quite obvious that "Elders" was a term of respect rather than entirely a literal description of age.

The two from outer space were at the head of the table and in the solemn silence that accompanied a rather frugal meal that seemed ceremonious rather than nourishing, absorbed the new, contrasting atmosphere.

After the meal and after one or two respectful remarks – too short and simple to be called speeches – had been made by those of the Elders apparently held most in esteem, an informality forced itself upon the assembly.

It was as if the dignity of greeting foreign personages had finally given way to the amiable rustic qualities of curiosity and friendliness.

They crowded around the two strangers and the flood of questions came.

They asked if it were difficult to handle a spaceship, how many men were required for the job, if better motors could be made for their ground-cars, if it was true that it rarely snowed on other worlds as was said to be the case with Tazenda, how many people lived on their world, if it was as large as Tazenda, if it was far away, how their clothes were

woven and what gave them the metallic shimmer, why they did not wear furs, if they shaved every day, what sort of stone that was in Pritcher's ring – The list stretched out.

And almost always the questions were addressed to Pritcher as though, as the elder, they automatically invested him with the greater authority. Pritcher found himself forced to answer at greater and greater length. It was like an immersion in a crowd of children. Their questions were those of utter and disarming wonder. Their eagerness to know was completely irresistible and would not be denied.

Pritcher explained that spaceships were not difficult to handle and that crews varied with the size, from one to many, that the motors of their ground-cars were unknown in detail to him but could doubtless be improved, that the climates of worlds varied almost infinitely, that many hundreds of millions lived on his world but that it was far smaller and more insignificant than the great empire of Tazenda, that their clothes were woven of silicone plastics in which metallic luster was artificially produced by proper orientation of the surface molecules, and that they could be artificially heated so that furs were unnecessary, that they shaved every day, that the stone in his ring was an amethyst. The list stretched out. He found himself thawing to these naive provincials against his will.

And always as he answered there was a rapid chatter among the Elders, as though they debated the information gained. It was difficult to follow these inner discussions of theirs for they lapsed into their own accented version of the universal Galactic language that, through long separation from the currents of living speech, had become archaic.

Almost, one might say, their curt comments among themselves hovered on the edge of understanding, but just managed to elude the clutching tendrils of comprehension.

Until finally Channis interrupted to say, "Good sirs, you must answer us for a while, for we are strangers and would be very much interested to know all we can of Tazenda."

And what happened then was that a great silence fell and each of the hitherto voluble Elders grew silent. Their hands, which had been moving in such rapid and delicate accompaniment to their words as though to give them greater scope and varied shades of meaning, fell suddenly limp. They stared furtively at one another, apparently quite willing each to let the other have all the floor.

Pritcher interposed quickly, "My companion asks this in friendliness, for the fame of Tazenda fills the Galaxy and we, of course, shall inform the governor of the loyalty and love of the Elders of Rossem."

No sigh of relief was heard but faces brightened. An Elder stroked his beard with thumb and forefinger, straightening its slight curl with a gentle pressure, and said: "We are faithful servants of the Lords of Tazenda."

Pritcher's annoyance at Channis' bald question subsided. It was apparent, at least, that the age that he had felt creeping over him of late had not yet deprived him of his own capacity for making smooth the blunders of others.

He continued: "We do not know, in our far part of the universe, much of the past history of the Lords of Tazenda. We presume they have ruled benevolently here for a long time."

The same Elder who spoke before, answered. In a soft, automatic way he had become spokesman. He said: "Not the grandfather of the oldest can recall a time in which the Lords were absent."

"It has been a time of peace?"

"It has been a time of peace!" He hesitated. "The governor is a strong and powerful Lord who would not hesitate to punish traitors. None of us are traitors, of course."

"He has punished some in the past, I imagine, as they deserve."

Again hesitation, "None here have ever been traitors, or our fathers or our fathers' fathers. But on other worlds, there have been such, and death followed for them quickly. It is not good to think of for we are humble men who are poor farmers and not concerned with matters of politics."

The anxiety in his voice, the universal concern in the eyes of all of them was obvious.

Pritcher said smoothly: "Could you inform us as to how we can arrange an audience with your governor."

And instantly an element of sudden bewilderment entered the situation.

For after a long moment, the elder said: "Why, did you not know? The governor will be here tomorrow. He has expected you. It has been a great honor for us. We . . . we hope earnestly that you will report to him satisfactorily as to our loyalty to him."

Pritcher's smile scarcely twitched. "Expected us?"

The Elder looked wonderingly from one to the other. "Why . . . it is now a week since we have been waiting for you."

Their quarters were undoubtedly luxurious for the world. Pritcher had lived in worse. Channis showed nothing but indifference to externals.

But there was an element of tension between them of a different nature than hitherto. Pritcher, felt the time approaching for a definite decision and yet there was still the desirability of additional waiting. To see the governor first would be to increase the gamble to dangerous dimensions and yet to win that gamble might multi-double the winnings. He felt a surge of anger at the slight crease between Channis' eyebrows, the delicate uncertainty with which the young man's lower lip presented itself to an upper tooth. He detested the useless play-acting and yearned for an end to it.

He said: "We seem to be anticipated."

"Yes," said Channis, simply.

"Just that? You have no contribution of greater pith to make. We come here and find that the governor expects us. Presumably we shall find from the governor that Tazenda itself expects us. Of what value then is our entire mission?"

Channis looked up, without endeavoring to conceal the weary note in his voice: "To expect us is one thing; to know who we are and what we came for, is another."

"Do you expect to conceal these things from men of the Second Foundation?"

"Perhaps. Why not? Are you ready to throw your hand in? Suppose our ship was detected in space. Is it unusual for a realm to maintain frontier observation posts? Even if we were ordinary strangers, we would be of interest."

"Sufficient interest for a governor to come to us rather than the reverse?"

Channis shrugged: "We'll have to meet that problem later. Let us see what this governor is like."

Pritcher bared his teeth in a bloodless kind of scowl. The situation was becoming ridiculous.

Channis proceeded with an artificial animation: "At least we know one thing. Tazenda is the Second Foundation or a million shreds of evidence are unanimously pointing the wrong way. How do you interpret the obvious terror in which these natives hold Tazenda? I see no signs of political domination. Their groups of Elders apparently meet freely and without interference of any sort. The taxation they speak of doesn't seem at all extensive to me or efficiently carried through. The natives speak much of poverty but seem sturdy and well-fed. The houses are uncouth and their villages rude, but are obviously adequate for the purpose.

"In fact, the world fascinates me. I have never seen a more forbidding one, yet I am convinced there is no suffering among the population and that their uncomplicated lives manage to contain a well-balanced happiness lacking in the sophisticated populations of the advanced centers."

"Are you an admirer of peasant virtues, then?"

"The stars forbid." Channis seemed amused at the idea. "I merely point out the significance of all this. Apparently, Tazenda is an efficient administrator – efficient in a sense far different from the efficiency of the old Empire or of the First Foundation, or even of our own Union. All these have brought mechanical efficiency to their subjects at the cost of more intangible values. Tazenda brings happiness and sufficiency. Don't you see that the whole orientation of their domination is different? It is not physical, but psychological."

"Really?" Pritcher, allowed himself irony. "And the terror with which the Elders spoke of the punishment of treason by these kind hearted psychologist administrators? How does that suit your thesis?"

"Were they the objects of the punishment? They speak of punishment only of others. It is as if knowledge of punishment has been so well implanted in them that punishment itself need never be used. The proper mental attitudes are so inserted into their minds that I am certain that not a Tazendian soldier exists on the planet. Don't you see all this?"

"I'll see perhaps," said Pritcher, coldly, "when I see the governor. And what, by the way, if *our* mentalities are handled?"

Channis replied with brutal contempt: "You should be accustomed to *that*."

Pritcher whitened perceptibly, and, with an effort, turned away. They spoke to one another no more that day.

It was in the silent windlessness of the frigid night, as he listened to the soft, sleeping motions of the other, that Pritcher silently adjusted his wrist-transmitter to the ultrawave region for which Channis' was unadjustable and, with noiseless touches of his fingernail, contacted the ship.

The answer came in little periods of noiseless vibration that barely lifted themselves above the sensory threshold.

Twice Pritcher asked: "Any communications at all yet?"

Twice the answer came: "None. We wait always."

He got out of bed. It was cold in the room and he pulled the furry blanket around him as he sat in the chair and stared out at the crowding stars so different in the brightness and complexity of their arrangement from the even fog of the Galactic Lens that dominated the night sky of his native Periphery.

Somewhere there between the stars was the answer to the complications that overwhelmed him, and he felt the yearning for that solution to arrive and end things.

For a moment he wondered again if the Mule were right – if Conversion had robbed him of the firm sharp edge of self-reliance. Or was it simply age and the fluctuations of these last years?

He didn't really care.

He was tired.

The governor of Rossem arrived with minor ostentation. His only companion was the uniformed man at the controls of the ground-car.

The ground-car itself was of lush design but to Pritcher it appeared inefficient. It turned clumsily; more than once it apparently balked at what might have been a too-rapid change of gears. It was obvious at once from its design that it ran on chemical, and not on atomic, fuel.

The Tazendian governor stepped softly on to the thin layer of snow and advanced between two lines of respectful Elders. He did not look at them but entered quickly. They followed after him.

From the quarters assigned to them, the two men of the Mule's Union watched. He – the governor – was thickset, rather stocky, short, unimpressive.

But what of that?

Pritcher cursed himself for a failure of nerve. His face, to be sure, remained icily calm. There was no humiliation before Channis – but he knew very well that his blood pressure had heightened and his throat had become dry.

It was not a case of physical fear. He was not one of those dull-witted, unimaginative men of nerveless meat who were too stupid ever to be afraid – but physical fear he could account for and discount.

But this was different. It was the other fear.

He glanced quickly at Channis. The young man glanced idly at the nails of one hand and poked leisurely at some trifling unevenness.

Something inside Pritcher became vastly indignant. What had Channis to fear of mental handling?

Pritcher caught a mental breath and tried to think back. How had he been before the Mule had Converted him from the die-hard Democrat that he was. It was hard to remember. He could not place himself mentally. He could not break the clinging wires that bound him emotionally to the Mule. Intellectually, he could remember that he had once tried to assassinate the Mule but not for all the straining he could endure, could he remember his emotions at the time. That might be the self-defense of his own mind, however, for at the intuitive thought of what those emotions might have been – not realizing the details, but merely comprehending the drift of it – his stomach grew queasy.

What if the governor tampered with his mind?

What if the insubstantial mental tendrils of a Second Foundationer insinuated itself down the emotional crevices of his makeup and pulled them apart and rejoined them?

There had been no sensation the first time. There had been no pain, no mental jar – not even a feeling of discontinuity. He had always loved the Mule. If there had ever been a time long before – as long before as five short years – when he had thought he hadn't loved him, that he had hated him – that was just a horrid illusion. The thought of that illusion embarrassed him.

But there had been no pain.

Would meeting the governor duplicate that? Would all that had gone before – all his service for the Mule – all his life's orientation – join the hazy, other-life dream that held the word, Democracy. The Mule also a dream, and only to Tazenda, his loyalty–

Sharply, he turned away.

There was that strong desire to retch.

And then Channis' voice clashed on his ear, "I think this is it, general."

Pritcher turned again. An Elder had opened the door silently and stood with a dignified and calm respect upon the threshold.

He said, "His Excellency, Governor of Rossem, in the name of the Lords of Tazenda, is pleased to present his permission for an audience and request your appearance before him."

"Sure thing," and Channis tightened his belt with a jerk and adjusted a Rosseman hood over his head.

Pritcher's jaw set. *This* was the beginning of the real gamble.

The governor of Rossem was not of formidable appearance. For one thing, he was bareheaded, and his thinning hair, light brown, tending to gray, lent him mildness. His bony eye-ridges lowered at them, and his eyes, set in a fine network of surrounding wrinkles, seemed calculating, but his fresh-cropped chin was soft and small and, by the universal convention of followers of the pseudoscience of reading character by facial bony structure, seemed "weak."

Pritcher, avoided the eyes and watched the chin. He didn't know whether that would be effective – if anything would be.

The governor's voice was high-pitched, indifferent: "Welcome to Tazenda. We greet you in peace. You have eaten?"

His hand – long fingers, gnarled veins – waved almost regally at the U-shaped table.

They bowed and sat down. The governor sat at the outer side of the base of the U, they on the inner; along both arms sat the double row of silent Elders.

The governor spoke in short, abrupt sentences – praising the food as Tazendian importations – and it had indeed a quality different if, somehow, not so much better, than the rougher food of the Elders – disparaging Rosseman weather, referring with an attempt at casualness to the intricacies of space travel.

Channis talked little. Pritcher not at all.

Then it was over. The small, stewed fruits were finished; the napkins used and discarded, and the governor leaned back.

His small eyes sparkled.

"I have inquired as to your ship. Naturally, I would like to see that it receives due care and overhaul. I am told its whereabouts are unknown."

"True." Channis replied lightly. "We have left it in space. It is a large ship, suitable for long journeys in sometimes hostile regions, and we felt that landing it here might give rise to doubts as to our peaceful intentions. We preferred to land alone, unarmed."

"A friendly act," commented the governor, without conviction. "A large ship, you say?"

"Not a vessel of war, excellency."

"Ha, hum. Where is it you come from?"

"A small world of the Santanni sector, your excellency. It may be you are not aware of its existence for it lacks importance. We are interested in establishing trade relationships."

"Trade, eh? And what have you to sell? "

"Machines of all sorts, excellency. In return, food, wood, ores"

"Ha, hum." The governor seemed doubtful. "I know little these matters. Perhaps mutual profit may be arranged. Perhaps, after I have examined your credentials at length – for much information will be required by my government before matters may proceed, you understand – and after I have looked over your ship, it would be advisable for you to proceed to Tazenda."

There was no answer to that, and the governor's attitude iced perceptibly.

"It is necessary that I see your ship, however."

Channis said distantly: "The ship, unfortunately, is undergoing repairs at the moment. If your excellency would not object giving us forty-eight hours, it will be at your service."

"I am not accustomed to waiting."

For the first time, Pritcher met the glare of the other, eye to eye, and his breath exploded softly inside him. For a moment, he had the sensation of drowning, but then his eyes tore away.

Channis did not waver. He said: "The ship cannot be landed for forty-eight hours, excellency. We are here and unarmed. Can you doubt our honest intentions?"

There was a long silence, and then the governor said gruffly, "Tell me of the world from which you come."

That was all. It passed with that. There was no more unpleasantness. The governor, having fulfilled his official duty, apparently lost interest and the audience died a dull death.

And when it was *all* over, Pritcher found himself back in their quarters and took stock of himself.

Carefully – holding his breath – he "felt" his emotions. Certainly he seemed no different to himself, but *would* he feel any difference? Had he felt different after the Mule's Conversion? Had not everything seemed natural? As it should have been?

He experimented.

With cold purpose, he shouted inside the silent caverns of his mind, and the shout was, "The Second Foundation must be discovered and destroyed."

And the emotion that accompanied it was honest hate. There was not as much as a hesitation involved in it.

And then it was in his mind to substitute the word "Mule" for the phrase "Second Foundation" and his breath caught at the mere emotion and his tongue clogged.

So far, good.

But had he been handled otherwise – more subtly? Had tiny changes been made? Changes that he couldn't detect because their very existence warped his judgment.

There was no way to tell.

But he still felt absolute loyalty to the Mule! If that were unchanged, nothing else really mattered.

He turned his mind to action again. Channis was busy at his end of the room. Pritcher's thumbnail idled at his wrist communicator.

And then at the response that came he felt a wave of relief surge over him and leave him weak.

The quiet muscles of his face did not betray him, but inside he was shouting with joy – and when Channis turned to face him, he knew that the farce was about over.

FOURTH INTERLUDE

The two Speakers passed each other on the road and one stopped the other.

"I have word from the First Speaker."

There was a half-apprehensive flicker in the other's eyes. "Intersection point?"

"Yes! May we live to see the dawn!"

5. ONE MAN AND THE MULE

There was no sign in any of Channis' actions that he was aware of any subtle change in the attitude of Pritcher, and in their relations to each other. He leaned back on the hard wooden bench and spread-eagled his feet out in front of him.

"What did you make of the governor?"

Pritcher shrugged: "Nothing at all. He certainly seemed no mental genius to me. A very poor specimen of the Second Foundation, if that's what he was supposed to be."

"I don't think he was, you know. I'm not sure what to make of it. Suppose you were a Second Founder," Channis grew thoughtful, "what would you do? Suppose you had an idea of our purpose here. How would you handle us?"

"Conversion, of course."

"Like the Mule?" Channis looked up, sharply. "Would we know if they *had* converted us? I wonder— And what if they were simply psychologists, but very clever ones."

"In that case, I'd have us killed rather quickly."

"And our ship? No." Channis wagged a forefinger. "We're playing a bluff, Pritcher, old man. It can only be a bluff. Even if they have emotional control down pat, we – you and I – are only fronts. It's the Mule they must fight, and they're being just as careful of us as we are of them. I'm assuming that they know who we are."

Pritcher, stared coldly: "What do you intend doing?"

"Wait." The word was bitten off. "Let them come to us. They're worried, maybe about the ship, but probably about the Mule. They bluffed with the governor. It didn't work. We stayed pat. The next person they'll send *will* be a Second Founder, and he'll propose a deal of some sort."

"And then?"

"And then we make the deal."

"I don't think so."

"Because you think it will double-cross the Mule? It won't."

"No, the Mule could handle your double-crosses, any you could invent. But I still don't think so."

"Because you think then we couldn't double-cross the Foundationers?"

"Perhaps not. But that's not the reason."

Channis let his glance drop to what the other held in his fist, and said grimly: "You mean *that's* the reason."

Pritcher cradled his blaster, "That's right. You are under arrest."

"Why?"

"For treason to the First Citizen of the Union."

Channis' lips hardened upon one another: "What's going on?"

"Treason! As I said. And correction of the matter, on my part."

"Your proof? Or evidence, assumptions, daydreams? Are you mad?"

"No. Are you? Do you think the Mule sends out unweaned youngsters on ridiculous swashbuckling missions for nothing? It was queer to me at the time. But I wasted time in doubting myself. Why should he send *you*? Because you smile and dress well? Because you're twenty-eight."

"Perhaps because I can be trusted. Or aren't you in the market for logical reasons?"

"Or perhaps because you can't be trusted. Which is logical enough, as it turns out."

"Are we matching paradoxes, or is this all a word game to see who can say the least in the most words?"

And the blaster advanced, with Pritcher after it. He stood erect before the younger man: "Stand up!"

Channis did so, in no particular hurry, and felt the muzzle of the blaster touch his belt with no shrinking of the stomach muscles.

Pritcher said: "What the Mule wanted was to find the Second Foundation. He had failed and I had failed, and the secret that neither of us can find is a well-hidden one. So there was one outstanding possibility left – and that was to find a seeker who ready knew the hiding-place."

"Is that I?"

"Apparently it was. I didn't know then, of course, but though my mind must be slowing, it still points in the right direction. How easily we found Star's End! How miraculously you examined the correct Field Region of the Lens from among an infinite number of possibilities! And having done so, how nicely we observe just the correct point for observation! You clumsy fool! Did you so underestimate me that no combination of impossible fortuties struck you as being too much for me to swallow?"

"You mean I've been too successful?"

"Too successful by half for any loyal man."

"Because the standards of success you set me were so low?"

And the blaster prodded, *though in* the face that confront Channis only the cold glitter of the eyes betrayed the growing anger: "Because you are in the pay of the Second Foundation."

"Pay?" – infinite contempt. "Prove that."

"Or under the mental influence."

"Without the Mule's knowledge? Ridiculous."

"*With* the Mule's knowledge. Exactly my point, my you dullard. *With* the Mule's knowledge. Do you suppose else that you would be given a ship to play with? You led us to the Second Foundation as you were supposed to do."

"I thresh a kernel of something or other out of this immensity of chaff. May I ask why I'm supposed to be doing all this? If were a traitor, why should I lead you to the Second Foundation? Why not hither and yon through the Galaxy, skipping gaily, finding no more than you ever did?"

"For the sake of the ship. And because the men of the Second Foundation quite obviously need atomic warfare for self-defense."

"You'll have to do better than that. One ship won't mean thing to them, and if they think they'll learn science from it a build atomic power plants next year, they are very, very simple Second Foundationers, indeed. On the order of simplicity as yourself, I should say."

"You will have the opportunity to explain that to the Mule."

"We're going back to Kalgan?"

"On the contrary. We're staying here. And the Mule will join us in fifteen minutes – more or less. Do you think he hasn't followed us, my sharp-witted, nimble-minded lump of self-admiration? You have played the decoy well in reverse. You may not have led our victims to us, but you have certainly led us to our victims."

"May I sit down," said Channis, "and explain something to you in picture drawings? Please."

"You will remain standing."

At that, I can say it as well standing. You think the Mule followed us because of the hypertracer on the communication circuit?"

The blaster might have wavered. Channis wouldn't have sworn to it. He said: "You don't look surprised. But I don't waste time doubting that you feel surprised. Yes, I knew about it. And now, having shown you that I knew of something you didn't think I did, I'll tell you something *you* don't know, that I know you don't."

"You allow yourself too many preliminaries, Channis. I should think your sense of invention was more smoothly greased."

"There's on invention to this. There *have* been traitors, of course, or enemy agents, if you prefer that term. But the Mule knew of that in a rather curious way. It seems, you see, that some of his Converted men had been tampered with."

The blaster did waver that time. Unmistakably.

"I emphasize that, Pritcher. It was why he needed me. I was an Unconverted man. Didn't he emphasize to you that he needed an Unconverted? Whether he gave you the real reason or not?"

"Try something else, Channis. If I were against the Mule, I'd know it." Quietly, rapidly, Pritcher was feeling his mind. It felt the same. It felt the same. Obviously the man was lying.

"You mean you feel loyal to the Mule. Perhaps. Loyalty wasn't tampered with. Too easily detectable, the Mule said. But how do you feel mentally? Sluggish? Since you started this trip, have you always felt normal? Or have you felt strange sometimes, as though you weren't quite yourself? What are you trying to do, bore a hole through me without touching the trigger?"

Pritcher withdrew his blaster half an inch, "What are you trying to say?"

"I say that you've been tampered with. You've been handled. You didn't see the Mule install that hypertracer. You didn't see anyone do it. You just found it there, and assumed it was the Mule, and ever since you've been assuming he was following us. Sure,

the wrist receiver you're wearing contacts the ship on a wave length mine isn't good for. Do you think I didn't know that?" He was speaking quickly now, angrily. His cloak of indifference had dissolved into savagery. "But it's not the Mule that's coming toward us from out there. It's not the Mule."

"Who, if not?"

"Well, who do you suppose? I found that hypertracer, the day we left. But I didn't think it was the Mule. *He* had no reason for indirection at that point. Don't you see the nonsense of it? If I were a traitor and he knew that, I could be Converted as easily as you were, and he would have the secret of the location of the Second Foundation out of my mind without sending me half across the Galaxy. Can you keep a secret from the Mule? And if *I didn't* know, then I couldn't lead him to it. So why send me in either case?"

"Obviously, that hypertracer must have been put there by an agent of the Second Foundation. *That's* who's coming towards us now. And would you have been fooled if your precious mind hadn't been tampered with? What kind of normality have you that you imagine immense folly to be wisdom? *Me* bring a ship to the Second Foundation? What would they do with a ship?"

"It's *you* they want, Pritcher. You know more about the Union than anyone but the Mule, and you're not dangerous to them while he is. That's why they put the direction of search into my mind. Of course, it was completely impossible for me to find Tazenda by random searchings of the Lens. I knew that. But I knew there was the Second Foundation after us, and I knew they engineered it. Why not play their game? It was a battle of bluffs. They wanted us and I wanted their location – and space take the one that couldn't outbluff the other."

"But it's *we* that will lose as long as you hold that blaster on me. And it obviously isn't your idea. It's theirs. Give me the blaster, Pritcher. I know it seems wrong to you, but it isn't your mind speaking, it's the Second Foundation within you. Give me the blaster, Pritcher, and we'll face what's coming now, together."

Pritcher, faced a growing confusion in horror. Plausibility! Could he be so wrong? Why this eternal doubt of himself? Why wasn't he sure? What made Channis sound so plausible?

Plausibility!

Or was it his own tortured mind fighting the invasion of the alien.

Was he split in two?

Hazily, he saw Channis standing before him, hand outstretched – and suddenly, he knew he was going to give him the blaster.

And as the muscles of his arm were on the point of contracting in the proper manner to do so, the door opened, not hastily, behind him – and he turned.

There are perhaps men in the Galaxy who can be confused for one another even by men at their peaceful leisure. Correspondingly, there may be conditions of mind when even unlikely pairs may be mis-recognized. But the Mule rises above any combination of the two factors.

Not all Pritcher's agony of mind prevented the instantaneous mental flood of cool vigor that engulfed him.

Physically, the Mule could not dominate any situation. Nor did he dominate this one.

He was rather a ridiculous figure in his layers of clothing that thickened him past his normality without allowing him to reach normal dimensions even so. His face was muffled and the usually dominant beak covered what was left in a cold-red prominence.

Probably as a vision of rescue, no greater incongruity could exist.

He said: "Keep your blaster, Pritcher."

Then he turned to Channis, who had shrugged and seated himself: "The emotional context here seems rather confusing and considerably in conflict. What's this about someone other than myself following you?"

Pritcher intervened sharply: "Was a hypertracer placed upon our ship by your orders, sir?"

The Mule turned cool eyes upon him, "Certainly. Is it very likely that any organization in the Galaxy other than the Union of Worlds would have access to it?"

"He said—"

"Well, he's here, general. Indirect quotation is not necessary. Have you been saying anything, Channis?"

"Yes. But mistakes apparently, sir. It has been my opinion that the tracer was put there by someone in the pay of the Second Foundation and that we had been led here for some purpose of theirs, which I was prepared to counter. I was under the further impression that the general was more or less in their hands."

"You sound as if you think so no longer."

"I'm afraid not. Or it would not have been you at the door."

"Well, then, let us thresh this out." The Mule peeled off the outer layers of padded, and electrically heated clothing. "Do you mind if I sit down as well? Now – we are safe here and perfectly free of any danger of intrusion. No native of this lump of ice will have any desire to approach this place. I assure you of that," and there was a grim earnestness about his insistence upon his powers.

Channis showed his disgust. "Why privacy? Is someone going to serve tea and bring out the dancing girls?"

"Scarcely. What was this theory of yours, young man? A Second Foundationer was tracing you with a device which no one but I have and – how did you say you found this place?"

"Apparently, sir, it seems obvious, in order to account for known facts, that certain notions have been put into my head—"

"By these same Second Foundationers?"

"No one else, I imagine."

"Then it did not occur to you that if a Second Foundationer could force, or entice, or inveigle you into going to the Second Foundation for purposes of his own – and I assume you imagined he used methods similar to mine, though, mind you, I can implant

only emotions, not ideas – it did not occur to you that if he could do that there was little necessity to put a hypertracer on you.

And Channis looked up sharply and met his sovereign's large eyes with sudden startle. Pritcher grunted and a visible relaxation showed itself in his shoulders.

"No," said Channis, "that hadn't occurred to me."

"Or that if they were obliged to trace you, they couldn't feel capable of directing you, and that, undirected, you could have precious little chance of finding your way here as you did. Did *that* occur to you?"

"That, neither."

"Why not? Has your intellectual level receded to a so-much-greater-than-probable degree?"

"The only answer is a question, sir. Are you joining General Pritcher in accusing me of being a traitor?"

"You have a defense in case I am?"

"Only the one I presented to the general. If I were a traitor and knew the whereabouts of the Second Foundation, you could Convert me and learn the knowledge directly. If you felt it necessary to trace me, then I hadn't the knowledge beforehand and wasn't a traitor. So I answer your paradox with another."

"Then your conclusion?"

"That I am not a traitor."

"To which I must agree, since your argument is irrefutable."

"Then may I ask you why you had us secretly followed?"

"Because to all the facts there is a third explanation. Both you and Pritcher explained some facts in your own individual ways, but not all. I – if you can spare me the time – will explain all. And in a rather short time, so there is little danger of boredom. Sit down, Pritcher, and give me your blaster. There is no danger of attack on us any longer. None from in here and none from out there. None in fact even from the Second Foundation. Thanks to you, Channis."

The room was lit in the usual Rossemanian fashion of electrically heated wire. A single bulb was suspended from the ceiling and in its dim yellow glow, the three cast their individual shadows.

The Mule said: "Since I felt it necessary to trace Channis, it was obvious I expect to gain something thereby. Since he went to the Second Foundation with a startling speed and directness, we can reasonably assume that that was what I was expecting to happen. Since I did not gain the knowledge from him directly, something must have been preventing me. Those are the facts. Channis, of course, knows the answer. So do I. Do you see it, Pritcher?"

And Pritcher said doggedly: "No, sir."

"Then I'll explain. Only one kind of man can both know the location of the Second Foundation and prevent me from learning it. Channis, I'm afraid you're a Second Foundationer yourself."

And Channis' elbows rested on his knees as he leaned forward, and through stiff and angry lips said: "What is your direct evidence? Deduction has proven wrong twice today."

"There is direct evidence, too, Channis. It was easy enough. I told you that my men had been tampered with. The tamperer must have been, obviously, someone who was a) Unconverted, and b) fairly close to the center of things. The field was large but not entirely unlimited. You were too successful, Channis. People liked you too much. You got along too well. I wondered—

"And then I summoned you to take over this expedition and it didn't set you back. I watched your emotions. It didn't bother you. You overplayed the confidence there, Channis. No man of real competence could have avoided a dash of uncertainty at a job like that. Since your mind did avoid it, it was either a foolish one or a controlled one.

It was easy to test the alternatives. I seized your mind at a moment of relaxation and filled it with grief for an instant and then removed it. You were angry afterwards with such accomplished art that I could have sworn it was a natural reaction, but for that which went first. For when I wrenched at your emotions, for just one instant, for one tiny instant before you could catch yourself, your mind resisted. It was all I needed to know.

"No one could have resisted me, even for that tiny instant, without control similar to mine."

Channis' voice was low and bitter: "Well, then? Now what?"

"And now you die – as a Second Foundationer. Quite necessary, as I believe you realize."

And once again Channis stared into the muzzle of a blaster. A muzzle guided this time by a mind, not like Pritcher's capable of offhand twisting to suit himself, but by one as mature as his own and as resistant to force as his own.

And the period of time allotted him for a correction of events was small.

What followed thereafter is difficult to describe by one with the normal complement of senses and the normal incapacity for emotional control.

Essentially, this is what Channis realized in the tiny space of time involved in the pushing of the Mule's thumb upon the trigger contact.

The Mule's current emotional makeup was one of a hard and polished determination, unmisted by hesitation in the least. Had Channis been sufficiently interested afterward to calculate the time involved from the determination to shoot to the arrival of the disintegrating energies, he might have realized that his leeway was about one-fifth of a second.

That was barely time.

What the Mule realized in that same tiny space of time was that the emotional potential of Channis' brain had surged suddenly upwards without his own mind feeling any impact and that, simultaneously, a flood of pure, thrilling hatred cascaded upon him from an unexpected direction.

It was that new emotional element that jerked his thumb off the contact. Nothing else could have done it, and almost together with his change of action, came complete realization of the new situation.

It was a tableau that endured far less than the significance adhering to it should require from a dramatic standpoint. There was the Mule, thumb off the blaster, staring intently upon Channis. There was Channis taut, not quite daring to breathe yet. And there was Pritcher, convulsed in his chair; every muscle at a spasmodic breaking point; every tendon writhing in an effort to hurl forward; his face twisted at last out of schooled woodenness into an unrecognizable death mask of horrid hate; and his eyes only and entirely and supremely upon the Mule.

Only a word or two passed between Channis and the Mule – only a word or two and that utterly revealing stream of emotional consciousness that remains forever the true interplay of understanding between such as they. For the sake of our own limits, it is necessary to translate into words what went on, then, and thenceforward.

Channis said, tensely: "You're between two fires, First Citizen. You can't control two minds simultaneously, not when one of them is mine – so you have your choice. Pritcher, is free of your Conversion now. I've snapped the bonds. He's the old Pritcher; the one who tried to kill you once; the one who thinks you're the enemy of all that is free and right and holy; and he's the one besides who knows that you've debased him to helpless adulation for five years. I'm holding him back now by suppressing his will, but if you kill me, that ends, and in considerably less time than you could shift your blaster or even your will – he will kill you."

The Mule quite plainly realized that. He did not move.

Channis continued: "If you turn to place him under control, to kill him, to do anything, you won't ever be quick enough to turn again to stop me."

The Mule still did not move. Only a soft sigh of realization.

"So," said Channis, "throw down the blaster, and let us be on even terms again, and you can have Pritcher back."

"I made a mistake," said the Mule, finally. "It was wrong to have a third party present when I confronted you. It introduced one variable too many. It is a mistake that must be paid for, I suppose."

He dropped the blaster carelessly, and kicked it to the other end of the room. Simultaneously, Pritcher crumpled into profound sleep.

"He'll be normal when he awakes," said the Mule, indifferently.

The entire exchange from the time the Mule's thumb had begun pressing the trigger-contact to the time he dropped the blaster had occupied just under a second and a half of time.

But just beneath the borders of consciousness, for a time just above the borders of detection, Channis caught a fugitive emotional gleam in the Mule's mind. And it was still one of sure and confident triumph.

6. ONE MAN, THE MULE – AND ANOTHER

Two men, apparently relaxed and entirely at ease, poles apart physically – with every nerve that served as emotional detector quivering tensely.

The Mule, for the first time in long years, had insufficient surety of his own way. Channis knew that, though he could protect himself for the moment, it was an effort – and that the attack upon him was none such for his opponent. In a test of endurance, Channis knew he would lose.

But it was deadly to think of that. To give away to the Mule an emotional weakness would be to hand him a weapon. There was already that glimpse of something – a winner's something – in the Mule's mind.

To gain time–

Why did the others delay? Was that the source of the Mule's confidence? What did his opponent know that he didn't? The mind he watched told nothing. If only he could read ideas. And yet–

Channis braked his own mental whirling roughly. There was only that; to gain time–

Channis said: "Since it is decided, and not denied by myself after our little duel over Pritcher, that I am a Second Foundationer, suppose you tell me why I came to Tazenda."

"Oh, no," and the Mule laughed, with high-pitched confidence, "I am not Pritcher. I need make no explanations to you. You had what you thought were reasons. Whatever they were, your actions suited me, and so I inquire no further."

"Yet there must be such gaps in your conception of the story. Is Tazenda the Second Foundation you expected to find? Pritcher spoke much of your other attempt at finding it, and of your psychologist tool, Ebling Mis. He babbled a bit sometimes under my . . . uh . . . slight encouragement. Think back on Ebling Mis, First Citizen."

"Why should I?" Confidence!

Channis felt that confidence edge out into the open, as if with the passage of time, any anxiety the Mule might be having was increasingly vanishing.

He said, firmly restraining the rush of desperation: "You lack curiosity, then? Pritcher told me of Mis' vast surprise at *something*. There was his terribly drastic urging for speed, for a rapid warning of the Second Foundation? Why? Why? Ebling Mis died. The Second Foundation was not warned. And yet the Second Foundation exists."

The Mule smiled in real pleasure, and with a sudden and surprising dash of cruelty that Channis felt advance and suddenly withdraw: "But apparently the Second Foundation was warned. Else how and why did one Bail Channis arrive on Kalgan to handle my men and to assume the rather thankless task of outwitting me. The warning came too late, that is all."

"Then," and Channis allowed pity to drench outward from him, "you don't even know what the Second Foundation is, or anything of the deeper meaning of all that has been going on."

To gain time!

The Mule felt the other's pity, and his eyes narrowed with instant hostility. He rubbed his nose in his familiar four-fingered gesture, and snapped: "Amuse yourself, then. What of the Second Foundation?"

Channis spoke deliberately, in words rather than in emotional symbology. He said: "From what I have heard, it was the mystery that surrounded the Second Foundation that most puzzled Mis. Hari Seldon founded his two units so differently. The First Foundation was a splurge that in two centuries dazzled half the Galaxy. And the Second was an abyss that was dark.

"You won't understand why that was, unless you can once again feel the intellectual atmosphere of the days of the dying Empire. It was a time of absolutes, of the great final generalities, at least in thought. It was a sign of decaying culture, of course, that dams had been built against the further development of ideas. It was his revolt against these dams that made Seldon famous. It was that one last spark of youthful creation in him that lit the Empire in a sunset glow and dimly foreshadowed the rising sun of the Second Empire."

"Very dramatic. So what?"

"So he created his Foundations according to the laws of psychohistory, but who knew better than he that even those laws were relative. *He* never created a finished product. Finished products are for decadent minds. His was an evolving mechanism and the Second Foundation was the instrument of that evolution. *We*, First Citizen of your Temporary Union of Worlds, we are the guardians of Seldon's Plan. Only *we*!"

"Are you trying to talk yourself into courage," inquired the Mule, contemptuously, "or are you trying to impress me? For the Second Foundation, Seldon's Plan, the Second Empire all impresses me not the least, nor touches any spring of compassion, sympathy, responsibility, nor any other source of emotional aid you may be trying to tap in me. And in any case, poor fool, speak of the Second Foundation in the past tense, for it is destroyed."

Channis felt the emotional potential that pressed upon his mind rise in intensity as the Mule rose from his chair and approached. He fought back furiously, but something crept relentlessly on within him, battering and bending his mind back – and back.

He felt the wall behind him, and the Mule faced him, skinny arms akimbo, lips smiling terribly beneath that mountain of nose.

The Mule said: "Your game is through, Channis. The game of all of you-of all the men of what used to be the Second Foundation. Used to be! *Used to be!*"

"What were you sitting here waiting for all this time, with your babble to Pritcher, when you might have struck him down and taken the blaster from him without the least effort of physical force? You were waiting for me, weren't you, waiting to greet me in a situation that would not too arouse my suspicions.

"Too bad for you that I needed no arousal. I knew you. I knew you well, Channis of the Second Foundation.

"But what are you waiting for now? You still throw words at me desperately, as though the mere sound of your voice would freeze me to my seat. And all the while you

speaking, something in your mind is waiting and waiting and is still waiting. But no one is coming. None of those you expect – none of your allies. You are alone here, Channis, and you will remain alone. Do you know why?

"It is because your Second Foundation miscalculated me to the very dregs of the end. I knew their plan early. They thought I would follow you here and be proper meat for their cooking. You were to be a decoy indeed – a decoy for a poor, foolish weakling mutant, so hot on the trail of Empire that he would fall blindly into an obvious pit. But am I their prisoner?"

"I wonder if it occurred to them that I'd scarcely be here without my fleet – against the artillery of any unit of which they are entirely and pitifully helpless? Did it occur to them that I would not pause for discussion or wait for events?"

"My ships were launched against Tazenda twelve hours ago and they are quite, quite through with their mission. Tazenda is laid in ruins; its centers of population are wiped out. There was no resistance. The Second Foundation no longer exists, Channis – and I, the queer, ugly weakling, am the ruler of the Galaxy."

Channis could do nothing but shake his head feebly. "No– No–"

"Yes– Yes–" mimicked the Mule. "And if you are the last one alive, and you may be, that will not be for long either."

And then there followed a short, pregnant pause, and Channis almost howled with the sudden pain of that tearing penetration of the innermost tissues of his mind.

The Mule drew back and muttered: "Not enough. You do not pass the test after all. Your despair is pretense. Your fear is not the broad overwhelming that adheres to the destruction of an ideal, but the puny seeping fear of personal destruction."

And the Mule's weak hand seized Channis by the throat in a puny grip that Channis was somehow unable to break.

"You are my insurance, Channis. You are my director and safeguard against any underestimation I may make." The Mule's eyes bore down upon him. Insistent– Demanding–

"Have I calculated rightly, Channis? Have I outwitted your men of the Second Foundation? Tazenda *is* destroyed, Channis, tremendously destroyed; so why is your despair pretense? Where is the reality? I must have reality and truth! Talk, Channis talk. Have I penetrated then, not deeply enough? Does the danger still exist? *Talk, Channis.* Where have I done wrong?"

Channis felt the words drag out of his mouth. They did not come willingly. He clenched his teeth against them. He bit his tongue. He tensed every muscle of his throat.

And they came out – gasping – pulled out by force and tearing his throat and tongue and teeth on the way.

"Truth," he squeaked, "truth–"

"Yes, truth. What is left to be done?"

"Seldon founded Second Foundation here. Here, as I said. I told no lie. The psychologists arrived and took control of the native population."

"Of Tazenda?" The Mule plunged deeply into the flooding torture of the other's emotional upwellings – tearing at them brutally. "It is Tazenda I have destroyed. You know what I want. Give it to me."

"Not Tazenda. I said Second Foundationers might not be those apparently in power; Tazenda is the figurehead—" The words were almost unrecognizable, forming themselves against every atom of will of the Second Founder, "Rossem— Rossem— Rossem is the world—"

The Mule loosed his grip and Channis dropped into a huddle of pain and torture.

"And you thought to fool me?" said the Mule, softly.

"You were fooled." It was the last dying shred of resistance in Channis.

"But not long enough for you and yours. I am in communication with my Fleet. And after Tazenda can come Rossem. But first—"

Channis felt the excruciating darkness rise against him, and the automatic lift of his arm to his tortured eyes could not ward it off. It was a darkness that throttled, and as he felt his tom, wounded mind reeling backwards, backwards into the everlasting black – there was that final picture of the triumphant Mule – laughing matchstick – that long, fleshy nose quivering with laughter.

The sound faded away. The darkness embraced him lovingly.

It ended with a cracking sensation that was like the jagged glare of a lightning flash, and Channis came slowly to earth while sight returned painfully in blurry transmission through tear-drenched eyes.

His head ached unbearably, and it was only with a stab of agony that he could bring up a hand to it.

Obviously, he was alive. Softly, like feathers caught up in an eddy of air that had passed, his thoughts steadied and drifted to rest. He felt comfort suck in – from outside. Slowly, torturedly, he bent his neck – and relief was a sharp pang.

For the door was open; and the First Speaker stood just inside the threshold. He tried to speak, to shout, to warn – but his tongue froze and he knew that a part of the Mule's mighty mind still held him and clamped all speech within him.

He bent his neck once more. The Mule was still in the room. He was angry and hot-eyed. He laughed no longer, but his teeth were bared in a ferocious smile.

Channis felt the First Speaker's mental influence moving gently over his mind with a healing touch and then there was the numbing sensation as it came into contact with the Mule's defense for an instant of struggle and withdrew.

The Mule said gratingly, with a fury that was grotesque in his meagre body: "Then another comes to greet me." His agile mind reached its tendrils out of the room— out— out—

"You are alone," he said.

And the First Speaker interrupted with an acquiescence: "I am thoroughly alone. It is necessary that I be alone, since it was I who miscalculated your future five years ago. There would be a certain satisfaction to me in correcting that matter without aid. Unfortunately, I did not count on the strength of your Field of Emotional Repulsion that

surrounded this place. It took me long to penetrate. I congratulate you upon the skill with which it was constructed."

"Thank you for nothing," came the hostile rejoinder. "Bandy no compliments with me. Have you come to add your brain splinter to that of yonder cracked pillar of your realm?"

The First Speaker smiled: "Why, the man you call Bail Channis performed his mission well, the more so since he was not your mental equal by far. I can see, of course, that you have mistreated him, yet it may be that we may restore him fully even yet. He is a brave man, sir. He volunteered for this mission although we were able to predict mathematically the huge chance of damage to his mind – a more fearful alternative than that of mere physical crippling."

Channis' mind pulsed futilely with what he wanted to say and couldn't; the warning he wished to shout and was unable to. He could only emit that continuous stream of fear–fear–

The Mule was calm. "You know, of course, of the destruction of Tazenda."

"I do. The assault by your fleet was foreseen."

Grimly: "Yes, so I suppose. But not prevented, eh?"

"No, not prevented." The First Speaker's emotional symbology was plain. It was almost a self-horror; a complete self-disgust: "And the fault is much more mine than yours. Who could have imagined your powers five years ago. We suspected from the start – from the moment you captured Kalgan – that you had the powers of emotional control. That was not too surprising, First Citizen, as I can explain to you.

"Emotional contact such as you and I possess is not a very new development. Actually it is implicit in the human brain. Most humans can read emotion in a primitive manner by associating it pragmatically with facial expression, tone of voice and so on. A good many animals possess the faculty to a higher degree; they use the sense of smell to a good extent and the emotions involved are, of course, less complex.

"Actually, humans are capable of much more, but the faculty of direct emotional contact tended to atrophy with the development of speech a million years back. It has been the great advance of our Second Foundation that this forgotten sense has been restored to at least some of its potentialities.

"But we are not born with its full use. A million years of decay is a formidable obstacle, and we must educate the sense, exercise it as we exercise our muscles. And there you have the main difference. *You* were born with it.

"So much we could calculate. We could also calculate the effect of such a sense upon a person in a world of men who did not possess it. The seeing man in the kingdom of the blind– We calculated the extent to which a megalomania would take control of you and we thought we were prepared. But for two factors we were not prepared.

"The first was the great extent of your sense. We can induce emotional contact only when in eyeshot, which is why we are more helpless against physical weapons than you might think. Sight plays such an enormous part. Not so with you. You are definitely

known to have had men under control, and, further, to have had intimate emotional contact with them when out of sight and out of earshot. That was discovered too late.

"Secondly, we did not know of your physical shortcomings, particularly the one that seemed so important to you, that you adopted the name of the Mule. We didn't foresee that you were not merely a mutant, but a sterile mutant and the added psychic distortion due to your inferiority complex passed us by. We allowed only for a megalomania – not for an intensely psychopathic paranoia as well.

"It is myself that bears the responsibility for having missed all that, for I was the leader of the Second Foundation when you captured Kalgan. When you destroyed the First Foundation, we found out – but too late – and for that fault millions have died on Tazenda."

"And you will correct things now?" The Mules thin lips curled, his mind pulsing with hate: "What will you do? Fatten me? Restore me to a masculine vigor? Take away from my past the long childhood in an alien environment. Do you regret *my* sufferings? Do you regret *my* unhappiness? I have no sorrow for what I did in my necessity. Let the Galaxy Protect itself as best it can, since it stirred not a whit for my protection when I needed it."

Your emotions are, of course," said the First Speaker, "only the children of your background and are not to be condemned – merely changed. The destruction of Tazenda was unavoidable. The alternative would have been a much greater destruction generally throughout the Galaxy over a period of centuries. We did our best in our limited way. We withdrew as many men from Tazenda as we could. We decentralized the rest of the world. Unfortunately, our measures were of necessity far from adequate. It left many millions to die – do you not regret that?"

"Not at all – any more than I regret the hundred thousand that must die on Rossem in not more than six hours."

"On Rossem?" said the First Speaker, quickly.

He turned to Channis who had forced himself into a half-sitting posture, and his mind exerted its force. Channis, felt the duel of minds strain over him, and then there was a short snapping of the bond and the words came tumbling out of his mouth: "Sir, I have failed completely. He forced it from me not ten minutes before your arrival. I could not resist him and I offer no excuses. He knows Tazenda is not the Second Foundation. He knows that Rossem is."

And the bonds closed down upon him again.

The First Speaker frowned: "I see. What is it you are planning to do?"

"Do you really wonder? Do you really find it difficult to penetrate the obvious? All this time that you have preached to me of the nature of emotional contact – all this time that you have been throwing words such as megalomania and paranoia at me, I have been working. I have been in contact with my Fleet and it has its orders. In six hours, unless I should for some reason counteract my orders, they are to bombard all of Rossem except this lone village and an area of a hundred square miles about it. They are to do a thorough job and are then to land here.

"You have six hours, and in six hours, you cannot beat down my mind, nor can you save the rest of Rossem."

The Mule spread his hands and laughed again while the First Speaker seemed to find difficulty in absorbing this new state of affairs.

He said: "The alternative?"

"Why should there even be an alternative? I can stand to gain no more by any alternative. Is it the lives of those on Rossem I'm to be chary of? Perhaps if you allow my ships to land and submit, all of you – all the men on the Second Foundation – to mental control sufficient to suit myself, I may countermand the bombardment orders. It may be worthwhile to put so many men of high intelligence under my control. But then again it would be a considerable effort and perhaps not worth it after all, so I'm not particularly eager to have you agree to it. What do you say, Second Founder? What weapon have you against my mind which is as strong as yours at least and against my ships which are stronger than anything you have ever dreamed of possessing?"

"What have I?" repeated the First Speaker, slowly: "Why nothing – except a little grain – such a little grain of knowledge that even yet you do not possess."

"Speak quickly," laughed the Mule, "speak inventively. For squirm as you might, you won't squirm out of this."

"Poor mutant," said the First Speaker, "I have nothing to squirm out of. Ask yourself – why was Bail Channis sent to Kalgan as a decoy – Bail Channis, who though young and brave is almost as much your mental inferior as is this sleeping officer of yours, this Han Pritcher. Why did not I go, or another of our leaders, who would be more your match?"

"Perhaps," came the supremely confident reply, "you were not sufficiently foolish, since perhaps none of you are my match."

"The true reason is more logical. You knew Channis to be a Second Founder. He lacked the capacity to hide that from you. And you knew, too, that you were his superior, so you were not afraid to play his game and follow him as he wished you to in order to outwit him later. Had I gone to Kalgan, you would have killed me for I would have been a real danger, or had I avoided death by concealing my identity, I would yet have failed in persuading you to follow me into space. It was only known inferiority that lured you on. And had you remained on Kalgan, not all the force of the Second Foundation could have harmed you, surrounded as you were by your men, your machines, and your mental power."

"My mental power is yet with me, squirmer," said the Mule, "and my men and machines are not far off."

"Truly so, but you are not on Kalgan. You are here in the Kingdom of Tazenda, logically presented to you as the Second Foundation – very logically presented. It had to be so presented, for you are a wise man, First Citizen, and would follow only logic."

"Correct, and it was a momentary victory for your side, but there was still time for me to worm the truth from your man, Channis, and still wisdom in me to realize that such a truth might exist."

"And on our side, oh, not-quite-sufficiently-subtle one, was the realization that you might go that one step further and so Bail Channis was prepared for you."

"That he most certainly was not, for I stripped his brain clean as any plucked chicken. It quivered bare and open before me and when he said Rossem was the Second Foundation, it was basic truth for I had ground him so flat and smooth that not the smidgeon of a deceit could have found refuge in any microscopic crevice."

"True enough. So much the better for our foresight. For I have told you already that Bail Channis was a volunteer. Do you know what sort of a volunteer? Before he left our Foundation for Kalgan and you, he submitted to emotional surgery of a drastic nature. Do you think it was sufficient to deceive you? Do you think Bail Channis, mentally untouched, could possibly deceive you? No, Bail Channis was himself deceived, of necessity and voluntarily. Down to the inmost core of his mind, Bail Channis honestly believes that Rossem is the Second Foundation.

"And for three years now, we of the Second Foundation have built up the appearance of that here in the Kingdom of Tazenda, in preparation and waiting for you. And we have succeeded, have we not? You penetrated to Tazenda, and beyond that, to Rossem – but past that, you could not go."

The Mule was upon his feet: "You dare tell me that Rossem also, is not the Second Foundation?"

Channis, from the floor, felt his bonds burst for good, under a stream of mental force on the part of the First Speaker and strained upright. He let out one long, incredulous cry: "You mean Rossem is *not* the Second Foundation?"

The memories of life, the knowledge of his mind – everything – whirled mistily about him in confusion.

The First Speaker smiled: "You see, First Citizen, Channis is as upset as you are. Of course, Rossem is not the Second Foundation. Are we madmen then, to lead you, our greatest, most powerful, most dangerous enemy to our own world? Oh, no!

"Let your Fleet bombard Rossem, First Citizen, if you must have it so. Let them destroy all they can. For at most they can kill only Channis and myself – and that will leave you in a situation improved not in the least.

"For the Second Foundation's Expedition to Rossem which has been here for three years and has functioned, temporarily, as Elders in this village, embarked yesterday and are returning to Kalgan. They will evade your Fleet, of course, and they will arrive in Kalgan at least a day before you can, which is why I tell you all this. Unless I countermand my orders, when you return, you will find a revolting Empire, a disintegrated realm, and only the men with you in your Fleet here will be loyal to you. They will be hopelessly outnumbered. And moreover, the men of the Second Foundation will be with your Home Fleet and will see to it that you reconvert no one. Your Empire is done, mutant."

Slowly, the Mule bowed his head, as anger and despair cornered his mind completely, "Yes. Too late– Too late– Now I see it."

"Now you see it," agreed the First Speaker, "and now you don't."

In the despair of that moment, when the Mule's mind lay open, the First Speaker – ready for that moment and pre-sure of its nature – entered quickly. It required a rather insignificant fraction of a second to consummate the change completely.

The Mule looked up and said: "Then I shall return to Kalgan?"

"Certainly. How do you feel?"

"Excellently well." His brow puckered: "Who are you?"

"Does it matter?"

"Of course not." He dismissed the matter, and touched Pritcher's shoulder: "Wake up, Pritcher, we're going home."

It was two hours later that Bail Channis felt strong enough to walk by himself. He said: "He won't ever remember?"

"Never. He retains his mental powers and his Empire – but his motivations are now entirely different. The notion of a Second Foundation is a blank to him, and he is a man of peace. He will be a far happier man henceforward, too, for the few years of life left him by his maladjusted physique. And then, after he is dead Seldon's Plan will go on – somehow."

"And it is true," urged Channis, "it is true that Rossem is not the Second Foundation? I could swear – I tell you I *know* it is. I am not mad."

"You are not mad, Channis, merely, as I have said, changed. Rossem is *not* the Second Foundation. Come! We, too, will return home."

LAST INTERLUDE

Bail Channis sat in the small white-tiled room and allowed his mind to relax. He was content to live in the present. There were the walls and the window and the grass outside. They had no names. They were just things. There was a bed and a chair and books that developed themselves idly on the screen at the foot of his bed. There was the nurse who brought him his food.

At first he had made efforts to piece together the scraps of things he had heard. Such as those two men talking together.

One had said: "Complete aphasia now. It's cleaned out, and I think without damage. It will only be necessary to return the recording of his original brain-wave makeup."

He remembered the sounds by rote, and for some reason they seemed peculiar sounds – as if they meant something. But why bother.

Better to watch the pretty changing colors on the screen at the foot of the thing he lay on.

And then someone entered and did things to him and for a long time, he slept.

And when that had passed, the bed was suddenly a bed and he knew he was in a hospital, and the words he remembered made sense.

He sat up: "What's happening?"

The First Speaker was beside him, "You're on the Second Foundation, and you have your mind back – your original mind."

"Yes! Yes!" Channis came to the realization that he was *himself*, and there was incredible triumph and joy in that.

"And now tell me," said the First Speaker, "do you know where the Second Foundation is now?"

And the truth came flooding down in one enormous wave and Channis did not answer. Like Ebling Mis before him, he was conscious of only one vast, numbing surprise.

Until he finally nodded, and said: "By the Stars of the Galaxy – now, I know."

PART II

SEARCH BY THE FOUNDATION

7. ARCADIA

DARELL, ARKADY novelist, born 11, 5, 362 F.E., died 1, 7, 443 F.E. Although primarily a writer of fiction, Arkady Darell is best known for her biography of her grandmother, Bayta Darell. Based on first-hand information, it has for centuries served as a primary source of information concerning the Mule and his times. . . . Like "Unkeyed Memories", her novel "Time and Time and Over" is a stirring reflection of the brilliant Kalganian society of the early Interregnum, based, it is said, on a visit to Kalgan in her youth. . . .

ENCYCLOPEDIA GALACTICA

Arcadia Darell declaimed firmly into the mouthpiece of her transcriber:

"The Future of Seldon's Plan, by A. Darell" and then thought darkly that some day when she was a great writer, she would write all her masterpieces under the pseudonym of Arkady. Just Arkady. No last name at all.

"A. Darell" *would* be just the sort of thing that she would have to put on all her themes for her class in Composition and Rhetoric – so tasteless. All the other kids had to do it, too, except for Olynthus Dam, because the class laughed so when he did it the first time, And "Arcadia" was a little girls name, wished on her because her great-grandmother had been called that; her parents just had no imagination *at all*.

Now that she was two days past fourteen, you'd think they'd recognize the simple fact of adulthood and call her Arkady. Her lips tightened as she thought of her father looking up from his book-viewer just long enough to say, "But if you're going to pretend you're nineteen, Arcadia, what will you do when you're twenty-five and all the boys think you're thirty?"

From where she sprawled across the arms and into the hollow of her own special armchair, she could see the mirror on her dresser. Her foot was a little in the way because her house slipper kept twirling about her big toe, so she pulled it in and sat up with an unnatural straightness to her neck that she felt sure, somehow, lengthened it a full two inches into slim regality.

For a moment, she considered her face thoughtfully – too fat. She opened her jaws half an inch behind closed lips, and caught the resultant trace of unnatural gauntness at every angle. She licked her lips with a quick touch of tongue and let them pout a bit in moist softness. Then she let her eyelids droop in a weary, worldly way– Oh, golly if only her cheeks weren't that silly *pink*.

She tried putting her fingers to the outer corners of her eye and tilting the lids a bit to get that mysterious exotic languor of the women of the inner star systems, but her hands were in the way and she couldn't see her face very well.

Then she lifted her chin, caught herself at a half-profile, and with her eyes a little strained from looking out the corner and her neck muscles faintly aching, she said, in a voice one octave below its natural pitch, "Really, father, if you think it makes a *particle* of difference to me what some silly old boys think you just—"

And then she remembered that she still had the transmitter open in her hand and said, drearily, "Oh, golly," and shut it off.

The faintly violet paper with the peach margin line on the left had upon it the following:

"THE FUTURE OF SELDON'S PLAN

"Really, father, if you think it makes a particle of difference to me what some silly old boys think you just"

"Oh, golly."

She pulled the sheet out of the machine with annoyance and another clicked neatly into place.

But her face smoothed out of its vexation, nevertheless, and her wide, little mouth stretched into a self-satisfied smile. She sniffed at the paper delicately. just right. Just that proper touch of elegance and charm. And the penmanship was just the last word.

The machine had been delivered two days ago on her first adult birthday. She had said, "But father, everybody – just everybody in the class who has the slightest pretensions to *being* anybody has one. Nobody but some old drips would use hand machines—"

The salesman had said, "There is no other model as compact on the one hand and as adaptable on the other. It will spell and punctuate correctly according to the sense of the sentence. Naturally, it is a great aid to education since it encourages the user to employ careful enunciation and breathing in order to make sure of the correct spelling, to say nothing of demanding a proper and elegant delivery for correct punctuation."

Even then her father had tried to get one geared for type-print as if she were some dried-up, old-maid teacher.

But when it was delivered, it was the model she wanted – obtained perhaps with a little more wail and snuffle than quite went with the adulthood of fourteen – and copy was turned out in a charming and entirely feminine handwriting, with the most beautifully graceful capitals anyone ever saw.

Even the phrase, "Oh, golly." somehow breathed glamour when the Transcriber was done with it.

But just the same she had to get it right, so she sat up straight in her chair, placed her first draft before her in businesslike fashion, and began again, crisply and clearly; her

abdomen flat, her chest lifted, and her breathing carefully controlled. She intoned, with dramatic fervor: The Future of Seldon's Plan.

"The Foundation's past history is, I am sure, well-known to all of us who have had the good fortune to be educated in our planet's efficient and well-staffed school system.

(There! That would start things off right with Miss Erlking, that mean old hag.)

That past history is largely the past history of the great Plan of Hari Seldon. The two are one. But the question in the mind of most people today is whether this Plan will continue in all its great wisdom, or whether it will be foully destroyed, or, perhaps, has been so destroyed already.

"To understand this, it may be best to pass quickly over some of the highlights of the Plan as it has been revealed to humanity thus far.

(This part was easy because she had taken Modern History the semester before.)

"In the days, nearly four centuries ago, when the First Galactic Empire was decaying into the paralysis that preceded final death, one man – the great Hari Seldon – foresaw the approaching end. Through the science of psychohistory, the intricacies of whose mathematics has long since been forgotten,

(She paused in a trifle of doubt. She was sure that "intricacies" was pronounced with soft c's but the spelling didn't look right. Oh, well, the machine couldn't very well be wrong–) he and the men who worked with him are able to foretell the course of the great social and economic currents sweeping the Galaxy at the time. It was possible for them to realize that, left to itself, the Empire would break up, and that thereafter there would be at least thirty thousand years of anarchic chaos prior to the establishment of a new Empire.

"It was too late to prevent the great Fall, but it was still possible, at least, to cut short the intermediate period of chaos. The Plan was, therefore, evolved whereby only a single millennium would separate the Second Empire from the First. We are completing the fourth century of that millennium, and many generations of men have lived and died while the Plan has continued its inexorable workings.

"Hari Seldon established two Foundations at the opposite ends of the Galaxy, in a manner and under such circumstances as would yield the best mathematical solution for his psychohistorical problem. In one of these, *our* Foundation, established here on Terminus, there was concentrated the physical science of the Empire, and through the possession of that science, the Foundation was able to withstand the attacks of the barbarous kingdoms which had broken away and become independent, out at the hinge of the Empire.

"The Foundation, indeed, was able to conquer in its turn these short-lived kingdoms by means of the leadership of a series of wise and heroic men like Salvor Hardin and Hober Mallow who were able to interpret the Plan intelligently and to guide our land through its (She had written "intricacies" here also, but decided not to risk it a second time.) complications. All our planets still revere their memories although centuries have passed.

"Eventually, the Foundation established a commercial system which controlled a large portion of the Siwennian and Anacreonian sectors of the Galaxy, and even defeated the remnants of the old Empire under its last great general, Bel Riose. It seemed that nothing could now stop the workings of Seldon's plan. Every crisis that Seldon had planned had come at its appropriate time and had been solved, and with each solution the Foundation had taken another giant stride toward Second Empire and peace.

"And then,

(Her breath came short at this point, and she hissed the word, between her teeth, but the Transmitter simply wrote them calmly and gracefully.) with the last remnants of the dead First Empire gone and with only ineffectual warlords ruling over the splinters and remnants of the decayed colossus,

(She got *that* phrase out of a thriller on the video last week, but old Miss Erlking never listened to anything but symphonies and lectures, so *she'd* never know.) there came the Mule.

"This strange man was not allowed for in the Plan. He was a mutant, whose birth could not have been predicted. He had strange and mysterious power of controlling and manipulating human emotions and in this manner could bend all men to his will. With breath-taking swiftness, he became a conqueror and Empire-builder, until, finally, he even defeated the Foundation itself.

"Yet he never obtained universal dominion, since in his first overpowering lunge he was stopped by the wisdom and daring of a great woman (Now there was that old problem again. Father *would* insist that she never bring up the fact that she was the grandchild of Bayta Darell. Everyone knew it and Bayta was just about the greatest woman there ever was and she *had* stopped the Mule singlehanded.) in a manner the true story of which is known in its entirety to very few.

(There! If she had to read it to the class, that last could he said in a dark voice, and someone would be sure to ask what the true story was, and then – well, and then she couldn't *help* tell the truth if they asked her, could she? In her mind, she was already wordlessly whizzing through a hurt and eloquent explanation to a stern and questioning paternal parent.)

"After five years of restricted rule, another change took place, the reasons for which are not known, and the Mule abandoned all plans for further conquest. His last five years were those of an enlightened despot.

"It is said by some that the change in the Mule was brought about by the intervention of the Second Foundation. However, no man has ever discovered the exact location of this other Foundation, nor knows its exact function, so that theory remains unproven.

"A whole generation has passed since the death of the Mule. What of the future, then, now that he has come and gone? He interrupted Seldon's Plan and seemed to have burst it to fragments, yet as soon as he died, the Foundation rose again, like a nova from the dead ashes of a dying star.

(She had made that up herself.)

Once again, the planet Terminus houses the center of a commercial federation almost as great and as rich as before the conquest, and even more peaceful and democratic.

"Is this planned? Is Seldon's great dream still alive, and will a Second Galactic Empire yet be formed six hundred years from now? I, myself, believe so, because (This was the important part. Miss Erlking always had those large, ugly red-pencil scrawls that went: 'But this is only descriptive. What are your personal reactions? Think! Express yourself! Penetrate your own soul!' Penetrate your own soul. A lot *she* knew about souls, with her lemon face that never smiled in its life—) never at any time has the political situation been so favorable. The old Empire is completely dead and the period of the Mule's rule put an end to the era of warlords that preceded him. Most of the surrounding portions of the Galaxy are civilized and peaceful.

"Moreover the internal health of the Foundation is better than ever before. The despotic times of the pre-Conquest hereditary mayors have given way to the democratic elections of early times. There are no longer dissident worlds of independent Traders; no longer the injustices and dislocations that accompanied accumulations of great wealth in the hands of a few.

"There is no reason, therefore, to fear failure, unless it is true that the Second Foundation itself presents a danger. Those who think so have no evidence to back their claim, but merely vague fears and superstitions. I think that our confidence in ourselves, in our nation, and in Hari Seldon's great Plan should drive from our hearts and minds all uncertainties and (Hm-m-m. This was awfully corny, but something like this was expected at the end.) so I say—"

That is as far as "The Future of Seldon's Plan" got, at that moment, because there was the gentlest little tap on the window, and when Arcadia shot up to a balance on one arm of the chair, she found herself confronted by a smiling face beyond the glass, its even symmetry of feature interestingly accentuated by the short, vertical fine of a finger before its lips.

With the slight pause necessary to assume an attitude of bewilderment, Arcadia dismounted from the armchair, walked to the couch that fronted the wide window that held the apparition and, kneeling upon it, stared out thoughtfully.

The smile upon the man's face faded quickly. While the fingers of one hand tightened whitely upon the sill, the other made a quick gesture. Arcadia obeyed calmly, and closed the latch that moved the lower third of the window smoothly into its socket in the wall, allowing the warm spring air to interfere with the conditioning within.

"You can't get in," she said, with comfortable smugness. "The windows are all screened, and keyed only to people who belong here. If you come in, all sorts of alarms will break loose." A pause, then she added, "You look sort of silly balancing on that ledge underneath the window. If you're not careful, you'll fall and break your neck and a lot of valuable flowers."

"In that case," said the man at the window, who had been thinking that very thing – with a slightly different arrangement of adjectives– "will you shut off the screen and let me in?"

"No use in doing that'" said Arcadia. "You're probably thinking of a different house, because I'm not the kind of girl who lets strange men into their . . . her bedroom this time of night." Her eyes, as she said it, took on a heavy-lidded sultriness – or an unreasonable facsimile thereof.

All traces of humor whatever had disappeared from the young stranger's face. He muttered, "This is Dr. Darell's house, isn't it?"

"Why should I tell you?"

"Oh, Galaxy– Good-by–"

"If you jump off, young man, I will personally give the alarm." (This was intended as a refined and sophisticated thrust of irony, since to Arcadia's enlightened eyes, the intruder was an obviously mature thirty, at least – quite elderly, in fact.)

Quite a pause. Then, tightly, he said, "Well, now, look here, girlie, if you don't want me to stay, and don't want me to go, what *do* you want me to do?"

"You can come in, I suppose. Dr. Darell *does* live here. I'll shut off the screen now."

Warily, after a searching look, the young man poked his hand through the window, then hunched himself up and through it. He brushed at his knees with an angry, slapping gesture, and lifted a reddened face at her.

"You're quite sure that your character and reputation won't suffer when they find me here, are you?"

"Not as much as yours would, because just as soon as I hear footsteps outside, I'll just shout and yell and say you forced your way in here."

"Yes?" he replied with heavy courtesy, "And how do you intend to explain the shut-off protective screen?"

"Poof! That would be easy. There wasn't any there in the first place."

The man's eyes were wide with chagrin. "That was a bluff? How old are you, kid?"

"I consider that a very impertinent question, young man. And I am not accustomed to being addressed as 'kid.'"

"I don't wonder. You're probably the Mule's grandmother in disguise. Do you mind if I leave now before you arrange a lynching party with myself as star performer?"

"You had better not leave – because my father's expecting you."

The man's look became a wary one, again. An eyebrow shot up as he said, lightly, "Oh? Anyone with your father?"

"No."

"Anyone called on him lately?"

"Only tradespeople – and you."

"Anything unusual happen at all?"

"Only you."

"Forget me, will you? No, don't forget me. Tell me, how did you know your father was expecting me?"

"Oh, that was easy. Last week, he received a Personal Capsule, keyed to him personally, with a self-oxidizing message, you know. He threw the capsule shell into the Trash Disinto, and yesterday, he gave Poli – that's our maid, you see – a month's vacation so she could visit her sister in Terminus City, and this afternoon, he made up the bed in the spare room. So I knew he expected somebody that I wasn't supposed to know anything about. Usually, he tells me everything."

"Really! I'm surprised he has to. I should think you'd know everything before he tells you."

"I usually do." Then she laughed. She was beginning to feel very much at ease. The visitor was elderly, but very distinguished-looking with curly brown hair and very blue eyes. Maybe she could meet somebody like that again, sometimes, when she was old herself.

"And just how," he asked, "did you know it was I he expected."

"Well, who else *could* it be? He was expecting somebody in so secrecy a way, if you know what I mean – and then you come gumping around trying to sneak through windows, instead of walking through the front door, the way you would if you had any sense." She remembered a favorite line, and used it promptly. "Men are so stupid!"

"Pretty stuck on yourself, aren't you, kid? I mean, Miss. You could be wrong, you know. What if I told you that all this is a mystery to me and that as far as I know, your father is expecting someone else, not me."

"Oh, I don't think so. I didn't ask you to come in, until after I saw you drop your briefcase."

"My what?"

"Your briefcase, young man. I'm not blind. You didn't drop it by accident, because you looked down *first*, so as to make sure it would land right. Then you must have realized it would land just under the hedges and wouldn't be seen, so you dropped it and *didn't* look down afterwards. Now since you came to the window instead of the front door, it must mean that you were a little afraid to trust yourself in the house before investigating the place. And after you had a little trouble with me, you took care of your briefcase before taking care of yourself, which means that you consider whatever your briefcase has in it to be more valuable than your own safety, and *that* means that as long as you're in here and the briefcase is out there and we know that it's out there, you're probably pretty helpless."

She paused for a much-needed breath, and the man said, grittily, "Except that I think I'll choke you just about medium dead and get out of here, *with* the briefcase."

"Except, young man, that I happen to have a baseball bat under my bed, which I can reach in two seconds from where I'm sitting, and I'm very strong for a girl."

Impasse. Finally, with a strained courtesy, the "young man" said, "Shall I introduce myself, since we're being so chummy. I'm Pelleas Anthon. And your name?"

"I'm Arca– Arkady Darell. Pleased to meet you."

"And now Arkady, would you be a good little girl and call your father?"

Arcadia bridled. "I'm not a little girl. I think you're very rude – especially when you're asking a favor."

Pelleas Anthon sighed. "Very well. Would you be a good, kind, dear, little old lady, just chock full of lavender, and call your father?"

"That's not what I meant either, but I'll call him. Only not so I'll take my eyes off you, young man." And she stamped on the floor.

There came the sound of hurrying footsteps in the hall, and the door was flung open.

"Arcadia—" There was a tiny explosion of exhaled air, and Dr. Darell said, "Who are you, sir?"

Pelleas sprang to his feet in what was quite obviously relief. "Dr. Toran Darell? I am Pelleas Anthon. You've received word about me, I think. At least, your daughter says you have."

"My daughter says I have?" He bent a frowning glance at her which caromed harmlessly off the wide-eyed and impenetrable web of innocence with which she met the accusation.

Dr. Darell said, finally: "I have been expecting you. Would you mind coming down with me, please?" And he stopped as his eye caught a flicker of motion, which Arcadia caught simultaneously.

She scrambled toward her Transcriber, but it was quite useless, since her father was standing right next to it. He said, sweetly, "You've left it going all this time, Arcadia."

"Father," she squeaked, in real anguish, "it is very ungentlemanly to read another person's private correspondence, especially when it's talking correspondence."

"Ah," said her father, "but 'talking correspondence' with a strange man in your bedroom! As a father, Arcadia, I must protect you against evil."

"Oh, golly – it was nothing like *that*."

Pelleas laughed suddenly, "Oh, but it was, Dr. Darell. The young lady was going to accuse me of all sorts of things, and I must insist that you read it, if only to clear *my* name."

"Oh—" Arcadia held back her tears with an effort. Her own father didn't even trust her. And that darned Transcriber— If that silly fool hadn't come gooping at the window, and making her forget to turn it off. And now her father would be making long, gentle speeches about what young ladies aren't supposed to do. There just wasn't anything they were supposed to do, it looked like, except choke and die, maybe.

"Arcadia," said her father, gently, "it strikes me that a young lady—"

She knew it. She knew it.

"—should not be quite so impertinent to men older than she is.

"Well, what did he want to come peeping around my window for? A young lady has a right to privacy— Now I'll have to do my whole darned composition over."

"It's not up to you to question his propriety in coming to your window. You should simply not have let him in. You should have called me instantly – especially if you thought I was expecting him."

She said, peevishly, "It's just as well if you didn't see him – stupid thing. Hell give the whole thing away if he keeps on going to windows, instead of doors."

"Arcadia, nobody wants your opinion on matters you know nothing of."

"I do, too. It's the Second Foundation, that's what it is."

There was a silence. Even Arcadia felt a little nervous stirring in her abdomen.

Dr. Darell said, softly, "Where have you heard this?"

"Nowheres, but what else is there to be so secret about? And you don't have to worry that I'll tell anyone."

"Mr. Anthon," said Dr. Darell, "I must apologize for all this."

"Oh, that's all right," came Anthon's rather hollow response. "It's not your fault if she's sold herself to the forces of darkness. But do you mind if I ask her a question before we go. Miss Arcadia—"

"What do you want?"

"Why do you think it is stupid to go to windows instead of to doors?"

"Because you advertise what you're trying to hide, silly. If I have a secret, I don't put tape over my mouth and let everyone *know* I have a secret. I talk just as much as usual, only about something else. Didn't you ever read any of the sayings of Salvor Hardin? He was our first Mayor, you know."

"Yes, I know."

"Well, he used to say that only a he that wasn't ashamed of itself could possibly succeed. He also said that nothing had to *be* true, but everything had to *sound* true. Well, when you come in through a window, it's a lie that's ashamed of itself and it doesn't sound true."

"Then what would you have done?"

"If I had wanted to see my father on top secret business, I would have made his acquaintance openly and seen him about all sorts of strictly legitimate things. And then when everyone knew all about you and connected you with my father as a matter of course, you could be as top secret as you want and nobody would ever think of questioning it."

Anthon looked at the girl strangely, then at Dr. Darell. He said, "Let's go. I have a briefcase I want to pick up in the garden. Wait! Just one last question. Arcadia, you don't really have a baseball bat under your bed, do you?"

"No! I don't."

"Hah. I didn't think so."

Dr. Darell stopped at the door. "Arcadia," he said, "when you rewrite your composition on the Seldon Plan, don't be unnecessarily mysterious about your grandmother. There is no necessity to mention that part at all."

He and Pelleas descended the stairs in silence. Then the visitor asked in a strained voice, "Do you mind, sir? How old is she?"

"Fourteen, day before yesterday."

"Fourteen? Great Galaxy— Tell me, has she ever said she expects to marry some day?"

"No, she hasn't. Not to me."

Well, if she ever does, shoot him. The one she's going to marry, I mean." He stared earnestly into the older man's eyes. "I'm serious. Life could hold no greater horror than living with what shall be like when she's twenty. I don't mean to offend you, of course."

"You don't offend me. I think I know what you mean."

Upstairs, the object of their tender analyses faced the Transcriber with revolted weariness and said, dully: "Thefutureofseldonsplan." The Transcriber with infinite aplomb, translated that into elegantly, complicated script capitals as:

"The Future of Seldon's Plan."

8. SELDON'S PLAN

MATHEMATICS The synthesis of the calculus of n -variables and of n -dimensional geometry is the basis of what Seldon once called "my little algebra of humanity". . . .

ENCYCLOPEDIA GALACTICA

Consider a room!

The location of the room is not in question at the moment. It is merely sufficient to say that in that room, more than anywhere, the Second Foundation existed.

It was a room which, through the centuries, had been the abode of pure science — yet it had none of the gadgets with which, through millennia of association, science has come to be considered equivalent. It was a science, instead, which dealt with mathematical concepts only, in a manner similar to the speculation of ancient, ancient races in the primitive, prehistoric days before technology had come to be; before Man had spread beyond a single, now-unknown world.

For one thing, there was in that room — protected by a mental science as yet unassailable by the combined physical might of the rest of the Galaxy — the Prime Radiant, which held in its vitals the Seldon Plan — complete.

For another, there was a man, too, in that room — The First Speaker.

He was the twelfth in the line of chief guardians of the Plan, and his title bore no deeper significance than the fact that at the gatherings of the leaders of the Second Foundation, he spoke first.

His predecessor had beaten the Mule, but the wreckage of that gigantic struggle still littered the path of the Plan— For twenty-five years, he, and his administration, had been trying to force a Galaxy of stubborn and stupid human beings back to the path— It was a terrible task.

The First Speaker looked up at the opening door. Even while, in the loneliness of the room, he considered his quarter century of effort, which now so slowly and inevitably approached its climax; even while he had been so engaged, his mind had been considering the newcomer with a gentle expectation. A youth, a student, one of those who might take over, eventually.

The young man stood uncertainly at the door, so that the First Speaker had to walk to him and lead him in, with a friendly hand upon the shoulder.

The Student smiled shyly, and the First Speaker responded by saying, "First, I must tell you why you are here."

They faced each other now, across the desk. Neither was speaking in any way that could be recognized as such by any man in the Galaxy who was not himself a member of the Second Foundation.

Speech, originally, was the device whereby Man learned, imperfectly, to transmit the thoughts and emotions of his mind. By setting up arbitrary sounds and combinations of sounds to represent certain mental nuances, he developed a method of communication – but one which in its clumsiness and thick-thumbed inadequacy degenerated all the delicacy of the mind into gross and guttural signaling.

Down– down– the results can be followed; and all the suffering that humanity ever knew can be traced to the one fact that no man in the history of the Galaxy, until Hari Seldon, and very few men thereafter, could really understand one another. Every human being lived behind an impenetrable wall of choking mist within which no other but he existed. Occasionally there were the dim signals from deep within the cavern in which another man was located–so that each might grope toward the other. Yet because they did not know one another, and could not understand one another, and dared not trust one another, and felt from infancy the terrors and insecurity of that ultimate isolation – there was the hunted fear of man for man, the savage rapacity of man toward man.

Feet, for tens of thousands of years, had clogged and shuffled in the mud – and held down the minds which, for an equal time, had been fit for the companionship of the stars.

Grimly, Man had instinctively sought to circumvent the prison bars of ordinary speech. Semantics, symbolic logic, psychoanalysis – they had all been devices whereby speech could either be refined or by-passed.

Psychohistory had been the development of mental science, the final mathematicization thereof, rather, which had finally succeeded. Through the development of the mathematics necessary to understand the facts of neural physiology and the electrochemistry of the nervous system, which themselves had to be, *had to be*, traced down to nuclear forces, it first became possible to truly develop psychology. And through the generalization of psychological knowledge from the individual to the group, sociology was also mathematicized.

The larger groups; the billions that occupied planets; the trillions that occupied Sectors; the quadrillions that occupied the whole Galaxy, became, not simply human

beings, but gigantic forces amenable to statistical treatment – so that to Hari Seldon, the future became clear and inevitable, and the Plan could be set up.

The same basic developments of mental science that had brought about the development of the Seldon Plan, thus made it also unnecessary for the First Speaker to use words in addressing the Student.

Every reaction to a stimulus, however slight, was completely indicative of all the trifling changes, of all the flickering currents that went on in another's mind. The First Speaker could not sense the emotional content of the Student's instinctively, as the Mule would have been able to do – since the Mule was a mutant with powers not ever likely to become completely comprehensible to any ordinary man, even a Second Founder – rather he deduced them, as the result of intensive training.

Since, however, it is inherently impossible in a society based on speech to indicate truly the method of communication of Second Founders among themselves, the whole matter will be hereafter ignored. The First Speaker will be represented as speaking in ordinary fashion, and if the translation is not always entirely valid, it is at least the best that can be done under the circumstances.

It will be pretended therefore, that the First Speaker *did* actually say, "First, I must tell you why you are here," instead of smiling *just* so and lifting a finger *exactly* thus.

The First Speaker said, "You have studied mental science hard and well for most of your life. You have absorbed all your teachers could give you. It is time for you and a few others like yourself to begin your apprenticeship for Speakerhood."

Agitation from the other side of the desk.

"No – now you must take this phlegmatically. You had hoped you would qualify. You had feared you would not. Actually, both hope and fear are weaknesses. You *knew* you would qualify and you hesitate to admit the fact because such knowledge might stamp you as cocksure and therefore unfit. Nonsense! The most hopelessly stupid man is he who is not aware that he is wise. It is part of your qualification that you *knew* you would qualify."

Relaxation on the other side of the desk.

"Exactly. Now you feel better and your guard is down. You are fitter to concentrate and fitter to understand. Remember, to be truly effective, it is not necessary to hold the mind under a tight, controlling barrier which to the intelligent probe is as informative as a naked mentality. Rather, one should cultivate an innocence, an awareness of self, and an unself-consciousness of self which leaves one nothing to hide. My mind is open to you. Let this be so for both of us."

He went on. "It is not an easy thing to be a Speaker. It is not an easy thing to be a Psychohistorian in the first place; and not even the best Psychohistorian need necessarily qualify to be a Speaker. There is a distinction here. A Speaker must not only be aware of the mathematical intricacies of the Seldon Plan; he must have a sympathy for it and for its ends. He must *love* the Plan; to him it must be life and breath. More than that it must even be as a living friend.

"Do you know what this is?"

The First Speaker's hand hovered gently over the black, shining cube in the middle of the desk. It was featureless.

"No, Speaker, I do not."

"You have heard of the Prime Radiant?"

"This?" –Astonishment.

"You expected something more noble and awe-inspiring? Well, that is natural. It was created in the days of the Empire, by men of Seldon's time. For nearly four hundred years, it has served our needs perfectly, without requiring repairs or adjustment. And fortunately so, since none of the Second Foundation is qualified to handle it in any technical fashion." He smiled gently. "Those of the First Foundation might be able to duplicate this, but they must never know, of course."

He depressed a lever on his side of the desk and the room was in darkness. But only for a moment, since with a gradually livening flush, the two long walls of the room glowed to life. First, a pearly white, unrelieved, then a trace of faint darkness here and there, and finally, the fine neatly printed equations in black, with an occasional red hairline that wavered through the darker forest like a staggering rillet.

"Come, my boy, step here before the wall. You will not cast a shadow. This light does not radiate from the Radiant in an ordinary manner. To tell you the truth, I do not know even faintly by what medium this effect is produced, but you will not cast a shadow. I know that."

They stood together in the light. Each wall was thirty feet long, and ten high. The writing was small and covered every inch.

"This is not the whole Plan," said the First Speaker. "To get it all upon both walls, the individual equations would have to be reduced to microscopic size – but that is not necessary. What you now see represents the main portions of the Plan till now. You have learned about this, have you not?"

"Yes, Speaker, I have."

"Do you recognize any portion."

A slow silence. The student pointed a finger and as he did so, the line of equations marched down the wall, until the single series of functions he had thought of – one could scarcely consider the quick, generalized gesture of the finger to have been sufficiently precise – was at eye-level.

The First Speaker laughed softly, "You will find the Prime Radiant to be attuned to your mind. You may expect more surprises from the little gadget. What were you about to say about the equation you have chosen?"

"It," faltered the Student, "is a Rigellian integral, using a planetary distribution of a bias indicating the presence of two chief economic classes on the planet, or maybe a Sector, plus an unstable emotional pattern."

"And what does it signify?"

"It represents the limit of tension, since we have here" – he pointed, and again the equations veered – "a converging series."

"Good," said the First Speaker. "And tell me, what do you think of all this. A finished work of art, is it not?"

"Definitely!"

"Wrong! It is not." This, with sharpness. "It is the first lesson you must unlearn. The Seldon Plan is neither complete nor correct. Instead, it is merely the best that could be done at the time. Over a dozen generations of men have pored over these equations, worked at them, taken them apart to the last decimal place, and put them together again. They've done more than that. They've watched nearly four hundred years pass and against the predictions and equations, they've checked reality, and they have learned.

"They have learned more than Seldon ever knew, and if with the accumulated knowledge of the centuries we could repeat Seldon's work, we could do a better job. Is that perfectly clear to you?"

The Student appeared a little shocked.

"Before you obtain your Speakerhood," continued the First Speaker, "you yourself will have to make an original contribution to the Plan. It is not such great blasphemy. Every red mark you see on the wall is the contribution of a man among us who lived since Seldon. Why . . . why—" He looked upward, "There!"

The whole wall seemed to whirl down upon him.

"This," he said, "is mine." A fine red line encircled two forking arrows and included six square feet of deductions along each path. Between the two were a series of equations in red.

"It does not," said the Speaker, "seem to be much. It is at a point in the Plan which we will not reach yet for a time as long as that which has already passed. It is at the period of coalescence, when the Second Empire that is to be is in the grip of rival personalities who will threaten to pull it apart if the fight is too even, or clamp it into rigidity, if the fight is too uneven. Both possibilities are considered here, followed, and the method of avoiding either indicated.

"Yet it is all a matter of probabilities and a third course can exist. It is one of comparatively low likelihood – twelve point six four percent, to be exact – but even smaller chances have *already* come to pass and the Plan is only forty percent complete. This third probability consists of a possible compromise between two or more of the conflicting personalities being considered. This, I showed, would first freeze the Second Empire into an unprofitable mold, and then, eventually, inflict more damage through civil wars than would have taken place had a compromise never been made in the first place. Fortunately, that could be prevented, too. And that was my contribution."

"If I may interrupt, Speaker— How is a change made?"

"Through the agency of the Radiant. You will find in your own case, for instance, that your mathematics will be checked rigorously by five different boards; and that you will be required to defend it against a concerted and merciless attack. Two years will then pass, and your development will be reviewed again. It has happened more than once that a seemingly perfect piece of work has uncovered its fallacies only after an induction period of months or years. Sometimes, the contributor himself discovers the flaw.

"If, after two years, another examination, not less detailed than the first, still passes it, and – better still – if in the interim the young scientist has brought to light additional details, subsidiary evidence, the contribution will be added to the Plan. It was the climax of my career; it will be the climax of yours.

"The Prime Radiant can be adjusted to your mind, and all corrections and additions can be made through mental rapport. There will be nothing to indicate that the correction or addition is yours. In all the history of the Plan there has been no personalization. It is rather a creation of all of us together. Do you understand?"

"Yes, Speaker!"

"Then, enough of that." A stride to the Prime Radiant, and the walls were blank again save for the ordinary room-lighting region along the upper borders. "Sit down here at my desk, and let me talk to you. It is enough for a Psychohistorian, as such, to know his Biostatistics and his Neurochemical Electromathematics. Some know nothing else and are fit only to be statistical technicians. But a Speaker must be able to discuss the Plan without mathematics. If not the Plan itself, at least its philosophy and its aims.

"First of all, what is the aim of the Plan? Please tell me in your own words – and don't grope for fine sentiment. You won't be judged on polish and suavity, I assure you."

It was the Student's first chance at more than a bisyllable, and he hesitated before plunging into the expectant space cleared away for him. He said, diffidently: "As a result of what I have learned, I believe that it is the intention of the Plan to establish a human civilization based on an orientation entirely different from anything that ever before existed. An orientation which, according to the findings of Psychohistory, could never *spontaneously* come into being–"

"Stop!" The First Speaker was insistent. 'You must not say 'never.' That is a lazy slurring over of the facts. Actually, Psychohistory predicts only probabilities. A particular event may be infinitesimally probable, but the probability is always greater than zero."

"Yes, Speaker. The orientation desired, if I may correct myself, then, is well known to possess no significant probability of spontaneously coming to pass."

"Better. What is the orientation?"

"It is that of a civilization based on mental science. In all the known history of Mankind, advances have been made primarily in physical technology; in the capacity of handling the inanimate world about Man. Control of self and society has been left to chance or to the vague gropings of intuitive ethical systems based on inspiration and emotion. As a result, no culture of greater stability than about fifty-five percent has ever existed, and these only as the result of great human misery."

"And why is the orientation we speak of a nonspontaneous one?"

"Because a large minority of human beings are mentally equipped to take part in the advance of physical science, and all receive the crude and visible benefits thereof. Only an insignificant minority, however, are inherently able to lead Man through the greater involvements of Mental Science; and the benefits derived therefrom, while longer lasting, are more subtle and less apparent. Furthermore, since such an orientation would lead to the development of a benevolent dictatorship of the mentally best – virtually a

higher subdivision of Man – it would be resented and could not be stable without the application of a force which would depress the rest of Mankind to brute level. Such a development is repugnant to us and must be avoided."

"What, then, is the solution?"

"The solution is the Seldon Plan. Conditions have been so arranged and so maintained that in a millennium from its beginnings – six hundred years from now, a Second Galactic Empire will have been established in which Mankind will be ready for the leadership of Mental Science. In that same interval, the Second Foundation in *its* development, will have brought forth a group of Psychologists ready to assume leadership. Or, as I have myself often thought, the First Foundation supplies the physical framework of a single political unit, and the Second Foundation supplies the mental framework of a ready-made ruling class."

"I see. Fairly adequate. Do you think that *any* Second Empire, even if formed in the time set by Seldon, would do as a fulfillment of his Plan?"

"No, Speaker, I do not. There are several possible Second Empires that may be formed in the period of time stretching from nine hundred to seventeen hundred years after the inception of the Plan, but only one of these is *the* Second Empire."

"And in view of all this, why is it necessary that the existence of the Second Foundation be hidden – above all, from the First Foundation?"

The Student probed for a hidden meaning to the question and failed to find it. He was troubled in his answer, "For the same reason that the details of the Plan as a whole must be hidden from Mankind in general. The laws of Psychohistory are statistical in nature and are rendered invalid if the actions of individual men are not random in nature. If a sizable group of human beings learned of key details of the Plan, their actions would be governed by that knowledge and would no longer be random in the meaning of the axioms of Psychohistory. In other words, they would no longer be perfectly predictable. Your pardon, Speaker, but I feel that the answer is not satisfactory."

"It is well that you do. Your answer is quite incomplete. It is the Second Foundation itself which must be hidden, not simply the Plan. The Second Empire is not yet formed. We have still a society which would resent a ruling class of psychologists, and which would fear its development and fight against it. Do you understand that?"

"Yes, Speaker, I do. The point has never been stressed—"

"Don't minimize. It has never been made – in the classroom, though you should be capable of deducing it yourself. This and many other points we will make now and in the near future during your apprenticeship. You will see me again in a week. By that time, I would like to have comments from you as to a certain problem which I now set before you. I don't want complete and rigorous mathematical treatment. That would take a year for an expert, and not a week for you. But I do want an indication as to trends and directions"

"You have here a fork in the Plan at a period in time of about half a century ago. The necessary details are included. You will note that the path followed by the assumed reality diverges from all the plotted predictions; its probability being under one percent.

You will estimate for how long the divergence may continue before it becomes uncorrectable. Estimate also the probable end if uncorrected, and a reasonable method of correction."

The Student flipped the Viewer at random and looked stonily at the passages presented on the tiny, built-in screen.

He said: "Why this particular problem, Speaker? It obviously has significance other than purely academic."

"Thank you, my boy. You are as quick as I had expected. The problem is not supposititious. Nearly half a century ago, the Mule burst into Galactic history and for ten years was the largest single fact in the universe. He was unprovided for; uncalculated for. He bent the Plan seriously, but not fatally.

"To stop him before he *did* become fatal, however, we were forced to take active part against him. We revealed our existence, and infinitely worse, a portion of our power. The First Foundation has learned of us, and their actions are now predicated on that knowledge. Observe in the problem presented. Here. And here.

"Naturally, you will not speak of this to anyone."

There was an appalled pause, as realization seeped into the Student. He said: "Then the Seldon Plan has failed!"

"Not yet. It merely may have failed. The probabilities of success are *still* twenty-one point four percent, as of the last assessment."

9. THE CONSPIRATORS

For Dr. Darell and Pelleas Anthor, the evenings passed in friendly intercourse; the days in pleasant unimportance. It might have been an ordinary visit. Dr. Darell introduced the young man as a cousin from across space, and interest was dulled by the cliché.

Somehow, however, among the small talk, a name might be mentioned. There would be an easy thoughtfulness. Dr. Darell might say, "No," or he might say, "Yes." A call on the open Communi-wave issued a casual invitation, "Want you to meet my cousin."

And Arcadia's preparations proceeded in their own manner. In fact, her actions might be considered the least straightforward of all.

For instance, she induced Olynthus Dam at school to donate to her a home-built, self-contained sound-receiver by methods which indicated a future for her that promised peril to all males with whom she might come into contact. To avoid details, she merely exhibited such an interest in Olynthus' self-publicized hobby – he had a home workshop-combined with such a well-modulated transfer of this interest to Olynthus' own pudgy features, that the unfortunate youth found himself: 1) discoursing at great and animated length upon the principles of the hyperwave motor; 2) becoming dizzyingly aware of the great, absorbed eyes that rested so lightly upon his; and 3) forcing into her willing hands his own greatest creation, the aforesaid sound-receiver.

Arcadia cultivated Olynthus in diminishing degree thereafter for just long enough to remove all suspicion that the sound-receiver had been the cause of the friendship. For months afterwards, Olynthus felt the memory of that short period in his life over and over again with the tendrils of his mind, until finally, for lack of further addition, he gave up and let it slip away.

When the seventh evening came, and five men sat in the Darell living room with food within and tobacco without, Arcadia's desk upstairs was occupied by this quite unrecognizable home-product of Olynthus' ingenuity.

Five men then. Dr. Darell, of course, with graying hair and meticulous clothing, looking somewhat older than his forty-two years. Pelleas Anthor, serious and quick-eyed at the moment looking young and unsure of himself. And the three new men: Jole Turbor, visicaster, bulky and plump-lipped; Dr. Elvett Semic, professor-emeritus of physics at the University, scrawny and wrinkled, his clothes only half-filled; Homir Munn, librarian, lanky and terribly ill-at-ease.

Dr. Darell spoke easily, in a normal, matter-of-fact tone: "This gathering has been arranged, gentlemen, for a trifle more than merely social reasons. You may have guessed this. Since you have been deliberately chosen because of your backgrounds, you may also guess the danger involved. I won't minimize it, but I will point out that we are all condemned men, in any case.

"You will notice that none of you have been invited with any attempt at secrecy. None of you have been asked to come here unseen. The windows are not adjusted to non-insight. No screen of any sort is about the room. We have only to attract the attention of the enemy to be ruined; and the best way to attract that attention is to assume a false and theatrical secrecy.

(Hah, thought Arcadia, bending over the voices coming – a bit screechily – out of the little box.)

"Do you understand that?"

Elvett Semic twitched his lower lip and bared his teeth in the screwup, wrinkled gesture that preceded his every sentence. "Oh, get on with it. Tell us about the youngster."

Dr. Darell said, "Pelleas Anthor is his name. He was a student of my old colleague, Kleise, who died last year. Kleise sent me his brain-pattern to the fifth sublevel, before he died, which pattern has been now checked against that of the man before you. You know, of course, that a brain-pattern cannot be duplicated that far, even by men of the Science of Psychology. If you don't know that, you'll have to take my word for it."

Turbor said, purse-lipped, "We might as well make a beginning somewhere. We'll take your word for it, especially since you're the greatest electroneurologist in the Galaxy now that Kleise is dead. At least, that is the way I've described you in my visicast comment, and I even believe it myself. How old are you, Anthor?"

"Twenty-nine, Mr. Turbor."

"Hm-m-m. And are you an electroneurologist, too? A great one?"

"Just a student of the science. But I work hard, and I've had the benefit of Kleise's training."

Munn broke in. He had a slight stammer at periods of tension. "I . . . I wish you'd g . . . get started. I think everyone's t . . . talking too much."

Dr. Darell lifted an eyebrow in Munn's direction. "you're right, Homir. Take over, Pelleas."

"Not for a while," said Pelleas Anthon, slowly, "because before we can get started – although I appreciate Mr. Munn's sentiment – I must request brain-wave data."

Darell frowned. "What is this, Anthon? What brain-wave data do you refer to?"

"The patterns of all of you. You have taken mine, Dr. Darell. I must take yours and those of the rest of you. And I must take the measurements myself."

Turbor said, "There's no reason for him to trust us, Darell. The young man is within his rights."

"Thank you," said Anthon. "If you'll lead the way to your laboratory then, Dr. Darell, well proceed. I took the liberty this morning of checking your apparatus."

The science of electroencephalography was at once new and old. It was old in the sense that the knowledge of the microcurrents generated by nerve cells of living beings belonged to that immense category of human knowledge whose origin was completely lost. It was knowledge that stretched back as far as the earliest remnants of human history–

And yet it was new, too. The fact of the existence of microcurrents slumbered through the tens of thousands of years of Galactic Empire as one of those vivid and whimsical, but quite useless, items of human knowledge. Some had attempted to form classifications of waves into waking and sleeping, calm and excited, well and ill – but even the broadest conceptions had had their hordes of vitiating exceptions.

Others had tried to show the existence of brain-wave groups, analogous to the well-known blood groups, and to show that external environment was the defining factor. These were the race-minded people who claimed that Man could be divided into subspecies. But such a philosophy could make no headway against the overwhelming ecumenical drive involved in the fact of Galactic Empire – one political unit covering twenty million stellar systems, involving all of Man from the central world of Trantor – now a gorgeous and impossible memory of the great past – to the loneliest asteroid on the periphery.

And then again, in a society given over, as that of the First Empire was, to the physical sciences and inanimate technology, there was a vague but mighty sociological *push* away from the study of the mind. It was less respectable because less immediately useful; and it was poorly financed since it was less profitable.

After the disintegration of the First Empire, there came the fragmentation of organized science, back, back – past even the fundamentals of atomic power into the chemical power of coal and oil. The one exception to this, of course, was the First Foundation where the spark of science, revitalized and grown more intense was

maintained and fed to flame. Yet there, too, it was the physical that ruled, and the brain, except for surgery, was neglected ground.

Hari Seldon was the first to express what afterwards came to be accepted as truth.

"Neural microcurrents," he once said, "carry within them the spark of every varying impulse and response, conscious and unconscious. The brain-waves recorded on neatly squared paper in trembling peaks and troughs are the mirrors of the combined thought-pulses of billions of cells. Theoretically, analysis should reveal the thoughts and emotions of the subject, to the last and least. Differences should be detected that are due not only to gross physical defects, inherited or acquired, but also to shifting states of emotion, to advancing education and experience, even to something as subtle as a change in the subject's philosophy of life."

But even Seldon could approach no further than speculation.

And now for fifty years, the men of the First Foundation had been tearing at that incredibly vast and complicated storehouse of new knowledge. The approach, naturally, was made through new techniques – as, for example, the use of electrodes at skull sutures by a newly-developed means which enabled contact to be made directly with the gray cells, without even the necessity of shaving a patch of skull. And then there was a recording device which automatically recorded the brain-wave data as an overall total, and as separate functions of six independent variables.

What was most significant, perhaps, was the growing respect in which encephalography and the encephalographer was held. Kleise, the greatest of them, sat at scientific conventions on an equal basis with the physicist. Dr. Darell, though no longer active in the science, was known for his brilliant advances in encephalographic analysis almost as much as for the fact that he was the son of Bayta Darell, the great heroine of the past generation.

And so now, Dr. Darell sat in his own chair, with the delicate touch of the feathery electrodes scarcely hinting at pressure upon his skull, while the vacuum-incased needles wavered to and fro. His back was to the recorder – otherwise, as was well known, the sight of the moving curves induced an unconscious effort to control them, with noticeable results – but he knew that the central dial was expressing the strongly rhythmic and little-varying Sigma curve, which was to be expected of his own powerful and disciplined mind. It would be strengthened and purified in the subsidiary dial dealing with the Cerebellar wave. There would be the sharp, near-discontinuous leaps from the frontal lobe, and the subdued shakiness from the subsurface regions with its narrow range of frequencies–

He knew his own brain-wave pattern much as an artist might be perfectly aware of the color of his eyes.

Pelleas Anthor made no comment when Darell rose from the reclining chair. The young man abstracted the seven recordings, glanced at them with the quick, all-embracing eyes of one who knows exactly what tiny facet of near-nothingness is being looked for.

"If you don't mind, Dr. Semic."

Semic's age-yellowed face was serious. Electroencephalography was a science of his old age of which he knew little; an upstart that he faintly resented. He knew that he was old and that his wave-pattern would show it. The wrinkles on his face showed it, the stoop in his walk, the shaking of his hand – but *they* spoke only of his body. The brain-wave patterns might show that his mind was old, too. An embarrassing and unwarranted invasion of a man's last protecting stronghold, his own mind.

The electrodes were adjusted. The process did not hurt, of course, from beginning to end. There was just that tiny tingle, far below the threshold of sensation.

And then came Turbor, who sat quietly and unemotionally through the fifteen minute process, and Munn, who jerked at the first touch of the electrodes and then spent the session rolling his eyes as though he wished he could turn them backwards and watch through a hole in his occiput.

"And now—" said Darell, when all was done.

"And now," said Anthor, apologetically, "there is one more person in the house."

Darell, frowning, said: "My daughter?"

"Yes. I suggested that she stay home tonight, if you'll remember."

"For encephalographical analysis? What in the Galaxy for?"

"I cannot proceed without it."

Darell shrugged and climbed the stairs. Arcadia, amply warned, had the sound-receiver off when he entered; then followed him down with mild obedience. It was the first time in her life – except for the taking of her basic mind pattern as an infant, for identification and registration purposes – that she found herself under the electrodes.

"May I see," she asked, when it was over, holding out her hand.

Dr. Darell said, "You would not understand, Arcadia. Isn't it time for you to go to bed?"

"Yes, father," she said, demurely. "Good night, all."

She ran up the stairs and plumped into bed with a minimum of basic preparation. With Olynthus' sound-receiver propped beside her pillow, she felt like a character out of a book-film, and hugged every moment of it close to her chest in an ecstasy of "Spy-stuff."

The first words she heard were Anthor's and they were: "The analyses, gentlemen, are all satisfactory. The child's as well."

Child, she thought disgustedly, and bristled at Anthor in the darkness.

Anthor had opened his briefcase now, and out of it, he took several dozen brain-wave records. They were not originals. Nor had the briefcase been fitted with an ordinary lock. Had the key been held in any hand other than his own, the contents thereof would have silently and instantly oxidized to an indecipherable ash. Once removed from the briefcase, the records did so anyway after half an hour.

But during their short lifetime, Anthor spoke quickly. "I have the records here of several minor government officials at Anacreon. This is a psychologist at Locris University; this an industrialist at Siwenna. The rest are as you see."

They crowded closely. To all but Darell, they were so many quivers on parchment. To Darell, they shouted with a million tongues.

Author pointed lightly, "I call your attention, Dr. Darell, to the plateau region among the secondary Tauian waves in the frontal lobe, which is what all these records have in common. Would you use my Analytical Rule, sir, to check my statement?"

The Analytical Rule might be considered a distant relation – as a skyscraper is to a shack – of that kindergarten toy, the logarithmic Slide Rule. Darell used it with the wristflip of long practice. He made freehand drawings of the result and, as Author stated, there were featureless plateaus in frontal lobe regions where strong swings should have been expected.

"How would you interpret that, Dr. Darell?" asked Author.

"I'm not sure. Offhand, I don't see how it's possible. Even in cases of amnesia, there is suppression, but not removal. Drastic brain surgery, perhaps?"

"Oh, something's been cut out," cried Author, impatiently, "yes! Not in the physical sense, however. You know, the Mule could have done just that. He could have suppressed completely all capacity for a certain emotion or attitude of mind, and leave nothing but just such a flatness. Or else–"

"Or else the Second Foundation could have done it. Is that it?" asked Turbor, with a slow smile.

There was no real need to answer that thoroughly rhetorical question.

"What made you suspicious, Mr. Author?" asked Munn.

"It wasn't I. It was Dr. Kleise. He collected brain-wave patterns much as the Planetary Police do, but along different lines. He specialized in intellectuals, government officials and business leaders. You see, it's quite obvious that if the Second Foundation is directing the historical course of the Galaxy – of us – that they must do it subtly and in as minimal a fashion as possible. If they work through minds, as they must, it is the minds of people with influence; culturally, industrially, or politically. And with those he concerned himself."

"Yes," objected Munn, "but is there corroboration? How do these people act – I mean the ones with the plateau. Maybe it's all a perfectly normal phenomenon." He looked hopelessly at the others out of his, somehow, childlike blue eyes, but met no encouraging return.

"I leave that to Dr. Darell," said Author. "Ask him how many times he's seen this phenomenon in his general studies, or in reported cases in the literature over the past generation. Then ask him the chances of it being discovered in almost one out of every thousand cases among the categories Dr. Kleise studied."

"I suppose that there is no doubt," said Darell, thoughtfully, "that these are artificial mentalities. They have been tampered with. In a way, I have suspected this–"

"I know that, Dr. Darell," said Author. "I also know you once worked with Dr. Kleise. I would like to know why you stopped."

There wasn't actually hostility in his question. Perhaps nothing more than caution; but, at any rate, it resulted in a long pause. Darell looked from one to another of his guests, then said brusquely, "Because there was no point to Kleise's battle. He was competing with an adversary too strong for him. He was detecting what we – he and I –

knew he would detect – that we were not our own masters. *And I didn't want to know!* I had my self-respect. I liked to think that our Foundation was captain of its collective soul; that our forefathers had not quite fought and died for nothing. I thought it would be most simple to turn my face away as long as I was not quite sure. I didn't need my position since the Government pension awarded to my mother's family in perpetuity would take care of my uncomplicated needs. My home laboratory would suffice to keep boredom away, and life would some day end– Then Kleise died–"

Semic showed his teeth and said: "This fellow Kleise; I don't know him. How did he die?"

Anchor cut in: "He *died*. He thought he would. He told me half a year before that he was getting too close--"

"Now we're too c . . . close, too, aren't we?" suggested Munn, dry-mouthed, as his Adam's apple jiggled.

"Yes," said Anchor, flatly, "but we were, anyway – all of us. It's why you've all been chosen. I'm Kleise's student. Dr. Darell was his colleague. Jole Turbor has been denouncing our blind faith in the saving hand of the Second Foundation on the air, until the government shut him off – through the agency, I might mention, of a powerful financier whose brain shows what Kleise used to call the Tamper Plateau. Homir Munn has the largest home collection of Muliana – if I may use the phrase to signify collected data concerning the Mule – in existence, and has published some papers containing speculation on the nature and function of the Second Foundation. Dr. Semic has contributed as much as anyone to the mathematics of encephalographic analysis, though I don't believe he realized that his mathematics could be so applied."

Semic opened his eyes wide and chuckled gaspingly, "No, young fellow. I was analyzing intranuclear motions – the n-body problem, you know. I'm lost in encephalography."

"Then we know where we stand. The government can, of course, do nothing about the matter. Whether the mayor or anyone in his administration is aware of the seriousness of the situation, I don't know. But this I do know – we five have nothing to lose and stand to gain much. With every increase in our knowledge, we can widen ourselves in safe directions. We are but a beginning, you understand."

"How widespread," put in Turbor, "is this Second Foundation infiltration?"

"I don't know. There's a flat answer. All the infiltrations we have discovered were on the outer fringes of the nation. The capital world may yet be clean, though even that is not certain – else I would not have tested you. You were particularly suspicious, Dr. Darell, since you abandoned research with Kleise. Kleise never forgave you, you know. I thought that perhaps the Second Foundation had corrupted you, but Kleise always insisted that you were a coward. You'll forgive me, Dr. Darell, if I explain this to make my own position clear. I, personally, think I understand your attitude, and, if it was cowardice, I consider it venial."

Darell drew a breath before replying. "I ran away! Call it what you wish. I tried to maintain our friendship, however, yet he never wrote nor called me until the day he sent me your brainwave data, and that was scarcely a week before he died—"

"If you don't mind," interrupted Homir Munn, with a flash of nervous eloquence, "I d . . . don't see what you think you're doing. We're a p . . . poor bunch of conspirators, if we're just going to talk and talk and t . . . talk. And I don't see what else we can do, anyway. This is v . . . very childish. B . . . brain-waves and mumbo jumbo and all that. Is there just one thing you intend to *do*?"

Pelleas Author's eyes were bright, "Yes, there is. We need more information on the Second Foundation. It's the prime necessity. The Mule spent the first five years of his rule in just that quest for information and failed – or so we have all been led to believe. But then he stopped looking. Why? Because he failed? Or because he succeeded?"

"M . . . more talk," said Munn, bitterly. "How are we ever to know?"

"If you'll listen to me— The Mule's capital was on Kalgan. Kalgan was not part of the Foundation's commercial sphere of influence before the Mule and it is not part of it now. Kalgan is ruled, at the moment, by the man, Stettin, unless there's another palace revolution by tomorrow. Stettin calls himself First Citizen and considers himself the successor of the Mule. If there is any tradition in that world, it rests with the super-humanity and greatness of the Mule – a tradition almost superstitious in intensity. As a result, the Mule's old palace is maintained as a shrine. No unauthorized person may enter; nothing within has ever been touched."

"Well?"

"Well, why is that so? At times like these, nothing happens without a reason. What if it is not superstition only that makes the Mule's palace inviolate? What if the Second Foundation has so arranged matters? In short what if the results of the Mule's five-year search are within—"

"Oh, p . . . poppycock."

"Why not?" demanded Anthon. "Throughout its history the Second Foundation has hidden itself and interfered in Galactic affairs in minimal fashion only. I know that to us it would seem more logical to destroy the Palace or, at the least, to remove the data. But you must consider the psychology of these master psychologists. They are Seldons; they are Mules and they work by indirection, through the mind. They would never destroy or remove when they could achieve their ends by creating a state of mind. Eh?"

No immediate answer, and Anthon continued, "And you, Munn, are just the one to get the information we need."

"/?" It was an astounded yell. Munn looked from one to the other rapidly, "I can't do such a thing. I'm no man of action; no hero of any televue. I'm a librarian. If I can help you that way, all right, and I'll risk the Second Foundation, but I'm not going out into space on any qu . . . quixotic thing like that."

"Now, look," said Anthon, patiently, "Dr. Darell and I have both agreed that you're the man. It's the only way to do it naturally. You say you're a librarian. Fine! What is your main field of interest? Muliana! You already have the greatest collection of material on the

Mule in the Galaxy. It is natural for you to want more; more natural for you than for anyone else. You could request entrance to the Kalgan Palace without arousing suspicion of ulterior motives. You might be refused but you would not be suspected. What's more, you have a one-man cruiser. You're known to have visited foreign planets during your annual vacation. You've even been on Kalgan before. Don't you understand that you need only act as you always have?"

"But I can't just say, 'W . . . won't you kindly let me in to your most sacred shrine, M . . . Mr. First Citizen?'"

"Why not?"

"Because, by the Galaxy, he won't let me!"

"All right, then. So he won't. Then you'll come home and we'll think of something else."

Munn looked about in helpless rebellion. He felt himself being talked into something he hated. No one offered to help him extricate himself.

So in the end two decisions were made in Dr. Darell's house. The first was a reluctant one of agreement on the part of Munn to take off into space as soon as his summer vacation began.

The other was a highly unauthorized decision on the part of a thoroughly unofficial member of the gathering, made as she clicked off a sound-receiver and composed herself for a belated sleep. This second decision does not concern us just yet.

10. APPROACHING CRISIS

A week had passed on the Second Foundation, and the First Speaker was smiling once again upon the Student.

"You must have brought me interesting results, or you would not be so filled with anger."

The Student put his hand upon the sheaf of calculating paper he had brought with him and said, "Are you sure that the problem is a factual one?"

"The premises are true. I have distorted nothing."

"Then I *must* accept the results, and I do not want to."

"Naturally. But what have your wants to do with it? Well, tell me what disturbs you so. No, no, put your derivations to one side. I will subject them to analysis afterward. Meanwhile, *talk* to me. Let me judge your understanding."

"Well, then, Speaker— It becomes very apparent that a gross overall change in the basic psychology of the First Foundation has taken place. As long as they knew of the existence of a Seldon Plan, without knowing any of the details thereof, they were confident but uncertain. They knew they would succeed, but they didn't know when or how. There was, therefore, a continuous atmosphere of tension and strain — which was what Seldon desired. The First Foundation, in other words, could be counted upon to work at maximum potential."

"A doubtful metaphor," said the First Speaker, "but I understand you."

"But now, Speaker, they know of the existence of a Second Foundation in what amounts to detail, rather merely than as an ancient and vague statement of Seldon's. They have an inkling as to its function as the guardian of the Plan. They know that an agency exists which watches their every step and will not let them fall. So they abandon their purposeful stride and allow themselves to be carried upon a litter. Another metaphor, I'm afraid."

"Nevertheless, go on."

"And that very abandonment of effort; that growing inertia; that lapse into softness and into a decadent and hedonistic culture, means the ruin of the Plan. They *must* be self-propelled."

"Is that all?"

"No, there is more. The majority reaction is as described. But a great probability exists for a minority reaction. Knowledge of our guardianship and our control will rouse among a few, not complacency, but hostility. This follows from Korillov's Theorem—"

"Yes, yes. I know the theorem."

"I'm sorry, Speaker. It is difficult to avoid mathematics. In any case, the effect is that not only is the Foundation's effort diluted, but part of it is turned against us, actively against us."

"And is *that* all?"

"There remains one other factor of which the probability is moderately low---"

"Very good. What is that?"

"While the energies of the First Foundation were directed only to Empire; while their only enemies were huge and outmoded hulks that remained from the shambles of the past, they were obviously concerned only with the physical sciences. With us forming a new, large part of their environment, a change in view may well be imposed on them. They may try to become psychologists—"

"That change," said the First Speaker, coolly, "*has* already taken place."

The Student's lips compressed themselves into a pale line. "Then all is over. It is the basic incompatibility with the Plan. Speaker, would I have known of this if I had lived — outside?"

The First Speaker spoke seriously, "You feel humiliated, my young man, because, thinking you understood so much so well, you suddenly find that many very apparent things were unknown to you. Thinking you were one of the Lords of the Galaxy; you suddenly find that you stand near to destruction. Naturally, you will resent the ivory tower in which you lived; the seclusion in which you were educated; the theories on which you were reared.

"I once had that feeling. It is normal. Yet it was necessary that in your formative years you have no direct contact with the Galaxy, that you remain *here*, where all knowledge is filtered to you, and your mind carefully sharpened. We could have shown you this . . . this part-failure of the Plan earlier and spared you the shock now, but you

would not have understood the significance properly, as you now will. Then you find no solution at all to the problem?"

The Student shook his head and said hopelessly, "None!"

"Well, it is not surprising. Listen to me, young man. A course of action exists and has been followed for over a decade. It is not a usual course, but one that we have been forced into against our will. It involves low probabilities, dangerous assumptions— We have even been forced to deal with individual reactions at times, because that was the only possible way, and you know that Psychostatistics by its very nature has no meaning when applied to less than planetary numbers."

"Are we succeeding?" gasped the Student.

"There's no way of telling yet. We have kept the situation stable so far – but for the first time in the history of the Plan, it is possible for the unexpected actions of a single individual to destroy it. We have adjusted a minimum number of outsiders to a needful state of mind; we have our agents – but their paths are planned. They dare not improvise. That should be obvious to you. And I will not conceal the worst – if we are discovered, here, on this world, it will not only be the Plan that is destroyed, but ourselves, our physical selves. So you see, our solution is not very good."

"But the little you have described does not sound like a solution at all, but like a desperate guess."

"No. Let us say, an intelligent guess."

"When is the crisis, Speaker? When will we know whether we have succeeded or not?"

"Well within the year, no doubt."

The Student considered that, then nodded his head. He shook hands with the Speaker. "Well, it's good to know."

He turned on his heel and left.

The first Speaker looked out silently as the window gained transparency. Past the giant structures to the quite, crowding stars.

A year would pass quickly. Would any of them, any of Seldon's heritage, be alive at its end?

11. STOWAWAY

It was a little over a month before the summer could be said to have started. Started, that is, to the extent that Homir Munn had written his final financial report of the fiscal year, seen to it that the substitute librarian supplied by the Government was sufficiently aware of the subtleties of the post – last year's man had been quite unsatisfactory – and arranged to have his little cruiser the *Unimara* – named after a tender and mysterious episode of twenty years past – taken out of its winter cobwebbery.

He left Terminus in a sullen distemper. No one was at the port to see him off. That would not have been natural since no one ever had in the past. He knew very well that it

was important to have this trip in no way different from any he had made in the past, yet he felt drenched in a vague resentment. He, Homir Munn, was risking his neck in derring-doery of the most outrageous sort, and yet he left alone.

At least, so he thought.

And it was because he thought wrongly, that the following day was one of confusion, both on the *Unimara* and in Dr. Darell's suburban home.

It hit Dr. Darell's home first, in point of time, through the medium of Poli, the maid, whose month's vacation was now quite a thing of the past. She flew down the stairs in a flurry and stutter.

The good doctor met her and she tried vainly to put emotion into words but ended by thrusting a sheet of paper and a cubical object at him.

He took them unwillingly and said: "What's wrong, Poli?"

"She's gone, doctor."

"Who's gone?"

"Arcadia!"

"What do you mean, gone? Gone where? What are you talking about?"

And she stamped her foot: 'I don't know. She's gone, and there's a suitcase and some clothes gone with her and there's that letter. Why don't you read it, instead of just standing there? Oh, you men!'"

Dr. Darell shrugged and opened the envelope. The letter was not long, and except for the angular signature, "Arkady," was in the ornate and flowing handwriting of Arcadia's transcriber.

Dear Father:

It would have been simply too heartbreaking to say good-by to you in person. I might have cried like a little girl and you would have been ashamed of me. So I'm writing a letter instead to tell you how much I'll miss you, even while I'm having this perfectly wonderful summer vacation with Uncle Homir. I'll take good care of myself and it won't be long before I'm home again. Meanwhile, I'm leaving you something that's all my own. You can have it now.

Your loving daughter,

Arkady.

He read it through several times with an expression that grew blanker each time. He said stiffly, "Have you read this, Poli?"

Poli was instantly on the defensive. "I certainly can't be blamed for that, doctor. The envelope has 'Poli' written on the outside, and I had no way of telling there was a letter for you on the inside. I'm no snoop, doctor, and in the years I've been with—"

Darell held up a placating hand, "Very well, Poli. It's not important. I just wanted to make sure you understood what had happened."

He was considering rapidly. It was no use telling her to forget the matter. With regard to the enemy, "forget" was a meaningless word; and the advice, insofar as it made the matter more important, would have had an opposite effect.

He said instead, "She's a queer little girl, you know. Very romantic. Ever since we arranged to have her go off on a space trip this summer, she's been quite excited."

"And just why has no one told me about this space trip?"

"It was arranged while you were away, and we forgot. It's nothing more complicated than that."

Poli's original emotions now concentrated themselves into a single, overwhelming indignation, "Simple, is it? The poor chick has gone off with one suitcase, without a decent stitch of clothes to her, and alone at that. How long will she be away?"

"Now I won't have you worrying about it, Poli. There will be plenty of clothes for her on the ship. It's been all arranged. Will you tell Mr. Anthor, that I want to see him? Oh, and first – is this the object that Arcadia has left for me?" He turned it over in his hand.

Poli tossed her head. "I'm sure I don't know. The letter was on top of it and that's every bit I can tell you. Forget to tell me, indeed. If her mother were alive–"

Darell, waved her away. "Please call Mr. Anthor."

Anthor's viewpoint on the matter differed radically from that of Arcadia's father. He punctuated his initial remarks with clenched fists and tom hair, and from there, passed on to bitterness.

"Great Space, what are you waiting for? What are we both waiting for? Get the spaceport on the viewer and have them contact the *Unimara*."

"Softly, Pelleas, she's my daughter."

"But it's not your Galaxy."

"Now, wait. She's an intelligent girl, Pelleas, and she's thought this thing out carefully. We had better follow her thoughts while this thing is fresh. Do you know what this thing is?"

"No. Why should it matter what it is?"

"Because it's a sound-receiver."

"That thing?"

"It's homemade, but it will work. I've tested it. Don't you see? It's her way of telling us that she's been a party to our conversations of policy. She knows where Homir Munn is going and why. She's decided it would be exciting to go along."

"Oh, Great Space," groaned the younger man. "Another mind for the Second Foundation to pick."

"Except that there's no reason why the Second Foundation should, *a priori*, suspect a fourteen-year-old girl of being a danger – *unless* we do anything to attract attention to her, such as calling back a ship out of space for no reason other than to take

her off. Do you forget with whom we're dealing? How narrow the margin is that separates us from discovery? How helpless we are thereafter?"

"But we can't have everything depend on an insane child."

She's not insane, and we have no choice. She need not have written the letter, but she did it to keep us from going to the police after a lost child. Her letter suggests that we convert the entire matter into a friendly offer on the part of Munn to take an old friend's daughter off for a short vacation. And why not? He's been my friend for nearly twenty years. He's known her since she was three, when I brought her back from Trantor. It's a perfectly natural thing, and, in fact, ought to decrease suspicion. A spy does not carry a fourteen-year-old niece about with him."

"So. And what will Munn do when he finds her?"

Dr. Darell heaved his eyebrows once. "I can't say – but I presume she'll handle him."

But the house was somehow very lonely at night and Dr. Darell found that the fate of the Galaxy made remarkably little difference while his daughter's mad little life was in danger.

The excitement on the *Unimara*, if involving fewer people, was considerably more intense.

In the luggage compartment, Arcadia found herself, in the first place, aided by experience, and in the second, hampered by the reverse.

Thus, she met the initial acceleration with equanimity and the more subtle nausea that accompanied the inside-outness of the first jump through hyperspace with stoicism. Both had been experienced on space hops before, and she was tensed for them. She knew also that luggage compartments were included in the ship's ventilation-system and that they could even be bathed in wall-light. This last, however, she excluded as being too unconscionably unromantic. She remained in the dark, as a conspirator should, breathing very softly, and listening to the little miscellany of noises that surrounded Homir Munn.

They were undistinguished noises, the kind made by a man alone. The shuffling of shoes, the rustle of fabric against metal, the souging of an upholstered chair seat retreating under weight, the sharp click of a control unit, or the soft slap of a palm over a photoelectric cell.

Yet, eventually, it was the lack of experience that caught up with Arcadia. In the book films and on the videos, the stowaway seemed to have such an infinite capacity for obscurity. Of course, there was always the danger of dislodging something which would fall with a crash, or of sneezing – in videos you were almost sure to sneeze; it was an accepted matter. She knew all this, and was careful. There was also the realization that thirst and hunger might be encountered. For this, she was prepared with ration cans out of the pantry. But yet things remained that the films never mentioned, and it dawned upon Arcadia with a shock that, despite the best intentions in the world, she could stay hidden in the closet for only a limited time.

And on a one-man sports-cruiser, such as the *Unimara*, living space consisted, essentially, of a single room, so that there wasn't even the risky possibility of sneaking out of the compartment while Munn was engaged elsewhere.

She waited frantically for the sounds of sleep to arise. If only she knew whether he snored. At least she knew where the bunk was and she could recognize the rolling protest of one when she heard it. There was a long breath and then a yawn. She waited through a gathering silence, punctuated by the bunk's soft protest against a changed position or a shifted leg.

The door of the luggage compartment opened easily at the pressure of her finger, and her craning neck—

There was a definite human sound that broke off sharply.

Arcadia solidified. Silence! Still silence!

She tried to poke her eyes outside the door without moving her head and failed. The head followed the eyes.

Homir Munn was awake, of course — reading in bed, bathed in the soft, unspreading bed light, staring into the darkness with wide eyes, and groping one hand stealthily under the pillow.

Arcadia's head moved sharply back of itself. Then, the light went out entirely and Munn's voice said with shaky sharpness, "I've got a blaster, and I'm shooting, by the Galaxy—"

And Arcadia wailed, "It's only me. Don't shoot."

Remarkable what a fragile flower romance is. A gun with a nervous operator behind it can spoil the whole thing.

The light was back on — all over the ship — and Munn was sitting up in bed. The somewhat grizzled hair on his thin chest and the sparse one-day growth on his chin lent him an entirely fallacious appearance of disreputability.

Arcadia stepped out, yanking at her metallene jacket which was supposed to be guaranteed wrinkleproof.

After a wild moment in which he almost jumped out of bed, but remembered, and instead yanked the sheet up to his shoulders, Munn gargled, "W . . . wha . . . what—"

He was completely incomprehensible.

Arcadia said meekly, "Would you excuse me for a minute? I've got to wash my hands." She knew the geography of the vessel, and slipped away quickly. When she returned, with her courage oozing back, Homir Munn was standing before her with a faded bathrobe on the outside and a brilliant fury on the inside.

"What the black holes of Space are you d . . . doing aboard this ship? H . . . how did you get on here? What do you th . . . think I'm supposed to do with you? What's going on here?"

He might have asked questions indefinitely, but Arcadia interrupted sweetly, "I just wanted to come along, Uncle Homir."

"Why? I'm not going anywhere?"

"You're going to Kalgan for information about the Second Foundation."

And Munn let out a wild howl and collapsed completely. For one horrified moment, Arcadia thought he would have hysterics or beat his head against the wall. He was still holding the blaster and her stomach grew ice-cold as she watched it.

"Watch out— Take it easy—" was all she could think of to say.

But he struggled back to relative normality and threw the blaster on to the bunk with a force that should have set it off and blown a hole through the ship's hull.

"How did you get on?" he asked slowly, as though gripping each word with his teeth very carefully to prevent it from trembling before letting it out.

"It was easy. I just came into the hangar with my suitcase, and said, 'Mr. Munn's baggage!' and the man in charge just waved his thumb without even looking up."

"I'll have to take you back, you know," said Homir, and there was a sudden wild glee within him at the thought. By Space, this wasn't his fault.

"You can't," said Arcadia, calmly, "it would attract attention."

"What?"

"You know. The whole purpose of *your* going to Kalgan was because it was natural for you to go and ask for permission to look into the Mule's records. And you've got to be so natural that you're to attract no attention at all. If you go back with a girl stowaway, it might even get into the tele-news reports."

"Where did you g . . . get those notions about Kalgan? These . . . uh . . . childish—" He was far too flippant for conviction, of course, even to one who knew less than did Arcadia.

"I heard," she couldn't avoid pride completely, "with a sound-recorder. I know all about it — so you've got to let me come along."

"What about your father?" He played a quick trump. "For all he knows, you're kidnapped . . . dead."

"I left a note," she said, overtrumping, "and he probably knows he mustn't make a fuss, or anything. You'll probably get a space-gram from him."

To Munn the only explanation was sorcery, because the receiving signal sounded wildly two seconds after she finished.

She said: "That's my father, I bet," and it was.

The message wasn't long and it was addressed to Arcadia. It said: "Thank you for your lovely present, which I'm sure you put to good use. Have a good time."

"You see," she said, "that's instructions."

Homir grew used to her. After a while, he was glad she was there. Eventually, he wondered how he would have made it without her. She prattled! She was excited! Most of all, she was completely unconcerned. She knew the Second Foundation was the enemy, yet it didn't bother her. She knew that on Kalgan, he was to deal with a hostile officialdom, but she could hardly wait.

Maybe it came of being fourteen.

At any rate, the week-long trip now meant conversation rather than introspection. To be sure, it wasn't a very enlightening conversation, since it concerned, almost entirely,

the girl's notions on the subject of how best to treat the Lord of Kalgan. Amusing and nonsensical, and yet delivered with weighty deliberation.

Homir found himself actually capable of smiling as he listened and wondered out of just which gem of historical fiction she got her twisted notion of the great universe.

It was the evening before the last jump. Kalgan was a bright star in the scarcely-twinkling emptiness of the outer reaches of the Galaxy. The ship's telescope made it a sparkling blob of barely-perceptible diameter.

Arcadia sat cross-legged in the good chair. She was wearing a pair of slacks and a none-too-roomy shirt that belonged to Homir. Her own more feminine wardrobe had been washed and ironed for the landing.

She said, "I'm going to write historical novels, you know." She was quite happy about the trip. Uncle Homir didn't the least mind listening to her and it made conversation so much more pleasant when you could talk to a really intelligent person who was serious about what you said.

She continued: "I've read books and books about all the great men of Foundation history. You know, like Seldon, Hardin, Mallow, Devers and all the rest. I've even read most of what you've written about the Mule, except that it isn't much fun to read those parts where the Foundation loses. Wouldn't you rather read a history where they skipped the silly, tragic parts?"

"Yes, I would," Munn assured her, gravely. "But it wouldn't be a fair history, would it, Arkady? You'd never get academic respect, unless you give the whole story."

"Oh, poof. Who cares about academic respect?" She found him delightful. He hadn't missed calling her Arkady for days. "My novels are going to be interesting and are going to sell and be famous. What's the use of writing books unless you sell them and become well-known? I don't want just some old professors to know me. It's got to be everybody."

Her eyes darkened with pleasure at the thought and she wriggled into a more comfortable position. "In fact, as soon as I can get father to let me, I'm going to visit Trantor, so's I can get background material on the First Empire, you know. I was born on Trantor; did you know that?"

He did, but he said, "You were?" and put just the right amount of amazement into his voice. He was rewarded with something between a beam and a simper.

"Uh-huh. My grandmother . . . you know, Bayta Darell, you've heard of *her* . . . was on Trantor once with my grandfather. In fact, that's where they stopped the Mule, when all the Galaxy was at his feet; and my father and mother went there also when they were first married. I was born there. I even lived there till mother died, only I was just three then, and I don't remember much about it. Were you ever on Trantor, Uncle Homir?"

"No, can't say I was." He leaned back against the cold bulkhead and listened idly. Kalgan was very close, and he felt his uneasiness flooding back.

"Isn't it just the most *romantic* world? My father says that under Stannel V, it had more people than any *ten* worlds nowadays. He says it was just one big world of metals –

one big city – that was the capital of all the Galaxy. He's shown me pictures that he took on Trantor. It's all in ruins now, but it's still stupendous. I'd just *love* to see it again. In fact . . . Homir!"

"Yes?"

"Why don't we go there, when we're finished with Kalgan?"

Some of the fright hurtled back into his face. "What? Now don't start on that. This is business, not pleasure. Remember that."

"But it *is* business" she squeaked. "There might be incredible amounts of information on Trantor, don't you think so? "

"No, I don't He scrambled to his feet "Now untangle yourself from the computer. We've got to make the last jump, and then you turn in." One good thing about landing, anyway; he was about fed up with trying to sleep on an overcoat on the metal floor.

The calculations were not difficult. The "Space Route Handbook" was quite explicit on the Foundation-Kalgan route. There was the momentary twitch of the timeless passage through hyperspace and the final light-year dropped away.

The sun of Kalgan was a sun now – large, bright, and yellow-white; invisible behind the portholes that had automatically closed on the sun-lit side.

Kalgan was only a night's sleep away.

12. LORD

Of all the worlds of the Galaxy, Kalgan undoubtedly had the most unique history. That of the planet Terminus, for instance, was that of an almost uninterrupted rise. That of Trantor, once capital of the Galaxy, was that of an almost uninterrupted fall. But Kalgan–

Kalgan first gained fame as the pleasure world of the Galaxy two centuries before the birth of Hari Seldon. It was a pleasure world in the sense that it made an industry – and an immensely profitable one, at that – out of amusement.

And it was a stable industry. It was the most stable industry in the Galaxy. When all the Galaxy perished as a civilization, little by little, scarcely a feather's weight of catastrophe fell upon Kalgan. No matter how the economy and sociology of the neighboring sectors of the Galaxy changed, there was always an elite; and it is always the characteristic of an elite that it possesses leisure as *the* great reward of its elite-hood.

Kalgan was at the service, therefore, successively – and successfully – of the effete and perfumed dandies of the Imperial Court with their sparkling and libidinous ladies; of the rough and raucous warlords who ruled in iron the worlds they had gained in blood, with their unbridled and lascivious wenches; of the plump and luxurious businessmen of the Foundation, with their lush and flagitious mistresses.

It was quite indiscriminating, since they all had money. And since Kalgan serviced all and barred none; since its commodity was in unfailing demand; since it had the wisdom to interfere in no world's politics, to stand on no one's legitimacy, it prospered when nothing else did, and remained fat when all grew thin.

That is, until the Mule. Then, somehow, it fell, too, before a conqueror who was impervious to amusement, or to anything but conquest. To him all planets were alike, even Kalgan.

So for a decade, Kalgan found itself in the strange role of Galactic metropolis; mistress of the greatest Empire since the end of the Galactic Empire itself.

And then, with the death of the Mule, as sudden as the zoom, came the drop. The Foundation broke away. With it and after it, much of the rest of the Mule's dominions. Fifty years later there was left only the bewildering memory of that short space of power, like an opium dream. Kalgan never quite recovered. It could never return to the unconcerned pleasure world it had been, for the spell of power never quite releases its hold. It lived instead under a succession of men whom the Foundation called the Lords of Kalgan, but who styled themselves First Citizen of the Galaxy, in imitation of the Mule's only title, and who maintained the fiction that they were conquerors too.

The current Lord of Kalgan had held that position for five months. He had gained it originally by virtue of his position at the head of the Kalganian navy, and through a lamentable lack of caution on the part of the previous lord. Yet no one on Kalgan was quite stupid enough to go into the question of legitimacy too long or too closely. These things happened, and are best accepted.

Yet that sort of survival of the fittest in addition to putting a premium on bloodiness and evil, occasionally allowed capability to come to the fore as well. Lord Stettin was competent enough and not easy to manage.

Not easy for his eminence, the First Minister, who, with fine impartiality, had served the last lord as well as the present; and who would, if he lived long enough, serve the next as honestly.

Nor easy for the Lady Callia, who was Stettin's more than friend, yet less than wife.

In Lord Stettin's private apartments the three were alone that evening. The First Citizen, bulky and glistening in the admiral's uniform that he affected, scowled from out the unupholstered chair in which he sat as stiffly as the plastic of which it was composed. His First Minister Lev Meirus, faced him with a far-off unconcern, his long, nervous fingers stroking absently and rhythmically the deep line that curved from hooked nose along gaunt and sunken cheek to the point, nearly, of the gray-bearded chin. The Lady Callia disposed of herself gracefully on the deeply furred covering of a foamite couch, her full lips trembling a bit in an unheeded pout.

"Sir," said Meirus – it was the only title adhering to a lord who was styled only First Citizen, "you lack a certain view of the continuity of history. Your own life, with its tremendous revolutions, leads you to think of the course of civilization as something equally amenable to sudden change. But it is not."

"The Mule showed otherwise."

"But who can follow in his footsteps. He was more than man, remember. And he, too, was not entirely successful."

"Poochie," whimpered the Lady Callia, suddenly, and then shrank into herself at the furious gesture from the First Citizen.

Lord Stettin said, harshly, "Do not interrupt, Callia. Meirus, I am tired of inaction. My predecessor spent his life polishing the navy into a finely-turned instrument that has not its equal in the Galaxy. And he died with the magnificent machine lying idle. Am I to continue that? I, an Admiral of the Navy?"

"How long before the machine rusts? At present, it is a drain on the Treasury and returns nothing. Its officers long for dominion, its men for loot. All Kalgan desires the return of Empire and glory. Are you capable of understanding that?"

"These are but words that you use, but I grasp your meaning. Dominion, loot, glory – pleasant when they are obtained, but the process of obtaining them is often risky and always unpleasant. The first fine flush may not last. And in all history, it has never been wise to attack the Foundation. Even the Mule would have been wiser to refrain–"

There were tears in the Lady Callia's blue, empty eyes. Of late, Poochie scarcely saw her, and now, when he had promised the evening to her, this horrible, thin, gray man, who always looked through her rather than at her, had forced his way in. And Poochie *let* him. She dared not say anything; was frightened even of the sob that forced its way out.

But Stettin was speaking now in the voice she hated, hard and impatient. He was saying: "You're a slave to the far past. The Foundation is greater in volume and population, but they are loosely knit and will fall apart at a blow. What holds them together these days is merely inertia; an inertia I am strong enough to smash. You are hypnotized by the old days when only the Foundation had atomic power. They were able to dodge the last hammer blows of the dying Empire and then faced only the unbrained anarchy of the warlords who would counter the Foundation's atomic vessels only with hulks and relics.

"But the Mule, my dear Meirus, has changed that. He spread the knowledge, that the Foundation had hoarded to itself, through half the Galaxy and the monopoly in science is gone forever. We can match them."

"And the Second Foundation?" questioned Meirus, coolly.

"And the Second Foundation?" repeated Stettin as coolly. "Do you know its intentions? It took ten years to stop the Mule, if, indeed, it was the factor, which some doubt. Are you unaware that a good many of the Foundation's psychologists and sociologists are of the opinion that the Seldon Plan has been completely disrupted since the days of the Mule? If the Plan has gone, then a vacuum exists which I may fill as well as the next man."

"Our knowledge of these matters is not great enough to warrant the gamble."

"Our knowledge, perhaps, but we have a Foundation visitor on the planet. Did you know that? A Homir Munn – who, I understand, has written articles on the Mule, and has expressed exactly that opinion, that the Seldon Plan no longer exists."

The First Minister nodded, "I have heard of him, or at least of his writings. What does he desire?"

"He asks permission to enter the Mule's palace."

"Indeed? It would be wise to refuse. It is never advisable to disturb the superstitions with which a planet is held."

"I will consider that – and we will speak again."

Meirus bowed himself out.

Lady Callia said tearfully, "Are you angry with me, Poochie?" Stettin turned on her savagely. "Have I not told you before never to call me by that ridiculous name in the presence of others?"

"You *used* to like it."

"Well, I don't any more, and it is not to happen again."

He stared at her darkly. It was a mystery to him that he tolerated her these days. She was a soft, empty-headed thing, comfortable to the touch, with a pliable affection that was a convenient facet to a hard life. Yet, even that affection was becoming wearisome. She dreamed of marriage, of being First Lady.

Ridiculous!

She was all very well when he had been an admiral only – but now as First Citizen and future conqueror, he needed more. He needed heirs who could unite his future dominions, something the Mule had never had, which was why his Empire did not survive his strange nonhuman life. He, Stettin, needed someone of the great historic families of the Foundation with whom he could fuse dynasties.

He wondered testily why he did not rid himself of Callia now. It would be no trouble. She would whine a bit– He dismissed the thought. She had her points, occasionally.

Callia was cheering up now. The influence of Graybeard was gone and her Poochie's granite face was softening now. She lifted herself in a single, fluid motion and melted toward him.

"You're not going to scold me, are you?"

"No." He patted her absently. "Now just sit quietly for a while, will you? I want to think."

"About the man from the Foundation?"

"Yes."

"Poochie?" This was a pause.

"What?"

"Poochie, the man has a little girl with him, you said. Remember? Could I see her when she comes? I never–"

"Now what do you think I want him to bring his brat with him for? Is my audience room to be a grammar school? Enough of your nonsense, Callia."

"But I'll take care of her, Poochie. You won't even have to bother with her. It's just that I hardly ever see children, and you know how I love them."

He looked at her sardonically. She never tired of this approach. She loved children; i.e. *his* children; i.e. his *legitimate* children; i.e. marriage. He laughed.

"This particular little piece," he said, "is a great girl of fourteen or fifteen. She's probably as tall as you are."

Callia looked crushed. "Well, could I, anyway? She could tell me about the Foundation? I've always wanted to go there, you know. My grandfather was a Foundation man. Won't you take me there, sometime, Poochie?"

Stettin smiled at the thought. Perhaps he would, as conqueror. The good nature that the thought supplied him with made itself felt in his words, "I will, I will. And you can see the girl and talk Foundation to her all you want. But not near me, understand."

"I won't bother you, honestly. I'll have her in my own rooms." She was happy again. It was not very often these days that she was allowed to have her way. She put her arms about his neck and after the slightest hesitation, she felt its tendons relax and the large head come softly down upon her shoulder.

13. LADY

Arcadia felt triumphant. How life had changed since Pelleas Anthor had stuck his silly face up against her window – and all because she had the vision and courage to do what needed to be done.

Here she was on Kalgan. She had been to the great Central Theater – the largest in the Galaxy – and seen *in person* some of the singing stars who were famous even in the distant Foundation. She had shopped all on her own along the Flowered Path, fashion center of the gayest world in Space. And she had made her own selections because Homir just didn't know anything about it at all. The saleswomen raised no objections at all to long, shiny dresses with those vertical sweeps that made her look so tall – and Foundation money went a long, long way. Homir had given her a ten-credit bill and when she changed it to Kalganian "Kalganids," it made a terribly thick sheaf.

She had even had her hair redone – sort of half-short in back, with two glistening curls over each temple. And it was treated so that it looked goldier than ever; it just *shone*.

But *this*, this was best of all. To be sure, the Palace of Lord Stettin wasn't as grand and lavish as the theaters, or as mysterious and historical as the old palace of the Mule – of which, so far they had only glimpsed the lonely towers in their air flight across the planet – but, imagine, a real Lord. She was rapt in the glory of it.

And not only that. She was actually face to face with his Mistress. Arcadia capitalized the word in her mind, because she knew the role such women had played in history; knew their glamour and power. In fact, she had often thought of being an all-powerful and glittering creature, herself, but somehow mistresses weren't in fashion at the Foundation just then and besides, her father probably wouldn't let her, if it came to that.

Of course, the Lady Callia didn't quite come up to Arcadia's notion of the part. For one thing, she was rather plump, and didn't look at all wicked and dangerous. just sort of faded and near-sighted. Her voice was high, too, instead of throaty, and–

Callia said, "Would you like more tea, child?"

"I'll have another cup, thank you, your grace," – or was it your highness?

Arcadia continued with a connoisseur's condescension, "Those are lovely pearls you are wearing, my lady." (On the whole, "my lady" seemed best.)

"Oh? Do you think so?" Callia seemed vaguely pleased. She removed them and let them swing milkily to and fro. "Would you like them? You can have them, if you like."

"Oh, my— You really mean—" She found them in her hand, then, repelling them mournfully, she said, "Father wouldn't like it."

"He wouldn't like the pearls? But they're quite nice pearls."

"He wouldn't like my taking them, I mean. You're not supposed to take expensive presents from other people, he says."

"You aren't? But . . . I mean, this was a present to me from Poo . . . from the First Citizen. Was that wrong, do you suppose?"

Arcadia reddened. "I didn't mean--"

But Callia had tired of the subject. She let the pearls slide to the ground and said, "You were going to tell me about the Foundation. Please do so right now."

And Arcadia was suddenly at a loss. What does one say about a world dull to tears. To her, the Foundation was a suburban town, a comfortable house, the annoying necessities of education, the uninteresting eternities of a quiet life. She said, uncertainly, "It's just like you view in the book-films, I suppose."

"Oh, do you view book-films? They give me such a headache when I try. But do you know I always love video stories about your Traders – such big, savage men. It's always so exciting. Is your friend, Mr. Munn, one of them? He doesn't seem nearly savage enough. Most of the Traders had beards and big bass voices, and were so domineering with women – don't you think so?"

Arcadia smiled, glassily. "That's just part of history, my lady. I mean, when the Foundation was Young, the Traders were the pioneers pushing back the frontiers and bringing civilization to the rest of the Galaxy. We learned all about that in school. But that time has passed. We don't have Traders any more; just corporations and things."

"Really? What a shame. Then what does Mr. Munn do? I mean, if he's not a Trader."

"Uncle Homir's a librarian."

Callia put a hand to her lips and tittered. "You mean he takes care of book-films. Oh, my! It seems like such a silly thing for a grown man to do."

"He's a very good librarian, my lady. It is an occupation that is very highly regarded at the Foundation." She put down the little, iridescent teacup upon the milky-metaled table surface.

Her hostess was all concern. "But my dear child. I'm sure I didn't mean to offend you. He must be a very *intelligent* man. I could see it in his eyes as soon as I looked at him. They were so . . . so *intelligent*. And he must be brave, too, to want to see the Mule's palace."

"Brave?" Arcadia's internal awareness twitched. This was what she was waiting for. Intrigue! Intrigue! With great indifference, she asked, staring idly at her thumbtip: "Why must one be brave to wish to see the Mule's palace?"

"Didn't you know?" Her eyes were round, and her voice sank. "There's a curse on it. When he died, the Mule directed that no one ever enter it until the Empire of the Galaxy is established. Nobody on Kalgan would dare even to enter the grounds."

Arcadia absorbed that. "But that's superstition—"

"Don't say that," Callia was distressed. "Poochie always says that. He says it's useful to say it isn't though, in order to maintain his hold over the people. But I notice he's never gone in himself. And neither did Thallos, who was First Citizen before Poochie." A thought struck her and she was all curiosity again: "But why does Mr. Munn want to see the Palace?"

And it was here that Arcadia's careful plan could be put into action. She knew well from the books she had read that a ruler's mistress was the real power behind the throne, that she was the very well-spring of influence. Therefore, if Uncle Homir failed with Lord Stettin – and she was sure he would – she must retrieve that failure with Lady Callia. To be sure, Lady Callia was something of a puzzle. She didn't seem at *all* bright. But, well, all history proved—

She said, "There's a reason, my lady – but will you keep it in confidence?"

"Cross my heart," said Callia, making the appropriate gesture on the soft, billowing whiteness of her breast.

Arcadia's thoughts kept a sentence ahead of her words. "Uncle Homir is a great authority on the Mule, you know. He's written books and books about it, and he thinks that all of Galactic history has been changed since the Mule conquered the Foundation."

"Oh, my."

"He thinks the Seldon Plan—"

Callia clapped her hands. "I know about the Seldon Plan. The videos about the Traders were always all about the Seldon Plan. It was supposed to arrange to have the Foundation win all the time. Science had something to do with it, though I could never quite see how. I always get so restless when I have to listen to explanations. But you go right ahead, my dear. It's different when you explain. You make everything seem so clear."

Arcadia continued, "Well, don't you see then that when the Foundation was defeated by the Mule, the Seldon Plan didn't work and it hasn't worked since. So who will form the Second Empire?"

"The Second Empire?"

"Yes, one must be formed some day, but how? That's the problem, you see. And there's the Second Foundation."

"The *Second* Foundation?" She was quite completely lost.

"Yes, they're the planners of history that are following in the footsteps of Seldon. They stopped the Mule because he was premature, but now, they may be supporting Kalgan."

"Why?"

"Because Kalgan may now offer the best chance of being the nucleus for a new Empire."

Dimly, Lady Callia seemed to grasp that. "You mean *Poochie* is going to make a new Empire."

"We can't tell for sure. Uncle Homir thinks so, but hell have to see the Mule's records to find out."

"It's all very complicated," said Lady Callia, doubtfully.

Arcadia gave up. She had done her best.

Lord Stettin was in a more-or-less savage humor. The session with the milksop from the Foundation had been quite unrewarding. It had been worse; it had been embarrassing. To be absolute ruler of twenty-seven worlds, master of the Galaxy's greatest military machine, owner of the universe's most vaulting ambition – and left to argue nonsense with an antiquarian.

Damnation!

He was to violate the customs of Kalgan, was he? To allow the Mule's palace to be ransacked so that a fool could write another book? The cause of science! The sacredness of knowledge! Great Galaxy! Were these catchwords to be thrown in his face in all seriousness? Besides – and his flesh prickled slightly – there was the matter of the curse. He didn't believe in it; no intelligent man could. But if he was going to defy it, it would have to be for a better reason than any the fool had advanced.

"What do *you* want?" he snapped, and Lady Callia cringed visibly in the doorway.

"Are you busy?"

"Yes. I am busy."

"But there's nobody here, Poochie. Couldn't I even speak to you for a minute?"

"Oh, Galaxy! What do you want? Now hurry."

Her words stumbled. "The little girl told me they were going into the Mule's palace. I thought we could go with her. It must be gorgeous inside."

"She told you that, did she? Well, she isn't and we aren't. Now go tend your own business. I've had about enough of you."

"But, Poochie, why not? Aren't you going to let them? The little girl said that you were going to make an Empire!"

"I don't care what she said– What was that?" He strode to Callia, and caught her firmly above the elbow, so that his fingers sank deeply into the soft flesh, "What did she tell you?"

"You're hurting me. I can't remember what she said, if you're going to look at me like that."

He released her, and she stood there for a moment, rubbing vainly at the red marks. She whimpered, "The little girl made me promise not to tell."

"That's too bad. Tell me! *Now!*"

"Well, she said the Seldon Plan was changed and that there was another Foundation somewheres that was arranging to have you make an Empire. That's all. She said Mr. Munn was a very important scientist and that the Mule's palace would have proof of all that. That's every bit of what she said. Are you angry?"

But Stettin did not answer. He left the room, hurriedly, with Callia's cowlike eyes staring mournfully after him. Two orders were sent out over the official seal of the First Citizen before the hour was up. One had the effect of sending five hundred ships of the line into space on what were officially to be termed as "war games." The other had the effect of throwing a single man into confusion.

Homir Munn ceased his preparations to leave when that second order reached him. It was, of course, official permission to enter the palace of the Mule. He read and reread it with anything but joy.

But Arcadia was delighted. She knew what had happened.

Or, at any rate, she thought she did.

14. ANXIETY

Poli placed the breakfast on the table, keeping one eye on the table news-recorder which quietly disgorged the bulletins of the day. It could be done easily enough without loss of efficiency, this one-eye-absent business. Since all items of food were sterilely packed in containers which served as discardable cooking units, her duties vis-a-vis breakfast consisted of nothing more than choosing the menu, placing the items on the table, and removing the residue thereafter.

She clacked her tongue at what she saw and moaned softly in retrospect.

"Oh, people are so wicked," she said, and Darell merely hemmed in reply.

Her voice took on the high-pitched rasp which she automatically assumed when about to bewail the evil of the world. "Now why do these terrible Kalganese" – she accented the second syllable and gave it a long "a" – "do like that? You'd think they'd give a body peace. But no, it's just trouble, trouble, all the time.

"Now look at that headline: 'Mobs Riot Before Foundation Consulate.' Oh, would I like to give them a piece of my mind, if I could. That's the trouble with people; they just don't remember. They just *don't* remember, Dr. Darell – got no memory at all. Look at the last war after the Mule died – of course I was just a little girl then – and oh, the fuss and trouble. My own uncle was killed, him being just in his twenties and only two years married, with a baby girl. I remember him even yet – blond hair he had, and a dimple in his chin. I have a trimensional cube of him somewheres–

"And now his baby girl has a son of her own in the navy and most like if anything happens–

"And we had the bombardment patrols, and all the old men taking turns in the stratospheric defense – I could imagine what they would have been able to do if the Kalganese had come that far. My mother used to tell us children about the food rationing and the prices and taxes. A body could hardly make ends meet–

"You'd think if they had sense people would just never want to start it again; just have nothing to do with it. And I suppose it's not people that do it, either; I suppose even Kalganese would rather sit at home with their families and not go fooling around in ships

and getting killed. It's that awful man, Stettin. It's a wonder people like that are let live. He kills the old man – what's his name – Thallos, and now he's just spoiling to be boss of everything.

"And why he wants to fight us, I don't know. He's bound to lose – like they always do. Maybe it's all in the Plan, but sometimes I'm sure it must be a wicked plan to have so much fighting and killing in it, though to be sure I haven't a word to say about Hari Seldon, who I'm sure knows much more about that than I do and perhaps I'm a fool to question him. And the *other* Foundation is as much to blame. *They* could stop Kalgan now and make everything fine. They'll do it anyway in the end, and you'd think they'd do it before there's any damage done."

Dr. Darell looked up. "Did you say something, Poli?"

Poli's eyes opened wide, then narrowed angrily. "Nothing, doctor, nothing at all. I haven't got a word to say. A body could as soon choke to death as say a word in this house. It's jump here, and jump there, but just try to say a word—" and she went off simmering.

Her leaving made as little impression on Darell as did her speaking.

Kalgan! Nonsense! A merely physical enemy! Those had always been beaten!

Yet he could not divorce himself of the current foolish crisis. Seven days earlier, the mayor had asked him to be Administrator of Research and Development. He had promised an answer today.

Well—

He stirred uneasily. Why, himself! Yet could he refuse? It would seem strange, and he dared not seem strange. After all, what did he care about Kalgan. To him there was only one enemy. Always had been.

While his wife had lived, he was only too glad to shirk the task; to hide. Those long, quiet days on Trantor, with the ruins of the past about them! The silence of a wrecked world and the forgetfulness of it all!

But she had died. Less than five years, all told, it had been; and after that he knew that he could live only by fighting that vague and fearful enemy that deprived him of the dignity of manhood by controlling his destiny; that made life a miserable struggle against a foreordained end; that made all the universe a hateful and deadly chess game.

Call it sublimation; he, himself did can it that – but the fight gave meaning to his life.

First to the University of Santanni, where he had joined Dr. Kleise. It had been five years well-spent.

And yet Kleise was merely a gatherer of data. He could not succeed in the real task – and when Darell had felt that as certainty, he knew it was time to leave.

Kleise may have worked in secret, yet he had to have men working for him and with him. He had subjects whose brains he probed. He had a University that backed him. All these were weaknesses.

Kleise could not understand that; and he, Darell, could not explain that. They parted enemies. It was well; they had to. He *had* to leave in surrender – in case someone watched.

Where Kleise worked with charts; Darell worked with mathematical concepts in the recesses of his mind. Kleise worked with many; Darell with none. Kleise in a University; Darell in the quiet of a suburban house.

And he was almost there.

A Second Founder is not human as far as his cerebrum is concerned. The cleverest physiologist, the most subtle neurochemist might detect nothing – yet the difference must be there.

And since the difference was one of the mind, it was *there* that it must be detectable.

Given a man like the Mule – and there was no doubt that the Second Founders had the Mule's powers, whether inborn or acquired – with the power of detecting and controlling human emotions, deduce from that the electronic circuit required, and deduce from that the last details of the encephalograph on which it could not help but be betrayed.

And now Kleise had returned into his life, in the person of his ardent young pupil, Anthor.

Folly! Folly! With his graphs and charts of people who had been tampered with. He had learned to detect that years ago, but of what use was it. He wanted the arm; not the tool. Yet he had to agree to join Anthor, since it was the quieter course.

Just as now he would become Administrator of Research and Development. It was the quieter course! And so he remained a conspiracy within a conspiracy.

The thought of Arcadia teased him for a moment, and he shuddered away from it. Left to himself, it would never have happened. Left to himself, no one would ever have been endangered but himself. Left to himself–

He felt the anger rising-against the dead Kleise, the living Anthor, all the well-meaning fools–

Well, she could take care of herself. She was a very mature little girl.

She could take care of herself!

It was a whisper in his mind–

Yet could she?

At the moment, that Dr. Darell told himself mournfully that she could, she was sitting in the coldly austere anteroom of the Executive Offices of the First Citizen of the Galaxy. For half an hour she had been sitting there, her eyes sliding slowly about the walls. There had been two armed guards at the door when she had entered with Homir Munn. They hadn't been there the other times.

She was alone, now, yet she sensed the unfriendliness of the very furnishings of the room. And for the first time.

Now, why should that be?

Homir was with Lord Stettin. Well, was that wrong?

It made her furious. In similar situations in the book-films and the videos, the hero foresaw the conclusion, was prepared for it when it came, and she – she just sat there. *Anything* could happen. *Anything!* And she just sat there.

Well, back again. Think it back. Maybe something would come.

For two weeks, Homir had nearly lived inside the Mule's palace. He had taken her once, with Stettin's permission. It was large and gloomily massive, shrinking from the touch of life to lie sleeping within its ringing memories, answering the footsteps with a hollow boom or a savage clatter. She hadn't liked it.

Better the great, gay highways of the capital city; the theaters and spectacles of a world essentially poorer than the Foundation, yet spending more of its wealth on display.

Homir would return in the evening, awed–

"It's a dream-world for me," he would whisper. "If I could only chip the palace down stone by stone, layer by layer of the aluminum sponge. If I could carry it back to Terminus– What a museum it would make."

He seemed to have lost that early reluctance. He was eager, instead; glowing. Arcadia knew that by the one sure sign; he practically never stuttered throughout that period.

One time, he said, "There are abstracts of the records of General Pritcher–"

"I know him. He was the Foundation renegade, who combed the Galaxy for the Second Foundation, wasn't he?"

"Not exactly a renegade, Arkady. The Mule had Converted him."

"Oh, it's the same thing."

"Galaxy, that combing you speak of was a hopeless task. The original records of the Seldon Convention that established both Foundations five hundred years ago, make only one reference to the Second Foundation. They say it's located 'at the other end of the Galaxy at Star's End.' That's all the Mule and Pritcher had to go on. They had no method of recognizing the Second Foundation even if they found it. What madness!

"They have records" – he was speaking to himself, but Arcadia listened eagerly – "which must cover nearly a thousand worlds, yet the number of worlds available for study must have been closer to a million. And we are no better off–"

Arcadia broke in anxiously, "*Shhh-h*" in a tight hiss.

Homir froze, and slowly recovered. "Let's not talk," he mumbled.

And now Homir was with Lord Stettin and Arcadia waited outside alone and felt the blood squeezing out of her heart for no reason at all. That was more frightening than anything else. That there seemed no reason.

On the other side of the door, Homir, too, was living in a sea of gelatin. He was fighting, with furious intensity, to keep from stuttering and, of course, could scarcely speak two consecutive words clearly as a result.

Lord Stettin was in full uniform, six-feet-six, large-jawed, and hard-mouthed. His balled, arrogant fists kept a powerful time to his sentences.

"Well, you have had two weeks, and you come to me with tales of nothing. Come, sir, tell me the worst. Is my Navy to be cut to ribbons? Am I to fight the ghosts of the Second Foundation as well as the men of the First?"

"I . . . I repeat, my lord, I am no p . . . pre . . . predictor. I . . . I am at a complete . . . loss."

"Or do you wish to go back to warn your countrymen? To deep Space with your play-acting. I want the truth or I'll have it out of you along with half your guts."

"I'm t . . . telling only the truth, and I'll have you re . . . remember, my l . . . lord, that I am a citizen of the Foundation. Y . . . you cannot touch me without harvesting m . . . m . . . more than you count on."

The Lord of Kalgan laughed uproariously. "A threat to frighten children. A horror with which to beat back an idiot. Come, Mr. Munn, I have been patient with you. I have listened to you for twenty minutes while you detailed wearisome nonsense to me which must have cost you sleepless nights to compose. It was wasted effort. I know you are here not merely to rake through the Mule's dead ashes and to warm over the cinders you find you come here for more than you have admitted. Is that not true?"

Homir Munn could no more have quenched the burning horror that grew in his eyes than, at that moment, he could have breathed. Lord Stettin saw that, and clapped the Foundation man upon his shoulder so that he and the chair he sat on reeled under the impact.

"Good. Now let us be frank. You are investigating the Seldon Plan. You know that it no longer holds. You know, perhaps, that I am the inevitable winner now; I and my heirs. Well, man, what matters it who established the Second Empire, so long as it is established. History plays no favorites, eh? Are you afraid to tell me? You see that I know your mission."

Munn said thickly, "What is it y . . . you w . . . want?"

"Your presence. I would not wish the Plan spoiled through overconfidence. You understand more of these things than I do; you can detect small flaws that I might miss. Come, you will be rewarded in the end; you will have your fair glut of the loot. What can you expect at the Foundation? To turn the tide of a perhaps inevitable defeat? To lengthen the war? Or is it merely a patriotic desire to die for your country?"

"I . . . I—" He finally spluttered into silence. Not a word would come.

"You will stay," said the Lord of Kalgan, confidently. "You have no choice. Wait" — an almost forgotten afterthought — "I have information to the effect that your niece is of the family of Bayta Darell."

Homir uttered a startled: "Yes." He could not trust himself at this point to be capable of weaving anything but cold truth.

"It is a family of note on the Foundation?"

Homir nodded, "To whom they would certainly b . . . brook no harm."

"Harm! Don't be a fool, man; I am meditating the reverse. How old is she?"

"Fourteen."

"Sol Well, not even the Second Foundation, or Hari Seldon, himself, could stop time from passing or girls from becoming women."

With that, he turned on his heel and strode to a draped door which he threw open violently.

He thundered, "What in Space have you dragged your shivering carcass here for?"

The Lady Callia blinked at him, and said in a small voice, "I didn't know anyone was with you."

"Well, there is. I'll speak to you later of this, but now I want to see your back, and quickly."

Her footsteps were a fading scurry in the corridor.

Stettin returned, "She is a remnant of an interlude that has lasted too long. It will end soon. Fourteen, you say?"

Homir stared at him with a brand-new horror!

Arcadia started at the noiseless opening of a door – jumping at the jangling sliver of movement it made in the corner of her eye. The finger that crooked frantically at her met no response for long moments, and then, as if in response to the cautions enforced by the very sight of that white, trembling figure, she tiptoed her way across the floor.

Their footsteps were a taut whisper in the corridor. It was the Lady Callia, of course, who held her hand so tightly that it hurt, and for some reason, she did not mind following her. Of the Lady Callia, at least, she was not afraid.

Now, why was that?

They were in a boudoir now, all pink fluff and spun sugar. Lady Callia stood with her back against the door.

She said, "This was our private way to me . . . to my room, you know, from his office. His, you know." And she pointed with a thumb, as though even the thought of him were grinding her soul to death with fear.

"It's so lucky . . . it's so lucky—" Her pupils had blackened out the blue with their size.

"Can you tell me—" began Arcadia timidly.

And Callia was in frantic motion. "No, child, no. There is no time. Take off your clothes. Please. Please. I'll get you more, and they won't recognize you."

She was in the closet, throwing useless bits of flummery in reckless heaps upon the ground, looking madly for something a girl could wear without becoming a living invitation to dalliance.

"Here, this will do. It will have to. Do you have money? Here, take it all – and this." She was stripping her ears and fingers. "Just go home – go home to your Foundation."

"But Homir . . . my uncle." She protested vainly through the muffling folds of the sweet-smelling and luxurious spun-metal being forced over her head.

"He won't leave. Poochie will hold him forever, but you mustn't stay. Oh, dear, don't you understand?"

"No." Arcadia forced a standstill, "I *don't* understand."

Lady Callia squeezed her hands tightly together. "You must go back to warn your people there will be war. Isn't that clear?" Absolute terror seemed paradoxically to have lent a lucidity to her thoughts and words that was entirely out of character. "Now come!"

Out another way! Past officials who stared after them, but saw no reason to stop one whom only the Lord of Kalgan could stop with impunity. Guards clicked heels and presented arms when they went through doors.

Arcadia breathed only on occasion through the years the trip seemed to take – yet from the first crooking of the white finger to the time she stood at the outer gate, with people and noise and traffic in the distance was only twenty-five minutes.

She looked back, with a sudden frightened pity. "I . . . I . . . don't know why you're doing this, my lady, but thanks– What's going to happen to Uncle Homir?"

"I don't know," wailed the other. "Can't you leave? Go straight to the spaceport. Don't wait. He may be looking for you this very minute."

And still Arcadia lingered. She would be leaving Homir; and, belatedly, now that she felt the free air about her, she was suspicious. "But what do you care if he does?"

Lady Callia bit her lower lip and muttered, "I can't explain to a little girl like you. It would be improper. Well, you'll be growing up and I . . . I met Poochie when I was sixteen. I can't have you about, you know." There was a half-ashamed hostility in her eyes.

The implications froze Arcadia. She whispered: "What will he do to you when he finds out?"

And she whimpered back: "I don't know," and threw her arm to her head as she left at a half-run, back along the wide way to the mansion of the Lord of Kalgan.

But for one eternal second, Arcadia *still* did not move, for in that last moment before Lady Callia left, Arcadia had seen something. Those frightened, frantic eyes had momentarily – flashingly – lit up with a cold amusement.

A vast, inhuman amusement.

It was much to see in such a quick flicker of a pair of eyes, but Arcadia had no doubt of what she saw.

She was running now – running wildly – searching madly for an unoccupied public booth at which one could press a button for public conveyance.

She was not running from Lord Stettin; not from him or from all the human hounds he could place at her heels – not from all his twenty-seven worlds rolled into a single gigantic phenomenon, hallooing at her shadow.

She was running from a single, frail woman who had helped her escape. From a creature who had loaded her with money and jewels; who had risked her own life to save her. From an entity she knew, certainly and finally, to be a woman of the Second Foundation.

An air-taxi came to a soft clicking halt in the cradle. The wind of its coming brushed against Arcadia's face and stirred at the hair beneath the softly-furred hood Callia had given her.

"Where'll it be, lady?"

She fought desperately to low-pitch her voice to make it not that of a child. "How many spaceports in the city?"

"Two. Which one ya want?"

"Which is closer?"

He stared at her: "Kalgan Central, lady."

"The other one, please. I've got the money." She had a twenty-Kalganid note in her hand. The denomination of the note made little difference to her, but the taxi-man grinned appreciatively.

"Anything ya say, lady. Sky-line cabs take ya anywhere."

She cooled her cheek against the slightly musty upholstery. The lights of the city moved leisurely below her.

What should she do? *What should she do?*

It was in that moment that she knew she was a *stupid*, stupid little girl, away from her father, and frightened. Her eyes were full of tears, and deep down in her throat, there was a small, soundless cry that hurt her insides.

She wasn't afraid that Lord Stettin would catch her. Lady Callia would see to that. Lady Callia! Old, fat, stupid, but she held on to her lord, somehow. Oh, it was clear enough, now. *Everything* was clear.

That tea with Callia at which she had been so smart. Clever little Arcadia! Something inside Arcadia choked and hated itself. That tea had been maneuvered, and then Stettin had probably been maneuvered so that Homir was allowed to inspect the Palace after all. *She*, the foolish Callia, has wanted it so, and arranged to have smart little Arcadia supply a foolproof excuse, one which would arouse no suspicions in the minds of the victims, and yet involve a minimum of interference on her part.

Then why was she free? Homir was a prisoner, of course—

Unless—

Unless she went back to the Foundation as a decoy – a decoy to lead others into the hands of . . . of *them*.

So she couldn't return to the Foundation—

"Spaceport, lady." The air-taxi had come to a halt. Strange! She hadn't even noticed.

What a dream-world it was.

"Thanks," she pushed the bill at him without seeing anything and was stumbling out the door, then running across the springy pavement.

Lights. Unconcerned men and women. Large gleaming bulletin boards, with the moving figures that followed every single spaceship that arrived and departed.

Where was she going? She didn't care. She only knew that she wasn't going to the Foundation! Anywhere else at all would suit.

Oh, thank Seldon, for that forgetful moment – that last split-second when Callia wearied of her act because she had to do only with a child and had let her amusement spring through.

And then something else occurred to Arcadia, something that had been stirring and moving at the base of her brain ever since the flight began – something that forever killed the fourteen in her.

And she knew that she *must* escape.

That above all. Though they located every conspirator on the Foundation; though they caught her own father; she could not dare not, risk a warning. She could not risk her own life – not in the slightest – for the entire realm of Terminus. She was the most important person in the Galaxy. She was the *only* important person in the Galaxy.

She knew that even as she stood before the ticket-machine and wondered where to go.

Because in all the Galaxy, she and she alone, except for *they*, themselves, knew the location of the Second Foundation.

15. THROUGH THE GRID

TRANTOR By the middle of the Interregnum, Trantor was a shadow. In the midst of the colossal ruins, there lived a small community of farmers. . . .

ENCYCLOPEDIA GALACTICA

There is nothing, never has been anything, quite like a busy spaceport on the outskirts of a capital city of a populous planet. There are the huge machines resting mightily in their cradles. If you choose your time properly, there is the impressive sight of the sinking giant dropping to rest or, more hair-raising still, the swiftening departure of a bubble of steel. All processes involved are nearly noiseless. The motive power is the silent surge of nucleons shifting into more compact arrangements.

In terms of area, ninety-five percent of the port has just been referred to. Square miles are reserved for the machines, and for the men who serve them and for the calculators that serve both.

Only five percent of the port is given over to the floods of humanity to whom it is the way station to all the stars of the Galaxy. It is certain that very few of the anonymous many-headed stop to consider the technological mesh that knits the spaceways. Perhaps some of them might itch occasionally at the thought of the thousands of tons represented by the sinking steel that looks so small off in the distance. One of those cyclopean cylinders could, conceivably, miss the guiding beam and crash half a mile from its expected landing point – through the glassite roof of the immense waiting room perhaps – so that only a thin organic vapor and some powdered phosphates would be left behind to mark the passing of a thousand men.

It could never happen, however, with the safety devices in use; and only the badly neurotic would consider the possibility for more than a moment.

Then what *do* they think about? It is not just a crowd, you see. It is a crowd with a purpose. That purpose hovers over the field and thickens the atmosphere. Lines queue up; parents herd their children; baggage is maneuvered in precise masses – people are *going* somewheres.

Consider then the complete psychic isolation of a single unit of this terribly intent mob that does not know where to go; yet at the same time feels more intensely than any of the others possibly can, the necessity of going somewheres; anywhere! Or almost anywhere!

Even lacking telepathy or any of the crudely definite methods of mind touching mind, there is a sufficient clash in atmosphere, in intangible mood, to suffice for despair.

To suffice? To overflow, and drench, and drown.

Arcadia Darell, dressed in borrowed clothes, standing on a borrowed planet in a borrowed situation of what seemed even to be a borrowed life, wanted earnestly the safety of the womb. She didn't know that was what she wanted. She only knew that the very openness of the open world was a great danger. She wanted a closed spot somewhere – somewhere far – somewhere in an unexplored nook of the universe – where no one would ever look.

And there she was, age fourteen plus, weary enough for eighty plus, frightened enough for five minus.

What stranger of the hundreds that brushed past her – actually brushed past her, so that she could feel their touch – was a Second Foundationer? What stranger could not help but instantly destroy her for her guilty knowledge – her unique knowledge – of knowing where the Second Foundation was?

And the voice that cut in on her was a thunderclap that iced the scream in her throat into a voiceless slash.

"Look, miss," it said, irritably, "are you using the ticket machine or are you just standing there?"

It was the first she realized that she was standing in front of a ticket machine. You put a high denomination bill into the clipper which sank out of sight. You pressed the button below your destination and a ticket came out together with the correct change as determined by an electronic scanning device that never made a mistake. It was a very ordinary thing and there is no cause for anyone to stand before it for five minutes.

Arcadia plunged a two-hundred credit into the clipper, and was suddenly aware of the button labeled "Trantor." Trantor, dead capital of the dead Empire – the planet on which she was born. She pressed it in a dream. Nothing happened, except that the red letters flicked on and off, reading 172.18– 172.18– 172.18–

It was the amount she was short. Another two-hundred credit. The ticket was spit out towards her. It came loose when she touched it, and the change tumbled out afterward.

She seized it and ran. She felt the man behind her pressing close, anxious for his own chance at the machine, but she twisted out from before him and did not look behind.

Yet there was nowhere to run. They were all her enemies.

Without quite realizing it, she was watching the gigantic, glowing signs that puffed into the air: *Steffani, Anacreon, Fermus*— There was even one that ballooned, *Terminus*, and she longed for it, but did not dare—

For a trifling sum, she could have hired a notifier which could have been set for any destination she cared and which would, when placed in her purse, make itself heard only to her, fifteen minutes before take-off time. But such devices are for people who are reasonably secure, however; who can pause to think of them.

And then, attempting to look both ways simultaneously, she ran head-on into a soft abdomen. She felt the startled outbreath and grunt, and a hand come down on her arm. She writhed desperately but lacked breath to do more than mew a bit in the back of her throat.

Her captor held her firmly and waited. Slowly, he came into focus for her and she managed to look at him. He was rather plump and rather short. His hair was white and copious, being brushed back to give a pompadour effect that looked strangely incongruous above a round and ruddy face that shrieked its peasant origin.

"What's the matter?" he said finally, with a frank and twinkling curiosity. "You look scared."

"Sorry," muttered Arcadia in a frenzy. "I've got to go. Pardon me."

But he disregarded that entirely, and said, "Watch out, little girl. You'll drop your ticket." And he lifted it from her resistless white fingers and looked at it with every evidence of satisfaction.

"I thought so," he said, and then bawled in bull-like tones, "*Mommuh!*"

A woman was instantly at his side, somewhat more short, somewhat more round, somewhat more ruddy. She wound a finger about a stray gray lock to shove it beneath a well-outmoded hat.

"Pappa," she said, reprovingly, "why do you shout in a crowd like that? People look at you like you were crazy. Do you think you are on the farm?"

And she smiled sunnily at the unresponsive Arcadia, and added, "He has manners like a bear." Then, sharply, "Pappa, let go the little girl. What are you doing?"

But Pappa simply waved the ticket at her. "Look," he said, "she's going to Trantor."

Mamma's face was a sudden beam, "You're from Trantor? Let go her arm, I say, Pappa." She turned the overstuffed valise she was carrying onto its side and forced Arcadia to sit down with a gentle but unrelenting pressure. "Sit down," she said, "and rest your little feet. It will be no ship yet for an hour and the benches are crowded with sleeping loafers. You are from Trantor?"

Arcadia drew a deep breath and gave in. Huskily, she said, "I was born there."

And Mamma clapped her hands gleefully, "One month we've been here and till now we met nobody from home. This is very nice. Your parents—" she looked about vaguely.

"I'm not with my parents," Arcadia said, carefully.

"All alone? A little girl like you?" Mamma was at once a blend of indignation and sympathy, "How does that come to be?"

"Mamma," Pappa plucked at her sleeve, "let me tell you. There's something wrong. I think she's frightened." His voice, though obviously intended for a whisper was quite plainly audible to Arcadia. "She was running – I was watching her – and not looking where she was going. Before I could step out of the way, she bumped into me. And you know what? I think she's in trouble."

"So shut your mouth, Pappa. Into you, anybody could bump." But she joined Arcadia on the valise, which creaked wearily under the added weight and put an arm about the girl's trembling shoulder. "You're running away from somebody, sweetheart? Don't be afraid to tell me. I'll help you."

Arcadia looked across at the kind gray eyes of the woman and felt her lips quivering. One part of her brain was telling her that here were people from Trantor, with whom she could go, who could help her remain on that planet until she could decide what next to do, where next to go. And another part of her brain, much the louder, was telling her in jumbled incoherence that she did not remember her mother, that she was weary to death of fighting the universe, that she wanted only to curl into a little ball with strong, gentle arms about her, that if her mother had lived, she might . . . she might–

And for the first time that night, she was crying; crying like a little baby, and glad of it; clutching tightly at the old-fashioned dress and dampening a corner of it thoroughly, while soft arms held her closely and a gentle hand stroked her curls.

Pappa stood helplessly looking at the pair, fumbling futilely for a handkerchief which, when produced, was snatched from his hand. Mamma glared an admonition of quietness at him. The crowds surged about the little group with the true indifference of disconnected crowds everywhere. They were effectively alone.

Finally, the weeping trickled to a halt, and Arcadia smiled weakly as she dabbed at red eyes with the borrowed handkerchief. "Golly," she whispered,

"*Shh. Shh.* Don't talk," said Mamma, fussily, "just sit and rest for a while. Catch your breath. Then tell us what's wrong, and you'll see, we'll fix it up, and everything will be all right."

Arcadia scabbled what remained of her wits together. She could not tell them the truth. She could tell nobody the truth– And yet she was too worn to invent a useful lie.

She said, whisperingly, "I'm better, now."

"Good," said Mamma. "Now tell me why you're in trouble. You did nothing wrong? Of course, whatever you did, we'll help you; but tell us the truth."

"For a friend from Trantor, anything," added Pappa, expansively, "eh, Mamma?"

"Shut your mouth, Pappa," was the response, without rancor.

Arcadia was groping in her purse. That, at least, was still hers, despite the rapid clothes-changing forced upon her in Lady Callia's apartments. She found what she was looking for and handed it to Mamma.

"These are my papers," she said, diffidently. It was shiny, synthetic parchment which had been issued her by the Foundation's ambassador on the day of her arrival and

which had been countersigned by the appropriate Kalganian official. It was large, florid, and impressive. Mamma looked at it helplessly, and passed it to Pappa who absorbed its contents with an impressive pursing of the lips.

He said, "You're from the Foundation?"

"Yes. But I was born in Trantor. See it says that—"

"Ah-hah. It looks all right to me. You're named Arcadia, eh? That's a good Trantorian name. But where's your uncle? It says here you came in the company of Homir Munn, uncle."

"He's been arrested," said Arcadia, drearily.

"Arrested!" – from the two of them at once. "What for?" asked Mamma. "He did something?"

She shook her head. "I don't know. We were just on a visit. Uncle Homir had business with Lord Stettin but—" She needed no effort to act a shudder. It was there.

Pappa was impressed. "With Lord Stettin. Mm-m-m, your uncle must be a big man."

"I don't know what it was all about, but Lord Stettin wanted *me* to stay—" She was recalling the last words of Lady Callia, which had been acted out for her benefit. Since Callia, as she now knew, was an expert, the story could do for a second time.

She paused, and Mamma said interestedly, "And why you?"

"I'm not sure. He . . . he wanted to have dinner with me all alone, but I said no, because I wanted Uncle Homir along. He looked at me funny and kept holding my shoulder."

Pappa's mouth was a little open, but Mamma was suddenly red and angry. "How old are you, Arcadia?"

"Fourteen and a half, almost."

Mamma drew a sharp breath and said, "That such people should be let live. The dogs in the streets are better. You're running from him, dear, is not?"

Arcadia nodded.

Mamma said, "Pappa, go right to Information and find out exactly when the ship to Trantor comes to berth. Hurry!"

But Pappa took one step and stopped. Loud metallic words were booming overhead, and five thousand pairs of eyes looked startledly upwards.

"Men and women," it said, with sharp force. "The airport is being searched for a dangerous fugitive, and it is now surrounded. No one can enter and no one can leave. The search will, however, be conducted with great speed and no ships will reach or leave berth during the interval, so you will not miss your ship. I repeat, no one will miss his ship. The grid will descend. None of you will move outside your square until the grid is removed, as otherwise we will be forced to use our neuronic whips."

During the minute or less in which the voice dominated the vast dome of the spaceport's waiting room, Arcadia could not have moved if all the evil in the Galaxy had concentrated itself into a ball and hurled itself at her.

They could mean only her. It was not even necessary to formulate that idea as a specific thought. But why—

Callia had engineered her escape. And Callia was of the Second Foundation. Why, then, the search now? Had Callia failed? *Could* Callia fail? Or was this part of the plan, the intricacies of which escaped her?

For a vertiginous moment, she wanted to jump up and shout that she gave up, that she would go with them, that . . . that—

But Mamma's hand was on her wrist. "Quick! Quick! Well go to the lady's room before they start."

Arcadia did not understand. She merely followed blindly. They oozed through the crowd, frozen as it was into clumps, with the voice still booming through its last words.

The grid was descending now, and Pappa, openmouthed, watched it come down. He had heard of it and read of it, but had never actually been the object of it. It glimmered in the air, simply a series of cross-hatched and tight radiation-beams that set the air aglow in a harmless network of flashing light.

It always was so arranged as to descend slowly from above in order that it might represent a falling net with all the terrific psychological implications of entrapment.

It was at waist-level now, ten feet between glowing lines in each direction. In his own hundred square feet, Pappa found himself alone, yet the adjoining squares were crowded. He felt himself conspicuously isolated but knew that to move into the greater anonymity of a group would have meant crossing one of those glowing lines, stirring an alarm, and bringing down the neuronic whip.

He waited.

He could make out over the heads of the eerily quiet and waiting mob, the far-off stir that was the line of policemen covering the vast floor area, lighted square by lighted square.

It was a long time before a uniform stepped into his square and carefully noted its coordinates into an official notebook.

"Papers!"

Pappa handed them over, and they were flipped through in expert fashion.

"You're Preem Palver, native of Trantor, on Kalgan for a month, returning to Trantor. Answer, yes or no."

"Yes, yes."

"What's your business on Kalgan?"

"I'm trading representative of our farm co-operative. I've been negotiating terms with the Department of Agriculture on Kalgan."

"Um-m-m. Your wife is with you? Where is she? She is mentioned in your papers."

"Please. My wife is in the—" He pointed.

"Hanto," roared the policeman. Another uniform joined him.

The first one said, dryly, "Another dame in the can, by the Galaxy. The place must be busting with them. Write down her name." He indicated the entry in the papers which gave it.

"Anyone else with you?"

"My niece."

"She's not mentioned in the papers."

"She came separately."

"Where is she? Never mind, I know. Write down the niece's name, too, Hanto.

What's her name? Write down Arcadia Palver. You stay right here, Palver. We'll take care of the women before we leave."

Pappa waited interminably. And then, long, long after, Mamma was marching toward him, Arcadia's hand firmly in hers, the two policemen trailing behind her.

They entered Pappa's square, and one said, "Is this noisy old woman your wife?"

"Yes, sir," said Pappa, placatingly.

"Then you'd better tell her she's liable to get into trouble if she talks the way she does to the First Citizen's police." He straightened his shoulders angrily. "Is this your niece?"

"Yes, sir."

"I want her papers."

Looking straight at her husband, Mamma slightly, but no less firmly, shook her head.

A short pause, and Pappa said with a weak smile, "I don't think I can do that."

"What do you mean you can't do that?" The policeman thrust out a hard palm.

"Hand it over."

"Diplomatic immunity," said Pappa, softly.

"What do you mean?"

"I said I was trading representative of my farm co-operative. I'm accredited to the Kalganian government as an official foreign representative and my papers prove it. I showed them to you and now I don't want to be bothered any more."

For a moment, the policeman was taken aback. "I got to see your papers. It's orders."

"You go away," broke in Mamma, suddenly. "When we want you, we'll send for you, you . . . you *bum*."

The policeman's lips tightened. "Keep your eye on them, Hanto. I'll get the lieutenant."

"Break a leg!" called Mamma after him. Someone laughed, and then choked it off suddenly.

The search was approaching its end. The crowd was growing dangerously restless. Forty-five minutes had elapsed since the grid had started falling and that is too long for best effects. Lieutenant Dirige threaded his way hastily, therefore, toward the dense center of the mob.

"Is this the girl?" he asked wearily. He looked at her and she obviously fitted the description. All this for a child.

He said, "Her papers, if you please?"

Pappa began, "I have already explained—"

"I know what you have explained, and I'm sorry," said the lieutenant, "but I have my orders, and I can't help them. If you care to make a protest later, you may. Meanwhile, if necessary, I must use force."

There was a pause, and the lieutenant waited patiently.

Then Pappa said, huskily, "Give me your papers, Arcadia."

Arcadia shook her head in panic, but Pappa nodded his head. "Don't be afraid. Give them to me."

Helplessly she reached out and let the documents change hands. Pappa fumbled them open and looked carefully through them, then handed them over. The lieutenant in his turn looked through them carefully. For a long moment, he raised his eyes to rest them on Arcadia, and then he closed the booklet with a sharp snap.

"All in order," he said. "All right, men."

He left, and in two minutes, scarcely more, the grid was gone, and the voice above signified a back-to-normal. The noise of the crowd, suddenly released, rose high.

Arcadia said: "How . . . how—"

Pappa said, "*Sh-h*. Don't say a word. Let's better go to the ship. It should be in the berth soon."

They were on the ship. They had a private stateroom and a table to themselves in the dining room. Two light-years already separated them from Kalgan, and Arcadia finally dared to broach the subject again.

She said, "But they were after me, Mr. Palver, and they must have had my description and all the details. Why did he let me go?"

And Pappa smiled broadly over his roast beef. "Well, Arcadia, child, it was easy. When you've been dealing with agents and buyers and competing co-operatives, you learn some of the tricks. I've had twenty years or more to learn them in. You see, child, when the lieutenant opened your papers, he found a five hundred credit bill inside, folded up small. Simple, no?"

"I'll pay you back—Honest, I've got lots of money."

"Well," Pappa's broad face broke into an embarrassed smile, as he waved it away. "For a country-woman—"

Arcadia desisted. "But what if he'd taken the money and turned me in anyway. And accused me of bribery."

"And give up five hundred credits? I know these people better than you do, girl."

But Arcadia knew that he did not know people better. Not *these* people. In her bed that night, she considered carefully, and *knew* that no bribe would have stopped a police lieutenant in the matter of catching her unless that had been planned. They *didn't* want to catch her, yet had made every motion of doing so, nevertheless.

Why? To make sure she left? And for Trantor? Were the obtuse and soft-hearted couple she was with now only a pair of tools in the hands of the Second Foundation, as helpless as she herself?

They must be!

Or were they?

It was all so useless. How could she fight them. Whatever she did, it might only be what those terrible omnipotents wanted her to do.

Yet she had to outwit them. *Had to. Had to! Had to!!*

16. BEGINNING OF WAR

For reason or reasons unknown to members of the Galaxy at the time of the era under discussion, Intergalactic Standard Time defines its fundamental unit, the second, as the time in which light travels 299,776 kilometers. 86,400 seconds are arbitrarily set equal to one Intergalactic Standard Day; and 365 of these days to one Intergalactic Standard Year.

Why 299,776?– Or 86,400?– Or 365?

Tradition, says the historian, begging the question. Because of certain and various mysterious numerical relationships, say the mystics, cultists, numerologists, metaphysicists. Because the original home-planet of humanity had certain natural periods of rotation and revolution from which those relationships could be derived, say a very few.

No one really knew.

Nevertheless, the date on which the Foundation cruiser, the *Hober Mallow* met the Kalganian squadron, headed by the *Fearless*, and, upon refusing to allow a search party to board, was blasted into smoldering wreckage was 185; 11692 G.E. That is, it was the 185th day of the 11,692nd year of the Galactic Era which dated from the accession of the first Emperor of the traditional Kamble dynasty. It was also 185; 419 A.S. – dating from the birth of Seldon – or 185; 348 Y.F. – dating from the establishment of the Foundation. On Kalgan it was 185; 56 F.C. – dating from the establishment of the First Citizenship by the Mule. In each case, of course, for convenience, the year was so arranged as to yield the same day number regardless of the actual day upon which the era began.

And, in addition, to all the millions of worlds of the Galaxy, there were millions of local times, based on the motions of their own particular heavenly neighbors.

But whichever you choose: 185; 11692-419-348-56 – or anything – it was this day which historians later pointed to when they spoke of the start of the Stettinian war.

Yet to Dr. Darell, it was none of these at all. It was simply and quite precisely the thirty-second day since Arcadia had left Terminus.

What it cost Darell to maintain stolidity through these days was not obvious to everyone.

But Elvett Semic thought he could guess. He was an old man and fond of saying that his neuronic sheaths had calcified to the point where his thinking processes were stiff and unwieldy. He invited and almost welcomed the universal underestimation of his decaying powers by being the first to laugh at them. But his eyes were none the less seeing for being faded; his mind none the less experienced and wise, for being no longer agile.

He merely twisted his pinched lips and said, "Why don't you do something about it?"

The sound was a physical jar to Darell, under which he winced. He said, gruffly, "Where were we?"

Semic regarded him with grave eyes. "You'd better do something about the girl." His sparse, yellow teeth showed in a mouth that was open in inquiry.

But Darell replied coldly, "The question is: Can you get a Symes-Molff Resonator in the range required?"

Well, I said I could and you weren't listening—

"I'm sorry, Elvett. It's like this. What we're doing now can be more important to everyone in the Galaxy than the question of whether Arcadia is safe. At least, to everyone but Arcadia and myself, and I'm willing to go along with the majority. How big would the Resonator be?"

Semic looked doubtful, "I don't know. You can find it somewhere in the catalogues."

"About how big. A ton? A pound? A block long?"

"Oh, I thought you meant exactly. It's a little jigger." He indicated the first joint of his thumb. "About that."

"All right, can you do something like this?" He sketched rapidly on the pad he held in his lap, then passed it over to the old physicist, who peered at it doubtfully, then chuckled.

"Y'know, the brain gets calcified when you get as old as I am. What are you trying to do?"

Darell hesitated. He longed desperately, at the moment, for the physical knowledge locked in the other's brain, so that he need not put his thought into words. But the longing was useless, and he explained.

Semic was shaking his head. "You'd need hyper-relays. The only things that would work fast enough. A thundering lot of them."

"But it can be built?"

"Well, sure."

"Can you get all the parts? I mean, without causing comment? In line with your general work."

Semic lifted his upper lip. "Can't get fifty hyper-relays? I wouldn't use that many in my whole life."

"We're on a defense project, now. Can't you think of something harmless that would use them? We've got the money."

"Hm-m-m. Maybe I can think of something."

"How small can you make the whole gadget?"

"Hyper-relays can be had micro-size . . . wiring . . . tubes – Space, you've got a few hundred circuits there."

"I know. How big?"

Semic indicated with his hands.

"Too big," said Darell. "I've got to swing it from my belt"

Slowly, he was crumpling his sketch into a tight ball. When it was a hard, yellow grape, he dropped it into the ash tray and it was gone with the tiny white flare of molecular decomposition.

He said, "Who's at your door?"

Semic leaned over his desk to the little milky screen above the door signal. He said, "The young fellow, Anthor. Someone with him, too."

Darell scraped his chair back. "Nothing about this, Semic, to the others yet. It's deadly knowledge, if they find out, and two lives are enough to risk."

Pelleas Anthor was a pulsing vortex of activity in Semic's office, which, somehow, managed to partake of the age of its occupant. In the slow turgor of the quiet room, the loose, summery sleeves of Anthor's tunic seemed still a-quiver with the outer breezes.

He said, "Dr. Darell, Dr. Semic – Orum Dirige."

The other man was tall. A long straight nose that lent his thin face a saturnine appearance. Dr. Darell held out a hand.

Anthor smiled slightly. "Police Lieutenant Dirige," he amplified. Then, significantly, "Of Kalgan."

And Darell turned to stare with force at the young man. "Police Lieutenant Dirige of Kalgan," he repeated, distinctly. "And you bring him here. Why?"

"Because he was the last man on Kalgan to see your daughter. Hold, man."

Anthor's look of triumph was suddenly one of concern, and he was between the two, struggling violently with Darell. Slowly, and not gently, he forced the older man back into the chair.

"What are you trying to do?" Anthor brushed a lock of brown hair from his forehead, tossed a hip lightly upon the desk, and swung a leg, thoughtfully. "I thought I was bringing you good news."

Darell addressed the policeman directly, "What does he mean by calling you the last man to see my daughter? Is my daughter dead? Please tell me without preliminary." His face was white with apprehension.

Lieutenant Dirige said expressionlessly, "'Last man on Kalgan' was the phrase. She's not on Kalgan now. I have no knowledge past that."

"Here," broke in Anthor, "let me put it straight. Sorry if I overplayed the drama a bit, Doc. You're so inhuman about this, I forget you have feelings. In the first place, Lieutenant Dirige is one of us. He was born on Kalgan, but his father was a Foundation man brought to that planet in the service of the Mule. I answer for the lieutenant's loyalty to the Foundation.

"Now I was in touch with him the day after we stopped getting the daily report from Munn—"

"Why?" broke in Darell, fiercely. "I thought it was quite decided that we were not to make a move in the matter. You were risking their lives and ours."

"Because," was the equally fierce retort, "I've been involved in this game for longer than you. Because I know of certain contacts on Kalgan of which you know nothing. Because I act from deeper knowledge, do you understand?"

"I think you're completely mad."

"Will you listen?"

A pause, and Darell's eyes dropped.

Anthor's lips quirked into a half smile, "All right, Doc. Give me a few minutes. Tell him, Dirige."

Dirige spoke easily: "As far as I know, Dr. Darell, your daughter is at Trantor. At least, she had a ticket to Trantor at the Eastern Spaceport. She was with a Trading Representative from that planet who claimed she was his niece. Your daughter seems to have a queer collection of relatives, doctor. That was the second uncle she had in a period of two weeks, eh? The Trantorian even tried to bribe me – probably thinks that's why they got away." He smiled grimly at the thought.

"How was she?"

"Unharmd, as far as I could see. Frightened. I don't blame her for that. The whole department was after her. I still don't know why."

Darell drew a breath for what seemed the first time in several minutes. He was conscious of the trembling of his hands and controlled them with an effort. "Then she's all right. This Trading Representative, who was he? Go back to him. What part does he play in it?"

"I don't know. Do you know anything about Trantor?"

"I lived there once."

"It's an agricultural world, now. Exports animal fodder and grains, mostly. High quality! They sell them all over the Galaxy. There are a dozen or two farm co-operatives on the planet and each has its representatives overseas. Shrewd sons of guns, too– I knew this one's record. He'd been on Kalgan before, usually with his wife. Perfectly honest. Perfectly harmless."

"Um-m-m," said Anthor. "Arcadia was born in Trantor, wasn't she, Doc?"

Darell nodded.

"It hangs together, you see. She wanted to go away – quickly and far – and Trantor would suggest itself. Don't you think so?"

Darell said: "Why not back here?"

"Perhaps she was being pursued and felt that she had to double off in a new angle, eh?"

Dr. Darell lacked the heart to question further. Well, then, let her be safe on Trantor, or as safe as one could be anywhere in this dark and horrible Galaxy. He groped toward the door, felt Anthor's light touch on his sleeve, and stopped, but did not turn.

"Mind if I go home with you, Doc?"

"You're welcome," was the automatic response.

By evening, the exteriormost reaches of Dr. Darell's personality, the ones that made immediate contact with other people had solidified once more. He had refused to

eat his evening meal and had, instead, with feverish insistence, returned to the inchwise advance into the intricate mathematics of encephalographic analysis.

It was not till nearly midnight, that he entered the living room again.

Pelleas Anthon was still there, twiddling at the controls of the video. The footsteps behind him caused him to glance over his shoulder.

"Hi. Aren't you in bed yet? I've been spending hours on the video, trying to get something other than bulletins. It seems the *F.S. Hober Mallow* is delayed in course and hasn't been heard from"

"Really? What do they suspect?"

"What do you think? Kalganian skulduggery. There are reports that Kalganian vessels were sighted in the general space sector in which the *Hober Mallow* was last heard from?"

Darell shrugged, and Anthon rubbed his forehead doubtfully.

"Look doc," he said, "why don't you go to Trantor?"

"Why should I?"

"Because "You're no good to us here. You're not yourself. You can't be. And you could accomplish a purpose by going to Trantor, too. The old Imperial Library with the complete records of the Proceedings of the Seldon Commission are there—"

"No! The Library has been picked clean and it hasn't helped anyone."

"It helped Ebling Mis once."

"How do you know? Yes, he *said* he found the Second Foundation, and my mother killed him five seconds later as the only way to keep him from unwittingly revealing its location to the Mule. But in doing so, she also, you realize, made it impossible ever to tell whether Mis *really* did know the location. After all, no one else has ever been able to deduce the truth from those records."

"Ebling Mis, if you'll remember, was working under the driving impetus of the Mule's mind."

"I know that, too, but *Mis'* mind was, by that very token, in an abnormal state. Do you and I know anything about the properties of a mind under the emotional control of another; about its abilities and shortcomings? In any case, I will not go to Trantor."

Anthon frowned, "Well, why the vehemence? I merely suggested it as – well, by Space, I don't understand you. You look ten years older. You're obviously having a hellish time of it. You're not doing anything of value here. If I were you, I'd go and get the girl."

"Exactly! It's what I want to do, too. *That's why I won't do it.* Look, Anthon, and try to understand. You're playing – we're both playing – with something completely beyond our powers to fight. In cold blood, if you have any, you know that, whatever you may think in your moments of quixoticism.

"For fifty years, we've known that the Second Foundation is the real descendent and pupil of Seldonian mathematics. What that means, and you know that, too, is that nothing in the Galaxy happens which does not play a part in their reckoning. To us, all life is a series of accidents, to be met with by improvisations. To them, all life is purposive and should be met by precalculation.

"But they have their weakness. Their work is statistical and only the mass action of humanity is truly inevitable. Now how *I* play a part, as an individual, in the foreseen course of history, I don't know. Perhaps I have no definite part, since the Plan leaves individuals to indeterminacy and free will. But I am important and they – *they*, you understand – may at least have calculated my probable reaction. So I distrust, my impulses, my desires, my probable reactions.

"I would rather present them with an improbable reaction. I will stay here, despite the fact that I yearn very desperately to leave. "No! *Because* I yearn very desperately to leave."

The younger man smiled sourly. "You don't know your own mind as well as *they* might. Suppose that – knowing you – they might count on what you think, merely *think*, is the improbable reaction, simply by knowing in advance what your line of reasoning would be."

"In that case, there is no escape. For if I follow the reasoning you have just outlined and go to Trantor, they may have foreseen that, too. There is an endless cycle of double-double-double-double-crosses. No matter how far I follow that cycle, I can only either go or stay. The intricate act of luring my daughter halfway across the Galaxy cannot be meant to make me stay where I am, since I would most certainly have stayed if they had done nothing. It can only be to make me move, and so I will stay.

"And besides, Anthor, not everything bears the breath of the Second Foundation; not all events are the results of their puppeting. They may have had nothing to do with Arcadia's leave-taking, and she may be safe on Trantor when all the rest of us are dead."

"No," said Anthor, sharply, "now you are off the track."

"You have an alternative interpretation?"

"I have – if you'll listen."

"Oh, go ahead. I don't lack patience."

"Well, then – how well do you know your own daughter?"

"How well can any individual know any other? Obviously, my knowledge is inadequate."

"So is mine on that basis, perhaps even more so – but at least, I viewed her with fresh eyes. Item one: She is a ferocious little romantic, the only child of an ivory-tower academician, growing up in an unreal world of video and book-film adventure. She lives in a weird self-constructed fantasy of espionage and intrigue. Item two: She's intelligent about it; intelligent enough to outwit us, at any rate. She planned carefully to overhear our first conference and succeeded. She planned carefully to go to Kalgan with Munn and succeeded. Item three: She has an unholy hero-worship of her grandmother – your mother – who defeated the Mule.

"I'm right so far, I think? All right, then. Now, unlike you, I've received a complete report from Lieutenant Dirige and, in addition, my sources of information on Kalgan are rather complete, and all sources check. We know, for instance, that Homir Munn, in conference with the Lord of Kalgan was refused admission to the Mule's Palace, and that

this refusal was suddenly abrogated after Arcadia had spoken to Lady Callia, the First Citizen's very good friend."

Darell interrupted. "And how do you know all this?"

"For one thing, Munn was interviewed by Dirige as part of the police campaign to locate Arcadia. Naturally, we have a complete transcript of the questions and answers.

"And take Lady Callia herself. It is rumored that she has lost Stettin's interest, but the rumor isn't borne out by facts. She not only remains unreplaced; is not only able to mediate the lord's refusal to Munn into an acceptance; but can even engineer Arcadia's escape openly. Why, a dozen of the soldiers about Stettin's executive mansion testified that they were seen together on the last evening. Yet she remains unpunished. This despite the fact that Arcadia was searched for with every appearance of diligence."

"But what is your conclusion from all this torrent of ill-connection?"

"That Arcadia's escape was arranged."

"As I said."

"With this addition. That Arcadia must have known it was arranged; that Arcadia, the bright little girl who saw cabals everywhere, saw this one and followed your own type of reasoning. They wanted her to return to the Foundation, and so she went to Trantor, instead. But why Trantor?"

"Well, why?"

"Because that is where Bayta, her idolized grandmother, escaped when *she* was in flight. Consciously or unconsciously, Arcadia imitated that. I wonder, then, if Arcadia was fleeing the same enemy."

"The Mule?" asked Darell with polite sarcasm.

"Of course not. I mean, by the enemy, a mentality that she could not fight. She was running from the Second Foundation, or such influence thereof as could be found on Kalgan."

"What influence is this you speak of?"

"Do you expect Kalgan to be immune from that ubiquitous menace? We both have come to the conclusion, somehow, that Arcadia's escape was arranged. Right? She was searched for and found, but deliberately allowed to slip away by Dirige. By Dirige, do you understand? But how was that? Because he was our man. But how did they know that? Were they counting on him to be a traitor? Eh, doc?"

"Now you're saying that they honestly meant to recapture her. Frankly, you're tiring me a bit, Anthor. Finish your say; I want to go to bed."

"My say is quickly finished." Anthor reached for a small group of photo-records in his inner pocket. It was the familiar wiggings of the encephalograph. "Dirige's brainwaves," Anthor said, casually, "taken since he returned."

It was quite visible to Darell's naked eye, and his face was gray when he looked up. "He is Controlled."

"Exactly. He allowed Arcadia to escape not because he was our man but because he was the Second Foundation's."

"Even after he knew she was going to Trantor, and not to Terminus."

Author shrugged. "He had been geared to let her go. There was no way *he* could modify that. He was only a tool, you see. It was just that Arcadia followed the least probable course, and is probably safe. Or at least safe until such time as the Second Foundation can modify the plans to take into account this changed state of affairs—"

He paused. The little signal light on the video set was flashing. On an independent circuit, it signified the presence of emergency news. Darell saw it, too, and with the mechanical movement of long habit turned on the video. They broke in upon the middle of a sentence but before its completion, they knew that the *Hober Mallow*, or the wreck thereof, had been found and that, for the first time in nearly half a century, the Foundation was again at war.

Author's jaw was set in a hard line. "All right, doc, you heard that. Kalgan has attacked; and Kalgan is under the control of the Second Foundation. Will you follow your daughter's lead and move to Trantor?"

"No. I will risk it. Here."

"Dr. Darell. You are not as intelligent as your daughter. I wonder how far you can be trusted." His long level stare held Darell for a moment, and then without a word, he left.

And Darell was left in uncertainty and – almost – despair.

Unheeded, the video was a medley of excited sight-sound, as it described in nervous detail the first hour of the war between Kalgan and the Foundation.

17. WAR

The mayor of the Foundation brushed futilely at the picket fence of hair that rimmed his skull. He sighed. "The years that we have wasted; the chances we have thrown away. I make no recriminations, Dr. Darell, but we deserve defeat."

Darell said, quietly, "I see no reason for lack of confidence in events, sir."

"Lack of confidence! Lack of confidence! By the Galaxy, Dr. Darell, on what would you base any other attitude? Come here—"

He half-led half-forced Darell toward the limpid ovoid cradled gracefully on its tiny force-field support. At a touch of the mayor's hand, it glowed within – an accurate three-dimensional model of the Galactic double-spiral.

"In yellow," said the mayor, excitedly, "we have that region of Space under Foundation control; in red, that under Kalgan."

What Darell saw was a crimson sphere resting within a stretching yellow fist that surrounded it on all sides but that toward the center of the Galaxy.

"Galactography," said the mayor, "is our greatest enemy. Our admirals make no secret of our almost hopeless, strategic position. Observe. The enemy has inner lines of communication. He is concentrated; can meet us on all sides with equal ease. He can defend himself with minimum force.

"We are expanded. The average distance between inhabited systems within the Foundation is nearly three times that within Kalgan. To go from Santanni to Locris, for instance, is a voyage of twenty-five hundred parsecs for us, but only eight hundred parsecs for them, if we remain within our respective territories—"

Darell said, "I understand all that, sir."

"And you do not understand that it may mean defeat."

"There is more than distance to war. I say we cannot lose. It is quite impossible."

"And why do you say that?"

"Because of my own interpretation of the Seldon Plan."

"Oh," the mayor's lips twisted, and the hands behind his back flapped one within the other, "then you rely, too, on the mystical help of the Second Foundation."

"No. Merely on the help of inevitability – and of courage and persistence."

And yet behind his easy confidence, he wondered—

What if—

Well— What if Anthor were right, and Kalgan were a direct tool of the mental wizards. What if it was their purpose to defeat and destroy the Foundation. No! It made no sense!

And yet—

He smiled bitterly. Always the same. Always that peering and peering through the opaque granite which, to the enemy, was so transparent.

Nor were the galactographic verities of the situation lost upon Stettin.

The Lord of Kalgan stood before a twin of the Galactic model which the mayor and Darell had inspected. Except that where the mayor frowned, Stettin smiled.

His admiral's uniform glistened imposingly upon his massive figure. The crimson sash of the Order of the Mule awarded him by the former First Citizen whom six months later he had replaced somewhat forcefully, spanned his chest diagonally from right shoulder to waist. The Silver Star with Double Comets and Swords sparkled brilliantly upon his left shoulder.

He addressed the six men of his general staff whose uniforms were only less grandiloquent than his own, and his First Minister as well, thin and gray – a darkling cobweb, lost in the brightness.

Stettin said, "I think the decisions are clear. We can afford to wait. To them, every day of delay will be another blow at their morale. If they attempt to defend all portions of their realm, they will be spread thin and we can strike through in two simultaneous thrusts here and here." He indicated the directions on the Galactic model – two lances of pure white shooting through the yellow fist from the red ball it inclosed, cutting Terminus off on either side in a tight arc. "In such a manner, we cut their fleet into three parts which can be defeated in detail. If they concentrate, they give up two-thirds of their dominions voluntarily and will probably risk rebellion."

The First Minister's thin voice alone seeped through the hush that followed. "In six months," he said, "the Foundation will grow six months stronger. Their resources are

greater, as we all know, their navy is numerically stronger; their manpower is virtually inexhaustible. Perhaps a quick thrust would be safer."

His was easily the least influential voice in the room. Lord Stettin smiled and made a flat gesture with his hand. "The six months – or a year, if necessary – will cost us nothing. The men of the Foundation cannot prepare; they are ideologically incapable of it. It is in their very philosophy to believe that the Second Foundation will save them. But not this time, eh?"

The men in the room stirred uneasily.

"You lack confidence, I believe," said Stettin, frigidly. "Is it necessary once again to describe the reports of our agents in Foundation territory, or to repeat the findings of Mr. Homir Munn, the Foundation agent now in our . . . uh . . . service? Let us adjourn, gentlemen."

Stettin returned to his private chambers with a fixed smile still on his face. He sometimes wondered about this Homir Munn. A queer water-spined fellow who certainly did not bear out his early promise. And yet he crawled with interesting information that carried conviction with it – particularly when Callia was present.

His smile broadened. That fat fool had her uses, after all. At least, she got more with her wheedling out of Munn than he could, and with less trouble. Why not give her to Munn? He frowned. Callia. She and her stupid jealousy. Space! If he still had the Darell girl- Why hadn't he ground her skull to powder for that?

He couldn't quite put his finger on the reason.

Maybe because she got along with Munn. And he needed Munn. It was Munn, for instance, who had demonstrated that, at least in the belief of the Mule, there was no Second Foundation. His admirals needed that assurance.

He would have liked to make the proofs public, but it was better to let the Foundation believe in their nonexistent help. Was it actually Callia who had pointed that out? That's right. She had said–

Oh, nonsense! She couldn't have said anything.

And yet–

He shook his head to clear it and passed on.

18. GHOST OF A WORLD

Trantor was a world in dregs and rebirth. Set like a faded jewel in the midst of the bewildering crowd of suns at the center of the Galaxy – in the heaps and clusters of stars piled high with aimless prodigality – it alternately dreamed of past and future.

Time had been when the insubstantial ribbons of control had stretched out from its metal coating to the very edges of stardom. It had been a single city, housing four hundred billion administrators; the mightiest capital that had ever been.

Until the decay of the Empire eventually reached it and in the Great Sack of a century ago, its drooping powers had been bent back upon themselves and broken

forever. In the blasting ruin of death, the metal shell that circled the planet wrinkled and crumpled into an aching mock of its own grandeur.

The survivors tore up the metal plating and sold it to other planets for seed and cattle. The soil was uncovered once more and the planet returned to its beginnings. In the spreading areas of primitive agriculture, it forgot its intricate and colossal past.

Or would have but for the still mighty shards that heaped their massive ruins toward the sky in bitter and dignified silence.

Arcadia watched the metal rim of the horizon with a stirring of the heart. The village in which the Palvers lived was but a huddle of houses to her – small and primitive. The fields that surrounded it were golden-yellow, wheat-clogged tracts.

But there, just past the reaching point was the memory of the past, still glowing in unruined splendor, and burning with fire where the sun of Trantor caught it in gleaming highlights. She had been there once during the months since she had arrived at Trantor. She had climbed onto the smooth, unjointed pavement and ventured into the silent dust-streaked structures, where the light entered through the jags of broken walls and partitions.

It had been solidified heartache. It had been blasphemy.

She had left, clangingly – running until her feet pounded softly on earth once more.

And then she could only look back longingly. She dared not disturb that mighty brooding once more.

Somewhere on this world, she knew, she had been born – near the old Imperial Library, which was the veriest Trantor of Trantor. It was the sacred of the sacred; the holy of holies! Of all the world, it alone had survived the Great Sack and for a century it had remained complete and untouched; defiant of the universe.

There Hari Seldon and his group had woven their unimaginable web. There Ebling Mis pierced the secret, and sat numbed in his vast surprise, until he was killed to prevent the secret from going further.

There at the Imperial Library, her grandparents had lived for ten years, until the Mule died, and they could return to the reborn Foundation.

There at the Imperial Library, her own father returned with his bride to find the Second Foundation once again, but failed. There, she had been born and there her mother had died.

She would have liked to visit the Library, but Preem Palver shook his round head. "It's thousands of miles, Arkady, and there's so much to do here. Besides, it's not good to bother there. You know; it's a shrine–"

But Arcadia knew that he had no desire to visit the Library; that it was a case of the Mule's Palace over again. There was this superstitious fear on the part of the pygmies of the present for the relics of the giants of the past.

Yet it would have been horrible to feel a grudge against the funny little man for that. She had been on Trantor now for nearly three months and in all that time, he and she – Pappa and Mamma – had been wonderful to her–

And what was her return? Why, to involve them in the common ruin. Had she warned them that she was marked for destruction, perhaps? No! She let them assume the deadly role of protectors.

Her conscience panged unbearably – yet what choice had she?

She stepped reluctantly down the stairs to breakfast. The voices reached her.

Preem Palver had tucked the napkin down his shirt collar with a twist of his plump neck and had reached for his poached eggs with an uninhibited satisfaction.

"I was down in the city yesterday, Mamma," he said, wielding his fork and nearly drowning the words with a capacious mouthful.

"And what is down in the city, Pappa?" asked Mamma indifferently, sitting down, looking sharply about the table, and rising again for the salt.

"Ah, not so good. A ship came in from out Kalgan-way with newspapers from there. It's war there."

"War! So! Well, let them break their heads, if they have no more sense inside. Did your pay check come yet? Pappa, I'm telling you again. You warn old man Cosker this isn't the only cooperative in the world. It's bad enough they pay you what I'm ashamed to tell my friends, but at least on time they could be!"

"Time; shmime," said Pappa, irritably. "Look, don't make me silly talk at breakfast, it should choke me each bite in the throat," and he wreaked havoc among the buttered toast as he said it. He added, somewhat more moderately, "The fighting is between Kalgan and the Foundation, and for two months, they've been at it."

His hands lunged at one another in mock-representation of a space fight.

"Um-m-m. And what's doing?"

"Bad for the Foundation. Well, you saw Kalgan; all soldiers. They were ready. The Foundation was not, and so – *poof!*"

And suddenly, Mamma laid down her fork and hissed, "Fool!"

"Huh?"

"Dumb-head! Your big mouth is always moving and wagging."

She was pointing quickly and when Pappa looked over his shoulder, there was Arcadia, frozen in the doorway.

She said, "The Foundation is at war?"

Pappa looked helplessly at Mamma, then nodded.

"And they're losing?"

Again the nod.

Arcadia felt the unbearable catch in her throat, and slowly approached the table. "Is it over?" she whispered.

"Over?" repeated Pappa, with false heartiness. "Who said it was over? In war, lots of things can happen. And . . . and–"

"Sit down, darling," said Mamma, soothingly. "No one should talk before breakfast. You're not in a healthy condition with no food in the stomach."

But Arcadia ignored her. "Are the Kalganians on Terminus?"

"No," said Pappa, seriously. "The news is from last week, and Terminus is still fighting. This is honest. I'm telling the truth. And the Foundation is still strong. Do you want me to get you the newspapers?"

"Yes!"

She read them over what she could eat of her breakfast and her eyes blurred as she read. Santanni and Korell were gone – without a fight. A squadron of the Foundation's navy had been trapped in the sparsely-sunned Ifni sector and wiped out to almost the last ship.

And now the Foundation was back to the Four-Kingdom core – the original Realm which had been built up under Salvor Hardin, the first mayor. But still it fought – and still there might be a chance-and whatever happened, she must inform her father. She must somehow reach his ear. She *must!*

But how? With a war in the way.

She asked Pappa after breakfast, "Are you going out on a new mission soon, Mr. Palver?"

Pappa was on the large chair on the front lawn, sunning himself. A fat cigar smoldered between his plump fingers and he looked like a beatific pug-dog.

"A mission?" he repeated, lazily. "Who knows? It's a nice vacation and my leave isn't up. Why talk about new missions? You're restless, Arkady?"

"Me? No, I like it here. You're very good to me, you and Mrs. Palver."

He waved his hand at her, brushing away her words.

Arcadia said, "I was thinking about the war."

"But don't think about it. What can you do? If it's something you can't help, why hurt yourself over it?"

"But I was thinking that the Foundation has lost most of its farming worlds. They're probably rationing food there."

Pappa looked uncomfortable. "Don't worry. It'll be all right."

She scarcely listened. "I wish I could carry food to them, that's what. You know after the Mule died, and the Foundation rebelled, Terminus was just about isolated for a time and General Han Pritcher, who succeeded the Mule for a while was laying siege to it. Food was running awfully low and my father says that *his* father told him that they only had dry amino-acid concentrates that tasted terrible. Why, one egg cost two hundred credits. And then they broke the siege just in time and food ships came through from Santanni. It must have been an awful time. Probably it's happening all over, now."

There was a pause, and then Arcadia said, "You know, I'll bet the Foundation would be willing to pay smuggler's prices for food now. Double and triple and more. Gee, if any co-operative, f'r instance, here on Trantor took over the job, they might lose some ships, but, I'll bet they'd be war millionaires before it was over. The Foundation Traders in the old days used to do that all the time. There'd be a war, so they'd sell whatever was needed bad and take their chances. Golly, they used to make as much as two million dollars out of one trip – *profit*. That was just out of what they could carry on one ship, too."

Pappa stirred. His cigar had gone out, unnoticed. "A deal for food, huh? Hm-m-m— But the Foundation is so far away."

"Oh, I know. I guess you couldn't do it from here. If you took a regular liner you probably couldn't get closer than Massena or Smushyk, and after that you'd have to hire a small scoutship or something to slip you through the lines."

Pappa's hand brushed at his hair, as he calculated.

Two weeks later, arrangements for the mission were completed. Mamma railed for most of the time— First, at the incurable obstinacy with which he courted suicide. Then, at the incredible obstinacy with which he refused to allow her to accompany him.

Pappa said, "Mamma, why do you act like an old lady. I can't take you. It's a man's work. What do you think a war is? Fun? Child's play?"

"Then why do *you* go? Are *you* a man, you old fool – with a leg and half an arm in the grave. Let some of the young ones go – not a fat bald-head like you?"

"I'm not a bald-head," retorted Pappa, with dignity. "I got yet lots of hair. And why should it not be me that gets the commission? Why, a young fellow? Listen, this could mean millions?"

She knew that and she subsided.

Arcadia saw him once before he left.

She said, "Are you going to Terminus?"

"Why not? You say yourself they need bread and rice and potatoes. Well, I'll make a deal with them, and they'll get it."

"Well, then – just one thing: If you're going to Terminus, could you . . . would you see my father?"

And Pappa's face crinkled and seemed to melt into sympathy, "Oh – and I have to wait for you to tell me. Sure, I'll see him. I'll tell him you're safe and everything's O.K., and when the war is over, I'll bring you back."

"Thanks. I'll tell you how to find him. His name is Dr. Toran Darell and he lives in Stanmark. That's just outside Terminus City, and you can get a little commuting plane that goes there. We're at 55 Channel Drive."

"Wait, and I'll write it down."

"No, no," Arcadia's arm shot out. "You mustn't write anything down. You must remember – and find him without anybody's help."

Pappa looked puzzled. Then he shrugged his shoulders. "All right, then. It's 55 Channel Drive in Stanmark, outside Terminus City, and you commute there by plane. All right?"

"One other thing."

"Yes?"

"Would you tell him something from me?"

"Sure."

"I want to whisper it to you."

He leaned his plump cheek toward her, and the little whispered sound passed from one to the other.

Pappa's eyes were round. "That's what you want me to say? But it doesn't make sense."

"He'll know what you mean. Just say I sent it and that I said he would know what it means. And you say it exactly the way I told you. No different. You won't forget it?"

"How can I forget it? Five little words. Look—"

"No, no." She hopped up and down in the intensity of her feelings. "Don't repeat it. Don't ever repeat it to anyone. Forget all about it except to my father. Promise me."

Pappa shrugged again. "I promise! All right!"

"All right," she said, mournfully, and as he passed down the drive to where the air taxi waited to take him to the spaceport, she wondered if she had signed his death warrant. She wondered if she would ever see him again.

She scarcely dared to walk into the house again to face the good, kind Mamma. Maybe when it was all over, she had better kill herself for what she had done to them.

19. END OF WAR

QUORISTON, BATTLE OF Fought on 9, 17, 377 F.E. between the forces of the Foundation and those of Lord Stettin of Kalgan, it was the last battle of consequence during the Interregnum

ENCYCLOPEDIA GALACTICA

Jole Turbor, in his new role of war correspondent, found his bulk incased in a naval uniform, and rather liked it. He enjoyed being back on the air, and some of the fierce helplessness of the futile fight against the Second Foundation left him in the excitement of another sort of fight with substantial ships and ordinary men.

To be sure, the Foundation's fight had not been remarkable for victories, but it was still possible to be philosophic about the matter. After six months, the hard core of the Foundation was untouched, and the hard core of the Fleet was still in being. With the new additions since the start of the war, it was almost as strong numerically, and stronger technically, than before the defeat at Ifni.

And meanwhile, planetary defenses were being strengthened; the armed forces better trained; administrative efficiency was having some of the water squeezed out of it — and much of the Kalganian's conquering fleet was being wallowed down through the necessity of occupying the "conquered" territory.

At the moment, Turbor was with the Third Fleet in the outer reaches of the Anacreonian sector. In line with his policy of making this a "little man's war," he was interviewing Fennel Leemor, Engineer Third Class, volunteer.

"Tell us a little about yourself, sailor," said Turbor.

"Ain't much to tell," Leemor shuffled his feet and allowed a faint, bashful smile to cover his face, as though he could see all the millions that undoubtedly could see him at the moment. I'm a Locrian. Got a job in an air-car factory; section head and good pay. I'm

married; got two kids, both girls. Say, I couldn't say hello to them, could I – in case they're listening."

"Go ahead, sailor. The video is all yours."

"Gosh, thanks." He burred, "Hello, Milla, in case you're listening, I'm fine. Is Sunni all right? And Tomma? I think of you all the time and maybe I'll be back on furlough after we get back to port. I got your food parcel but I'm sending it back. We get our regular mess, but they say the civilians are a little tight. I guess that's all."

"I'll look her up next time I'm on Locris, sailor, and make sure she's not short of food. O.K.?"

The young man smiled broadly and nodded his head. "Thank you, Mr. Turbor. I'd appreciate that."

"All right. Suppose you tell us, then– You're a volunteer, aren't you?"

"Sure am. If anyone picks a fight with me, I don't have to wait for anyone to drag me in. I joined up the day I heard about the *Hober Mallow*."

"That's a fine spirit. Have you seen much action? I notice "You're wearing two battle stars."

"*Ptah*." The sailor spat. "Those weren't battles, they were chases. The Kalganians don't fight, unless they have odds of five to one or better in their favor. Even then they just edge in and try to cut us up ship by ship. Cousin of mine was at Ifni and he was on a ship that got away, the old *Ebling Mis*. He says it was the same there. They had their Main Fleet against just a wing division of ours, and down to where we only had five ships left, they kept stalking instead of fighting. We got twice as many of their ships at *that* fight."

"Then you think we're going to win the war?"

Sure bet; now that we aren't retreating. Even if things got too bad, that's when I'd expect the Second Foundation to step in. We still got the Seldon Plan – and *they* know it, too."

Turbor's lips curled a bit. "You're counting on the Second Foundation, then?"

The answer came with honest surprise. "Well, doesn't everyone?"

Junior Officer Tippellum stepped into Turbor's room after the visicast. He shoved a cigarette at the correspondent and knocked his cap back to a perilous balance on the occiput.

"We picked up a prisoner," he said.

"Yes?"

"Little crazy fellow. Claims to be a neutral – diplomatic immunity, no less. I don't think they know what to do with him. His name's Palvro, Palver, something like that, and he says he's from Trantor. Don't know what in space he's doing in a war zone."

But Turbor had swung to a sitting position on his bunk and the nap he had been about to take was forgotten. He remembered quite well his last interview with Darell, the day after war had been declared and he was shoving off.

"Preem Palver," he said. It was a statement.

Tippellum paused and let the smoke trickle out the sides of his mouth. "Yeah," he said, "how in space did you know?"

"Never mind. Can I see him?"

"Space, I can't say. The old man has him in his own room for questioning. Everyone figures he's a spy."

"You tell the old man that I know him, if he's who he claims he is. I'll take the responsibility."

Captain Dixyl on the flagship of the Third Fleet watched unremittingly at the Grand Detector. No ship could avoid being a source of subatomic radiation – not even if it were lying an inert mass – and each focal point of such radiation was a little sparkle in the three-dimensional field.

Each one of the Foundation's ships were accounted for and no sparkle was left over, now that the little spy who claimed to be a neutral had been picked up. For a while, that outside ship had created a stir in the captain's quarters. The tactics might have needed changing on short notice. As it was–

"Are you sure you have it?" he asked.

Commander Cenn nodded. "I will take my squadron through hyperspace: radius, 10.00 parsecs; theta, 268.52 degrees; phi, 84.15 degrees. Return to origin at 1330. Total absence 11.83 hours."

"Right. Now we are going to count on pin-point return as regards both space and time. Understand?"

"Yes, captain." He looked at his wrist watch, "My ships will be ready by 0140."

"Good," said Captain Dixyl.

The Kalganian squadron was not within detector range now, but they would be soon. There was independent information to that effect. Without Cenn's squadron the Foundation forces would be badly outnumbered, but the captain was quite confident. *Quite* confident.

Preem Palver looked sadly about him. First at the tall, skinny admiral; then at the others, everyone in uniform; and now at this last one, big and stout, with his collar open and no tie – not like the rest – who said he wanted to speak to him.

Jole Turbor was saying: "I am perfectly aware, admiral, of the serious possibilities involved here, but I tell you that if I can be allowed to speak to him for a few minutes, I may be able to settle the current uncertainty."

"Is there any reason why you can't question him before me?"

Turbor pursed his lips and looked stubborn. "Admiral," he said, "while I have been attached to your ships, the Third Fleet has received an excellent press. You may station men outside the door, if you like, and you may return in five minutes. But, meanwhile, humor me a bit, and your public relations will not suffer. Do you understand me?"

He did.

Then Turbor in the isolation that followed, turned to Palver, and said, "Quickly – what is the name of the girl you abducted."

And Palver could simply stare round-eyed, and shake his head.

"No nonsense," said Turbor. "If you do not answer, you will be a spy and spies are blasted without trial in war time."

"Arcadia Darell!" gasped Palver.

"Well! All right, then. Is she safe?"

Palver nodded.

"You had better be sure of that, or it won't be well for you."

"She is in good health, perfectly safe," said Palver, palely.

The admiral returned, "Well?"

"The man, sir, is not a spy. You may believe what he tells you. I vouch for him."

"That so?" The admiral frowned. "Then he represents an agricultural co-operative on Trantor that wants to make a trade treaty with Terminus for the delivery of grains and potatoes. Well, all right, but he can't leave now."

"Why not?" asked Palver, quickly.

"Because we're in the middle of a battle. After it is over – assuming we're still alive – we'll take you to Terminus."

The Kalganian fleet that spanned through space detected the Foundation ships from an incredible distance and were themselves detected. Like little fireflies in each other's Grand Detectors, they closed in across the emptiness.

And the Foundation's admiral frowned and said, "This must be their main push. Look at the numbers." Then, "They won't stand up before us, though; not if Cenn's detachment can be counted on."

Commander Cenn had left hours before – at the first detection of the coming enemy. There was no way of altering the plan now. It worked or it didn't, but the admiral felt quite comfortable. As did the officers. As did the men.

Again watch the fireflies.

Like a deadly ballet dance, in precise formations, they sparked.

The Foundation fleet edged slowly backwards. Hours passed and the fleet veered slowly off, teasing the advancing enemy slightly off course, then more so.

In the minds of the dictators of the battle plan, there was a certain volume of space that must be occupied by the Kalganian ships. Out from that volume crept the Foundationers; into it slipped the Kalganians. Those that passed out again were attacked, suddenly and fiercely. Those that stayed within were not touched.

It all depended on the reluctance of the ships of Lord Stettin to take the initiative themselves – on their willingness to remain where none attacked.

Captain Dixyl stared frigidly at his wrist watch. It was 1310, "We've got twenty minutes," he said.

The lieutenant at his side nodded tensely, "It looks all right so far, captain. We've got more than ninety percent of them boxed. If we can keep them that way–"

"Yes! If–"

The Foundation ships were drifting forward again – very slowly. Not quick enough to urge a Kalganian retreat and just quickly enough to discourage a Kalganian advance. They preferred to wait.

And the minutes passed.

At 1325, the admiral's buzzer sounded in seventy-five ships of the Foundation's line, and they built up to a maximum acceleration towards the front-plane of the Kalganian fleet, itself three hundred strong. Kalganian shields flared into action, and the vast energy beams flicked out. Every one of the three hundred concentrated in the same direction, towards their mad attackers who bore down relentlessly, uncaringly and—

At 1330, fifty ships under Commander Cenn appeared from nowhere, in one single bound through hyperspace to a calculated spot at a calculated time – and were spaced in tearing fury at the unprepared Kalganian rear.

The trap worked perfectly.

The Kalganians still had numbers on their side, but they were in no mood to count. Their first effort was to escape and the formation once broken was only the more vulnerable, as the enemy ships bumped into one another's path.

After a while, it took on the proportions of a rat hunt.

Of three hundred Kalganian ships, the core and pride of their fleet, some sixty or less, many in a state of near-hopeless disrepair, reached Kalgan once more. The Foundation loss was eight ships out of a total of one hundred twenty-five.

Preem Palver landed on Terminus at the height of the celebration. He found the furore distracting, but before he left the planet, he had accomplished two things, and received one request.

The two things accomplished were: 1) the conclusion of an agreement whereby Palver's co-operative was to deliver twenty shiploads of certain foodstuffs per month for the next year at a war price, without, thanks to the recent battle, a corresponding war risk, and 2) the transfer to Dr. Darell of Arcadia's five short words.

For a startled moment, Darell had stared wide-eyed at him, and then he had made his request. It was to carry an answer back to Arcadia. Palver liked it; it was a simple answer and made sense. It was: "Come back now. There won't be any danger."

Lord Stettin was in raging frustration. To watch his every weapon break in his hands; to feel the firm fabric of his military might part like the rotten thread it suddenly turned out to be – would have turned phlegmaticism itself into flowing lava. And yet he was helpless, and knew it.

He hadn't really slept well in weeks. He hadn't shaved in three days. He had canceled all audiences. His admirals were left to themselves and none knew better than the Lord of Kalgan that very little time and no further defeats need elapse before he would have to contend with internal rebellion.

Lev Meirus, First Minister, was no help. He stood there, calm and indecently old, with his thin, nervous finger stroking, as always, the wrinkled line from nose to chin.

"Well," shouted Stettin at him, "contribute something. We stand here defeated, do you understand? *Defeated!* And why? I don't know why. There you have it. I don't know why. Do you know why?"

"I think so," said Meirus, calmly.

"Treason!" The word came out softly, and other words followed as softly. "You've known of treason, and you've kept quiet. You served the fool I ejected from the First

Citizenship and you think you can serve whatever foul rat replaces me. If you have acted so, I will extract your entrails for it and burn them before your living eyes."

Meirus was unmoved. "I have tried to fill you with my own doubts, not once, but many times. I have dinned it in your ears and you have preferred the advice of others because it stuffed your ego better. Matters have turned out not as I feared, but even worse. If you do not care to listen now, say so, sir, and I shall leave, and, in due course, deal with your successor, whose first act, no doubt, will be to sign a treaty of peace."

Stettin stared at him red-eyed, enormous fists slowly clenching and unclenching. "Speak, you gray slug. *Speak!*"

"I have told you often, sir, that you are not the Mule. You may control ships and guns but you cannot control the minds of your subjects. Are you aware, sir, of who it is you are fighting? You fight the Foundation, which is never defeated – the Foundation, which is protected by the Seldon Plan – the Foundation, which is destined to form a new Empire."

"There is no Plan. No longer. Munn has said so."

"Then Munn is wrong. And if he were right, what then? You and I, sir, are not the people. The men and women of Kalgan and its subject worlds believe utterly and deeply in the Seldon Plan as do all the inhabitants of this end of the Galaxy. Nearly four hundred years of history teach the fact that the Foundation cannot be beaten. Neither the kingdoms nor the warlords nor the old Galactic Empire itself could do it."

"The Mule did it."

"Exactly, and he was beyond calculation – and you are not. What is worse, the people know that you are not. So your ships go into battle fearing defeat in some unknown way. The insubstantial fabric of the Plan hangs over them so that they are cautious and look before they attack and wonder a little too much. While on the other side, that same insubstantial fabric fills the enemy with confidence, removes fear, maintains morale in the face of early defeats. Why not? The Foundation has always been defeated at first and has always won in the end.

"And your own morale, sir? You stand everywhere on enemy territory. Your own dominions have not been invaded; are still not in danger of invasion – yet you are defeated. You don't believe in the possibility, even, of victory, because you know there is none.

"Stoop, then, or you will be beaten to your knees. Stoop voluntarily, and you may save a remnant. You have depended on metal and power and they have sustained you as far as they could. You have ignored mind and morale and they have failed you. Now, take my advice. You have the Foundation man, Homir Munn. Release him. Send him back to Terminus and he will carry your peace offers."

Stettin's teeth ground behind his pale, set lips. But what choice had he?

On the first day of the new year, Homir Munn left Kalgan again. More than six months had passed since he had left Terminus and in the interim, a war had raged and faded.

He had come alone, but he left escorted. He had come a simple man of private life; he left the unappointed but nevertheless, actual, ambassador of peace.

And what had most changed was his early concern over the Second Foundation. He laughed at the thought of that: and pictured in luxuriant detail the final revelation to Dr. Darell, to that energetic, young competent, Anthon, to all of them—

He knew. He, Homir Munn, finally knew the truth.

20. "I KNOW . . . "

The last two months of the Stettinian war did not lag for Homir. In his unusual office as Mediator Extraordinary, he found himself the center of interstellar affairs, a role he could not help but find pleasing.

There were no further major battles – a few accidental skirmishes that could scarcely count – and the terms of the treaty were hammered out with little necessity for concessions on the part of the Foundation. Stettin retained his office, but scarcely anything else. His navy was dismantled; his possessions outside the home system itself made autonomous and allowed to vote for return to previous status, full independence or confederation within the Foundation, as they chose.

The war was formally ended on an asteroid in Terminus' own stellar system; site of the Foundation's oldest naval base. Lev Meirus signed for Kalgan, and Homir was an interested spectator.

Throughout all that period he did not see Dr. Darell, nor any of the others. But it scarcely mattered. His news would keep – and, as always, he smiled at the thought.

Dr. Darell returned to Terminus some weeks after VK day, and that same evening, his house served as the meeting place for the five men who, ten months earlier, had laid their first plans.

They lingered over dinner and then over wine as though hesitating to return again to the old subject.

It was Jole Turbor, who, peering steadily into the purple depths of the wineglass with one eye, muttered, rather than said, "Well, Homir, you are a man of affairs now, I see. You handled matters well."

"I?" Munn laughed loudly and joyously. For some reason, he had not stuttered in months. "I hadn't a thing to do with it. It was Arcadia. By the by, Darell, how is she? She's coming back from Trantor, I heard?"

"You heard correctly," said Darell, quietly. "Her ship should dock within the week." He looked, with veiled eyes, at the others, but there were only confused, amorphous exclamations of pleasure. Nothing else.

Turbor said, "Then it's over, really. Who would have predicted all this ten months ago. Munn's been to Kalgan and back. Arcadia's been to Kalgan and Trantor and is coming back. We've had a war and won it, by Space. They tell you that the vast sweeps of history can be predicted, but doesn't it seem conceivable that all that has just happened,

with its absolute confusion to those of us who lived through it, couldn't possibly have been predicted."

"Nonsense," said Anthon, acidly. "What makes you so triumphant, anyway? You talk as though we have really won a war, when actually we have won nothing but a petty brawl which has served only to distract our minds from the real enemy."

There was an uncomfortable silence, in which only Homir Munn's slight smile struck a discordant note.

And Anthon struck the arm of his chair with a balled and furyfilled fist, "Yes, I refer to the Second Foundation. There is no mention of it and, if I judge correctly, every effort to have no thought of it. Is it because this fallacious atmosphere of victory that palls over this world of idiots is so attractive that you feel you must participate? Turn somersaults then, handspring your way into a wall, pound one another's back and throw confetti out the window. Do whatever you please, only get it out of your system – and when you are quite done and you are yourselves again, return and let us discuss that problem which exists now precisely as it did ten months ago when you sat here with eyes cocked over your shoulders for fear of you knew not what. Do you really think that the Mind-masters of the Second Foundation are less to be feared because you have beat down a foolish wielder of spaceships."

He paused, red-faced and panting.

Munn said quietly, "Will you hear *me* speak now, Anthon? Or do you prefer to continue your role as ranting conspirator?"

"Have your say, Homir," said Darell, "but let's all of us refrain from over-picturesqueness of language. It's a very good thing in its place, but at present, it bores me."

Homir Munn leaned back in his armchair and carefully refilled his glass from the decanter at his elbow.

"I was sent to Kalgan," he said, "to find out what I could from the records contained in the Mule's Palace. I spent several months doing so. I seek no credit for that accomplishment. As I have indicated, it was Arcadia whose ingenuous intermeddling obtained the entry for me. Nevertheless, the fact remains that to my original knowledge of the Mule's life and times, which, I submit, was not small, I have added the fruits of much labor among primary evidence which has been available to no one else.

"I am, therefore, in a unique position to estimate the true danger of the Second Foundation; much more so than is our excitable friend here."

"And," grated Anthon, "what is your estimate of that danger?"

"Why, zero."

A short pause, and Elvett Semic asked with an air of surprised disbelief, "You mean zero danger?"

"Certainly. Friends, there is no Second Foundation!"

Anthon's eyelids closed slowly and he sat there, face pale and expressionless.

Munn continued, attention-centering and loving it, "And what is more, there was never one."

"On what," asked Darell, "do you base this surprising conclusion?"

"I deny," said Munn, "that it is surprising. You all know the story of the Mule's search for the Second Foundation. But what do you know of the intensity of that search – of the single-mindedness of it. He had tremendous resources at his disposal and he spared none of it. He was single-minded – and yet he failed. No Second Foundation was found."

"One could scarcely expect it to be found," pointed out Turbor, restlessly. "It had means of protecting itself against inquiring minds."

"Even when the mind that is inquiring is the Mule's mutant mentality? I think not. But come, you do not expect me to give you the gist of fifty volumes of reports in five minutes. All of it, by the terms of the peace treaty will be part of the Seldon Historical Museum eventually, and you will all be free to be as leisurely in your analysis as I have been. You will find his conclusion plainly stated, however, and that I have already expressed. There is not, and has never been, any Second Foundation."

Semic interposed, "Well, what stopped the Mule, then?"

"Great Galaxy, what do you suppose stopped him? Death did; as it will stop all of us. The greatest superstition of the age is that the Mule was somehow stopped in an all-conquering career by some mysterious entities superior even to himself. It is the result of looking at everything in wrong focus.

"Certainly no one in the Galaxy can help knowing that the Mule was a freak, physical as well as mental. He died in his thirties because his ill-adjusted body could no longer struggle its creaking machinery along. For several years before his death he was an invalid. His best health was never more than an ordinary man's feebleness. All right, then. He conquered the Galaxy and, in the ordinary course of nature, proceeded to die. It's a wonder he proceeded as long and as well as he did. Friends, it's down in the very clearest print. You have only to have patience. You have only to try to look at all facts in new focus."

Darell said, thoughtfully, "Good, let us try that Munn. It would be an interesting attempt and, if nothing else, would help oil our thoughts. These tampered men – the records of which Anthor brought to us nearly a year ago, what of them? Help us to see them in focus."

"Easily. How old a science is encephalographic analysis? Or, put it another way, how well-developed is the study of neuronc pathways."

"We are at the beginning in this respect. Granted," said Darell.

"Right. How certain can we be then as to the interpretation of what I've heard Anthor and yourself call the Tamper Plateau. You have your theories, but how certain can you be. Certain enough to consider it a firm basis for the existence of a mighty force for which all other evidence is negative? It's always easy to explain the unknown by postulating a superhuman and arbitrary will.

"It's a very human phenomenon. There have been cases all through Galactic history where isolated planetary systems have reverted to savagery, and what have we learned there? In every case, such savages attribute the to-them-incomprehensible forces

of Nature – storms, pestilences, droughts – to sentient beings more powerful and more arbitrary than men.

"It is called anthropomorphism, I believe, and in this respect, we are savages and indulge in it. Knowing little of mental science, we blame anything we don't know on supermen – those of the Second Foundation in this case, based on the hint thrown us by Seldon."

"Oh," broke in Anthon, "then you *do* remember Seldon. I thought you had forgotten. Seldon did say there was a Second Foundation. Get *that* in focus."

"And are you aware then of all Seldon's purposes. Do you know what necessities were involved in his calculations? The Second Foundation may have been a very necessary scarecrow, with a highly specific end in view. How did we defeat Kalgan, for instance? What were you saying in your last series of articles, Turbor?"

Turbor stirred his bulk. "Yes, I see what you're driving at. I was on Kalgan towards the end, Darell, and it was quite obvious that morale on the planet was incredibly bad. I looked through their news-records and – well. they expected to be beaten. Actually, they were completely unmanned by the thought that eventually the Second Foundation would take a hand, on the side of the First, naturally."

"Quite right," said Munn. "I was there all through the war. I told Stettin there was no Second Foundation and he believed me. *He* felt safe. But there was no way of making the people suddenly disbelieve what they had believed all their lives, so that the myth eventually served a very useful purpose in Seldon's cosmic chess game."

But Anthon's eyes opened, quite suddenly, and fixed themselves sardonically on Munn's countenance. "*I say you lie.*"

Homir turned pale, "I don't see that I have to accept, much less answer, an accusation of that nature."

"I say it without any intention of personal offense. You cannot help lying; you don't realize that you are. But you lie just the same."

Semic laid his withered hand on the young man's sleeve. "Take a breath, young fella."

Anthon shook him off, none too gently, and said, "I'm out of patience with all of you. I haven't seen this man more than half a dozen times in my life, yet I find the change in him unbelievable. The rest of you have known him for years, yet pass it by. It is enough to drive one mad. Do you call this man you've been listening to Homir Munn? He is not the Homir Munn I knew."

A medley of shock; above which Munn's voice cried, "You claim me to be an impostor?"

"Perhaps not in the ordinary sense," shouted Anthon above the din, "but an impostor nonetheless. Quiet, everyone! I demand to be heard."

He frowned them ferociously into obedience. "Do any of you remember Homir Munn as I do – the introverted librarian who never talked without obvious embarrassment; the man of tense and nervous voice, who stuttered out his uncertain sentences? Does *this*

man sound like him? He's fluent, he's confident, he's fun of theories, and, by Space, he doesn't stutter. *Is he the same person?*"

Even Munn looked confused, and Pelleas Anthon drove on. "Well, shall we test him?"

"How?" asked Darell.

"*You* ask how? There is the obvious way. You have his encephalographic record of ten months ago, haven't you? Run one again, and compare."

He pointed at the frowning librarian, and said violently, "I dare him to refuse to subject himself to analysis."

"I don't object," said Munn, defiantly. "I am the man I always was."

"*Can you* know?" said Anthon with contempt. "I'll go further. I trust no one here. I want everyone to undergo analysis. There has been a war. Munn has been on Kalgan; Turbor has been on board ship and all over the war areas. Darell and Semic have been absent, too – I have no idea where. Only I have remained here in seclusion and safety, and I no longer trust any of the rest of you. And to play fair, I'll submit to testing as well. Are we agreed then? Or do I leave now and go my own way?"

Turbor shrugged and said, "I have no objection."

"I have already said I don't," said Munn.

Semic moved a hand in silent assent, and Anthon waited for Darell. Finally, Darell nodded his head.

"Take me first," said Anthon.

The needles traced their delicate way across the cross-hatchings as the young neurologist sat frozen in the reclining seat, with lidded eyes brooding heavily. From the files, Darell removed the folder containing Anthon's old encephalographic record. He showed them to Anthon.

"That's your own signature, isn't it?"

"Yes, yes. It's my record. Make the comparison."

The scanner threw old and new on to the screen. All six curves in each recording were there, and in the darkness, Munn's voice sounded in harsh clarity. "Well, now, look there. There's a change."

"Those are the primary waves of the frontal lobe. It doesn't mean a thing, Homir. Those additional jags you're pointing to are just anger. It's the others that count."

He touched a control knob and the six pairs melted into one another and coincided. The deeper amplitude of primaries alone introduced doubling.

"Satisfied?" asked Anthon.

Darell nodded curtly and took the seat himself. Semic followed him and Turbor followed him. Silently the curves were collected; silently they were compared.

Munn was the last to take his seat. For a moment, he hesitated, then, with a touch of desperation in his voice, he said, "Well now, look, I'm coming in last and I'm under tension. I expect due allowance to be made for that."

"There will be," Darell assured him. "No conscious emotion of yours will affect more than the primaries and they are not important."

It might have been hours, in the utter silence that followed.

And then in the darkness of the comparison, Anthor said huskily: "Sure, sure, it's only the onset of a complex. Isn't that what he told us? No such thing as tampering; it's all a silly anthropomorphic notion – but look at it! A coincidence I suppose."

"What's the matter?" shrieked Munn.

Darell's hand was tight on the librarian's shoulder. "Quiet, Munn – you've been handled; you've been adjusted by *them*."

Then the light went on, and Munn was looking about him with broken eyes, making a horrible attempt to smile.

"You can't be serious, surely. There is a purpose to this. You're testing me."

But Darell only shook his head. "No, no, Homir. It's true."

The librarian's eyes were filled with tears, suddenly. "I don't feel any different. I can't believe it." With sudden conviction: "You are all in this. It's a conspiracy."

Darell attempted a soothing gesture, and his hand was struck aside. Munn snarled, "You're planning to kill me. By Space, you're planning to kill me."

With a lunge, Anthor was upon him. There was the sharp crack of bone against bone, and Homir was limp and flaccid with that look of fear frozen on his face.

Anthor rose shakily, and said, "We'd better tie and gag him. Later, we can decide what to do." He brushed his long hair back.

Turbor said, "How did you guess there was something wrong with him?"

Anthor turned sardonically upon him. "It wasn't difficult. You see, *I happen to know where the Second Foundation really is.*"

Successive shocks have a decreasing effect–

It was with actual mildness that Semic asked, "Are you sure? I mean we've just gone through this sort of business with Munn–"

This isn't quite the same," returned Anthor. "Darell, the day the war started, I spoke to you most seriously. I tried to have you leave Terminus. I would have told you then what I will tell you now, if I had been able to trust you."

"You mean you have known the answer for half a year?" smiled Darell.

"I have known it from the time I learned that Arcadia had left for Trantor."

And Darell started to his feet in sudden consternation. "What had Arcadia to do with it? What are you implying?"

"Absolutely nothing that is not plain on the face of all the events we know so well. Arcadia goes to Kalgan and flees in terror to the very center of the Galaxy, rather than return home. Lieutenant Dirige, our best agent on Kalgan is tampered with. Homir Munn goes to Kalgan and *he* is tampered with. The Mule conquered the Galaxy, but, queerly enough, he made Kalgan his headquarters, and it occurs to me to wonder if he was conqueror or, perhaps, tool. At every turn, we meet with Kalgan, Kalgan – nothing but Kalgan, the world that somehow survived untouched all the struggles of the warlords for over a century."

"Your conclusion, then."

"Is obvious," Anthor's eyes were intense. "The Second Foundation is on Kalgan."

Turbor interrupted. "I was on Kalgan, Anthon. I was there last week. If there was any Second Foundation on it, I'm mad. Personally, I think you're mad."

The young man whirled on him savagely. "Then you're a fat fool. What do you expect the Second Foundation to be? A grammar school? Do you think that Radiant Fields in tight beams spell out 'Second Foundation' in green and purple along the incoming spaceship routes? Listen to me, Turbor. Wherever they are, they form a tight oligarchy. They must be as well hidden on the world on which they exist, as the world itself is in the Galaxy as a whole."

Turbor's jaw muscles writhed. "I don't like your attitude, Anthon."

"That certainly disturbs me," was the sarcastic response. "Take a look about you here on Terminus. We're at the center – the core – the origin of the First Foundation with all its knowledge of physical science. Well, how many of the population are physical scientists? Can you operate an Energy Transmitting Station? What do you know of the operation of a hyperatomic motor? Eh? The number of real scientists on Terminus – even on Terminus – can be numbered at less than one percent of the population.

"And what then of the Second Foundation where secrecy must be preserved. There will still be less of the cognoscenti, and these will be hidden even from their own world."

"Say," said Semic, carefully. "We just licked Kalgan—"

"So we did. So we did," said Anthon, sardonically. "Oh, we celebrate that victory. The cities are still illuminated; they are still shooting off fireworks; they are still shouting over the televisions. But now, now, when the search is on once more for the Second Foundation, where is the last place we'll look; where is the last place anyone will look? Right!" Kalgan!

"We haven't hurt them, you know; not really. We've destroyed some ships, killed a few thousands, torn away their Empire, taken over some of their commercial and economic power – but that all means nothing. I'll wager that not one member of the real ruling class of Kalgan is in the least discomfited. On the contrary, they are now safe from curiosity. But not from my curiosity. What do you say, Darell?"

Darell shrugged his shoulders. "Interesting. I'm trying to fit it in with a message I received from Arcadia a few months since."

"Oh, a message?" asked Anthon. "And what was it?"

"Well, I'm not certain. Five short words. But it's interesting."

"Look," broke in Semic, with a worried interest, "there's something I don't understand."

"What's that?"

Semic chose his words carefully, his old upper lip lifting with each word as if to let them out singly and reluctantly. "Well, now, Homir Munn was saying just a while ago that Hari Seldon was faking when he said that he had established a Second Foundation. Now you're saying that it's not so; that Seldon wasn't faking, eh?"

"Right, he wasn't faking. Seldon said he had established a Second Foundation and so he had."

"All right, then, but he said something else, too. He said he established the two Foundations at opposite ends of the Galaxy. Now, young man, was *that* a fake – because Kalgan isn't at the opposite end of the Galaxy."

Author seemed annoyed, "That's a minor point. That part may well have been a cover up to protect them. But after all, think– What real use would it serve to have the Mind-masters at the opposite end of the Galaxy? What is their function? To help preserve the Plan. Who are the main card players of the Plan? We, the First Foundation. Where can they best observe us, then, and serve their own ends? At the opposite end of the Galaxy? Ridiculous! They're within fifty parsecs, actually, which is much more sensible."

"I like that argument," said Darell. "It makes sense. Look here, Munn's been conscious for some time and I propose we loose him. He can't do any harm, really."

Author looked rebellious, but Homir was nodding vigorously. Five seconds later he was rubbing his wrists just as vigorously.

"How do you feel?" asked Darell.

"Rotten," said Munn, sulkily, "but never mind. There's something I want to ask this bright young thing here. I've heard what he's had to say, and I'd just like permission to wonder what we do next."

There was a queer and incongruous silence.

Munn smiled bitterly. "Well, suppose Kalgan *is* the Second Foundation. *Who* on Kalgan are they? How are you going to find them? How are you going to tackle them *if* you find them, eh?"

"Ah," said Darell, "I can answer that, strangely enough. Shall I tell you what Semic and I have been doing this past half-year? It may give you another reason, Author, why I was anxious to remain on Terminus all this time."

"In the first place," he went on, "I've been working on encephalographic analysis with more purpose than any of you may suspect. Detecting Second Foundation minds is a little more subtle than simply finding a Tamper Plateau – and I did not actually succeed. But I came close enough.

"Do you know, any of you, how emotional control works? It's been a popular subject with fiction writers since the time of the Mule and much nonsense has been written, spoken, and recorded about it. For the most part, it has been treated as something mysterious and occult. Of course, it isn't. That the brain is the source of a myriad, tiny electromagnetic fields, everyone knows. Every fleeting emotion varies those fields in more or less intricate fashion, and everyone should know that, too.

"Now it is possible to conceive a mind which can sense these changing fields and even resonate with them. That is, a special organ of the cerebrum can exist which can take on whatever field-pattern it may detect. Exactly how it would do this, I have no idea, but that doesn't matter. if I were blind, for instance, I could still learn the significance of photons and energy quanta and it could be reasonable to me that the absorption of a photon of such energy could create chemical changes in some organ of the body such that its presence would be detectable. But, of course, I would not be able, thereby, to understand color.

"Do all of you follow?"

There was a firm nod from Anthor; a doubtful nod from the others.

"Such a hypothetical Mind Resonating Organ, by adjusting itself to the Fields emitted by other minds could perform what is popularly known as 'reading emotion' or even 'reading minds,' which is actually something even more subtle. It is but an easy step from that to imagining a similar organ which could actually force an adjustment on another mind. It could orient with its stronger Field the weaker one of another mind – much as a strong magnet will orient the atomic dipoles in a bar of steel and leave it magnetized thereafter.

"I solved the mathematics of Second Foundationism in the sense that I evolved a function that would predict the necessary combination of neuron paths that would allow for the formation of an organ such as I have just described – but, unfortunately, the function is too complicated to solve by any of the mathematical tools at present known. That is too bad, because it means that I can never detect a Mind-worker by his encephalographic pattern alone.

"But I could do something else. I could, with Semic's help, construct what I shall describe as a Mental Static device. It is not beyond the ability of modern science to create an energy source that will duplicate an encephalograph-type pattern of electromagnetic field. Moreover, it can be made to shift at complete random, creating, as far as this particular mind-sense is concerned, a sort of 'noise' or 'static' which masks other minds with which it may be in contact.

"Do you still follow?"

Semic chuckled. He had helped create blindly, but he had guessed, and guessed correctly. The old man had a trick or two left–

Anthor said, "I think I do."

"The device," continued Darell, "is a fairly easy one to produce, and I had all the resources of the Foundation under my control as it came under the heading of war research. And now the mayor's offices and the Legislative assemblies are surrounded with Mental Static. So are most of our key factories. So is this building. Eventually, any place we wish can be made absolutely safe from the Second Foundation or from any future Mule. And that's it."

He ended quite simply with a flat-palmed gesture of the hand.

Turbor seemed stunned. "Then it's all over. Great Seldon, it's all over."

"Well," said Darell, "not exactly."

"How, not exactly? Is there something more?"

"Yes, we haven't located the Second Foundation yet!"

"What," roared Anthor, "are you trying to say–"

"Yes, I am. Kalgan is not the Second Foundation."

"How do you know?"

"It's easy," grunted Darell. "You see *I happen to know where the Second Foundation really is.*"

21. THE ANSWER THAT SATISFIED

Turbor laughed suddenly – laughed in huge, windy gusts that bounced ringingly off the walls and died in gasps. He shook his head, weakly, and said, "Great Galaxy, this goes on all night. One after another, we put up our straw men to be knocked down. We have fun, but we don't get anywhere. Space! Maybe all planets are the Second Foundation. Maybe they have no planet, just key men spread on all the planets. And what does it matter, since Darell says we have the perfect defense?"

Darell smiled without humor. "The perfect defense is not enough, Turbor. Even my Mental Static device is only something that keeps us in the same place. We cannot remain forever with our fists doubled, frantically staring in all directions for the unknown enemy. We must know not only *how* to win, but whom to defeat. And there *is* a specific world on which the enemy exists."

"Get to the point," said Anthon, wearily. "What's your information?"

"Arcadia," said Darell, "sent me a message, and until I got it, I never saw the obvious. I probably would never have seen the obvious. Yet it was a simple message that went: 'A circle has no end.' Do you see?"

"No," said Anthon, stubbornly, and he spoke, quite obviously, for the others.

"A circle has no end," repeated Munn, thoughtfully, and his forehead furrowed.

"Well," said Darell, impatiently, "it was clear to me— What is the one absolute fact we know about the Second Foundation, eh? I'll tell you! We know that Hari Seldon located it at the opposite end of the Galaxy. Homir Munn theorized that Seldon lied about the existence of the Foundation. Pelleas Anthon theorized that Seldon had told the truth that far, but lied about the location of the Foundation. But I tell you that Hari Seldon lied in no particular; that he told the absolute truth.

"*But*, what is the other end? The Galaxy is a flat, lens-shaped object. A cross section along the flatness of it is a circle, and a circle had no end – as Arcadia realized. We – we, the First Foundation – are located on Terminus at the rim of that circle. We are at an end of the Galaxy, by definition. Now follow the rim of that circle and find the other end. Follow it, follow it, follow it, and you will find no other end. You will merely come back to your starting point—

"And *there* you will find the Second Foundation."

"There?" repeated Anthon. "Do you mean *here*?"

"Yes, I mean here!" cried Darell, energetically. "Why, where else could it possibly be? You said yourself that if the Second Foundationers were the guardians of the Seldon Plan, it was unlikely that they could be located at the so-called other end of the Galaxy, where they would be as isolated as they could conceivably be. You thought that fifty parsecs distance was more sensible. I tell you that that is also too far. That no distance at all is more sensible. And where would they be safest? Who would look for them here? Oh, it's the old principle of the most obvious place being the least suspicious.

"Why was poor Ebling Mis so surprised and unmanned by his discovery of the location of the Second Foundation? There he was, looking for it desperately in order to

warn it of the coming of the Mule, only to find that the Mule had already captured both Foundations at a stroke. And why did the Mule himself fail. in his search? Why not? If one is searching for an unconquerable menace, one would scarcely look among the enemies already conquered. So the Mind-masters, in their own leisurely time, could lay their plans to stop the Mule, and succeeded in stopping him.

"Oh, it is maddeningly simple. For here we are with our plots and our schemes, thinking that we are keeping our secrecy – when all the time we are in the very heart and core of our enemy's stronghold. It's humorous."

Anthor did not remove the skepticism from his face, "You honestly believe this theory, Dr. Darell?"

"I honestly believe it."

"Then any of our neighbors, any man we pass in the street might be a Second Foundation superman, with his mind watching yours and feeling the pulse of its thoughts."

"Exactly."

"And we have been permitted to proceed all this time, without molestation?"

"Without molestation? Who told you we were not molested? You, yourself, showed that Munn has been tampered with. What makes you think that we sent him to Kalgan in the first place entirely of our own volition – or that Arcadia overheard us and followed him on her own volition? Hah! We have been molested without pause, probably. And after all, why should they do more than they have? It is far more to their benefit to mislead us, than merely to stop us."

Anthor buried himself in meditation and emerged therefrom with a dissatisfied expression. "Well, then, I don't like it. Your Mental Static isn't worth a thought. We can't stay in the house forever and as soon as we leave, we're lost, with what we now think we know. Unless you can build a little machine for every inhabitant in the Galaxy."

"Yes, but we're not quite helpless, Anthor. These men of the Second Foundation have a special sense which we lack. It is their strength and also their weakness. For instance, is there any weapon of attack that will be effective against a normal, sighted man which is useless against a blind man?"

"Sure," said Munn, promptly. "A light in the eyes."

"Exactly," said Darell. "A good, strong blinding light."

"Well, what of it?" asked Turbor.

"But the analogy is clear. I have a Mind Static device. It sets up an artificial electromagnetic pattern, which to the mind of a man of the Second Foundation would be like a beam of light to us. But the Mind Static device is kaleidoscopic. It shifts quickly and continuously, faster than the receiving mind can follow. All right then, consider it a flickering light; the kind that would give you a headache, if continued long enough. Now intensify that light or that electromagnetic field until it is blinding – and it will become a pain, an unendurable pain. But only to those with the proper sense; *not* to the unsensed."

"Really?" said Anthor, with the beginnings of enthusiasm. "Have you tried this?"

"On whom? Of course, I haven't tried it. But it will work."

"Well, where do you have the controls for the Field that surrounds the house? I'd like to see this thing."

"Here." Darell reached into his jacket pocket. It was a small thing, scarcely bulging his pocket. He tossed the black, knob-studded cylinder to the other.

Anthor inspected it carefully and shrugged his shoulders. "It doesn't make me any smarter to look at it. Look Darell, what mustn't I touch? I don't want to turn off the house defense by accident, you know."

"You won't," said Darell, indifferently. "That control is locked in place." He flicked at a toggle switch that didn't move.

"And what's this knob?"

"That one varies rate of shift of pattern. Here – this one varies the intensity. It's that which I've been referring to."

"May I—" asked Anthor, with his finger on the intensity knob. The others were crowding close.

"Why not?" shrugged Darell. "It won't affect us."

Slowly, almost wincingly, Anthor turned the knob, first in one direction, then in another. Turbor was gritting his teeth, while Munn blinked his eyes rapidly. It was as though they were keening their inadequate sensory equipment to locate this impulse which could not affect them.

Finally, Anthor shrugged and tossed the control box back into Darell's lap. "Well, I suppose we can take your word for it. But it's certainly hard to imagine that anything was happening when I turned the knob."

"But naturally, Pelleas Anthor," said Darell, with a tight smile. "The one I gave you was a dummy. You see I have another." He tossed his jacket aside and seized a duplicate of the control box that Anthor had been investigating, which swung from his belt.

"You see," said Darell, and in one gesture turned the intensity knob to maximum.

And with an unearthly shriek, Pelleas Anthor sank to the floor. He rolled in his agony; whitened, gripping fingers clutching and tearing futilely at his hair.

Munn lifted his feet hastily to prevent contact with the squirming body, and his eyes were twin depths of horror. Semic and Turbor were a pair of plaster casts; stiff and white.

Darell, somber, turned the knob back once more. And Anthor twitched feebly once or twice and lay still. He was alive, his breath racking his body.

"Lift him on to the couch," said Darell, grasping the young man's head. "Help me here."

Turbor reached for the feet. They might have been lifting a sack of flour. Then, after long minutes, the breathing grew quieter, and Anthor's eyelids fluttered and lifted. His face was a horrid yellow; his hair and body was soaked in perspiration, and his voice, when he spoke, was cracked and unrecognizable.

"Don't," he muttered, "don't! Don't do that again! You don't know— You don't know— Oh-h-h." It was a long, trembling moan.

"We won't do it again," said Darell, "if you will tell us the truth. You are a member of the Second Foundation?"

"Let me have some water," pleaded Anthor.

"Get some, Turbor," said Darell, "and bring the whiskey bottle."

He repeated the question after pouring a jigger of whiskey and two glasses of water into Anthor. Something seemed to relax in the young man—

"Yes," he said, wearily. "I am a member of the Second Foundation."

"Which," continued Darell, "is located on Terminus – here?"

"Yes, yes. You are right in every particular, Dr. Darell."

"Good! Now explain what's been happening this past half year. Tell us!"

"I would like to sleep," whispered Anthor.

"Later! Speak now!"

A tremulous sigh. Then words, low and hurried. The others bent over him to catch the sound, "The situation was growing dangerous. We knew that Terminus and its physical scientists were becoming interested in brain-wave patterns and that the times were ripe for the development of something like the Mind Static device. And there was growing enmity toward the Second Foundation. We had to stop it without ruining Seldon's Plan.

"We . . . we tried to control the movement. We tried to join it. It would turn suspicion and efforts away from us. We saw to it that Kalgan declared war as a further distraction. That's why I sent Munn to Kalgan. Stettin's supposed mistress was one of us. She saw to it that Munn made the proper moves—"

"Callia is—" cried Munn, but Darell waved him silent.

Anthor continued, unaware of any interruption, "Arcadia followed. We hadn't counted on that – can't foresee everything – so Callia maneuvered her to Trantor to prevent interference. That's all. Except that we lost."

"You tried to get me to go to Trantor, didn't you?" asked Darell.

Anthor nodded, "Had to get you out of the way. The growing triumph in your mind was clear enough. You were solving the problems of the Mind Static device."

"Why didn't you put me under control?"

"Couldn't . . . couldn't. Had my orders. We were working according to a Plan. If I improvised, I would have thrown everything off. Plan only predicts probabilities . . . you know that . . . like Seldon's Plan." He was talking in anguished pants, and almost incoherently. His head twisted from side to side in a restless fever. "We worked with individuals . . . not groups . . . very low probabilities involved . . . lost out. Besides . . . if control you . . . someone else invent device . . . no use . . . had to control *times* . . . more subtle . . . First Speaker's own plan . . . don't know all angles . . . except . . . didn't work a-a-a—" He ran down.

Darell shook him roughly, "You can't sleep yet. How many of you are there?"

"Huh? Whatjasay . . . oh . . . not many . . . be surprised fifty . . . don't need more."

"All here on Terminus?"

"Five . . . six out in Space . . . like Callia . . . got to sleep."

He stirred himself suddenly as though to one giant effort, and his expressions gained in clarity. It was a last attempt at self-justification, at moderating his defeat.

"Almost got you at the end. Would have turned off defenses and seized you. Would have seen who was master. But you gave me dummy controls . . . suspected me all along—"

And finally he was asleep.

Turbor said, in awed tones, "How long did you suspect him, Darell?"

"Ever since he first came here," was the quiet response. "He came from Kleise, he said. But I knew Kleise; and I knew on what terms we parted. He was a fanatic on the subject of the Second Foundation and I had deserted him. My own purposes were reasonable, since I thought it best and safest to pursue my own notions by myself. But I couldn't tell Kleise that; and he wouldn't have listened if I had. To him, I was a coward and a traitor, perhaps even an agent of the Second Foundation. He was an unforgiving man and from that time almost to the day of his death he had no dealings with me. Then, suddenly, in his last few weeks of life, he writes me – as an old friend – to greet his best and most promising pupil as a co-worker and begin again the old investigation.

"It was out of character. How could he possibly do such a thing without being under outside influence, and I began to wonder if the only purpose might not be to introduce into my confidence a real agent of the Second Foundation. Well, it was so—"

He sighed and closed his own eyes for a moment.

Semic put in hesitantly, "What will we do with all of them . . . these Second Foundation fellas?"

"I don't know," said Darell, sadly. "We could exile them, I suppose. There's Zoranel, for instance. They can be placed there and the planet saturated with Mind Static. The sexes can be separated, or, better still, they can be sterilized – and in fifty years, the Second Foundation will be a thing of the past. Or perhaps a quiet death for all of them would be kinder."

"Do you suppose," said Turbor, "we could learn the use of this sense of theirs. Or are they born with it, like the Mule."

"I don't know. I think it is developed through long training, since there are indications from encephalography that the potentialities of it are latent in the human mind. But what do you want that sense for? It hasn't helped *them*."

He frowned.

Though he said nothing, his thoughts were shouting.

It had been too easy – too easy. They had fallen, these invincibles, fallen like book-villains, and he didn't like it.

Galaxy! When can a man know he is not a puppet? How can a man know he is not a puppet?

Arcadia was coming home, and his thoughts shuddered away from that which he must face in the end.

She was home for a week, then two, and he could not loose the tight check upon those thoughts. How could he? She had changed from child to young woman in her absence, by some strange alchemy. She was his link to life; his fink to a bittersweet marriage that scarcely outlasted his honeymoon.

And then, late one evening, he said as casually as he could, "Arcadia, what made you decide that Terminus contained both Foundations?"

They had been to the theater; in the best seats with private trimensional viewers for each; her dress was new for the occasion, and she was happy.

She stared at him for a moment, then tossed it off. "Oh, I Don't know, Father. It just came to me."

A layer of ice thickened about Dr. Darell's heart.

"Think," he said, intensely. "This is important. What made you decide both Foundations were on Terminus."

She frowned slightly. "Well, there was Lady Callia. I knew *she* was a Second Foundationer. Anthon said so, too."

"But she was on Kalgan," insisted Darell. "*What made you decide on Terminus?*"

And now Arcadia waited for several minutes before she answered. What *had* made her decide? What had made her decide?

She had the horrible sensation of something slipping just beyond her grasp.

She said, "She knew about things – Lady Callia did – and must have had her information from Terminus. Doesn't that sound right, Father?"

But he just shook his head at her.

"Father," she cried, "I *knew*. The more I thought, the surer I was. It just made sense."

There was that lost look in her father's eyes, "It's no good, Arcadia. Its no good. Intuition is suspicious when concerned with the Second Foundation. You see that, don't you? It *might* have been intuition – and it might have been control!"

"Control! You mean they changed me? Oh, no. No, they couldn't." She was backing away from him. "But didn't Anthon say I was right? He admitted it. He admitted everything. And you've found the whole bunch right here on Trantor. Didn't you? Didn't you?" She was breathing quickly.

"I know, but– Arcadia, will you let me make an encephalographic analysis of your brain?"

She shook her head violently, "No, no! I'm too scared."

"Of me, Arcadia? There's nothing to be afraid of. But we must know. You see that, don't you?"

She interrupted him only once, after that. She clutched at his arm just before the last switch was thrown. "What if I *am* different, Father? What will you have to do?"

"I won't have to do anything, Arcadia. If you're different, well leave. Well go back to Trantor, you and I, and . . . and we won't care about anything else in the Galaxy."

Never in Darell's life had an analysis proceeded so slowly, cost him so much, and when it was over, Arcadia huddled down and dared not look. Then she heard him laugh and that was information enough. She jumped up and threw herself into his opened arms.

He was babbling wildly as they squeezed one another, "The house is under maximum Mind Static and your brain-waves are normal. We really have trapped them, Arcadia, and we can go back to living."

"Father," she gasped, "can we let them give us medals now?"

"How did you know I'd asked to be left out of it?" He held her at arm's mind; you know everything. All right, you can have your medal on a platform, with speeches."

"And Father?"

"Yes?"

"Can you call me Arkady from now on."

"But— Very well, Arkady."

Slowly the magnitude of the victory was soaking into him and saturating him. The Foundation – the First Foundation – now the only Foundation – was absolute master of the Galaxy. No further barrier stood between themselves and the Second Empire – the final fulfillment of Seldon's Plan.

They had only to reach for it—

Thanks to—

22. THE ANSWER THAT WAS TRUE

An unlocated room on an unlocated world!

And a man whose plan had worked.

The First Speaker looked up at the Student, "Fifty men and women," he said. "Fifty martyrs! They knew it meant death or permanent imprisonment and they could not even be oriented to prevent weakening – since orientation might have been detected. Yet they did not weaken. They brought the plan through, because they loved the greater Plan."

"Might they have been fewer?" asked the Student, doubtfully.

The First Speaker slowly shook his head, "It was the lower limit. Less could not possibly have carried conviction. In fact, pure objectivism would have demanded seventy-five to leave margin for error. Never mind. Have you studied the course of action as worked out by the Speakers' Council fifteen years ago?"

"Yes, Speaker."

"And compared it with actual developments?"

"Yes, Speaker." Then, after a pause—

"I was quite amazed, Speaker."

"I know. There is always amazement. If you knew how many men labored for how many months – years, in fact – to bring about the polish of perfection, you would be less amazed. Now tell me what happened – in words. I want your translation of the mathematics."

"Yes, Speaker." The young man marshaled his thoughts. "Essentially, it was necessary for the men of the First Foundation to be thoroughly convinced that they had located *and destroyed* the Second Foundation. In that way, there would be reversion to the intended original. To all intents, Terminus would once again know nothing about us; include us in none of their calculations. We are hidden once more, and safe – at the cost of fifty men."

"And the purpose of the Kalganian war?"

"To show the Foundation that they could beat a physical enemy – to wipe out the damage done to their self-esteem and self-assuredness by the Mule."

"There you are insufficient in your analysis. Remember, the population of Terminus regarded us with distinct ambivalence. They hated and envied our supposed superiority; yet they relied on us implicitly for protection. If we had been 'destroyed' before the Kalganian war, it would have meant panic throughout the Foundation. They would then never have had the courage to stand up against Stettin, when he *then* attacked; and he would have. Only in the full flush of victory could the 'destruction' have taken place with minimum ill-effects. Even waiting a year, thereafter, might have meant a too-great cooling off spirit for success."

The Student nodded. "I see. Then the course of history will proceed without deviation in the direction indicated by the Plan."

"Unless," pointed out the First Speaker, "further accidents, unforeseen and individual, occur."

"And for that," said the Student, "we still exist. Except– Except– One facet of the present state of affairs worries me, Speaker. The First Foundation is left with the Mind Static device – a powerful weapon against us. That, at least, is not as it was before."

"A good point. But they have no one to use it against. It has become a sterile device; just as without the spur of our own menace against them, encephalographic analysis will become a sterile science. Other varieties of knowledge will once again bring more important and immediate returns. So this first generation of mental scientists among the First Foundation will also be the last – and, in a century, Mind Static will be a nearly forgotten item of the past."

"Well–" The Student was calculating mentally. "I suppose you're right."

But what I want you most to realize, young man, for the sake of your future in the Council is the consideration given to the tiny intermeshings that were forced into our plan of the last decade and a half simply because we dealt with individuals. There was the manner in which Anthor had to create suspicion against himself in such a way that it would mature at the right time, but that was relatively simple.

"There was the manner in which the atmosphere was so manipulated that to no one on Terminus would it occur, prematurely, that Terminus itself might be the center they were seeking. That knowledge had to be supplied to the young girl, Arcadia, who would be heeded by no one but her own father. She had to be sent to Trantor, thereafter, to make certain that there would be no premature contact with her father. Those two were the two poles of a hyperatomic motor; each being inactive without the other. And

the switch had to be thrown – contact had to be made – at just the right moment. I saw to that!

"And the final battle had to be handled properly. The Foundation's fleet had to be soaked in self-confidence, while the fleet of Kalgan made ready to run. I saw to that, also!"

Said the Student, "It seems to me, Speaker, that you . . . I mean, all of us . . . were counting on Dr. Darell not suspecting that Arcadia was our tool. According to *my* check on the calculations, there was something like a thirty percent probability that he *would* so suspect. What would have happened then?"

"We had taken care of that. What have you been taught about Tamper Plateaus? What are they? Certainly not evidence of the introduction of an emotional bias. That can be done without any chance of possible detection by the most refined conceivable encephalographic analysis. A consequence of Leffert's Theorem, you know. It is the removal, the cutting-out, of previous emotional bias, that shows. It *must* show.

"And, of course, Anthor made certain that Darell knew all about Tamper Plateaus.

"However– When can an individual be placed under Control without showing it? Where there is no previous emotional bias to remove. In other words, when the individual is a new-born infant with a blank slate of a mind. Arcadia Darell was such an infant here on Trantor fifteen years ago, when the first line was drawn into the structure of the plan. She will never know that she has been Controlled, and will be all the better for it, since her Control involved the development of a precocious and intelligent personality."

The First Speaker laughed shortly, "In a sense, it is the irony of it all that is most amazing. For four hundred years, so many men have been blinded by Seldon's words 'the other end of the Galaxy.' They have brought their own peculiar, physical-science thought to the problem, measuring off the other end with protractors and rulers, ending up eventually either at a point in the periphery one hundred eighty degrees around the rim of the Galaxy, or back at the original point.

"Yet our very greatest danger lay in the fact that there was a possible solution based on physical modes of thought. The Galaxy, you know, is not simply a flat ovoid of any sort; nor is the periphery a closed curve. Actually, it is a double spiral, with at least eighty percent of the inhabited planets on the Main Arm. Terminus is the extreme outer end of the spiral arm, and we are at the other – since, what is the opposite end of a spiral? Why, the center.

"But that is trifling. It is an accidental and irrelevant solution. The solution could have been reached immediately, if the questioners had but remembered that Hari Seldon was a social scientist not a physical scientist and adjusted their thought processes accordingly. What *could* 'opposite ends' mean to a social scientist? Opposite ends on the map? Of course not. That's the mechanical interpretation only.

"The First Foundation was at the periphery, where the original Empire was weakest, where its civilizing influence was least, where its wealth and culture were most nearly absent. And where is the *social opposite end of the Galaxy*? Why, at the place

where the original Empire was strongest, where its civilizing influence was most, where its wealth and culture were most strongly present.

"Here! At the center! At Trantor, capital of the Empire of Seldon's time.

"And it is so inevitable. Hari Seldon left the Second Foundation behind him to maintain, improve, and extend his work That has been known, or guessed at, for fifty years. But where could that best be done? At Trantor, where Seldon's group had worked, and where the data of decades had been accumulated. And it was the purpose of the Second Foundation to protect the Plan against enemies. That, too, was known! And where was the source of greatest danger to Terminus and the Plan?

"Here! Here at Trantor, where the Empire dying though it was, could, for three centuries, still destroy the Foundation, if it could only have decided to do so.

"Then when Trantor fell and was sacked and utterly destroyed, a short century ago, we were naturally able to protect our headquarters, and, on all the planet, the Imperial Library and the grounds about it remained untouched. This was well-known to the Galaxy, but even that apparently overwhelming hint passed them by.

"It was here at Trantor that Ebling Mis discovered us; and here that we saw to it that he did not survive the discovery. To do so, it was necessary to arrange to have a normal Foundation girl defeat the tremendous mutant powers of the Mule. Surely, such a phenomenon might have attracted suspicion to the planet on which it happened— It was here that we first studied the Mule and planned his ultimate defeat. It was here that Arcadia was born and the train of events begun that led to the great return to the Seldon Plan.

"And all those flaws in our secrecy; those gaping holes; remained unnoticed because Seldon had spoken of 'the other end' in his way, and they had interpreted it in their way."

The First Speaker had long since stopped speaking to the Student. It was an exposition to himself, really, as he stood before the window, looking up at the incredible blaze of the firmament, at the huge Galaxy that was now safe forever.

"Hari Seldon called Trantor, 'Star's End,'" he whispered, "and why not that bit of poetic imagery. All the universe was once guided from this rock; all the apron strings of the stars led here. 'All roads lead to Trantor,' says the old proverb, 'and that is where all stars end.'"

Ten months earlier, the First Speaker had viewed those same crowding stars – nowhere as crowded as at the center of that huge cluster of matter Man calls the Galaxy – with misgivings; but now there was a somber satisfaction on the round and ruddy face of Preem Palver – First Speaker.

FOUNDATION'S EDGE

1982

It is 498 years since the establishment of the First Foundation. The threat of the Mule has been rebuffed; on Trantor it is a period of calm and prosperity. But an unexpected appearance by psychohistorian Hari Seldon raises some interesting questions and the young Councilman who asks them finds himself exiled into space in search of answers: Does the Second Foundation still exist? And does it continue to control human history from a secret Galactic refuge? At issue-the destiny of humankind.

FOUNDATION'S EDGE is the most eagerly anticipated science fiction novel of our time. It is the first science fiction novel from the Master in a decade-a stirring blend of actions and ideas with future technology and hyperspace travel. The sequel to The Foundation Trilogy has all the wisdom, humor, and intrigue that have made its predecessors the most widely read science fiction series of all time. Asimov has done his classic threesome one better.

PROLOGUE

THE FIRST GALACTIC EMPIRE WAS FALLING. IT HAD BEEN DECAYING and breaking down for centuries and only one man fully realized that fact.

He was Hari Seldon the last great scientist of the First Empire, and it was he who perfected psychohistory-the science of human behavior reduced to mathematical equations.

The individual human being is unpredictable, but the reactions of human mobs, Seldon found, could be treated statistically. The larger the mob, the greater the accuracy that could be achieved. And the size of the human masses that Seldon worked with was no less than the population of all the inhabited millions of worlds of the Galaxy.

Seldon's equations told him that, left to itself, the Empire would fall and that thirty thousand years of human misery and agony would elapse before a Second Empire would arise from the ruins. And yet, if one could adjust some of the conditions that existed, that Interregnum could be decreased to a single millennium-just one thousand years.

It was to insure this that Seldon set up two colonies of scientists that he called "Foundations." With deliberate intention, he set them up "at opposite ends of the Galaxy." The First Foundation, which centered on physical science, was set up in the full daylight of publicity. The existence of the other, the Second Foundation, a world of psychohistorical and "mentalic" scientists, was drowned in silence.

In The Foundation Trilogy, the story of the first four centuries of the Interregnum is told. The First Foundation (commonly known as simply "The Foundation," since the existence of another was unknown to almost all) began as a small community lost in the emptiness of the Outer Periphery of the Galaxy. Periodically it faced a crisis in which the variables of human intercourse -and of the social and economic currents of the time- constricted about it. Its freedom to move lay along only one certain line and when it moved in that direction a new horizon of development opened before it. All had been planned by Hari Seldon, long dead now.

The First Foundation with its superior science, took over the barbarized planets that surrounded it. It faced the anarchic warlords who broke away from a dying, empire and beat them. It faced the remnant of the Empire itself under its last strong Emperor and its last strong general-and beat it.

It seemed as though the "Seldon Plan" was going through smoothly and that nothing would prevent the Second Empire from being established or, time-and with a minimum of intermediate devastation.

But psychohistory is a statistical science. Always there is a small chance that something will go wrong, and something did-something which Hari Seldon could not have foreseen. One man, called the Mule, appeared atom nowhere He had mental powers in a Galaxy that lacked them. He could mold men's emotions and shape their minds so that his bitterest opponents were made into his devoted servants. Aries could

not, would not, fight him. The First Foundation fell and Seldon's Plan seemed to lie in ruins.

There was left the mysterious Second Foundation, which had been caught unprepared by the sudden appearance of the Mule, but which was now slowly working out a counterattack. Its great defense was the fact of its unknown location. The Mule sought it in order to make his conquest of the Galaxy complete. The faithful of what was left of the First Foundation sought it to obtain help.

Neither found it. The Mule was stopped first by the action of a woman, Bayta Darell and that bought enough time for the Second Foundation to organize the proper action and, with that, to stop the Mule permanently. Slowly they prepared to reinstate the Seldon Plan.

But, in a way, the cover of the Second Foundation was gone. The First Foundation knew of the second's existence, and the First did not want a future in which they, were overseen by the mentalists. The First Foundation was the superior in physical force, while the Second Foundation was hampered not only by that fact, but by being faced by a double task: it had not only to stop the First Foundation but had also to regain its anonymity.

This the Second Foundation, under its greatest "First Speaker," Preem salver, manages to do. The First Foundation was allowed to seem to win, to seem to defeat the Second Foundation, and it moved on to greater and greater strength in the Galaxy, totally ignorant that the Second Foundation still existed.

It is now four hundred and ninety-eight years after the First Foundation had come into existence. It is at the peak of its strength, but one man does not accept appearances-

1. COUNCILMAN

"I DON'T BELIEVE IT, OF COURSE," SAID GOLAN TREVIZE STANDING ON the wide steps of Seldon Hall and looking out over the city as it sparkled in the sunlight.

Terminus was a mild planet, with a high water/land ratio. The introduction of weather control had made it all the more comfortable and considerably less interesting, Trevize often thought.

"I don't believe any of it," he repeated and smiled. His white, even teeth gleamed out of his youthful face.

His companion and fellow Councilman, Munn Li Compur who had adopted a middle name in defiance of Terminus tradition, shook his head uneasily. "What don't you believe? That we saved the city?"

"Oh, I believe that. We did, didn't we? And Seldon said that we would, and he said we would be right to do so, and that he knew all about it five hundred years ago."

Compur's voice dropped and he said in a half-whisper, "Look, I don't mind your talking like this to me, because I take it as just talk, but if you shout it out in crowds others will hear and, frankly, I don't want to be standing near you when the lightning strikes. I'm not sure how precise the aim will be."

Trevize's smile did not waver. He said, "Is there harm in saying that the city is saved? And that we did it without a war?"

"There was no one to fight," said Compur. He had hair of a buttery yellow, eyes of a sky blue, and he always resisted the impulse to alter those unfashionable hues.

"Have you never heard of civil war, Compur?" said Trevize. He was tall, his hair was black, with a gentle wave to it, and he had a habit of walking with his thumbs hitched into the soft-fibered sash he always wore.

"A civil war over the location of the capital?"

"The question was enough to bring on a Seldon Crisis. It destroyed Hannis's political career. It put you and me into the Council last election and the issue hung-" He heisted one hand slowly, back and forth, like a balance coming to rest on the level.

He paused on the steps, ignoring the other members of the government and the media, as well as the fashionable society types who had finagled an invitation to witness Seldon's return (or the return of his image, at any rate).

All were walking down the stairs, talking, laughing, glorying in the correctness of everything, and basking in Seldon's approval.

Trevize stood still and let the crowd swirl past him. Compur, having walked two steps ahead, paused-an invisible cord stretching between them. He said, "Aren't you coming?"

"There's no hurry. They won't start the Council meeting until Mayor Branno has reviewed the situation in her usual flat-footed, one-syllable-at-a-time way. I'm in no hurry to endure another ponderous speech. -Look at the city!"

"I see it. I saw it yesterday, too."

"Yes, but did you see it five hundred years ago when it was founded?"

"Four hundred ninety-eight," Compdor corrected him automatically. "Two years from now, they'll have the hemimillennial celebration and Mayor Branno will still be in the office at the time, barring events of, we hope, minor probability."

"We hope," said Trevize dryly. "But what was it like five hundred years ago when it was founded? One city! One small city, occupied by a group of men preparing an Encyclopedia that was never finished!"

"Of course it was finished."

"Are you referring to the Encyclopedia Galactica we have now? What we have isn't what they were working on. What we have is in a computer and it's revised daily. Have you ever looked at the uncompleted original?"

"You mean in the Hardin Museum?"

"The Salvor Hardin Museum of Origins. Let's have the full name, please, since you're so careful about exact dates. Have you looked at it?"

"No. Should I?"

"No, it isn't worth it. But anyway-there they were-a group of Encyclopedists, forming the nucleus of a town-one small town in a world virtually without metals, circling a sun isolated from the rest of the Galaxy, at the edge, the very edge. And now, five hundred years later, we're a suburban world. The whole place is one big park, with all the metal we want. We're at the center of everything now?"

"Not really," said Compdor. "We're still circling a sun isolated from the rest of the Galaxy. Still at the very edge of the Galaxy."

"Ah no, you're saying that without thinking. That was the whole point of this little Seldon Crisis. We are more than the single world of Terminus. We are the Foundation, which sends out its tentacles Galaxy-wide and rules that Galaxy from its position at the very edge. We can do it because we're not isolated, except in position, and that doesn't count."

"All right. I'll accept that." Compdor was clearly uninterested and took another step downward. The invisible cord between them stretched farther.

Trevize reached out a hand as though to haul his companion up the steps again. "Don't you see the significance, Compdor? There's this enormous change, but we don't accept it. In our hearts we want the small Foundation, the small one-world operation we had in the old days-the days of iron heroes and noble saints that are gone forever."

"Come on!"

"I mean it. Look at Seldon Hall. To begin with, in the first crises in Salvor Hardin's day, it was just the Time Vault, a small auditorium in which the holographic image of Seldon appeared. That was a11. Now it's a colossal mausoleum, but is there a force-field ramp in the place? A slideway? A gravitic lift? -No, just these steps, and we walk down them and we walk up them as Hardin would have had to do. At odd and unpredictable times, we cling in fright to the past."

He flung his arm outward passionately. "Is there any structural component visible that is metal? Not one. It wouldn't do to have any, since in Salvor Hardin's day there was no native metal to speak of and hardly any imported metal. We even installed old plastic, pink with age, when we built this huge pile, so that visitors from other worlds can stop and say, 'Galaxy! What lovely old plastics' I tell you, Compor, it's a sham."

"Is that what you don't believe, then? Seldon Hall?"

"And all its contents," said Trevize in a fierce whisper. "I don't really believe there's any sense in hiding here at the edge of the Universe, just because our ancestors did. I believe we ought to be out there, in the middle of everything."

"But Seldon says you're wrong. The Seldon Plan is working out as it should."

"I know. I know. And every child on Terminus is brought up to believe that Hari Seldon formulated a Plan, that he foresaw everything five centuries ago, that he set up the Foundation in such a way that he could spot certain crises, and that his image would appear holographically at those crises, and tell us the minimum we had to know to go on to the next crisis, and thus lead us through a thousand years of history until we could safely build a Second and Greater Galactic Empire on the ruins of the old decrepit structure that was falling apart five centuries ago and had disintegrated completely by two centuries ago."

"Why are you telling me all this, Golan?"

"Because I'm telling you it's a sham. It's all a sham. -Or if it was real to begin with, it's a sham now! We are not our own masters. It is not we who are following the Plan."

Compor looked at the other searchingly. "You've said things like this before, Golan, but I've always thought you were just saying ridiculous things to stir me up. By the Galaxy, I actually think you're serious."

"Of course I'm serious!"

"You can't be. Either this is some complicated piece of fun at my expense or you're out of your mind."

"Neither. Neither," said Trevize, quiet now, hitching his thumbs into his sash as though he no longer needed the gestures of hands to punctuate passion. "I speculated on it before, I admit, but that was just intuition. That farce in there this morning, however, has made it suddenly all. quite plain to me and I intend, in turn, to make it quite plain to the Council."

Compor said, "You are crazy!"

"All right. Come with me and listen."

The two walked down the stairs. They were the only ones left-the last to complete the descent. And as Trevize moved slightly to the fore, Compor's lips moved silently, casting a voiceless word in the direction of the other's back: "Fool!"

Mayor Harla Branno called the session of the Executive Council to order. Her eyes had looked with no visible sign of interest at the gathering; yet no one there doubted that she had noted all who were present and all who had not yet arrived.

Her gray hair was carefully arranged in a style that was neither markedly feminine nor imitation masculine. It was simply the way she wore it, no more. Her matter-of-fact

face was not notable for beauty, but somehow it was never for beauty that one searched there.

She was the most capable administrator on the planet. No one could, or did, accuse her of the brilliance of the Salvor Hardins and the Hober Mallows whose histories enlivened the first two centuries of the Foundation's existence, but neither would anyone associate her with the follies of the hereditary Indburs who had ruled the Foundation just prior to the time of the Mule.

Her speeches did not stir men's minds, nor did she have a gift for the dramatic gesture, but she had a capacity for making quiet decisions and sticking by them as long as she was convinced she was right. Without any obvious charisma, she had the knack of persuading the voters those quiet decisions would be right.

Since by the Seldon doctrine, historical change is to a large degree difficult to swerve (always barring the unpredictable, something most Seldonists forget, despite the wrenching incident of the Mule), the Foundation might have retained its capital on Terminus under any conditions. That is a "might," however. Seldon, in his just finished appearance as a five-century-old simulacrum, had calmly placed the probability of remaining on Terminus at 87.2 percent.

Nevertheless, even to Seldonists, that meant there was a 12.8 percent chance that the shift to some point closer to the center of the Foundation Federation would have been made, with all the dire consequences that Seldon had outlined. That this one-out-of-eight chance did not take place was surely due to Mayor Branno.

It was certain she would not have allowed it. Through periods of considerable unpopularity, she had held to her decision that Terminus was the traditional seat of the Foundation and there it would remain. Her political enemies had caricatured her strong jaw (with some effectiveness, it had to be admitted) as an underslung granite block.

And now Seldon had backed her point of view and, for the while at least, that would give her an overwhelming political advantage. She had been reported to have said a year earlier that if in the coming appearance Seldon did back her, she would consider her task successfully completed. She would then retire and take up the role of elder statesperson, rather than risk the dubious results of further political wars.

No one had really believed her. She was at home in the political wars to an extent few before her had been, and now that Seldon's image had come and gone there was no hint of retirement about her.

She spoke in a perfectly clear voice with an unashamed Foundation accent (she had once served as Ambassador to Mandrels, but had not adopted the old Imperial style of speech that was so fashionable now-and was part of what had been a quasi-Imperial drive to the Inner Provinces).

She said, "The Seldon Crisis is over and it is a tradition, and a wise one, that no reprisals of any kind-either in deed or in speech -be taken against those who supported the wrong side. Many honest people believed they had good reason for wanting that which Seldon did not want. There is no point in humiliating them to the point where they can retrieve their self-respect only by denouncing the Seldon Plan itself. In turn, it is a

strong and desirable custom that those who supported the lost side accept the loss cheerfully and without further discussion. The issue is behind us, on both sides, forever."

She paused, gazed levelly at the assembled faces for a moment, then went on, "Half the time has passed, people of the Council- half the thousand-year stretch between Empires. It has been a time of difficulties, but we have come a fang way. We are, indeed, almost a Galactic Empire already and there remain no external enemies of consequence.

"The Interregnum would have endured thirty thousand years, were it not for the Seldon Plan. After thirty thousand years of disintegration, it might be there would be no strength left with which to form an Empire again. There might be left only isolated and probably dying worlds.

"What we have today we owe to Hari Seldon and it is upon his long-dead mind that we must rely far the rest. The danger henceforward, Councillors, is ourselves, and from this point on there must be no official doubt of the value of the Plan. Let us agree nosy, quietly and firmly, that there are to be no official doubts, criticisms, or condemnations of the Plan. We must support it completely. It has proved itself over five centuries. It is the security of€ humanity and it must not be tampered with. Is it agreed?"

There was a quiet murmur. The Mayor hardly looked up to seek visual proof of agreement. She knew every member of the Council and how each would react. In the wake of the victory, there would be no objection now. Next year perhaps. Not now. She would tackle the problems of next year next year.

Always except for-

"Thought control, Mayor Branno?" asked Golan Trevize, striding down the aisle and speaking loudly, as though to make up for the silence of the rest. He did not bother to take his seat which, since he was a new member, was in fine back row.

Branno still did not look up. She said, "Your views, Councilman Trevize?"

"That the government cannot impose a ban on free speech; that all individuals- most certainly including Councilmen and Councilwomen who have been elected for the purpose-have a right to discuss the political issues of the day; and that no political issue can possibly be divorced from the Seldon Plan:"

Branno folded her hands and looked up. Her face was expressionless. She said, "Councilman Trevize, you have entered this debate irregularly and were out of order in doing so. However, I asked you to state your views and I will now answer you.

"There is no limit to free speech within the context of the Seldon Plan. It is only the Plan itself that limits us by its very nature. There can be many ways of interpreting events before the image makes the final decision, but once he makes that decision it can be questioned no further in Council. Nor may it be questioned in advance as though one were to say, 'If Hari Seldon were to state thus-and-so, he would be wrong. ' "

"And yet if one honestly felt so, Madam Mayor?"

"Then one could say so, if one were a private individual, discussing fine matter in a private context."

"You mean, then, that the limitations on free speech which you propose are to apply entirely and specifically to government officials?"

"Exactly. This is not a new principle of Foundation law. It has been applied before by Mayors of all parties. A private point of view means nothing; an official expression of opinion carries weight and can be dangerous. We have not come this far to risk danger now."

"May I point out, Madam Mayor, that this principle of yours has been applied, sparsely and occasionally, to specific acts of Council. It has never been applied to something as vast and indefinable as the Seldon Plan."

"The Seldon Plan needs the protection most, for it is precisely there that questioning can be most fatal."

"Will you not consider, Mayor Branno-" Trevize turned, addressing now the seated rows of Council members, who seemed one and all to have caught their breath, as though awaiting the outcome of a duel. "Will you not consider, Council members, that there is every reason to think that there is no Seldon Plan at all?"

"We have all witnessed its workings today," said Mayor Branno, even more quietly as Trevize became louder and more oratorical.

"It is precisely because we have seen its workings today, Councilmen and Councilwomen, that we can see that the Seldon Plan, as we have been taught to believe it to be, cannot exist."

"Councilman Trevize, you are out of order and must not continue along these lines."

"I have the privilege of office, Mayor."

"That privilege has been withdrawn, Councilman."

"You cannot withdraw the privilege. Your statement limiting free speech cannot, in itself, have the force of law. There has been no formal vote in Council, Mayor, and even if there were I would have the right to question its legality."

"The withdrawal, Councilman, has nothing to do with my statement protecting the Seldon Plan."

"On what, then, does it depend?"

"You are accused of treason, Councilman. I wish to do the Council the courtesy of not arresting you within the Council Chamber, but waiting at the door are members of Security who will take you into custody as you leave. I will ask you now to leave quietly. If you make any ill-considered move, then, of course, that will be considered a present danger and Security will enter the Chamber. I trust you will not make that necessary."

Trevize frowned. There was absolute silence in the hall. (Did everyone expect this - everyone but himself and Compore?) He looked back at the exit. He saw nothing, but he had no doubt that Mayor Branno was not bluffing.

He stammered in rage. "I represent an important constituency, Mayor Branno-"

"No doubt, they will be disappointed in you."

"On what evidence do you bring forth this wild charge?"

"That will appear in due course, but be assured that we have all we need. You are a most indiscreet young man and should realize that someone may be your friend and yet not be willing to accompany you into treason:"

Trevize whirled to meet Compore's blue eyes. They met his stonily.

Mayor Branno said calmly, "I call upon all to witness that when I made my last statement, Councilman Trevize turned to look at Councilman Compore. Will you leave now, Councilman, or will you force us to engage in the indignity of an arrest within the Chamber?"

Golan Trevize turned, mounted the steps again, and, at the door, two men in uniform, well armed, fell in on either side.

And Harla Branno, looking after him impassively, whispered through barely parted lips, "Fool!"

Liono Kodell had been Director of Security through all of Mayor Branno's administration. It was not a backbreaking job, as he liked to say, but whether he was lying or not, one could not, of course, tell. He didn't look like a liar, but that did not necessarily mean anything.

He looked comfortable and friendly, and it might well be that this was appropriate for the job. He was rather below the average height, rather above the average weight, had a bushy mustache (most unusual for a citizen of Terminus) that was now more white than gray, bright brown eyes, and a characteristic patch of primary color marking the outer breast pocket of his drab coverall.

He said, "Sit down, Trevize. Let us keep this on a friendly basis if we can."

"Friendly? With a traitor?" Trevize hooked both his thumbs in his sash and remained standing.

"With an accused traitor. We have not yet come to the point where accusation—even by the Mayor herself—is the equivalent of conviction. I trust we never do. My job is to clear you, if I can. I would much rather do so now while no harm is done—except, perhaps, to your pride—rather than be forced to make it all a matter of a public trial. I hope you are with me in this."

Trevize didn't soften. He said, "Let's not bother with ingratiation. Your job is to badger me as though I were a traitor. I am not one, and I resent the necessity of having to have that point demonstrated to your satisfaction. Why should you not have to prove your loyalty to my satisfaction?"

"In principle, none. The sad fact, however, is that I have power on my side, and you have none on yours. Because of that, it is my privilege to question, and not yours. If any suspicion of disloyalty or treason fell upon me, by the way, I imagine I would find myself replaced, and I would then be questioned by someone else, who, I earnestly hope, would treat me no worse than I intend to treat you."

"And how do you intend to treat me?"

"Like, I trust, a friend and an equal, if you will so treat me."

"Shall I stand you a drink?" asked Trevize bitterly.

"Later, perhaps, but for now, please sit down. I ask it as a friend."

Trevize hesitated, then sat. Any further defiance suddenly seemed meaningless to him. "What now?" he said.

"Now, may I ask that you will answer my questions truthfully and completely and without evasion?"

"And if not? What is the threat behind it? A Psychic Probe?"

"I trust not."

"I trust not, too. Not on a Councilman. It will reveal no treason, and when I am then acquitted, I will have your political head and the Mayor's too, perhaps. It might almost be worth making you try a Psychic Probe."

Kodell frowned and shook his head slightly. "Oh no. Oh no. Too much danger of brain damage. It's slow healing sometimes, and it would not be worth your while. Definitely. You know, sometimes, when the Probe is used in exasperation-

"A threat, Kodell?"

"A statement of fact, Trevize. -Don't mistake me, Councilman. If I must use the Probe I will, and even if you are innocent you will have no recourse."

"What do you want to know?"

Kodell closed a switch on the desk before him. He said, "What I ask and what you answer to my questions will be recorded, both sight and sound. I do not want any volunteered statements from you, or anything nonresponsive. Not at this time. You understand that, I am sure."

"I understand that you will record only what you please," said Trevize contemptuously.

"That is right, but again, don't mistake me. I will not distort anything you say. I will use it or not use it, that is all. But you will know what I will not use and you will not waste my time and yours.

"We'll see."

"We have reason to think, Councilman Trevize"-and somehow the touch of added formality in his voice was evidence enough that he was recording-"that you have stated openly, and on a number of occasions, that you do not believe in the existence of the Seldon Plan."

Trevize said slowly, "If I have said so openly, and on a number of occasions, what more do you need?"

"Let us not waste time with quibbles, Councilman. You know that what I want is an open admission in your own voice, characterized by its own voiceprints, under conditions where you are clearly in perfect command of yourself."

"Because, I suppose, the use of any hypno-effect, chemical or otherwise, would alter the voiceprints?"

"Quite noticeably."

"And you are anxious to demonstrate that you have made use of no illegal methods in questioning a Councilman? I don't blame you ..

"I'm glad you do not blame me, Councilman. Then let us continue. You have stated openly, and on a number of occasions, that you do not believe in the existence of the Seldon Plan. Do you admit that?"

Trevize said slowly, choosing his words, "I do not believe that what we call Seldon's Plan has the significance we usually apply to it.

"A vague statement. Would you care to elaborate?"

"My view is that the usual concept that Hari Seldon, five hundred years ago, making use of the mathematical science of psychohistory, worked out the course of human events to the last detail and that we are following a course designed to take us from the First Galactic Empire to the Second Galactic Empire along the line of maximum probability, is naive. It cannot be so:"

"Do you mean that, in your opinion, Hari Seldon never existed?"

"Not at all. Of course he existed."

"That he never evolved the science of psychohistory?"

"No, of course I don't mean any such thing. See here, Director, I would have explained this to the Council if I had been allowed to, and I will explain it to you. The truth of what I am going to say is so plain-"

The Director of Security had quietly, and quite obviously, turned off the recording device.

Trevize paused and frowned. "Why did you do that?"

"You are wasting my time, Councilman. I am not asking you for speeches."

"You are asking me to explain my views, aren't you?"

"Not at all. I am asking you to answer questions—simply, directly, and straightforwardly. Answer only the questions and offer nothing that I do not ask for. Do that and this won't take long."

Trevize said, "You mean you will elicit statements from me that will reinforce the official version of what I am supposed to have done."

"We ask you only to make truthful statements, and I assure you we will not distort them. Please, let me try again. We were talking about Hari Seldon." The recording device was in action once more and Kodell repeated calmly, "That he never evolved the science of psychohistory?"

"Of course he evolved the science that we call psychohistory," said Trevize, failing to mask his impatience, and gesturing with exasperated passion.

"Which you would define—how?"

"Galaxy! It is usually defined as that branch of mathematics that deals with the overall reactions of large groups of human beings to given stimuli under given conditions. In other words, it is supposed to predict social and historical changes"

"You say 'supposed to': Do you question that from the standpoint of mathematical expertise?"

"No," said Trevize. "I am not a psychohistorian. Nor is any member of the Foundation government, nor any citizen of Terminus, nor any—"

Kodell's hand raised. He said softly, "Councilman, please!" and Trevize was silent.

Kodell said, "Have you any reason to suppose that Hari Seldon did not make the necessary analysis that would combine, as efficiently as possible, the factors of maximum probability and shortest duration in the path leading from the First to the Second Empire by way of the Foundation?"

"I wasn't there," said Trevize sardonically. "How can I know?"

"Can you know he didn't?" No.

"Do you deny, perhaps, that the holographic image of Hari Seldon that has appeared during each of a number of historical crises over the past five hundred years is, in actual fact, a reproduction of Hari Seldon himself, made in the last year of his life, shortly before the establishment of the Foundation?"

"I suppose I can't deny that."

"You 'suppose.' Would you care to say that it is a fraud, a hoax devised by someone in past history for some purpose?"

Trevize sighed. "No. I am not maintaining that."

"Are you prepared to maintain that the messages that Hari Seldon delivers are in any way manipulated by anyone at all?"

"No. I have no reason to think that such manipulation is either possible or useful."

"I see. You witnessed this most recent appearance of Seldon's image. Did you find that his analysis-prepared five hundred years ago-did not match the actual conditions of today quite closely?"

"On the contrary," said Trevize with sudden glee. "It matched very closely."

Kodell seemed indifferent to the other's emotion. "And yet, Councilman, after the appearance of Seldon, you still maintain that the Seldon Plan does not exist."

"Of course I do. I maintain it does not exist precisely because the analysis matched so perfectly-"

Kodell had turned off the recorder. "Councilman," he said, shaking his head, "you put me to the trouble of erasing. I ask if you still maintain this odd belief of yours and you start giving me reasons. Let me repeat my question."

He said, "And yet, Councilman, after the appearance of Seldon, you still maintain that the Seldon Plan does not exist."

"How do you know that? No one had a chance to speak to my informer friend, Compor, after the appearance."

"Let us say we guessed, Councilman. And let us say you have already answered, 'Of course I do: If you will say that once more without volunteering added information, we can get on with it. ' "

"Of course I do," said Trevize ironically.

"Well," said Kodell, "I will choose whichever of the 'Of course I do's' sounds more natural. Thank you, Councilman," and the recording device was turned off again.

Trevize said, "Is that it?"

"For what I need, yes."

"What you need, quite clearly, is a set of questions and answers that you can present to Terminus and to all the Foundation Federation which it rules, in order to show

that I accept the legend of the Seldon Plan totally. That will make any denial of it that I later make seem quixotic or outright insane."

"Or even treasonable in the eyes of an excited multitude which sees the Plan as essential to the Foundation's safety. It will perhaps not be necessary to publicize this, Councilman Trevize, if we can come to some understanding, but if it should prove necessary we will see to it that the Federation hears."

"Are you fool enough, sir," said Trevize, frowning, "to be entirely uninterested in what I really have to say?"

"As a human being I am very interested, and if an appropriate time comes I will listen to you with interest and a certain amount of skepticism. As Director of Security, however, I have, at the present moment, exactly what I want"

"I hope you know that this will do you, and the Mayor, no good."

"Oddly enough, I am not at all of that opinion. You will now leave. Under guard, of course."

"Where am I to be taken?"

Kodell merely smiled. "Good-bye, Councilman. You were not perfectly cooperative, but it would have been unrealistic to have expected you to be."

He held out his hand.

Trevize, standing up, ignored it. He smoothed the creases out of his sash and said, "You only delay the inevitable. Others must think as I do now, or will come to think that way later. To imprison me or to kill me will serve to inspire wonder and, eventually, accelerate such thinking. In the end the truth and I shall win."

Kodell took back his hand and shook his head slowly. "Really, Trevize," he said. "You are a fool."

It was not till midnight that two guards came to remove Trevize from what was, he had to admit, a luxurious room at Security Headquarters. Luxurious but locked. A prison cell by any name.

Trevize had over four hours to second-guess himself bitterly, striding restlessly across the floor for much of the period.

Why did he trust Compdor?

Why not? He had seemed so clearly in agreement. -No, not that. He had seemed so ready to be argued into agreement. -No, not that, either. He had seemed so stupid, so easily dominated, so surely lacking a mind and opinions of his own that Trevize enjoyed the chance of using him as a comfortable sounding board. Compdor had helped Trevize improve and hone his opinions. He had been useful and Trevize had trusted him for no other reason than that it had been convenient to do so.

But it was useless now to try to decide whether he ought to have seen through Compdor. He should have followed the simple generalization: Trust nobody.

Yet can one go through life trusting nobody?

Clearly one had to.

And who would have thought that Branno would have had the audacity to pluck a Councilman out of the Council-and that not one of the other Councilmen would move to

protect one of their own? Though they had disagreed with Trevize to their very hearts; though they would have been ready to bet their blood, drop by drop, on Branno's rightness; they should still, on principle, have interposed themselves against this violation of their prerogatives. Branno the Bronze she was sometimes called, and she certainly acted with metallic rigor--

Unless she herself was already in the grip-

No! That way led to paranoia!

And yet-

His mind tiptoed in circles, and had not broken out of uselessly repetitive thought when the guards came.

"You will have to come with us, Councilman," the senior of the two said with unemotional gravity. His insignia showed him to be a lieutenant. He had a small scar on his right cheek, and he looked tired, as though he had been at his Job too long and had done too little-as might be expected of a soldier whose people had been at peace for over a century.

Trevize did not budge. "Your name, Lieutenant."

"I am Lieutenant Evander Sopellor, Councilman."

"You realize you are breaking the law, Lieutenant Sopellor. You cannot arrest a Councilman."

The lieutenant said, "We have our direct orders, sir."

"That does not matter. You cannot be ordered to arrest a Councilman. You must understand that you will be liable for court-martial as a result."

The lieutenant said, "You are not being arrested, Councilman."

"Then I don't have to go with you, do I?"

"We have been instructed to escort you to your home."

"I know the way."

"And to protect you en route."

"From what? -Or from whom?"

"From any mob that may gather."

"At midnight?"

"It is why we have waited for midnight, sir. -And now, sir, for your protection we must ask you to come with us. May I say-not as a threat but as a matter of information-that we are authorized to use force if necessary."

Trevize was aware of the neuronics whips with which they were armed. He rose with what he hoped was dignity. "To my home, then. -Or will I find out that you are going to take me to prison?"

"We have not been instructed to lie to you, sir," said the lieutenant with a pride of his own. Trevize became aware that he was in the presence of a professional man who would require a direct order before he would lie-and that even then his expression and his tone of voice would give him away.

Trevize said, "I ask your pardon, Lieutenant. I did not mean to imply that I doubted your word."

A ground-car was waiting for them outside. The street was empty and there was no sign of any human being, let alone a mob-but the lieutenant had been truthful. He had not said there was a mob outside or that one would form. He had referred to "any mob that may gather." He had only said "may."

The lieutenant had carefully kept Trevize between himself and the car. Trevize could not have twisted away and made a run for it. The lieutenant entered immediately after him and sat beside him in the back.

The car moved off.

Trevize said, "Once I am home, I presume I may then go about my business freely-that I may leave, for instance, if I choose."

"We have no order to interfere with you, Councilman, in any way, except insofar as we are ordered to protect you."

"Insofar? What does that mean in this case?"

"I am instructed to tell you that once you are home, you may not leave it. The streets are not safe for you and I am responsible for your safety."

"You mean I am under house arrest."

"I am not a lawyer, Councilman. I do not know what that means."

He gazed straight ahead, but his elbow made contact with Trevize's side. Trevize could not have moved, however slightly, without the lieutenant becoming aware of it.

The car stopped before Trevize's small house in the suburb of Flexner. At the moment, he lacked a housemate-Flavella having wearied of the erratic life that Council membership had forced upon him-so he expected no one to be waiting for him.

"Do I get out now?" Trevize asked.

"I will get out first, Councilman. We will escort you in."

"For my safety?"

"Yes, sir."

There were two guards waiting inside his front door. A night-light was gleaming, but the windows had been opacified and it was not visible from outside.

For a moment, he was indignant at the invasion and then he dismissed it with an inward shrug. If the Council could not protect him in the Council Chamber itself, then surely his house could not serve as his castle.

Trevize said, "How many of you do I have in here altogether? A regiment?"

"No, Councilman," came a voice, hard and steady. "Just one person aside from those you see, and I have been waiting for you long enough."

Harla Branno, Mayor of Terminus, stood in the door that led into the living room. "Time enough, don't you think, for us to talk?"

Trevize stared. "All this rigmarole to-"

But Branno said in a low, forceful voice. "Quiet, Councilman. -And you four, outside. Outside! -All will be well in here."

The four guards saluted and turned on their heels. Trevize and Branno were alone.

2. MAYOR

BRANNO HAD BEEN WAITING FOR AN HOUR, THINKING WEARILY. Technically speaking, she was guilty of breaking and entering. What's more, she had violated, quite unconstitutionally, the rights of a Councilman. By the strict laws that held Mayors to account since the days of Indbur III and the Mute, nearly two centuries before-she was impeachable.

On this one day, however, for twenty-four hours she could do no wrong.

But it would pass. She stirred restlessly.

The first two centuries had been the Golden Age of the Foundation, the Heroic Era-at least in retrospect, if not to the unfortunates who had lived in that insecure time. Salvor Hardin and Hober Mallow had been the two great heroes, semideified to the point of rivaling the incomparable Hari Seldon himself. The three were a tripod on which all Foundation legend (and even Foundation history) rested.

In those days, though, the Foundation had been one puny world, with a tenuous hold on the Four Kingdoms and with only a dim awareness of the extent to which the Seldon Plan was holding its protective hand over it, caring for it even against the remnant of the mighty Galactic Empire.

And the more powerful the Foundation grew as a political and commercial entity, the less significant its rulers and fighters had come to seem. Lathan Devers was almost forgotten. If he was remembered at all, it was for his tragic death in the slave mines, rather than for his unnecessary but successful fight against Bel Riose.

As for Bel Riose, the noblest of the Foundation's adversaries, he too was nearly forgotten, overshadowed by the Mule, who alone among enemies had broken the Seldon Plan and defeated and ruled the Foundation. He alone was the Great Enemy-indeed, the last of the Greats.

It was little remembered that the Mule had been, in essence, defeated by one person-a woman, Bayta Darell-and that she had accomplished the victory without the help of anyone, -without even the support of the Seldon Plan. So, too, was it almost forgotten that her son and granddaughter, Toran and Arkady Darrell, had defeated the Second Foundation, leaving the Foundation, the First Foundation, supreme.

These latter-day victors were no longer heroic figures. The times had become too expansive to do anything but shrink heroes into ordinary mortals. Then, too, Arkady's biography of her grandmother had reduced her from a heroine to a figure of romance.

And since then there had been no heroes-not even figures of romance. The Kalganian war had been the last moment of violence engulfing the Foundation and that had been a minor conflict. Nearly two centuries of virtual peace! A hundred and twenty years without so much as a ship scratched.

It had been a good peace-Branno would not deny that-a profitable peace. The Foundation had not established a Second Galactic Empire-it was only halfway there by

the Seldon Plan-but, as the Foundation Federation, it held a strong economic grip on over a third of the scattered political units of the Galaxy, and influenced what it didn't control. There were few places where "I am of the Foundation" was not met with respect. There was no one who ranked higher in all the millions of inhabited worlds than the Mayor of Terminus.

That was still the title. It was inherited from the leader of a single small and almost disregarded city on a lonely world on the far edge of civilization, some five centuries before, but no one would dream of changing it or of giving it one atom more glory-in-sound. As it was, only the all-but-forgotten title of Imperial Majesty could rival it in awe.

-Except on Terminus itself, where the powers of the Mayor were carefully limited. The memory of the Indburs still remained. It was not their tyranny that people could not forget but the fact that they had lost to the Mule.

And here she was, Harla Branno, the strongest to rule since the Mule's death (she knew that) and only the fifth woman to do so. On this day only had she been able to use her strength openly.

She had fought for her interpretation of what was right and what should be-against the dogged opposition of those who longed for the prestige-filled Interior of the Galaxy and for the aura of Imperial power-and she had won.

Not yet, she had said. Not yet! Jump too soon for the Interior and you will lose far this reason and for that. And Seldon had appeared and had supported her in language almost identical with her own.

It made her, for a time, in the eyes of all fine Foundation, as wise as Seldon himself. She knew they could forget that any hour, however.

And this young man dared to challenge her on this day of days.

And he dared to be right?

That was the danger of it. He was right? And by being right, he might destroy the Foundation!

And now she faced him and they were alone.

She said sadly, "Could you not have come to see me privately? Did you have to shout it all out in the Council Chamber in your idiotic desire to make a fool of me? What have you done, you mindless boy?"

Trevize felt himself flushing and fought to control his anger. The Mayor was an aging woman who would be sixty-three on her next birthday. He hesitated to engage in a shouting match with someone nearly twice his age.

Besides, she was well practiced in the political wars and knew that if she could place her opponent off-balance at the start then the battle was half-won. But it took an audience to make such a tactic effective and there was no audience before whom one might be humiliated. There were just the two of them.

So he ignored her words and did his best to survey her dispassionately. She was an old woman wearing the unisex fashions which had prevailed for two generations now. They did not become her. The Mayor, the leader of the Galaxy-if leader there could be-was just a plain old woman who might easily have been mistaken for an old man, except

that her iron-gray hair was tied tightly back, instead of being worn free in the traditional male style.

Trevize smiled engagingly. However much an aged opponent strove to make the epithet "boy" sound like an insult, this particular "boy" had the advantage of youth and good looks-and the full awareness of both.

He said, "It's true. I'm thirty-two and, therefore, a boy-in a manner of speaking. And I'm a Councilman and, therefore, ex officio, mindless. The first condition is unavoidable. For the second, I can only say I'm sorry."

"Do you know what you've done? Don't stand there and strive for wit. Sit down. Put your mind into gear, if you can, and answer me rationally."

"I know what I've done. I've told the truth as I've seen it."

"And on this day you try to defy me with it? On this one day when my prestige is such that I could pluck you out of the Council Chamber and arrest you, with no one daring to protest?"

"The Council will recover its breath and it will protest. They may be protesting now. And they will listen to me all the more for the persecution to which you are subjecting me."

"No one will listen to you, because if I thought you would continue what you have been doing, I would continue to treat you as a traitor to the full extent of the law."

"I would then have to be tried.. I'd have my day in court."

"Don't count on that. A Mayor's emergency powers are enormous, even if they are rarely used."

"On what grounds would you declare an emergency?"

"I'll invent the grounds. I have that much ingenuity left, and I do not fear taking the political risk. Don't push me, young man. We are going to come to an agreement here or you will never be free again. You will be imprisoned for the rest of your life. I guarantee it.

They stared at each other: Branno in gray, Trevize in multishade brown.

Trevize said, "What kind of an agreement?"

"Ah. You're curious. That's better. Then we can engage in conversation instead of confrontation. What is your point of view?"

"You know it well. You have been crawling in the mud with Councilman Compore, have you not?"

"I want to hear it from you-in the light of the Seldon Crisis just passed."

"Very well, if that's what you want-Madam Mayor!" (He had been on the brink of saying "old woman.") "The image of Seldon was too correct, too impossibly correct after five hundred years. It's the eighth time he has appeared, I believe. On some occasions, no one was there to hear him. On at least one occasion, in the time of Indbur III, what he had to say was utterly out of synchronization with reality but that was in the time of the Mule, wasn't it? But when, on any of those occasions, was he as correct as he was now?"

Trevize allowed himself a small smile. "Never before, Madam Mayor, as far as our recordings of the past are concerned, has Seldon managed to describe the situation so perfectly, in all its smallest details."

Branno said, "Is it your suggestion that the Seldon appearance, the holographic image, is faked; that the Seldon recordings have been prepared by a contemporary such as myself, perhaps; that an actor was playing the Seldon role?"

"Not impossible, Madam Mayor, but that's not what I mean. The truth is far worse. I believe that it is Seldon's image we see, and that his description of the present moment in history is the description he prepared five hundred years ago. I have said as much to your man, Kodell, who carefully guided me through a charade in which I seemed to support the superstitions of the unthinking Foundationer."

"Yes. The recording will be used, if necessary, to allow the Foundation to see that you were never really in the opposition."

Trevize spread his arms. "But I am. There is no Seldon Plan in the sense that we believe there is, and there hasn't been for perhaps two centuries. I have suspected that for years now, and what we went through in the Time Vault twelve hours ago proves it."

"Because Seldon was too accurate?"

"Precisely. Don't smile. That is the final proof."

"I'm not smiling, as you can see. Go on."

"How could he have been so accurate? Two centuries ago, Seldon's analysis of what was then the present was completely wrong. Three hundred years had passed since the Foundation was set up and he was wide of the mark. Completely!"

"That, Councilman, you yourself explained a few moments ago. It was because of the Mule. The Mule was a mutant with intense mental power and there had been no way of allowing for him in the Plan."

"But he was there just the same-allowed or not. The Seldon Plan was derailed. The Mule didn't rule for long and he had no successor. The Foundation regained its independence and its domination, but how could the Seldon Plan have gotten back on target after so enormous a tearing of its fabric?"

Branno looked grim and her aging hands clasped together tightly. "You know the answer to that. They were one of two Foundations. You've read the history books."

"I've read Arkady's biography of her grandmother-required reading in school, after all-and I've read her novels, too. I've read the official view of the history of the Mule and afterward. Am I to be allowed to doubt them?"

"In what way?"

"Officially we, the First Foundation, were to retain the knowledge of the physical sciences and to advance them. We were to operate openly, our historical development following-whether we knew it or not-the Seldon Plan. There was, however, also the Second Foundation, which was to preserve and further develop the psychological sciences, including psychohistory, and their existence was to be a secret even from us. The Second Foundation was the fine-tuning agency of the Plan, acting to adjust the currents of Galactic history, when they turned from the paths outlined by the Plan."

"Then you answer yourself," said the Mayor. "Bayta Darell defeated the Mule, perhaps under the inspiration of the Second Foundation, although her granddaughter insists that was not so. It was the Second Foundation without doubt, however, which

labored to bring Galactic history back to the Plan after the Mule died and, quite obviously, they succeeded. -What on Terminus, then, are you talking about, Councilman?"

"Madam Mayor, if we follow Arkady Darell's account, it is clear that the Second Foundation, in making the attempt to correct Galactic history, undermined Seldon's entire scheme, since in their attempt to correct they destroyed their own secrecy. We, the First Foundation, realized that our mirror image, the Second Foundation, existed, and we could not live with the knowledge that we were being manipulated. We therefore labored to find the Second Foundation and to destroy it."

Branno nodded. "And we succeeded, according to Arkady Darell's account, but quite obviously, not until the Second Foundation had placed Galactic history firmly on track again after its disruption by the Mule. It is still on track."

"Can you believe that? The Second Foundation, according to the account, was located and its various members dealt with. That was in 378 F.E., a hundred twenty years ago. For five generations, they have supposedly been operating without the Second Foundation, and yet have remained so close to target where the Plan is concerned that you and the image of Seldon spoke almost identically."

"This might be interpreted to mean that I have seen into the significance of developing history with keen insight:"

"Forgive me. I do not intend to cast doubt upon your keen insight, but to me it seems that the more obvious explanation is that the Second Foundation was never destroyed. It still rules us. It still manipulates us. -And that is why we have returned to the track of the Seldon Plan."

If the Mayor was shocked by the statement, she showed no sign of it.

It was past 1 A.m. and she wanted desperately to bring an end to it, and yet could not hasten. The young man had to be played and she did not want to have him break the fishing line. She did not want to have to dispose of him uselessly, when he might first be made to serve a function.

She said, "Indeed? You say then that Arkady's tale of the Kalganian war and the destruction of the Second Foundation was false? Invented? A game? A lie?"

Trevize shrugged. "It doesn't have to be. That's beside the point. Suppose Arkady's account were completely true, to the best of her knowledge. Suppose all took place exactly as Arkady said it did; that the nest of Second Foundationers was discovered, and that they were disposed of. How can we possibly say, though, that we got every last one of them? The Second Foundation was dealing with the entire Galaxy. They were not manipulating the history of Terminus alone or even of the Foundation alone. Their responsibilities involved more than our capital world or our entire Federation. There were bound to be some Second Foundationers that were a thousand -or more-parsecs away. Is it likely we would have gotten them all?"

"And if we failed to get them all, could we say we had won? Could the Mule have said it in his time? He took Terminus, and with it all the worlds it directly controlled-but the Independent Trading Worlds still stood. He took the Trading Worlds-yet three

fugitives remained: Ebling Mis, Bayta Darell, and her husband. He kept both men under control and left Bayta-only Bayta-uncontrolled. He did this out of sentiment, if we are to believe Arkady's romance. And that was enough. According to Arkady's account, one person-only Bayta-was left to do as she pleased, and because of her actions the Mule was not able to locate the Second Foundation and was therefore defeated.

"One person left untouched, and all was Lost! That's the importance of one person, despite all the legends that surround Seldon's Plan to the effect that the individual is nothing and the mass is all.

"And if we left not just one Second Foundationer behind, but several dozen, as seems perfectly likely, what then? Would they not gather together, rebuild their fortunes, take up their careers again, multiply their numbers by recruitment and training, and once more make us all pawns?"

Branno said gravely, "Do you believe that?"

"I am sure of it."

"But tell me, Councilman? Why should they bother? Why should the pitiful remnant continue to cling desperately to a duty no one welcomes? What drives them to keep the Galaxy along its path to the Second Galactic Empire? And if the small band insists on fulfilling its mission, why should we care? Why not accept the path of the Plan and be thankful that they will see to it that we do not stray or lose our way?"

Trevize put his hand over his eyes and rubbed them. Despite his youth, he seemed the more tired of the two. He stared at the Mayor and said, "I can't believe you. Are you under the impression that the Second Foundation is doing this for us? That they are some sort of idealists? Isn't it clear to you from your knowledge of politics-of the practical issues of power and manipulation-that they are doing it for themselves?"

"We are the cutting edge. We are the engine, the force. We labor and sweat and bleed and weep. They merely control-adjusting an amplifier here, closing a contact there, and doing it all with ease and without risk to themselves. Then, when it is all done and when, after a thousand years of heaving and straining, we have set up the Second Galactic Empire, the people of the Second Foundation will move in as the ruling elite."

Branno said, "Do you want to eliminate the Second Foundation then? Having moved halfway to the Second Empire, do you want to take the chance of completing the task on our own and serving as our own elite? Is that it?"

"Certainly! Certainly! Shouldn't that be what you want, too? You and I won't live to see it, but you have grandchildren and someday I may, and they will have grandchildren, and so on. I want them to have the fruit of our labors and I want them to look back to us as the source, and to praise us for what we have accomplished. I don't want it all to fall to a hidden conspiracy devised by Seldon-who is no hero of mine. I tell you he is a greater threat than the Mule-if we allow his Plan to go through. By the Galaxy, I wish the Mule had disrupted the Plan altogether-and forever. We would have survived him. He was one of a kind and very mortal. The Second Foundation seems to be immortal."

"But you would like to destroy the Second Foundation, is that not so?"

"If I knew how!"

"Since you don't know how, don't you think it quite likely they will destroy you?"

Trevize looked contemptuous. "I have had the thought that even you might be under their control. Your accurate guess as to what Seldon's image would say and your subsequent treatment of me could be all Second Foundation. You could be a hollow shell with a Second Foundation content."

"Then why are you talking to me as you are?"

"Because if you are under Second Foundation control, I am lost in any case and I might as well expel some of the anger within me and because, in actual fact, I am gambling that you are not under their control, that you are merely unaware of what you do."

Branno said, "You win that gamble, at any rate. I am not under anyone's control but my own. Still, can you be sure I am telling the truth? Were I under control of the Second Foundation, would I admit it? Would I even myself know that I was under their control?"

"But there is no profit in such questions. I believe I am not under control and you have no choice but to believe it, too. Consider this, however. If the Second Foundation exists, it is certain that their biggest need is to make sure that no one in the Galaxy knows they exist. The Seldon Plan only works well if the pawns-we are not aware of how the Plan works and of how we are manipulated. It was because the Mule focused the attention of the Foundation on the Second Foundation that the Second Foundation was destroyed in Arkady's time. -Or should I say nearly destroyed, Councilman?"

"From this we can deduce two corollaries. First, we can reasonably suppose that they interfere grossly as little as they can. We can assume it would be impossible to take us all over. Even the Second Foundation, if it exists, must have limits to its power. To take over some and allow others to guess the fact would introduce distortions to the Plan. Consequently, we come to the conclusion that their interference is as delicate, as indirect, as sparse as is possible-and therefore I am not controlled. Nor are you:"

Trevize said, "That is one corollary and I tend to accept it-out of wishful thinking, perhaps. What is the other?"

"A simpler and more inevitable one. If the Second Foundation exists and wishes to guard the secret of that existence, then one thing is sure. Anyone who thinks it still exists, and talks about it, and announces it, and shouts it to all the Galaxy must, in some subtle way, be removed by them at once, wiped out, done away with. Wouldn't that be your conclusion, too?"

Trevize said, "Is that why you have taken me into custody, Madam Mayor? To protect me from the Second Foundation?"

"In a way. To an extent. Liono Kodell's careful recording of your beliefs must be publicized not only in order to keep the people of Terminus and the Foundation from being unduly disturbed by your silly talk-but to keep the Second Foundation from being disturbed. If it exists, I do not want to have its attention drawn to you."

"Imagine that," said Trevize with heavy irony. "For my sake? For my lovely brown eyes?"

Branno stirred and then, quite without warning, laughed quietly. She said, "I am not so old, Councilman, that I am not unaware that you have lovely brown eyes and, thirty years ago, that might have been motive enough. At this time, however, I wouldn't move a millimeter to save them-or all the rest of you-if only your eyes were involved. But if the Second Foundation exists, and if their attention, is drawn to you, they may not stop with you. There's my life to consider, and that of a number of others far more intelligent and valuable than you-and all the plans we have made."

"Oh? Do you believe the Second Foundation exists, then, that you react so carefully to the possibility of their response?"

Branno brought her fist down upon the table before her. "Of course I do, you consummate fool! If I didn't know the Second Foundation exists, and if I weren't fighting them as hard and as effectively as I could, would I care what you say about such a subject? If the Second Foundation did not exist, would it matter that you are announcing they do? I've wanted for months to shut you up before you went public, but lacked the political power to deal roughly with a Councilman. Seldon's appearance made me look good and gave me the power-if only temporarily-and at that moment, you did go public. I moved at once, and now I will have you killed without a twinge of conscience or a microsecond of hesitation-if you don't do exactly as you're told.

"Our entire conversation now, at an hour in which I would much rather be in bed and asleep, was designed to bring you to the point of believing me when I tell you this. I want you to know that the problem of the Second Foundation, which I was careful to have you outline, gives me reason enough and inclination to have you brainstopped without trial."

Trevize half-rose from his seat.

Branno said, "Oh, don't make any moves. I'm only an old woman, as you're undoubtedly telling yourself, but before you could place a hand on me, you'd be dead. We are under observation, foolish young man, by my people."

Trevize sat down. He said, just a bit shakily, "You make no sense. If you believed the Second Foundation existed, you wouldn't be speaking of it so freely. You wouldn't expose yourself to the dangers to which you say I am exposing myself."

"You recognize, then, that I have a bit more good sense than you do. In other words, you believe the Second Foundation exists, yet you speak freely about it, because you are foolish. I believe it exists, and I speak freely, too-but only because I have taken precautions. Since you seem to have read Arkady's history carefully, you may recall that she speaks of her father having invented what she called a 'Mental Static Device.' It serves as a shield to the kind of mental power the Second Foundation has. It still exists and has been improved on, too, under conditions of the greatest secrecy. This house is, for the moment, reasonably safe against their prying. With that understood, let me tell you what you are to do."

"What's that?"

"You are to find out whether what you and I think is so is indeed so. You are to find out if the Second Foundation still exists and, if so, where. That means you will have to leave Terminus and go I know not where-even though it may in the end turn out, as in Arkady's day, that the Second Foundation exists among us. It means you will not return till you have something to tell us; and if you have nothing to tell us, you will never return, and the population of Terminus will be less one fool."

Trevize found himself stammering. "How on Terminus can I look for them without giving away the fact? They will simply arrange a death for me, and you will be none the wiser."

"Then don't look for them, you naive child. Look for something else. Look for something else with all your heart and mind, and if, in the process, you come across them because they have not bothered to pay you any attention, then goods You may, in that case, send us the information by shielded and coded hyperwave, and you may then return as a reward."

"I suppose you have something in mind that I should look for."

"Of course I do. Do you know Janov Pelorat?"

"Never heard of him."

"You will meet him tomorrow. He will tell you what you are looking for and he will leave with you in one of our most advanced ships. There will be just the two of you, for two are quite enough to risk. And if you ever try to return without satisfying us that you have the knowledge we want, then you will be blown out of space before you come within a parsec of Terminus. That's all. This conversation is over."

She arose, looked at her bare hands, then slowly drew on her gloves. She turned toward the door, and through it came two guards, weapons in hand. They stepped apart to let her pass.

At the doorway she turned. "There are other guards outside. Do nothing that disturbs them or you will save us all the trouble of your existence."

"You will also then lose the benefits I might bring you," said Trevize and, with an effort, lie managed to say it lightly.

"We'll chance that," said Branno with an unamused smile.

Outside Liono Kodell was waiting for her. He said, "I listened to the whole thing, Mayor. You were extraordinarily patient."

"And I am extraordinarily tired. I think the day has been seventy-two hours long. You take over now."

"I will, but tell me- Was there really a Mental Static Device about the house?"

"Oh, Kodell," said Branno wearily. "You know better than that. What was the chance anyone was watching? Do you imagine the Second Foundation is watching everything, everywhere, always? I'm not the romantic young Trevize is; he might think that, but I don't. And even if that were the case, if Second Foundational eyes and ears were everywhere, would not the presence of an MSD have given us away at once? For

that matter, would not its use have shown the Second Foundation a shield against its powers existed-once they detected a region that was mentally opaque? Isn't the secret of such a shield's existence-until we are quite ready to use it to the full - something worth not only more than Trevize, but more than you and I together? And yet-

They were in the ground-car, with Kodell driving. "And yet-" said Kodell.

"And yet what?" said Branno. "-Oh yes. And yet that young man is intelligent. I called him a fool in various ways half a dozen times just to keep him in his place, but he isn't one. He's young and he's read too many of Arkady Darell's novels, and they have made him think that that's the way the Galaxy is-but he has a quick insight about him and it will be a pity to lose him."

"You are sure then that he will be lost?"

"Quite sure," said Branno sadly. "Just the same, it is better that way. We don't need young romantics charging about blindly and smashing in an instant, perhaps, what it has taken us years to build. Besides, he will serve a purpose. He will surely attract the attention of the Second Foundationers-always assuming they exist and are indeed concerning themselves with us. And while they are attracted to him, they will, perchance, ignore us. Perhaps we can gain even more than the good fortune of being ignored. They may, we can hope, unwittingly give themselves away to us in their concern with Trevize, and let us have an opportunity and time to devise countermeasures."

"Trevize, then, draws the lightning."

Branno's lips twitched. "Ah, the metaphor I've been looking for. He is our lightning rod, absorbing the stroke and protecting us from harm."

"And this Pelorat, who wilt also be in the path of the lightning bolt?"

"He may suffer, too. That can't be helped."

Kodell nodded. "Well, you know what Salvor Hardin used to say- 'Never let your sense of morals keep you from doing what is right.'"

"At the moment, I haven't got a sense of morals," muttered Branno. "I have a sense of bone-weariness. And yet-I could name a number of people I would sooner lose than Golan Trevize. He is a handsome young man. -And, of course, he knows it." Her tact words slurred as she closed her eyes and fell into a light sleep.

3. HISTORIAN

JANOV PELORAT WAS WHITE-HAIRED AND HIS FACE, IN REPOSE, LOOKED rather empty. It was rarefy in anything but repose. He was of average height and weight and tended to move without haste and to speak with deliberation. He seemed considerably older than his fifty-two years.

He had never left Terminus, something that was most unusual, especially for one of his profession. He himself wasn't sure whether his sedentary ways were because of-or in spite of-his obsession with history.

The obsession had come upon him quite suddenly at the age of fifteen when, during some indisposition, he was given a book of early legends. In it, he found the repeated motif of a world that was alone and isolated - a world that was not even aware of its isolation, since it had never known anything else.

His indisposition began to clear up at once. Within two days, he had read the book three times and was out of bed. The day after that he was at his computer terminal, checking for any records that the Terminus University Library might have on similar legends.

It was precisely such legends that had occupied him ever since. The Terminus University Library had by no means been a great resource in this respect but, when he grew older, he discovered the joys of interlibrary loans. He had printouts in his possession which had been taken off hyper-radiational signals from as far away as Ifnia.

He had become a professor of ancient history and was now beginning his first sabbatical - one for which he had applied with the idea of taking a trip through space (his first) to Trantor itself - thirty-seven years later.

Pelorat was quite aware that it was most unusual for a person of Terminus to have never been in space. It had never been his intention to be notable in this particular way. It was just that whenever he might have gone into space, some new book, some new study, some new analysis came his way. He would delay his projected trip until he had wrung the new matter dry and had added, if possible, one more item of fact, or speculation, or imagination to the mountain he had collected. In the end, his only regret was that the particular trip to Trantor had never been made.

Trantor had been the capital of the First Galactic Empire. It had been the seat of Emperors for twelve thousand years and, before that, the capital of one of the most important pre-Imperial kingdoms, which had, little by little, captured or otherwise absorbed the other kingdoms to establish the Empire.

Trantor had been a world-girdling city, a metal-coated city. Pelorat had read of it in the works of Gaal Dornick, who had visited it in the time of Hari Seldon himself. Dornick's volume no longer circulated and the one Pelorat owned might have been sold for half the historian's annual salary. A suggestion that he might part with it would have horrified the historian.

Of course, what Pelorat cared about, as far as Trantor was concerned, was the Galactic Library, which in Imperial times (when it was the Imperial Library) had been the largest in the Galaxy. Trantor was the capital of the largest and most populous Empire humanity had ever seen. It had been a single worldwide city with a population well in excess of forty billion, and its Library had been the gathered record of all the creative (and not-so-creative) work of humanity, the full summary of its knowledge. And it was all computerized in so complex a manner that it took experts to handle the computers.

What was more, the Library had survived. To Pelorat, that was the amazing thing about it. When Trantor had fallen and been sacked, nearly two and a half centuries before, it had undergone appalling destruction, and the tales of human misery and death would not bear repeating-yet the Library had survived, protected (it was said) by the University students, who used ingeniously devised weapons. (Some thought the defense by the students might well have been thoroughly romanticized.)

In any case, the Library had endured through the period of devastation. Ebling Mis had done his work in an intact Library in a ruined world when he had almost located the Second Foundation (according to the story which the people of the Foundation still believed, but which historians have always treated with reserve). The three generations of Darells-Bayta, Toran, and Arkady-had each, at one time or another, been on Trantor. However, Arkady had not visited the Library, and since her time the Library had not impinged on Galactic history.

No Foundationer had been on Trantor in a hundred and twenty years, but there was no reason to believe the Library was not still there. That it had made no impingement was the surest evidence in favor of its being there. Its destruction would surely have made a noise.

The Library was outmoded and archaic-it had been so even in Ebling Mis's time-but that was all to the good. Pelorat always rubbed his hands with excitement when he thought of an old and outmoded Library. The older and the more outmoded, the more likely it was to have what he needed. In his dreams, he would enter the Library and ask in breathless alarm, "Has the Library been modernized? Have you thrown out the old tapes and computerizations?" And always he imagined the answer from dusty and ancient librarians, "As it has been, Professor, so is it still."

And now his dream would come true. The Mayor herself had assured him of that. How she had known of his work, he wasn't quite sure. He had not succeeded in publishing many papers. Little of what he had done was solid enough to be acceptable for publication and what had appeared had left no mark. Still, they said Branno the Bronze knew all that went on in Terminus and had eyes at the end of every finger and toe. Pelorat could almost believe it, but if she knew of his work, why on Terminus didn't she see its importance and give him a little financial support before this?

Somehow, he thought, with as much bitterness as he could generate, the Foundation had its eyes fixed firmly on the future. It was the Second Empire and their destiny that absorbed them. They had no time, no desire, to peer back into the past-and they were irritated by those who did.

The more fools they, of course, but he could not single-handedly wipe out folly. And it might be better so. He could hug the great pursuit to his own chest and the day would come when he would be remembered as the great Pioneer of the Important.

That meant, of course (and he was too intellectually honest to refuse to perceive it), that he, too, was absorbed in the future—a future in which he would be recognized, and in which he would be a hero on a par with Hari Seldon. In fact, he would be the greater, for how could the working out of a clearly visualized future a millennium long stand comparison with the working out of a lost past at least twenty-five millennia old.

And this was the day; this was the day.

The Mayor had said it would be the day after Seldon's image made its appearance. That was the only reason Pelorat had been interested in the Seldon Crisis that for months had occupied every mind on Terminus and indeed almost every mind in the Federation.

It had seemed to him to make the most trifling difference as to whether the capital of the Foundation had remained here at Terminus, or had been shifted somewhere else. And now that the crisis had been resolved, he remained unsure as to which side of the matter Hari Seldon had championed, or if the matter under dispute had been mentioned at all.

It was enough that Seldon had appeared and that now this was the day.

It was a little after two in the afternoon that a ground-car slid to a halt in the driveway of his somewhat isolated house just outside Terminus proper.

A rear door slid back. A guard in the uniform of the Mayoralty Security Corps stepped out, then a young man, then two more guards.

Pelorat was impressed despite himself. The Mayor not only knew of his work but clearly considered it of the highest importance. The person who was to be his companion was given an honor guard, and he had been promised a first-class vessel which his companion would be able to pilot. Most flattering! Most-

Pelorat's housekeeper opened the door. The young man entered and the two guards positioned themselves on either side of the entrance. Through the window, Pelorat saw that the third guard remained outside and that a second ground-car had now pulled up. Additional guards!

Confusing!

He turned to find the young man in his room and was surprised to find that he recognized him. He had seen him on holocasts. He said, "You're that Councilman. You're Trevize!"

"Golan Trevize. That's right. You are Professor Janov Pelorat?"

"Yes, yes," said Pelorat. "Are you he who will—"

"We are going to be fellow travelers," said Trevize woodenly. "Or so I have been told."

"But you're not a historian."

"No, I'm not. As you said, I'm a Councilman, a politician."

"Yes- Yes- But what am I thinking about? I am a historian, therefore what need for another? You can pilot a spaceship."

"Yes, I'm pretty good at that."

"Well, that's what we need, then. Excellent! I'm afraid I'm not one of your practical thinkers, young man, so if it should happen that you are, we'll make a good team."

Trevize said, "I am not, at the moment, overwhelmed with the excellence of my own thinking, but it seems we have no choice but to try to make it a good team."

"Let's hope, then, that I can overcome my uncertainty about space. I've never been in space, you know, Councilman. I am a groundhog, if that's the term. Would you like a glass of tea, by the way? I'll have Moda prepare us something. It is my understanding that it will be some hours before we leave, after all. I am prepared right now, however. I have what is necessary for both of us. The Mayor has been most cooperative. Astonishing-her interest in the project."

Trevize said, "You've known about this, then? How long?"

"The Mayor approached me" (here Pelorat frowned slightly and seemed to be making certain calculations) "two, or maybe three, weeks ago. I was delighted. And now that I have got it clear in my head that I need a pilot and not a second historian, I am also delighted that my companion will be you, my dear fellow."

"Two, maybe three, weeks ago," repeated Trevize, sounding a little dazed. "She was prepared all this time, then. And I-" He faded out.

"Pardon me?"

"Nothing, Professor. I have a bad habit of muttering to myself. It is something you will have to grow accustomed to, if our trip extends itself."

"It will. It will," said Pelorat, bustling the other to the dining room table, where an elaborate tea was being; prepared by his housekeeper. "Quite open-ended. The Mayor said we were to take as long as we liked and that the Galaxy lay all before us and, indeed, that wherever we went we could call upon Foundation funds. She said, of course, that we would have to be reasonable. I promised that much." He chuckled and rubbed his hands: "Sit down, my good fellow, sit down. This may be our last meal on Terminus for a very long time."

Trevize sat down. He said, "Do you have a family, Professor?"

"I have a son. He's on the faculty at Santanni University. A chemist, I believe, or something like that. He took after his mother's side. She hasn't been with me for a long time, so you see I have no responsibilities, no active hostages to fortune. I trust you have none - help yourself to the sandwiches, my boy."

"No hostages at the moment. A few women. They come and go."

"Yes. Yes. Delightful when it works out. Even more delightful when you find it need not be taken seriously. -No children, I take it.

"None."

"Good! You know, I'm in the most remarkable good humor. I was taken aback when you first came in. I admit it. But I find you quite exhilarating now. What I need is youth and enthusiasm and someone who can find his way about the Galaxy. We're on a search, you know. A remarkable search." Pelorat's quiet face and quiet voice achieved an

unusual animation without any particular change in either expression or intonation. "I wonder if you have been told about this.

Trevize's eyes narrowed. "A remarkable search?"

"Yes indeed. A pearl of great price is hidden among the tens of millions of inhabited worlds in the Galaxy and we have nothing but the faintest clues to guide us. Just the same, it will be an incredible prize if we can find it. If you and I can carry it off, my boy - Trevize, I should say, for I don't mean to patronize - our names will ring down the ages to the end of time."

"The prize you speak of - this pearl of great price -"

"I sound like Arkady Darell - the writer, you know - speaking of the Second Foundation, don't I? No wonder you look astonished." Pelorat leaned his head back as though he were going to break into loud laughter but he merely smiled. "Nothing so silly and unimportant, I assure you."

Trevize said, "If you are not speaking of the Second Foundation, Professor, what are you speaking of?"

Pelorat was suddenly grave, even apologetic. "Ah, then the Mayor has not told you? - It is odd, you know. I've spent decades resenting the government and its inability to understand what I'm doing, and now Mayor Branno is being remarkably generous."

"Yes," said Trevize, not trying to conceal an intonation of irony, "she is a woman of remarkable hidden philanthropy, but she has not told me what this is all about."

"You are not aware of my research, then?"

"No. I'm sorry."

"No need to excuse yourself. Perfectly all right. I have not exactly made a splash. Then let me tell you. You and I are going to search for - and find, for I have an excellent possibility in mind - Earth."

Trevize did not sleep well that night.

Over and over, he thrashed about the prison that the old woman had built around him. Nowhere could he find a way out.

He was being driven into exile and he could do nothing about it. She had been calmly inexorable and did not even take the trouble to mask the unconstitutionality of it all. He had relied on his rights as a Councilman and as a citizen of the Federation, and she hadn't even paid them lip service.

And now this Pelorat, this odd academic who seemed to be located in the world without being part of it, told him that the fearsome old woman had been making arrangements for this for weeks.

He felt like the "boy" that she had called him.

He was to be exiled with a historian who kept "dear fellowing" him and who seemed to be in a noiseless fit of joy over beginning a Galactic search for Earth?

What in the name of the Mule's grandmother was Earth?

He had asked. Of course! He had asked upon the moment of its mention.

He had said, "Pardon me, Professor. I am ignorant of your specialty and I trust you won't be annoyed if I ask for an explanation in simple terms. What is Earth?"

Pelorat stared at him gravely while twenty seconds moved slowly past. He said, "It is a planet. The original planet. The one on which human beings first appeared, my dear fellow."

Trevize stared. "First appeared? From where?"

"From nowhere. It's the planet on which humanity developed through evolutionary processes from lower animals."

Trevize thought about it, then shook his head. "I don't know what you mean."

An annoyed expression crossed Pelorat's face briefly. He cleared his throat and said, "There was a time when Terminus had no human beings upon it. It was settled by human beings from other worlds. You know that, I suppose?"

"Yes, of course," said Trevize impatiently. He was irritated at the other's sudden assumption of pedagogy.

"Very well. This is true of all the other worlds. Anacreon, Santanni, Kalgan - all of them. They were all, at some time in the past, founded. People arrived there from other worlds. It's true even of Trantor. It may have been a great metropolis for twenty thousand years, but before that it wasn't."

"Why, what was it before that?"

"Empty? At least of human beings."

"That's hard to believe."

"It's true. The old records show it."

"Where did the people come from who first settled Trantor?"

"No one is certain. There are hundreds of planets which claim to have been populated in the dim mists of antiquity and whose people present fanciful tales about the nature of the first arrival of humanity. Historians tend to dismiss such things and to brood over the 'Origin Question."

"What is that? I've never heard of it."

"That doesn't surprise me. It's not a popular historical problem now, I admit, but there was a time during the decay of the Empire when it roused a certain interest among intellectuals. Salvor Hardin mentions it briefly in his memoirs. It's the question of the identity and location of the one Planet from which it all started. If we look backward in time, humanity flows inward from the most recently established worlds to older ones, to still older ones, until all concentrates on one-the original."

Trevize thought at once of the obvious flaw in the argument. "Might there not have been a large number of originals?"

"Of course not. All human beings all over the Galaxy are of a single species. A single species cannot originate on more than one planet. Quite impossible."

"How do you know?"

"In the first place-" Pelorat ticked off the first finger of his left hand with the first finger of his right, and then seemed to think better of what would undoubtedly have been a long and intricate exposition. He put both hands at his side and said with great earnestness, "My dear fellow, I give you my word of honor."

Trevize bowed formally and said, "I would not dream of doubting it, Professor Pelorat. Let us say, then, that there is one planet of origin, but might there not be hundreds who lay claim to the honor?"

"There not only might be, there are. Yet every claim is without merit. Not one of those hundreds that aspire to the credit of priority shows any trace of a prehyperspatial society, let alone any trace of human evolution from prehuman organisms."

"Then are you saying that there is a planet of origin, but that, for some reason, it is not making the claim?"

"You have hit it precisely."

"And you are going to search for it?"

"We are. That is our mission. Mayor Branno has arranged it all. You will pilot our ship to Trantor."

"To Trantor? It's not the planet of origin. You said that much a while ago."

"Of course Trantor isn't. Earth is."

"Then why aren't you telling me to pilot the ship to Earth?"

"I am not making myself clear. Earth is a legendary name. It is enshrined in ancient myths. It has no meaning we can be certain of, but it is convenient to use the word as a one-syllable synonym for 'the planet of origin of the human species.' just which planet in real space is the one we are defining as 'Earth' is not known."

"Will they know on Trantor?"

"I hope to find information there, certainly. Trantor possesses the Galactic Library, the greatest in the system."

"Surely that Library has been searched by those people you said were interested in the 'Origin Question' in the time of the First Empire."

Pelorat nodded thoughtfully, "Yes, but perhaps not well enough. I have learned a great deal about the 'Origin Question' that perhaps the Imperials of five centuries back did not know. I might search the old records with greater understanding, you see. I have been thinking about this for a long time and I have an excellent possibility in mind."

"You have told Mayor Branno all this, I imagine, and she approves?"

"Approves? My dear fellow, she was ecstatic. She told me that Trantor was surely the place to find out all I needed to know."

"No doubt," muttered Trevize.

That was part of what occupied him that night. Mayor Branno was sending him out to find out what he could about the Second Foundation. She was sending him with Pelorat so that he might mask his real aim with the pretended search for Earth—a search that could carry him anywhere in the Galaxy. It was a perfect cover, in fact, and he admired the Mayor's ingenuity.

But Trantor? Where was the sense in that? Once they were on Trantor, Pelorat would find his way into the Galactic Library and would never emerge. With endless stacks of books, films, and recordings, with innumerable computerizations and symbolic representations, he would surely never want to leave.

Besides that -

Ebling Mis had once gone to Trantor, in the Mule's time. The story was that he had found the location of the Second Foundation there and had died before he could reveal it. But then, so had Arkady Darell, and she had succeeded in locating the Second Foundation. But the location she had found was on Terminus itself, and there the nest of Second Foundationers was wiped out. Wherever the Second Foundation was now would be elsewhere, so what more had Trantor to tell? If be were looking for the Second Foundation, it was best to go anywhere but Trantor.

Besides that -

What further plans Branno had, he did not know, but he was not in the mood to oblige her. Branno had been ecstatic, had she, about a trip to Trantor? Well, if Branno wanted Trantor, they were not going to Trantor! -Anywhere else. -But not Trantor!

And worn out, with the night verging toward dawn, Trevize fell at last into a fitful slumber.

Mayor Branno had had a good day on the one following the arrest of Trevize. She had been extolled far beyond her deserts and the incident was never mentioned.

Nevertheless, she knew well that the Council would soon emerge from its paralysis and that questions would be raised. She would have to act quickly. So, putting a great many matters to one side, she pursued the matter of Trevize.

At the time when Trevize and Pelorat were discussing Earth, Branno was facing Councilman Munn Li Compur in the Mayoralty Office. As he sat across the desk from her, perfectly at ease, she appraised him once again.

He was smaller and slighter than Trevize and only two years older. Both were freshmen Councilmen, young and brash, and that must have been the only thing that held them together, for they were different in all other respects.

Where Trevize seemed to radiate a glowering intensity, Compur shone with an almost serene self-confidence. Perhaps it was his blond hair and blue eyes, not at all common among Foundationers. They lent him an almost feminine delicacy that (Branno judged) made him less attractive to women than Trevize was. He was clearly vain of his looks, though, and made the most of them, wearing his hair rather long and making sure that it was carefully waved. He wore a faint blue shadowing under his eyebrows to accentuate the eye color. (Shadowing of various tints had become common among men these last ten years.)

He was no womanizer. He lived sedately with his wife, but had not yet registered parental intent and was not known to have a clandestine second companion. That, too, was different from Trevize, who changed housemates as often as he changed the loudly colored sashes for which he was notorious.

There was little about either young Councilman that Kodell's department had not uncovered, and Kodell himself sat quietly in one corner of the room, exuding a comfortable good cheer as always.

Branno said, "Councilman Compur, you have done the Foundation good service, but unfortunately for yourself, it is not of the sort that can be praised in public or repaid in ordinary fashion."

Compor smiled. He had white and even teeth, and Branno idly wondered, for one flashing moment if all the inhabitants of the Sirius Sector looked like that. Compor's tale of stemming from that particular, rather peripheral, region went back to his maternal grandmother, who had also been blond-haired and blue-eyed and who had maintained that her mother was from the Sirius Sector. According to Kodell, however, there was no hard evidence in favor of that.

Women being what they were, Kodell had said, she might well have claimed distant and exotic ancestry to add to her glamour and her already formidable attractiveness.

"Is that how women are?" Branno had asked drily, and Kodell had smiled and muttered that he was referring to ordinary women, of course.

Compor said, "It is not necessary that the people of the Foundation know of my service-only that you do."

"I know and I will not forget. What I also will not do is to let you assume that your obligations are now over. You have embarked on a complicated course and you must continue. We want more about Trevize."

"I have told you all I know concerning him."

"That may be what you would have me believe. That may even be what you truly believe yourself. Nevertheless, answer my questions. Do you know a gentleman named Janov Pelorat?"

For just a moment Compor's forehead creased, then smoothed itself almost at once. He said carefully, "I might know him if I were to see him, but the name does not seem to cause any association within me."

"He is a scholar."

Compor's mouth rounded into a rather contemptuous but unsounded "Oh?" as though he were surprised that the Mayor would expect him to know scholars.

Branno said, "Pelorat is an interesting person who, for reasons of his own, has the ambition of visiting Trantor. Councilman Trevize will accompany him. Now, since you have been a good friend of Trevize and perhaps know his system of thinking, tell me- Do you think Trevize will consent to go to Trantor?"

Compor said, "If you see to it that Trevize gets on the ship, and if the ship is piloted to Trantor, what can he do but go there? Surely you don't suggest he will mutiny and take over the ship."

"You don't understand. He and Pelorat will be alone on the ship and it will be Trevize at the controls."

"You are asking whether he would go voluntarily to Trantor?"

"Yes, that is what I am asking."

"Madam Mayor, how can I possibly know what he will do?"

"Councilman Compor, you have been close to Trevize. You know his belief in the existence of the Second Foundation. Has he never spoken to you of his theories as to where it might exist, where it might be found?"

"Never, Madam Mayor."

"Do you think he will find it?"

Compor chuckled. "I think the Second Foundation, whatever it was and however important it might have been, was wiped out in the time of Arkady Darell. I believe her story."

"Indeed? In that case, why did you betray your friend? If he were searching for something that does not exist, what harm could he have done by propounding his quaint theories?"

Compor said, "It is not the truth alone that can harm. His theories may have been merely quaint, but they might have succeeded in unsettling the people of Terminus and, by introducing doubts and fears as to the Foundation's role in the great drama of Galactic history, have weakened its leadership of the Federation and its dreams of a Second Galactic Empire. Clearly you thought this yourself, or you would not have seized him on the floor of the Council, and you would not now be forcing him into exile without trial. Why have you done so, if I may ask, Mayor?"

"Shall we say that I was cautious enough to wonder if there were some faint chance that he might be right, and that the expression of his views might be actively and directly dangerous?"

Compor said nothing.

Branno said, "I agree with you, but I am forced by the responsibilities of my position to consider the possibility. Let me ask you again if you have any indication as to where he might think the Second Foundation exists, and where he might go."

"I have none."

"He has never given you any hints in that direction?"

"No, of course not."

"Never? Don't dismiss the thought easily. Think! Never?"

"Never," said Compor firmly.

"No hints? No joking remarks? No doodles? No thoughtful abstractions at moments that achieve significance as you look back on them?"

"None. I tell you, Madam Mayor, his dreams of the Second Foundation are the most nebulous starshine. You know it, and you but waste your time and your emotions in your concern over it."

"You are not by some chance suddenly changing sides again and protecting the friend you delivered into my hands?"

"No," said Compor. "I turned him over to you for what seemed to me to be good and patriotic reasons. I have no reason to regret the action, or to change my attitude."

"Then you can give me no hint as to where he might go once he has a ship at his disposal?"

"As I have already said-"

"And yet, Councilman," and here the lines of the Mayor's face so folded as to make her seem wistful, "I would like to know where he goes."

"In that case, I think you ought to place a hyper-relay on his ship."

"I have thought of that, Councilman. He is, however, a suspicious man and I suspect he will find it-however cleverly it might be placed. Of course, it might be placed in such a way that he cannot remove it without crippling the ship, and he might therefore be forced to leave it in place-

"An excellent notion."

"Except that," said Branno, "he would then be inhibited. He might not go where he would go if he felt himself free and untrammled. The knowledge I would gain would be useless to me."

"In that case, it appears you cannot find out where he will go."

"I might, for I intend to be very primitive. A person who expects the completely sophisticated and who guards against it is quite apt never to think of the primitive. -I'm thinking of having Trevize followed."

"Followed?"

"Exactly. By, another pilot in another spaceship. See how astonished you are at the thought? He would be equally astonished. He might not think of scouring space for an accompanying mass and, in any case, we will see to it that his ship is not equipped with our latest mass-detection devices."

Compor said, "Madam Mayor, I speak with all possible respect, but I must point out that you lack experience in space flight. To have one ship followed by another is never done-because it won't work. Trevize will escape with the first hyperspatial jump. Even if he doesn't know he is being followed, that first jump will be his path to freedom. If he doesn't have a hyper-relay on board ship, he can't be traced."

"I admit my lack of experience. Unlike you and Trevize, I have had no naval training. Nevertheless, I am told by my advisers-who have had such training-that if a ship is observed immediately prior to a jump, its direction, speed, and acceleration make it possible to guess what the jump might be-in a general way. Given a good computer and an excellent sense of judgment, a follower might duplicate the jump closely enough to pick up the trail at the other end -especially if the follower has a good mass-detector."

"That might happen once," said Compor energetically, "even twice if the follower is very lucky, but that's it. You can't rely on such things."

"Perhaps we can. -Councilman Compor, you have hyper-raced in your time. You see, I know a great deal about you. You are an excellent pilot and have done amazing things when it comes to following a competitor through a jump."

Compor's eyes widened. He almost squirmed in his chair. "I was in college then. I am older now."

"Not too old. Not yet thirty-five. Consequently you are going to follow Trevize, Councilman. Where he goes, you will follow, and you will report back to me. You will leave soon after Trevize does, and he will be leaving in a few hours. If you refuse the task, Councilman, you will be imprisoned for treason. If you take the ship that we will provide for you, and if you fail to follow, you need not bother coming back. You will be shot out of space if you try."

Compor rose sharply- to his feet. "I have a life to live. I have work to do. I have a wife. I cannot leave it all."

"You will have to. Those of us who choose to serve the Foundation must be prepared at all times to serve it in a prolonged and uncomfortable fashion, if that should become necessary."

"My wife must go with me, of course."

"Do you take me for an idiot? She stays here, of course."

"As a hostage?"

"If you like the word. I prefer to say that you will be taking yourself into danger and my kind heart wants her to stay here where she will not be in danger. -There is no room for discussion. You are as much under arrest as Trevize is, and I am sure you understand I must act quickly - before the euphoria enveloping Terminus wears off. I fear my star will soon be in the descendant."

Kodell said, "You were not easy on him, Madam Mayor."

The Mayor said with a sniff, "Why should I have been? He betrayed a friend."

"That was useful to us."

"Yes, as it happened. His next betrayal, however, might not be."

"Why should there be another?"

"Come, Liono," said Branno impatiently, "don't play games with me. Anyone who displays a capacity for double-dealing must forever be suspected of being capable of displaying it again."

"He may use the capability to combine with Trevize once again. Together, they may-"

"You don't believe that. With all his folly and naivete, Trevize goes straight for his goal. He does not understand betrayal and he will never, under any circumstances, trust Compor a second time."

Kodell said, "Pardon me, Mayor, but let me make sure I follow your thinking. How far, then, can you trust Compor? How do you know he will follow Trevize and report honestly? Do you count on his fears for the welfare of his wife as a restraint? His longing to return to her?"

"Both are factors, but I don't entirely rely on that. On Compor's ship there will be a hyper-relay. Trevize would suspect pursuit and would search for one. However Compor - being the pursuer-will, I assume, not suspect pursuit and will not search for one. -Of course, if he does, and if he finds it, then we must depend on the attractions of his wife."

Kodell laughed. "To think I once had to give you lessons. And the purpose of the pursuit?"

"A double layer of protection. If Trevize is caught, it may be that Compor will carry on and give us the information that Trevize will not be able to."

"One more question. What if, by some chance, Trevize finds the Second Foundation, and we learn of it through him, or through Compor, or if we gain reason to suspect its existence-despite the deaths of both?"

"I'm hoping the Second Foundation does exist, Liono," she said. "In any case, the Seldon Plan is not going to serve us much longer. The great Hari Seldon devised it in the dying days of the Empire, when technological advance had virtually stopped. Seldon was a product of his times, too, and however brilliant this semimythical science of psychohistory must have been, it could not rise out of its roots. It surely would not allow for rapid technological advance. The Foundation has been achieving that, especially in this last century. We have mass-detection devices of a kind undreamed of earlier, computers that can respond to thought, and-most of all-mental shielding. The Second Foundation cannot control us for much longer, if they can do so now. I want, in my final years in power, to be the one to start Terminus on a new path."

"And if there is, in fact, no Second Foundation?"

"Then we start on a new path at once."

The troubled sleep that had finally come to Trevize did not last long. A touch on his shoulder was repeated a second time.

Trevize started up, bleary and utterly failing to understand why he should be in a strange bed. "What - What-?"

Pelorat said to him apologetically, "I'm sorry, Councilman Trevize. You are my guest and I owe you rest, but the Mayor is here." He was standing at the side of the bed in flannel pajamas and shivering slightly. Trevize's senses leaped to a weary wakefulness and he remembered.

The Mayor was in Pelorat's living room, looking as composed as always. Kodell was with her, rubbing lightly at his white mustache.

Trevize adjusted his sash to the proper snugness and wondered how long the two of them-Branno and Kodell - were ever apart.

Trevize said mockingly, "Has the Council recovered yet? Are its members concerned over the absence of one of them?"

The Mayor said, "There are signs of life, yes, but not enough to do you any good. There is no question but that I still have the power to force you to leave. You will be taken to Ultimate Spaceport-"

"Not Terminus Spaceport, Madam Mayor? Am I to be deprived of a proper farewell from weeping thousands?"

"I see you have recovered your penchant for teenage silliness, Councilman, and I am pleased. It stills what might otherwise be a certain rising twinge of conscience. At Ultimate Spaceport, you and Professor Pelorat will leave quietly."

"And never return?"

"And perhaps never return. Of course," and here she smiled briefly, "if you discover something of so great an importance and usefulness that even I will be glad to have you back with your information, you will return. You may even be treated with honor."

Trevize nodded casually, "That may happen."

"Almost anything may happen. -In any case, you will be comfortable. You are being assigned a recently completed pocket-cruiser, the Far Star, named for Hober

Mallow's cruiser. One person can handle it, though it will hold as many as three with reasonable comfort."

Trevize was jolted out of his carefully assumed mood of light irony. "Fully armed?"

"Unarmed but otherwise fully equipped. Wherever you go, you will be citizens of the Foundation and there will always be a consul to whom you can turn, so you will not require arms. You will be able to draw on funds at need. -Not unlimited funds, I might add."

"You are generous."

"I know that, Councilman. But, Councilman, understand me. You are helping Professor Pelorat search for Earth. Whatever you think you are searching for, you are searching for Earth. All whom you meet must understand that. And always remember that the Far Star is not armed."

"I am searching for Earth;" said Trevize. "I understand that perfectly."

"Then you will go now."

"Pardon me, but surely there is more to all of this than we have discussed. I have piloted ships in my time, but I have had no experience with a late-model pocket-cruiser. What if I cannot pilot it?"

"I am told that the Far Star is thoroughly computerized. -And before you ask, you don't have to know how to handle a late-model ship's computer. It will itself tell you anything you need to know. Is there anything else you need?"

Trevize looked down at himself ruefully. "A change of clothing."

"You will find them on board ship. Including those girdles you wear, or sashes, whichever they are called. The professor is also supplied with what he needs. Everything reasonable is already aboard, although I hasten to add that this does not include female companions."

"Too bad," said Trevize. "It would be pleasant, but then, I have no likely candidate at the moment, as it happens. Still, I presume the Galaxy is populous and that once away from here I may do as I Please."

"With regard to companions? Suit yourself."

She rose heavily. "I will not take you to the spaceport," she said, "but there are those who will, and you must make no effort to do anything you are not told to do. I believe they will kill you if you make an effort to escape. The fact that I will not be with them will remove any inhibition."

Trevize said, "I will make no unauthorized effort, Madam Mayor, but one thing-

"Yes?"

Trevize searched his mind rapidly and finally said with a smile that he very much hoped looked unforced, "The time may come, Madam Mayor, when you will ask me for an effort. I will then do as I choose, but I will remember the past two days."

Mayor Branno sighed. "Spare me the melodrama. If the time comes, it will come, but for now-I am asking for nothing."

4. SPACE

THE SHIP LOOKED EVEN MORE IMPRESSIVE THAN TREVIZE - WITH HIS memories of the time when the new cruiser-class had been glowingly publicized-had expected.

It was not the size that was impressive-for it was rather small. It was designed for maneuverability and speed, for totally gravitic engines, and most of all for advanced computerization. It didn't need size-size would have defeated its purpose.

It was a one-man device that could replace, with advantage, the older ships that required a crew of a dozen or more. With a second or even a third person to establish shifts of duty, one such ship could fight off a flotilla of much larger non-Foundation ships. In addition, it could outspeed and escape from any other ship in existence.

There was a sleekness about it-not a wasted line, not a superfluous curve inside or out. Every cubic meter of volume was used to its maximum, so as to leave a paradoxical aura of spaciousness within. Nothing the Mayor might have said about the importance of his mission could have impressed Trevize more than the ship with which he was asked to perform it.

Branno the Bronze, he thought with chagrin, had maneuvered him into a dangerous mission of the greatest significance. He might not have accepted with such determination had she not so arranged matters that he wanted to show her what he could do.

As for Pelorat, he was transported with wonder. "Would you believe," he said, placing a gentle finger on the hull before he had climbed inside, "that I've never been close to a spaceship?"

"I'll believe it, of course, if you say so, Professor, but how did you manage it?"

"I scarcely know, to be honest with you, dear fel-, I mean, my dear Trevize. I presume I was overly concerned with my research. When one's home has a really excellent computer capable of reaching other computers anywhere in the Galaxy, one scarcely needs to budge, you know. -Somehow I expected spaceships to be larger than this."

"This is a small model, but even so, it's much larger inside than any other ship of this size."

"How can that be? You are making fun of my ignorance."

"No, no. I'm serious. This is one of the first ships to be completely graviticized."

"What does that mean? -But please don't explain if it requires extensive physics. I will take your word, as you took mine yesterday in connection with the single species of humanity and the single world of origin."

"Let's try, Professor Pelorat. Through all the thousands of years of space flight, we've had chemical motors and ionic motors and hyperatomic motors, and all these things have been bulky. The old Imperial Navy had ships five hundred meters long with

no more living space in them than would fit into a small apartment. Fortunately the Foundation has specialized in miniaturization through all the centuries of its existence, thanks to its lack of material resources. This ship is the culmination. It makes use of antigravity and the device that makes that possible takes up virtually no space and is actually included in the hull. If it weren't that we still need the hyperatomic-

A Security guard approached. "You will have to get on, gentlemen!"

The sky was grooving light, though sunrise was still half an hour off.

Trevize looked about. "Is my baggage loaded?"

"Yes, Councilman, you will find the ship fully equipped."

"With clothing, I suppose, that is not my size or to my taste."

The guard smiled, quite suddenly and almost boyishly. "I think it is," he said. "The Mayor had us working overtime these last thirty or forty hours and we've matched what you had closely. Money no object. Listen," he looked about as though to make sure no one noticed his sudden fraternization, "you two are lucky. Best ship in the world. Fully equipped, except for armament. You're swimming in cream."

"Sour cream, possibly," said Trevize. "Well, Professor, are you ready?"

"With this I am," Pelorat said and held up a square wafer about twenty centimeters to the side and encased in a jacket of silvery plastic. Trevize was suddenly aware that Pelorat had been holding it since they had left his home, shifting it from hand to hand and never putting it down, even when they had stopped for a quick breakfast.

"What's that, Professor?"

"My library. It's indexed by subject matter and origin and I've gotten it all into one wafer. If you think this ship is a marvel, how about this wafer? A whole library! Everything I have collected! Wonderful! Wonderful!"

"Well," said Trevize, "we are swimming in cream."

Trevize marveled at the inside of the ship. The utilization of space was ingenious. There was a storeroom, with supplies of food, clothing, films, and games. There was a gym, a parlor, and two nearly identical bedrooms.

"This one," said Trevize, "must be yours, Professor. At least, it contains an FX Reader."

"Good," said Pelorat with satisfaction. "What an ass I have been to avoid space flight as I have. I could live here, my dear Trevize, in utter satisfaction."

"Roomier than I expected," said Trevize with pleasure.

"And the engines are really in the hull, as you said?"

"The controlling devices are, at any rate. We don't have to store fuel or make use of it on the spot. We're making use of the fundamental energy store of the Universe, so that the fuel and the engines are all-out there." He gestured vaguely.

"Well, now that I think of it-what if something goes wrong?"

Trevize shrugged. "I've been trained in space navigation, but not on these ships. If something goes wrong with the gravitics, I'm afraid there's nothing I can do about it."

"But can you run this ship? Pilot it?"

"I'm wondering that myself."

Pelorat said, "Do you suppose this is an automated ship? Might we not merely be passengers? We might simply be expected to sit here."

"They have such things in the case of ferries between planets and space stations within a stellar system, but I never heard of automated hyperspace travel. At least, not so far. -Not so far."

He looked about again and there was a trickle of apprehension within him. Had that harridan Mayor managed to maneuver that far ahead of him? Had the Foundation automated interstellar travel, too, and was he going to be deposited on Trantor quite against his will, and with no more to say about it than any of the rest of the furniture aboard ship?

He said with a cheerful animation he didn't feel, "Professor, you sit down. The Mayor said this ship was completely computerized. If your room has the FX Reader, mine ought to have a computer in it. Make yourself comfortable and let me look around a bit on my own."

Pelorat looked instantly anxious. "Trevize, my dear chap- You're not getting off the ship, are you?"

"Not my plan at all, Professor. And if I tried, you can count on my being stopped. It is not the Mayor's intention to allow me off. All I'm planning to do is to learn what operates the Far Star." He smiled, "I won't desert you, Professor."

He was still smiling as he entered, what he felt to be his own bedroom, but his face grew sober as he closed the door softly behind him. Surely there must be some means of communicating with a planet in the neighborhood of the ship. It was impossible to imagine a ship deliberately sealed off from its surroundings and, therefore, somewhere - perhaps in a wall recess-there would have to be a Reacher. He could use it to call the Mayor's office to ask about controls.

Carefully he inspected the walls, the headboard of the bed, and the neat, smooth furniture. If nothing turned up here, he would go through the rest of the ship.

He was about to turn away when his eye caught a glint of light on the smooth, light brown surface of the desk. A round circle of light, with neat lettering that read: COMPUTER INSTRUCTIONS.

Ah!

Nevertheless his heart beat rapidly. There were computers and computers, and there were programs that took a long time to master. Trevize had never made the mistake of underestimating his own intelligence, but, on the other hand, he was not a Grand Master. There were those who had a knack for using a computer, and those who had not - and Trevize knew very well into which class he fell.

In his hitch in the Foundation Navy, he had reached the rank of lieutenant and had, on occasion, been officer of the day and had had occasion to use the ship's computer. He had never been in sole charge of it, however, and he had never been expected to know anything more than the routine maneuvers being officer of the day required.

He remembered, with a sinking feeling, the volumes taken up by a fully described program in printout, and he could recall the behavior of Technical Sergeant Krasnet at the

console of the ship's computer. He played it as though it were the most complex musical instrument in the Galaxy, and did it all with an air of nonchalance, as though he were bored at its simplicity-yet even he had had to consult the volumes at times, swearing at himself in embarrassment.

Hesitantly Trevize placed a finger on the circle of light and at once the light spread out to cover the desk top. On it were the outline of two hands: a right and a left. With a sudden, smooth movement, the desk top tilted to an angle of forty-five degrees.

Trevize took the seat before the desk. No words were necessary. It was clear what he was expected to do.

He placed his hands on the outlines on the desk, which were positioned for him to do so without strain. The desk top seemed soft, nearly velvety, where he touched it-and his hands sank in.

He stared at his hands with astonishment, for they had not sunk in at all. They were on the surface, his eyes told him. Yet to his sense of touch it was as though the desk surface had given way, and as though something were holding his hands softly and warmly.

Was that all?

Now what?

He looked about and then closed his eyes in response to a suggestion.

He had heard nothing. He had heard nothing!

But inside his brain, as though it were a vagrant thought of his own, there was the sentence, "Please close your eyes. Relax. We will make connection."

Through the hands?

Somehow Trevize had always assumed that if one were going to communicate by thought with a computer, it would be through a hood placed over the head and with electrodes against the eyes and skull.

The hands?

But why not the hands? Trevize found himself floating away, almost drowsy, but with no loss of mental acuity. Why not the hands?

The eyes were no more than sense organs. The brain was no more than a central switchboard, encased in bone and removed from the working surface of the body. It was the hands that were the working surface, the hands that felt and manipulated the Universe.

Human beings thought with their hands. It was their hands that were the answer of curiosity, that felt and pinched and turned and lifted and hefted. There were animals that had brains of respectable size, but they had no hands and that made all the difference.

And as he and the computer held hands, their thinking merged and it no longer mattered whether his eyes were open or closed. Opening them did not improve his vision nor did closing them dim it.

Either way, he saw the room with complete clarity-not just in the direction in which he was looking, but all around and above and below.

He saw every room in the spaceship and he saw outside as well. The sun had risen and its brightness was dimmed in the morning mist, but he could look at it directly without being dazzled, for the computer automatically filtered the light waves.

He felt the gentle wind and its temperature, and the sounds of the world about him. He detected the planet's magnetic field and the tiny electrical charges on the wall of the ship.

He became aware of the controls of the ship, without even knowing what they were in detail. He knew only that if he wanted to lift the ship, or turn it, or accelerate it, or make use of any of its abilities, the process was the same as that of performing the analogous process to his body. He had but to use his will.

Yet his will was not unalloyed. The computer itself could override. At the present moment, there was a formed sentence in his head and he knew exactly when and how the ship would take off. There was no flexibility where that was concerned. Thereafter, he knew just as surely, he would himself be able to deride.

He found-as he cast the net of his computer-enhanced consciousness outward-that he could sense the condition of the upper atmosphere; that he could see the weather patterns; that he could detect the other ships that were swarming upward and the others that were settling downward. All of this had to be taken into account and the computer was taking it into account. If the computer had not been doing so, Trevize realized, he need only desire the computer to do so-and it would be done.

So much for the volumes of programming; there were none. Trevize thought of Technical Sergeant Krasnet and smiled. He had read often enough of the immense revolution that gravities would make in the world, but the fusion of computer and mind was still a state secret. It would surely produce a still greater revolution.

He was aware of time passing. He knew exactly what time it was by Terminus Local and by Galactic Standard.

How did he let go?

And even as the thought entered his mind, his hands were released and the desk top moved back to its original position-and Trevize was left with his own unaided senses.

He felt blind and helpless as though, for a time, he had been held and protected by a superbeing and now was abandoned. Had he not known that he could make contact again at any time, the feeling might have reduced him to tears.

As it was he merely struggled for re-orientation, for adjustment to limits, then rose uncertainly to his feet and walked out of the room.

Pelorat looked up. He had adjusted his Reader, obviously, and he said, "It works very well. It has an excellent Search Program. -Did you find the controls, my boy?"

"Yes, Professor. All is well."

"In that case, shouldn't we do something about takeoff? I mean, self-protection? Aren't we supposed to strap ourselves in or something? I looked about for instructions, but I didn't find anything and that made me nervous. I had to turn to my library. Somehow when I am at my work-"

Trevize had been pushing his hands at the professor as though to dam and stop the flood of words. Now he had to speak loudly in order to override him. "None of that is necessary, Professor. Antigravity is the equivalent of noninertia. There is no feeling of acceleration when velocity changes, since everything on the ship undergoes the change simultaneously."

"You mean, we won't know when we are off the planet and out in space?"

"It's exactly what I mean, because even as I speak to you, we have taken off. We will be cutting through the upper atmosphere in a very few minutes and within half an hour we will be in outer space."

Pelorat seemed to shrink a little as he stared at Trevize. His long rectangle of a face grew so blank that, without showing any emotion at all, it radiated a vast uneasiness.

Then his eyes shifted right-Left.

Trevize remembered how he had felt on his own first trip beyond the atmosphere.

He said, in as matter-of-fact a manner as he could, "Janov," (it was the first time he had addressed the professor familiarly, but in this case experience was addressing inexperience and it was necessary to seem the older of the two) "we are perfectly safe here. We are in the metal womb of a warship of the Foundation Navy. We are not fully armed, but there is no place in the Galaxy where the name of the Foundation will not protect us. Even if some ship went mad and attacked, we could move out of its reach in a moment. And I assure you I have discovered that I can handle the ship perfectly."

Pelorat said, "It is the thought, Go-Golan, of nothingness-"

"Why, there's nothingness all about Terminus. There's just a thin layer of very tenuous air between ourselves on the surface and the nothingness just above. All we're doing is to go past that inconsequential layer."

"It may be inconsequential, but we breathe it."

"We breathe here, too. The air on this ship is cleaner and purer, and will indefinitely remain cleaner and purer than the natural atmosphere of Terminus."

"And the meteorites?"

"What about meteorites?"

"The atmosphere protects us from meteorites. Radiation, too, for that matter."

Trevize said, "Humanity has been traveling through space for twenty millennia, I believe-"

"Twenty-two. If we go by the Hallblockian chronology, it is quite plain that, counting the-"

"Enough! Have you heard of meteorite accidents or of radiation deaths? -I mean, recently? -I mean, in the case of Foundation ships?"

"I have not really followed the news in such matters, but I am a historian, my boy, and-"

"Historically, yes, there have been such things, but technology improves. There isn't a meteorite large enough to damage us that can possibly approach us before we take the necessary evasive action. Four meteorites-coming at us simultaneously from the four directions drawn from the vertices of a tetrahedron-might conceivably pin us down,

but calculate the chances of that and you'll find that you'll die of old. age a trillion trillion times over before you will have a fifty-fifty chance of observing so interesting a phenomenon."

"You mean, if you were at the computer?"

"No," said Trevize in Scorn. "If I were running the computer on the basis of my own senses and responses, we would be hit before I ever knew what was happening. It is the computer itself that is at work, responding millions of times faster than you or I could." He held out his hand abruptly. "Janov, come let me show you what the computer can do, and let me show you what space is like."

Pelorat stared, goggling a bit. Then he laughed briefly. "I'm not sure I wish to know, Golan."

"Of course you're not sure, Janov, because you don't know what it is that is waiting there to be known. Chance it! Come! Into my room!"

Trevize held the other's hand, half leading him, half drawing him. He said, as he sat down at the computer, "Have you ever seen the Galaxy, Janov? Have you ever looked at it?"

Pelorat said, "You mean in the sky?"

"Yes, certainly. Where else?"

"I've seen it. Everyone has seen it. If one looks up, one sees it."

"Have you ever stared at it on a dark, clear night, when the Diamonds are below the horizon?"

The "Diamonds" referred to those few stars that were luminous enough and close enough to shine with moderate brightness in the night sky of Terminus. They- were a small group that spanned a width of no more than twenty degrees, and for large parts of the night they were all below the horizon. Aside from the group, there was a scattering of dim stars just barely visible to the unaided eye. There was nothing more but the faint milky way of the Galaxy-the view one might expect when one dwelt on a world like Terminus which was at the extreme edge of the outermost spiral of the Galaxy.

"I suppose so, but why stare? It's a common sight."

"Of course it's a common sight," said Trevize. "That's why no one sees it. Why see it if you can always see it? But now you'll see it, and not from Terminus, where the mist and the clouds are forever interfering. You'll see it as you'd never see it from Terminus-no matter how you stared, and no matter how clear and dark the night. How I wish I had never been in space before, so that-like you-I could see the Galaxy in its bare beauty for the first time."

He pushed a chair in Pelorat's direction. "Sit there, Janov. This may take a little time. I have to continue to grow accustomed to the computer. From what I've already felt, I know the viewing is holographic, so we won't need a screen of any sort. It makes direct contact with my brain, but I think I can have it produce an objective image that you will see, too. -Put out the light, will you? -No, that's foolish of me. I'll have the computer do it. Stay where you are."

Trevize made contact with the computer, holding hands warmly and intimately.

The light dimmed, then went out completely, and in the darkness, Pelorat stirred.

Trevize said, "Don't get nervous, Janov. I may have a little trouble trying to control the computer, but I'll start easy and you'll have to be patient with me. Do you see it? The crescent?"

It hung in the darkness before them. A little dim and wavering at first, but getting sharper and brighter.

Pelorat's voice sounded awed. "Is that Terminus? Are we that far from it?"

"Yes, the ship's moving quickly."

The ship was curving into the night shadow of Terminus, which appeared as a thick crescent of bright light. Trevize had a momentary urge to send the ship in a wide arc that would carry them over the daylight side of the planet to show it in all its beauty, but he held back.

Pelorat might find novelty in this, but the beauty would be tame. There were too many photographs, too many reaps, too many globes. Every child knew what Terminus looked like. A water planet more so than most-rich in water and poor in minerals, good in agriculture and poor in heavy industry, but the best in the Galaxy in high technology and in miniaturization.

If he could have the computer use microwaves and translate it into a visible model, they would see every one of Terminus's ten thousand inhabited islands, together with the only one of them large enough to be considered a continent, the one that bore Terminus City and turn away!

It was just a thought, an exercise of the will, but the view shifted at once. The lighted crescent moved off toward the borders of vision and rolled off the edge. The darkness of starless space filled his eyes.

Pelorat cleared his throat. "I wish you would bring back Terminus, my boy. I feel as though I've been blinded." There was a tightness in his voice.

"You're not blind. Look!"

Into the field of vision came a filmy fog of pale translucence. It spread and became brighter, until the whole room seemed to glow.

Shrink!

Another exercise of will and the Galaxy drew off, as though seen through a diminishing telescope that was steadily growing more powerful in its ability to diminish. The Galaxy contracted and became a structure of varying luminosity.

Brighten!

It grew more luminous without changing size, and because the stellar system to which Terminus belonged was above the Galactic plane, the Galaxy was not seen exactly edge-on. It was a strongly foreshortened double spiral, with curving dark-nebula rifts streaking the glowing edge of the Terminus side. The creamy haze of the nucleus-far off and shrunken by the distance-looked unimportant.

Pelorat said in an awed whisper, "You are right. I have never seen it like this. I never dreamed it had so much detail."

"How could you? You can't see the outer half when Terminus's atmosphere is between you and it. You can hardly see the nucleus from Terminus's surface."

"What a pity we're seeing it so nearly head-on."

"We don't have to. The computer can show it in any orientation. I just have to express the wish-and not even aloud."

Shift coordinates!

This exercise of will was by no means a precise command. Yet as the image of Galaxy began to undergo a slow change, his mind guided the computer and had it do what he wished.

Slowly the Galaxy was turning so that it could be seen at right angles to the Galactic plane. It spread out like a gigantic, glowing whirlpool, with curves of darkness, and knots of brightness, and a central all-but-featureless blaze.

Pelorat asked, "How can the computer see it from a position in space that must be more than fifty thousand parsecs from this place?" Then he added, in a choked whisper, "Please forgive me that I ask. I know nothing about all this."

Trevize said, "I know almost as little about this computer as you do. Even a simple computer, however, can adjust coordinates and show the Galaxy in any position, starting with what it can sense in the natural position, the one, that is, that would appear from the computer's local position in space. Of course, it makes use only of the information it can sense to begin with, so when it changes to the broadside view we would find gaps and blurs in what it would show. In this case, though-

"Yes?"

"We have an excellent view. I suspect that the computer is outfitted with a complete map of the Galaxy and can therefore view it from any angle with equal ease."

"How do you mean, a complete map?"

"The spatial coordinates of every star in it must be in the computer's memory banks."

"Every star?" Pelorat seemed awed.

"Well, perhaps not all three hundred billion. It would include the stars shining down on populated planets, certainly, and probably every star of spectral class K and brighter. That means about seventy-five billion, at least."

"Every star of a populated system?"

"I wouldn't want to be pinned down; perhaps not all. There were, after all, twenty-five million inhabited systems in the time of Hari Seldon-which sounds like a lot but is only one star out of every twelve thousand. And then, in the five centuries since Seldon, the general breakup of the Empire didn't prevent further colonization. I should think it would have encouraged it. There are still plenty of habitable planets to expand into, so there may be thirty million now. It's possible that not all the new ones are in the Foundation's records."

"But the old ones? Surely they must all be there without exception."

"I imagine so. I can't guarantee it, of course, but I would be surprised if any long-established inhabited system were missing from the records. Let me show you something- if my ability to control the computer will go far enough."

Trevize's hands stiffened a bit with the effort and they seemed to sink further into the clasp of the computer. That might not have been necessary; he might only have had to think quietly and casually: Terminus!

He did think that and there was, in response, a sparkling red diamond at the very edge of the whirlpool.

"There's our sun," he said with excitement. "That's the star that Terminus circles."

"Ah," said Pelorat with a low, tremulous sigh.

A bright yellow dot of light sprang into life in a rich cluster of stars deep in the heart of the Galaxy but well to one side of the central haze. It was rather closer to the Terminus edge of the Galaxy than to the other side.

"And that," said Trevize, "is Trantor's sun."

Another sigh, then Pelorat said, "Are you sure? They always speak of Trantor as being located in the center of the Galaxy."

"It is, in a way. it's as close to the center as a planet can get and still be habitable. It's closer than any other major populated system. The actual center of the Galaxy consists of a black hole with a mass of nearly a million stars, so that the center is a violent place. As far as we know, there is no life in the actual center and maybe there just can't be any life there. Trantor is in the innermost subring of the spiral arms and, believe me, if you could see its night sky, you would think it was in the center of the Galaxy. It's surrounded by an extremely rich clustering of stars."

"Have you been on Trantor, Golan?" asked Pelorat in clear envy.

"Actually no, but I've seen holographic representations of its sky."

Trevize stared at the Galaxy somberly. In the great search for the Second Foundation during the time of the Mule, how everyone had played with Galactic maps- and how many volumes had been written and filmed on the subject.

And all because Hari Seldon had said, at the beginning, that the Second Foundation would be established "at the other end of the Galaxy," calling the place "Star's End."

At the other end of the Galaxy! Even as Trevize thought it, a thin blue line sprang into view, stretching from Terminus, through the Galaxy's central black hole, to the other end. Trevize nearly jumped. He had not directly ordered the line, but he had thought of it quite clearly and that had been enough for the computer.

But, of course, the straight-line route to the opposite side of the Galaxy was not necessarily an indication of the "other end" that Seldon had spoken of. It was Arkady Darell (if one could believe her autobiography) who had made use of the phrase "a circle has no end" to indicate what everyone now accepted as truth.

And though Trevize suddenly tried to suppress the thought, the computer was too quick for him. The blue line vanished and was replaced with a circle that neatly rimmed the Galaxy in blue and that passed through the deep red dot of Terminus's sun.

A circle has no end, and if the circle began at Terminus, then if we searched for the other end, it would merely return to Terminus, and there the Second Foundation had indeed been found, inhabiting the same world as the First.

But if, in reality, it had not been found-if the so-called finding of the Second Foundation had been an illusion-what then? What beside a straight line and a circle would make sense in this connection?

Pelorat said, "Are you creating illusions? Why is there a blue circle?"

"I was just testing my controls. -Would you like to locate Earth?"

There was silence for a moment or two, then Pelorat said, "Are you joking?"

"No. I'll try."

He did. Nothing happened.

"Sorry," said Trevize.

"It's not there? No Earth?"

"I suppose I might have misthought my command, but that doesn't seem likely. I suppose it's more likely that Earth isn't listed in the computer's vitals."

Pelorat said, "It may be listed under another name."

Trevize jumped at that quickly, "What other name, Janov?"

Pelorat said nothing and, in the darkness, Trevize smiled. It occurred to him that things might just possibly be falling into place. Let it go for a while. Let it ripen. He deliberately changed the subject and said, "I wonder if we can manipulate time."

"Time! How can we do that?"

"The Galaxy is rotating. It takes nearly half a billion years for Terminus to move about the grand circumference of the Galaxy once. Stars that are closer to the center complete the journey much more quickly, of course. The motion of each star, relative to the central black hole, might be recorded in the computer and, if so, it may be possible to have the computer multiply each motion by millions of times and make the rotational effect visible. I can try to have it done."

He did and he could not help his muscles tightening with the effort of will he was exerting-as though he were taking hold of the Galaxy and accelerating it, twisting it, forcing it to spin against terrible resistance.

The Galaxy was moving. Slowly, mightily, it was twisting in the direction that should be working to tighten the spiral arms.

Time was passing incredibly rapidly as they watched-a false, artificial time-and, as it did so, stars became evanescent things.

Some of the larger ones-here and there-reddened and grew brighter as they expanded into red giants. And then a star in the central clusters blew up soundlessly in a blinding blaze that, for a tiny fraction of a second, dimmed the Galaxy and then was gone. Then another in one of the spiral arms, then still another not very far away from it.

"Supernovas," said Trevize a little shakily.

Was it possible that the computer could predict exactly which stars would explode and when? Or was it just using a simplified model that served to show the starry future in general terms, rather than precisely?

Pelorat said in a husky whisper, "The Galaxy looks like a living thing, crawling through space."

"It does," said Trevize, "but I'm growing tired. Unless I learn to do this less tensely, I'm not going to be able to play this kind of game for long."

Ire let go. The Galaxy slowed, then halted, then tilted, until it was in the view-from-the-side from which they had seen it at the start.

Trevize closed his eyes and breathed deeply. He was aware of Terminus shrinking behind them, with the last perceptible wisps of atmosphere gone from their surroundings. He was aware of all the ships filling Terminus's near-space.

It did not occur to him to check whether there was anything special about any one of those ships. Was there one that was gravitic like his own and matched his trajectory more closely than chance would allow?

5. SPEAKER

TRANTOR!

For eight thousand years, it was the capital of a large and mighty political entity that spanned an ever-growing union of planetary systems. For twelve thousand years after that, it was the capital of a political entity that spanned the entire Galaxy. It was the center, the heart, the epitome of the Galactic Empire.

It was impossible to think of the Empire without thinking of Trantor.

Trantor did not reach its physical peak until the Empire was far gone in decay. In fact, no one noticed that the Empire had lost its drive, its forward look, because Trantor gleamed in shining metal.

Its growth had peaked at the point where it was a planet-girdling city. Its population was stabilized (by law) at forty-five billion and the only surface greenery was at the Imperial Palace and the Galactic University/Library complex.

Trantor's land surface was metal-coated. Its deserts and its fertile areas were alike engulfed and made into warrens of humanity, administrative jungles, computerized elaborations, vast storehouses of food and replacement parts. Its mountain ranges were beaten down; its chasms filled in. The city's endless corridors burrowed under the continental shelves and the oceans were turned into huge underground aquacultural cisterns-the only (and insufficient native source of food and minerals.

The connections with the Outer Worlds, from which Trantor obtained the resources it required, depended upon its thousand spaceports, its ten thousand warships, its hundred thousand merchant ships, its million space freighters.

No city so vast was ever recycled so tightly. No planet in the Galaxy had ever made so much use of solar power or went to such extremes to rid itself of waste heat. Glittering radiators stretched up into the thin upper atmosphere upon the nightside and were withdrawn into the metal city on the dayside. As the planet turned, the radiators rose as night progressively fell around the world and sank as day progressively broke. So Trantor always had an artificial asymmetry that was almost its symbol.

At this peak, Trantor ran the Empire?

It ran it poorly, but nothing could have run the Empire well. The Empire was too large to be run from a single world-even under the most dynamic of Emperors. How could Trantor have helped but run it poorly when, in the ages of decay, the Imperial crown was traded back and forth by sly politicians and foolish incompetents and the bureaucracy had become a subculture of corruptibles?

But even at its worst, there was some self-propelled worth to the machinery. The Galactic Empire could not have been run without Trantor.

The Empire crumbled steadily, but as long as Trantor remained Trantor, a core of the Empire remained and it retained an air of pride, of millennia, of tradition and power and-exaltation.

Only when the unthinkable happened-when Trantor finally fell and was sacked; when its citizens were killed by the millions and left to starve by the billions; when its mighty metal coating was scarred and punctured and fused by the attack of the "barbarian" fleet-only then was the Empire considered to have fallen. The surviving remnants on the once-great world undid further what had been left and, in a generation, Trantor was transformed from the greatest planet the human race had ever seen to an inconceivable tangle of ruins.

That had been nearly two and a half centuries ago. In the rest of the Galaxy, Trantor-as-it-had-been still was not forgotten. It would live forever as the favored site of historical novels, the favored symbol and memory of the past, the favored word for sayings such as "All starships land on Trantor,"

"Like looking for a person in Trantor," and "No more alike than this and Trantor."
In all the rest of the Galaxy -

But that was not true on Trantor itself! Here the old Trantor was forgotten. The surface metal seas gone, almost everywhere. Trantor was now a sparsely settled world of self-sufficient farmers, a place where trading ships rarely came and were not particularly welcome when they did come. The very word "Trantor," though still in official use, had dropped out of popular speech. By present-day Trantorians, it was called "Name," which in their dialect was what would be called "Home" in Galactic Standard.

Quindor Shandess thought of all this and much more as he sat quietly in a welcome state of half-drowse, in which he could allow his mind to run along a self-propelled and unorganized stream of thought.

He had been First Speaker of the Second Foundation for eighteen years, and he might well bold on for ten or twelve years more if his mind remained reasonably vigorous and if he could continue to fight the political wars.

He was the analog, the mirror image, of the Mayor of Terminus, who ruled over the First Foundation, but how different they were in every respect. The Mayor of Terminus was known to all the Galaxy and the First Foundation was therefore simply "the Foundation" to all the worlds. The First Speaker of the Second Foundation was known only to his associates.

And yet it was the Second Foundation, under himself and his predecessors, who held the real power. The First Foundation was supreme in the realm of physical power, of technology, of war weapons. The Second Foundation was supreme in the realm of mental power, of the mind, of the ability to control. In any conflict between the two, what would it matter how many ships and weapons the First Foundation disposed of, if the Second Foundation could control the minds of those who controlled the ships and weapons?

But how long could he revel in this realization of secret power?

He was the twenty-fifth First Speaker and his incumbency was already a shade longer than average. Ought he, perhaps, not be too keen on holding on and keeping out the younger aspirants? There was Speaker Gendibal, the keenest and newest at the Table. Tonight they would spend time together and Shandess looked forward to it. Ought he look forward also to Gendibal's possible accession some day?

The answer to the question was that Shandess had no real thought of leaving his post. He enjoyed it too much.

He sat there, in his old age, still perfectly capable of performing his duties. His hair was gray, but it had always been light in color and he wore it cut an inch long so that the color scarcely mattered. His eyes were a faded blue and his clothing conformed to the drab styling of the Trantorian farmers.

The First Speaker could, if he wished, pass among the Hamish people as one of them, but his hidden power nevertheless existed. He could choose to focus his eyes and mind at any time and they would then act according to his will and recall nothing about it afterward.

It rarely happened. Almost never. The Golden Rule of the Second Foundation was, "Do nothing unless you must, and when you must act - hesitate."

The First Speaker sighed softly. Living in the old University, with the brooding grandeur of the ruins of the Imperial Palace not too far distant, made one wonder on occasion how Golden the Rule might be.

In the days of the Great Sack, the Golden Rule had been strained to the breaking point. There was no way of saving Trantor without sacrificing the Seldon Plan for establishing a Second Empire. It would have been humane to spare the forty-five billion, but they could not have been spared without retention of the core of the First Empire and that would have only delayed the reckoning. It would have led to a greater destruction some centuries later and perhaps no Second Empire ever.

The early First Speakers had worked over the clearly foreseen Sack for decades but had found no solution-no way of assuring both the salvation of Trantor and the eventual establishment of the Second Empire. The lesser evil had to be chosen and Trantor had died!

The Second Foundationers of the time had managed-by the narrowest of margins-to save the University/Library complex and there had been guilt forever after because of that, too. Though no one had ever demonstrated that saving the complex had led to the of the Mule, there was always the intuition that there was a connection.

How nearly that had wrecked everything!

Yet following the decades of the Sack and the Mule came the Golden Age of the Second Foundation.

Prior to that, for over two and a half centuries after Seldon's death, the Second Foundation had burrowed like moles into the Library, intent only on staying out of the way of the Imperials. They served as librarians in a decaying society that cared less and less for the ever-more-misnamed Galactic Library, which fell into the desuetude that best suited the purpose of the Second Foundationers.

It was an ignoble life. They merely conserved the Plan, while out at the end of the Galaxy, the First Foundation fought for its life against always greater enemies with neither help from the Second Foundation nor any real knowledge of it.

It was the Great Sack that liberated the Second Foundation - another reason (young Gendibal - who had courage-had recently said that it was the chief reason) why the Sack was allowed to proceed.

After the Great Sack, the Empire was gone and, in all the later times, the Trantorian survivors never trespassed on Second Foundation territory uninvited. The Second Foundationers saw to it that the University/Library complex which had survived the Sack also survived the Great Renewal. The ruins of the Palace were preserved, too. The metal was gone over almost all the rest of the world. The great and endless corridors were covered up, filled in, twisted, destroyed, ignored; all under rock and soil-all except here, where metal still surrounded the ancient open places.

It might be viewed as a grand memorial of greatness, the sepulcher of Empire, but to the Trantorians - the Hamish people-these were haunted places, filled with ghosts, not to be stirred. Only the Second Foundationers ever set foot in the ancient corridors or touched the titanium gleam.

And even so, all had nearly come to nothing because of the Mule.

The Mule had actually been on Trantor. What if he had found out the nature of the world he had been standing on? His physical weapons were far greater than those at the disposal of the Second Foundation, his mental weapons almost as great. The Second Foundation would have been hampered always by the necessity of doing nothing but what they must, and by the knowledge that almost any hope of tinning the immediate fight might portend a greater eventual loss.

Had it not been for Banta Darell and her swift moment of action- And that, too, had been without the help of the Second Foundation?

And then-the Golden ?age, when somehow the First Speakers of the time found ways of becoming active, stopping the Mule in his career of conquest, controlling his mind at last; and then stopping the First Foundation itself when it grew wary and overcurious concerning the nature and identity of the Second Foundation. There was Preem Palver, nineteenth First Speaker and greatest of them all, who had managed to put an end to all danger-not without terrible sacrifice - and who had rescued the Seldon Plan.

Now, for a hundred and twenty years, the Second Foundation was again as it once had been, hiding in a haunted portion of Trantor. They were hiding no longer from the Imperials, but from the First Foundation still-a First Foundation almost as large as the Galactic Empire had been and even greater in technological expertise.

The First Speaker's eyes closed in the pleasant warmth and he passed into that never-never state of relaxing hallucinatory experiences that were not quite dreams and not quite conscious thought.

Enough of gloom. All would be well. Trantor was still capital of the Galaxy, for the Second Foundation was here and it was mightier and more in control than ever the Emperor had been.

The First Foundation would be contained and guided and would move correctly. However formidable their ships and weapons, they could do nothing as long as key leaders could be, at need, mentally controlled.

And the Second Empire would come, but it would not be like the first. It would be a Federated Empire, with its parts possessing considerable self-rule, so that there would be none of the apparent strength and actual weakness of a unitary, centralized government. The new Empire would be looser, more pliant, more flexible, more capable of withstanding strain, and it would be guided always-always-by the hidden men and women of the Second Foundation. Trantor would then be still the capital, more powerful with its forty thousand psychohistorians than ever it had been with its forty-five billion.

The First Speaker snapped awake. The sun was lower in the sky. Had he been mumbling? Had he said anything aloud?

If the Second Foundation had to know much and say little, the ruling Speakers had to know mere and say less, and the First Speaker had to know mist and say least.

He smiled wryly. It was always so tempting to become a Trantorian patriot-to see the whole purpose of the Second Empire as that of bringing about Trantorian hegemony. Seldon had warned of it; he had foreseen even that, five centuries before it could come to pass.

The First Speaker had not slept too long, however. It was not yet time for Gendibal's audience.

Shandess was looking forward to that private meeting. Gendibal was young enough to look at the Plan with new eyes, and keen enough to see what others might not. And it was not beyond possibility that Shandess would learn from what the youngster had to say.

No one would ever be certain how much Preem Palver - the great Palver himself - had profited from that day when the young Kol Benjoam, not yet thirty, came to talk to him about possible ways of handling the First Foundation. Benjoam, who was later recognized as the greatest theorist since Seldon, never spoke of that audience in later years, but eventually he became the twenty-first First Speaker. There were some who credited Benjoam, rather than Palver, for the great accomplishments of Palver's administration.

Shandess amused himself with the thought of what Gendibal might say. It was traditional that keen youngsters, confronting the First Speaker alone for the first time, would place their entire thesis in the first sentence. And surely they would not ask for that precious first audience for something trivial-something that might ruin their entire subsequent career by convincing the First Speaker they were lightweights.

Four hours later, Gendibal faced him. The young man showed no sign of nervousness. He waited calmly for Shandess to speak first.

Shandess said, "You have asked for a private audience, Speaker, on a matter of importance. Could you please summarize the matter for me?"

And Gendibal, speaking quietly, almost as though he were describing what he had just eaten at dinner, said, "First Speaker, the Seldon Plan is meaningless!"

Stor Gendibal did not require the evidence of others to give him a sense of worth. He could not recall a time when he did not !:now himself to be unusual. He had been

recruited for the Second Foundation when he was only a ten-year-old boy by an agent who had recognized the potentialities of his mind.

He had then done remarkably well at his studies and had taken to psychohistory as a spaceship responds to a gravitational field. Psychohistory had pulled at him and he had curved toward it, reading Seldon's text on the fundamentals when others his age were merely trying to handle differential equations.

When he was fifteen, he entered Trantor's Galactic University (as the University of Trantor had been officially renamed), after an interview during which, when asked what his ambitions were, he had answered firmly, "To be First Speaker before I am forty."

He had not bothered to aim for the First Speaker's chair without qualification. To gain it, one way or another, seemed to him to be a certainty. It was to do it in youth that seemed to him to be the goal. Even Preem Palver had been forty-two on his accession.

The interviewer's expression had flickered when Gendibal had said that, but the young man already had the feel of psycholanguage and could interpret that flicker. He knew, as certainly as though the interviewer had announced it, that a small notation would go on his records to the effect that he would be difficult to handle.

Well, of course!

Gendibal intended to be difficult to handle.

He was thirty now. He would be thirty-one in a matter of two months and he was already a member of the Council of Speakers. He had nine years, at most, to become First Speaker and he knew he would make it. This audience with the present First Speaker was crucial to his plans and, laboring to present precisely the proper impression, he had spared no effort to polish his command of psycholanguage.

When two Speakers of the Second Foundation communicate with each other, the language is like no other in the Galaxy. It is as much a language of fleeting gestures as of words, as much a matter of detected mental-change patterns as anything else.

An outsider would hear little or nothing, but in a short time, much in the way of thought would be exchanged and the communication would be unreportable in its literal form to anyone but still another Speaker.

The language of Speakers had its advantage in speed and in infinite delicacy, but it had the disadvantage of making it almost impossible to mask true opinion.

Gendibal knew his own opinion of the First Speaker. He felt the First Speaker to be a man past his mental prime. The First Speaker -in Gendibal's assessment-expected no crisis, was not trained to meet one, and lacked the sharpness to deal with one if it appeared. With all Shandess's goodwill and amiability, he was the stuff of which disaster was made.

All of this Gendibal had to hide not merely from words, gestures, and facial expressions, but even from his thoughts. He knew no way of doing so efficiently enough to keep the First Speaker from catching a whiff of it.

Nor could Gendibal avoid knowing something of the First Speaker's feeling toward him. Through bonhomie and goodwill - quite apparent and reasonably sincere-Gendibal

could feel the distant edge of condescension and amusement, and tightened his own mental grip to avoid revealing any resentment in return-or as little as possible.

The First Speaker smiled and leaned back in his chair. He did not actually lift his feet to the desk top, but he got across just the right mixture of self-assured ease and informal friendship-just enough of each to leave Gendibal uncertain as to the effect of his statement.

Since Gendibal had not been invited to sit down, the actions and attitudes available to him that might be designed to minimize the uncertainty were limited. It was impossible that the First Speaker did not understand this.

Shandess said, "The Seldon Plan is meaningless? What a remarkable statement! Have you looked at the Prime Radiant lately, Speaker Gendibal?"

"I study it frequently, First Speaker. It is my duty to do so and my pleasure as well."

"Do you, by any chance, study only those portions of it that fall under your purview, now and then? Do you observe it in microfashion-an equation system here, an adjustment rivulet there? Highly important, of course, but I have always thought it an excellent occasional exercise to observe the whole course. Studying the Prime Radiant, acre by acre, has its uses-but observing it as a continent is inspirational. To tell you the truth, Speaker, I have not done it for a long time myself. Would you join me?"

Gendibal dared not pause too long. It had to be done, and it must be done easily and pleasantly or it might as well not be done. "It would be an honor and a pleasure, First Speaker."

The First Speaker depressed a lever on the side of his desk. There was one such in the office of every Speaker and the one in Gendibal's office was in no way inferior to that of the First Speaker. The Second Foundation was an equalitarian society in all its surface manifestations-the unimportant ones. In fact, the only official prerogative of the First Speaker was that which was explicit in his title he always spoke first.

The room grew dark with the depression of the lever but, almost at once, the darkness lifted into a pearly dimness. Both long walls turned faintly creamy, then brighter and whiter, and finally there appeared neatly printed equations-so small that they could not be easily read.

"If you have no objections," said the First Speaker, making it quite clear that there would be none allowed, "we will reduce the magnification in order to see as much at one time as we can."

The neat printing shrank down into fine hairlines, faint black meanderings over the pearly background.

The First Speaker touched the keys of the small console built into the arm of his chair. "We'll bring it back to the start-to the lifetime of Hari Seldon - and we'll adjust it to a small forward movement. We'll shutter it so that we can only see a decade of development at a time. It gives one a wonderful feeling of the flow of history, with no distractions by the details. I wonder if you have ever done this."

"Never exactly this way, First Speaker."

"You should. It's a marvelous feeling. Observe the sparseness of the black tracery at the start. There was not much chance for alternatives in the first few decades. The branch points, however, increase exponentially with time. Were it not for the fact that, as soon as a particular branch is taken, there is an extinction of a vast array of others in its future, all would soon become unmanageable. Of course, in dealing with the future, we must be careful what extinctions we rely upon."

"I know, First Speaker." There was a touch of dryness in Gendibal's response that he could not quite remove.

The First Speaker did not respond to it. "Notice the winding lines of symbols in red. There is a pattern to them. To all appearances, they should exist randomly, as even-Speaker earns his place by adding refinements to Seldon's original Plan. It would seem there is no way, after all, of predicting where a refinement can be added easily or where a particular Speaker will find his interests or his ability tending, and yet I have long suspected that the admixture of Seldon Black and Speaker Red follows a strict law that is strongly dependent on time and on very little else."

Gendibal watched as the years passed and as the black and red hairlines made an almost hypnotic interlacing pattern. The pattern meant nothing in itself, of course. What counted were the symbols of which it was composed.

Here and there a bright-blue rivulet made its appearance, bellying out; branching, and becoming prominent, then falling in upon itself and fading into the black or red.

The First Speaker said, "Deviation Blue," and the feeling of distaste, originating in each, filled the space between them. "We catch it over and over, and we'll be coming to the Century of Deviations eventually."

They did. One could tell precisely when the shattering phoneme- non of the Mule momentarily filled the Galaxy, as the Prime Radiant suddenly grew thick with branching rivulets of blue-more starting than could be closed down-until the room itself seemed to turn blue as the lines thickened and marked the wall with brighter and brighter pollution. (It was the only word.)

It reached its peak and then faded, thinned, and came together for a long century before it trickled to its end at last. When it was gone, and when the Plan had returned to black and red, it was clear that Preem Palver's hand had been there.

Onward, onward.

"That's the present," said the First Speaker comfortably.

Onward, onward.

Then a narrowing into a veritable knot of close-knit black with little red in it.

"That's the establishment of the Second Empire," said the First Speaker.

He shut off the Prime Radiant and the room was bathed in ordinary light.

Gendibal said, "That was an emotional experience."

"Yes," smiled the First Speaker, "and you are careful not to identify the emotion, as far as you can manage to fail to identify it. It doesn't matter. Let me make the points I wish to make."

"You will notice, first, the all-but-complete absence of Deviation Blue after the time of Preem Palver - over the last twelve decades, in other words. You will notice that there are no reasonable probabilities of Deviations above the fifth-class over the next five centuries. You will notice, too, that we have begun extending the refinements of psychohistory beyond the establishment of the Second Empire. As you undoubtedly know, Hari Seldon - although a transcendent genius-is not, and could not, be all-knowing. We have improved on him. We know more about psychohistory than he could possibly have known.

"Seldon ended his calculations with the Second Empire and we have continued beyond it. Indeed, if I may say so without offense, the new Hyper-Plan that goes past the establishment of the Second Empire is very largely my doing and has earned me my present post.

"I tell you all this so that you can spare me unnecessary talk. With all this, how do you manage to conclude that the Seldon Plan is meaningless? It is without flaw. The mere fact that it survived the Century of Deviations-with all due respect to Palver's genius-is the best evidence we have that it is without flaw. Where is its weakness, young man, that you should brand the Plan as meaningless?"

Gendibal stood stiffly upright. "You are right, First Speaker. The Seldon Plan has no flaw."

"You withdraw your remark, then?"

"No, First Speaker. Its lack of flaw is its flaw. Its flawlessness is fatal!"

The First Speaker regarded Gendibal with equanimity. He had learned to control his expressions and it amused him to watch Gendibal's ineptness in this respect. At every exchange, the young man did his best to hide his feelings, but each time, he exposed them completely.

Shandess studied him dispassionately. He was a thin young man, not much above the middle height, with thin lips and bony, restless hands. He had dark, humorless eyes that tended to smolder.

He would be, the First Speaker knew, a hard person to talk out of his convictions.

"You speak in paradoxes, Speaker," he said.

"It sounds like a paradox, First Speaker, because there is so much about Seldon's Plan that we take for granted and accept in so unquestioning a manner."

"And what is it you question, then?"

"The Plan's very basis. We all know that the Plan will not work if its nature-or even its existence-is known to too many of those whose behavior it is designed to predict."

"I believe Hari Seldon understood that. I even believe he made it one of his two fundamental axioms of psychohistory."

"He did not anticipate the Mule, First Speaker, and therefore he could not anticipate the extent to which the Second Foundation would become an obsession with the people of the First Foundation, once they had been shown its importance by the Mule."

"Hari Seldon-" and for one moment, the First Speaker shuddered and fell silent.

Hari Seldon's physical appearance was known to all the members of the Second Foundation. Reproductions of him in two and in three dimensions, photographic and holographic, in bas-relief and in the round, sitting and standing, were ubiquitous. They all represented him in the last few years of his life. All were of an old and benign man, face wrinkled with the wisdom of the aged, symbolizing the quintessence of well-ripened genius.

But the First Speaker now recalled seeing a photograph reputed to be Seldon as a young man. The photograph was neglected, since the thought of a young Seldon was almost a contradiction in terms. Yet Shandess had seen it, and the thought had suddenly come to him that Stor Gendibal looked remarkably like the young Seldon.

Ridiculous? It was the sort of superstition that afflicted everyone, now and then, however rational they might be. He was deceived by a fugitive similarity. If he had the photograph before him, he would see at once that the similarity was an illusion. Yet why should that silly thought have occurred to him now?

He recovered. It had been a momentary quaver—a transient derailment of thought—too brief to be noticed by anyone but a Speaker. Gendibal might interpret it as he pleased.

"Hari Seldon," he said very firmly the second time, "knew well that there were an infinite number of possibilities he could not foresee, and it was for that reason that he set up the Second Foundation. We did not foresee the Mule either, but he recognized him once he was upon us and we stopped him. We did not foresee the subsequent obsession of the First Foundation with ourselves, but we saw it when it came and we stopped it. What is it about this that you can possibly find fault with?"

"For one thing," said Gendibal, "the obsession of the First Foundation with us is not yet over."

There was a distinct ebb in the deference with which Gendibal had been speaking. He had noted the quaver in the First Speaker's voice (Shandess decided) and had interpreted it as uncertainty. That had to be countered.

The First Speaker said briskly, "Let me anticipate. There would be people on the First Foundation, who—comparing the hectic difficulties of the first nearly four centuries of existence with the placidity of the last twelve decades—will come to the conclusion that this cannot be unless the Second Foundation is taking good care of the Plan—and, of course, they will be right in so concluding. They will decide that the Second Foundation may not have been destroyed after all—and, of course, they will be right in so deciding. In fact, we've received reports that there is a young man on the First Foundation's capital world of Terminus, an official of their government, who is quite convinced of all this. —I forget his name—"

"Golan Trevize," said Gendibal softly. "It was I who first noted the matter in the reports, and it was I who directed the matter to your office."

"Oh?" said the First Speaker with exaggerated politeness. "And how did your attention come to be focused on him?"

"One of our agents on Terminus sent in a tedious report on the newly elected members of their Council—a perfectly routine matter usually sent to and ignored by all Speakers. This one caught my eye because of the nature of the description of one new Councilman, Golan Trevize. From the description, he seemed unusually self-assured and combative."

"You recognized a kindred spirit, did you?"

"Not at all," said Gendibal, stiffly. "He seemed a reckless person who enjoyed doing ridiculous things, a description which does not apply to me. In any case, I directed an in-depth study. It did not take long for me to decide that he would have made good material for us if he had been recruited at an early age."

"Perhaps," said the First Speaker, "but you know that we do not recruit on Terminus."

"I know that well. In any case, even without our training, he has an unusual intuition. It is, of course, thoroughly undisciplined. I was, therefore, not particularly surprised that he had grasped the fact that the Second Foundation still exists. I felt it important enough, however, to direct a memo on the matter to your office."

"And I take it from your manner that there is a new development?"

"Having grasped the fact that we still exist, thanks to his highly developed intuitive abilities, he then used it in a characteristically undisciplined fashion and has, as a result, been exiled from Terminus."

The First Speaker lifted his eyebrows. "You stop suddenly. You want me to interpret the significance. Without using my computer, let me mentally apply a rough approximation of Seldon's equations and guess that a shrewd Mayor, capable of suspecting that the Second Foundation exists, prefers not to have an undisciplined individual shout it to the Galaxy and thus alert said Second Foundation to the danger. I take it Branno the Bronze decided that Terminus is safer with Trevize off the planet."

"She might have imprisoned Trevize or had him quietly assassinated."

"The equations are not reliable when applied to individuals, as you well know. They deal only with humanity in mass. Individual behavior is therefore unpredictable and it is possible to assume that the Mayor is a humane individual who feels imprisonment, let alone assassination, is unmerciful."

Gendibal said nothing for a while. It was an eloquent nothing, and he maintained it just long enough for the First Speaker to grow uncertain of himself but not so long as to induce a defensive anger.

He timed it to the second and then he said, "That is not my interpretation. I believe that Trevize, at this moment, represents the cutting edge of the greatest threat to the Second Foundation in its history—a greater danger even than the Mule!"

Gendibal was satisfied. The force of the statement had worked well. The First Speaker had not expected it and was caught off-balance. From this moment, the whip hand was Gendibal's. If he had any doubt of that at all, it vanished with Shandess's next remark.

"Does this have anything to do with your contention that Seldon's Plan is meaningless?"

Gendibal gambled on complete certainty, driving in with a didacticism that would not allow the First Speaker to recover. He said, "First Speaker, it is an article of faith that it was Preem Palver who restored the Plan to its course after the wild aberrance of the Century of Deviations. Study the Prime Radiant and you will see that the Deviations did not disappear till two decades after Palver's death and that not one Deviation has appeared since. The credit might rest with the First Speakers since Palver, but that is improb-

"Improbable? Granted none of us have been Palvers, but-why? "

"Will you allow me to demonstrate, First Speaker? Using the mathematics of psychohistory, I can clearly show that the chances of total disappearance of Deviation are too microscopically small to have taken place through anything the Second Foundation can do. You need not allow me if you lack the time or the desire for the demonstration, which will take half an hour of close attention. I can, as an alternative, call for a full meeting of the Speaker's Table and demonstrate it there. But that would mean a loss of time for me and unnecessary controversy."

"Yes, and a possible loss of face for me. -Demonstrate the matter to me now. But a word of warning." The First Speaker was making a heroic effort to recover. "If what you show me is worthless, I will not forget that."

"If it proves worthless," said Gendibal with an effortless pride that overrode the other, "you will have my resignation on the spot."

It took, actually, considerably more than half an hour, for the First Speaker questioned the mathematics with near-savage intensity.

Gendibal made up some of the time by his smooth use of his MicroRadiant. The device-which could locate any portion of the vast Plan holographically and with required n either wall nor desk sized console-had come into use only a decade ago and the First Speaker had never learned the knack of handling it. Gendibal was aware of that. The First Speaker knew that he was.

Gendibal hooked it over his right thumb and manipulated it with his four fingers, using his hand deliberately as though it were a musical instrument. (Indeed, he had written a small paper on the analogies.)

The equations Gendibal produced (and found with sure ease) moved back and forth snakily to accompany his commentary. He could obtain definitions, if necessary; set up axioms; and produce graphics, both two-dimensional and three-dimensional (to say nothing of projections of multidimensional relationships).

Gendibal's commentary was clear and incisive and the First Speaker abandoned the game. He was won over and said, "I do not recall having seen an analysis of this nature. Whose work is it?"

"First Speaker, it is my own. I have published the basic mathematics involved."

"Very clever, Speaker Gendibal. Something like this will put you in line for the First Speakership, should I die-or retire."

"I have given that matter no thought, First Speaker-but since there's no chance of your believing that, I withdraw the comment. I have given it thought and I hope I will be First Speaker, since whoever succeeds to the post must follow a procedure that only I see clearly."

"Yes," said the First Speaker, "inappropriate modesty can be very dangerous. What procedure? Perhaps the present First Speaker may follow it, too. If I am too old to have made the creative leap you have, I am not so old that I cannot follow your direction."

It was a graceful surrender and Gendibal's heart warned, rather unexpectedly, toward the older man, even as he realized that this was precisely the First Speaker's intention.

"Thank you, First Speaker, for I will need your help badly. I cannot expect to sway the Table without your enlightened leadership." (Grace for grace.) "I assume, then, that you have already seen from what I have demonstrated that it is impossible for the Century of Deviations to have been corrected under our policies or for all Deviations to have ceased since then."

"This is clear to me," said the First Speaker. "If your mathematics is correct, then in order for the Plan to have recovered as it did and to work as perfectly as it seems to be working, it would be necessary for us to be able to predict the reactions of small groups of people - even of individuals-with some degree of assurance."

"Quite so. Since the mathematics of psychohistory does not allow this, the Deviations should not have vanished and, even more so, should not have remained absent. You see, then, what I meant when I said earlier that the flaw in the Seldon Plan was its flawlessness."

The First Speaker said, "Either the Seldon Plan does possess Deviations, then, or there is something wrong in your mathematics. Since I must admit that the Seldon Plan has not shown Deviations in a century and more, it follows that there is something wrong with your mathematics-except that I detected no fallacies or missteps."

"You do wrong," said Gendibal, "to exclude a third alternative. It is quite possible for the Seldon Plan to possess no Deviations and yet for there to be nothing wrong in my mathematics when it predicts that to be impossible."

"I fail to see the third alternative."

"Suppose the Seldon Plan is being controlled by means of a psychohistorical method so advanced that the reactions of small groups of people-even perhaps of individual persons-can be predicted, a method that we of the Second Foundation do not possess. Then, and only then, my mathematics would predict that the Seldon Plan should indeed experience no Deviations?"

For a while (by Second Foundation standards) the First Speaker made no response. He said, "There is no such advanced psychohistorical method that is known to me or, I am certain from your manner, to you. If you and I know of none, the chance that any other Speaker, or any group of Speakers, has developed such a micropsychohistory-if I may call

it that-and has kept it secret from the rest of the Table is infinitesimally small. Don't you agree?"

"I agree."

"Then either your analysis is wrong or else micropsychohistory is in the hands of some group outside the Second Foundation."

"Exactly, First Speaker, the latter alternative must be correct."

"Can you demonstrate the truth of such a statement?"

"I cannot, in any formal way; but consider- Has there not already been a person who could affect the Seldon Plan by dealing with individual people?"

"I presume you are referring to the Mule."

"Yes, certainly."

"The Mule could only disrupt. The problem here is that the Seldon Plan is working too well, considerably closer to perfection than your mathematics would allow. You would need an Anti-Mule-someone who is as capable of overriding the Plan as the Mule was, but who acts for the opposite motive-overriding not to disrupt but to perfect."

"Exactly, First Speaker. I wish I had thought of that expression. What was the Mule? A mutant. But where did he come from? How did he come to be? No one really knows. Might there not be more?"

"Apparently not. The one thing that is best known about the Mule is that he was sterile. Hence his name. Or do you think that is a myth?"

"I am not referring to descendants of the Mule. Might it not be that the Mule was an aberrant member of what is-or has now become-a sizable group of people with Mulous powers who-for some reason of their own-are not disrupting the Seldon Plan but supporting it?"

"Why in the Galaxy should they support it?"

"Why do we support it? We plan a Second Empire in which we -or, rather, our intellectual descendants-will be the decision makers. If, some other group is supporting the Plan even more efficiently than we are, they cannot be planning to leave the decision-making to us. They will make the decisions-but to what end? Ought we not try to find out what kind of a Second Empire they are sweeping us into?"

"And how do you propose to find out?"

"Well, why has the Mayor of Terminus exiled Golan Trevize? By doing so, she allows a possibly dangerous person to move freely about the Galaxy. That she does it out of motives of humanity, I cannot believe. Historically the rulers of the First Foundation have always acted realistically, which means, usually, without regard for 'morality.' One of their heroes-Salvor Hardin-counseled against morality, in fact. No, I think the Mayor acted under compulsion from agents of the Anti-Mules, to use your phrase. I think Trevize has been recruited by them and I think he is the spearhead of danger to us. Deadly danger."

And the First Speaker said, "By Seldon, you may be right. But how will we ever convince the Table of this?"

"First Speaker, you underestimate your eminence."

6. EARTH

TREVIZE WAS HOT AND ANNOYED. HE AND PELORAT WERE SITTING IN the small dining area, having just completed their midday meal.

Pelorat said, "We've only been in space two days and I find myself quite comfortable, although I miss fresh air, nature, and all that. Strange! Never seemed to notice all that sort of thing when it was all round me. Still between my wafer and that remarkable computer of yours, I have my entire library with me-or all that matters, at any rate. And I don't feel the least bit frightened of being out in space now. Astonishing!"

Trevize made a noncommittal sound. His eyes were inwardly focused.

Pelorat said gently, "I don't mean to intrude, Golan, but I don't really think you're listening. Not that I'm a particularly interesting person always been a bit of a bore, you know. Still, you seem preoccupied in another way. -Are we in trouble? Needn't be afraid to tell me, you know. Not much I could do, I suppose, but I won't go into panic, dear fellow."

"In trouble?" Trevize seemed to come to his senses, frowning slightly.

"I mean the ship. It's a new model, so I suppose there could be something wrong:" Pelorat allowed himself a small, uncertain smile.

Trevize shook his head vigorously. "Stupid of me to leave you in such uncertainty, Janov. There's nothing wrong at all with the ship. It's working perfectly. It's just that I've been looking for a hyper-relay."

"Ah, I see. -Except that I don't. What is a hyper-relay?"

"Well, let me explain, Janov. I am in communication with Terminus. At least, I can be anytime I wish and Terminus can, in reverse, be in communication with us. They know the ship's location, having observed its trajectory. Even if they had not, they could locate us by scanning near-space for mass, which would warn them of the presence of a ship or, possibly, a meteoroid. But they could further detect an energy pattern, which would not only distinguish a ship from a meteoroid but would identify a particular ship, for no two ships make use of energy in quite the same way. In some way, our pattern remains characteristic, no matter what appliances or instruments we turn on and off. The ship may be unknown, of course, but if it is a ship whose energy pattern is on record in Terminus-as ours is-it can be identified as soon as detected:'

Pelorat said, "It seems to me, Golan, that the advance of civilization is nothing but an exercise in the limiting of privacy."

"You may be right. Sooner or later, however, we must move through hyperspace or we will be condemned to remain within a parsec or two of Terminus for the rest of our lives. We will then be unable to engage in interstellar travel to any but the slightest degree. In passing through hyperspace, on the other hand, we undergo a discontinuity in ordinary space. We pass from here to there-and I mean across a gap of hundreds of parsecs sometimes-in an instant of experienced time. We are suddenly enormously far

away in a direction that is very difficult to predict and, in a practical sense, we can no longer be detected."

"I see that. Yes."

"Unless, of course, they have planted a hyper-relay on board. A hyperrelay sends out a signal through hyperspace - a signal characteristic of this ship-and the authorities on Terminus would know where we are at all times. That answers your question, you see. There would be nowhere in the Galaxy we could hide and no combination of jumps through hyperspace would make it possible for us to evade their instruments:"

"But, Golan," bald Pelorat softly, "don't 13'e want Foundation protection?"

"Yes, Janov, but only when we ask for it. You said the advance of civilization meant the continuing restriction of privacy. -Well. I don't want to be that advanced. I want freedom to move undetected as I wish - unless and until I want protection So I would feel better, a great deal better, if there weren't a hyper-relay on board."

"Have you found one, Golan?"

"No, I have not. If I had, I might be able to render it inoperative somehow."

"Would you know one if you saw it?"

"That's one of the difficulties. I might not be able to recognize it. I know what a hyper-relay looks like generally and I know ways of testing a suspicious object-but this is a late-model ship, designed for special tasks. A hyper-relay may have been incorporated into its design in such a way as to show no signs of its presence."

"On the other hand, maybe there is no hyper-relay present and that's why you haven't found it."

"I don't dare assume that and I don't like the thought of making a jump until I know."

Pelorat looked enlightened. "That's why we've just been drifting through space. I've been wondering why we haven't jumped. I've heard about jumps, you know. Been a little nervous about it, actually-been wandering when you'd order me to strap myself in or take a pill or something like that."

Trevize managed a smile. "No need for apprehension. These aren't ancient times. On a ship like this, you just leave it all to the computer. You give it your instructions and it does the rest. You won't know that anything has happened at all, except that the view of space will suddenly change. If you've ever seen a slide show, you'll know what happens when one slide is suddenly projected in place of another. Well, that's what the jump will seem like."

"Dear me. One won't feel anything? Odd! I find that somewhat disappointing."

"I've never felt anything and the ships I've been in haven't been as advanced as this baby of ours. -But it's not because of the hyperrelay that we haven't jumped. We have to get a bit further away from Terminus-and from the sun, too. The farther we are from any massive object, the easier to control the jump, to make re-emergence into space at exactly desired coordinates. In an emergency, you might risk a jump when you're only two hundred kilometers off the surface of a planet and just trust to luck that you'll end up safely. Since there is much more safe than unsafe volume in the Galaxy, you can

reasonably count on safety. Still, there's all-ways the possibility that random factors will cause you to re-emerge within a few million kilometers of a large star or in the Galactic core-and you will find yourself fried before you can blink. The further away you are from mass, the smaller those factors and the less likely it is that anything untoward will happen."

"In that case, I commend your caution. We're not in a tearing hurry,"

"Exactly. -Especially since I would dearly love to find the hyperrelay before I make a move. -Or find a way of convincing myself there is no hyper-relay."

Trevize seemed to drift off again into his private concentration and Pelorat said, raising his voice a little to surmount the preoccupation barrier, "How much longer do we have?"

"What?"

"I mean, when would you make the jump if you had no concerns over the hyper-relay, my dear chap?"

"At our present speed and trajectory, I should say on our fourth day out. I'll work out the proper time on the computer."

"Well, then, you still have two days for your search. May I make a suggestion?"

"Go ahead."

"I have always found in my own work-quite different from yours, of course, but possibly we may generalize-that zeroing in tightly on a particular problem is self-defeating. Why not relax and talk about something else, and your unconscious mind-not laboring under the weight of concentrated thought-may solve the problem for you."

Trevize looked momentarily annoyed and then laughed. "Well, why not? -Tell me, Professor, what got you interested in Earth? What brought up this odd notion of a particular planet from which we all started?"

"Ah!" Pelorat nodded his head reminiscently. "That's going back a while. Over thirty years. I planned to be a biologist when I was going to college. I was particularly interested in the variation of species on different worlds. The variation, as you know-well, maybe you don't know, so you won't mind if I tell you-is very small. All forms of life throughout the Galaxy-at least all that we have yet encountered-share a water-based protein/nucleic acid chemistry."

Trevize said, "I went to military college, which emphasized nucleonics and gravities, but I'm not exactly a narrow specialist. I know a bit about the chemical basis of life. We were taught that water, proteins, and nucleic acids are the only possible basis for life."

"That, I think, is an unwarranted conclusion. It is safer to say that no other form of life has yet been found-or, at any rate, been recognized - and let it go at that. What is more surprising is that indigenous species - that is, species found on only a single planet and no other-are few in number. Most of the species that exist, including Homo sapiens in particular, are distributed through all or most of the inhabited worlds of the Galaxy and are closely related biochemically, physiologically, and morphologically. The indigenous

species, on the other hand, are widely separated in characteristics from both the widespread forms and from each other."

"Well, what of that?"

"The conclusion is that one world in the Galaxy-one world-is different from the rest. Tens of millions of worlds in the Galaxy-no one knows exactly how many-have developed life. It was simple life, sparse life, feeble life-not very variegated, not easily maintained, and not easily spread. One world, one world alone, developed life in millions of species-easily millions-some of it very specialized, highly developed, very prone to multiplication and to spreading, and including us. We were intelligent enough to form a civilization, to develop hyperspatial flight, and to colonize the Galaxy-and, in spreading through the Galaxy, we took many other forms of lifeforms related to each other and to ourselves-along with us."

"If you stop to think of it," said Trevize rather indifferently, "I suppose that stands to reason. I mean, here we are in a human Galaxy. If we assume that it all started on some one world, then that one world would have to be different. But why not? The chances of life developing in that riotous fashion must be very slim indeed - perhaps one in a hundred million-so the chances are that it happened in one life-bearing world out of a hundred million. It had to be one."

"But what is it that made that particular one world so different from the others?" said Pelorat excitedly. "What were the conditions that made it unique?"

"Merely chance, perhaps. After all, human beings and the lifeforms they brought with them now exist on tens of millions of planets, all of which can support life, so all those worlds must be good enough."

"No! Once the human species had evolved, once it had developed a technology, once it had toughened itself in the hard struggle for survival, it could then adapt to life on any world that is in the least hospitable-on Terminus, for instance. But can you imagine intelligent life having developed on Terminus? When Terminus was first occupied by human beings in the days of the Encyclopedists, the highest form of plant life it produced was a mosslike growth on rocks; the highest forms of animal life were small coral-like growths in the ocean and insectlike flying organisms on land. We just about wiped them out and stocked sea and land with fish and rabbits and goats and grass and grain and trees and so on. We have nothing left of the indigenous life, except for what exists in zoos and aquaria."

"Hmm," said Trevize.

Pelorat stared at him for a full minute, then sighed and said, "You don't really care, do you? Remarkable! I find no one who does, somehow. My fault, I think. I cannot make it interesting, even though it interests me so much."

Trevize said, "It's interesting. It is. But-but-so what?"

"It doesn't strike you that it might be interesting scientifically to study a world that gave rise to the only really flourishing indigenous ecological balance the Galaxy has ever seen?"

"Maybe, if you're a biologist. -I'm not, you see. You must forgive me."

"Of course, dear fellow. It's just that I never found any biologists who were interested, either. I told you I was a biology major. I took it up with my professor and he wasn't interested. He told me to turn to some practical problem. That so disgusted me I took up history instead-which had been rather a hobby of mine from my teenage years, in any case-and tackled the 'Origin Question' from that angle."

Trevize said, "But at least it has given you a lifework, so you must be pleased that your professor was so unenlightened."

"Yes, I suppose one might look at it that way. And the lifework is an interesting one, of which I have never tired. -But I do wish it interested you. I hate this feeling of forever talking to myself."

Trevize leaned his head back and laughed heartily.

Pelorat's quiet face took on a trace of hurt. "Why are you laughing at me?"

"Not you, Janov," said Trevize. "I was laughing at my own stupidity. Where you're concerned, I am completely grateful. You were perfectly right, you know,"

"To take up the importance of human origins?"

"No, no. -Well, yes, that too. -But I meant you were right to tell me to stop consciously thinking of my problem and to turn my mind elsewhere. It worked. When you were talking about the manner in which life evolved, it finally occurred to me that I knew how to find that hyperrelay-if it existed."

"Oh, that!"

"Yes, that! That's my monomania at the moment. I've been looking for that hyper-relay as though I were on my old scow of a training ship, studying every part of the ship by eye, looking for something that stood out from the rest. I had forgotten that this ship is a developed product of thousands of years of technological evolution. Don't you see?"

"No, Golan."

"We have a computer aboard. How could I have forgotten?"

He waved his hand and passed into his own room, urging Pelorat along with him.

"I need only try to communicate," he said, placing his hands onto the computer contact.

It was a matter of trying to reach Terminus, which was now some thousands of kilometers behind.

Reach! Speak! It was as though nerve endings sprouted and extended, reaching outward with bewildering speed-the speed of light, of course - to make contact.

Trevize felt himself touching-well, not quite touching, but sensing - well, not quite sensing, but-it didn't matter, for there wasn't a word for it.

He was aware of Terminus within reach and, although the distance between himself and it was lengthening by some twenty kilometers per second, contact persisted as though planet and ship were motionless and separated by a few meters.

He said nothing. He clamped shut. He was merely testing the principle of communication; he was not actively communicating.

Out beyond, eight parsecs away, was Anacreon, the nearest large planet-in their backyard, by Galactic standards. To send a message by the same light-speed system that

had just worked for Terminus - and to receive an answer as well-would take fifty-two years.

Reach for Anacreon! Think Anacreon! Think it as clearly as you can. You know its position relative to Terminus and the Galactic core; you've studied its planetography and history; you've solved military problems where it was necessary to recapture Anacreon (in the impossible case - these days-that it was taken by an enemy).

Space! You've been on Anacreon.

Picture it! Picture it! You will sense being on it via hyper-relay.

Nothing! His nerve endings quivered and came to rest nowhere.

Trevize pulled loose. "There's no hyper-relay on board the Far Star, Janov. I'm positive. -And if I hadn't followed your suggestion, I wonder how long it would have taken me to reach this point."

Pelorat, without moving a facial muscle, positively glowed. "I'm so pleased to have been of help. Does this mean we jump?"

"No, we still wait two more days, to be safe. We have to get away from mass, remember? -Ordinarily, considering that I have a new and untried ship with which I am thoroughly unacquainted, it would probably take me two days to calculate the exact procedure - the proper hyperthrust for the first jump, in particular. I have a feeling, though, the computer will do it all."

"Dear me! That leaves us facing a rather boring stretch of time, it seems to me."

"Boring?" Trevize smiled broadly. "Anything but! You and I, Janov, are going to talk about Earth."

Pelorat said, "Indeed? You are trying to please an old man? That is kind of you. Really it is."

"Nonsense! I'm trying to please myself. Janov, you have made a convert. As a result of what you have told me, I realize that Earth is the most important and the most devouringly interesting object in the Universe."

It must surely have struck Trevize at the moment that Pelorat had presented his view of Earth. It was only because his mind was reverberating with the problem of the hyper-relay that he hadn't responded at once. And the instant the problem had gone, he had responded.

Perhaps the one statement of Hari Seldon's that was most often repeated was his remark concerning the Second Foundation being "at the other end of the Galaxy" from Terminus. Seldon had even named the spot. It was to be "at Star's End."

This had been included in Gaal Dornick's account of the day of the trial before the Imperial court. "The other end of the Galaxy" - those were the words Seldon had used to Dornick and ever since that day their significance had been debated.

What was it that connected one end of the Galaxy with "the other end"? Was it a straight line, a spiral, a circle, or what?

And now, luminously, it was suddenly clear to Trevize that it was no line and no curve that should-or could-be drawn on the map of the Galaxy. It was more subtle than that.

It was perfectly clear that the one end of the Galaxy was Terminus. It was at the edge of the Galaxy, yes-our Foundation's edge -which gave the word "end" a literal meaning. It was, however, also the newest world of the Galaxy at the time Seldon was speaking, a world that was about to be founded, that had not as yet been in existence for a single moment.

What would be the other end of the Galaxy, in that light? The other Foundation's edge? Why, the oldest world of the Galaxy? And according to the argument Pelorat had presented-without knowing what he was presenting-that could only be Earth. The Second Foundation might well be on Earth.

Yet Seldon had said the other end of the Galaxy was "at Star's End." Who could say he was not speaking metaphorically? Trace the history of humanity backward as Pelorat did and the line would stretch back from each planetary system, each star that shone down on an inhabited planet, to some other planetary system, some other star from which the first migrants had come, then back to a star before that-until finally, all the lines stretched back to the planet on which humanity had originated. It was the star that shone upon Earth that was "Star's End:"

Trevize smiled and said almost lovingly, "Tell me more about Earth, Janov."

Pelorat shook his head. "I have told you all there is, really. We will find out more on Trantor."

Trevize said, "No, we won't, Janov. We'll find out nothing there. Why? Because we're not going to Trantor. I control this ship and I assure you we're not."

Pelorat's mouth fell open. He struggled for breath for a moment and then said, woebegone, "Oh, my dear fellow!"

Trevize said, "Come on, Janov. Don't look like that. We're going to find Earth."

"But it's only on Trantor that - "

"No, it's not. Trantor is just someplace you can study brittle films and dusty documents and turn brittle and dusty yourself."

"For decades, I've dreamed-"

"You've dreamed of finding Earth."

"But it's only-"

Trevize stood up, leaned over, caught the slack of Pelorat's tunic, and said, "Don't repeat that, Professor. Don't repeat it. When you first told me we were going to look for Earth, before ever we got onto this ship, you said we were sure to find it because, and I quote your own words, 'I have an excellent possibility in mind: Now I don't ever want to hear you say 'Trantor' again. I just want you to tell me about this excellent possibility.'"

"But it must be confirmed. So far, it's only a thought, a hope, a vague possibility."

"Good! Tell me about it!"

"You don't understand. You simply don't understand. It is not a field in which anyone but myself has done research. There is nothing historical, nothing firm, nothing

real. People talk about Earth as though it's a fact, and also as though it's a myth. There are a million contradictory tales-

"Well then, what has your research consisted of?"

"I've been forced to collect every tale, every bit of supposed history, every legend, every misty myth. Even fiction. Anything that includes the name of Earth or the idea of a planet of origin. For over thirty years, I've been collecting everything I could find from every planet of the Galaxy. Now if I could only get something more reliable than all of these from the Galactic Library at- But you don't want me to say the word."

"That's right. Don't say it. Tell me instead that one of these items has caught your attention, and tell me your reasons for thinking why it, of them all, should be legitimate."

Pelorat shook his head. "There, Golan, if you will excuse my saying so, you talk like a soldier or a politician. That is not the way history works."

Trevize took a deep breath and kept his temper. "Tell me how it works, Janov. We've got two days. Educate me."

"You can't rely on any one myth or even on any one group. I've had to gather them all, analyze them, organize them, set up symbols to represent different aspects of their content-tales of impossible weather, astronomic details of planetary systems at variance with what actually exists, place of origin of culture heroes specifically stated not to be native, quite literally hundreds of other items. No use going through the entire list. Even two days wouldn't be enough. I spent over thirty years, I tell you.

"I then worked up a computer program that searched through all these myths for common components and sought a transformation that would eliminate the true impossibilities. Gradually I worked up a model of what Earth must have been like. After all, if human beings all originated on a single planet, that single planet must represent the one fact that all origin myths, all culture-hero tales, have in common. -Well, do you want me to go into mathematical detail?"

Trevize said, "Not at the moment, thank you, but how do you know you won't be misled by your mathematics? We know for a fact that Terminus was founded only five centuries ago and that the first human beings arrived as a colony from Trantor but had been assembled from dozens-if not hundreds-of other worlds. Yet someone who did not know this could assume that Hari Seldon and Salvor Hardin, neither of whom were born on Terminus, came from Earth and that Trantor was really a name that stood for Earth. Certainly, if the Trantor as described in Seldon's time were searched for -a world with all its land surface coated with metal-it would not be found and it might be considered an impossible myth."

Pelorat looked pleased. "I withdraw my earlier remark about soldiers and politicians, my dear fellow. You have a remarkable intuitive sense. Of course, I had to set up controls. I invented a hundred falsities based on distortions of actual history and imitating myths of the type I had collected. I then attempted to incorporate my inventions into the model. One of my inventions was even based on Terminus's early history. The computer rejected them all. Every one. To be sure, that might have meant I simply lacked the fictional talents to make up something reasonable, but I did my best"

"I'm sure you did, Janov. And what did your model tell you about Earth?"

"A number of things of varying degrees of likelihood. A kind of profile. For instance, about 90 percent of the inhabited planets in the Galaxy have rotation periods of between twenty-two and twenty-six Galactic Standard Hours. Well - "

Trevize cut in. "I hope you didn't pay any attention to that, Janov. There's no mystery there. For a planet to be habitable, you don't want it to rotate so quickly that air circulation patterns produce impossibly stormy conditions or so slowly that temperature variation patterns are extreme. It's a property that's self-selective. Human beings prefer to live on planets with suitable characteristics, and then when all habitable planets resemble each other in these characteristics, some say, 'What an amazing coincidence,' when it's not amazing at all and not even a coincidence."

"As a matter of fact," said Pelorat calmly, "that's a well-known phenomenon in social science. In physics, too, I believe-but I'm not a physicist and I'm not certain about that. In any case, it is called the 'anthropic principle: The observer influences the events he observes by the mere act of observing them or by being there to observe them. But the question is: Where is the planet that served as a model? Which planet rotates in precisely one Galactic Standard Day of twenty-four Galactic Standard Hours?"

Trevize looked thoughtful and thrust out his lower lip. "You think that might be Earth? Surely Galactic Standard could have been based on the local characteristics of any world, might it not?"

"Not likely. It's not the human way. Trantor was the capital world of the Galaxy for twelve thousand years-the most populous world for twenty thousand years-yet it did not impose its rotation period of 1.08 Galactic Standard Days on all the Galaxy. And Terminus's rotation period is 0.91 GSD and we don't enforce ours on the planets dominated by us. Every planet makes use of its own private calculations in its own Local Planetary Day system, and for matters of interplanetary importance converts-with the help of computers-back and forth between LPD and GSD. The Galactic Standard Day must come from Earth"

"Why is it a must?"

"For one thing, Earth was once the only inhabited world, so naturally its day and year would be standard and would very likely remain standard out of social inertia as other worlds were populated. Then, too, the model I produced was that of an Earth that rotated on its axis in just twenty-four Galactic Standard Hours and that revolved about its sun in just one Galactic Standard Year."

"Might that not be coincidence?"

Pelorat laughed. "Now it is you who are talking coincidence. Would you care to lay a wager on such a thing happening by coincidence?"

"Well well," muttered Trevize.

"In fact, there's more to it. There's an archaic measure of time that's called the month-"

"I've heard of it."

"It, apparently, about fits the period of revolution of Earth's satellite about Earth. However-

"Yes?"

"Well, one rather astonishing factor of the model is that the satellite I just mentioned is huge-over one quarter the diameter of the Earth itself."

"Never heard of such a thing, Janov. There isn't a populated planet in the Galaxy with a satellite like that."

"But that's good," said Pelorat with animation. "If Earth is a unique world in its production of variegated species and the evolution of intelligence, then we want some physical uniqueness."

"But what could a large satellite have to do with variegated species, intelligence, and all that?"

"Well now, there you hit a difficulty. I don't really know. But it's worth examination, don't you think?"

Trevize rose to his feet and folded his arms across his chest. "But what's the problem, then? Look up the statistics on inhabited planets and find one that has a period of rotation and of revolution that are exactly one Galactic Standard Day and one Galactic Standard Year in length, respectively. And if it also has a gigantic satellite, you'd have what you want. I presume, from your statement that you 'have an excellent possibility in mind,' that you've done just this, and that you have your world."

Pelorat looked disconcerted. "Well, now, that's not exactly what happened. I did look through the statistics, or at least I had it done by the astronomy department and-well, to put it bluntly, there's no such world."

Trevize sat down again abruptly. "But that means your whole argument falls to the ground."

"Not quite, it seems to me."

"What do you mean, not quite? You produce a model with all sorts of detailed descriptions and you can't find anything that fits. Your model is useless, then. You must start from the beginning."

"No. It just means that the statistics on populated planets are incomplete. After all, there are tens of millions of them and some are very obscure worlds. For instance, there is no good data on the population of nearly half. And concerning six hundred and forty thousand populated worlds there is almost no information other than their names and sometimes the location. Some galactographers have estimated that there may be up to ten thousand inhabited planets that aren't listed at all. The worlds prefer it that way, presumably. During the Imperial Era, it might have helped them avoid taxation."

"And in the centuries that followed," said Trevize cynically. "It might have helped them serve as home bases for pirates, and that might have, on occasion, proved more enriching than ordinary trade."

"I 'wouldn't know about that," said Pelorat doubtfully.

Trevize said, "Just the same, it seems to me that Earth would have to be on the list of inhabited planets, whatever its own desires. It would be the oldest of them all, by

definition, and it could not have been overlooked in the early centuries of Galactic civilization. And once on the list, it would stay on. Surely we could count on social inertia there."

Pelorat hesitated and looked anguished. "Actually, there-there is a planet named Earth on the list of inhabited planets."

Trevize stared. "I'm under the impression that you told me a while ago that Earth was not on the list?"

"As Earth, it is not. There is, however, a planet named Gaia."

"What has that got to do with it? Gahyah?"

"It's spelled GA-I-A. It means 'Earth.' "

"Why should it mean Earth, Janov, any more than anything else? The name is meaningless to me."

Pelorat's ordinarily expressionless face came close to a grimace. "I'm not sure you'll believe this- If I go by my analysis of the myths, there were several different, mutually unintelligible, languages on Earth."

"What?"

"Yes. After all, we have a thousand different ways of speaking across the Galaxy-

"Across the Galaxy, there are certainly dialectical variations, but these are not mutually unintelligible. And even if understanding some of them is a matter of difficulty, we all share Galactic Standard."

"Certainly, but there is constant interstellar travel. What if some world was in isolation for a prolonged period?"

"But you're talking of Earth. A single planet. Where's the isolation?"

"Earth is the planet of origin, don't forget, where humanity must at one time have been primitive beyond imagining. Without interstellar travel, without computers, without technology at all, struggling up from nonhuman ancestors."

"This is so ridiculous."

Pelorat hung his head in embarrassment at that. "There is perhaps no use discussing this, old chap. I never have managed to make it convincing to anyone. My own fault, I'm sure."

Trevize was at once contrite. "Janov, I apologize. I spoke without thinking. These are views, after all, to which I am not accustomed. You have been developing your theories for over thirty years, while I've been introduced to them all at once. You must make allowances. -Look, I'll imagine that we have primitive people on Earth who speak two completely different, mutually unintelligible, languages. "

"Half a dozen, perhaps," said Pelorat diffidently. "Earth may have been divided into several large land masses and it may be that there were, at first, no communications among them. The inhabitants of each land mass might have developed an individual language."

Trevize said with careful gravity, "And on each of these land masses, once they grew cognizant of one another, they might have argued an 'origin Question' and wondered on which one human beings had first arisen from other animals."

"They might very well, Golan. It would be a very natural attitude for them to have."

"And in one of those languages, Gaia means Earth. And the word 'Earth' itself is derived from another one of those languages."

"Yes, yes: "

"And while Galactic Standard is the language that descended from the particular language in which 'Earth' means 'Earth,' the people of Earth for some reason call their planet 'Gala' from another of their languages."

"Exactly! You are indeed quick, Golan."

"But it seems to me that there's no need to make a mystery of this. If Gaia is really Earth, despite the difference in names, then Gala, by your previous argument, ought to have a period of rotation of just one Galactic Day, a period of revolution of just one Galactic Year, and a giant satellite that revolves about it in just one month."

"Yes, it would have to be so."

"Well then, does it or doesn't it fulfill these requirements?"

"Actually I can't say. The information isn't given in the tables."

"Indeed? Well, then, Janov, shall we go to Gaia and time its periods and stare at its satellite?"

"I would like to, Golan," Pelorat hesitated. "The trouble is that the location isn't given exactly, either."

"You mean, all you have is the name and nothing more, and that is your excellent possibility?"

"But that is just why I want to visit the Galactic Library!"

"Well, wait. You say the table doesn't give the location exactly. Does it give any information at all?"

"It lists it in the Sayshell Sector-and adds a question mark."

"Well, then- Janov, don't be downcast. We will go to the Sayshell Sector and somehow we will find Gaia!"

7. FARMER

STOR GENDIBAL JOGGED ALONG THE COUNTRY ROAD OUTSIDE THE UNIVERSITY. It was not common practice for Second Foundationers to venture into the farming world of Trantor. They could do so, certainly, but when they did, they did not venture either far or for long.

Gendibal was an exception and he had, in times past, wondered why. Wondering meant exploring his own mind, something that Speakers, in particular, were encouraged to do. Their minds were at once their weapons and their targets, and they had to keep both offense and defense well honed.

Gendibal had decided, to his own satisfaction, that one reason he was different was because he had come from a planet that was both colder and more massive than the average inhabited planet. When he was brought to Trantor as a boy (through the net that was quietly cast throughout the Galaxy by agents of the Second Foundation on the lookout for talent), he found himself, therefore, in a lighter gravitational field and a delightfully mild climate. Naturally he enjoyed being in the open more than some of the others might.

In his early years on Trantor, he grew conscious of his puny, undersized frame, and he was afraid that settling back into the comfort of a benign world would turn him flabby indeed. He therefore undertook a series of self-developing exercises that had left him still puny in appearance but kept him wiry and with a good wind. Part of his regimen were these long walks and joggings-about which some at the Speaker's Table muttered. Gendibal disregarded their chattering.

He kept his own ways, despite the fact that he was first-generation. All the others at the Table were second- and third-generation, with parents and grandparents who had been Second Foundationers. And they were all older than he, too. What, then, was to be expected but muttering?

By long custom, all minds at the Speaker's Table were open (supposedly altogether, though it was a rare Speaker who didn't maintain a corner of privacy somewhere-in the long run, ineffectively, of course) and Gendibal knew that what they felt was envy. So did they; just as Gendibal knew his own attitude was defensive, overcompensating ambition. And so did they.

Besides (Gendibal's mind reverted to the reasons for his ventures into the hinterland) he had spent his childhood in a whole world-a large and expansive one, with grand and variegated scenery-and in a fertile valley of that world, surrounded by what he believed to be the most beautiful mountain ranges in the Galaxy. They were unbelievably spectacular in the grim winter of that world. He remembered his former world and the glories of a now-distant childhood. He dreamed about it often. How could he bring himself to be confined to a few dozen square miles of ancient architecture?

He looked about disparagingly as he jogged. Trantor was a mild and pleasant world, but it was not a rugged and beautiful one. Though it was a farming world, it was not a fertile planet.

It never had been. Perhaps that, as much as any other factor, had led to its becoming the administrative center of, first, an extensive union of planets and then of a Galactic Empire. There was no strong push to have it be anything else. It wasn't extraordinarily good for anything else.

After the Great Sack, one thing that kept Trantor going was its enormous supply of metal. It was a great mine, supplying half a hundred worlds with cheap alloy steel, aluminum, titanium, copper, magnesium - returning, in this way, what it had collected over thousands of years; depleting its supplies at a rate hundreds of times faster than the original rate of accumulation.

There were still enormous metal supplies available, but they were underground and harder to obtain. The Hamish farmers (who never called themselves "Trantorians," a term they considered ill-omened and which the Second Foundationers therefore reserved for themselves) had grown reluctant to deal with the metal any further. Superstition, undoubtedly.

Foolish of them. The metal that remained underground might well be poisoning the soil and further lowering its fertility. And yet, on the other hand, the population was thinly spread and the land supported them. And there were some sales of metal, always.

Gendibal's eyes roved over the fiat horizon. Trantor was alive geologically, as almost all inhabited planets were, but it had been a hundred million years, at least, since the last major geological mountain-building period had occurred. What uplands existed had been eroded into gentle hills. Indeed, many of them had been leveled during the great metal-coating period of Trantor's history.

Off to the south, well out of sight, was the shore of Capital Bay, and beyond that, the Eastern Ocean, both of which had been re-established after the disruption of the underground cisterns.

To the north were the towers of Galactic University, obscuring the comparatively squat-but-wide Library (most of which was underground), and the remains of the Imperial Palace still farther north.

Immediately on either side were farms, on which there was an occasional building. He passed groups of cattle, goats, chickens-the wide variety of domesticated animals found on any Trantorian farm. None of them paid him any mind.

Gendibal thought casually that anywhere in the Galaxy, on any of the vast number of inhabited worlds, he would see these animals and that on no two worlds would they be exactly alike. He remembered the goats of home and his own tame nanny whom he had once milked. They were much larger and more resolute than the small and philosophical specimens that had been brought to Trantor and established there since the Great Sack. Over the inhabited worlds of the Galaxy, there were varieties of each of these animals, in numbers almost beyond counting, and there was no sophisticate on any world who didn't

swear by his favorite variety, whether for meat, milk, eggs, wool, or anything else they could produce.

As usual, there were no Hamish in view. Gendibal had the feeling that the farmers avoided being seen by those whom they referred to as "scowlers" (a mispronunciation- perhaps deliberately-of the word "scholars" in their dialect). -Superstition, again.

Gendibal glanced up briefly at Trantor's sun. It was quite high in the sky, but its heat was not oppressive. In this location, at this latitude, the warmth saved mild and the cold never bit. (Gendibal ever missed the biting cold sometimes or so he imagined. He had never revisited his native world. Perhaps, he admitted to himself, because he didn't want to be disillusioned.)

He had the pleasant feel of muscles that were sharpened and tightened to keenness and he decided he had jogged just long enough. He settled down to a walk, breathing deeply.

He would be ready for the upcoming Table meeting and for one last push to force a change in policy, a new attitude that would recognize the growing danger from the First Foundation and elsewhere and that would put an end to the fatal reliance on the "perfect" working of the Plan. When would they realize that the very perfection was the surest sign of danger?

Had anyone but himself proposed it, he knew, it would have gone through without trouble. As things stood now, there would be trouble, but it would go through, just the same, for old Shandess was supporting him and would undoubtedly continue to do so. He would not wish to enter the history books as the particular First Speaker under whom the Second Foundation had withered.

Hamish!

Gendibal was startled. He became aware of the distant tendril of mind well before he saw the person. It was Hamish mind-a farmer -coarse and unsubtle. Carefully Gendibal withdrew, leaving a touch so light as to be undetectable. Second Foundation policy was very firm in this respect. The farmers were the unwitting shields of the Second Foundation. They must be left as untouched as possible.

No one who came to Trantor for trade or tourism ever saw anything other than the farmers, plus perhaps a few unimportant scholars living in the past. Remove the farmers or merely tamper with their innocence and the scholars would become more noticeable-with catastrophic results. (That was one of the classic demonstrations which neophytes at the University were expected to work out for themselves. The tremendous Deviations displayed on the Prime Radiant when the farmer minds were even slightly tampered with were astonishing.)

Gendibal saw him. It was a farmer, certainly, Hamish to the core. He was almost a caricature of what a Trantorian farmer should be tall and wide, brown-skinned, roughly dressed, arms bare, dark-haired, dark-eyed, a long ungainly stride. Gendibal felt as though he could smell the barnyard about him. (Not too much scorn, he thought. Preem Palver had not minded playing the role of farmer, when that was necessary to his plans.

Some farmer he was-short and plump and soft. It was his mind that had fooled the teenaged Arkady, never his body.)

The farmer was approaching him, clumping down the road, staring at him openly-something that made Gendibal frown. No Hamish man or woman had ever looked at him in this manner. Even the children ran away and peered from a distance.

Gendibal did not slow his own stride. There would be room enough to pass the other with neither comment nor glance and that would be best. He determined to stay away from the farmer's mind.

Gendibal drifted to one side, but the farmer was not going to have that. He stopped, spread his legs wide, stretched out his large arms as though to block passage, and said, "Ho! Be you scowler?"

Try as he might, Gendibal could not refrain from sensing the wash of pugnacity in the approaching mind. He stopped. It would be impossible to attempt to pass by without conversation and that would be, in itself, a weary task. Used as one was to the swift and subtle interplay of sound and expression and thought and mentality that combined to make up the communication between Second Foundationers, it was wearisome to resort to word combination alone. It was like prying up a boulder by arm and shoulder, with a crowbar lying nearby.

Gendibal said, quietly and with careful lack of emotion, "I am a scholar. Yes."

"Ho! You am a scowler. Don't we speak outlandish now? And cannot I see that you be one or am one?" He ducked his head in a mocking bow. "Being, as you be, small and weazen and pale and uposed."

"What is it you want of me, Hamishman?" asked Gendibal, unmoved.

"I be titled Rufirant. And Karoll be my previous." His accent became noticeably more Hamish. His r's rolled throatily.

Gendibal said, "What is it you want with me, Karoll Rufirant?"

"And how be you titled, scowler?"

"Does it matter? You may continue to call me 'scholar'."

"If I ask, it matters that I be answered, little up-nosed scowler."

"Well then, I am titled Stor Gendibal and I will now go about my business."

"What be your business?"

Gendibal felt the hair prickling on the back of his neck. There were other minds present. He did not have to turn to know there were three more Hamishmen behind him. Off in the distance, there were others. The farmer smell was strong.

"My business, Karoll Rufirant, is certainly none of yours."

"Say you so?" Rufirant's voice rose. "Mates, he says his business be not ours."

There was a laugh from behind him and a voice sounded. "Right he be, for his business be book-mucking and 'puter-rubbing, and that be naught for true men."

"Whatever my business is," said Gendibal firmly, "I will be about it now."

"And how will you do that, wee scowler?" said Rufirant.

"By passing you."

"You would try? You would not fear arm-stopping?"

"By you and all your mates? Or by you alone?" Gendibal suddenly dropped into thick Hamish dialect. "Art not feared alone?"

Strictly speaking, it was not proper to prod him in this manner, but it would stop a mass attack and that had to be stopped, lest it force a still greater indiscretion on his part.

It worked. Rufirant's expression grew lowering. "If fear there be, bookboy, th'art the one to be full of it. Mates, make room. Stand back and let him pass that he may see if I be feared alane."

Rufirant lifted his great arms and moved them about. Gendibal did not fear the farmer's pugilistic science; but there was always a chance that a goodly blow might land.

Gendibal approached cautiously, working with delicate speed within Rufirant's mind. Not much-just a touch, unfelt-but enough to slow reflexes that crucial notch. Then out, and into all the others, who were now gathering in greater numbers. Gendibal's Speaker mind darted back and forth with virtuosity, never resting in one mind long enough to leave a mark, but just long enough for the detection of something that might be useful.

He approached the farmer catlike, watchful, aware and relieved that no one was making a move to interfere.

Rufirant struck suddenly, but Gendibal saw it in his mind before any muscle had begun to tighten and he stepped to one side. The blow whistled past, with little room to spare. Yet Gendibal still stood there, unshaken. There was a collective sigh from the others.

Gendibal made no attempt to either parry or return a blow. It would be difficult to parry without paralyzing his own arm and to return a blow would be of no use, for the farmer would withstand it without trouble.

He could only maneuver the man as though he were a bull, forcing him to miss. That would serve to break his morale as direct opposition would not.

Bull-like and roaring, Rufirant charged. Gendibal was ready and drifted to one side just sufficiently to allow the farmer to miss his clutch. Again the charge. Again the miss.

Gendibal felt his own breath begin to whistle through his nose. The physical effort was small, but the mental effort of trying to control without controlling was enormously difficult. He could not keep it up long.

He said-as calmly as he could while batting lightly at Rufirant's fear-depressant mechanism, trying to rouse in a minimalist manner what must surely be the farmer's superstitious dread of scholars-"I will now go about my business."

Rufirant's face distorted with rage, but for a moment he did not move. Gendibal could sense his thinking. The little scholar had melted away like magic. Gendibal could feel the other's fear rise and for a moment.

But then the Hamish rage surged higher and drowned the fear.

Rufirant shouted, "Mates! Scowler he dancer. He do duck on nimble toes and scorns the rules of honest Hamish blow-for-blow. Seize him. Hold him. We will trade blow for blow, then. He may be firststriker, gift of me, and I-I will be last-striker."

Gendibal found the gaps among those who now surrounded him. His only chance was to maintain a gap long enough to get through, then to run, trusting to his own wind and to his ability to dull the farmers' will.

Back and forth he dodged, with his mind cramping in effort.

It would not work. There were too many of them and the necessity of abiding within the rules of Trantorian behavior was too constricting.

He felt hands on his arms. He was held.

He would have to interfere with at least a few of the minds. It would be unacceptable and his cancer would be destroyed. But his life-his very life-was at hazard.

How had this happened?

The meeting of the Table was not complete.

It was not the custom to wait if any Speaker were late. Nor, thought Shandess, was the Table in a mood to wait, in any case. Stor Gendibal was the youngest and far from sufficiently aware of the fact. He acted as though youth were in itself a virtue and age a matter of negligence on the part of those who should know better. Gendibal was not popular with the other Speakers. He was not, in point of fact, entirely popular with Shandess himself. But popularity was not at issue here.

Delora Delarmi broke in on his reverie. She was looking at him out of wide blue eyes, her round face-with its accustomed air of innocence and friendliness-masking an acute mind (to all but other Second Foundationers of her own rank) and ferocity of concentration.

She said, smiling, "First Speaker, do we wait longer?" (The meeting had not yet been formally called to order so that, strictly speaking, she could open the conversation, though another might have waited for Shandess to speak first by right of his title.)

Shandess looked at her disarmingly, despite the slight breach in courtesy. "Ordinarily we would not, Speaker Delarmi, but since the Table meets precisely to hear Speaker Gendibal, it is suitable to stretch the rules."

"Where is he, First Speaker?"

"That, Speaker Delarmi, I do not know."

Delarmi looked about the rectangle of faces. There was the First Speaker and what should have been eleven other Speakers. -Only twelve. Through five centuries, the Second Foundation had expanded its powers and its duties, but all attempts to expand the Table beyond twelve had failed.

Twelve it had been after Seldon's death, when the second First Speaker (Seldon himself had always been considered as having been the first of the line) had established it, and twelve it still was.

Why twelve? That number divided itself easily into groups of identical size. It was small enough to consult as a whole and large enough to do work in subgroups. More would have been too unwieldy; fewer, too inflexible.

So went the explanations. In fact, no one knew why the number had been chosen-or why it should be immutable. But then, even the Second Foundation could find itself a slave to tradition.

It took Delarmi only a flashing moment to have her mind twiddle the matter as she looked from face to face, and mind to mind, and then, sardonically, at the empty seat-the junior seat.

She was satisfied that there was no sympathy at all with Gendibal. The young man, she had always felt, had all the charm of a centipede and was best treated as one. So far, only his unquestioned ability and talent had kept anyone from openly proposing trial for expulsion. (Only two Speakers had been impeached-but not convicted-in the hemimillennial history of the Second Foundation.)

The obvious contempt, however, of missing a meeting of the Table was worse than many an offense and Delarmi was pleased to sense that the mood for trial had moved forward rather more than a notch.

She said, "First Speaker, if you do not know the whereabouts of Speaker Gendibal, I would be pleased to tell you."

"Yes, Speaker?"

"Who among us does not know that this young man" (she used no honorific in speaking of him, and it was something that everyone noted, of course) "finds business among the Hamish continually? What that business might be, I do not ask, but he is among them now and his concern with them is clearly important enough to take precedence over this Table."

"I believe," said another of the Speakers, "that he merely walks or jogs as a form of physical exercise."

Delarmi smiled again. She enjoyed smiling. It cost her nothing. "The University, the Library, the Palace, and the entire region surrounding these are ours. It is small in comparison with the planet itself, but it contains room enough, I think, for physical exercise. -First Speaker, might we not begin?"

The First Speaker sighed inwardly. He had the full power to keep the Table waiting-or, indeed, to adjourn the meeting until a time when Gendibal was present.

No First Speaker could long function smoothly, however, without at least the passive support of the other Speakers and it was never wise to irritate them. Even Preem Palver had occasionally been forced into cajolery to get his way. -Besides, Gendibal's absence was annoying, even to the First Speaker. The young Speaker might as well learn he was not a law unto himself.

And now, as First Speaker, he did speak first, saying, "We will begin. Speaker Gendibal has presented some startling deductions from Prime Radiant data. He believes that there is some organization that is working to maintain the Seldon Plan more efficiently than we can and that it does so for its own purpose. We must, in his view therefore, learn more about it out of self-defense. You all have been informed of this, and this meeting is to allow you all a chance to question Speaker Gendibal, in order that we may come to some conclusion as to future policy."

It was, in fact, even unnecessary to say this much. Shandess held his mind open, so they all knew. Speaking was a matter of courtesy.

Delarmi looked about swiftly. The other ten seemed content to allow her to take on the role of anti-Gendibal spokesperson. She said, "Yet Gendibal" (again the omission of the honorific) "does not know and cannot say what or who this other organization is."

She phrased it unmistakably as a statement, which skirted the edge of rudeness. It was as much as to say: I can analyze your mind; you need not bother to explain.

The First Speaker recognized the rudeness and made the swift decision to ignore it. "The fact that Speaker Gendibal" (he punctiliously avoided the omission of the honorific and did not even point up the fact by stressing it) "does not know and cannot say what the other organization is, does not mean it does not exist. The people of the First Foundation, through most of their history, knew virtually nothing about us and, in fact, know next to nothing about us now. Do you question our existence?"

"It does not follow," said Delarmi, "that because we are unknown and yet exist, that anything, in order to exist, need only be unknown." And she laughed lightly.

"True enough. That is why Speaker Gendibal's assertion must be examined most carefully. It is based on rigorous mathematical deduction, which I have gone over myself and which I urge you all to consider. It is" (he searched for a cast of mind that best expressed his views) "not unconvincing."

"And this First Founder, Golan Trevize, who hovers in your mind but whom you do not mention?" (Another rudeness and this time the First Speaker flushed a bit.) "What of him?"

The First Speaker said, "It is Speaker Gendibal's thought that this man, Trevize, is the tool-perhaps an unwitting one-of this organization and that we must not ignore him."

"If," said Delarmi, sitting back in her chair and pushing her graying hair backward and out of her eyes, "this organization-whatever it is - exists and if it is dangerously powerful in its mental capabilities and is so hidden, is it likely to be maneuvering so openly by way of someone as noticeable as an exiled Councilman of the First Foundation?"

The First Speaker said gravely, "One would think not. And yet I have noticed something that is most disquieting. I do not understand it." Almost involuntarily he buried the thought in his mind, ashamed that others might see it.

Each of the Speakers noted the mental action and, as was rigorously required, respected the shame. Delarmi did, too, but she did so impatiently. She said, in accordance with the required formula, "May we request that you let us know your thoughts, since we understand and forgive any shame you may feel?"

The First Speaker said, "Like you, I do not see on what grounds one should suppose Councilman Trevize to be a tool of the other organization, or what purpose he could possibly serve if he were. Yet Speaker Gendibal seems sure of it, and one cannot ignore the possible value of intuition in anyone who has qualified for Speaker. I therefore attempted to apply the Plan to Trevize."

"To a single person?" said one of the Speakers in low voiced surprised, and then indicated his contrition at once for having accompanied the question with a thought that was clearly the equivalent of: What a fool!

"To a single person," said the First Speaker, "and you are right. What a fool I am! I know very well that the Plan cannot possibly apply to individuals, not even to small groups of individuals. Nevertheless, I was curious. I extrapolated the Interpersonal Intersections far past the reasonable limits, but I did it in sixteen different ways and chose a region rather than a point. I then made use of all the details we know about Trevize - a Councilman of the First Foundation does not go completely unnoticed-and of the Foundation's Mayor. I then threw it all together, rather higgledy-piggledy, I'm afraid." He paused.

"Well?" said Delarmi. "I gather you- Were the results surprising?"

"There weren't any results, as you might all expect," said the First Speaker.

"Nothing can be done with a single individual, and yet-and yet-"

"And yet?"

"I have spent forty years analyzing results and I have grown used to obtaining a clear feeling of what the results would be before they were analyzed-and I have rarely been mistaken. In this case, even though there were no results, I developed the strong feeling that Gendibal was right and that Trevize should not be left to himself."

"Why not, First Speaker?" asked Delarmi, clearly taken aback at the strong feeling in the First Speaker's mind.

"I am ashamed," said the First Speaker, "that I have let myself be tempted into using the Plan for a purpose for which it is not fit. I am further ashamed now that I am allowing myself to be influenced by something that is purely intuitive. -Yet I must, for I feel this very strongly. If Speaker Gendibal is right-if we are in danger from an unknown direction-then I feel that when the time comes that our affairs are at a crisis, it will be Trevize who will hold and play the deciding card."

"On what basis do you feel this?" said Delarmi, shocked.

First Speaker Shandess looked about the table miserably, "I have no basis. The psychohistorical mathematics produces nothing, but as I watched the interplay of relationships, it seemed to me that Trevize is the key to everything. Attention must be paid to this young man."

Gendibal knew that he would not get back in time to join the meeting of the Table. It might be that he would not get back at all.

He was held firmly and he tested desperately about him to see how he could best manage to force them to release him.

Rufirant stood before him now, exultant. "Be you ready now, scowler? Blow for blow, strike for strike, Hamish-fashion. Come then, art the smaller; strike then first."

Gendibal said, "Will someone hold thee, then, as I be held?"

Rufirant said, "Let him go. Nah nah. His arms alane. Leave arms free, but hold legs strong. We want no dancing."

Gendibal felt himself pinned to the ground. His arms were free.

"Strike, scowler," said Rufirant. "Give us a blow."

And then Gendibal's probing mind found something that answered - indignation, a sense of injustice and pity. He had no choice; he would have to run the risk of outright

strengthening and then improvising on the basis of There was no need! He had not touched this new mind, yet it reacted as he would have wished. Precisely.

He suddenly became aware of a small figure-stocky, with long, tangled black hair and arms thrust outward-careening madly into his field of view and pushing madly at the Hamish farmer.

The figure was that of a woman. Gendibal thought grimly that it was a measure of his tension and preoccupation that he had not noted this till his eyes told him so.

"Karoll Rufirant!" She shrieked at the farmer. "Art bully and coward! Strike for strike, Hamish-fashion? You be two times yon scowler's size. You'll be in more sore danger attacking me. Be there renown in pashing yon poor spalp? There be shame, I'm thinking. It will be a fair heap of finger-pointing and there'll be full saying, 'Yon be Rufirant, renowned baby-smasher.' It'll be laughter, I'm thinking, and no decent Hamishman will be drinking with you-and no decent Hamishwoman will be ought with you."

Rufirant was trying to stem the torrent, warding off the blows she was aiming at him, attempting weakly to answer with a placating, "Now, Sura. Now, Sura."

Gendibal was aware that hands no longer grasped him, that Rufirant no longer glared at him, that the minds of all were no longer concerned with him.

Sura was not concerned with him, either; her fury was concentrated solely on Rufirant. Gendibal, recovering, now looked to take measures to keep that fury alive and to strengthen the uneasy shame flooding Rufirant's mind, and to do both so lightly and skillfully as to leave no mark. Again, there was no need.

The woman said, "All of you back-step. Look here. If it be not sufficient that this Karoll-heap be like giant to this starveling, there must be five or six more of you ally-friends to share in shame and go back to farm with glorious tale of dewing-do in baby-smashing. 'I held the spalp's arm,' you'll say, 'and giant Rufirant-block pashed him in face when he was not to back-strike.' And you'll say, 'But I held his foot, so give me also-glory.' And Rufirant-chunk will say, 'I could not have kiln on his lane, so my furrow-mates pinned him and, with help of all six, I gloried on him.'"

"But Sura," said Rufirant, almost whining, "I told scowler he might have first-shrike."

"And fearful you were of the mighty blows of his thin arms, not so, Rufirant thickhead. Come. Let him go where he be going, and the rest of you to your homes back-crawl, if so be those homes will still find a welcome-making for you. You had all best hope the grand deeds of this day be forgotten. And they will not be, for I be spreading them far-wide, if you do make me any the more fiercely raging than I be raging now."

They trooped off quietly, heads hanging, not looking back.

Gendibal stared after them, then back at the woman. She was dressed in blouse and trousers, with roughmade shoes on her feet. Her face was wet with perspiration and she breathed heavily. Her nose was rather large, her breasts heavy (as best Gendibal could tell through the looseness of her blouse), and her bare arms muscular. -But then, the Hamishwomen worked in the fields beside their men.

She was looking at him sternly, arms akimbo. "Well, scowler, why be lagging? Go on to Place of Scowlers. Be you feared? Shall I company you?"

Gendibal could smell the perspiration on clothes that were clearly not freshly laundered, but under the circumstances it would be most discourteous to show any repulsion.

"I thank you, Miss Sura-

"The name be Novi," she said gruffly. "Sura Novi. You may say Novi. It be unneeded to moresay."

"I thank you, Novi. You have been very helpful. You be welcome to company me, not for fear o€ mine but for company-pleasure in you." And he bowed gracefully, as he might have bowed to one of the young women at the University.

Novi flushed, seemed uncertain, and then tried to imitate his gesture. "Pleasure-be mine," she said, as though searching for words that would adequately express her pleasure and lend an air of culture.

They walked together. Gendibal knew well that each leisurely step made him the more unforgiveably late for the Table meeting, but by now he had had a chance to think on the significance of what had taken place and he was icily content to let the lateness grow.

The University buildings were looming ahead of them when Sura Novi stopped and said hesitantly, "Master Scowler?"

Apparently, Gendibal thought, as she approached what she called the "Place of Scowlers," she grew mare polite. He had a momentary urge to say, "Address you not yon poor spalp?" -But that would embarrass her beyond reason.

"Yes, Novi?"

"Be it very fine like and rich in Place of Scowlers?"

"It's nice," said Gendibal.

"I once dreamed I be in Place. And-and I be scowler."

"Someday," said Gendibal politely, "I'll show it thee."

Her look at him showed plainly she didn't take it for mere politeness. She said, "I can write. I be taught by schoolmaster. If I write letter to thee," she tried to make it casual, "how do I mark it so it come to thee?"

"Just say, 'Speaker's House, Apartment 27,' and it will come to me. But I must go, Novi."

He bowed again, and again she tried to imitate the action. They moved off in opposite directions and Gendibal promptly put her out of his mind. He thought instead of the Table meeting and, in particular, of Speaker Delora Delarmi. His thoughts were not gentle.

8. FARMWOMAN

THE SPEAKERS SAT ABOUT THE TABLE, FROZEN IN THEIR MENTAL shielding. It was as though all-with one accord-had hidden their minds to avoid irrevocable insult to the First Speaker after his statement concerning Trevize. Surreptitiously they glanced toward Delarmi and even that gave away much. Of them all, she was best known for her irreverence -Even Gendibal paid more lip service to convention.

Delarmi was aware of the glances and she knew that she had no choice but to face up to this impossible situation. In fact, she did not want to duck the issue. In all the history of the Second Foundation, no First Speaker had ever been impeached for misanalysis (and behind the term, which she had invented as cover-up, was the unacknowledged incompetence). Such impeachment now became possible. She would not hang back.

"First Speaker!" she said softly, her thin, colorless lips more nearly invisible than usual in the general whiteness of her face. "You yourself say you have no basis for your opinion, that the psychohistorical mathematics show nothing. Do you ask us to base a crucial decision on a mystical feeling?"

The First Speaker looked up, his forehead corrugated. He was aware of the universal shielding at the Table. He knew what it meant. He said coldly, "I do not hide the lack of evidence. I present you with nothing falsely. What I offer is the strongly intuitive feeling of a First Speaker, one with decades of experience who has spent nearly a lifetime in the close analysis of the Seldon Plan." He looked about him with a proud rigidity he rarely displayed, and one by one the mental shields softened and dropped. Delarmi's (when he turned to stare at her) was the last.

She said, with a disarming frankness that filled her mind as though nothing else had ever been there, "I accept your statement, of course, First Speaker. Nevertheless, I think you might perhaps want to reconsider. As you think about it now, having already expressed shame at having to fall back on intuition, would you wish your remarks to be stricken from the record if, in your judgment they should be-"

And Gendibal's voice cut in. "What are these remarks that should be stricken from the record?"

Every pair of eyes turned in unison. Had their shields not been up during the crucial moments before, they would have been aware of his approach long before he was at the door.

"All shields up a moment ago? All unaware of my entrance?" said Gendibal sardonically. "What a commonplace meeting of the Table we have here. Was no one on their guard for my coming? Or did you all fully expect that I would not arrive?"

This outburst was a flagrant violation of all standards. For Gendibal to arrive late was bad enough. For him to then enter unannounced was worse. For him to speak before the First Speaker had acknowledged his attendance was worst of all.

The First Speaker turned to him. All else was superceded. The question of discipline came first.

"Speaker Gendibal," he said, "you are late. You arrive unannounced. You speak. Is there any reason why you should not be suspended from your seat for thirty days?"

"Of course. The move for suspension should not be considered until first we consider who it was that made it certain I would be late-and why." Gendibal's words were cool and measured, but his mind clothed his thoughts with anger and he did not care who sensed it.

Certainly Delarmi sensed it. She said forcefully, "This man is mad."

"Mad? This woman is mad to say so. Or aware of guilt. -First Speaker, I address myself to you and move a point of personal privilege," said Gendibal.

"Personal privilege of what nature, Speaker?"

"First Speaker, I accuse someone here of attempted murder."

The room exploded as every Speaker rose to his or her feet in a simultaneous babble of words, expression, and mentality.

The First Speaker raised his arms. He cried, "The Speaker must have his chance to express his point of personal privilege." He found himself forced to intensify his authority, mentally, in a manner most inappropriate to the place-yet there was no choice.

The babble quieted.

Gendibal waited unmoved until the silence was both audibly and mentally profound. He said, "On my way here, moving along a Hamish road at a distance and approaching at a speed that would have easily assured my arrival in good time for the meeting, I was stopped by several farmers and narrowly escaped being beaten, perhaps being killed. As it was, I was delayed and have but just arrived. May I point out, to begin with, that I know of no instance since the Great Sack that a Second Founder has been spoken to disrespectfully-let alone manhandled-by one of these Hamish people."

"Nor do I," said the First Speaker.

Delarmi cried out, "Second Founders do not habitually walk alone in Hamish territory! You invite this by doing so?"

"It is true," said Gendibal, "that I habitually walk alone in Hamish territory. I have walked there hundreds of times in every direction. Yet I have never been accosted before. Others do not walk with the freedom that I do, but no one exiles himself from the world or imprisons himself in the University and no one has ever been accosted. I recall occasions when Delarmi-" and then, as though remembering the honorific too late, he deliberately converted it into a deadly insult. "I mean to say, I recall when Speakeress Delarmi was in Hamish territory, at one time or another, and yet she was not accosted."

"Perhaps," said Delarmi, with eyes widened into a glare, "because I did not speak to them first and because I maintained my distance. Because I behaved as though I deserved respect, I was accorded it."

"Strange," said Gendibal, "and I was about to say that it was because you presented a more formidable appearance than I did. After all, few dare approach you even here. -But tell me, why should it be that of all times for interference, the Hamish

would choose this day to face me, when I am to attend an important meeting of the Table?"

"If it were not because of your behavior, then it must 'have been chance," said Delarmi. "I have not heard that even all of Seldon's mathematics has removed the role of chance from the Galaxy - certainly not in the case of individual events. Or are you, too, speaking from intuitional inspiration?" (There was a soft mental sigh from one or two Speakers at this sideways thrust at the First Speaker.)

"It was not my behavior. It was not chance. It was deliberate interference," said Gendibal.

"How can we know that?" asked the First Speaker gently. He could not help but soften toward Gendibal as a result of Delarmi's last remark.

"My mind is open to you, First Speaker. I give you-and all the Table-my memory of events."

The transfer took but a few moments. The First Speaker said, "Shocking! You behaved very well, Speaker, under circumstances of considerable pressure. I agree that the Hamish behavior is anomalous and warrants investigation. In the meantime, please join our meeting-"

"A moments" cut in Delarmi. "How certain are we that the Speaker's account is accurate?"

Gendibal's nostrils flared at the insult, but he retained his level composure. "My mind is open:"

"I have known open minds that were not open."

"I have no doubt of that, Speaker," said Gendibal, "since you, like the rest of us, must keep your own mind under inspection at all times. My mind, when open, however, is open."

The First Speaker said, "Let us have no further-"

"A point of personal privilege, First Speaker, with apologies for the interruption," said Delarmi.

"Personal privilege of what nature, Speaker?"

"Speaker Gendibal has accused one of us of attempted murder, presumably by instigating the farmer to attack him. As long as the accusation is not withdrawn, I must be viewed as a possible murderer, as would every person in this room-including you, First Speaker."

The First Speaker said, "Would you withdraw the accusation, Speaker Gendibal?"

Gendibal took his seat and put his hands down upon its arms, gripping them tightly, as though taking ownership of it, and said, "I will do so, as soon as someone explains why a Hamish farmer, rallying several others, should deliberately set out to delay me on my way to this meeting."

"A thousand reasons, perhaps," said the First Speaker. "I repeat that this event will be investigated. Will you, for now, Speaker Gendibal, and in the interest of continuing the present discussion, withdraw your accusation?"

"I cannot, First Speaker. I spent long minutes trying, as delicately as I might, to search his mind for ways to alter his behavior without damage and failed. His mind lacked the give it should have had. His emotions were fixed, as though by an outside mind."

Delarmi said with a sudden little smile, "And you think one of us was the outside mind? Might it not have been your mysterious organization that is competing with us, that is more powerful than we are?"

"It might," said Gendibal.

"In that case, we-who are not members of this organization that only you know of-are not guilty and you should withdraw your accusation. Or can it be that you are accusing someone here of being under the control of this strange organization? Perhaps one of us here is not quite what he or she seems?"

"Perhaps," said Gendibal stolidly, quite aware that Delarmi was feeding him rope with a noose at the end of it.

"It might seem," said Delarmi, reaching the noose and preparing to tighten it, "that your dream of a secret, unknown, hidden, mysterious organization is a nightmare of paranoia. It would fit in with your paranoid fantasy that Hamish farmers are being influenced, that Speakers are under hidden control. I am willing, however, to follow this peculiar thought line of yours for a while longer. Which of us here, Speaker, do you think is under control? Might it be me?"

Gendibal said, "I would not think so, Speaker. If you were attempting to rid yourself of me in so indirect a manner, you would not so openly advertise your dislike for me."

"A double-double-cross, perhaps?" said Delarmi. She was virtually purring. "That would be a common conclusion in a paranoid fantasy."

"So it might be. You are more experienced in such matters than I."

Speaker Lestim Gianni interrupted hotly. "See here, Speaker Gendibal, if you are exonerating Speaker Delarmi, you are directing your accusations the more tightly at the rest of us. What grounds would any of us have to delay your presence at this meeting, let alone wish you dead?"

Gendibal answered quickly, as though he had been waiting for the question. "When I entered, the point under discussion was the striking of remarks from the record, remarks made by the First Speaker. I was the only Speaker not in a position to hear those remarks. Let me know what they were and I rather think I will tell you the motive for delaying me."

The First Speaker said, "I had stated-and it was something to which Speaker Delarmi and others took serious exception-that I had decided, on the basis of intuition and of a most inappropriate use of psychohistorical mathematics, that the entire future of the Plan may rest on the exile of First Founder Golan Trevize:"

Gendibal said, "What other Speakers may think is up to them. For my part, I agree with this hypothesis. Trevize is the key. I find his sudden ejection by the First Foundation too curious to be innocent."

Delarmi said, "Would you care to say, Speaker Gendibal, that Trevize is in the grip of this mystery organization-or that the people who exiled him are? Is perhaps everyone and everything in their control except you and the First Speaker-and me, whom you have declared to be uncontrolled?"

Gendibal said, "These ravings require no answer. Instead let me ask if there is any Speaker here who would like to express agreement on this matter with the First Speaker and myself? You have read, I presume, the mathematical treatment that I have, with the First Speaker's approval, circulated among you."

There was silence.

"I repeat my request," said Gendibal. "Anyone?"

There was silence.

Gendibal said, "First Speaker, you now have the motive for delaying me."

The First Speaker said, "State it explicitly."

"You have expressed the need to deal with Trevize, with this First Founder. It represents an important initiative in policy and if the Speakers had read my treatment, they would have known in a general way what was in the wind. If, nevertheless, they had unanimously disagreed with you-unanimously-then, by traditional self-limitation, you would have been unable to go forward. If even one Speaker backed you, then you would be able to implement this new policy. I was the one Speaker who would back you, as anyone who had read my treatment would know, and it was necessary that I must, at all costs, be kept from the Table. That trick proved nearly successful, but I am now here and back the First Speaker. I agree with him and he can, in accordance with tradition, disregard the disagreement of the ten other Speakers."

Delarmi struck the table with her fist. "The implication is that someone knew in advance what the First Speaker would advise, knew in advance that Speaker Gendibal would support it and that all the rest would not-that someone knew what he could not have known. There is the further implication that this initiative is not to the liking of Speaker Gendibal's paranoia-inspired organization and that they are fighting to prevent it and that, therefore, one or more of us is under the control of that organization:"

"The implication is there," agreed Gendibal. "Your analysis is masterly."

"Whom do you accuse?" cried out Delarmi.

"No one. I call upon the First Speaker to take up the matter. It is clear that there is someone in our organization who is working against us. I suggest that everyone working for the Second Foundation should undergo a thorough mental analysis. Everyone, including the Speakers themselves. Even including myself-and the First Speaker."

The meeting of the Table broke up in greater confusion and greater excitement than any on record.

And when the First Speaker finally spoke the phrase of adjournment, Gendibal-without speaking to anyone-made his way back to his room. He knew well that he had not one friend among the Speakers, that even whatever support the First Speaker could give him would be half-hearted at best.

He could not tell whether he feared for himself or for the entire Second Foundation. The taste of doom was sour in his mouth.

Gendibal did not sleep well. His waking thoughts and his sleeping dreams were alike engaged in quarreling with Delora Delarmi. In one passage of one dream, there was even a confusion between her and the Hamish farmer, Rufirant, so that Gendibal found himself facing an out-of-proportion Delarmi advancing upon him with enormous fists and a sweet smile that revealed needlelike teeth.

He finally woke, later than usual, with no sensation of having rested and with the buzzer on his night table in muted action. He turned over to bring his hand down upon the contact.

"Yes? What is it?"

"Speaker!" The voice was that of the floor proctor, rather less than suitably respectful. "A visitor wishes to speak to you:"

"A visitor?" Gendibal punched his appointment schedule and the screen showed nothing before noon. He pushed the time button; it was 8:30 A.m. He said peevishly, "Who in space and time is it?"

"Will not give a name, Speaker." Then, with clear disapproval, "One of these Hamishers, Speaker. Arrived at your invitation." The last sentence was said with even clearer disapproval.

"Let him wait in the reception room till I come down. It will take time."

Gendibal did not hurry. Throughout the morning ablutions, he remained lost in thought. That someone was using the Hamish to hamper his movements made sense-but he would like to know who that someone was. And what was this new intrusion of the Hamish into his very quarters? A complicated trap of some sort?

How in the name of Seldon would a Hamish farmer get into the University? What reason could he advance? What reason could he really have?

For one fleeting moment, Gendibal wondered if he ought to arm himself. He decided against it almost at once, since he felt contemptuously certain of being able to control any single farmer on the University grounds without any danger to himself-and without any unacceptable marking of a Hamish mind.

Gendibal decided he had been too strongly affected by the incident with Karoll Rufirant the day before. -Was it the very farmer, by the way? No longer under the influence, perhaps-of whatever or whoever it was he might well have come to Gendibal to apologize for what he had done and with apprehension of punishment. -But how would Rufirant know where to go? Whom to approach?

Gendibal swung down the corridor resolutely and entered the waiting room. He stopped in astonishment, then fumed to the proctor, who was pretending to be busy in his glass-walled cubicle.

"Proctor, you did not say the visitor was a woman."

The proctor said quietly, "Speaker, I said a Hamisher. You did not ask further."

"Minimal information, Proctor? I must remember that as one of your characteristics." (And he must check to see if the proctor was a Delarmi appointee. And

he must remember, from now on, to note the functionaries who surrounded him, "Lowlies" whom it was too easy to ignore from the height of his still-new Speakership.) "Are any of the conference rooms available?"

The proctor said, "Number 4 is the only one available, Speaker. It will be free for three hours." He glanced briefly at the Hamishwoman, then at Gendibal, with blank innocence.

"We will use Number 4, Proctor, and I would advise you to mind your thoughts." Gendibal struck, not gently, and the proctor's shield closed far too slowly. Gendibal knew well it was beneath his dignity to manhandle a lesser mind, but a person who was incapable of shielding an unpleasant conjecture against a superior ought to learn not to indulge in one. The proctor would have a mild headache for a few hours. It was well deserved.

Her name did not spring immediately to mind and Gendibal was in no mood to delve deeper. She could scarcely expect him to remember, in any case.

He said peevishly, "You are—"

"I be Novi, Master Scowler," she said in what was almost a gasp. "My previous be Sura, but I be called Novi plain."

"Yes. Novi. We met yesterday; I remember now. I have not forgotten that you came to my defense." He could not bring himself to use the Hamish accent on the very University grounds. "Now how did you get here?"

"Master, you said I might write letter. You said, it should say, 'Speaker's House, Apartment 27-' I self-bring it and I show the writing - my own writing, Master." She said it with a kind of bashful pride. "They ask, 'For whom be this writing?' I heard your calling when you said it to that oafish bane-top, Rufirant. I say it be for Stor Gendibal, Master Scowler."

"And they let you pass, Novi? Didn't they ask to see the letter?"

"I be very frightened. I think maybe they feel gentle-sorry. I said, 'Scowler Gendibal promise to show me Place of Scowlers,' and they smile. One of them at gate-door say to other, 'And that not all he be show her.' And they show me where to go, and say not to go elseplace at all or I be thrown out moment-wise."

Gendibal reddened faintly. By Seldon, if he felt the need for Hamish amusement, it would not be in so open a fashion and his choice would have been made more selectively. He looked at the Trantorian woman with an inward shake of his head.

She seemed quite young, younger perhaps than hard work had made her appear. She could not be more than twenty-five, at which age Hamishwomen were usually already married. She wore her dark hair in the braids that signified her to be unmarried-virginal, in fact—and he was not surprised. Her performance yesterday showed her to have enormous talent as a shrew and he doubted that a Hamishman could easily be found who would dare be yoked to her tongue and her ready fist. Nor was her appearance much of an attraction. Though she had gone to pains to make herself look presentable, her face was angular and plain, her hands red and knobby. What he could see of her figure seemed built for endurance rather than for grace.

Her lower lip began to tremble under his scrutiny. He could sense her embarrassment and fright quite plainly and felt pity. She had, indeed, been of use to him yesterday and that was what counted.

He said, in an attempt to be genial and soothing, "So you have come to see the uh-Place of Scholars?"

She opened her dark eyes wide (they were rather fine) and said, "Master, be not ired with me, but I come to be scowler own-self."

"You want to be a scholar?" Gendibal was thunderstruck. "My good woman-"

He paused. How on Trantor could one explain to a completely unsophisticated farmwoman the level of intelligence, training, and mental stamina required to be what Trantorians called a "scowler"?

But Sura Novi drove on fiercely. "I be a writer and a reader. I have read whole books to end and from beginning, too. And I have wish to be scowler. I do not wish to be farmer's wife. I be no person for farm. I will not wed farmer or have farmer children." She lifted her head and said proudly, "I be asked. Many times. I always say, 'Nay! Politely, but 'Nay.'"

Gendibal could see plainly enough that she was lying. She had not been asked, but he kept his face straight. He said, "What will you do with your life if you do not marry?"

Novi brought her hand down on the table, palm flat. "I will be scowler. I not be farmwoman."

"What if I cannot make you a scholar?"

"Then I be nothing and I wait to die. I be nothing in life if I be not a scowler."

For a moment there was the impulse to search her mind and find out the extent of her motivation. But it would be wrong to do so. A Speaker did not amuse one's self by rummaging through the helpless minds of others. There was a code to the science and technique of mental control-mentals-as to other professions. Or there should be. (He was suddenly regretful he had struck out at the proctor.)

He said, "Why not be a farmwoman, Novi?" With a little manipulation, he could make her content with that and manipulate some Hamish lout into being happy to marry her-and she to marry him. It would do no harm. It would be a kindness. -But it was against the law and thus unthinkable.

She said, "I not be. A farmer is a clod. He works with earthlumps, and he becomes earth-lump. If I be farmwoman, I be earthlump, too. I will be timeless to read and write, and I will forget. My head," she put her hand to her temple, "will grow sour and stale. No! A scowler be different. Thoughtful!" (She meant by the word, Gendibal noted, "intelligent" rather than "considerate.")

"A scowler," she said, "live with books and with-with-I forget what they be name-said." She made a gesture as though she were making some sort of vague manipulations that would have meant nothing to Gendibal-if he did not have her mind radiations to guide him.

"Microfilms," he said. "How do you know about microfilms?"

"In books, I read of many things," she said proudly.

Gendibal could no longer fight off the desire to know more. This was an unusual Hamisher; he had never heard of one like this. The Hamish were never recruited, but if Novi were younger, say ten years old.

What a waste? He would not disturb her; he would not disturb her in the least, but of what use was it to be a Speaker if one could not observe unusual minds and learn from them?

He said, "Novi, I want you to sit there for a moment. Be very quiet. Do not say anything. Do not think of saying anything. just think of falling asleep: Do you understand?"

Her fright returned at once, "Why must I do this, Master?"

"Because I wish to think how you might become a scholar."

After all, no matter what she had read, there was no possible way in which she could know what being a "scholar" truly meant. It was therefore necessary to find out what she thought a scholar was.

Very carefully and with infinite delicacy he probed her mind; sensing without actually touching-like placing one's hand on a polished metal surface without leaving fingerprints. To her a scholar was someone who always read books. She had not the slightest idea of why one read books. For herself to be a scholar-the picture in her mind was that of doing the labor she knew-fetching, carrying, cooking, cleaning, following orders - but on the University grounds where books were available and where she would have time to read them and, very vaguely, "to become learned." What it amounted to was that she wanted to be a servant-his servant.

Gendibal frowned. A Hamishwoman servant-and one who was plain, graceless, uneducated, barely literate. Unthinkable.

He would simply have to divert her. There would have to be some way of adjusting her desires to make her content to be a farmwoman, some way that would leave no mark, some way about which even Delarmi could not complain.

-Or had she been sent by Delarmi? Was all this a complicated plan to lure him into tampering with a Hamish mind, so that he might be caught and impeached?

Ridiculous. He was in danger of growing paranoid. Somewhere in the simple tendrils of her uncomplicated mind, a trickle of mental current needed to be diverted. It would only take a tiny push.

It was against the letter of the law, but it would do no harm and no one would ever notice.

He paused.

Back. Back. Back.

Space! He had almost missed it!

Was he the victim of an illusion?

No! Now that his attention was drawn. to it, he could make it out clearly. There was the tiniest tendril disarranged-an abnormal disarray. Yet it was so delicate, so ramification-free.

Gendibal emerged from her mind. He said gently, "Novi."

Her eyes focused. She said, "Yes, Master?"

Gendibal said, "You may work with me. I will make you a scholar."

Joyfully, eyes blazing, she said, "Master."

He detected it at once. She was going to throw herself at his feet. He put his hands on her shoulders and held her tightly. "Don't move, Novi. Stay where you are. -Stay!"

He might have been talking to a half-trained animal. When he could see the order had penetrated, he let her go. He was conscious of the hard muscles along her upper arms.

He said, "If you are to be a scholar, you must behave like one. That means you will have to be always quiet, always soft-spoken, always doing what I tell you to do. And you must try to learn to talk as I do. You will also have to meet other scholars. Will you be afraid?"

"I be not afeared - afraid, Master, if you be with me."

"I wilt be with you. But now, first- I must find you a room, arrange to have you assigned a lavatory, a place in the dining room, and clothes, too. You will have to wear clothes more suitable to a scholar, Novi."

"These be all I-" she began miserably.

"We will supply others."

Clearly he would have to get a woman to arrange for a new supply of clothing for Novi. He would also need someone to teach the Hamisher the rudiments of personal hygiene. After all, though the clothes she wore were probably her best and though she had obviously spruced herself up, she still had a distinct odor that was faintly unpleasant.

And he would have to make sure that the relationship between them was understood. It was always an open secret that the men (and women, too) of the Second Foundation made occasional forays among the Hamish for their pleasure. If there was no interference with Hamish minds in the process, no one dreamed of making a fuss about it. Gendibal himself had never indulged in this, and he liked to think it was because he felt no need for sex that might be coarser and more highly spiced than was available at the University. The women of the Second Foundation might be pallid in comparison to the Hamish, but they were clean and their skins were smooth.

But even if the matter were misunderstood and there were sniggers at a Speaker who not only turned to the Hamish but brought one into his quarters, he would have to endure the embarrassment. As it stood, this farmwoman, Sura Novi, was his key to victory in the inevitable forthcoming duel with Speaker Delarmi and the rest of the Table.

Gendibal did not see Novi again till after dinnertime, at which time she was brought to him by the woman to whom he had endlessly explained the situation-at least, the nonsexual character of the situation. She had understood-or, at least, did not dare show any indication of failure to understand, which was perhaps just as good.

Novi stood before him now, bashful, proud, embarrassed, triumphant - all at once, in an incongruous mixture.

He said, "You look very nice, Novi."

The clothes they had given her fit surprisingly well and there was no question that she did not look at all ludicrous. Had they pinched in her waist? Lifted her breasts? Or had that just been not particularly noticeable in her farmwoman clothing?

Her buttocks were prominent, but not displeasingly so. Her face, of course, remained plain, but when the tan of outdoor life faded and she learned how to care for her complexion, it would not look downright ugly.

By the Old Empire, that woman did think Novi was to be his mistress. She had tried to make her beautiful for him.

And then he thought: Well, why not?

Novi would have to face the Speaker's Table-and the more attractive she seemed, the more easily he would be able to get his point across.

It was with this thought that the message from the First Speaker reached him. It had the kind of appropriateness that was common in a mentalic society. It was called, more or less informally, the "Coincidence Effect." If you think vaguely of someone when someone is thinking vaguely of you, there is a mutual, escalating stimulation which in a matter of seconds makes the two thoughts sharp, decisive, and, to all appearances, simultaneous.

It can be startling even to those who understand it intellectually, particularly if the preliminary vague thoughts were so dim-on one side or the other (or both)-as to have gone consciously unnoticed.

"I can't be with you this evening, Novi," said Gendibal. "I have scholar work to do. I will take you to your room. There will be some books there and you can practice your reading. I will show you how to use the signal if you need help with anything-and I will see you tomorrow."

Gendibal said politely, "First Speaker?"

Shandess merely nodded. He looked dour and fully his age. He looked as though he were a man who did not drink, but who could use a stiff one. He said finally, "I 'called' you-"

"No messenger. I presumed from the direct 'call' that it was important."

"It is. Your quarry-the First Founder-Trevize-"

"Yes?"

"He is not coming to Trantor."

Gendibal did not look surprised. "Why should he? The information we received was that he was leaving with a professor of ancient history who was seeking Earth."

"Yes, the legendary Primal Planet. And that is why he should be coming to Trantor. After all, does the professor know where Earth is? Do you? Do I? Can we be sure it exists at all, or ever existed? Surely they would have to come to this Library to obtain the necessary information-if it were to be obtained anywhere. I have until this hour felt that the situation was not at crisis level-that the First Founder would come here and that we would, through him, learn what we need to know."

"Which would certainly be the reason he is not allowed to come here."

"But where is he going, then?"

"We have not yet found out, I see."

The First Speaker said pettishly, "You seem calm about it."

Gendibal said, "I wonder if it is not better so. You want him to come to Trantor to keep him safe and use him as a source of information. Will he not, however, prove a source of more important information, involving others still more important than himself, if he goes where he wants to go and does what he wants to do-provided we do not lose sight of him?"

"Not enough!" said the First Speaker. "you have persuaded me of the existence of this new enemy of ours and now I cannot rest. Worse, I have persuaded myself that we must secure Trevize or we have lost everything. I cannot rid myself of the feeling that he-and nothing else-is the key."

Gendibal said intensely, "Whatever happens, we will not lose, First Speaker. That would only have been possible, if these Anti-Mules, to use your phrase again, had continued to burrow beneath us unnoticed. But we know they are there now. We no longer work blind. At the next meeting of the Table, if we can work together, we shall begin the counterattack."

The First Speaker said, "It was not the matter of Trevize that had me send out the call to you. The subject came up first only because it seemed to me a personal defeat. I had misanalyzed that aspect of the situation. I was wrong to place personal pique above general policy and I apologize. There is something else."

"More serious, First Speaker?"

"More serious, Speaker Gendibal." The First Speaker sighed and drummed his fingers on the desk while Gendibal stood patiently before it and waited.

The First Speaker finally said, in a mild way, as though that would ease the blow, "At an emergency meeting of the Table, initiated by Speaker Delarmi-

"Without your consent, First Speaker?"

"For what she wanted, she needed the consent of only three other Speakers, not including myself. At the emergency meeting that was then called, you were impeached, Speaker Gendibal. You have been accused as being unworthy of the post of Speaker and you must be tried. This is the first time in over three centuries that a bill of impeachment has been carried out against a Speaker-

Gendibal said, fighting to keep down any sign of anger, "Surely you did not vote for my impeachment yourself."

"I did not, but I was alone. The rest of the Table was unanimous and the vote was ten to one for impeachment. The requirement for impeachment, as you know, is eight votes including the First Speaker-or ten without him."

"But T was not present."

"You would not have been able to vote."

"I might have spoken in my defense."

"Not at that stage. The precedents are few, but clear. Your defense will be at the trial, which will come as soon as possible, naturally."

Gendibal bowed his head in thought. Then he said, "This does not concern me overmuch, First Speaker. Your initial instinct, I think, was right. The matter of Trevize takes precedence. May I suggest you delay the trial on that ground?"

The First Speaker held up his hand. "I don't blame you for not understanding the situation, Speaker. Impeachment is so rare an event that I myself have been forced to look up the legal procedures involved. Nothing takes precedence. We are forced to move directly to the trial, postponing everything else."

Gendibal placed his fists on the desk and leaned toward the First Speaker. "You are not serious?"

"It is the law."

"The law can't be allowed to stand in the way of a clear and present danger."

"To the Table, Speaker Gendibal, you are the clear and present danger. -No, listen to me! The law that is involved is based on the conviction that nothing can be more important than the possibility of corruption or the misuse of power on the part of a Speaker."

"But I am guilty of neither, First Speaker, and you knew it. This is a matter of a personal vendetta on the part of Speaker Delarmi. If there is misuse of power, it is on her part. My crime is that I have never labored to make myself popular-I admit that much-and I have paid too little attention to fools who are old enough to be senile but young enough to have power."

"Like myself, Speaker?"

Gendibal sighed. "You see, I've done it again. I don't refer to you, First Speaker. - Very well, then, let us have an instant trial, then. Let us have it tomorrow. Better yet, tonight. Let us get it over with and then pass on to the matter of Trevize. We dare not wait."

The First Speaker said, "Speaker Gendibal. I don't think you understand the situation. We have had impeachments before-not many, just two. Neither of those resulted in a conviction. You, however, will be convicted! You will then no longer be a member of the Table and you will no longer have a say in public policy. You will not, in fact, even have a vote at the annual meeting of the Assembly."

"And you will not act to prevent that?"

"I cannot. I will be voted down unanimously. I will then lie forced to resign, which I think is what the Speakers would like to see.

"And Delarmi will become First Speaker?"

"That is certainly a strong possibility."

"But that must not be allowed to happen!"

"Exactly! Which is why I will have to vote for your conviction."

Gendibal drew a deep breath. "I still demand an instant trial."

"You must have time to prepare your defense."

"What defense? They will listen to no defense. Instant trial!"

"The Table must have time to prepare their case."

"They have no case and will want none. They have me convicted in their minds and will require nothing more. In fact, they would rather convict me tomorrow than the day after-and tonight rather than tomorrow. Put it to them."

The First Speaker rose to his feet. They faced each other across the desk. The First Speaker said, "Why are you in such a hurry?"

"The matter of Trevize will not wait."

"Once you are convicted and I am rendered feeble in the face of a Table united against me, what will have been accomplished?"

Gendibal said in an intense whisper, "Have no fears! Despite everything, I will not be convicted."

9. HYPERSPACE

TREVIZE SAID, "ARE YOU READY, JANOV?"

Pelorat looked up from the book he was viewing and said, "You mean, for the jump, old fellow?"

"For the hyperspatial jump. Yes."

Pelorat swallowed. "Now, you're sure that it will be in no way uncomfortable. I know it is a silly thing to fear, but the thought of having myself reduced to incorporeal tachyons, which no one has ever seen or detected-"

"Come, Janov, it's a perfected thing. Upon my honor! The jump has been in use for twenty-two thousand years, as you explained, and I've never heard of a single fatality in hyperspace. We might come out of hyperspace in an uncomfortable place, but then the accident would happen in space-not while we are composed of tachyons."

"Small consolation, it seems to me."

"We won't come out in error, either. To tell you the truth, I was thinking of carrying it through without telling you, so that you would never know it had happened. On the whole, though, I felt it would be better if you experienced it consciously, saw that it was no problem of any kind, and could forget it totally henceforward."

"Well " said Pelorat dubiously. "I suppose you're right, but honestly I'm in no hurry."

"I assure you-"

"No no, old fellow, I accept your assurances unequivocally. It's just that - Did you ever read Sanerestil Matt?"

"Of course. I'm not illiterate."

"Certainly. Certainly. I should not have asked. Do you remember it?"

"Neither am I an amnesiac."

"I seem to have a talent for offending. All I mean is that I keep thinking of the scenes where Sanerestil and his friend, Ban, have gotten away from Planet 17 and are lost in space. I think of those perfectly hypnotic scenes among the stars, lazily moving along in deep silence, in changelessness, in- Never believed it, you know. I loved it and I was moved by it, but I never really believed it. But now-after I got used to just the notion of being in space, I'm experiencing it and-it's silly, I know-but I don't want to give it up. It's as though I'm Sanerestil-"

"And I'm Ban," said Trevize with just an edge of impatience.

"In a way. The small scattering of dim stars out there are motionless, except our sun, of course, which must be shrinking but which we don't see. The Galaxy retains its dim majesty, unchanging. Space is silent and I have no distractions-"

"Except me."

"Except you. -But then, Golan, dear chap, talking to you about Earth and trying to teach you a bit of prehistory has its pleasures, too. I don't want that to come to an end, either."

"It won't. Not immediately, at any rate. You don't suppose we'll take the jump and come through on the surface of a planet, do you? We'll still be in space and the jump will have taken no measurable time at all. It may well be a week before we make surface of any kind, so do relax."

"By surface, you surely don't mean Gaia. We may be nowhere near Gaia when we come out of the jump."

"I know that, Janov, but we'll be in the right sector, if your information is correct. If it isn't-well-"

Pelorat shook his head glumly. "How will being in the right sector help if we don't know Gaia's coordinates?"

Trevize said, "Janov, suppose you were on Terminus, heading for the town of Argyropol, and you didn't know where that town was except that it was somewhere on the isthmus. Once you were on the isthmus, what would you do?"

Pelorat waited cautiously, as though feeling there must be a terribly sophisticated answer expected of him. Finally giving up, he said, "I suppose I'd ask somebody."

"Exactly! What else is there to do? -Now, are you ready?"

"You mean, now?" Pelorat scrambled to his feet, his pleasantly unemotional face coming as near as it might to a look of concern. "What am I supposed to do? Sit? Stand? What?"

"Time and Space, Pelorat, you don't do anything. Just come with me to my room so I can use the computer, then sit or stand or turn cartwheels-whatever will make you most comfortable. My suggestion is that you sit before the viewscreen and watch it. It's sure to be interesting. Come!"

They stepped along the short corridor to Trevize's room and he seated himself at the computer. "Would you like to do this, Janov?" he asked suddenly. "I'll give you the figures and all you do is think them. The computer will do the rest."

Pelorat said, "No thank you. The computer doesn't work well with me, somehow. I know you say I just need practice, but I don't believe that. There's something about your mind, Golan-"

"Don't be foolish."

"No, no. That computer just seems to fit you. You and it seem to be a single organism when you're hooked up. When I'm hooked up, there are two objects involved-Janov Pelorat and a computer. It's just not the same."

"Ridiculous," said Trevize, but he was vaguely pleased at the thought and stroked the hand-rests of the computer with loving fingertips.

"So I'd rather watch," said Pelorat. "I mean, I'd rather it didn't happen at all, but as long as it will, I'd rather watch." He fixed his eyes anxiously on the viewscreen and on the foggy Galaxy with the thin powdering of dim stars in the foreground. "Let me know when it's about to happen." Slowly he backed against the wall and braced himself.

Trevize smiled. He placed his hands on the rests and felt the mental union. It came more easily day by day, and more intimately, too, and however he might scoff at what Pelorat said-he actually felt it. It seemed to him he scarcely needed to think of the coordinates in any conscious way. It almost seemed the computer knew what he wanted, without the conscious process of "telling." It lifted the information out of his brain for itself.

But Trevize "told" it and then asked for a two-minute interval before the jump.

"All right, Janov. We have two minutes: 120 - 115 - 110 Just watch the viewscreen."

Pelorat did, with a slight tightness about the corners of his mouth and with a holding of his breath.

Trevize said softly, "15 - 10 - 5 - 4 - 3 - Z - 1 - o "

With no perceptible motion, no perceptible sensation, the view on the screen changed. There was a distinct thickening of the starfield and the Galaxy vanished.

Pelorat started and said, "Was that it?"

"Was what it? You flinched. But that was your fault. You felt nothing. Admit it."

"I admit it."

"Then that's it. Way back when hyperspatial travel was relatively new - according to the books, anyway-there would be a queer internal sensation and some people felt dizziness or nausea. It was perhaps psychogenic, perhaps not. In any case, with more and more experience with hyperspatiality and with better equipment, that decreased. With a computer like the one on board this vessel, any effect is well below the threshold of sensation. At least, I find it so."

"And I do, too, I must admit. Where are we, Golan?"

"Just a step forward. In the Kalganian region. There's a long way to go yet and before we make another move, we'll have to check the accuracy of the jump."

"What bothers me is-where's the Galaxy?"

"All around us, Janov. We're weal inside it, now. If we focus the viewscreen properly, we can see the more distant parts of it as a luminous band across the sky."

"The Milky Way!" Pelorat cried out joyfully. "Almost every world describes it in their sky, but it's something we don't see on Terminus. Show it to me, old fellow!"

The viewscreen tilted, giving the effect of a swimming of the starfield across it, and then there was a thick, pearly luminosity nearly filling the field. The screen followed it around, as it thinned, then swelled again.

Trevize said, "It's thicker in the direction of the center of the Galaxy. Not as thick or as bright as it might be, however, because of the dark clouds in the spiral arms. You see something like this from most inhabited worlds."

"And from Earth, too."

"That's no distinction. That would not be an identifying characteristic."

"Of course not. But you know- You haven't studied the history of science, have you?"

"Not really, though I've picked up some of it, naturally. Still, if you have questions to ask, don't expect me to be an expert."

"It's just that making this jump has put me in mind of something that has always puzzled me. It's possible to work out a description of the Universe in which hyperspatial travel is impossible and in which the speed of light traveling through a vacuum is the absolute maximum where speed is concerned."

"Certainly."

"Under those conditions, the geometry of the Universe is such that it is impossible to make the trip we have just undertaken in less time than a ray of light would make it. And if we did it at the speed of light, our experience of duration would not match that of the Universe generally. If this spot is, say, forty parsecs from Terminus, then if we had gotten here at the speed of light, we would have felt no time lapse-but on Terminus and in the entire Galaxy, about a hundred and thirty years would have passed. Now we have made a trip, not at the speed of light but at thousands of times the speed of light actually, and there has been no time advance anywhere. At least, I hope not."

Trevize said, "Don't expect me to give you the mathematics of the Olanjen Hyperspatial Theory to you. All I can say is that if you had traveled at the speed of light within normal space, time would indeed have advanced at the rate of 3.26 years per parsec, as you described. The so-called relativistic Universe, which humanity has understood as far back as we can probe inter prehistory-though that's your department, I think-remains, and its laws have not been repealed. In our hyperspatial jumps, however, we do something out side the conditions under which relativity operates and the rules are different. Hyperspatially the Galaxy is a tiny object-ideally a nondimensional dot-and there are no relativistic effects at all.

"In fact, in the mathematical formulations of cosmology, there are two symbols for the Galaxy: Gr for the "relativistic Galaxy," where the speed of light is a maximum, and Gh for the "hyperspatial Galaxy," where speed does not really have a meaning. Hyperspatially the value of all speed is zero and we do not move with reference to space itself, speed is infinite. I can't explain things a bit more than that.

"Oh, except that one of the beautiful catches in theoretical physics is to place a symbol or a value that has meaning in Gr into an equation dealing with G11-or vice versa-and leave it there for a student to deal with. The chances are enormous that the student falls into the trap and generally remains there, sweating and panting, with nothing seeming to work, till some kindly elder helps him out. I was neatly caught that way, once."

Pelorat considered that gravely for a while, then said in a perplexed sort of way, "But which is the true Galaxy?"

"Either, depending on what you're doing. If you're back on Terminus, you can use a car to cover distance on land and a ship to cover distance across the sea. Conditions are different in every way, so which is the true Terminus, the land or the sea?"

Pelorat nodded. "Analogies are always risky," he said, "but I'd rather accept that one than risk my sanity by thinking about hyperspace any further. I'll concentrate on what we're doing now."

"Look upon what we just did," said Trevize, "as our first stop toward Earth."

And, he thought to himself, toward what else, I wonder.

"Well," said Trevize. "I've wasted a day."

"Oh?" Pelorat looked up from his careful indexing. "In what way?"

Trevize spread his arms. "I didn't trust the computer. I didn't dare to, so I checked our present position with the position we had aimed at in the jump. The difference was not measurable. There was no detectable error."

"That's good, isn't it?"

"It's more than good. It's unbelievable. I've never heard of such a thing. I've gone through jumps and I've directed them, in all kinds of ways and with all kinds of devices. In school, I had to work one out with a hand computer and then I sent off a hyper-relay to check results. Naturally I couldn't send a real ship, since-aside from the expense-I could easily have placed it in the middle of a star at the other end.

"I never did anything that bad, of course," Trevize went on, "but there would always be a sizable error. There's always some error, even with experts. There's got to be, since there are so many variables. Put it this way-the geometry of space is too complicated to handle and hyperspace compounds all those complications with a complexity of its own that we can't even pretend to understand. That's why we have to go by steps, instead of making one big jump from here to Sayshell. The errors would grow worse with distance."

Pelorat said, "But you said this computer didn't make an error."

"It said it didn't make an error. I directed it to check our actual position with our precalculated position-'what is' against 'what was asked for.' It said that the two were identical within its limits of measurement and I thought: What if it's lying?"

Until that moment, Pelorat had held his printer in his hand. He now put it down and looked shaken. "Are you joking? A computer can't lie. Unless you mean you thought it might be out of order."

"No, that's not what I thought. Space! I thought it was lying. This computer is so advanced I can't think of it as anything but human - superhuman, maybe. Human enough to have pride-and to lie, perhaps. I gave it directions-to work out a course through hyperspace to a position near Sayshell Planet, the capital of the Sayshell Union. It did, and charted a course in twenty-nine steps, which is arrogance of the worst sort."

"Why arrogance?"

"The error in the first jump makes the second jump that much less certain, and the added error then makes the third jump pretty wobbly and untrustworthy, and so on. How do you calculate twenty-nine steps all at once? The twenty-ninth could end up anywhere in the Galaxy, anywhere at all. So I directed it to make the first step only. Then we could check that before proceeding."

"The cautious approach," said Pelorat warmly. "I approve!"

"Yes, but having made the first step, might the computer not feel wounded at my having mistrusted it? Would it then be forced to salve its pride by telling me there was no

error at all when I asked it? Would it find it impossible to admit a mistake, to own up to imperfection? If that were so, we might as well not have a computer."

Pelorat's long and gentle face saddened. "What can we do in that case, Golan?"

"We can do what I did-waste a day. I checked the position of several of the surrounding stars by the most primitive possible methods: telescopic observation, photography, and manual measurement. I compared each actual position with the position expected if there had been no error. The work of it took me all day and wore me down to nothing."

"Yes, but what happened?"

"I found two whopping errors and checked them over and found them in my calculations. I had made the mistakes myself. I corrected the calculations, then ran them through the computer from scratch-just to see if it would come up with the same answers independently. Except that it worked them out to several more decimal places, it turned out that my figures were right and they showed that the computer had made no errors. The computer may be an arrogant son-of-the-Mule, but it's got something to be arrogant about."

Pelorat exhaled a long breath. "Well, that's good."

"Yes indeed! So I'm going to let it take the other twenty-eight steps."

"All at once? But-"

"Not all at once. Don't worry. I haven't become a daredevil just yet. It will do them one after the other-but after each step it will check the surroundings and, if that is where it is supposed to be within tolerable limits, it can take the next one. Any time it finds the error too great-and, believe me, I didn't set the limits generously at all-it will have to stop and recalculate the remaining steps."

"When are you going to do this?"

"When? Right now. -Look, you're working on indexing your Library-"

"Oh, but this is the chance to do it, Golan. I've been meaning to do it for years, but something always seemed to get in the way."

"I have no objections. You go on and do it and don't worry. Concentrate on the indexing. I'll take care of everything else."

Pelorat shook his head. "Don't be foolish. I can't relax till this is over. I'm scared stiff."

"I shouldn't have told you, then-but I had to tell someone and you're the only one here. Let me explain frankly. There's always the chance that we'll come to rest in a perfect position in interstellar space and that that will happen to be the precise position which a speeding meteoroid is occupying, or a mini-black hole, and the ship is wrecked, and we're dead. Such things could-in theory - happen.

"The chances are very small, however. After all, you could be at home, Janov - in your study and working on your films or in your bed sleeping-and a meteoroid could be streaking toward you through Terminus's atmosphere and hit you right in the head and you'd be dead. But the chances are small.

"In fact, the chance of intersecting the path of something fatal, but too small for the computer to know about, in the course of a hyperspatial jump is far, far smaller than that of being hit by a meteor in your home. I've never heard of a ship being lost that way in all the history of hyperspatial travel. Any other type of risk-like ending in the middle of a star-is even smaller."

Pelorat said, "Then why do you tell me all this, Golan?"

Trevize paused, then bent his head in thought, and finally said, "I don't know. -Yes, I do. What I suppose it is, is that however small the chance of catastrophe might be, in enough people take enough chances, the catastrophe must happen eventually. No matter how sure I am that nothing will go wrong, there's a small nagging voice inside me that says, 'Maybe it will happen this time.' And it makes me feel guilty. -I guess that's it. Janov, if something goes wrong, forgive me!"

"But Golan, my dear chap, if something goes wrong, we will both be dead instantly. I will not be able to forgive, nor you to receive forgiveness."

"I understand that, so forgive me now, will you?"

Pelorat smiled. "I don't know why, but this cheers me up. There's something pleasantly humorous about it. Of course, Golan, I'll forgive you. There are plenty of myths about some form of afterlife in world literature and if there should happen to be such a place - about the same chance as landing on a mini-black hole, I suppose, or less-and we both turn up in the same one, then I will bear witness that you did your honest best and that my death should not be laid at your door."

"Thank you! Now I'm relieved. I'm willing to take my chance, but I did not enjoy the thought of you taking my chance as well."

Pelorat wrung the other's hand. "You know, Golan, I've only known you less than a week and I suppose I shouldn't make hasty judgments in these matters, but I think you're an excellent chap. -And now let's do it and get it over with."

"Absolutely! All I have to do is touch that little contact. The computer has its instructions and it's just waiting for me to say: 'Starts' Would you like to-"

"Never! It's all yours? It's your computer."

"Very well. And it's my responsibility. I'm still trying to duck it, you see. Keep your eye on the screen!"

With a remarkably steady hand and with his smile looking utterly genuine, Trevize made contact.

There was a momentary pause and then the starfield changed-and again-and again. The stars spread steadily thicker and brighter over the viewscreen.

Pelorat was counting under his breath. At "15" there was a halt, as though some piece of apparatus had jammed.

Pelorat whispered, clearly afraid that any noise might jar the mechanism fatally. "What's wrong? What's happened?"

Trevize shrugged. "I imagine it's recalculating. Some object in space is adding a perceptible bump to the general shape of the overall gravitational field-some object not taken into account-some uncharted dwarf star or rogue planet-"

"Dangerous?"

"Since we're still alive, it's almost certainly not dangerous. A planet could be a hundred million kilometers away and still introduce a large enough gravitational modification to require recalculation. A dwarf star could be ten billion kilometers away and-

The screen shifted again and Trevize fell silent. It shifted again-and again- Finally, when Pelorat said, "a8," there was no further motion.

Trevize consulted the computer. "We're here," he said.

"I counted the first jump as 'r.' and in this series I started with 'z': That's twenty-eight jumps altogether. You said twenty-nine."

"The recalculation at jump i5 probably saved us one jump. I can check with the computer if you wish, but there's really no need. We're in the vicinity of Sayshell Planet. The computer says so and I don't doubt it. If I were to orient the screen properly, we'd see a nice, bright sun, but there's no point in placing a needless strain on its screening capacity. Sayshell Planet is the fourth one out and it's about 3.2 million kilometers away from our present position, which is about as close as we want to be at a jump conclusion. We can get there in three days-two, if we hurry."

Trevize drew a deep breath and tried to let the tension drain.

"Do you realize what this means, Janov?" he said. "Every ship I've ever been in-or heard of-would have made those jumps with at least a day in between for painstaking calculation and re-checking, even with a computer. The trip would have taken nearly a month.

"Or perhaps two or three weeks, if they were willing to be reckless about it. We did it in half an hour. When every ship is equipped with a computer like this one-

Pelorat said, "I wonder why the Mayor let us have a ship this advanced. It must be incredibly expensive."

"It's experimental," said Trevize dryly. "Maybe fine good woman was perfectly willing to have us try it out and see what deficiencies might develop."

"Are you serious?"

"Don't get nervous. After all, there's nothing to worry about. We haven't found any deficiencies. I wouldn't put it past her, though. Such a thing would put no great strain on her sense of humanity. Besides, she hasn't trusted us with offensive weapons and that cuts the expense considerably."

Pelorat said thoughtfully, "It's the computer I'm thinking about. It seems to be adjusted so well for you-and it can't be adjusted that well for everyone. It just barely works with me."

"So much the better for us, that it works so well with one of us."

"Yes, but is that merely chance?"

"What else, Janov?"

"Surely the Mayor knows you pretty well."

"I think she does, the old battlecraft."

"Might she not have had a computer designed particularly for you?"

"I just wonder if we're not going where the computer wants to take us."

Trevize stared. "You mean that while I'm connected to the computer, it is the computer-and not me-who is in real charge?"

"I just wonder."

"That is ridiculous. Paranoid. Come on, Janov."

Trevize turned back to the computer to focus Sayshell Planet on the screen and to plot a normal-space course to it.

Ridiculous!

But why had Pelorat put the notion into his head?

10. TABLE

TWO DAYS HAD PASSED AND GENDIBAL FOUND HIMSELF NOT SO MUCH heavyhearted as enraged. There was no reason why there could not have been an immediate hearing. Had he been unprepared-had he needed time-they would have forced an immediate hearing on him, he was sure.

But since there was nothing more facing the Second Foundation than the greatest crisis since the Mule, they wasted time-and to no purpose but to irritate him.

They did irritate him and, by Seldon, that would make his counterstroke the heavier. He was determined on that.

He looked about him. The anteroom was empty. It had been like that for two days now. He was a marked man, a Speaker whom all knew would-by means of an action unprecedented in the five-century history of the Second Foundation-soon lose his position. He would be demoted to the ranks, demoted to the position of a Second Founder, plain and simple.

It was one thing, however-and a very honored thing-to be a Second Founder of the ranks, particularly if one held a respectable title, as Gendibal might even after the impeachment. It would be quite another thing to have once been a Speaker and to have been demoted.

It won't happen though, thought Gendibal savagely, even though for two days he had been avoided. Only Sura Novi treated him as before, but she was too naive to understand the situation. To her, Gendibal was still "Master."

It irritated Gendibal that he found a certain comfort in this. He felt ashamed when he began to notice that his spirits rose when he noticed her gazing at him worshipfully. Was he becoming grateful for gifts that small?

A clerk emerged from the Chamber to tell him that the Table was ready for him and Gendibal stalked in. The clerk was one Gendibal knew well; he was one who knew-to the tiniest fraction-the precise gradation of civility that each Speaker deserved. At the moment, that accorded Gendibal was appallingly low. Even the clerk thought him as good as convicted.

They were all sitting about the Table gravely, wearing the black robes of judgment. First Speaker Shandess looked a bit uncomfortable, but he did not allow his face to crease into the smallest touch of friendliness. Delarmi - one of the three Speakers who were women-did not even look at him.

The First Speaker said, "Speaker Stor Gendibal, you have been impeached for behaving in a manner unbecoming a Speaker. You have, before us all, accused the Table-vaguely and without evidence-of treason and attempted murder. You have implied that all Second Founders-including the Speakers and the First Speaker-require a thorough mental analysis to ascertain who among them are no longer to be trusted. Such behavior breaks the bonds of community, without which the Second Foundation cannot

control an intricate and potentially hostile Galaxy and without which they cannot build, with surety, a viable Second Empire.

"Since we have all witnessed those offenses, we will forego the presentation of a formal case for the prosecution. We will therefore move directly to the next stage. Speaker Stor Gendibal, do you have a defense?"

Now Delarmi-still not looking at him-allowed herself a small catlike smile.

Gendibal said, "If truth be considered a defense, I have one. There are grounds for suspecting a breach of security. That breach may involve the mental control of one or more Second Foundationers-not excluding members here present-and this has created a deadly crisis for the Second Foundation. If, indeed, you hasten this trial because you cannot waste time, you may all perhaps dimly recognize the seriousness of the crisis, but in that case, why have you wasted two days after I had formally requested an immediate trial? I submit that it is this deadly crisis that has forced me to say what I have said. I would have behaved in a manner unbecoming a Speaker -had I not done so."

"He but repeats the offense, First Speaker," said Delarmi softly.

Gendibal's seat was further removed from the Table than that of the others-a clear demotion already. He pushed it farther back, as though he cared nothing for that, and rose.

He said, "Will you convict me now, out of hand, in defiance of law-or may I present my defense in detail?"

The First Speaker said, "This is not a lawless assemblage, Speaker. Without much in fine way of precedent to guide us, we will lean in your direction, recognizing that if our too-human abilities should cause us to deviate from absolute justice, it is better to allow the guilty to go free than to convict the innocent. Therefore, although the case before us is so grave that we may not lightly allow the guilty to go free, we will permit you to present your case in such manner as you wish and for as long as you require, until it is decided by unanimous vote, including my own" (and he raised his voice at that phrase) "that enough has been heard."

Gendibal said, "Let me begin, then, by saying that Golan Trevize -the First Foundationer who has been driven from Terminus and whom the First Speaker and I believe to be the knife-edge of the gathering crisis has moved off in an unexpected direction."

"Point of information," said Delarmi softly. "How does the speaker" (the intonation clearly indicated that the word was not capitalized) "know this?"

"I was informed of this by the First Speaker," said Gendibal, "but I confirm it of my own knowledge. Under the circumstances, however, considering my suspicions concerning the level of the security of the Chamber, I must be allowed to keep my sources of information secret."

The First Speaker said, "I will suspend judgment on that. Let us proceed without that item of information but if, in the judgment of the Table, the information must be obtained, Speaker Gendibal will have to yield it."

Delarmi said, "If the speaker does not yield the information now, it is only fair to say that I assume he has an agent serving him—an agent who is privately employed by him and who is not responsible to the Table generally. We cannot be sure that such an agent is obeying the rules of behavior governing Second Foundation personnel.

The First Speaker said with some displeasure, "I see all the implications, Speaker Delarmi. There is no need to spell them out for me."

"I merely mention it for the record, First Speaker, since this aggravates the offense and it is not an item mentioned in the bill of impeachment, which, I would like to say, has not been read in full and to which I move this item be added."

"The clerk is directed to add the item," said the First Speaker, "and the precise wording will be adjusted at the appropriate time. -Speaker Gendibal" (he, at least, capitalized) "your defense is indeed a step backward. Continue."

Gendibal said, "Not only has this Trevize moved in an unexpected direction, but at an unprecedented speed. My information, which the First Speaker does not yet have, is that he has traveled nearly ten thousand parsecs in well under an hour."

"In a single jump?" said one of the Speakers incredulously.

"In over two dozen jumps, one after the other, with virtually no time intervening," said Gendibal, "something that is even more difficult to imagine than a single jump. Even if he is now located, it will take time to follow him and, if he detects us and really means to flee us, we will not be able to overtake him. -And you spend your time in games of impeachment and allow two days to pass so that you might savor them the more."

The First Speaker managed to mask his anguish. "Please tell us, Speaker Gendibal, what you think the significance of this might be."

"It is an indication, First Speaker, of the technological advances that are being made by the First Foundation, who are far more powerful now than they were in the time of Preem Palver. We could not stand up against them if they found us and were free to act."

Speaker Delarmi rose to her feet. She said, "First Speaker, our time is being wasted with irrelevancies. We are not children to be frightened with tales by Grandmother Spacewarp. It does not matter how impressive the machinery of the First Foundation is when, in any crisis, their minds will be in our control."

"What do you have to say to that, Speaker Gendibal?" asked the First Speaker.

"Merely that we will come to the matter of minds in due course. For the moment, I merely wish to stress the superior—and increasing technological might of the First Foundation."

The First Speaker said, "Pass on to the next point, Speaker Gendibal. Your first point, I must tell you, does not impress me as very pertinent to the matter contained in the bill of impeachment."

There was a clear gesture of agreement from the Table generally.

Gendibal said, "I pass on. Trevize has a companion in his present journey" (he paused momentarily to consider pronunciation) "one Janov Pelorat, a rather ineffectual scholar who has devoted his life to tracking down myths and legends concerning Earth."

"You know all this about him? Your hidden source, I presume?" said Delarmi, who had settled into her role of prosecutor with a clear feeling of comfort.

"Yes, I know all this about him," said Gendibal stolidly. "A few months ago, the Mayor of Terminus, an energetic and capable woman, grew interested in this scholar for no clear reason, and so I grew interested, too, as a matter of course. Nor have I kept this to myself. All the information I have gained has been made available to the First Speaker."

"I bear witness to that," said the First Speaker in a low voice.

An elderly Speaker said, "What is this Earth? Is it the world of origin we keep coming across in fables? The one they made a fuss about in old Imperial times?"

Gendibal nodded. "In the tales of Grandmother Spacewarp, as Speaker Delarmi would say. -I suspect it was Pelorat's dream to come to Trantor to consult the Galactic Library, in order to find information concerning Earth that he could not obtain in the interstellar library service available on Terminus.

"When he left Terminus with Trevize, he must have been under the impression that that dream was to be fulfilled. Certainly we were expecting the two and counted on having the opportunity to examine them-to our own profit. As it turns out-and as you all know by now-they are not coming. They have turned off to some destination that is not yet clear and for some reason that is not yet known."

Delarmi's round face looked positively cherubic as she said, "And why is this disturbing? We are no worse off for their absence, surely. Indeed, since they dismiss us so easily, we can deduce that the First Foundation does not know the true nature of Trantor and we can applaud the handiwork of Preem Palver."

Gendibal said, "If we thought no further, we might indeed come to such a comforting solution. Could it be, though, that the turnoff was not the result of any failure to see the importance of Trantor? Could it be that the turnoff resulted from anxiety lest Trantor, by examining these two men, see the importance of Earth?"

There was a stir about the Table.

"Anyone," said Delarmi coldly, "can invent formidable-sounding propositions and couch them in balanced sentences. But do they make sense when you do invent them? Why should anyone care what we of the Second Foundation think of Earth? Whether it is the true planet of origin, or whether it is a myth, or whether there is no one place of origin to begin with, is surely something that should interest only historians, anthropologists, and folk-tale collectors, such as this Pelorat of yours. Why us?"

"Why indeed?" said Gendibal. "How is it, then, that there are no references to Earth in the Library?"

For the first time, something in the atmosphere that was other than hostility made itself felt about the Table.

Delarmi said, "Aren't there?"

Gendibal said quite calmly, "When word first reached me that Trevize and Pelorat might be coming here in search of information concerning Earth, I, as a matter of course, had our Library computer make a listing of documents containing such information. I was

mildly interested when it turned up nothing. Not minor quantities. Not very little. -
Nothing?

"But then you insisted I wait for two days before this hearing could take place, and at the same time, my curiosity was further piqued by the news that the First Foundationers were not coming here after all. I had to amuse myself somehow. While the rest of you therefore were, as the saying goes, sipping wine while the house was falling, I went through some history books in my own possession. I came across passages that specifically mentioned some of the investigations on the 'Origin Question' in late-Imperial times. Particular documents-both printed and filmed-were referred to and quoted from. I returned to the Library and made a personal check for those documents. I assure you there was nothing."

Delarmi said, "Even if this is so, it need not be surprising. If Earth is indeed a myth-
"

"Then I would find it in mythological references. If it were a story of Grandmother Spacewarp, I would find it in the collected tales of Grandmother Spacewarp. If it were a figment of the diseased mind, I would find it under psychopathology. The fact is that something about Earth exists or you would not all have heard of it and, indeed, immediately recognized it as the name of the putative planet of origin of the human species. Why, then, is there no reference to it in the Library, anywhere?"

Delarmi was silent for a moment and another Speaker interposed. He was Leonis Cheng, a rather small man with an encyclopedic knowledge of the minutiae of the Seldon Plan and a rather myopic attitude toward the actual Galaxy. His eyes tended to blink rapidly when he spoke.

He said, "It is well known that the Empire in its final days attempted to create an Imperial mystique by soft-pedaling all interest in pre-Imperial times."

Gendibal nodded. "Soft-pedaled is the precise term, Speaker Cheng. That is not equivalent to destroying evidence. As you should know better than anyone, another characteristic of Imperial decay was a sudden interest in earlier-and presumably better-times. I have just referred to the interest in the 'Origin Question' in Hari Seldon's time."

Cheng interrupted with a formidable clearing of the throat. "I know this very well, young man, and know far more of these social problems of Imperial decay than you seem to think I do. The process of 'Imperialization' overtook these dilettantish games concerning Earth. Under Cleon II, during the Empire's last resurgence, two centuries after Seldon, Imperialization reached its peak and all speculation on the question of Earth came to an end. There was even a directive in Cleon's time concerning this, referring to the interest in such things as (and I think I quote it correctly) 'stale and unproductive speculation that tends to undermine the people's love of the Imperial throne'."

Gendibal smiled. "Then it was in the time of Cleon II, Speaker Cheng, that you would place the destruction of all reference to Earth?"

"I draw no conclusions. I have simply stated what I have stated."

"It is shrewd of you to draw no conclusions. By Cleon's time, the Empire may have been resurgent, but the University and Library, at least, were in our hands or, at any rate,

in those of our predecessors. It would have been impossible for any material to be removed from the Library without the Speakers of the Second Foundation knowing it. In fact, it would have been the Speakers to whom the task would have had to be entrusted, though the dying Empire would not have known that."

Gendibal paused, but Cheng, saying nothing, looked over the other's head.

Gendibal said, "It follows that the Library could not have been emptied of material on Earth during Seldon's time, since the 'Origin Question' was then an active preoccupation. It could not have been emptied afterward because the Second Foundation was in charge. Yet the Library is empty of it now. How can this be?"

Delarmi broke in impatiently, "You may stop weaving the dilemma, Gendibal. We see it. What is it that you suggest as a solution? That you have removed the documents yourself?"

"As usual, Delarmi, you penetrate to the heart." And Gendibal bent his head to her in sardonic respect (at which she allowed herself a slight lifting of the lip). "One solution is that the cleansing was done by a Speaker of the Second Foundation, someone who would know how to use curators without leaving a memory behind -and computers without leaving a record behind:"

First Speaker Shandess turned red. "Ridiculous, Speaker Gendibal. I cannot imagine a Speaker doing this. What would the motivation be? Even if, for some reason, the material on Earth were removed, why keep it from the rest of the Table? Why risk a complete destruction of one's career by tampering with the Library when the chances of its being discovered are so great? Besides, I don't think that even the most skillful Speaker could perform the task without leaving a trace."

"Then it must be, First Speaker, that you disagree with Speaker Delarmi in her suggestion that I did it"

"I certainly do," said the First Speaker. "Sometimes I doubt your judgment, but I have yet to consider you downright insane."

"Then it must never have happened, First Speaker. The material on Earth must still be in the Library, for we now seem to have eliminated all the possible ways in which it could have been removed-and yet the material is not there."

Delarmi said with an affectation of weariness, "Well well, let us finish. Again, what is it you suggest as a solution? I am sure you think you have one."

"If you are sure, Speaker, we may all be sure as well. My suggestion is that the Library was cleansed by someone of the Second Foundation who was under the control of a subtle force from outside the Second Foundation. The cleansing went unnoticed because that same force saw to it that it was not noticed."

Delarmi laughed. "Until you found out. You-the uncontrolled. and uncontrollable. If this mysterious force existed, how did you find out about the absence of material from the Library? Why weren't you controlled?"

Gendibal said may feel, as we gravely, "It's not a laughing matter, Speaker. They feel, that all tampering should be held to a minimum. When my life was in danger a few days ago, I was more concerned with refraining from fiddling with a Hamish mind than

with protecting myself. So it might be with these others-as soon as they felt it was safe they ceased tampering. That is the danger, the deadly danger. The fact that I could find out what has happened may mean they no longer care that I do. The fact that they no longer care may mean that they feel they have already won. And we continue to play our games here!"

"But what aim do they have in all this? What conceivable aim?" demanded Delarmi, shuffling her feet and biting her lips. She felt her power fading as the Table grew more interested-concerned.

Gendibal said, "Consider- The First Foundation, with its enormous arsenal of physical power, is searching for Earth. They pretend to send out two exiles, hoping we will think that is all they are, but would they equip them with ships of unbelievable power-ships that can move ten thousand parsecs in less than an hour-if that was all that they were?"

"As for the Second Foundation, we have not been searching for Earth and, clearly, steps have been taken without our knowledge to keep any information of Earth away from us. The First Foundation is now so close to finding Earth and we are so far from doing so, that-"

Gendibal paused and Delarmi said, "That what? Finish your childish tale. Do you know anything or don't you?"

"I don't know everything, Speaker. I have not penetrated the total depth of the web that is encircling us, but I know the web is there. I don't know what the significance of finding Earth might be, but I am certain the Second Foundation is in enormous danger and, with it, the Seldon Plan and the future of all humanity."

Delarmi rose to her feet. She was not smiling and she spoke in a tense but tightly controlled voice. "Trash? First Speaker, put an end to this! What is at issue is the accused's behavior. What he tells us is not only childish but irrelevant. He cannot extenuate his behavior by building a cobwebbery of theories that makes sense only in his own mind. I call for a vote on the matter now-a unanimous vote for conviction."

"Wait," said Gendibal sharply. "I have been told I would have an opportunity to defend myself, and there remains one more item-one more. Let me present that, and you may proceed to a vote with no further objection from me."

The First Speaker rubbed his eyes wearily. "You may continue, Speaker Gendibal. Let me point out to the Table that the conviction of an impeached Speaker is so weighty and, indeed, unprecedented an action that we dare not give the appearance of not allowing a full defense. Remember, too, that even if the verdict satisfies us, it may not satisfy those who come after us, and I cannot believe that a Second Founder of any level-let alone the Speakers of the Table-would not have a full appreciation of the importance of historical perspective. Let us so act that we can be certain of the approval of the Speakers who will follow us in the coming centuries."

Delarmi said bitterly, "We run the risk, First Speaker, of having posterity laugh at us for belaboring the obvious. To continue the defense is your decision."

Gendibal drew a deep breath. "In line with your decision, then, First Speaker, I wish to call a witness—a young woman I met three days ago and without whom I might not have reached the Table meeting at all, instead of merely being late."

"Is the woman you speak of known to the Table?" asked the First Speaker.

"No, First Speaker. She is native to this planet."

Delarmi's eyes opened wide. "A Hamishwoman?"

"Indeed! Just so!"

Delarmi said, "What have we to do with one of those? Nothing they say can be of any importance. They don't exist!"

Gendibal's lips drew back tightly over his teeth in something that could not possibly have been mistaken for a smile. He said sharply, "Physically all the Hamish exist. They are human beings and play their part in Seldon's Plan. In their indirect protection of the Second Foundation, they play a crucial part. I wish to dissociate myself from Speaker Delarmi's inhumanity and hope that her remark will be retained in the record and be considered hereafter as evidence for her possible unfitness for the position of Speaker. - Will the rest of the Table agree with the Speaker's incredible remark and deprive me of my witness?"

The First Speaker said, "Call your witness, Speaker."

Gendibal's lips relaxed into the normal expressionless features of a Speaker under pressure. His mind was guarded and fenced in, but behind this protective barrier, he felt that the danger point had passed and that he had won.

Sura Novi looked strained. Her eyes were wide and her lower lip was faintly trembling. Her hands were slowly clenching and unclenching and her chest was heaving slightly. Her hair had been pulled back and braided into a bun; her sun-darkened face twitched now and then. Her hands fumbled at the pleats of her long skirt. She looked hastily around the Table—from Speaker to Speaker—her wide eyes filled with awe.

They glanced back at her with varying degrees of contempt and discomfort. Delarmi kept her eyes well above the top of Novi's head, oblivious to her presence.

Carefully Gendibal touched the skin of her mind, soothing and relaxing it. He might have done the same by patting her hand or stroking her cheek, but here, under these circumstances, that was impossible, of course.

He said, "First Speaker, I am numbing this woman's conscious awareness so that her testimony will not be distorted by fear. Will you please observe—will the rest of you, if you wish, join me and observe that I will, in no way, modify her mind?"

Novi had started back in terror at Gendibal's voice, and Gendibal was not surprised at that. He realized that she had never heard Second Foundationers of high rank speak among themselves. She had never experienced that odd swift combination of sound, tone, expression and thought. The terror, however, faded as quickly as it came, as he gentled her mind.

A look of placidity crossed her face.

"There is a chair behind you, Novi," Gendibal said. "Please sit down."

Novi curtsied in a small and clumsy manner and sat down, holding herself stiffly.

She talked quite clearly, but Gendibal made her repeat when her Hamish accent became too thick. And because he kept his own speech formal in deference to the Table, he occasionally had to repeat his own questions to her.

The tale of the fight between himself and Rufirant was described quietly and well.

Gendibal said, "Did you see all this yourself, Novi?"

"Nay, Master, or I would have sooner-stopped it. Rufirant be good fellow, but not quick in head."

"But you described it all. How is that possible if you did not see it all?"

"Rufirant be telling me thereof, on questioning. He be ashamed."

"Ashamed? Have you ever known him to behave in this manner in earlier times?"

"Rufirant? Nay, Master. He be gentle, though he be large. He be no fighter and he be afeared of scowlers. He say often they are mighty and possessed of power."

"Why didn't he feel this way when he met me?"

"It be strange. It be not understood." She shook her head. "He be not his ain self. I said to him, 'Thou blubber-head. Be it your place to assault scowler?' And he said, 'I know not how it happened. It be like I am to one side, standing and watching not-I.'"

Speaker Cheng interrupted. "First Speaker, of what value is it to have this woman report what a man has told her? Is not the man available for questioning?"

Gendibal said, "He is. If, on completion of this woman's testimony, the Table wishes to hear more evidence, I will be ready to call Karoll Rufirant-my recent antagonist-to the stand. If not, the Table can move directly to judgment when I am done with this witness."

"Very well," said the First Speaker. "Proceed with your witness."

Gendibal said, "And you, Novi? Was it like you to interfere in a fight in this manner?"

Novi did not say anything for a moment. A small frown appeared between her thick eyebrows and then disappeared. She said, "I know not. I wish no harm to scowlers. I be, driven, and without thought I iniddled myself." A pause, then., "I be do it over if need arise."

Gendibal said, "Novi, you will sleep now. You will think of nothing. You will rest and you will not even dream."

Novi mumbled for a moment. Her eyes closed and her head fell back against the headrest of her chair.

Gendibal waited a moment, then said, "First Speaker, with respect, follow me into this woman's mind. You will find it remarkably simple and symmetrical, which is fortunate, for what you will see might not have been visible otherwise. -Here-here! Do you observe? -If the rest of you will enter-it will be easier if it is done one at a time."

There was a rising buzz about the Table.

Gendibal said, "Is there any doubt among you?"

Delarmi said, "I doubt it, for-" She paused on the brink of what was-even for her-unsayable.

Gendibal said it for her. "You think I deliberately tampered with this mind in order to present false evidence? You think, therefore, that I am capable of bringing about so delicate an adjustment-one mental fiber clearly out of shape with nothing about it or its surroundings that is in the least disturbed? If I could do that, what need would I have to deal with any of you in this manner? Why subject myself to the indignity of a trial? Why labor to convince you? If I could do what is visible in this woman's mind, you would all be helpless before me unless you were well prepared. -The blunt fact is that none of you could manipulate a mind as this woman's has been manipulated. Neither can I. Yet it has been done."

He paused, looking at all the Speakers in turn, then fixing his gaze on Delarmi. He spoke slowly. "Now, if anything more is required, I will call in the Hamish farmer, Karoll Rufirant, whom I have examined and whose mind has also been tampered with in this manner."

"That will not be necessary," said the First Speaker, who was wearing an appalled expression. "What we have seen is mindshaking."

"In that case," said Gendibal, "may I rouse this Hamishwoman and dismiss her? I have arranged for there to be those outside who will see to her recovery."

When Novi had left, directed by Gendibal's gentle hold on her elbow, he said, "Let me quickly summarize. Minds can be-and have been altered in ways that are beyond our power. In this way, the curators themselves could have been influenced to remove Earth material from the Library-without our knowledge or their own. We see how it was arranged that I should be delayed in arriving at a meeting of the Table. I was threatened; I was rescued. The result was that I was impeached. The result of this apparently natural concatenation of events is that I may be removed from a position of power-and the course of action which I champion and which threatens these people, whoever they are, may be negated."

Delarmi leaned forward. She was clearly shaken. "If this secret organization is so clever, how were you able to discover all this?"

Gendibal felt free to smile, now. "No credit to me," he said. "I lay no claim to expertise superior to that of other Speakers; certainly not to the First Speaker. However, neither are these Anti-Mules-as the First Speaker has rather engagingly called them-infinately wise or infinitely immune to circumstance. Perhaps they chose this particular Hamishwoman as their instrument precisely because she needed very little adjustment. She was, of her own character, sympathetic to what she calls 'scholars,' and admired them intensely.

"But then, once this was over, her momentary contact with me strengthened her fantasy of becoming a 'scholar' herself. She came to me the next day with that purpose in mind. Curious at this peculiar ambition of hers, I studied her mind-which I certainly would not otherwise have done-and, more by accident than anything else, stumbled upon the adjustment and noted its significance. Had another woman been chosen-one with a less natural pro-scholar bias-the Anti-Mules might have had to labor more at the adjustment, but the consequences might well not have followed and I would have remained ignorant

of all this. The Anti-Mules miscalculated-or could not sufficiently allow for the unforeseen. That they can stumble so is heartening."

Delarmi said, "The First Speaker and you call this-organization -the 'Anti-Mules,' I presume, because they seem to labor to keep tile Galaxy in the path of the Seldon Plan, rather than to disrupt it as the Male himself did. If the Anti-Mines do this, why are they dangerous?"

"Why should then labor, if not for some purpose? We don't know what that purpose as. A cynic might say that they intend to step in at some future time and thin the current in another direction, one tat mar please them far more than it would please ifs. That is my own feeling, even though I do riot major in cynicism. Is Speaker Delarmi prepared to maintain, out of the love and trust that we all know form so great a part of her character, that these are cosmic altruists, doing our work for us, without dream of reward?"

There was a gentle susurrations of laughter about the Table at this and Gendibal knew that he had won. And Delarmi knew that she had lost, for there was a wash of rage that showed through her harsh mentalic control like a momentary ray of ruddy sunlight through a thick canopy of leaves.

Gendibal said, "When I first experienced the incident with the Hamish farmer, I leaped to the conclusion that another Speaker was behind it. When I noted the adjustment of the Hamishwoman's mind, I knew that I was right as to the plot but wrong as to the plotter. I apologize for the misinterpretation and I plead the circumstances as an extenuation."

The First Speaker said, "I believe this may be construed as an apology"

Delarmi interrupted. She was quite placid again-her face was friendly, her voice downright saccharine. "With total respect, First Speaker, if I may interrupt- Let us drop this matter of impeachment. At this moment, I would not vote for conviction and I imagine no one will. I would even suggest the impeachment be stricken from the Speaker's unblemished record. Speaker Gendibal has exonerated himself ably. I congratulate him on that-and for uncovering a crisis that the rest of us might well have allowed to smolder on indefinitely, with incalculable results. I offer the Speaker my wholehearted apologies for my earlier hostility."

She virtually beamed at Gendibal, who felt a reluctant admiration for the manner in which she shifted direction instantly in order to cut her losses. He also felt that all this was but preliminary to an attack from a new direction.

He was certain that what was coming would not be pleasant.

When she exerted herself to be charming, Speaker Delora Delarmi had a way of dominating the Speaker's Table. Her voice grew soft, her smile indulgent, her eyes sparkling, all of her sweet. No one cared to interrupt her and everyone waited for the blow to fall.

She said, "Thanks to Speaker Gendibal, I think we all now understand what we must do. We do not see the Anti-Mules; we know nothing about them, except for their fugitive touches on the minds of people right here in the stronghold of the Second

Foundation itself. We do not know what the power center of the First Foundation is planning. We may face an alliance of the Anti-Mules and the First Foundation. We don't know.

"We do know that this Golan Trevize and his companion, whose name escapes me at the moment, are going we know not where—and that the First Speaker and Gendibal feel that Trevize holds the key to the outcome of this great crisis. What, then, are we to do? Clearly we must find out everything we can about Trevize; where he is going, what he is thinking, what his purpose may be; or, indeed, whether he has any destination, any thought, any purpose; whether he might not, in fact, be a mere tool of a force greater than he. "

Gendibal said, "He is under observation. "

Delarmi pursed her lips in an indulgent smile. "By whom? By one of our outworld agents? Are such agents to be expected to stand against those with the powers we have seen demonstrated here? Surely not. In the Mule's time, and later on, too, the Second Foundation did not hesitate to send out—and even to sacrifice—volunteers from among the best we had, since nothing less would do. When it was necessary to restore the Seldon Plan, Preem Palver himself scoured the Galaxy as a Trantorian trader in order to bring back that girl, Arkady. We cannot sit here and wait, now, when the crisis may be greater than in either previous case. We cannot rely on minor functionaries—watchers and messenger boys. "

Gendibal said, "Surely you are not suggesting that the First Speaker leave Trantor at this time? "

Delarmi said, "Certainly not. We need him badly here. On the other hand, there is you, Speaker Gendibal. It is you who have correctly sensed and weighed the crisis. It is you who detected the subtle outside interference with the Library and with Hamish minds. It is you who have maintained your views against the united opposition of the Table—and won. No one here has seen as clearly as you have and no one can be trusted, as you can, to continue to see clearly. It is you who must, in my opinion, go out to confront the enemy. May I have the sense of the Table? "

There was no formal vote needed to reveal that sense. Each Speaker felt the minds of the others and it was clear to a suddenly appalled Gendibal that, at the moment of his victory and Delarmi's defeat, this formidable woman was managing to send him irrevocably into exile on a task that might occupy him for some indefinite period, while she remained behind to control the Table and, therefore, the Second Foundation and, therefore, the Galaxy—sending all alike, perhaps, to their doom.

And if Gendibal-in-exile should, somehow, manage to gather the information that would enable the Second Foundation to avert the gathering crisis, it would be Delarmi who would have the credit for having arranged it, and his success would but confirm her power. The quicker Gendibal would be, the more efficiently he succeeded, the more surely he would confirm her power.

It was a beautiful maneuver, an unbelievable recovery.

And so clearly was she dominating the Table even now that she was virtually usurping the First Speaker's role. Gendibal's thought to that effect was overtaken by the rage he sensed from the First Speaker.

He turned. The First Speaker was making no effort to hide his anger—and it soon was clear that another internal crisis was building to replace the one that had been resolved.

Quindor Shandess, the twenty-fifth First Speaker, had no extraordinary illusions about himself.

He knew he was not one of those few dynamic First Speakers who had illuminated the five-century-long history of the Second Foundation—but then, he didn't have to be. He controlled the Table in a quiet period of Galactic prosperity and it was not a time for dynamism. It had seemed to be a time to play a holding game and he had been the man for this role. His predecessor had chosen him for that reason.

"You are not an adventurer, you are a scholar, " the twenty-fourth First Speaker had said. "You will preserve the Plan, where an adventurer might ruin it. Preserve! Let that be the key word for your Table. "

He had tried, but it had meant a passive First Speakership and this had been, on occasion, interpreted as weakness. There had been recurrent rumors that he meant to resign and there had been open intrigue to assure the succession in one direction or another.

There was no doubt in Shandess's mind that Delarmi had been a leader in the fight. She was the strongest personality at the Table and even Gendibal, with all the fire and folly of youth, retreated before her, as he was doing right now.

But, by Seldon, passive he might be, or even weak, but there was one prerogative of the First Speaker that not one in the line had ever given up, and neither would he do so.

He rose to speak and at once there was a hush about the Table. 'When the First Speaker rose to speak, there could be no interruptions. Even Delarmi or Gendibal would not dare to interrupt.

He said, "Speakers! I agree that we face a dangerous crisis and that we must take strong measures. It is I who should go out to meet the enemy. Speaker Delarmi, with the gentleness that characterizes her, excuses me from the task by stating that I am needed here. The truth, however, is that I am needed neither here nor there. I grow old; I grow weary. There has long been expectation I would someday resign and perhaps I ought to. When this crisis is successfully surmounted, I shall resign.

"But, of course, it is the privilege of the First Speaker to choose his successor. I am going to do so now. There is one Speaker who has long dominated the proceedings of the Table; one Speaker who, by force of personality, has- often supplied the leadership that I could not. You all know I am speaking of Speaker Delarmi. "

He paused, then said, "You alone, Speaker Gendibal, are registering disapproval. May I ask why? "

He sat down, so that Gendibal might have the right to answer.

"I do not disapprove, First Speaker, " said Gendibal in a low voice. "It is your prerogative to choose your successor. "

"And so I will. 'When you return—having succeeded in initiating the process that will put an end to this crisis—it will be time for my resignation. My successor will then be directly in charge of conducting whatever policies may be required to carry on and complete that process. —Do you have anything to say, Speaker Gendibal? "

Gendibal said quietly, "When you make Speaker Delarmi your successor, First Speaker, I hope you will see fit to advise her to—"

The First Speaker interrupted him roughly. "I have spoken of Speaker Delarmi, but I have not named her as my successor. Now what do you have to say? "

"My apologies, First Speaker. I should have said, assuming you make Speaker Delarmi your successor upon my return from this mission, would you see fit to advise her to—"

"Nor will I make her my successor in the future, under any conditions. Now what do you have to say? "

The First Speaker was unable to make this announcement without a stab of satisfaction at the blow he was delivering to Delarmi. He could not have done it in a more humiliating fashion.

"Well, Speaker Gendibal, " he said, "what do you have to say? "

"That I am confused. "

The First Speaker rose again. He said, "Speaker Delarmi has dominated and led, but that is not all that is needed for the post of First Speaker. Speaker Gendibal has seen what we have not seen. He has faced the united hostility of the Table, and forced it to rethink matters, and has dragged it into agreement with him. I have my suspicions as to the motivation of Speaker Delarmi in placing the responsibility of the pursuit of Golan Trevize on the shoulders of Speaker Gendibal, but that is where the burden belongs. I know he will succeed—I trust my intuition in this—and when he returns, Speaker Gendibal will become the twenty-sixth First Speaker. "

He sat down abruptly and each Speaker began to make clear his opinion in a bedlam of sound, tone, thought, and expression. The First Speaker paid no attention to the cacophony, but stared indifferently before him. Now that it was done, he realized—with some surprise—the great comfort there was in laying down the mantle of responsibility. He should have done it before this—but he couldn't have.

It was not till now that he had found his obvious successor.

And then, somehow, his mind caught that of Delarmi and he looked up at her.

By Seldon! She was calm and smiling. Her desperate disappointment did not show—she had not given up. He wondered if he had played into her hands. 'What was there left for her to do?

Debra Delarmi would freely have shown her desperation and disappointment, if that would have proven of any use whatever.

It would have given her a great deal of satisfaction to strike out at that senile fool who controlled the Table or at that juvenile idiot with whom Fortune had conspired—but satisfaction wasn't what she wanted. She wanted something more.

She wanted to be First Speaker.

And while there was a card left to play, she would play it.

She smiled gently, and managed to lift her hand as though she were about to speak, and then held the pose just long enough to insure that when she did speak, all would be not merely normal, but radiantly quiet.

She said, "First Speaker, as Speaker Gendibal said earlier, I do not disapprove. It is your prerogative to choose your successor. If I speak now, it is in order that I may contribute—I hope—to the success of what has now become Speaker Gendibal's mission. May I explain my thoughts, First Speaker? "

"Do so, " said the First Speaker curtly. She was entirely too smooth, too pliant, it seemed to him.

Delarmi bent her head gravely. She no longer smiled. She said, "We have ships. They are not as technologically magnificent as those of the First Foundation, but they will carry Speaker Gendibal. He knows how to pilot one, I believe, as do we all. We have our representatives on every major planet in the Galaxy, and he will be welcomed everywhere. Moreover, he can defend himself against even these Anti-Mules, now that he is thoroughly aware of the danger. Even when we were unaware, I suspect they have preferred to work through the lower classes and even the Hamish farmers. We will, of course, thoroughly inspect the minds of all the Second Foundationers, including the Speakers, but I am sure they have remained inviolate. The Anti-Mules did not dare interfere with us.

"Nevertheless, there is no reason why Speaker Gendibal should risk more than he must. He is not intending to engage in derring-do and it will be best if his mission is to some extent disguised—if he takes them unaware. It will be useful if he goes in the role of a Hamish trader. Preem Palver, we all know, went off into the Galaxy as a supposed trader. "

The First Speaker said, "Preem Palver had a specific purpose in doing so; Speaker Gendibal has not. If it appears a disguise of some sort is necessary, I am sure he will be ingenious enough to adopt one. "

"With respect, First Speaker, I wish to point out a subtle disguise. Preem Palver, you will remember, took with him his wife and companion of many years. Nothing so thoroughly established the rustic nature of his character as the fact that he was traveling with his wife. It allayed all suspicion. "

Gendibal said, "I have no wife. I have had companions, but none who would now volunteer to assume the marital role. "

"This is well known, Speaker Gendibal, " said Delarmi, "but then people will take the role for granted if any woman is with you. Surely some volunteer can be found. And if you feel the need to be able to present documentary evidence, that can be provided. I think a woman should come with you. "

For a moment, Gendibal was breathless. Surely she did not mean— Could it be a ploy to achieve a share in the success? Could she be playing for a joint—or rotating— occupation of the First Speakership?

Gendibal said grimly, "I am flattered that Speaker Delarmi should feel that she—"

And Delarmi broke into an open laugh and looked at Gendibal with what was almost true affection. He had fallen into the trap and looked foolish for having done so. The Table would not forget that.

She said, "Speaker Gendibal, I would not have the impertinence to attempt to share in this task. It is yours and yours alone, as the post of First Speaker will be yours and yours alone. I would not have thought you wanted me with you. Really, Speaker, at my age, I no longer think of myself as a charmer—"

There were smiles around the Table and even the First Speaker tried to hide one.

Gendibal felt the stroke and labored not to compound the loss by failing to match her lightness. It was labor lost.

He said, as unsavagely as he could, "Then what is it you would suggest? It was not in my thoughts, I assure you, that you would wish to accompany me. You are at your best at the Table and not in the hurly-burly of Galactic affairs, I know. "

"I agree, Speaker Gendibal, I agree, " said Delarmi. "My suggestion, however, refers back to your role as Hamish trader. To make it indisputably authentic, what better companion need you ask but a Hamishwoman? "

"A Hamishwoman? " For a second time in rapid succession, Gendibal was caught by surprise and the Table enjoyed it.

"The Hamishwoman, " Delarmi went on. "The one who saved you from a beating. The one who gazes at you worshipfully. The one whose mind you probed and who then, quite unwittingly, saved you a second time from considerably more than a beating. I suggest you take her. "

Gendibal's impulse was to refuse, but he knew that she expected that. It would mean more enjoyment for the Table. It was clear now that the First Speaker, anxious to strike out at Delarmi, had made a mistake by naming Gendibal his successor—or, at the very least, that Delarmi had quickly converted it into one.

Gendibal was the youngest of the Speakers. He had angered the Table and had then avoided conviction by them. In a very real way, he had humiliated them. None could see him as the heir apparent without resentment.

That would have been hard enough to overcome, but now they would remember how easily Delarmi had twitched him into ridicule and how much they had enjoyed it. She would use that to convince them, all too easily, that he lacked the age and experience for the role of First Speaker. Their united pressure would force the First Speaker into changing his decision while Gendibal was off on his mission. Or, if the First Speaker held fast, Gendibal would eventually find himself with an office that would be forever helpless in the face of united opposition.

He saw it all in an instant and was able to answer as though with out hesitation.-

He said, "Speaker Delarmi, I admire your insight. I had thought to surprise you all. It was indeed my intention to take the Hamishwoman, though not quite for the very good reason you suggest. It was for her mind that I wished to take her with me. You have all examined that mind. You saw it for what it was: surprisingly intelligent but, more than that, clear, simple, utterly without guile. No touch upon it by others would go unnoticed, as I'm sure you all concluded.

"I wonder if it occurred to you, then, Speaker Delarmi, that she would serve as an excellent early-warning system. I would detect the first symptomatic presence of mentalism by way of her mind, earlier, I think, than by way of mine. "

There was a kind of astonished silence at that, and he said, lightly. "Ah, none of you saw that. Well well, not important! And I will take my leave now. There's no time to lose. "

"Wait, " said Delarmi, her initiative lost a third time. "What do you intend to do? "

Gendibal said with a small shrug. "Why go into details? The less the Table knows, the less the Anti-Mules are likely to attempt to disturb it. "

He said it as though the safety of the Table was his prime concern. He filled his mind with that, and let it show.

It would flatter them. More than that, the satisfaction it would bring might keep them from wondering whether, in fact, Gendibal knew exactly what it was he intended to do.

The First Speaker spoke to Gendibal alone that evening.

"You were right, " he said. "I could not help brushing below the surface of your mind. I saw you considered the announcement a mistake and it was. It was my eagerness to wipe that eternal smile off her face and to strike back at the casual way in which she so frequently usurps my role. "

Gendibal said gently, "It might have been better if you had told me privately and had then waited for my return to go further. "

"That would not have allowed me to strike out at her. —Poor motivation for a First Speaker, I know. "

"This won't stop her, First Speaker. She will still intrigue for the post and perhaps with good reason. I'm sure there are some who would argue that I should have refused your nomination. It would not be hard to argue that Speaker Delarmi has the best mind at the Table and would make the best First Speaker. "

"The best mind at the Table, not away from it, " grumbled Shandess. "She recognizes no real enemies, except for other Speakers. She ought never to have been made a Speaker in the first place. —See here, shall I forbid you to take the Hamishwoman? She maneuvered you into that, I know. "

"No no, the reason I advanced for taking her is a true one. She will be an early-warning system and I am grateful to Speaker Delarmi for pushing me into realizing that. The woman will prove very useful, I'm convinced. "

"Good, then. By the way, I wasn't lying, either. I am truly certain that you will accomplish whatever is needed to end this crisis—if you can trust my intuition. "

"I think I can trust it, for I agree with you. I promise you that whatever happens, I will return better than I receive. I will come back to be First Speaker, whatever the Anti-Mules—or Speaker Delarmi—can do. "

Gendibal studied his own satisfaction even as he spoke. Why was he so pleased, so insistent, on this one-ship venture into space? Ambition, of course. Preem Palver had once done just this sort of thing —and he was going to show that Stor Gendibal could do it, too. No one could withhold the First Speakership from him after that. And yet was there more than ambition? The lure of combat? The generalized desire for excitement in one who had been confined to a hidden patch on a backward planet all his adult life? — He didn't entirely know, but he knew he was desperately intent on going.

11. SAYSHELL

JANOV PELORAT WATCHED, FOR THE FIRST TIME IN HIS LIFE, AS THE bright star graduated into an orb after what Trevize had called a "micro-Jump. " The fourth planet—the habitable one and their immediate destination, Sayshell—then grew in size and prominence more slowly—over a period of days.

A map of the planet had been produced by the computer and was displayed on a portable screening device, which Pelorat held in his lap.

Trevize—with the aplomb of someone who had, in his time, touched down upon several dozen worlds—said, "Don't start watching too hard too soon, Janov. We have to go through the entry station first and that can be tedious. "

Pelorat looked up. "Surely that's just a formality."

"It is. But it can still be tedious."

"But it's peacetime."

"Of course. That means we'll be passed through. First, though, there's a little matter of the ecological balance. Every planet has its own and they don't want it upset. So they make a natural point of checking the ship for undesirable organisms, or infections. It's a reasonable precaution."

"We don't have such things, it seems to me."

"No, we don't and they'll find that out. Remember, too, that Sayshell is not a member of the Foundation Federation, so there's certain to be some leaning over backward to demonstrate their independence."

A small ship came out to inspect them and a Sayshellian Customs official boarded. Trevize was brisk, not having forgotten his military days.

"The Far Star, out of Terminus," he said. "Ship's papers. Unarmed. Private vessel. My passport. There is one passenger. His passport. We are tourists."

The Customs official wore a garish uniform in which crimson was the dominating color. Cheeks and upper lip were smooth-shaven, but he wore a short beard parted in such a way that tufts thrust out to both sides of his chin. He said, "Foundation ship?"

He pronounced it "Foundaysun sip," but Trevize was careful neither to correct him nor to smile. There were as many varieties of dialects to Galactic Standard as there were planets, and you just spoke your own. As long as there was cross-comprehension, it didn't matter.

"Yes, sir," said Trevize. "Foundation ship. Privately owned."

"Very nice. —Your lading, if you please."

"My what?"

"Your lading. What are you carrying?"

"Ah, my cargo. Here is the itemized list. Personal property only. We are not here to trade. As I told you, we are simply tourists."

The Customs official looked about curiously. "This is rather an elaborate vessel for tourists."

"Not by Foundation standards," said Trevize with a display of good humor. "And I'm well off and can afford this."

"Are you suggesting that I might be richified?" The official looked at him briefly, then looked away.

Trevize hesitated a moment in order to interpret the meaning of the word, then another moment to decide his course of action. He said, "No, it is not my intention to bribe you. I have no reason to bribe you—and you don't look like the kind of person who could be bribed, if that were my intention. You can look over the ship, if you wish."

"No need," said the official, putting away his pocket recorder. "You have already been examined for specific contraband infection and have passed. The ship has been assigned a radio wavelength that will serve as an approach beam."

He left. The whole procedure had taken fifteen minutes.

Pelorat said in a low voice. "Could he have made trouble? Did he really expect a bribe?"

Trevize shrugged. "Tipping the Customs man is as old as the Galaxy and I would have done it readily if he had made a second try for it. As it is—well, I presume he prefers not to take a chance with a Foundation ship, and a fancy one, at that. The old Mayor, bless her cross-grained hide, said the name of the Foundation would protect us wherever we went and she wasn't wrong. —It could have taken a great deal longer."

"Why? He seemed to find out what he wanted to know."

"Yes, but he was courteous enough to check us by remote radioscanning. If he had wished, he could have gone over the ship with a hand-machine and taken hours. He could have put us both in a field hospital and kept us days."

"What? My dear fellow!"

"Don't get excited. He didn't do it. I thought he might, but he didn't. Which means we're free to land. I'd like to go down gravitically—which could take us fifteen minutes—but I don't know where the permitted landing sites might be and I don't want to cause trouble. That means we'll have to follow the radio beam—which will take hours—as we spiral down through the atmosphere."

Pelorat looked cheerful. "But that's excellent, Golan. Will we be going slowly enough to watch the terrain?" He held up his portable viewscreen with the map spread out on it at low magnification.

"After a fashion. We'd have to get beneath the cloud deck, and we'll be moving at a few kilometers per second. It won't be ballooning through the atmosphere, but you'll spot the planetography."

"Excellent! Excellent!"

Trevize said thoughtfully, "I'm wondering, though, if we'll be on Sayshell Planet long enough to make it worth our while to adjust the ship's clock to local time."

"It depends on what we plan to do, I suppose. What do you think we'll be doing, Golan?"

"Our job is to find Gaia and I don't know how long that will take."

Pelorat said, "We can adjust our wrist-strips and leave the ship's clock as is."

"Good enough," said Trevize. He looked down at the planet spreading broadly beneath them. "No use waiting any longer. I'll adjust the computer to our assigned radio beam and it can use the gravities to mimic conventional flight. So! —Let's go down, Janov, and see what we can find."

He stared at the planet thoughtfully as the ship began to move on its smoothly adjusted gravitational potential-curve.

Trevize had never been in the Sayshell Union, but he knew that over the last century it had been steadfastly unfriendly to the Foundation. He was surprised—and a little dismayed—they had gotten through Customs so quickly.

It didn't seem reasonable.

The Customs official's name was Jogoroth Sobhaddartha and he had been serving on the station on and off for half his life.

He didn't mind the life, for it gave him a chance—one month out of three—to view his books, to listen to his music, and to be away from his wife and growing son.

Of course, during the last two years the current Head of Customs had been a Dreamer, which was irritating. There is no one so insufferable as a person who gives no other excuse for a peculiar action than saying he had been directed to it in a dream.

Personally Sobhaddartha decided he believed none of it, though he was careful not to say so aloud, since most people on Sayshell rather disapproved of antipsychic doubts. To become known as a materialist might put his forthcoming pension at risk.

He stroked the two tufts of hair at his chin, one with his right hand and the other with his left, cleared his throat rather loudly, and then, with inappropriate casualness, said, "Was that the ship, Head?"

The Head, who bore the equally Sayshellian name of Namarath Godhisavatta, was concerned with a matter involving some computer-born data and did not look up. "What ship?" he said.

"The Far Star. The Foundation ship. The one I just sent past. The one that was holographed from every angle. Was that the one you dreamed of?"

Godhisavatta looked up now. He was a small man, with eyes that were almost black and that were surrounded by fine wrinkles that had not been produced by any penchant for smiling. He said, "Why do you ask?"

Sobhaddartha straightened up and allowed his dark and luxuriant eyebrows to approach each other. "They said they were tourists, but I've never seen a ship like that before and my own opinion is they're Foundation agents." -

Godhisavatta sat back in his chair. "See here, my man, try as I might I cannot recall asking for your opinion."

"But Head, I consider it my patriotic duty to point out that—"

Godhisavatta crossed his arms over his chest and stared hard at the underling, who (though much the more impressive in physical stature and bearing) allowed himself to droop and take on a somehow bedraggled appearance under the gaze of his superior.

Godhisavatta said, "My man, if you know what is good for you, you will do your job without comment—or I'll see to it that there will be no pension when you retire, which will be soon if I hear any more on a subject that does not concern you."

In a low voice, Sobhaddartha said, "Yes, sir." Then, with a suspicious degree of subservience in his voice, he added, "Is it within the range of my duties, sir, to report that a second ship is in range of our screens?"

"Consider it reported," Godhisavatta said irritably, returning to his work.

"With," said Sobhaddartha even more humbly, "characteristics very similar to the one I just sent through."

Godhisavatta placed his hands on the desk and lifted himself to his feet. "A second one?"

Sobhaddartha smiled inwardly. That sanguinary person born of an irregular union (he was referring to the Head) had clearly not dreamed of two ships. He said, "Apparently, sir! I will now return to my post and await orders and I hope, sir—"

"Yes?"

Sobhaddartha could not resist, pension-risk notwithstanding. "And I hope, sir, we didn't send the wrong one through."

The Far Star moved rapidly across the face of Sayshell Planet and Pelorat watched with fascination. The cloud layer was thinner and more scattered than upon Terminus and, precisely as the map showed, the land surfaces were more compact and extensive—including broader desert areas, to judge by the rusty color of much of the continental expanse.

There were no signs of anything living. It seemed a world of sterile desert, gray plain, of endless wrinkles that might have represented mountainous areas, and, of course, of ocean.

"It looks lifeless," muttered Pelorat.

"You don't expect to see any life-signs at this height," said Trevize. "As we get lower, you'll see the land turn green in patches. Before that, in fact, you'll see the twinkling landscape on the night side. Human beings have a penchant for lighting their worlds when darkness falls; I've never heard of a world that's an exception to that rule. In other words, the first sign of life you'll see will not only be human but technological."

Pelorat said thoughtfully, "Human beings are diurnal in nature, after all. It seems to me that among the very first tasks of a developing technology would be the conversion of night to day. In fact, if a world lacked technology and developed one, you ought to be able to follow the progress of technological development by the increase in light upon the darkened surface. How long would it take, do you suppose, to go from uniform darkness to uniform light?"

Trevize laughed. "You have odd thoughts, but I suppose that comes from being a mythologist. I don't think a world would ever achieve a uniform glow. Night light would follow the pattern of population density, so that the continents would spark in knots and strings. Even Trantor at its height, when it was one huge structure, let light escape that structure only at scattered points."

The land turned green as Trevize had predicted and, on the last circling of the globe, he pointed out markings that he said were cities. "It's not a very urban world. I've never been in the Sayshell Union before, but according to the information the computer gives me, they tend to cling to the past. Technology, in the eyes of all the Galaxy, has been associated with the Foundation, and wherever the Foundation is unpopular, there is a tendency to cling to the past— except, of course, as far as weapons of war are concerned. I assure you Sayshell is quite modern in that respect."

"Dear me, Golan, this is not going to be unpleasant, is it? We are Foundationers, after all, and being in enemy territory—"

"It's not enemy territory, Janov. They'll be perfectly polite, never fear. The Foundation just isn't popular, that's all. Sayshell is not part of the Foundation Federation. Therefore, because they're proud of their independence and because they don't like to remember that they are much weaker than the Foundation and remain independent only because we're willing to let them remain so, they indulge in the luxury of disliking us." -

"I fear it will still be unpleasant, then," said Pelorat despondently. "Not at all," said Trevize. "Come on, Janov. I'm talking about the official attitude of the Sayshellian government. The individual people on the planet are just people, and if we're pleasant and don't act as though we're Lords of the Galaxy, they'll be pleasant, too. We're not coming to Sayshell in order to establish Foundation mastery. We're just tourists, asking the kind of questions about Sayshell that any tourist would ask."

"And we can have a little legitimate relaxation, too, if the situation permits. There's nothing wrong with staying here a few days and experiencing what they have to offer. They may have an interesting culture, interesting scenery, interesting food, and—if all else fails—interesting women. We have money to spend."

Pelorat frowned, "Oh, my dear chap."

"Come on," said Trevize. "You're not that old. Wouldn't you be interested?"

"I don't say there wasn't a time when I played that role properly, but surely this isn't the time for it. We have a mission. We want to reach Gaia. I have nothing against a good time—I really don't—but if we start involving ourselves, it might be difficult to pull free." He shook his head and said mildly, "I think you feared that I might have too good a time at the Galactic Library on Trantor and would be unable to pull free. Surely, what the Library is to me, an attractive dark-eyed damsel—or five or six—might be to you."

Trevize said, "I'm not a rakehell, Janov, but I have no intention of being ascetic, either. Very well, I promise you we'll get on with this business of Gaia, but if something pleasant comes my way, there's no reason in the Galaxy I ought not to respond normally."

"If you'll just put Gaia first—"

"I will. Just remember, though, don't tell anyone we're from the Foundation. They'll know we are, because we've got Foundation credits and we speak with strong Terminus accents, but if we say nothing about it, they can pretend we are placeless strangers and be friendly. If we make a point of being Foundationers, they will speak

politely enough, but they will tell us nothing, show us nothing, take us nowhere, and leave us strictly alone."

Pelorat sighed. "I will never understand people."

"There's nothing to it. All you have to do is take a close look at yourself and you will understand everyone else. We're in no way different ourselves. How would Seldon have worked out his Plan—and I don't care how subtle his mathematics was—if he didn't understand people; and how could he have done that if people weren't easy to understand? You show me someone who can't understand people and I'll show you someone who has built up a false image of himself—no offense intended."

"None taken. I'm willing to admit I'm inexperienced and that I've spent a rather self-centered and constricted life. It may be that I've never really taken a good look at myself, so I'll let you be my guide and adviser where people are concerned."

"Good. Then take my advice now and just watch the scenery. We'll be landing soon and I assure you you'll feel nothing. The computer and I will take care of everything."

"Golan, don't be annoyed. If a young woman should—"

"Forget it! Just let me take care of the landing."

Pelorat turned to look at the world at the end of the ship's contracting spiral. It would be the first foreign world upon which he would ever stand. This thought somehow filled him with foreboding, despite the fact that all the millions of inhabited planets in the Galaxy had been colonized by people who had not been born upon them.

All but one, he thought with a shudder of trepidation/delight.

The spaceport was not large by Foundation standards, but it was well kept. Trevize watched the Far Star moved into a berth and locked in place. They were given an elaborate coded receipt.

Pelorat said in a low voice, "Do we just leave it here?"

Trevize nodded and placed his hand on the other's shoulder in reassurance. "Don't worry," he said in an equally low voice.

They stepped into the ground-car they had rented and Trevize plugged in the map of the city, whose towers he could see on the horizon.

"Sayshell City," he said, "the capital of the planet. City—planet—star—all named Sayshell."

"I'm worried about the ship," insisted Pelorat.

"Nothing to worry about," said Trevize. "We'll be back tonight, because it will be our sleeping quarters if we have to stay here more than a few hours. You have to understand, too, that there's an interstellar code of spaceport ethics that—as far as I know—has never been broken, even in wartime. Spaceships that come in peace are inviolate. If that were not so, no one would be safe and trade would be impossible. Any world on which that code was broken would be boycotted by the space pilots of the Galaxy. I assure you, no world would risk that. Besides—"

"Besides?"

"Well, besides, I've arranged with the computer that anyone who doesn't look and sound like one of us will be killed if he—or she— tries to board the ship. I've taken the liberty of explaining that to the Port Commander. I told him very politely that I would love to turn off that particular facility out of deference to the reputation that the Sayshell City Spaceport holds for absolute integrity and security—throughout the Galaxy, I said—but the ship is a new model and I didn't know how to turn it off."

"He didn't believe that, surely."

"Of course not! But he had to pretend he did, as otherwise he would have no choice but to be insulted. And since there would be nothing he could do about that, being insulted would only lead to humiliation. And since he didn't want that, the simplest path to follow was to believe what I said."

"And that's another example of how people are?"

"Yes. You'll get used to this."

"How do you know this ground-car isn't bugged?"

"I thought it might be. So when they offered me one, I took another one at random. If they're all bugged—well, what have we been saying that's so terrible?"

Pelorat looked unhappy. "I don't know how to say this. It seems rather impolite to complain, but I don't like the way it smells. There's an—odor."

"In the ground-car?"

"Well, in the spaceport, to begin with. I suppose that's the way spaceports smell, but the ground-car carries the odor with it. Could we open the windows?"

Trevize laughed. "I suppose I could figure out which portion of the control panel will do that trick, but it won't help. This planet stinks. Is it very bad?"

"It's not very strong, but it's noticeable—and somewhat repulsive. Does the whole world smell this way?"

"I keep forgetting you've never been on another world. Every inhabited world has its own odor. It's the general vegetation, mostly, though I suppose the animals and even the human beings contribute. And as far as I know, nobody ever likes the smell of any world when he first lands on it. But you'll get used to it, Janov. In a few hours, I promise you won't notice."

"Surely you don't mean that all worlds smell like this."

"No. As I said, each has its own. If we really paid attention or if our noses were a little keener—like those of Anacreonian dogs—we could probably tell which world we were on with one sniff. When I first entered the Navy I could never eat the first day on a new world; then I learned the old spacer trick of sniffing a handkerchief with the world-scent on it during the landing. By the time you get out into the open world, you don't smell it. And after a while, you get hardened to the whole thing; you just learn to disregard it. —The worst of it is returning home, in fact."

"Why?"

"Do you think Terminus doesn't smell?"

"Are you telling me it does?"

"Of course it does. Once you get acclimated to the smell of another world, such as Sayshell, you'll be surprised at the stench of Terminus. In the old days, whenever the locks opened on Terminus after a sizable tour of duty, all the crew would call out, 'Back home to the crap.'"

Pelorat looked revolted.

The towers of the city were perceptibly closer, but Pelorat kept his eyes fixed on their immediate surroundings. There were other ground-cars moving in both directions and an occasional air-car above, but Pelorat was studying the trees.

He said, "The plant life seems strange. Do you suppose any of it is indigenous?"

"I doubt it," said Trevize absently. He was studying the map and attempting to adjust the programming of the car's computer. "There's not much in the way of indigenous life on any human planet. Settlers always imported their own plants and animals— either at the time of settling or not too long afterward."

"It seems strange, though."

"You don't expect the same varieties from world to world, Janov.

I was once told that the Encyclopedia Galactica people put out an atlas of varieties which ran to eighty-seven fat computer-discs and was incomplete even so—and outdated anyway, by the time it was finished."

The ground-car moved on and the outskirts of the city gaped and engulfed them. Pelorat shivered slightly, "I don't think much of their city architecture."

"To each his own," said Trevize with the indifference of the seasoned space traveler.

"Where are we going, by the way?"

"Well," said Trevize with a certain exasperation, "I'm trying to get the computer to guide this thing to the tourist center. I hope the computer knows the one-way streets and the traffic regulations, because I don't."

"What do we do there, Golan?"

"To begin with, we're tourists, so that's the place where we'd naturally go, and we want to be as inconspicuous and natural as we can. And secondly, where would you go to get information on Gaia?"

Pelorat said, "To a university—or an anthropological society—or a museum— Certainly not to a tourist center."

"Well, you're wrong. At the tourist center, we will be intellectual types who are eager to have a listing of the universities in the city and the museums and so on. We'll decide where to go to first and there we may find the proper people to consult concerning ancient history, galactography, mythology, anthropology, or anything else you can think of. —But the whole thing starts at the tourist center."

Pelorat was silent and the ground-car moved on in a tortuous manner as it joined and became part of the traffic pattern. They plunged into a sub-road and drove past signs that might have represented directions and traffic instructions but were in a style of lettering that made them all-but-unreadable.

Fortunately the ground-car behaved as though it knew the way, and when it stopped and drew itself into a parking spot, there was a sign that said: SAYSHELL OUT-WORLD MILIEU in the same difficult printing, and under it: SAYSHELL TOURIST CENTER in straightforward, easy-to-read Galactic Standard lettering.

They walked into the building, which was not as large as the façade had led them to believe. It was certainly not busy inside.

There were a series of waiting booths, one of which was occupied by a man reading the news-strips emerging from a small ejector; another contained two women who seemed to be playing some intricate game with cards and tiles. Behind a counter too large for him, with winking computer controls that seemed far too complex for him, was a bored-looking Sayshellian functionary wearing what looked like a multicolored checkerboard.

Pelorat stared and whispered, "This is certainly a world of extroverted garb."

"Yes," said Trevize, "I noticed. Still, fashions change from world to world and even from region to region within a world sometimes. And they change with time. Fifty years ago, everyone on Sayshell might have worn black, for all we know. Take it as it comes, Janov."

"I suppose I'll have to," said Pelorat, "but I prefer our own fashions. At least, they're not an assault upon the optic nerve."

"Because so many of us are gray on gray? That offends some people. I've heard it referred to as 'dressing in dirt.' Then too, it's Foundation colorlessness that probably keeps these people in their rainbows—just to emphasize their independence. It's all what you're accustomed to, anyway. —Come on, Janov."

The two headed toward the counter and, as they did so, the man in the booth forsook his news items, rose, and came to meet them, smiling as he did so. His clothing was in shades of gray.

Trevize didn't look in his direction at first, but when he did he stopped dead.

He took a deep breath, "By the Galaxy— My friend, the traitor!"

12. AGENT

MUNN LI COMPOR, COUNCILMAN OF TERMINUS, LOOKED UNCERTAIN as he extended his right hand to Trevize.

Trevize looked at the hand sternly and did not take it. He said, apparently to open air, "I am in no position to create a situation in which I may find myself arrested for disturbing the peace on a foreign planet, but I will do so anyway if this individual comes a step closer."

Compdor stopped abruptly, hesitated, and finally said in a low voice after glancing uncertainly at Pelorat, "Am I to have a chance to talk? To explain? Will you listen?"

Pelorat looked from one to the other with a slight frown on his long face. He said, "What's all this, Golan? Have we come to this far world and at once met someone you know?"

Trevize's eyes remained firmly fixed on Compdor, but he twisted his body slightly to make it clear that he was talking to Pelorat. Trevize said, "This—human being—we would judge that much from his shape—was once a friend of mine on Terminus. As is my habit with my friends, I trusted him. I told him my views, which were perhaps not the kind that should have received a general airing. He told them to the authorities in great detail, apparently, and did not take the trouble to tell me he had done so. For that reason, I walked neatly into a trap and now I find myself in exile. And now this—human being—wishes to be recognized as a friend."

He turned to Compdor full on and brushed his fingers through his hair, succeeding only in disarranging the curls further. "See here, you. I do have a question for you. What are you doing here? Of all the worlds in the Galaxy on which you could be, why are you on this one? And why now?"

Compdor's hand, which had remained outstretched throughout Trevize's speech, now fell to his side and the smile left his face. The air of self-confidence, which was ordinarily so much a part of him, was gone and in its absence he looked younger than his thirty-four years and a bit woebegone. "I'll explain," he said, "but only from the start!"

Trevize looked about briefly. "Here? You really want to talk about it here? In a public place? You want me to knock you down here after I've listened to enough of your lies?"

Compdor lifted both hands now, palms facing each other. "It's the safest place, believe me." And then, checking himself and realizing what the other was about to say, added hurriedly, "Or don't believe me, it doesn't matter. I'm telling the truth. I've been on the planet several hours longer than you and I've checked it out. This is some particular day they have here on Sayshell. It's a day for meditation, for some reason. Almost everyone is at home—or should be. —You see how empty this place is. You don't suppose it's like this every day."

Pelorat nodded and said, "I was wondering why it was so empty, at that." He leaned toward Trevize's ear and whispered, "Why not let him talk, Golan? He looks miserable, poor chap, and he may be trying to apologize. It seems unfair not to give him the chance to do so.'

Trevize said, "Dr. Pelorat seems anxious to hear you. I'm willing to oblige him, but you'll oblige me if you're brief about it. This may be a good day on which to lose my temper. If everyone is meditating, any disturbance I cause may not produce the guardians of the law. I may not be so lucky tomorrow. Why waste an opportunity?"

Comporg said in a strained voice, "Look, if you want to take a poke at me, do so. I won't even defend myself, see? Go ahead, hit me—but listen!"

"Go ahead and talk, then. I'll listen for a while."

"In the first place, Golan—"

"Address me as Trevize, please. I am not on first-name terms with you."

"In the first place, Trevize, you did too good a job convincing me of your views—"

"You hid that well. I could have sworn you were amused by me."

"I tried to be amused to hide from myself the fact that you were being extremely disturbing. —Look, let us sit down up against the wall. Even if the place is empty, some few may come in and I don't think we ought to be needlessly conspicuous."

Slowly the three men walked most of the length of the large room. Comporg was smiling tentatively again, but remained carefully at more than arm's length from Trevize.

They sat each on a seat that gave as their weight was placed upon it and molded itself into the shape of their hips and buttocks. Pelorat looked surprised and made as though to stand up.

"Relax, Professor," said Comporg. "I've been through this already. They're in advance of us in some ways. It's a world that believes in small comforts."

He turned to Trevize, placing one arm over the back of his chair and speaking easily now. "You disturbed me. You made me feel the Second Foundation did exist, and that was deeply upsetting. Consider the consequences if they did. Wasn't it likely that they might take care of you somehow? Remove you as a menace? And if I behaved as though I believed you, I might be removed as well. Do you see my point?"

"I see a coward."

"What good would it do to be storybook brave?" said Comporg warmly, his blue eyes widening in indignation. "Can you or I stand up to an organization capable of molding our minds and emotions? The only way we could fight effectively would be to hide our knowledge to begin with."

"So you hid it and were safe? —Yet you didn't hide it from Mayor Branno, did you? Quite a risk there."

"Yes! But I thought that was worth it. Just talking between ourselves might do nothing more than get ourselves mentally controlled—or our memories erased altogether. If I told the Mayor, on the other hand— She knew my father well, you know. My father and I were immigrants from Smyrno and the Mayor had a grandmother who—"

"Yes yes," said Trevize impatiently, "and several generations farther back you can trace ancestry to the Sirius Sector. You've told all that to everyone you know. Get on with it, Compor!"

"Well, I had her ear. If I could convince the Mayor that there was danger, using your arguments, the Federation might take some action. We're not as helpless as we were in the days of the Mule and—at the worst—this dangerous knowledge would be spread more widely and we ourselves would not be in as much specific danger."

Trevize said sardonically, "Endanger the Foundation, but keep ourselves safe. That's good patriotic stuff."

"That would be at the worst. I was counting on the best." His forehead had become a little damp. He seemed to be straining against Trevize's immovable contempt.

"And you didn't tell me of this clever plan of yours, did you?"

"No, I didn't and I'm sorry about that, Trevize. The Mayor ordered me not to. She said she wanted to know everything you knew but that you were the sort of person who would freeze if you knew that your remarks were being passed on."

"How right she was!"

"I didn't know—I couldn't guess—I had no way of conceiving that she was planning to arrest you and throw you off the planet."

"She was waiting for the right political moment, when my status as Councilman would not protect me. You didn't foresee that?"

"How could I? You yourself did not."

"Had I known that she knew my views, I would have." Compor said with a sudden trace of insolence, "That's easy enough to say—in hindsight."

"And what is it you want of me here? Now that you have a bit of hindsight, too."

"To make up for all this. To make up for the harm I unwittingly—unwittingly—did you."

"Goodness," said Trevize dryly. "How kind of you! But you haven't answered my original question. How did you come to be here? How do you happen to be on the very planet I am on?"

Compor said, "There's no complicated answer necessary for that. I followed you!"

"Through hyperspace? With my ship making Jumps in series?" Compor shook his head. "No mystery. I have the same kind of a ship you do, with the same kind of computer. You know I've always had this trick of being able to guess in which direction through hyperspace a ship would go. It's not usually a very good guess and I'm wrong two times out of three, but with the computer I'm much better. And you hesitated quite a bit at the start and gave me a chance to evaluate the direction and speed in which you were going before entering hyperspace. I fed the data—together with my own intuitive extrapolations—into the computer and it did the rest."

"And you actually got to the city ahead of me?"

"Yes. You didn't use gravitics and I did. I guessed you would come to the capital city, so I went straight down, while you—" Compor made a short spiral motion with his finger as though it were a ship riding a directional beam.

"You took a chance on a run-in with Sayshellian officialdom."

"Well—" Compor's face broke into a smile that lent it an undeniable charm and Trevize felt himself almost warming to him. Compor said, "I'm not a coward at all times and in all things."

Trevize steeled himself. "How did you happen to get a ship like mine?"

"In precisely the same way you got a ship like yours. The old lady —Mayor Branno—assigned it to me."

"Why?"

"I'm being entirely frank with you. My assignment was to follow you. The Mayor wanted to know where you were going and what you would be doing."

"And you've been reporting faithfully to her, I suppose. —Or have you been faithless to the Mayor also?"

"I reported to her. I had no choice, actually. She placed a hyperrelay on board ship, which I wasn't supposed to find, but which I did find."

"Well?"

"Unfortunately it's hooked up so that I can't remove it without immobilizing the vessel. At least, there's no way I can remove it. Consequently she knows where I am—and she knows where you are."

"Suppose you hadn't been able to follow me. Then she wouldn't have known where I was. Had you thought of that?"

"Of course I did. I thought of just reporting I had lost you—but she wouldn't have believed me, would she? And I wouldn't have been able to get back to Terminus for who knows how long. And I'm not like you, Trevize. I'm not a carefree person without attachments. I have a wife on Terminus—a pregnant wife—and I want to get back to her. You can afford to think only of yourself. I can't. —Besides, I've come to warn you. By Seldon, I'm trying to do that and you won't listen. You keep talking about other things."

"I'm not impressed by your sudden concern for me. What can you warn me against? It seems to me that you are the only thing I need be warned about. You betray me, and now you follow me in order to betray me again. No one else is doing me any harm."

Compor said earnestly, "Forget the dramatics, man. Trevize, you're a lightning rod! You've been sent out to draw Second Foundation response—if there is such a thing as the Second Foundation. I have an intuitive sense for things other than hyperspatial pursuit and I'm sure that's what she's planning. If you try to find the Second Foundation, they'll become aware of it and they'll act against you. If they do, they are very likely to tip their hand. And when they do, Mayor Branno will go for them."

"A pity your famous intuition wasn't working when Branno was planning my arrest."

Compor flushed and muttered, "You know it doesn't always work."

"And now it tells you she's planning to attack the Second Foundation. She wouldn't dare."

"I think she would. But that's not the point. The point is that right now she is throwing you out as bait."

"So?"

"So by all the black holes in space, don't search for the Second Foundation. She won't care if you're killed in the search, but I care. I feel responsible for this and I care."

"I'm touched," said Trevize coldly, "but as it happens I have another task on hand at the moment."

"You have?"

"Pelorat and I are on the track of Earth, the planet that some think was the original home of the human race. Aren't we, Janov?"

Pelorat nodded his head. "Yes, it's a purely scientific matter and a long-standing interest of mine."

Comporg looked blank for a moment. Then, "Looking for Earth? But why?"

"To study it," said Pelorat. "As the one world on which human beings developed—presumably from lower forms of life, instead of, as on all others, merely arriving ready-made—it should be a fascinating study in uniqueness."

"And," said Trevize, "as a world where, just possibly, I may learn more of the Second Foundation. —Just possibly."

Comporg said, "But there isn't any Earth. Didn't you know that?"

"No Earth?" Pelorat looked utterly blank, as he always did when he was preparing to be stubborn. "Are you saying there was no planet on which the human species originated?"

"Oh no. Of course, there was an Earth. There's no question of that! But there isn't any Earth now. No inhabited Earth. It's gone!"

Pelorat said, unmoved, "There are tales—"

"Hold on, Janov," said Trevize. "Tell me, Comporg, how do you know this?"

"What do you mean, how? It's my heritage. I trace my ancestry from the Sirius Sector, if I may repeat that fact without boring you. We know all about Earth out there. It exists in that sector, which means it's not part of the Foundation Federation, so apparently no one on Terminus bothers with it. But that's where Earth is, just the same."

"That is one suggestion, yes," said Pelorat. "There was considerable enthusiasm for that 'Sirius Alternative,' as they called it, in the days of the Empire."

Comporg said vehemently. "It's not an alternative. It's a fact."

Pelorat said, "What would you say if I told you I know of many different places in the Galaxy that are called Earth—or were called Earth—by the people who lived in its stellar neighborhood?"

"But this is the real thing," said Comporg. "The Sirius Sector is the longest-inhabited portion of the Galaxy. Everyone knows that."

"The Sirians claim it, certainly," said Pelorat, unmoved.

Comporg looked frustrated. "I tell you—"

But Trevize said, "Tell us what happened to Earth. You say it's not inhabited any longer. Why not?"

"Radioactivity. The whole planetary surface is radioactive because of nuclear reactions that went out of control, or nuclear explosions—I'm not sure—and now no life is possible there."

The three stared at each other for a while and then Compor felt it necessary to repeat. He said, "I tell you, there's no Earth. There's no use looking for it."

Janov Pelorat's face was, for once, not expressionless. It was not that there was passion in it—or any of the more unstable emotions. It was that his eyes had narrowed—and that a kind of fierce intensity had filled every plane of his face.

He said, and his voice lacked any trace of its usual tentative quality, "How did you say you know all this?"

"I told you," said Compor. "It's my heritage."

"Don't be silly, young man. You are a Councilman. That means you must be born on one of the Federation worlds—Smyrno, I think you said earlier."

"That's right."

"Well then, what heritage are you talking about? Are you telling me that you possess Sirian genes that fill you with inborn knowledge of the Sirian myths concerning Earth."

Compor looked taken aback. "No, of course not."

"Then what are you talking about?"

Compor paused and seemed to gather his thoughts. He said quietly, "My family has old books of Sirian history. An external heritage, not an internal one. It's not something we talk about outside, especially if one is intent on political advancement. Trevize seems to think I am, but, believe me, I mention it only to good friends."

There was a trace of bitterness in his voice. "Theoretically all Foundation citizens are alike, but those from the old worlds of the Federation are more alike than those from the newer ones—and those that trace from worlds outside the Federation are least alike of all. But, never mind that. Aside from the books, I once visited the old worlds. Trevize—hey, there—"

Trevize had wandered off toward one end of the room, looking out a triangular window. It served to let in a view of the sky and to diminish the view of the city—more light and more privacy. Trevize stretched upward to look down.

He returned through the empty room. "Interesting window design," he said. "You called me, Councilman?"

"Yes. Remember the postcollegiate tour I took?"

"After graduation? I remember very well. We were pals. Pals forever. Foundation of trust. Two against the world. You went off on your tour. I joined the Navy, full of patriotism. Somehow I didn't think I wanted to tour with you—some instinct told me not to. I wish the instinct had stayed with me."

Compor did not rise to the bait. He said, "I visited Comporellon. Family tradition said that my ancestors had come from there—at least on my father's side. We were of the ruling family in ancient times before the Empire absorbed us, and my name is derived

from the world—or so the family tradition has it. We had an old, poetic name for the star Comporellon circled—Epsilon Eridani."

"What does that mean?" asked Pelorat.

Compor shook his head. "I don't know that it has any meaning. Just tradition. They live with a great deal of tradition. It's an old world. They have long, detailed records of Earth's history, but no one talks about it much. They're superstitious about it. Every time they mention the word, they lift up both hands with first and second fingers crossed to ward off misfortune."

"Did you tell this to anyone when you came back?"

"Of course not. Who would be interested? And I wasn't going to force the tale on anyone. No, thank you! I had a political career to develop and the last thing I want is to stress my foreign origin."

"What about the satellite? Describe Earth's satellite," said Pelorat sharply.

Compor looked astonished. "I don't know anything about that."

"Does it have one?"

"I don't recall reading or hearing about it. But I'm sure if you'll consult the Comporellonian records, you can find out."

"But you know nothing?"

"Not about the satellite. Not that I recall."

"Huh! How did Earth come to be radioactive?"

Compor shook his head and said nothing.

Pelorat said, "Think! You must have heard something."

"It was seven years ago, Professor. I didn't know then you'd be questioning me about it now. There was some sort of legend—they considered it history—"

"What was the legend?"

"Earth was radioactive-ostracized and mistreated by the Empire, its population dwindling—and it was going to destroy the Empire somehow."

"One dying world was going to destroy the whole Empire?" interposed Trevize.

Compor said defensively, "I said it was a legend. I don't know the details. Bel Arvardan was involved in the tale, I know."

"Who was he?" asked Trevize.

"A historical character. I looked him up. He was an honest-to-Galaxy archaeologist back in the early days of the Empire and he maintained that Earth was in the Sirius Sector."

"I've heard the name," said Pelorat.

"He's a folk hero in Comporellon. Look, if you want to know these things—go to Comporellon. It's no use hanging around here."

Pelorat said, "Just how did they say Earth planned to destroy the Empire?"

"Don't know." A certain sullenness was entering Compor's voice.

"Did the radiation have anything to do with it?"

"Don't know. There were tales of some mind-expander developed on Earth—a Synapsifier or something."

"Did it create superminds?" said Pelorat in deepest tones of incredulity.

"I don't think so. What I chiefly remember is that it didn't work. People became bright and died young."

Trevize said, "It was probably a morality myth. If you ask for too much, you lose even that which you have."

Pelorat turned on Trevize in annoyance. "What do you know of morality myths?"

Trevize raised his eyebrows. "Your field may not be my field, Janov, but that doesn't mean I'm totally ignorant."

"What else do you remember about what you call the Synapsifier, Councilman Compor?" asked Pelorat.

"Nothing, and I won't submit to any further cross-examination. Look, I followed you on orders from the Mayor. I was not ordered to make personal contact with you. I have done so only to warn you that you were followed and to tell you that you had been sent out to serve the Mayor's purposes, whatever those might be. There was nothing else I should have discussed with you, but you surprised me by suddenly bringing up the matter of Earth. Well, let me repeat:

Whatever there has existed there in the past—Bel Arvardan, the Synapsifier, whatever—that has nothing to do with what exists now. I'll tell you again: Earth is a dead world. I strongly advise you to go to Comporellon, where you'll find out everything you want to know. Just get away from here."

"And, of course, you will dutifully tell the Mayor that we're going to Comporellon—and you'll follow us to make sure. Or maybe the Mayor knows already. I imagine she has carefully instructed and rehearsed you in every word you have spoken to us here because, for her own purposes, it's in Comporellon that she wants us. Right?"

Compor's face paled. He rose to his feet and almost stuttered in his effort to control his voice. "I've tried to explain. I've tried to be helpful. I shouldn't have tried. You can drop yourself into a black hole, Trevize."

He turned on his heel and walked away briskly without looking back.

Pelorat seemed a bit stunned. "That was rather tactless of you, Golan, old fellow. I could have gotten more out of him."

"No, you couldn't," said Trevize gravely. "You could not have gotten one thing out of him that he was not ready to let you have. Janov, you don't know what he is—Until today, I didn't know what he is."

Pelorat hesitated to disturb Trevize. Trevize sat motionless in his chair, deep in thought.

Finally Pelorat said, "Are we just sitting here all night, Golan?"

Trevize started. "No, you're quite right. We'll be better off with people around us. Come!"

Pelorat rose. He said, "There won't be people around us. Compor said this was some sort of meditation day."

"Is that what he said? Was there traffic when we came along the road in our ground-car?"

"Yes, some."

"Quite a bit, I thought. And then, when we entered the city, was it empty?"

"Not particularly. —Still, you've got to admit that this place has been empty."

"Yes, it has. I noticed that particularly. —But come, Janov, I'm hungry. There's got to be someplace to eat and we can afford to find something good. At any rate, we can find a place in which we can try some interesting Sayshellian novelty or, if we lose our nerve, good standard Galactic fare. —Come, once we're safely surrounded, I'll tell you what I think really happened here."

Trevize leaned back with a pleasant feeling of renewal. The restaurant was not expensive by Terminus standards, but it was certainly novel. It was heated, in part, by an open fire over which food was prepared. Meat tended to be served in bite-sized portions—in a variety of pungent sauces—which were picked up by fingers that were protected from grease and heat by smooth, green leaves that were cold, damp, and had a vaguely minty taste.

It was one leaf to each meat-bit and the whole was taken into the mouth. The waiter had carefully explained how it had to be done. Apparently accustomed to off-planet guests, he had smiled paternally as Trevize and Pelorat gingerly scooped at the steaming bits of meat, and was clearly delighted at the foreigners' relief at finding that the leaves kept the fingers cool and cooled the meat, too, as one chewed.

Trevize said, "Delicious!" and eventually ordered a second helping. So did Pelorat.

They sat over a spongy, vaguely sweet dessert and a cup of coffee that had a caramelized flavor at which they shook dubious heads. They added syrup, at which the waiter shook his head.

Pelorat said, "Well, what happened back there at the tourist center?"

"You mean with Compor?"

"Was there anything else there we might discuss?"

Trevize looked about. They were in a deep alcove and had a certain limited privacy, but the restaurant was crowded and the natural hum of noise was a perfect cover.

He said in a low voice, "Isn't it strange that he followed us to Sayshell?"

"He said he had this intuitive ability."

"Yes, he was all-collegiate champion at hypertracking. I never questioned that till today. I quite see that you might be able to judge where someone was going to Jump by how he prepared for it if you had a certain developed skill at it, certain reflexes—but I don't see how a tracker can judge a Jump series. You prepare only for the first one; the computer does all the others. The tracker can judge that first one, but by what magic can he guess what's in the computer's vitals?"

"But he did it, Golan."

"He certainly did," said Trevize, "and the only possible way I can imagine him doing so is by knowing in advance where we were going to go. By knowing, not judging."

Pelorat considered that. "Quite impossible, my boy. How could he know? We didn't decide on our destination till after we were on board the Far Star."

"I know that. —And what about this day of meditation?"

"Comporg didn't lie to us. The waiter said it was a day of meditation when we came in here and asked him."

"Yes, he did, but he said the restaurant wasn't closed. In fact, what he said was: 'Sayshell City isn't the backwoods. It doesn't close down.' People meditate, in other words, but not in the big town, where everyone is sophisticated and there's no place for small-town piety. So there's traffic and it's busy—perhaps not quite as busy as on ordinary days—but busy."

"But, Golan, no one came into the tourist center while we were there. I was aware of that. Not one person entered."

"I noticed that, too. I even went to the window at one point and looked out and saw clearly that the streets around the center had a good scattering of people on foot and in vehicles—and yet not one person entered. The day of meditation made a good cover. We would not have questioned the fortunate privacy we had if I simply hadn't made up my mind not to trust that son of two strangers."

Pelorat said, "What is the significance of all this, then?"

"I think it's simple, Janov. We have here someone who knows where we're going as soon as we do, even though he and we are in separate spaceships, and we also have here someone who can keep a public building empty when it is surrounded by people in order that we might talk in convenient privacy."

"Would you have me believe he can perform miracles?"

"Certainly. If it so happens that Comporg is an agent of the Second Foundation and can control minds; if he can read yours and mine in a distant spaceship; if he can influence his way through a customs station at once; if he can land gravitically, with no border patrol outraged at his defiance of the radio beams; and if he can influence minds in such a way as to keep people from entering a building he doesn't want entered."

"By all the stars," Trevize went on with a marked air of grievance, "I can even follow this back to graduation. I didn't go on the tour with him. I remember not wanting to. Wasn't that a matter of his influence? He had to be alone. Where was he really going?"

Pelorat pushed away the dishes before him, as though he wanted to clear a space about himself in order to have room to think. It seemed to be a gesture that signaled the busboy-robot, a self-moving table that stopped near them and waited while they placed their dishes and cutlery upon it.

When they were alone, Pelorat said, "But that's mad. Nothing has happened that could not have happened naturally. Once you get it into your head that somebody is controlling events, you can interpret everything in that light and find no reasonable certainty anywhere. Come on, old fellow, it's all circumstantial and a matter of interpretation. Don't yield to paranoia."

"I'm not going to yield to complacency, either."

"Well, let us look at this logically. Suppose he was an agent of the Second Foundation. Why would he run the risk of rousing our suspicions by keeping the tourist center empty? What did he say that was so important that a few people at a distance—

who would have been wrapped in their own concerns anyway—would have made a difference?"

"There's an easy answer to that, Janov. He would have to keep our minds under close observation and he wanted no interference from other minds. No static. No chance of confusion."

"Again, just your interpretation. What was so important about his conversation with us? It would make sense to suppose, as he himself insisted, that he met us only in order to explain what he had done, to apologize for it, and to warn us of the trouble that might await us. Why would we have to look further than that?"

The small card-receptacle at the farther rim of the table glittered unobtrusively and the figures representing the cost of the meal flashed briefly. Trevize groped beneath his sash for his credit card which, with its Foundation imprint, was good anywhere in the Galaxy—or anywhere a Foundation citizen was likely to go. He inserted it in the appropriate slot. It took a moment to complete the transaction and Trevize (with native caution) checked on the remaining balance before returning it to its pocket.

He looked about casually to make sure there was no undesirable interest in him on the faces of any of the few who still sat in the restaurant and then said, "Why look further than that? Why look further? That was not all he talked about. He talked about Earth. He told us it was dead and urged us very strongly to go to Comporellon. Shall we go?"

"It's something I've been considering, Golan," admitted Pelorat.

"Just leave here?"

"We can come back after we check Out the Sirius Sector."

"It doesn't occur to you that his whole purpose in seeing us was to deflect us from Sayshell and get us out of here? Get us anywhere but here?"

"Why?"

"I don't know. See here, they expected us to go to Trantor. That was what you wanted to do and maybe that's what they counted on us doing. I messed things up by insisting we go to Sayshell, which is the last thing they wanted, and so now they have to get us out of here."

Pelorat looked distinctly unhappy. "But Golan, you are just making statements. Why don't they want us on Sayshell?"

"I don't know, Janov. But it's enough for me that they want us out. I'm staying here. I'm not going to leave."

"But—but— Look, Golan, if the Second Foundation wanted us to leave, wouldn't they just influence our minds to make us want to leave? Why bother reasoning with us?"

"Now that you bring up the point, haven't they done that in your case, Professor?" and Trevize's eyes narrowed in sudden suspicion. "Don't you want to leave?"

Pelorat looked at Trevize in surprise. "I just think there's some sense to it."

"Of course you would, if you've been influenced."

"But I haven't been—"

"Of course you would swear you hadn't been if you had been."

Pelorat said, "If you box me in this way, there is no way of disproving your bare assertion. What are you going to do?"

"I will remain in Sayshell. And you'll stay here, too. You can't navigate the ship without me, so if Compdor has influenced you, he has influenced the wrong one."

"Very well, Golan. We'll stay in Sayshell until we have independent reasons to leave. The worst thing we can do, after all—worse than either staying or going—is to fall out with each other. Come, old chap, if I had been influenced, would I be able to change my mind and go along with you cheerfully, as I plan to do now?"

Trevize thought for a moment and then, as though with an inner shake, smiled and held out his hand. "Agreed, Janov. Now let's get back to the ship and make another start tomorrow. —If we can think of one."

Munn Li Compdor did not remember when he had been recruited. For one thing, he had been a child at the time; for another, the agents of the Second Foundation were meticulous in removing their traces as far as that was possible.

Compdor was an "Observer" and, to a Second Foundationer, he was instantly recognizable as such.

It meant that Compdor was acquainted with mentalics and could converse with Second Foundationers in their own fashion to a degree, but he was in the lowest rank of the hierarchy. He could catch glimpses of minds, but he could not adjust them. The education he had received had never gone that far. He was an Observer, not a Doer.

It made him second-class at best, but he did not mind—much. He knew his importance in the scheme of things.

During the early centuries of the Second Foundation, it had underestimated the task before it. It had imagined that its handful of members could monitor the entire Galaxy and that Seldon's Plan, to be maintained, would require only the most occasional, the lightest touch, here and there.

The Mule had stripped them of these delusions. Coming from nowhere, he had caught the Second Foundation (and, of course, the First—though that didn't matter) utterly by surprise and had left them helpless. It took five years before a counterattack could be organized, and then only at the cost of a number of lives.

With Palver a full recovery was made, again at a distressing cost, and he finally took the appropriate measures. The operations of the Second Foundation, he decided, must be enormously expanded without at the same time increasing the chances of detection unduly, so he instituted the corps of Observers.

Compdor did not know how many Observers were in the Galaxy or even how many there were on Terminus. It was not his business to know. Ideally there should be no detectable connection between any two Observers, so that the loss of one would not entail the loss of any other. All connections were with the upper echelons on Trantor.

It was Compdor's ambition to go to Trantor someday. Though he thought it extremely unlikely, he knew that occasionally an Observer might be brought to Trantor and promoted, but that was rare. The qualities that made for a good Observer were not those that pointed toward the Table.

There was Gendibal, for instance, who was four years younger than Compor. He must have been recruited as a boy, just as Compor was, but he had been taken directly to Trantor and was now a Speaker. Compor had no illusions as to why that should be. He had been much in contact with Gendibal of late and he had experienced the power of that young man's mind. He could not have stood up against it for a second.

Compor was not often conscious of a lowly status. There was almost never occasion to consider it. After all (as in the case of other Observers, he imagined) it was only lowly by the standards of Trantor. On their own non-Trantorian worlds, in their own nonmentalic societies, it was easy for Observers to obtain high status.

Compor, for instance, had never had trouble getting into good schools or finding good company. He had been able to use his mentalics in a simple way to enhance his natural intuitive ability (that natural ability had been why he had been recruited in the first place, he was sure) and, in this way, to prove himself a star at hyperspatial pursuit. He became a hero at college and this set his foot on the first rung of a political career. Once this present crisis was over, there was no telling how much farther he might advance.

If the crisis resolved itself successfully, as surely it would, would it not be recalled that it was Compor who had first noted Trevize—not as a human being (anyone could have done that) but as a mind?

He had encountered Trevize in college and had seen him, at first, only as a jovial and quick-witted companion. One morning, however, he had stirred sluggishly out of slumber and, in the stream of consciousness that accompanied the never-never land of half-sleep, he felt what a pity it was that Trevize had never been recruited.

Trevize couldn't have been recruited, of course, since he was Terminus-born and not, like Compor, a native of another world. And even with that aside, it was too late. Only the quite young are plastic enough to receive an education into mentalics; the painful introduction of that art—it was more than a science—into adult brains, set rustily in their mold, was a thing of the first two generations after Seldon only.

But then, if Trevize had been ineligible for recruiting in the first place and had outlived the possibility in the second, what had roused Compor's concern over the matter?

On their next meeting, Compor had penetrated Trevize's mind deeply and discovered what it was that must have initially disturbed him. Trevize's mind had characteristics that did not fit the rules he had been taught. Over and over, it eluded him. As he followed its workings, he found gaps—No, they couldn't be actual gaps—actual leaps of nonexistence. They were places where Trevize's manner of mind dove too deeply to be followed.

Compor had no way of determining what this meant, but he watched Trevize's behavior in the light of what he had discovered and he began to suspect that Trevize had an uncanny ability to reach right conclusions from what would seem to be insufficient data.

Did this have something to do with the gaps? Surely this was a matter for mentalism beyond his own powers—for the Table itself, perhaps. He had the uneasy feeling that Trevize's powers of decision were unknown, in their full, to the man himself, and that he might be able to— To do what? Compor's knowledge did not suffice. He could almost see the meaning of what Trevize possessed—but not quite. There was only the intuitive conclusion—or perhaps just a guess—that Trevize might be, potentially, a person of the utmost importance.

He had to take the chance that this might be so and to risk seeming to be less than qualified for his post. After all, if he were correct— He was not sure, looking back on it, how he had managed to find the courage to continue his efforts. He could not penetrate the administrative barriers that ringed the Table. He had all but reconciled himself to a broken reputation. He had worked himself down (despairingly) to the most junior member of the Table and, finally, Stor Gendibal had responded to his call.

Gendibal had listened patiently and from that time on there had been a special relationship between them. It was on Gendibal's behalf that Compor had maintained his relationship with Trevize and on Gendibal's direction that he had carefully set up the situation that had resulted in Trevize's exile. And it was through Gendibal that Compor might yet (he was beginning to hope) achieve his dream of promotion to Trantor.

All preparations, however, had been designed to send Trevize to Trantor. Trevize's refusal to do this had taken Compor entirely by surprise and (Compor thought) had been unforeseen by Gendibal as well.

At any rate, Gendibal was hurrying to the spot, and to Compor, that deepened the sense of crisis.

Compor sent out his hypersignal.

Gendibal was roused from his sleep by the touch on his mind. It was effective and not in the least disturbing. Since it affected the arousal center directly, he simply awoke.

He sat up in bed, the sheet falling from his well-shaped and smoothly muscular torso. He had recognized the touch; the differences were as distinctive to mentalists as were voices to those who communicated primarily by sound.

Gendibal sent out the standard signal, asking if a small delay were possible, and the "no emergency" call returned.

Without undue haste, then, Gendibal attended to the morning routine. He was still in the ship's shower—with the used water draining into the recycling mechanisms—when he made contact again.

"Compor?"

"Yes, Speaker."

"Have you spoken with Trevize and the other one."

"Pelorat. Janov Pelorat. Yes, Speaker."

"Good. Give me another five minutes and I'll arrange visuals." He passed Sura Novi on his way to the controls. She looked at him questioningly and made as though to speak, but he placed a finger on his lips and she subsided at once. Gendibal still felt a bit

uncomfortable at the intensity of adoration/respect in her mind, but it was coming to be a comfortingly normal part of his environment somehow.

He had hooked a small tendril of his mind to hers and there would now be no way to affect his mind without affecting hers. The simplicity of her mind (and there was an enormous aesthetic pleasure to be found in contemplating its unadorned symmetry, Gendibal couldn't help thinking) made it impossible for any extraneous mind field to exist in their neighborhood without detection. He felt a surge of gratitude for the courteous impulse that had moved him that moment they had stood together outside the University, and that had led her to come to him precisely when she could be most useful.

He said, "Compor?"

"Yes, Speaker."

"Relax, please. I must study your mind. No offense is intended."

"As you wish, Speaker. May I ask the purpose?"

"To make certain you are untouched."

Compor said, "I know you have political adversaries at the Table, Speaker, but surely none of them—"

"Do not speculate, Compor. Relax. —Yes, you are untouched. Now, if you will cooperate with me, we will establish visual contact."

What followed was, in the ordinary sense of the word, an illusion, since no one but someone who was aided by the mentalic power of a well-trained Second Foundationer would have been able to detect anything at all, either by the senses or by any physical detecting device.

It was the building up of a face and its appearance from the contours of a mind, and even the best mentalist could succeed in producing only a shadowy and somewhat uncertain figure. Compor's face was there in mid-space, as though it were seen through a thin but shifting curtain of gauze, and Gendibal knew that his own face appeared in an identical manner in front of Compor.

By physical hyperwave, communication could have been established through images so clear that speakers who were a thousand parsecs apart might judge themselves to be face-to-face. Gendibal's ship was equipped for the purpose.

There were, however, advantages to the mentalist-vision. The chief was that it could not be tapped by any device known to the First Foundation. Nor, for that matter, could one Second Foundationer tap the mentalist-vision of another. The play of mind might be followed, but not the delicate change of facial expression that gave the communication its finer points.

As for the Anti-Mules— Well, the purity of Novi's mind was sufficient to assure him that none were about.

He said, "Tell me precisely, Compor, the talk you had with Trevize and with this Pelorat. Precisely, to the level of mind."

"Of course, Speaker," said Compor.

It didn't take long. The combination of sound, expression, and mentalism compressed matters considerably, despite the fact that there was far more to tell at the level of mind than if there had been a mere parroting of speech.

Gendibal watched intently. There was little redundancy, if any, in mentalist-vision. In true vision, or even in physical hypervision across the parsecs, one saw enormously more in the way of information bits than was absolutely necessary for comprehension and one could miss a great deal without losing anything significant.

Through the gauze of mentalist-vision, however, one bought absolute security at the price of losing the luxury of being able to miss bits. Every bit was significant.

There were always horror tales that passed from instructor to student on Trantor, tales that were designed to impress on the young the importance of concentration. The most often repeated was certainly the least reliable. It told of the first report on the progress of the Mule before he had taken over Kalgan—of the minor official who received the report and who had no more than the impression of a horselike animal because he did not see or understand the small flick that signified "personal name." The official therefore decided that the whole thing was too unimportant to pass on to Trantor. By the time the next message came, it was too late to take immediate action and five more bitter years had to pass.

The event had almost certainly never happened, but that didn't matter. It was a dramatic story and it served to motivate every student into the habit of intent concentration. Gendibal remembered his own student days when he made an error in reception that seemed, in his own mind, to be both insignificant and understandable. His teacher—old Kendast, a tyrant to the roots of his cerebellum—had simply sneered and said, "A horselike animal, Cub Gendibal?" and that had been enough to make him collapse in shame.

Compor finished.

Gendibal said, "Your estimate, please, of Trevize's reaction. You know him better than I do, better than anyone does."

Compor said, "It was clear enough. The mentalic indications were unmistakable. He thinks my words and actions represent my extreme anxiety to have him go to Trantor or to the Sirius Sector or to any place but where, in fact, he is actually going. It meant, in my opinion, that he would remain firmly where he was. The fact that I attached great importance to his shifting his position, in short, forced him to give it the same importance, and since he feels his own interests to be diametrically opposed to mine, he will deliberately act against what he interprets to be my wish."

"You are certain of that?"

"Quite certain."

Gendibal considered this and decided that Compor was correct. He said, "I am satisfied. You have done well. Your tale of Earth's radioactive destruction was cleverly chosen to help produce the proper reaction without the need for direct manipulation of the mind. Commendable!"

Compdor seemed to struggle with himself a short moment. "Speaker," he said, "I cannot accept your praise. I did not invent the tale. It is true. There really is a planet called Earth in the Sirius Sector and it really is considered to be the original home of humanity. It was radioactive, either to begin with or eventually, and this grew worse till the planet died. There was indeed a mind-enhancing invention that came to nothing. All this is considered history on the home planet of my ancestors."

"So? Interesting!" said Gendibal with no obvious conviction. "And better yet. To know when a truth will do is admirable, since no nontruth can be presented with the same sincerity. Palver once said, "The closer to the truth, the better the lie, and the truth itself, when it can be used, is the best lie."

Compdor said, "There is one thing more to say. In following instructions to keep Trevize in the Sayshell Sector until you arrived—and to do so at all costs—I had to go so far in my efforts that it is clear that he suspects me of being under the influence of the Second Foundation."

Gendibal nodded. "That, I think, is unavoidable under the circumstances. His monomania on the subject would be sufficient to have him see Second Foundation even where it was not. We must simply take that into account."

"Speaker, if it is absolutely necessary that Trevize stay where he is until you can reach him, it would simplify matters if I came to meet you, took you aboard my ship, and brought you back. It would take less than a day—"

"No, Observer," said Gendibal sharply. "You will not do this. The people on Terminus know where you are. You have a hyper-relay on your ship which you cannot remove, have you not?"

"Yes, Speaker."

"And if Terminus knows you have landed on Sayshell, their ambassador on Sayshell knows of it—and the ambassador knows also that Trevize has landed. Your hyper-relay will tell Terminus that you have left for a specific point hundreds of parsecs away and returned; and the ambassador will inform them that Trevize has, however, remained in the sector. From this, how much will the people at Terminus guess? The Mayor of Terminus is, by all accounts, a shrewd woman and the last thing we want to do is to alarm her by presenting her with an obscure puzzle. We don't want her to lead a section of her fleet here. The chances of that are, in any case, uncomfortably high."

Compdor said, "With respect, Speaker— What reason do we have to fear a fleet if we can control a commander?"

"However little reason there might be, there is still less reason to fear if the fleet is not here. You stay where you are, Observer. 'When I reach you, I will join you on your ship and then—"

"And then, Speaker?"

"Why, and then I will take over."

Gendibal sat in place after he dismantled the mentalist-vision—and stayed there for long minutes—considering.

During this long trip to Sayshell, unavoidably long in this ship of his which could in no way match the technological advancement of the products of the First Foundation, he had gone over every single report on Trevize. The reports had stretched over nearly a decade.

Seen as a whole and in the light of recent events, there was no longer any doubt Trevize would have been a marvelous recruit for the Second Foundation, if the policy of never touching the Terminus-born had not been in place since Palver's time.

There was no telling how many recruits of highest quality had been lost to the Second Foundation over the centuries. There was no way of evaluating every one of the quadrillions of human beings populating the Galaxy. None of them was likely to have had more promise than Trevize, however, and certainly none could have been in a more sensitive spot.

Gendibal shook his head slightly. Trevize should never have been overlooked, Terminus-born or not. —And credit to Observer Compore for seeing it, even after the years had distorted him.

Trevize was of no use to them now, of course. He was too old for the molding, but he still had that inborn intuition, that ability to guess a solution on the basis of totally inadequate information, and something—something— Old Shandess—who, despite being past his prime, was First Speaker and had, on the whole, been a good one—saw something there, even without the correlated data and the reasoning that Gendibal had worked out in the course of this trip. Trevize, Shandess had thought, was the key to the crisis.

'Why was Trevize here at Sayshell? 'What was he planning? What was he doing?

And he couldn't be touched! Of that Gendibal was sure. Until it was known precisely what Trevize's role was, it would be totally wrong to try to modify him in any way. With the Anti-Mules— whoever they were—whatever they might be—in the field, a wrong move with respect to Trevize (Trevize, above all) might explode a wholly unexpected micro-sun in their faces.

He felt a mind hovering about his own and absently brushed at it as he might at one of the more annoying Trantorian insects— though with mind rather than hand. He felt the instant wash of other-pain and looked up.

Sura Novi had her palm to her furrowed brow. "Your pardon, Master, I be struck with sudden head-anguish."

Gendibal was instantly contrite. "I'm sorry, Novi. I wasn't thinking-or I was thinking too intently." Instantly—and gently—he smoothed the ruffled mind tendrils.

Novi smiled with sudden brightness. "It passed with sudden vanishing. The kind sound of your words, Master, works well upon me."

Gendibal said, "Coed! Is something wrong? Why are you here?" He forbore to enter her mind in greater detail in order to find out for himself. More and more, he felt a reluctance to invade her privacy.

Novi hesitated. She leaned toward him slightly. "I be concerned. You were looking at nothing and making sounds and your face was twitching. I stayed there, stick-frozen, afeared you were declining— ill—and unknowing what to do."

"It was nothing, Novi. You are not to fear." He patted her nearer hand. "There is nothing to fear. Do you understand?"

Fear—or any strong emotion—twisted and spoiled the symmetry of her mind somewhat. He preferred it calm and peaceful and happy, but he hesitated at the thought of adjusting it into that position by outer influence. She had felt the previous adjustment to be the effect of his words and it seemed to him that he preferred it that way.

He said, "Novi, why don't I call you Sura?"

She looked up at him in sudden woe. "Oh, Master, do not do so."

"But Rufirant did so on that day that we met. I know you well enough now—"

"I know well he did so, Master. It be how a man speak to girl who have no man, no betrothed, who is—not complete. You say her previous. It is more honorable for me if you say 'Novi' and I be proud that you say so. And if I have not man now, I have master and I be pleased. I hope it be not offensive to you to say 'Novi.'"

"It certainly isn't, Novi."

And her mind was beautifully smooth at that and Gendibal was pleased. Too pleased. Ought he to be so pleased?

A little shamefacedly, he remembered that the Mule was supposed to have been affected in this manner by that woman of the First Foundation, Bayta Darell, to his own undoing.

This, of course, was different. This Hamishwoman was his defense against alien minds and he wanted her to serve that purpose most efficiently.

No, that was not true— His function as a Speaker would be compromised if he ceased to understand his own mind or, worse, if he deliberately misconstrued it to avoid the truth. The truth was that it pleased him when she was calm and peaceful and happy endogenously—without his interference—and that it pleased him simply because she pleased him; and (he thought defiantly) there was nothing wrong with that.

He said, "Sit down, Novi."

She did so, balancing herself precariously at the edge of the chair and sitting as far away as the confines of the room allowed. Her mind was flooded with respect.

He said, "When you saw me making sounds, Novi, I was speaking at a long distance, scholar-fashion."

Novi said sadly, her eyes cast down, "I see, Master, that there be much to scowler-fashion I understand not and imagine not. It be difficult mountain-high art. I be ashamed to have come to you to be made scowler. How is it, Master, you did not be-laugh me?"

Gendibal said, "It is no shame to aspire to something even if it is beyond your reach. You are now too old to be made a scholar after my fashion, but you are never too old to learn more than you already know and to become able to do more than you already can. I will teach you something about this ship. By the time we reach our destination, you will know quite a bit about it."

He felt delighted. Why not? He was deliberately turning his back on the stereotype of the Hamish people. What right, in any case, had the heterogeneous group of the Second Foundation to set up such a stereotype? The young produced by them were only occasionally suited to become high-level Second Foundationers themselves. The children of Speakers almost never qualified to be Speakers. There were the three generations of Linguesters three centuries ago, but there was always the suspicion that the middle Speaker of that series did not really belong. And if that were true, who were the people of the University to place themselves on so high a pedestal?

He watched Novi's eyes glisten and was pleased that they did.

She said, "I try hard to learn all you teach me, Master."

"I'm sure you will," he said—and then hesitated. It occurred to him that, in his conversation with Comporg, he had in no way indicated at any time that he was not alone. There was no hint of a companion.

A woman could be taken for granted, perhaps; at least, Comporg would no doubt not be surprised. —But a Hamishwoman?

For a moment, despite anything Gendibal could do, the stereotype reigned supreme and he found himself glad that Comporg had never been on Trantor and would not recognize Novi as a Hamishwoman.

He shook it off. It didn't matter if Comporg knew or knew not-or if anyone did. Gendibal was a Speaker of the Second Foundation and he could do as he pleased within the constraints of the Seldon Plan—and no one could interfere.

Novi said, "Master, once we reach our destination, will we part?"

He looked at her and said, with perhaps more force than he intended, "We will not be separated, Novi."

And the Hamishwoman smiled shyly and looked for all the Galaxy as though she might have been—any woman.

13. UNIVERSITY

PELORAT WRINKLED HIS NOSE WHEN HE AND TREVIZE RE-ENTERED THE Far Star.

Trevize shrugged. "The human body is a powerful dispenser of odors. Recycling never works instantaneously and artificial scents merely overlay—they do not replace."

"And I suppose no two ships smell quite alike, once they've been occupied for a period of time by different people."

"That's right, but did you smell Sayshell Planet after the first hour?"

"No," admitted Pelorat.

"Well, you won't smell this after a while, either. In fact, if you live in the ship long enough, you'll welcome the odor that greets you on your return as signifying home. And by the way, if you become a Galactic rover after this, Janov, you'll have to learn that it is impolite to comment on the odor of any ship or, for that matter, any world to those who live on that ship or world. Between us, of course, it is all right."

"As a matter of fact, Golan, the funny thing is I do consider the Far Star home. At least it's Foundation-made." Pelorat smiled. "You know, I never considered myself a patriot. I like to think I recognize only humanity as my nation, but I must say that being away from the Foundation fills my heart with love for it."

Trevize was making his bed. "You're not very far from the Foundation, you know. The Sayshell Union is almost surrounded by Federation territory. We have an ambassador and an enormous presence here, from consuls on down. The Sayshellians like to oppose us in words, but they are usually very cautious about doing anything that gives us displeasure. —Janov, do turn in. We got nowhere today and we have to do better tomorrow."

Still, there was no difficulty in hearing between the two rooms, however, and when the ship was dark, Pelorat, tossing restlessly, finally said in a not very loud voice, "Golan?"

"Yes."

"You're not sleeping?"

"Not while you're talking."

"We did get somewhere today. Your friend, Compor—"

"Ex-friend," growled Trevize.

"Whatever his status, he talked about Earth and told us something I hadn't come across in my researches before. Radioactivity!"

Trevize lifted himself to one elbow. "Look, Golan, if Earth is really dead, that doesn't mean we return home. I still want to find Gaia."

Pelorat made a puffing noise with his mouth as though he were blowing away feathers. "My dear chap, of course. So do I. Nor do I think Earth is dead. Compor may have been telling what he felt was the truth, but there's scarcely a sector in the Galaxy

that doesn't have some tale or other that would place the origin of humanity on some local world. And they almost invariably call it Earth or some closely equivalent name.

"We call it 'globocentrism' in anthropology. People have a tendency to take it for granted that they are better than their neighbors; that their culture is older and superior to that of other worlds; that what is good in other worlds has been borrowed from them, while what is bad is distorted or perverted in the borrowing or invented elsewhere. And the tendency is to equate superiority in quality with superiority in duration. If they cannot reasonably maintain their own planet to be Earth or its equivalent—and the beginnings of the human species—they almost always do the best they can by placing Earth in their own sector, even when they cannot locate it exactly."

Trevize said, "And you're telling me that Compdor was just following the common habit when he said Earth existed in the Sirius Sector. —Still, the Sirius Sector does have a long history, so every world in it should be well known and it should be easy to check the matter, even without going there."

Pelorat chuckled. "Even if you were to show that no world in the Sirius Sector could possibly be Earth, that wouldn't help. You underestimate the depths to which mysticism can bury rationality, Golan. There are at least half a dozen sectors in the Galaxy where respectable scholars repeat, with every appearance of solemnity and with no trace of a smile, local tales that Earth—or whatever they choose to call it—is located in hyperspace and cannot be reached, except by accident."

"And do they say anyone has ever reached it by accident?"

"There are always tales and there is always a patriotic refusal to disbelieve, even though the tales are never in the least credible and are never believed by anyone not of the world that produces them."

"Then, Janov, let's not believe them ourselves. Let's enter our own private hyperspace of sleep."

"But, Golan, it's this business of Earth's radioactivity that interests me. To me, that seems to bear the mark of truth—or a kind of truth."

"What do you mean, a kind of truth?"

"Well, a world that is radioactive would be a world in which hard radiation would be present in higher concentration than is usual. The rate of mutation would be higher on such a world and evolution would proceed more quickly—and more diversely. I told you, if you remember, that among the points on which almost all the tales agree is that life on Earth was incredibly diverse: millions of species of all kinds of life. It is this diversity of life—this explosive development—that might have brought intelligence to the Earth, and then the surge outward into the Galaxy. If Earth were for some reason radioactive—that is, more radioactive than other planets—that might account for everything else about Earth that is—or was—unique."

Trevize was silent for a moment. Then, "In the first place, we have no reason to believe Compdor was telling the truth. He may well have been lying freely in order to induce us to leave this place and go chasing madly off to Sirius. I believe that's exactly

what he was doing. And even if he were telling the truth, what he said was that there was so much radioactivity that life became impossible."

Pelorat made the blowing gesture again. "There wasn't too much radioactivity to allow life to develop on Earth and it is easier for life to maintain itself—once established—than to develop in the first place. Granted, then, that life was established and maintained on Earth. Therefore the level of radioactivity could not have been incompatible with life to begin with and it could only have fallen off with time. There is nothing that can raise the level."

"Nuclear explosions?" suggested Trevize.

"What would that have to do with it?"

"I mean, suppose nuclear explosions took place on Earth?"

"On Earth's surface? Impossible. There's no record in the history of the Galaxy of any society being so foolish as to use nuclear explosions as a weapon of war. We would never have survived. During the Trigellian insurrections, when both sides were reduced to starvation and desperation and when Jendippurus Khoratt suggested the initiation of a fusion reaction in—"

"He was hanged by the sailors of his own fleet. I know Galactic history. I was thinking of accident."

"There's no record of accidents of that sort that are capable of significantly raising the intensity of radioactivity of a planet, generally." He sighed. "I suppose that when we get around to it, we'll have to go to the Sirius Sector and do a little prospecting there."

"Someday, perhaps, we will. But for now—"

"Yes, yes, I'll stop talking."

He did and Trevize lay in the dark for nearly an hour considering whether he had attracted too much attention already and whether it might not be wise to go to the Sirius Sector and then return to Gaia when attention—everyone's attention—was elsewhere.

He had arrived at no clear decision by the time he fell asleep. His dreams were troubled.

They did not arrive back in the city till midmorning. The tourist center was quite crowded this time, but they managed to obtain the necessary directions to a reference library, where in turn they received instruction in the use of the local models of data-gathering computers.

They went carefully through the museums and universities, beginning with those that were nearest, and checked out whatever information was available on anthropologists, archaeologists, and ancient historians.

Pelorat said, "Ah!"

"Ah?" said Trevize with some asperity. "Ah, what?"

"This name, Quintesetz. It seems familiar."

"You know him?"

"No, of course not, but I may have read papers of his. Back at the ship, where I have my reference collection—"

"We're not going back, Janov. If the name is familiar, that's a starting point. If he can't help us, he will undoubtedly be able to direct us further." He rose to his feet. "Let's find a way of getting to Sayshell University. And since there will be nobody there at lunchtime, let's eat first."

It was not till late afternoon that they had made their way out to the university, worked their way through its maze, and found themselves in an anteroom, waiting for a young woman who had gone off in search of information and who might—or might not—lead them to Quintesetz.

"I wonder," said Pelorat uneasily, "how much longer we'll have to wait. It must be getting toward the close of the schoolday."

And, as though that were a cue, the young lady whom they had last seen half an hour before, walked rapidly toward them, her shoes glinting red and violet and striking the ground with a sharp musical tone as she walked. The pitch varied with the speed and force of her steps.

Pelorat winced. He supposed that each world had its own ways of assaulting the senses, just as each had its own smell. He wondered if, now that he no longer noticed the smell, he might also learn not to notice the cacophony of fashionable young women when they walked.

She came to Pelorat and stopped. "May I have your full name, Professor?"

"It's Janov Pelorat, miss."

"Your home planet?"

Trevize began to lift one hand as though to enjoin silence, but Pelorat, either not seeing or not regarding, said, "Terminus."

The young woman smiled broadly, and looked pleased. "When I told Professor Quintesetz that a Professor Pelorat was inquiring for him, he said he would see you if you were Janov Pelorat of Terminus, but not otherwise."

Pelorat blinked rapidly. "You—you mean, he's heard of me?"

"It certainly seems so."

And, almost creakily, Pelorat managed a smile as he turned to Trevize. "He's heard of me. I honestly didn't think—I mean, I've written very few papers and I didn't think that anyone—" He shook his head. "They weren't really important."

"Well then," said Trevize, smiling himself, "stop hugging yourself in an ecstasy of self-underestimation and let's go." He turned to the woman. "I presume, miss, there's some sort of transportation to take us to him?"

"It's within walking distance. We won't even have to leave the building complex and I'll be glad to take you there. —Are both of you from Terminus?" And off she went.

The two men followed and Trevize said, with a trace of annoyance, "Yes, we are. Does that make a difference?"

"Oh no, of course not. There are people on Sayshell that don't like Foundationers, you know, but here at the university, we're more cosmopolitan than that. Live and let live is what I always say. I mean, Foundationers are people, too. You know what I mean?"

"Yes, I know what you mean. Lots of us say that Sayshellians are people."

"That's just the way it should be. I've never seen Terminus. It must be a big city."

"Actually it isn't," said Trevize matter-of-factly. "I suspect it's smaller than Sayshell City."

"You're tweaking my finger," she said. "It's the capital of the Foundation Federation, isn't it? I mean, there isn't another Terminus, is there?"

"No, there's only one Terminus, as far as I know, and that's where we're from—the capital of the Foundation Federation."

"Well then, it must be an enormous city. —And you're coming all the way here to see the professor. We're very proud of him, you know. He's considered the biggest authority in the whole Galaxy."

"Really?" said Trevize. "On what?"

Her eyes opened wide again, "You are a teaser. He knows more about ancient history than—than I know about my own family." And she continued to walk on ahead on her musical feet.

One can only be called a teaser and a finger-tweaker so often without developing an actual impulse in that direction. Trevize smiled and said, "The professor knows all about Earth, I suppose?"

"Earth?" She stopped at an office door and looked at them blankly.

"You know. The world where humanity got its start."

"Oh, you mean the planet-that-was-first. I guess so. I guess he should know all about it. After all, it's located in the Sayshell Sector. Everyone knows that! —This is his office. Let me signal him."

"No, don't," said Trevize. "Not for just a minute. Tell me about Earth."

"Actually I never heard anyone call it Earth. I suppose that's a Foundation word. We call it Gaia, here."

Trevize cast a swift look at Pelorat. "Oh? And where is it located?"

"Nowhere. It's in hyperspace and there's no way anyone can get to it. When I was a little girl, my grandmother said that Gaia was once in real space, but it was so disgusted at the—"

"Crimes and stupidities of human beings," muttered Pelorat, "that, out of shame, it left space and refused to have anything more to do with the human beings it had sent out into the Galaxy."

"You know the story, then. See? —A girlfriend of mine says it's superstition. Well, I'll tell her. If it's good enough for professors from the Foundation—"

A glittering section of lettering on the smoky glass of the door read: SOTAYN QUINTESETZ ABT in the hard-to-read Sayshellian calligraphy—and under it was printed, in the same fashion: DEPARTMENT OF ANCIENT HISTORY.

The woman placed her finger on a smooth metal circle. There was no sound, but the smokiness of the glass turned a milky white for a moment and a soft voice said, in an abstracted sort of way, "Identify yourself, please."

"Janov Pelorat of Terminus," said Pelorat, "with Golan Trevize of the same world." The door swung open at once.

The man who stood up, walked around his desk, and advanced to meet them was tall and well into middle age. He was light brown in skin color and his hair, which was set in crisp curls over his head, was iron-gray. He held out his hand in greeting and his voice was soft and low. "I am S.Q. I am delighted to meet you, Professors."

Trevize said, "I don't own an academic title. I merely accompany Professor Pelorat. You may call me simply Trevize. I am pleased to meet you, Professor Abt."

Quintesetz held up one hand in clear embarrassment. "No, no. Abt is merely a foolish title of some sort that has no significance outside of Sayshell. Ignore it, please, and call me S.Q. We tend to use initials in ordinary social intercourse on Sayshell. I'm so pleased to meet two of you when I had been expecting but one."

He seemed to hesitate a moment, then extended his right hand after wiping it unobtrusively on his trousers.

Trevize took it, wondering what the proper Sayshellian manner of greeting was.

Quintesetz said, "Please sit down. I'm afraid you'll find these chairs to be lifeless ones, but I, for one, don't want my chairs to hug me. It's all the fashion for chairs to hug you nowadays, but I prefer a hug to mean something, hey?"

Trevize smiled and said, "Who would not? Your name, S.Q., seems to be of the Rim Worlds and not Sayshellian. I apologize if the remark is impertinent."

"I don't mind. My family traces back, in part, to Askone. Five generations back, my great-great-grandparents left Askone when Foundation domination grew too heavy."

Pelorat said, "And we are Foundationers. Our apologies."

Quintesetz waved his hand genially, "I don't hold a grudge across a stretch of five generations. Not that such things haven't been done, more's the pity. Would you like to have something to eat? To drink? Would you like music in the background?"

"If you don't mind," said Pelorat, "I'd be willing to get right to business, if Sayshellian ways would permit."

"Sayshellian ways are not a barrier to that, I assure you. —You have no idea how remarkable this is, Dr. Pelorat. It was only about two weeks ago that I came across your article on origin myths in the *Archaeological Review* and it struck me as a remarkable synthesis— all too brief."

Pelorat flushed with pleasure. "How delighted I am that you have read it. I had to condense it, of course, since the *Review* would not print a full study. I have been planning to do a treatise on the subject."

"I wish you would. In any case, as soon as I had read it, I had this desire to see you. I even had the notion of visiting Terminus in order to do so, though that would have been hard to arrange—"

"Why so?" asked Trevize.

Quintesetz looked embarrassed. "I'm sorry to say that Sayshell is not eager to join the Foundation Federation and rather discourages any social communication with the Foundation. We've a tradition of neutralism, you see. Even the Mule didn't bother us, except to extort from us a specific statement of neutrality. For that reason, any application for permission to visit Foundation territory generally— and particularly Terminus—is

viewed with suspicion, although a scholar such as myself, intent on academic business, would probably obtain his passport in the end. —But none of that was necessary; you have come to me. I can scarcely believe it. I ask myself: Why? Have you heard of me, as I have heard of you?"

Pelorat said, "I know your work, S.Q., and in my records I have abstracts of your papers. It is why I have come to you. I am exploring both the matter of Earth, which is the reputed planet of origin of the human species, and the early period of the exploration and settlement of the Galaxy. In particular, I have come here to inquire as to the founding of Sayshell."

"From your paper," said Quintesetz, "I presume you are interested in myths and legends."

"Even more in history—actual facts—if such exist. Myths and legends, otherwise."

Quintesetz rose and walked rapidly back and forth the length of his office, paused to stare at Pelorat, then walked again.

Trevize said impatiently, "Well, sir."

Quintesetz said, "Odd! Really odd! It was only yesterday—"

Pelorat said, "What was only yesterday?"

Quintesetz said, "I told you, Dr. Pelorat—may I call you J.P., by the way? I find using a full-length name rather unnatural"

"Please do."

"I told you, J.P., that I had admired your paper and that I had wanted to see you. The reason I wanted to see you was that you clearly had an extensive collection of legends concerning the beginnings of the worlds and yet didn't have ours. In other words, I wanted to see you in order to tell you precisely what you have come to see me to find out."

"What has this to do with yesterday, S.Q.?" asked Trevize.

"We have legends. A legend. An important one to our society, for it has become our central mystery—"

"Mystery?" said Trevize.

"I don't mean a puzzle or anything of that sort. That, I believe, would be the usual meaning of the word in Galactic Standard. There's a specialized meaning here. It means 'something secret'; something only certain adepts know the full meaning of; something not to be spoken of to outsiders. —And yesterday was the day."

"The day of what, S.Q.?" asked Trevize, slightly exaggerating his air of patience.

"Yesterday was the Day of Flight."

"Ah," said Trevize, "a day of meditation and quiet, when everyone is supposed to remain at home."

"Something like that, in theory, except that in the larger cities, the more sophisticated regions, there is little observance in the older fashion. —But you know about it, I see."

Pelorat, who had grown uneasy at Trevize's annoyed tone, put in hastily, "We heard a little of it, having arrived yesterday."

"Of all days," said Trevize sarcastically. "See here, S.Q. As I said, I'm not an academic, but I have a question. You said you were speaking of a central mystery, meaning it was not to be spoken of to outsiders. Why, then, are you speaking of it to us? We are outsiders."

"So you are. But I'm not an observer of the day and the depth of my superstition in this matter is slight at best. J.P.'s paper, however, reinforced a feeling I have had for a long time. A myth or legend is simply not made up out of a vacuum. Nothing is-or can be. Somehow there is a kernel of truth behind it, however distorted that might be, and I would like the truth behind our legend of the Day of Flight."

Trevize said, "Is it safe to talk about it?"

Quintesetz shrugged. "Not entirely, I suppose. The conservative elements among our population would be horrified. However, they don't control the government and haven't for a century. The secularists are strong and would be stronger still, if the conservatives didn't take advantage of our—if you'll excuse me—anti-Foundation bias. Then, too, since I am discussing the matter out of my scholarly interest in ancient history, the League of Academicians will support me strongly, in case of need."

"In that case," said Pelorat, "would you tell us about your central mystery, S.Q.?"

"Yes, but let me make sure we won't be interrupted or, for that matter, overheard. Even if one must stare the bull in the face, one needn't slap its muzzle, as the saying goes."

He flicked a pattern on the work-face of an instrument on his desk and said, "We're incommunicado now."

"Are you sure you're not bugged?" asked Trevize.

"Bugged?"

"Tapped! Eavesdropped! —Subjected to a device that will have you under observation—visual or auditory or both."

Quintesetz looked shocked. "Not here on Sayshell!"

Trevize shrugged. "If you say so."

"Please go on, S.Q.," said Pelorat.

Quintesetz pursed his lips, leaned back in his chair (which gave slightly under the pressure) and put the tips of his fingers together. He seemed to be speculating as to just how to begin.

He said, "Do you know what a robot is?"

"A robot?" said Pelorat. "No."

Quintesetz looked in the direction of Trevize, who shook his head slowly.

"You know what a computer is, however?"

"Of course," said Trevize impatiently.

"Well then, a mobile computerized tool—"

"Is a mobile computerized tool." Trevize was still impatient. "There are endless varieties and I don't know of any generalized term for it except mobile computerized tool."

"—that looks exactly like a human being is a robot." S.Q. completed his definition with equanimity. "The distinction of a robot is that it is humaniform."

"Why humaniform?" asked Pelorat in honest amazement. "I'm not sure. It's a remarkably inefficient form for a tool, I grant you, but I'm just repeating the legend. 'Robot' is an old word from no recognizable language, though our scholars say it bears the connotation of 'work.'"

"I can't think of any word," said Trevize skeptically, "that sounds even vaguely like 'robot' and that has any connection with 'work.'"

"Nothing in Galactic, certainly," said Quintesetz, "but that's what they say."

Pelorat said, "It may have been reverse etymology. These objects were used for work, and so the word was said to mean 'work.' —In any case, why do you tell us this?"

"Because it is a firmly fixed tradition here on Sayshell that when Earth was a single world and the Galaxy lay all uninhabited before it, robots were invented and devised. There were then two sorts of human beings: natural and invented, flesh and metal, biological and mechanical, complex and simple—"

Quintesetz came to a halt and said with a rueful laugh, "I'm sorry. It is impossible to talk about robots without quoting from the Book of Flight. The people of Earth devised robots—and I need say no more. That's plain enough."

"And why did they devise robots?" asked Trevize.

Quintesetz shrugged. "Who can tell at this distance in time? Perhaps they were few in numbers and needed help, particularly in the great task of exploring and populating the Galaxy."

Trevize said, "That's a reasonable suggestion. Once the Galaxy was colonized, the robots would no longer be needed. Certainly there are no humanoid mobile computerized tools in the Galaxy today."

"In any case," said Quintesetz, "the story is as follows—if I may vastly simplify and leave out many poetic ornamentations which, frankly, I don't accept, though the general population does or pretends to. Around Earth, there grew up colony worlds circling neighboring stars and these colony worlds were far richer in robots than was Earth itself. There was more use for robots on raw, new worlds. Earth, in fact, retreated, wished no more robots, and rebelled against them."

"What happened?" asked Pelorat.

"The Outer Worlds were the stronger. With the help of their robots, the children defeated and controlled Earth—the Mother. Pardon me, but I can't help slipping into quotation. But there were those from Earth who fled their world—with better ships and stronger modes of hyperspatial travel. They fled to far distant stars and worlds, far beyond the closer worlds earlier colonized. New colonies were founded—without robots—in which human beings could live freely. Those were the Times of Flight, so-called, and the day upon which the first Earthmen reached the Sayshell Sector— this very planet, in fact—is the Day of Flight, celebrated annually for many thousands of years."

Pelorat said, "My dear chap, what you are saying, then, is that Sayshell was founded directly from Earth."

Quintesezt thought and hesitated for a moment. Then he said, "That is the official belief."

"Obviously," said Trevize, "you don't accept it."

"It seems to me—" Quintesezt began and then burst out, "Oh, Great Stars and Small Planets, I don't! It is entirely too unlikely, but it's official dogma and however secularized the government has become, lip service to that, at least, is essential. —Still, to the point. In your article, J.P., there is no indication that you're aware of this story—of robots and of two waves of colonization, a lesser one with robots and a greater one without."

"I certainly was not," said Pelorat. "I hear it now for the first time and, my dear S.Q., I am eternally grateful to you for making this known to me. I am astonished that no hint of this has appeared in any of the writings—"

"It shows," said Quintesezt, "how effective our social system is. It's our Sayshellian secret—our great mystery."

"Perhaps," said Trevize dryly. "Yet the second wave of colonization—the robotless wave—must have moved out in all directions. Why is it only on Sayshell that this great secret exists?"

Quintesezt said, "It may exist elsewhere and be just as secret. Our own conservatives believe that only Sayshell was settled from Earth and that all the rest of the Galaxy was settled from Sayshell. That, of course, is probably nonsense."

Pelorat said, "These subsidiary puzzles can be worked out in time. Now that I have the starting point, I can seek out similar information on other worlds. What counts is that I have discovered the question to ask and a good question is, of course, the key by which infinite answers can be educed. How fortunate that I—"

Trevize said, "Yes, Janov, but the good S.Q. has not told us the whole story, surely. What happened to the older colonies and their robots? Do your traditions say?"

"Not in detail, but in essence. Human and humanoid cannot live together, apparently. The worlds with robots died. They were not viable."

"And Earth?"

"Humans left it and settled here and presumably (though the conservatives would disagree) on other planets as well."

"Surely not every human being left Earth. The planet was not deserted."

"Presumably not. I don't know."

Trevize said abruptly, "Was it left radioactive?"

Quintesezt looked astonished. "Radioactive?"

"That's what I'm asking."

"Not to my knowledge. I never heard of such a thing."

Trevize put a knuckle to his teeth and considered. Finally he said, "S.Q., it's getting late and we have trespassed sufficiently on your time, perhaps." (Pelorat made a motion as though he were about to protest, but Trevize's hand was on the other's knee and his grip tightened—so Pelorat, looking disturbed, subsided.)

Quintesezt said, "I was delighted to be of use."

"You have been and if there's anything we can do in exchange, name it."

Quintesetz laughed gently. "If the good J.P. will be so kind as to refrain from mentioning my name in connection with any writing he does on our mystery, that will be sufficient repayment."

Pelorat said eagerly, "You would be able to get the credit you deserve—and perhaps be more appreciated—if you were allowed to visit Terminus and even, perhaps, remain there as a visiting scholar at our university for an extended period. We might arrange that. Sayshell might not like the Federation, but they might not like refusing a direct request that you be allowed to come to Terminus to attend, let us say, a colloquium on some aspect of ancient history."

The Sayshellian half-rose. "Are you saying you can pull strings to arrange that?"

Trevize said, "Why, I hadn't thought of it, but J.P. is perfectly right. That would be feasible—if we tried. And, of course, the more grateful you make us, the harder we will try."

Quintesetz paused, then frowned. "What do you mean, sir?"

"All you have to do is tell us about Gaia, S.Q.," said Trevize. And all the light in Quintesetz's face died.

Quintesetz looked down at his desk. His hand stroked absent-mindedly at his short, tightly curled hair. Then he looked at Trevize and pursed his lips tightly. It was as though he were determined not to speak.

Trevize lifted his eyebrows and waited and finally Quintesetz said in a strangled sort of way, "it is getting indeed late—quite glemmering."

Until then he had spoken in good Galactic, but now his words took on a strange shape as though the Sayshellian mode of speech were pushing past his classical education.

"Glemmering, S.Q.?"

"It is nearly full night."

Trevize nodded. "I am thoughtless. And I am hungry, too. Could you please join us for an evening meal, S.Q., at our expense? We could then, perhaps, continue our discussion—about Gaia."

Quintesetz rose heavily to his feet. He was taller than either of the two men from Terminus, but he was older and pudgier and his height did not lend him the appearance of strength. He seemed more weary than when they had arrived.

He blinked at them and said, "I forget my hospitality. You are Outworlders and it would not be fitting that you entertain me. Come to my home. It is on campus and not far and, if you wish to carry on a conversation, I can do so in a more relaxed manner there than here. My only regret" (he seemed a little uneasy) "is that I can offer you only a limited meal. My wife and I are vegetarians and if you are meat-eating, I can Only express my apologies and regrets."

Trevize said, "J.P. and I will be quite content to forego our carnivorous natures for one meal. Your conversation will more than make up for it—I hope."

"I can promise you an interesting meal, whatever the conversation," said Quintesetz, "if your taste should run to our Sayshellian spices. My wife and I have made a rare study of such things."

"I look forward to any exoticism you choose to supply, S.Q.," said Trevize coolly, though Pelorat looked a little nervous at the prospect.

Quintesetz led the way. The three left the room and walked down an apparently endless corridor, with the Sayshellian greeting students and colleagues now and then, but making no attempt to introduce his companions. Trevize was uneasily aware that others stared curiously at his sash, which happened to be one of his gray ones. A subdued color was not something that was de rigueur in campus clothing, apparently.

Finally they stepped through the door and out into the open. It was indeed dark and a little cool, with trees bulking in the distance and a rather rank stand of grass on either side of the walkway.

Pelorat came to a halt—with his back to the glimmer of lights that came from the building they had just left and from the glows that lined the walks of the campus. He looked straight upward.

"Beautiful!" he said. "There is a famous phrase in a verse by one of our better poets that speaks of 'the speckle-shine of Sayshell's soaring sky.'"

Trevize gazed appreciatively and said in a low voice, "Vie are from Terminus, S.Q., and my friend, at least, has seen no other skies. On Terminus, we see only the smooth dim fog of the Galaxy and a few barely visible stars. You would appreciate your own sky even more, had you lived with ours."

Quintesetz said gravely, "We appreciate it to the full, I assure you. It's not so much that we are in an uncrowded area of the Galaxy, but that the distribution of stars is remarkably even. I don't think that you will find, anywhere in the Galaxy, first-magnitude stars so generally distributed. —And yet not too many, either. I have seen the skies of worlds that are inside the outer reaches of a globular cluster and there you will see too many bright stars. It spoils the darkness of the night sky and reduces the splendor considerably."

"I quite agree with that," said Trevize.

"Now I wonder," said Quintesetz, "if you see that almost regular pentagon of almost equally bright stars. The Five Sisters, we call them. It's in that direction, just above the line of trees. Do you see it?"

"I see it," said Trevize. "Very attractive."

"Yes," said Quintesetz. "It's supposed to symbolize success in love —and there's no love letter that doesn't end in a pentagon of dots to indicate a desire to make love. Each of the five stars stands for a different stage in the process and there are famous poems which have vied with each other in making each stage as explicitly erotic as possible. In my younger days, I attempted versifying on the subject myself and I wouldn't have thought that the time would come when I would grow so indifferent to the Five Sisters, though I suppose it's the common fate. —Do you see the dim star just about in the center of the Five Sisters."

"That," said Quintesetz, "is supposed to represent unrequited love. There is a legend that the star was once as bright as the rest, but faded with grief." And he walked on rapidly.

The dinner, Trevize had been forced to admit to himself, was delightful. There was endless variety and the spicing and dressing were subtle but effective.

Trevize said, "All these vegetables—which have been a pleasure to eat, by the way—are part of the Galactic dietary, are they not, S.Q.?"

"Yes, of course."

"I presume, though, that there are indigenous forms of life, too."

"Of course. Sayshell Planet was an oxygen world when the first settlers arrived, so it had to be life-bearing. And we have preserved some of the indigenous life, you may be sure. We have quite extensive natural parks in which both the flora and the fauna of Old Sayshell survive."

Pelorat said sadly, "There you are in advance of us, S.Q. There was little land life on Terminus when human beings arrived and I'm afraid that for a long time no concerted effort was made to preserve the sea life, which had produced the oxygen that made Terminus habitable. Terminus has an ecology now that is purely Galactic in nature."

"Sayshell," said Quintesetz, with a smile of modest pride, "has a long and steady record of life-valuing."

And Trevize chose that moment to say, "When we left your office, S.Q., I believe it was your intention to feed us dinner and then tell us about Gaia."

Quintesetz's wife, a friendly woman—plump and quite dark, who had said little during the meal—looked up in astonishment, rose, and left the room without a word.

"My wife," said Quintesetz uneasily, "is quite a conservative, I'm afraid, and is a bit uneasy at the mention of—the world. Please excuse her. But why do you ask about it?"

"Because it is important for J.P.'s work, I'm afraid."

"But why do you ask it of me? We were discussing Earth, robots, the founding of Sayshell. What has all this to do with—what you ask?"

"Perhaps nothing, and yet there are so many oddnesses about the matter. Why is your wife uneasy at the mention of Gaia? Why are you uneasy? Some talk of it easily enough. We have been told only today that Gaia is Earth itself and that it has disappeared into hyperspace because of the evil done by human beings."

A look of pain crossed Quintesetz's face. "Who told you that gibberish?"

"Someone I met here at the university."

"That's just superstition."

"Then it's not part of the central dogma of your legends concerning the Flight?"

"No, of course not. It's just a fable that arose among the ordinary, uneducated people."

"Are you sure?" asked Trevize coldly.

Quintesetz sat back in his chair and stared at the remnant of the meal before him. "Come into the living room," he said. "My wife will not allow this room to be cleared and set to rights while we are here and discussing—this."

"Are you sure it is just a fable?" repeated Trevize, once they had seated themselves in another room, before a window that bellied upward and inward to give a clear view of Sayshell's remarkable night sky. The lights within the room glimmered down to avoid competition and Quintesetz's dark countenance melted into the shadow.

Quintesetz said, "Aren't you sure? Do you think that any world can dissolve into hyperspace? You must understand that the average person has only the vaguest notion of what hyperspace is."

"The truth is," said Trevize, "that I myself have only the vaguest notion of what hyperspace is and I've been through it hundreds of times."

"Let me speak realities, then. I assure you that Earth—wherever it is—is not located within the borders of the Sayshell Union and that the world you mentioned is not Earth."

"But even if you don't know where Earth is, S.Q., you ought to know where the world I mentioned is. It is certainly within the borders of the Sayshell Union. We know that much, eh, Pelorat?"

Pelorat, who had been listening stolidly, started at being suddenly addressed and said, "If it comes to that, Golan, I know where it is."

Trevize turned to look at him. "Since when, Janov?"

"Since earlier this evening, my dear Golan. You showed us the Five Sisters, S.Q., on our way from your office to your house. You pointed out a dim star at the center of the pentagon. I'm positive that's Gaia."

Quintesetz hesitated—his face, hidden in the dimness, was beyond any chance of interpretation. Finally he said, "Well, that's what our astronomers tell us—privately. It is a planet that circles that star."

Trevize gazed contemplatively at Pelorat, but the expression on the professor's face was unreadable. Trevize turned to Quintesetz, "Then tell us about that star. Do you have its coordinates?"

"I? No." He was almost violent in his denial. "I have no stellar coordinates here. You can get it from our astronomy department, though I imagine not without trouble. No travel to that star is permitted."

"Why not? It's within your territory, isn't it?"

"Spaciographically, yes. Politically, no."

Trevize waited for something more to be said. When that didn't come, he rose. "Professor Quintesetz," he said formally, "I am not a policeman, soldier, diplomat, or thug. I am not here to force information out of you. Instead, I shall, against my will, go to our ambassador. Surely, you must understand that it is not I, for my own personal interest, that request this information. This is Foundation business and I don't want to make an interstellar incident out of this. I don't think the Sayshell Union would want to, either."

Quintesetz said uncertainly, "What is this Foundation business?"

"That's not something I can discuss with you. If Gaia is not something you can discuss with me, then we will transfer it all to the government level and, under the circumstances, it may be the worse for Sayshell. Sayshell has kept its independence of the Federation and I have no objection to that. I have no reason to wish Sayshell ill and I do

not wish to approach our ambassador. In fact, I will harm my own career in doing so, for I am under strict instruction to get this information without making a government matter of it. Please tell me, then, if there is some firm reason why you cannot discuss Gaia. Will you be arrested or otherwise punished, if you speak? Will you tell me plainly that I have no choice but to go to the ambassadorial height?"

"No no," said Quintesetz, who sounded utterly confused. "I know nothing about government matters. We simply don't speak of that world."

"Superstition?"

"Well, yes! Superstition! —Skies of Sayshell, in what way am I better than that foolish person who told you that Gaia was in hyperspace—or than my wife who won't even stay in a room where Gaia is mentioned and who may even have left the house for fear it will be smashed by—"

"Lightning?"

"By some stroke from afar. And I, even I, hesitate to pronounce the name. Gaia! Gaia! The syllables do not hurt! I am unharmed! Yet I hesitate. —But please believe me when I say that I honestly don't know the coordinates for Gaia's star. I can try to help you get it, if that will help, but let me tell you that we don't discuss the world here in the Union. We keep hands and minds off it. I can tell you what little is known—really known, rather than supposed—and I doubt that you can learn anything more anywhere in these worlds of the Union.

"We know Gaia is an ancient world and there are some who think it is the oldest world in this sector of the Galaxy, but we are not certain. Patriotism tells us Sayshell Planet is the oldest; fear tells us Gaia Planet is. The only way of combining the two is to suppose that Gaia is Earth, since it is known that Sayshell was settled by Earthpeople.

"Most historians think—among themselves—that Gaia Planet was founded independently. They think it is not a colony of any world of our Union and that the Union was not colonized by Gaia. There is no consensus on comparative age, whether Gaia was settled before or after Sayshell was."

Trevize said, "So far, what you know is nothing, since every possible alternative is believed by someone or other."

Quintesetz nodded ruefully. "It would seem so. It was comparatively late in our history that we became conscious of the existence of Gaia. We had been preoccupied at first in forming the Union, then in fighting off the Galactic Empire, then in trying to find our proper role as an Imperial province and in limiting the power of the Viceroys.

"It wasn't till the days of Imperial weakness were far advanced that one of the later Viceroys, who was under very weak central control by then, came to realize that Gaia existed and seemed to maintain its independence from the Sayshellian province and even from the Empire itself. It simply kept to itself in isolation and secrecy, so that virtually nothing was known about it, anymore than is now known. The Viceroy decided to take it over. We have no details what happened, but his expedition was broken and few ships returned. In those days, of course, the ships were neither very good nor very well led.

"Sayshell itself rejoiced at the defeat of the Viceroy, who was considered an Imperial oppressor, and the debacle led almost directly to the re-establishment of our independence. The Sayshell Union snapped its ties with the Empire and we still celebrate the anniversary of that event as Union Day. Almost out of gratitude we left Gaia alone for nearly a century, but the time came when we were strong enough to begin to think of a little imperialistic expansion of our own. Why not take over Gaia? Why not at least establish a Customs Union? We sent out a fleet and it was broken, too.

"Thereafter, we confined ourselves to an occasional attempt at trade—attempts that were invariably unsuccessful. Gaia remained in firm isolation and never—to anyone's knowledge—made the slightest attempt to trade or communicate with any other world. It certainly never made the slightest hostile move against anyone in any direction. And then—"

Quintesetz turned up the light by touching a control in the arm of his chair. In the light, Quintesetz's face took on a clearly sardonic expression. He went on, "Since you are citizens of the Foundation, you perhaps remember the Mule."

Trevize flushed. In five centuries of existence, the Foundation had been conquered only once. The conquest had been only temporary and had not seriously interfered with its climb toward Second Empire, but surely no one who resented the Foundation and wished to puncture its self-satisfaction would fail to mention the Mule, its one conqueror. And it was likely (thought Trevize) that Quintesetz had raised the level of light in order that he might see Foundational self-satisfaction punctured.

He said, "Yes, we of the Foundation remember the Mule."

"The Mule," said Quintesetz, "ruled an Empire for a while, one that was as large as the Federation now controlled by the Foundation. He did not, however, rule us. He left us in peace. He passed through Sayshell at one time, however. We signed a declaration of neutrality and a statement of friendship. He asked nothing more. We were the only ones of whom he asked nothing more in the days before illness called a halt to his expansion and forced him to wait for death. He was not an unreasonable man, you know. He did not use unreasonable force, he was not bloody, and he ruled humanely."

"It was just that he was a conqueror," said Trevize sarcastically.

"Like the Foundation," said Quintesetz.

Trevize, with no ready answer, said irritably, "Do you have more to say about Gaia?"

"Just a statement that the Mule made. According to the account of the historic meeting between the Mule and President Kallo of the Union, the Mule is described as having put his signature to the document with a flourish and to have said, "You are neutral even toward Gaia by this document, which is fortunate for you. Even I will not approach Gaia."

Trevize shook his head. "Why should he? Sayshell was eager to pledge neutrality and Gaia had no record of ever troubling anyone. The Mule was planning the conquest of the entire Galaxy at the time, so why delay for trifles? Time enough to turn on Sayshell and Gaia, when that was done."

"Perhaps, perhaps," said Quintesetz, "but according to one witness at the time, a person we tend to believe, the Mule put down his pen as he said, 'Even I will not approach Gaia.' His voice then dropped and, in a whisper not meant to be heard, he added 'again.'"

"Not meant to be heard, you say. Then how was it he was heard?"

"Because his pen rolled off the table when he put it down and a Sayshellian automatically approached and bent to pick it up. His ear was close to the Mule's mouth when the word 'again' was spoken and he heard it. He said nothing until after the Mule's death."

"How can you prove it was not an invention."

"The man's life is not the kind that makes it probable he would invent something of this kind. His report is accepted."

"And if it is?"

"The Mule was never in—or anywhere near—the Sayshell Union except on this one occasion, at least after he appeared on the Galactic scene. If he had ever been on Gaia, it had to be before he appeared on the Galactic scene."

"Well?"

"Well, where was the Mule born?"

"I don't think anyone knows," said Trevize.

"In the Sayshell Union, there is a strong feeling he was born on Gaia."

"Because of that one word?"

"Only partly. The Mule could not be defeated because he had strange mental powers. Gaia cannot be defeated either."

"Gaia has not been defeated as yet. That does not necessarily prove it cannot be."

"Even the Mule would not approach. Search the records of his Overlordship. See if any region other than the Sayshell Union was so gingerly treated. And do you know that no one who has ever gone to Gaia for the purpose of peaceful trade has ever returned? Why do you suppose we know so little about it?"

Trevize said, "Your attitude seems much like superstition."

"Call it what you will. Since the time of the Mule, we have wiped Gaia out of our thinking. We don't want it to think of us. We only feel safe if we pretend it isn't there. It may be that the government has itself secretly initiated and encouraged the legend that Gaia has disappeared into hyperspace in the hope that people will forget that there is a real Star of that name."

"You think that Gaia is a world of Mules, then?"

"It may be. I advise you, for your good, not to go there. If you do, you will never return. If the Foundation interferes with Gaia, it will show less intelligence than the Mule did. You might tell your ambassador that."

Trevize said, "Get me the coordinates and I will be off your world at once. I will reach Gaia and I will return."

Quintesetz said, "I will get you the coordinates. The astronomy department works nights, of course, and I will get it for you now, if I can. —But let me suggest once more that you make no attempt to reach Gaia."

Trevize said, "I intend to make that attempt."

And Quintesetz said heavily, "Then you intend suicide."

14. FORWARD!

JANOV PELORAT LOOKED OUT AT THE DIM LANDSCAPE IN THE GRAYING dawn with an odd mixture of regret and uncertainty.

"We aren't staying long enough, Golan. It seems a pleasant and interesting world. I would like to learn more about it."

Trevize looked up from the computer with a wry smile. "You don't think I would like to? We had three proper meals on the planet—totally different and each excellent. I'd like more. And the only women we saw, we saw briefly—and some of them looked quite enticing, for—well, for what I've got in mind."

Pelorat wrinkled his nose slightly. "Oh, my dear chap. Those cowbells they call shoes, and all wrapped around in clashing colors, and whatever do they do to their eyelashes. Did you notice their eyelashes?"

"You might just as well believe I noticed everything, Janov. What you object to is superficial. They can easily be persuaded to wash their faces and, at the proper time, off come the shoes and the colors."

Pelorat said, "I'll take your word for that, Janov. However, I was thinking more of investigating the matter of Earth further. 'What we've been told about Earth, thus far, is so unsatisfactory, so contradictory—radiation according to one person, robots according to another."

"Death in either case."

"True," said Pelorat reluctantly, "but it may be that one is true and not the other, or that both are true to some extent, or that neither is true. Surely, Janov, when you hear tales that simply shroud matters in thickening mists of doubt, surely you must feel the itch to explore, to find out."

"I do," said Golan. "By every dwarf star in the Galaxy, I do. The problem at hand, however, is Gaia. Once that is straightened out, we can go to Earth, or come back here to Sayshell for a more extended stay. But first, Gaia."

Pelorat nodded, "The problem at hand! If we accept what Quintesetz told us, death is waiting for us on Gaia. Ought we to be going?"

Trevize said, "I ask myself that. Are you afraid?"

Pelorat hesitated as though he were probing his own feelings. Then he said in a quite simple and matter-of-fact manner. "Yes. Terribly!"

Trevize sat back in his chair and swiveled to face the other. He said, just as quietly and matter-of-factly, "Janov, there's no reason for you to chance this. Say the word and I'll let you off on Sayshell with your personal belongings and with half our credits. I'll pick you up when I return and it will be on to Sirius Sector, if you wish, and Earth, if that's where it is. If I don't return, the Foundation people on Sayshell will see to it that you get back to Terminus. No hard feelings if you stay behind, old friend."

Pelorat's eyes blinked rapidly and his lips pressed together for a few moments. Then he said, rather huskily, "Old friend? We've known each other what? A week or so? Isn't it strange that I'm going to refuse to leave the ship? I am afraid, but I want to remain with you."

Trevize moved his hands in a gesture of uncertainty. "But why? I honestly don't ask it of you."

"I'm not sure why, but I ask it of myself. It's—it's— Golan, I have faith in you. It seems to me you always know what you're doing. I wanted to go to Trantor where probably—as I now see— nothing would have happened. You insisted on Gaia and Gaia must somehow be a raw nerve in the Galaxy. Things seem to happen in connection with it. And if that's not enough, Golan, I watched you force Quintesetz to give you the information about Gaia. That was such a skillful bluff. I was lost in admiration."

"You have faith in me, then."

Pelorat said, "Yes, I do."

Trevize put his hand on the other's upper arm and seemed, for a moment, to be searching for words. Finally he said, "Janov, will you forgive me in advance if my judgment is wrong, and if you in one way or another meet with—whatever unpleasant may be awaiting us?"

Pelorat said, "Oh, my dear fellow, why do you ask? I make the decision freely for my reasons, not yours. And, please—let us leave quickly. I don't trust my cowardice not to seize me by the throat and shame me for the rest of my life."

"As you say, Janov," said Trevize. "We'll leave at the earliest moment the computer will permit. This time, we'll be moving gravitically—straight up—as soon as we can be assured the atmosphere above is clear of other ships. And as the surrounding atmosphere grows less and less dense, we'll put on more and more speed. Well within the hour, we'll be in open space."

"Good," Pelorat said and pinched the tip off a plastic coffee container. The opened orifice almost at once began steaming. Pelorat put the nipple to his mouth and sipped, allowing just enough air to enter his mouth to cool the coffee to a bearable temperature.

Trevize grinned. "You've learned how to use those things beautifully. You're a space veteran, Janov."

Pelorat stared at the plastic container for a moment and said, "Now that we have ships that can adjust a gravitational field at will, surely we can use ordinary containers, can't we?"

"Of course, but you're not going to get space people to give up their space-centered apparatus. How is a space rat going to put distance between himself and surface worms if he uses an openmouthed cup? See those rings on the walls and ceilings? Those have been traditional in spacecraft for twenty thousand years and more, but they're absolutely useless in a gravitic ship. Yet they're there and I'll bet the entire ship to a cup of coffee that your space rat will pretend he's being squashed into asphyxiation on

takeoff and will then sway back and forth from those rings as though he's under zero-grav when its gee-one—normal-grav, that is—on both occasions."

"You're joking."

"Well, maybe a little, but there's always social inertia to everything—even technological advance. Those useless wall rings are there and the cups they supply us have nipples."

Pelorat nodded thoughtfully and continued to sip at his coffee. Finally he said, "And when do we take off?"

Trevize laughed heartily and said, "Got you. I began talking about wall rings and you never noticed that we were taking off right at that time. We're a mile high right now."

"You don't mean it."

"Look out."

Pelorat did and then said, "But I never felt a thing."

"You're not supposed to."

"Aren't we breaking the regulations? Surely we ought to have followed a radio beacon in an upward spiral, as we did in a downward spiral on landing?"

"No reason to, Janov. No one will stop us. No one at all."

"Coming down, you said—"

"That was different. They weren't anxious to see us arrive, but they're ecstatic to see us go."

"Why do you say that, Golan? The only person who talked to us about Gaia was Quintesetz and he begged us not to go."

"Don't you believe it, Janov. That was for form. He made sure we'd go to Gaia. — Janov, you admired the way I bluffed the information out of Quintesetz. I'm sorry, but I don't deserve the admiration. If I had done nothing at all, he would have offered the information. If I had tried to plug my ears, he would have shouted it at me."

"Why do you say that, Golan? That's crazy."

"Paranoid? Yes, I know." Trevize turned to the computer and extended his sense intently. He said, "We're not being stopped. No ships in interfering distance, no warning messages of any kind."

Again he swiveled in the direction of Pelorat. He said, "Tell me, Janov, how did you find out about Gaia? You knew about Gaia while we were still on Terminus. You knew it was in the Sayshell Sector. You knew the name was, somehow, a form of Earth. Where did you hear all this?"

Pelorat seemed to stiffen. He said, "If I were back in my office on Terminus, I might consult my files. I have not brought everything with me—certainly not the dates on which I first encountered this piece of data or that."

"Well, think about it," said Trevize grimly. "Consider that the Sayshellians themselves are close-mouthed about the matter. They are so reluctant to talk about Gaia as it really is that they actually encourage a superstition that has the common people of the sector believing that no such planet exists in ordinary space. In fact, I can tell you something else. Watch this!"

Trevize swung to the computer, his fingers sweeping across the direction hand-rests with the ease and grace of long practice. When he placed his hands on the manuals, he welcomed their warm touch and enclosure. He felt, as always, a bit of his will oozing outward.

He said, "This is the computer's Galactic map, as it existed within its memory banks before we landed on Sayshell. I am going to show you that portion of the map that represents the night sky of Sayshell as we saw it this past night."

The room darkened and a representation of a night sky sprang out onto the screen.

Pelorat said in a low voice, "As beautiful as we saw it on Sayshell."

"More beautiful," said Trevize, impatiently. "There is no atmospheric interference of any kind, no clouds, no absorption at the horizon. But wait, let me make an adjustment"

The view shifted steadily, giving the two the uncomfortable impression that it was they who were moving. Pelorat instinctively took hold of the arms of his chair to steady himself.

"There!" said Trevize. "Do you recognize that?"

"Of course. Those are the Five Sisters—the pentagon of stars that Quintesetz pointed out. It is unmistakable."

"Yes indeed. But where is Gaia?"

Pelorat blinked. There was no dim star at the center.

"It's not there," he said.

"That's right. It's not there. And that's because its location is not included in the data banks of the computer. Since it passes the bounds of likelihood that those data banks were deliberately made incomplete in this respect for our benefit, I conclude that to the Foundation Gaiactographers who designed those data banks—and who had tremendous quantities of information at their disposal— Gaia was unknown."

"Do you suppose if we had gone to Trantor—" began Pelorat.

"I suspect we would have found no data on Gaia there, either. Its existence is kept a secret by the Sayshellians—and even more so, I suspect, by the Gaians themselves. You yourself said a few days ago it was not entirely uncommon that some worlds deliberately stayed out of sight to avoid taxation or outside interference."

"Usually," said Pelorat, "when mapmakers and statisticians come across such a world, they are found to exist in thinly populated sections of the Galaxy. It's isolation that makes it possible for them to hide. Gaia is not isolated."

"That's right. That's another of the things that makes it unusual. So let's leave this map on the screen so that you and I might continue to ponder the ignorance of our Gaiactographers—and let me ask you again— In view of this ignorance on the part of the most knowledgeable of people, how did you come to hear of Gaia?"

"I have been gathering data on Earth myths, Earth legends, and Earth histories for over thirty years, my good Golan. Without my complete records, how could I possibly—"

"We can begin somewhere, Janov. Did you learn about it in, say, the first fifteen years of your research or in the last fifteen?"

"Oh! Well, if we're going to be that broad, it was later on."

"You can do better than that. Suppose I suggest that you learned of Gaia only in the last couple of years."

Trevize peered in Pelorat's direction, felt the absence of any ability to read an unseen expression in the dimness, and raised the light level of the room a bit. The glory of the representation of the night sky on the screen dimmed in proportion. Pelorat's expression was stony and revealed nothing.

"Well?" said Trevize.

"I'm thinking," said Pelorat mildly. "You may be right. I wouldn't swear to it. When I wrote Jimbor of Ledbet University, I didn't mention Gaia, though in that case it would have been appropriate to do so, and that was in—let's see—in ' and that was three years ago. I think you're right, Golan."

"And how did you come upon it?" asked Trevize. "In a communication? A book? A scientific paper? Some ancient song? How? —Come on!"

Pelorat sat back and crossed his arms. He fell into deep thought and didn't move. Trevize said nothing and waited.

Finally Pelorat said, "In a private communication. —But it's no use asking me from whom, my dear chap. I don't remember."

Trevize moved his hands over his sash. They felt clammy as he continued his efforts to elicit information without too clearly forcing words into the other's mouth. He said, "From a historian? From an expert in mythology? From a Gaiactographer?"

"No use. I cannot match a name to the communication."

"Because, perhaps, there was none."

"Oh no. That scarcely seems possible."

"Why? Would you have rejected an anonymous communication?"

"I suppose not."

"Did you ever receive any?"

"Once in a long while. In recent years, I had become well known in certain academic circles as a collector of particular types of myths and legends and some of my correspondents were occasionally kind enough to forward material they had picked up from nonacademic sources. Sometimes these might not be attributed to anyone in particular."

Trevize said, "Yes, but did you ever receive anonymous information directly, and not by way of some academic correspondent?"

"That sometimes happened—but very rarely."

"And can you be certain that this was not so in the case of Gaia?"

"Such anonymous communications took place so rarely that I should think I would remember if it had happened in this case. Still, I can't say certainly that the information was not of anonymous origin. Mind, though, that's not to say that I did receive the information from an anonymous source."

"I realize that. But it remains a possibility, doesn't it?"

Pelorat said, very reluctantly, "I suppose it does. But what's all this about?"

"I'm not finished," said Trevize peremptorily. "Where did you get the information from—anonymous or not? What world?"

Pelorat shrugged. "Come now, I haven't the slightest idea."

"Could it possibly have been from Sayshell?"

"I told you. I don't know."

"I'm suggesting you did get it from Sayshell."

"You can suggest all you wish, but that does not necessarily make it so."

"No? When Quintesetz pointed out the dim Star at the center of the Five Sisters, you knew at once it was Gaia. You said so later on to Quintesetz, identifying it before he did. Do you remember?"

"Yes, of course."

"How was that possible? How did you recognize at once that the dim star was Gaia?"

"Because in the material I had on Gaia, it was rarely referred to by that name. Euphemisms were common, many different ones. One of the euphemisms, several times repeated, was 'the little Brother of the Five Sisters.' Another was 'the Pentagon's Center' and sometimes it was called 'o Pentagon.' When Quintesetz pointed out the Five Sisters and the central star, the allusions came irresistibly to mind."

"You never mentioned those allusions to me earlier."

"I didn't know what they meant and I didn't think it would have been important to discuss the matter with you, who were a—" Pelorat hesitated.

"A nonspecialist?"

"You realize, I hope, that the pentagon of the Five Sisters is an entirely relative form."

"What do you mean?"

Trevize laughed affectionately. "You surface worm. Do you think the sky has an objective shape of its own? That the stars are nailed in place? The pentagon has the shape it has from the surface of the worlds of the planetary system to which Sayshell Planet belongs—and from there only. From a planet circling any other star, the appearance of the Five Sisters is different. They are seen from a different angle, for one thing. For another, the five stars of the pentagon are at different distances from Sayshell and, seen from other angles, there could be no visible relationship among them at all. One or two stars might be in one half of the sky, the others in the other half. See here—"

Trevize darkened the room again and leaned over the computer. "There are eighty-six populated planetary systems making up the Sayshell Union. Let us keep Gaia—or the spot where Gaia ought to be—in place" (as he said that, a small red circle appeared in the center of the pentagon of the Five Sisters) "and shift to the skies as seen from any of the other eighty-six worlds taken at random."

The sky shifted and Pelorat blinked. The small red circle remained at the center of the screen, but the Five Sisters had disappeared. There were bright stars in the

neighborhood but no tight pentagon. Again the sky shifted, and again, and again. It went on shifting. The red circle remained in place always, but at no time did a small pentagon of equally bright stars appear. Sometimes what might be a distorted pentagon of stars—unequally bright—appeared, but nothing like the beautiful asterism Quintesetz had pointed out.

"Had enough?" said Trevize. "I assure you, the Five Sisters can never be seen exactly as we have seen it from any populated world but the worlds of the Sayshell planetary system."

Pelorat said, "The Sayshellian view might have been exported to other planets. There were many proverbs in Imperial times—some of which linger into our own, in fact—that are Trantor-centered."

"With Sayshell as secretive about Gaia as we know it to be? And why should worlds outside the Sayshell Union be interested? Why would they care about a 'little Brother of the Five Sisters' if there were nothing in the skies at which to point?"

"Maybe you're right."

"Then don't you see that your original information must have come from Sayshell itself? Not just from somewhere in the Union, but precisely from the planetary system to which the capital world of the Union belongs."

Pelorat shook his head. "You make it sound as though it must, but it's not something I remember. I simply don't."

"Nevertheless, you do see the force of my argument, don't you?"

"Yes, I do."

"Next— When do you suppose the legend could have originated?"

"Anytime. I should suppose it developed far back in the Imperial Era. It has the feel of an ancient—"

"You are wrong, Janov. The Five Sisters are moderately close to Sayshell Planet, which is why they're so bright. Four of them have high proper motions in consequence and no two are part of a family, so that they move in different directions. Watch what happens as I shift the map backward in time slowly."

Again the red circle that marked the site of Gaia remained in place, but the pentagon slowly fell apart, as four of the stars drifted in different directions and the fifth shifted slightly.

"Look at that, Janov," said Trevize. "Would you say that was a regular pentagon?"

"Clearly lopsided," said Pelorat.

"And is Gaia at the center?"

"No, it's well to the side."

"Very well. That is how the asterism looked one hundred and fifty years ago. One and a half centuries, that's all. —The material you received concerning 'the Pentagon's Center' and so on made no real sense till this century anywhere, not even in Sayshell. The material you received had to originate in Sayshell and sometime in this century, perhaps in the last decade. And you got it, even though Sayshell is so close-mouthed about Gaia."

Trevize put the lights on, turned the star map off, and sat there staring sternly at Pelorat.

Pelorat said, "I'm confused. What's this about?"

"You tell me. Consider! Somehow I got the idea into my head that the Second Foundation still existed. I was giving a talk during my election campaign. I started a bit of emotional byplay designed to squeeze votes out of the undecided with a dramatic 'If the Second Foundation still existed—' and later that day I thought to myself: What if it did still exist? I began reading history books and within a week, I was convinced. There was no real evidence, but I have always felt that I had the knack of snatching the right conclusion out of a welter of speculation. This time, though—"

Trevize brooded a bit, then went on. "And look at what has happened since. Of all people, I chose Compor as my confidant and he betrayed me. Whereupon Mayor Branno had me arrested and sent into exile. Why into exile, rather than just having me imprisoned, or trying to threaten me into silence? And why in a very late-model ship which gives me extraordinary powers of Jumping through the Galaxy? And why, of all things, does she insist I take you and suggest that I help you search for Earth?

"And why was I so certain that we should not go to Trantor? I was convinced you had a better target for our investigations and at once you come up with the mystery world of Gaia, concerning which, as it now turns out, you gained information under very puzzling circumstances.

"We go to Sayshell—the first natural stop—and at once we encounter Compor, who gives us a circumstantial story about Earth and its death. He then assures us its location is in the Sirius Sector and urges us to go there."

Pelorat said, "There you are. You seem to be implying that all circumstances are forcing us toward Gaia, but, as you say, Compor tried to persuade us to go elsewhere."

"And in response, I was determined to continue on our original line of investigation out of my sheer distrust for the man. Don't you suppose that that was what he might have been counting on? He may have deliberately told us to go elsewhere just to keep us from doing so."

"That's mere romance," muttered Pelorat.

"Is it? Let's go on. We get in touch with Quintesetz simply because he was handy—"

"Not at all," said Pelorat. "I recognized his name."

"It seemed familiar to you. You had never read anything he had written—that you could recall. Why was it familiar to you? —In any case, it turned out he had read a paper of yours and was overwhelmed by it—and how likely was that? You yourself admit your work is not widely known.

"What's more, the young lady leading us to him quite gratuitously mentions Gaia and goes on to tell us it is in hyperspace, as though to be sure we keep it in mind. When we ask Quintesetz about it, he behaves as though he doesn't want to talk about it, but he doesn't throw us out—even though I am rather rude to him. He takes us to his home instead and, on the way there, goes to the trouble of pointing out the Five Sisters. He

even makes sure we note the dim star at the center. Why? Is not all this an extraordinary concatenation of coincidence?"

Pelorat said, "If you list it like that—"

"List it any way you please," said Trevize. "I don't believe in extraordinary concatenations of coincidence."

"What does all this mean, then? That we are being maneuvered to Gaia?"

"By whom?"

Trevize said, "Surely there can be no question about that. Who is capable of adjusting minds, of giving gentle nudges to this one or that, of managing to divert progress in this direction or that?"

"You're going to tell me it's the Second Foundation."

"Well, what have we been told about Gaia? It is untouchable. Fleets that move against it are destroyed. People who reach it do not return. Even the Mule didn't dare move against it—and the Mule, in fact, was probably born there. Surely it seems that Gaia is the Second Foundation—and finding that, after all, is my ultimate goal."

Pelorat shook his head. "But according to some historians, the Second Foundation stopped the Mule. How could he have been one of them?"

"A renegade, I suppose."

"But why should we be so relentlessly maneuvered toward the Second Foundation by the Second Foundation?"

Trevize's eyes were unfocused, his brow furrowed. He said, "Let's reason it out. It has always seemed important to the Second Foundation that as little information as possible about it should be available to the Galaxy. Ideally it wants its very existence to remain unknown. We know that much about them. For a hundred twenty years, the Second Foundation was thought to be extinct and that must have suited them right down to the Galactic core. Yet when I began to suspect that they did exist, they did nothing. Compor knew. They might have used him to shut me up one way or another—had me killed, even. Yet they did nothing."

Pelorat said, "They had you arrested, if you want to blame that on the Second Foundation. According to what you told me, that resulted in the people of Terminus not knowing about your views. The people of the Second Foundation accomplished that much without violence and they may be devotees of Salvor Hardin's remark that 'Violence is the last refuge of the incompetent.'"

"But keeping it from the people of Terminus accomplishes nothing. Mayor Branno knows my view and—at the very least—must wonder if I am correct. So now, you see, it is too late for them to harm us. If they had gotten rid of me to begin with, they would be in the clear. If they had left me alone altogether, they might have still remained in the clear, for they might have maneuvered Terminus into believing I was an eccentric, perhaps a madman. The prospective ruin of my political career might even have forced me into silence as soon as I saw what the announcement of my beliefs would mean."

"And now it is too late for them to do anything. Mayor Branno was suspicious enough of the situation to send Compor after me and—having no faith in him either,

being wiser than I was—she placed a hyper-relay on Compor's ship. In consequence, she knows we are on Sayshell. And last night, while you were sleeping, I had our computer place a message directly into the computer of the Foundation ambassador here on Sayshell, explaining that we were on our way to Gaia. I took the trouble of giving its coordinates, too. If the Second Foundation does anything to us now, I am certain that Branno will have the matter investigated—and the concentrated attention of the Foundation must surely be what they don't want."

"Would they care about attracting the Foundation's attention, if they are so powerful?"

"Yes," said Trevize forcefully. "They lie hidden because, in some ways, they must be weak and because the Foundation is technologically advanced perhaps beyond even what Seldon himself might have foreseen. The very quiet, even stealthy, way in which they've been maneuvering us to their world would seem to show their eager desire to do nothing that will attract attention. And if so, then they have already lost, at least in part—for they've attracted attention and I doubt they can do anything to reverse the situation."

Pelorat said, "But why do they go through all this? Why do they ruin themselves—if your analysis is correct—by angling for us across the Galaxy? What is it they want of us?"

Trevize stared at Pelorat and flushed. "Janov," he said, "I have a feeling about this. I have this gift of coming to a correct conclusion on the basis of almost nothing. There's a kind of sureness about me that tells me when I'm right—and I'm sure now. There's something I have that they want—and want enough to risk their very existence for. I don't know what it can be, but I've got to find out, because if I've got it and if it's that powerful, then I want to be able to use it for what I feel is right." He shrugged slightly. "Do you still want to come along with me, old friend, now that you see how much a madman I am?"

Pelorat said, "I told you I had faith in you. I still do."

And Trevize laughed with enormous relief. "Marvelous! Because another feeling I have is that you are, for some reason, also essential to this whole thing. In that case, Janov, we move on to Gaia, full speed. Forward!"

Mayor Harla Branno looked distinctly older than her sixty-two years. She did not always look older, but she did now. She had been sufficiently wrapped up in thought to forget to avoid the mirror and had seen her image on her way into the map room. So she was aware of the haggardness of her appearance.

She sighed. It drained the life out of one. Five years a Mayor and for twelve years before that the real power behind two figureheads. All of it had been quiet, all of it successful, all of it—draining. How would it have been, she wondered, if there had been strain—failure—disaster.

Not so bad for her personally, she suddenly decided. Action would have been invigorating. It was the horrible knowledge that nothing but drift was possible that had worn her out.

It was the Seldon Plan that was successful and it was the Second Foundation that made sure it would continue to be. She, as the strong hand at the helm of the Foundation

(actually the First Foundation, but no one on Terminus ever thought of adding the adjective) merely rode the crest.

History would say little or nothing about her. She merely sat at the controls of a spaceship, while the spaceship was maneuvered from without.

Even Indbur III, who had presided over the Foundation's catastrophic fall to the Mule, had done something. He had, at least, collapsed.

For Mayor Branno there would be nothing!

Unless this Golan Trevize, this thoughtless Councilman, this lightning rod, made it possible— She looked at the map thoughtfully. It was not the kind of structure produced by a modern computer. It was, rather, a three-dimensional cluster of lights that pictured the Galaxy holographically in midair. Though it could not be made to move, to turn, to expand, or to contract, one could move about it and see it from any angle.

A large section of the Galaxy, perhaps a third of the whole (excluding the core, which was a "no-life's land") turned red when she touched a contact. That was the Foundation Federation, the more than seven million inhabited worlds ruled by the Council and by herself—the seven million inhabited worlds who voted for and were represented in the House of Worlds, which debated matters of minor importance, and then voted on them, and never, by any chance, dealt with anything of major importance.

Another contact and a faint pink jutted outward from the edges of the Federation, here and there. Spheres of influence! This was not Foundation territory, but the regions, though nominally independent, would never dream of resistance to any Foundation move.

There was no question in her mind that no power in the Galaxy could oppose the Foundation (not even the Second Foundation, if one but knew where it was), that the Foundation could, at will, reach out its fleet of modern ships and simply set up the Second Empire.

But only five centuries had passed since the beginning of the Plan. The Plan called for ten centuries before the Second Empire could be set up and the Second Foundation would make sure the Plan would hold. The Mayor shook her sad, gray head. If the Foundation acted now, it would somehow fail. Though its ships were irresistible, action now would fail.

Unless Trevize, the lightning rod, drew the lightning of the Second Foundation—and the lightning could be traced back to its source.

She looked about. Where was Kodell? This was no time for him to be late.

It was as though her thought had called him, for he came striding in, smiling cheerfully, looking more grandfatherly than ever with his gray-white mustache and tanned complexion. Grandfatherly, but not old. To be sure, he was eight years younger than she was.

How was it he showed no marks of strain? Did not fifteen years as Director of Security leave its scar?

Kodell nodded slowly in the formal greeting that was necessary in initiating a discussion with the Mayor. It was a tradition that had existed since the bad days of the Indburs. Almost everything had changed, but etiquette least of all.

He said, "Sorry I'm late, Mayor, but your arrest of Councilman Trevize is finally beginning to make its way through the anesthetized skin of the Council."

"Oh?" said the Mayor phlegmatically. "Are we in for a palace revolution?"

"Not the least chance. We're in control. But there'll be noise."

"Let them make noise. It will make them feel better, and I—I shall stay out of the way. I can count, I suppose, on general public opinion?"

"I think you can. Especially away from Terminus. No one outside Terminus cares what happens to a stray Councilman."

"I do."

"Ah? More news?"

"Liono," said the Mayor, "I want to know about Sayshell."

"I'm not a two-legged history book," said Liono Kodell, smiling.

"I don't want history. I want the truth. Why is Sayshell independent? —Look at it." She pointed to the red of the Foundation on the holographic map and there, well into the inner spirals, was an in-pocketing of white.

Branno said, "We've got it almost encapsulated—almost sucked in—yet it's white. Our map doesn't even show it as a loyal-ally-inpink."

Kodell shrugged. "It's not officially a loyal ally, but it never bothers us. It is neutral."

"All right. See this, then." Another touch at the controls. The red sprang out distinctly further. It covered nearly half the Galaxy. "That," said Mayor Branno, "was the Mule's realm at the time of his death. If you'll peer in among the red, you'll find the Sayshell Union, completely surrounded this time, but still white. It is the only enclave left free by the Mule."

"It was neutral then, too."

"The Mule had no great respect for neutrality."

"He seems to have had, in this case."

"Seems to have had. What has Sayshell got?"

Kodell said, "Nothing! Believe me, Mayor, she is ours any time we want her."

"Is she? Yet somehow she isn't ours."

"There's no need to want her."

Branno sat back in her chair and, with a sweep of her arm over the controls, turned the Galaxy dark. "I think we now want her."

"Pardon, Mayor?"

"Liono, I sent that foolish Councilman into space as a lightning rod. I felt that the Second Foundation would see him as a greater danger than he was and see the Foundation itself as the lesser danger. The lightning would strike him and reveal its origin to us."

"Yes, Mayor!"

"My intention was that he go to the decayed ruins of Trantor to fumble through what—if anything—was left of its Library and search for the Earth. That's the world, you remember, that these wearisome mystics tell us was the site of origin of humanity, as though that matters, even in the unlikely case it is true. The Second Foundation couldn't possibly have believed that was really what he was after and they would have moved to find out what he was really looking for."

"But he didn't go to Trantor."

"No. Quite unexpectedly, he has gone to Sayshell. Why?"

"I don't know. But please forgive an old bloodhound whose duty it is to suspect everything and tell me how you know he and this Pelorat have gone to Sayshell. I know that Compor reports it, but how far can we trust Compor?"

"The hyper-relay tells us that Compor's ship has indeed landed on Sayshell Planet."

"Undoubtedly, but how do you know that Trevize and Pelorat have? Compor may have gone to Sayshell for his own reasons and may not know—or care—where the others are."

"The fact is, that our ambassador on Sayshell has informed us of the arrival of the ship on which we placed Trevize and Pelorat. I am not ready to believe the ship arrived at Sayshell without them. What is more, Compor reports having talked to them and, if he cannot be trusted, we have other reports placing them at Sayshell University, where they consulted with a historian of no particular note."

"None of this," said Kodell mildly, "has reached me."

Branno sniffed. "Do not feel stepped on. I am dealing with this personally and the information has now reached you—with not much in the way of delay, either. The latest news—just received—is from the ambassador. Our lightning rod is moving on. He stayed on Sayshell Planet two days, then left. He is heading for another planetary system, he says, some ten parsecs away. He gave the name and the Galactic coordinates of his destination to the ambassador, who passed them on to us."

"Is there anything corroborative from Compor?"

"Compor's message that Trevize and Pelorat have left Sayshell came even before the ambassador's message. Compor has not yet determined where Trevize is going. Presumably he will follow."

Kodell said, "We are missing the why's of the situation." He popped a pastille into his mouth and sucked at it meditatively. "Why did Trevize go to Sayshell? Why did he leave?"

"The question that intrigues me most is: Where? Where is Trevize going?"

"You did say, Mayor, did you not, that he gave the name and coordinates of his destination to the ambassador. Are you implying that he lied to the ambassador? Or that the ambassador is lying to us?"

"Even assuming everyone told the truth all round and that no one made any errors, there is a name that interests me. Trevize told the ambassador he was going to Gaia. That's C-A-I-A. Trevize was careful to spell it."

Kodell said, "Gaia? I never heard of it."

"Indeed? That's not strange." Branno pointed to the spot in the air where the map had been. "Upon the map in this room, I can set up, at a moment's notice, every star—supposedly—around which there circles an inhabited world and many prominent stars with uninhabited systems. Over thirty million stars can be marked out—if I handle the controls properly—in single units, in pairs, in clusters. I can mark them out in any of five different colors, one at a time, or all together. What I cannot do is locate Gaia on the map. As far as the map is concerned, Gaia does not exist."

Kodell said, "For every star the map shows, there are ten thousand it doesn't show."

"Granted, but the stars it doesn't show lack inhabited planets and why would Trevize want to go to an uninhabited planet?"

"Have you tried the Central Computer? It has all three hundred billion Galactic stars listed."

"I've been told it has, but does it? We know very well, you and I, that there are thousands of inhabited planets that have escaped listing on any of our maps—not only on the one in this room, but even on the Central Computer. Gaia is apparently one of them."

Kodell's voice remained calm, even coaxing. "Mayor, there may well be nothing at all to be concerned about. Trevize may be off on a wild goose chase or he may be lying to us and there is no star called Gaia—and no star at all at the coordinates he gave us. He is trying to throw us off his scent, now that he has met Compdor and perhaps guesses he is being traced."

"How will this throw us off the scent? Compdor will still follow. No, Liono, I have another possibility in mind, one with far greater potentiality for trouble. Listen to me—"

She paused and said, "This room is shielded, Liono. Understand that. We cannot be overheard by anyone, so please feel free to speak. And I will speak freely, as well."

"This Gaia is located, if we accept the information, ten parsecs from Sayshell Planet and is therefore part of the Sayshell Union. The Sayshell Union is a well-explored portion of the Galaxy. All its star systems—inhabited or not inhabited—are recorded and the inhabited ones are known in detail. Gaia is the one exception. Inhabited or not, none have heard of it; it is present in no map. Add to this that the Sayshell Union maintains a peculiar state of independence with respect to the Foundation Federation, and did so even with respect to the Mule's former realm. It has been independent since the fall of the Galactic Empire."

"What of all this?" asked Kodell cautiously.

"Surely the two points I have made must be connected. Sayshell incorporates a planetary system that is totally unknown and Sayshell is untouchable. The two cannot be independent. Whatever Gaia is, it protects itself. It sees to it that there is no knowledge of its existence outside its immediate surroundings and it protects those surroundings so that outsiders cannot take over."

"You are telling me, Mayor, that Gaia is the seat of the Second Foundation?"

"I am telling you that Gaia deserves inspection."

"May I mention an odd point that might be difficult to explain by this theory?"

"Please do."

"If Gaia is the Second Foundation and if, for centuries, it has protected itself physically against intruders, protecting all of the Sayshell Union as a broad, deep shield for itself, and if it has even prevented knowledge of itself leaking into the Galaxy—then why has all that protection suddenly vanished? Trevize and Pelorat leave Terminus and, even though you had advised them to go to Trantor, they go immediately and without hesitation to Sayshell and now to Gaia. What is more, you can think of Gaia and speculate on it. Why are you not somehow prevented from doing So?"

Mayor Branno did not answer for a long time. Her head was bent and her gray hair gleamed dully in the light. Then she said, "Because I think Councilman Trevize has somehow upset things. He has done something—or is doing something—that is in some way endangering the Seldon Plan."

"That surely is impossible, Mayor."

"I suppose everything and everyone has its flaws. Even Hari Seldon was not perfect, surely. Somewhere the Plan has a flaw and Trevize has stumbled upon it, perhaps without even knowing that he has. We must know what is happening and we must be on the spot."

Finally Kodell looked grave. "Don't make decisions on your own, Mayor. We don't want to move without adequate consideration."

"Don't take me for an idiot, Liono. I'm not going to make war. I'm not going to land an expeditionary force on Gaia. I just want to be on the spot—or near it, if you prefer. Liono, find out for me—I hate talking to a war office that is as ridiculously hidebound as one is sure to be after one hundred and twenty years of peace, but you don't seem to mind—just how many warships are stationed close to Sayshell. Can we make their movements seem routine and not like a mobilization?"

"In these piping times of peace, there are not many ships in the vicinity, I am sure. But I will find out."

"Even two or three will be sufficient, especially if one is of the Supernova class."

"What do you want to do with them?"

"I want them to nudge as close to Sayshell as they can—without creating an incident—and I want them sufficiently close to each other to offer mutual support."

"What's all this intended for?"

"Flexibility. I want to be able to strike if I have to."

"Against the Second Foundation? If Gaia can keep itself isolated and untouchable against the Mule, it can surely withstand a few ships now."

Branno said, with the gleam of battle in her eyes, "My friend, I told you that nothing and no one is perfect, not even Hari Seldon. In setting up his Plan, he could not help being a person of his times. He was a mathematician of the days of the dying Empire, when technology was moribund. It followed that he could not have made sufficient allowance in his Plan for technological advance. Gravities, for instance, is a

whole new direction of advance he could not possibly have guessed at. And there are other advances, too.

"Gaia might also have advanced."

"In isolation? Come. There are ten quadrillion human beings within the Foundation Federation, from among whom contributors to technological advance can step forward. A single isolated world can do nothing in comparison. Our ships will advance and I will be with them."

"Pardon me, Mayor. What was that?"

"I will be going myself to the ships that will gather at the borders of Sayshell. I wish to see the situation for myself."

Kodell's mouth fell open for a moment. He swallowed and made a distinct noise as he did so. "Mayor, that is—not wise." If ever a man clearly intended a stronger remark, Kodell did.

"Wise or not," said Branno violently, "I will do it. I am tired of Terminus and of its endless political battles, its infighting, its alliances and counteralliances, its betrayals and renewals. I've had seventeen years at the center of it and I want to do something else—anything else. Out there," she waved her hand in a direction taken at random, "the whole history of the Galaxy may be changing and I want to take part in the process."

"You know nothing about such things, Mayor."

"Who does, Liono?" She rose stiffly to her feet. "As soon as you bring me the information I need on the ships and as soon as I can make arrangements for carrying on with the foolish business at home, I will go. —And, Liono, don't try to maneuver me out of this decision in any way or I'll wipe out our long friendship in a stroke and break you. I can still do that."

Kodell nodded. "I know you can, Mayor, but before you decide, may I ask you to reconsider the power of Seldon's Plan? What you intend may be suicide."

"I have no fears on that score, Liono. It was wrong with respect to the Mule, whom it could not anticipate—and a failure to anticipate at one time implies the possibility of failure at another."

Kodell sighed. "Well then, if you are really determined, I will support you to the best of my ability and with complete loyalty."

"Good. I warn you once again that you had better mean that remark with all your heart. And with that in mind, Liono, let us move on to Gaia. Forward!"

15. GAIA-S

SURA NOVI NOW STEPPED INTO THE CONTROL ROOM OF THE SMALL AND rather old-fashioned ship that was carrying Stor Gendibal and herself across the parsecs in deliberate Jumps.

She had clearly been in the compact cleaning room, where oils, warm air, and a minimum of water freshened her body. She had a robe wrapped about her and was holding it tightly to herself in an agony of modesty. Her hair was dry but tangled.

She said in a low voice, "Master?"

Gendibal looked up from his charts and from his computer. "Yes, Novi?"

"I be sorrow-laden—" She paused and then said slowly, "I am very sorry to bother you, Master" (then she slipped again) "but I be loss-ridden for my clothing."

"Your clothing?" Gendibal stared at her blankly for a moment and then rose to his feet in an access of contrition. "Novi, I forgot. They needed cleaning and they're in the detergent-hamper. They're cleaned, dried, folded, all set. I should have taken them out and placed them in clear sight. I forgot."

"I did not like to—to—" (she looked down at herself) "offend."

"You don't offend," said Gendibal cheerily. "Look, I promise you that when this is over I shall see to it that you have a great deal of clothing—new and in the latest fashion. We left in a hurry and it never occurred to me to bring a supply, but really, Novi, there are only the two of us and we'll be together for some time in very close quarters and it's needless to be—to be—so concerned—about—" He gestured vaguely, became aware of the horrified look in her eyes, and thought: Well, she's only a country girl after all and has her standards; probably wouldn't object to improprieties of all kinds—but with her clothes on.

Then he felt ashamed of himself and was glad that she was no "scholar" who could sense his thoughts. He said, "Shall I get your clothes for you?"

"Oh no, Master. It be not for you— I know where they are."

He next saw her properly dressed and with her hair combed. There was a distinct shyness about her. "I am ashamed, Master, to have behaved so improper—ly. I should have found them for myself."

"No matter," said Gendibal. "You are doing very well with your Galactic, Novi. You are picking up the language of scholars very quickly."

Novi smiled suddenly. Her teeth were somewhat uneven, but that scarcely detracted from the manner in which her face brightened and grew almost sweet under praise, thought Gendibal. He told himself that it was for that reason that he rather liked to praise her.

The Hamish will think little of me when I am back home," she said. "They will say I be—am a word-chopper. That is what they call someone who speaks—odd. They do not like such."

"I doubt that you will be going back to the Hamish, Novi," said Gendibal. "I am sure there will continue to be a place for you in the complex—with the scholars, that is—when this is over."

"I would like that, Master."

"I don't suppose you would care to call me 'Speaker Gendibal' or just— No, I see you wouldn't," he said, responding to her look of scandalized objection. "Oh well."

"It would not be fitting, Master. —But may I ask when this will be over?"

Gendibal shook his head. "I scarcely know. Right now, I must merely get to a particular place as quickly as I can. This ship, which is a very good ship for its kind, is slow and 'as quickly as I can' is not very quick. You see" (he gestured at the computer and the charts) "I must work out ways to get across large stretches of space, but the computer is limited in its abilities and I am not very skillful."

"Must you be there quickly because there is danger, Master?"

"What makes you think there is danger, Novi?"

"Because I watch you sometimes when I don't think you see me and your face looks—I do not know the word. Not afeared—I mean, frightened—and not bad-expecting, either."

"Apprehensive," muttered Gendibal.

"You look—concerned. Is that the word?"

"It depends. What do you mean by concerned, Novi?"

"I means you look as though you are saying to yourself, 'What am I going to do next in this great trouble?'"

Gendibal looked astonished. "That is 'concerned,' but do you see that in my face, Novi? Back in the Place of Scholars, I am extremely careful that no one should see anything in my face, but I did think that, alone in space—except for you—I could relax and let it sit around in its underwear, so to speak. —I'm sorry. That has embarrassed you.. What I'm trying to say is that if you're so perceptive, I shall have to be more careful. Every once in a while I have to relearn the lesson that even nonmentals can make shrewd guesses."

Novi looked blank. "I don't understand, Master."

"I'm talking to myself, Novi. Don't be concerned. —See, there's that word again."

"But is there danger?"

"There's a problem, Novi. I do not know what I shall find when I reach Sayshell—that is the place to which we are going. I may find myself in a situation of great difficulty."

"Does that not mean danger?"

"No, because I will be able to handle it."

"How can you tell this?"

"Because I am a—scholar. And I am the best of them. There is nothing in the Galaxy I cannot handle."

"Master," and something very like agony twisted Novi's face, "I do not wish to offensify—I mean, give offense—and make you angry. I have seen you with that oafish

Rufirant and you were in danger then—and he was only a Hamish farmer. Now I do not know what awaits you—and you do not, either."

Gendibal felt chagrined, "Are you afraid, Novi?"

"Not for myself, Master. I fear—I am afraid—for you."

"You can say, 'I fear,'" muttered Gendibal. "That is good Galactic, too."

For a moment he was engaged in thought. Then he looked up, took Sura Novi's rather coarse hands in his, and said, "Novi, I don't want you to fear anything. Let me explain. You know how you could tell there was-or rather might be—danger from the look on my face—almost as though you could read my thoughts?"

"Yes?"

"I can read thoughts better than you can. That is what scholars learn to do and I am a very good scholar."

Novi's eyes widened and her hand pulled loose from his. She seemed to be holding her breath. "You can read my thoughts?"

Gendibal held up a finger hurriedly. "I don't, Novi. I don't read your thoughts, except when I must. I do not read your thoughts."

(He knew that, in a practical sense, he was lying. It was impossible to be with Sura Novi and not understand the general tenor of some of her thoughts. One scarcely needed to be a Second Foundationer for that. Gendibal felt himself to be on the edge of blushing. But even from a Hamishwoman, such an attitude was flattering.

—And yet she had to be reassured-out of common humanity—)

He said, "I can also change the way people think. I can make people feel hurt. I can—"

But Novi was shaking her head. "How can you do all that, Master? Rufirant—"

"Forget Rufirant," said Gendibal testily. "I could have stopped him in a moment. I could have made him fall to the ground. I could have made all the Hamish—" He stopped suddenly and felt uneasily that he was boasting, that he was trying to impress this provincial woman. And she was shaking her head still.

"Master," she said, "you are trying to make me not afraid, but I am not afraid except for you, so there is no need. I know you are a great scholar and can make this ship fly through space where it seems to me that no person could do aught but—I mean, anything but—be lost. And you use machines I cannot understand—and that no Hamish person could understand. But you need not tell me of these powers of mind, which surely cannot be so, since all the things you say you could have done to Rufirant, you did not do, though you were in danger."

Gendibal pressed his lips together. Leave it at that, he thought. If the woman insists she is not afraid for herself, let it go at that. Yet he did not want her to think of him as a weakling and braggart. He simply did not.

He said, "If I did nothing to Rufirant, it was because I did not wish to. We scholars must never do anything to the Hamish. We are guests on your world. Do you understand that?"

"You are our masters. That is what we always say."

For a moment Gendibal was diverted. "How is it, then, that this Rufirant attacked me?"

"I do not know," she said simply. "I don't think he knew. He must have been mind-wandering—uh, out of his mind."

Gendibal grunted. "In any case, we do not harm the Hamish. If I had been forced to stop him by—hurting him, I might have been poorly thought of by the other scholars and might perhaps have lost my position. But to save myself being badly hurt, I might have had to handle him just a small bit—the smallest possible."

Novi drooped. "Then I need not have come rushing in like a great fool myself."

"You did exactly right," said Gendibal. "I have just said I would have done ill to have hurt him. You made it unnecessary to do so. You stopped him and that was well done. I am grateful."

She smiled again—blissfully. "I see, then, why you have been so kind to me."

"I was grateful, of course," said Gendibal, a little flustered, "but the important thing is that you must understand there is no danger. I can handle an army of ordinary people. Any scholar can— especially the important ones—and I told you I am the best of all of them. There is no one in the Galaxy who can stand against me."

"If you say so, Master, I am sure of it."

"I do say so. Now, are you afraid for me?"

"No, Master, except— Master, is it only our scholars who can read minds and— Are there other scholars, other places, who can oppose you?"

For a moment Gendibal was staggered. The woman had an astonishing gift of penetration.

It was necessary to lie. He said, "There are none."

"But there are so many stars in the sky. I once tried to count them and couldn't. If there are as many worlds of people as there are stars, wouldn't some of them be scholars? Besides the scholars on our own world, I mean?"

"What if there are?"

"They would not be as strong as I am."

"What if they leap upon you suddenly before you are aware?"

"They cannot do that. If any strange scholar were to approach, I would know at once. I would know it long before he could harm me."

"Could you run?"

"I would not have to run. —But" (anticipating her objection) "if I had to, I could be in a new ship soon—better than any in the Galaxy. They would not catch me."

"Might they not change your thoughts and make you stay?"

"No."

"There might be many of them. You are but one."

"As soon as they are there, long before they can imagine it would be possible, I would know they were there and I would leave. Our whole world of scholars would then turn against them and they would not stand. And they would know that, so they would

not dare do anything against me. In fact, they would not want me to know of them at all—and yet I will."

"Because you are so much better than they?" said Novi, her face shining with a doubtful pride.

Gendibal could not resist. Her native intelligence, her quick understanding was such that it was simple joy to be with her. That softvoiced monster, Speaker Debra Delarmi, had done him an incredible favor when she had forced this Hamish farmwoman upon him.

He said, "No, Novi, not because I am better than they, although I am. It is because I have you with me."

"I?"

"Exactly, Novi. Had you guessed that?"

"No, Master," she said, wondering. "What is it I could do?"

"It is your mind." He held up his hand at once. "I am not reading your thoughts. I see merely the outline of your mind and it is a smooth outline, an unusually smooth outline."

She put her hand to her forehead. "Because I am unlearned, Master? Because I am so foolish?"

"No, dear." He did not notice the manner of address. "It is because you are honest and possess no guile; because you are truthful and speak your mind; because you are warm of heart and—and other things. If other scholars send out anything to touch our minds—yours and mine—the touch will be instantly visible on the smoothness of your mind. I will be aware of that even before I would be aware of a touch on my own mind—and I will then have time for counteractive strategy; that is, to fight it off."

There was a silence for long moments after that. Gendibal realized that it was not just happiness in Novi's eyes, but exultation and pride, too. She said softly, "And you took me with you for that reason?"

Gendibal nodded. "That was an important reason. Yes."

Her voice sank to a whisper. "How can I help as much as possible, Master?"

He said. "Remain calm. Don't be afraid. And just—just stay as you are."

She said, "I will stay as I am. And I will stand between you and danger, as I did in the case of Rufirant."

She left the room and Gendibal looked after her.

It was strange how much there was to her. How could so simple a creature hold such complexity? The smoothness of her mind structure had, beneath it, enormous intelligence, understanding, and courage. What more could he ask-of anyone?

Somehow, he caught an image of Sura Novi—who was not a Speaker, not even a Second Foundationer, not even educated—grimly at his side, playing a vital auxiliary role in the drama that was coming.

Yet he could not see the details clearly. —He could not yet see precisely what it was that awaited them.

"A single Jump," muttered Trevize, "and there it is."

"Gaia?" asked Pelorat, looking over Trevize's shoulder at the screen.

"Gaia's sun," said Trevize. "Call it Gaia-S, if you like, to avoid confusion.

Gaiactographers do that sometimes."

"And where is Gaia itself, then? Or do we call it Gaia-P—for planet?"

"Gaia would be sufficient for the planet. We can't see Gaia yet, however. Planets aren't as easy to see as stars are and we're still a hundred microparsecs away from Gaia-S. Notice that it's only a star, even though a very bright one. We're not close enough for it to show as a disc. —And don't stare at it directly, Janov. It's still bright enough to damage the retina. I'll throw in a filter, once I'm through with my observations. Then you can stare."

"How much is a hundred microparsecs in units which a mythologist can understand, Golan?"

"Three billion kilometers; about twenty times the distance of Terminus from our own sun. Does that help?"

"Enormously. —But shouldn't we get closer?"

"No!" Trevize looked up in surprise. "Not right away. After what we've heard about Gaia, why should we rush? It's one thing to have guts; it's another to be crazy. Let's take a look first."

"At what, Golan? You said we can't see Gaia yet?"

"Not at a glance, no. But we have telescopic viewers and we have an excellent computer for rapid analysis. We can certainly study Gaia-S, to begin with, and we can perhaps make a few other observations. —Relax, Janov" He reached out and slapped the other's shoulder with an avuncular flourish.

After a pause Trevize said, "Gaia-S is a single star or, if it has a companion, that companion is much farther away from it than we are at the present moment and it is, at best, a red dwarf, which means we need not be concerned with it. Gaia-S is a G4 star, which means it is perfectly capable of having a habitable planet, and that's good. If it were an A or an M, we would have to turn around and leave right now."

Pelorat said, "I may be only a mythologist, but couldn't we have determined the spectral class of Gaia-S from Sayshell?"

"We could and we did, Janov, but it never hurts to check at closer quarters. — Gaia-S has a planetary system, which is no surprise. There are two gas giants in view and one of them is nice and large—if the computer's distance estimate is accurate. There could easily be another on the other side of the star and therefore not easily detectable, since we happen—by chance—to be somewhat close to the planetary plane. I can't make out anything in the inner regions, which is also no surprise."

"Is that bad?"

"Not really. It's expected. The habitable planets would be of rock and metal and would be much smaller than the gas giants and much closer to the star, if they're to be warm enough—and on both counts they would be much harder to see from out here. It means we'll have to get in considerably closer in order to probe the area within four microparsecs of Gaia-S."

"I'm ready."

"I'm not. We'll make the Jump tomorrow."

"Why tomorrow?"

"Why not? Let's give them a day to come out and get us—and for us to get away, perhaps, if we spot them coming and don't like what we see."

It was a slow and cautious process. During the day that passed, Trevize grimly directed the calculation of several different approaches and tried to choose between them. Lacking hard data, he could depend only on intuition, which unfortunately told him nothing. He lacked that "sureness" he sometimes experienced.

Eventually he punched in directions for a Jump that moved them far out of the planetary plane.

"That will give us a better view of the region as a whole," he said, "since we will see the planets in every part of their orbit at maximum apparent distance from the sun. And they—whoever they may be—might not be quite as watchful over regions outside the plane. —I hope."

They were now as close to Gaia-S as the nearest and largest of the gas giants was and they were nearly half a billion kilometers from it. Trevize placed it under full magnification on the screen for Pelorat's benefit. It was an impressive sight, even if the three sparse and narrow rings of debris were left out of account.

"It has the usual train of satellites," said Trevize, "but at this distance from Gaia-S, we know that none of them are habitable. Nor are any of them settled by 'human beings who survive, let us say, under a glass dome or under other strictly artificial conditions.'"

"How can you tell?"

"There's no radio noise with characteristics that point them out as of intelligent origin. Of course," he added, qualifying his statement at once, "it is conceivable that a scientific outpost might go to great pains to shield its radio signals and the gas giant produces radio noise that could mask what I was looking for. Still, our radio reception is delicate and our computer is an extraordinarily good one. I'd say the chance of human occupation of those satellites is extremely small."

"Does that mean there's no Gaia?"

"No. But it does mean that if there is a Gaia, it hasn't bothered to settle those satellites. Perhaps it lacks the capacity to do so—or the interest."

"Well, is there a Gaia?"

"Patience, Janov. Patience."

Trevize considered the sky with a seemingly endless supply of patience. He stopped at one point to say, "Frankly, the fact that they haven't come out to pounce on us is disheartening, in a way. Surely, if they had the capacities they were described as having, they would have reacted to us by now."

"It's conceivable, I suppose," said Pelorat glumly, "that the whole thing is a fantasy."

"Call it a myth, Janov," said Trevize with a wry smile, "and it will be right up your alley. Still, there's a planet moving through the ecosphere, which means it might be habitable. I'll want to observe it for at least a day."

"Why?"

"To make sure it's habitable, for one thing."

"You just said it was in the ecosphere, Golan."

"Yes, at the moment it is. But its orbit could be very eccentric, and could eventually carry it within a microparsec of the star, or out to fifteen microparsecs, or both. We'll have to determine and compare the planet's distance from Gaia-S with its orbital speed—and it would help to note the direction of its motion."

Another day.

"The orbit is nearly circular," Trevize said finally, "which means that habitability becomes a much safer bet. Yet no one's coming out to get us even now. We'll have to try a closer look."

Pelorat said, "Why does it take so long to arrange a Jump? You're just taking little ones."

"Listen to the man. Little Jumps are harder to control than big ones. Is it easier to pick up a rock or a fine grain of sand? Besides, Gaia-S is nearby and space is sharply curved. That complicates the calculations even for the computer. Even a mythologist should see that."

Pelorat grunted.

Trevize said, "You can see the planet with the unaided eye now. Right there. See it? The period of rotation is about twenty-two Galactic Hours and the axial inclination is twelve degrees. It is practically a textbook example of a habitable planet and it is life-bearing."

"How can you tell?"

"There are substantial quantities of free oxygen in the atmosphere. You can't have that without well-established vegetation."

"What about intelligent life?"

"That depends on the analysis of radio-wave radiation. Of course, there could be intelligent life that has abandoned technology, I suppose, but that seems very unlikely."

"There have been cases of that," said Pelorat.

"I'll take your word for it. That's your department. However, it's not likely that there would be nothing but pastoral survivors on a planet that frightened off the Mule."

Pelorat said, "Does it have a satellite?"

"Yes, it does," said Trevize casually.

"How big?" Pelorat said in a voice that was suddenly choking. "Can't tell for sure. Perhaps a hundred kilometers across."

"Dear me," said Pelorat wistfully. "I wish I had some worthier set of expletives on instant call, my dear chap, but there was just that one little chance—"

"You mean, if it had a giant satellite, it might be Earth itself?"

"Yes, but it clearly isn't."

"Well, if Compor is right, Earth wouldn't be in this Galactic region, anyway. It would be over Sirius way. —Really, Janov, I'm sorry."

"Oh well."

"Look, we'll wait, and risk one more small Jump. If we find no signs of intelligent life, then it should be safe to land—except that there will then be no reason to land, will there?"

After the next Jump, Trevize said in an astonished voice, "That does it, Janov. It's Gaia, all right. At least, it possesses a technological civilization."

"Can you tell that from the radio waves?"

"Better than that. There's a space station circling the planet. Do you see that?"

There was an object on display on the viewscreen. To Pelorat's unaccustomed eye, it didn't seem very remarkable, but Trevize said, "Artificial, metallic, and a radio-source."

"What do we do now?"

"Nothing, for a while. At this stage of technology, they cannot fail to detect us. If, after a while, they do nothing, I will beam a radio message at them. If they still do nothing, I will approach cautiously."

"What if they do do something?"

"It will depend on the 'something.' If I don't like it, then I'll have to take advantage of the fact that it is very unlikely that they have anything that can match the facility with which this ship can make a Jump."

"You mean we'll leave?"

"Like a hyperspatial missile."

"But we'll leave no wiser than we came."

"Not at all. At the very least we'll know that Gaia exists, that it has a working technology, and that it's done something to scare us."

"But, Golan, let's not be too easily scared."

"Now, Janov, I know that you want nothing more in the Galaxy than to learn about Earth at any cost, but please remember that I don't share your monomania. We are in an unarmed ship and those people down there have been isolated for centuries. Suppose they have never heard of the Foundation and don't know enough to be respectful of it. Or suppose this is the Second Foundation and once we're in their grip—if they're annoyed with us—we may never be the same again. Do you want them to wipe your mind clear and find you are no longer a mythologist and know nothing about any legends whatever?"

Pelorat looked grim. "If you put it that way— But what do we do once we leave?"

"Simple. We get back to Terminus with the news. —Or as near to Terminus as the old woman will allow. Then we might return to Gaia once again—more quickly and without all this inching along— and we return with an armed ship or an armed fleet. Things may well be different then."

They waited. It had grown to be a routine. They had spent far more time waiting in the approaches to Gaia than they had spent in all the flight from Terminus to Sayshell.

Trevize set the computer to automatic alarm and was even nonchalant enough to doze in his padded chair.

This meant he woke with a start when the alarm chimed. Pelorat came into Trevize's room, just as startled. He had been interrupted while shaving.

"Have we received a message?" asked Pelorat.

"No," said Trevize energetically. "We're moving."

"Moving? Where?"

"Toward the space station."

"Why is that?"

"I don't know. The motors are on and the computer doesn't respond to me—but we're moving. —Janov, we've been seized. We've come a little too close to Gaia."

16. CONVERGENCE

WHEN STOR GENDIBAL FINALLY MADE OUT COMPOR'S SHIP ON HIS viewscreen, it seemed like the end of an incredibly long journey. Yet, of course, it was not the end, but merely the beginning. The journey from Trantor to Sayshell had been nothing but prologue.

Novi looked awed. "Is that another ship of space, Master?"

"Spaceship, Novi. It is. It's the one we have been striving to reach. It is a larger ship than this one—and a better one. It can move through space so quickly that if it fled from us, this ship could not possibly catch it—or even follow it."

"Faster than a ship of the masters?" Sura Novi seemed appalled by the thought.

Gendibal shrugged. "I may be, as you say, a master, but I am not a master in all things. We scholars do not have ships like these, nor do we have many of the material devices that the owners of those ships have."

"But how can scholars lack such things, Master?"

"Because we are masters in what is important. The material advances that these others have are trifles."

Novi's brows bent together in thought. "It seems to me that to go so quickly that a master cannot follow is no trifle. Who are these people who are wonder-having—who have such things?"

Gendibal was amused. "They call themselves the Foundation. Have you ever heard of the Foundation?"

(He caught himself wondering what the Hamish knew or did not know of the Galaxy and why it never occurred to the Speakers to wonder about such things. —Or was it only he who had never wondered about such things—only he who assumed that the Hamish cared for nothing more than grubbing in the soil.)

Novi shook her head thoughtfully. "I have never heard of it, Master. When the schoolmaster taught me letter-lore—how to read, I mean—he told me there were many other worlds and told me the names of some. He said our Hamish world had the proper name of Trantor and that it once ruled all the worlds. He said Trantor was covered with gleaming iron and had an Emperor who was an allmaster."

Her eyes looked up at Gendibal with a shy merriment. "I unbelieve most of it, though. There are many stories the wordspinners tell in the meeting-halls in the time of longer nights. When I was a small girl, I believed them all, but as I grew older, I found that many of them were not true. I believe very few now; perhaps none. Even schoolmasters tell unbelievable."

"Just the same, Novi, that particular story of the schoolmaster is true—but it was long ago. Trantor was indeed covered by metal and had indeed an Emperor who ruled all the Galaxy. Now, however, it is the people of the Foundation who will someday rule all the worlds. They grow stronger all the time."

"They will rule all, Master?"

"Not immediately. In five hundred years."

"And they will master the masters as well?"

"No, no. They will rule the worlds. We will rule them—for their safety and the safety of all the worlds."

Novi was frowning again. She said, "Master, do these people of the Foundation have many of these remarkable ships?"

"I imagine so, Novi."

"And other things that are very—astonishing?"

"They have powerful weapons of all kinds."

"Then, Master, can they not take all the worlds now?"

"No, they cannot. It is not yet time."

"But why can they not? Would the masters stop them?"

"We wouldn't have to, Novi. Even if we did nothing, they could not take all the worlds."

"But what would stop them?"

"You see," began Gendibal, "there is a plan that a wise man once devised—"

He stopped, smiled slightly, and shook his head. "It is hard to explain, Novi. Another time, perhaps. In fact, when you see what will happen before we ever see Trantor again, you may even understand without my explaining."

"What will happen, Master?"

"I am not sure, Novi. But all will happen well."

He turned away and prepared to make contact with Compor. And, as he did so, he could not quite keep an inner thought from saying: At least I hope so.

He was instantly angry with himself, for he knew the source of that foolish and weakening drift of thought. It was the picture of the elaborate and enormous Foundation might in the shape of Compor's ship and it was his chagrin at Novi's open admiration of it.

Stupid! How could he let himself compare the possession of mere strength and power with the possession of the ability to guide events? It was what generations of Speakers had called "the fallacy of the hand at the throat."

To think that he was not yet immune to its allures.

Munn Li Compor was not in the least sure as to how he ought to comport himself. For most of his life, he had had the vision of allpowerful Speakers existing just beyond his circle of experience— Speakers, with whom he was occasionally in contact and who had, in their mysterious grip, the whole of humanity.

Of them all, it had been Stor Gendibal to whom, in recent years, he had turned for direction. It was not even a voice he had encountered most times, but a mere presence in his mind—hyperspeech without a hyper-relay.

In this respect, the Second Foundation had gone far beyond the Foundation. Without material device, but just by the educated and advanced power of the mind alone, they could reach across the par. sees in a manner that could not be tapped, could

not be infringed upon. It was an invisible, undetectable network that held all the worlds fast through the mediation of a relatively few dedicated individuals.

Compor had, more than once, experienced a kind of uplifting at the thought of his role. How small the band of which he was one; how enormous an influence they exerted.—And how secret it all was. Even his wife knew nothing of his hidden life.

And it was the Speakers who held the strings—and this one Speaker, this Gendibal, who might (Compor thought) be the next First Speaker, the more-than-Emperor of a more-than-Empire.

Now Gendibal was here, in a ship of Trantor, and Compor fought to stifle his disappointment at not having such a meeting take place on Trantor itself.

Could that be a ship of Trantor? Any of the early Traders who had carried the Foundation's wares through a hostile Galaxy would have had a better ship than that. No wonder it had taken the Speaker so long to cover the distance from Trantor to Sayshell.

It was not even equipped with a undock mechanism that would have welded the two ships into one when the crosstransfer of personnel was desired. Even the contemptible Sayshellian fleet was equipped with it. Instead, the Speaker had to match velocities and then cast a tether across the gap and swing along it, as in Imperial days.

That was it, thought Compor gloomily, unable to repress the feeling. The ship was no more than an old-fashioned Imperial vessel—and a small one at that.

Two figures were moving across the tether—one of them so clumsily that it was clear it had never attempted to maneuver through space before.-

Finally they were on board and removed their space suits. Speaker Stor Gendibal was of moderate height and of unimpressive appearance; he was not large and powerful, nor did he exude an air of learning. His dark, deep-set eyes were the only indication of his wisdom. But now the Speaker looked about with a clear indication of being in awe himself.

The other was a woman as tall as Gendibal, plain in appearance. Her mouth was open in astonishment as she looked about.

Moving across the tether had not been an entirely unpleasant experience for Gendibal. He was not a spaceman—no Second Foundationer was—but neither was he a complete surface worm, for no Second Foundationer was allowed to be that. The possible need for space flight was, after all, always looming above them, though every Second Foundationer hoped the need would arise only infrequently. (Preem Palver—the extent of whose space travels was legendary— had once said, ruefully, that the measure of the success of a Speaker was the fewness of the times he was compelled to move through space in order to assure the success of the Plan.)

Gendibal had had to use a tether three times before. This was his fourth use and even if he had felt tension over the matter, it would have disappeared in his concern for Sura Novi. He needed no mentalics to see that stepping into nothingness had totally upset her.

"I be afeared, Master," she said when he explained what would have to be done. "It be naughtness into which I will make footstep." If nothing else, her sudden descent into thick Hamish dialect showed the extent of her disturbance.

Gendibal said gently, "I cannot leave you on board this ship, Novi, for I will be going into the other and I must have you with me. There is no danger, for your space suit will protect you from all harm and there is no place for you to fall to. Even if you lose your grip on the tether, you will remain nearly where you are and I will be within arm's reach so that I can gather you in. Come, Novi, show me that you are brave enough—as well as bright enough—to become a scholar."

She made no further objection and Gendibal, unwilling to do anything that might disturb the smoothness of her mind-set, nevertheless managed to inject a soothing touch upon the surface of her mind.

"You can still speak to me," he said, after they were each enclosed in a space suit. "I can hear you if you think hard. Think the words hard and clearly, one by one. You can hear me now, can't you?"

"Yes, Master," she said.

He could see her lips move through the transparent faceplate and he said, "Say it without moving your lips, Novi. There is no radio in the kind of suits that scholars have. It is all done with the mind."

Her lips did not move and her look grew more anxious: Can you hear me, Master?

Perfectly well, thought Gendibal—and his lips did not move either: Do you hear me?

I do, Master.

Then come with me and do as I do.

They moved across. Gendibal knew the theory of it, even if he could handle the practice only moderately well. The trick was to keep one's legs extended and together and to swing them from the hips alone. That kept the center of gravity moving in a straight line as the arms swung forward in steady alternation. He had explained this to Sura Novi and, without turning to look at her, he studied the stance of her body from the set of the motor areas of her brain.

For a first-timer, she did very well, almost as well as Gendibal was managing to do. She repressed her own tensions and she followed directions. Gendibal found himself, once again, very pleased with her.

She was, however, clearly glad to be on board ship again—and so was Gendibal. He looked about as he removed his space suit and was rather dumbfounded at the luxury and style of the equipment. He recognized almost nothing and his heart sank at the thought that he might have very little time to learn how to handle it all. He might have to transfer expertise directly from the man already on board, something that was never quite as satisfactory as true learning.

Then he concentrated on Compor. Compor was tall and lean, a few years older than himself, rather handsome in a slightly weak way, with tightly waved hair of a startling buttery yellow.

And it was clear to Gendibal that this person was disappointed in, and even contemptuous of, the Speaker he was now meeting for the first time. What was more, he was entirely unsuccessful in hiding the fact.

Gendibal did not mind such things, on the whole. Compor was not a Trantorian—nor a full Second Foundationer—and he clearly had his illusions. Even the most superficial scan of his mind showed that. Among these was the illusion that true power was necessarily related to the appearance of power. He might, of course, keep his illusions as long as they did not interfere with what Gendibal needed, but at the present moment, this particular illusion did so interfere.

What Gendibal did was the mentalic equivalent of a snap of the fingers. Compor staggered slightly under the impress of a sharp but fleeting pain. There was an impress of enforced concentration that puckered the skin of his thought and left the man with the awareness of a casual but awesome power that could be utilized if the Speaker chose.

Compor was left with a vast respect for Gendibal.

Gendibal said pleasantly, "I am merely attracting your attention, Compor, my friend. Please let me know the present whereabouts of your friend, Golan Trevize, and his friend, Janov Pelorat."

Compor said hesitantly, "Shall I speak in the presence of the woman, Speaker?"

"The woman, Compor, is an extension of myself. There is no reason, therefore, why you should not speak openly."

"As you say, Speaker. Trevize and Pelorat are now approaching a planet known as Gaia."

"So you said in your last communication the other day. Surely they have already landed on Gaia and perhaps left again. They did not stay long on Sayshell Planet."

"They had not yet landed during the time I followed them, Speaker. They were approaching the planet with great caution, pausing substantial periods between micro-Jumps. It is clear to me they have no information about the planet they are approaching and therefore hesitate."

"Do you have information, Compor?"

"I have none, Speaker," said Compor, "or at least my ship's computer has none."

"This computer?" Gendibal's eyes fell upon the control panel and he asked in sudden hope, "Can it aid usefully in running the ship?"

"It can run the ship completely, Speaker. One need merely think into it."

Gendibal felt suddenly uneasy. "The Foundation has gone that far?"

"Yes, but clumsily. The computer does not work well. I must repeat my thoughts several times and even then I get but minimal information."

Gendibal said, "I may be able to do better than that."

"I am sure of it, Speaker," said Compor respectfully.

"But never mind that for the moment. Why does it have no information on Gaia?"

"I do not know, Speaker. It claims to have—as far as a computer may be said to be able to claim—records on every human-inhabited planet in the Galaxy."

"It cannot have more information than has been fed into it and if those who did the feeding thought they had records of all such planets when, in actual fact, they had not, then the computer would labor under the same misapprehension. Correct?"

"Certainly, Speaker."

"Did you inquire at Sayshell?"

"Speaker," said Compdor uneasily, "there are people who speak of Gaia on Sayshell, but what they say is valueless. Clearly superstition. The tale they tell is that Gaia is a powerful world that held off even the Mule."

"Is that what they say, indeed?" said Gendibal, suppressing excitement. "Were you so sure that this was superstition that you asked for no details?"

"No, Speaker. I asked a great deal, but what I have just told you is all that anyone can say. They can speak on the subject at great length, but when they have done so, all that it boils down to is what I have just said."

"Apparently," said Gendibal, "that is what Trevize has heard, too, and he goes to Gaia for some reason connected with that—to tap this great power, perhaps. And he does so cautiously, for perhaps he also fears this great power."

"That is certainly possible, Speaker."

"And yet you did not follow?"

"I did follow, Speaker, long enough to make sure he was indeed making for Gaia. I then returned here to the outskirts of the Gaian system."

"Why?"

"Three reasons, Speaker. First, you were about to arrive and I wanted to meet you at least partway and bring you aboard at the earliest moment, as you had directed. Since my ship has a hyperrelay on board, I could not move too far away from Trevize and Pelorat without rousing suspicion on Terminus, but I judged I could risk moving this far. Second, when it was clear that Trevize was approaching Gaia Planet very slowly, I judged there would be time enough for me to move toward you and hasten our meeting without being overtaken by events, especially since you would be more competent than I to follow him to the planet itself and to handle any emergency that might arise."

"Quite true. And the third reason?"

"Since our last communication, Speaker, something has happened that I did not expect and do not understand. I felt that—for that reason, too—I had better hasten our meeting as soon as I dared."

"And this event that you did not expect and do not understand?"

"Ships of the Foundation fleet are approaching the Sayshellian frontier. My computer has picked up this information from Sayshellian news broadcasts. At least five advanced ships are in the flotilla and these have enough power to overwhelm Sayshell."

Gendibal did not answer at once, for it would not do to show that he had not expected such a move—or that he didn't understand it. So, after a moment, he said negligently, "Do you suppose that this has something to do with Trevize's movement toward Gaia?"

"It certainly came immediately afterward—and if B follows A, then there is at least a possibility that A caused B," said Compor.

"Well then, it seems we all converge upon Gaia—Trevize, and I, and the First Foundation. —Come, you acted well, Compor," said Gendibal, "and here is what we will now do. First, you will show me how this computer works and, through that, how the ship may be handled. I am sure that will not take long.

"After that, you will get into my ship, since by then I will have impressed on your mind how to handle it. You will have no trouble maneuvering it, although I must tell you (as you have no doubt guessed from its appearance) that you will find it primitive indeed. Once you are in control of the ship, you will keep it here and wait for me."

"How long, Speaker?"

"Until I come for you. I do not expect to be gone long enough for you to be in danger of running out of supplies, but if I am unduly delayed, you may find your way to some inhabited planet of the Sayshell Union and wait there. Wherever you are, I will find you."

"As you say, Speaker."

"And do not be alarmed. I can handle this mysterious Gaia and, if need be, the five ships of the Foundation as well."

Littoral Thoobing had been the Foundation's Ambassador to Sayshell for seven years. He rather liked the position.

Tall and rather stout, he wore a thick brown mustache at a time when the predominant fashion, both in the Foundation and in Sayshell, was smooth-shaven. He had a strongly lined countenance, though he was only fifty-four—and was much given to a schooled indifference. His attitude toward his work was not easily seen.

Still, he rather liked the position. It kept him away from the hurly-burly of politics on Terminus—something he appreciated—and it gave him the chance to live the life of a Sayshellian sybarite and to support his wife and daughter in the style to which they had become addicted. He didn't want his life disturbed.

On the other hand, he rather disliked Liono Kodell, perhaps because Kodell also sported a mustache, though one which was smaller, shorter, and grayish-white. In the old days, they had been the only two people in prominent public life who had worn one and there had been rather a competition between them over the matter. Now (thought Thoobing) there was none; Kodell's was contemptible.

Kodell had been Director of Security when Thoobing was still on Terminus, dreaming of opposing Harla Branno in the race for Mayor, until he had been bought off with the ambassadorship. Branno had done it for her own sake, of course, but he had ended up owing her goodwill for that.

But not to Kodell, somehow. Perhaps it was because of Kodell's determined cheerfulness—the manner in which he was always such a friendly person—even after he had decided on just exactly the manner in which your throat was to be cut.

Now he sat there in hyperspatial image, cheerful as ever, brimming over with bonhomie. His actual body was, of course, back on Terminus, which spared Thoobing the necessity of offering him any physical sign of hospitality.

"Kodell," he said. "I want those ships withdrawn."

Kodell smiled sunnily. "Why, so do I, but the old lady has made up her mind."

"You've been known to persuade her out of this or that."

"On occasion. Perhaps. When she wanted to be persuaded. This time she doesn't want to be. —Thoobing, do your job. Keep Sayshell calm."

"I'm not thinking about Sayshell, Kodell. I'm thinking about the Foundation."

"So are we all."

"Kodell, don't fence. I want you to listen to me."

"Gladly, but these are hectic times on Terminus and I will not listen to you forever."

"I will be as brief as I can be—when discussing the possibility of the Foundation's destruction. If this hyperspatial line is not being tapped, I will speak openly."

"It is not being tapped."

"Then let me go on. I have received a message some days ago from one Golan Trevize. I recall a Trevize in my own political days, a Commissioner of Transportation."

"The young man's uncle," Kodell said.

"Ah, then you know the Trevize who sent the message to me. According to the information I have since gathered, he was a Councilman who, after the recent successful resolution of a Seldon Crisis, was arrested and sent into exile."

"Exactly."

"I don't believe it."

"What is it that you don't believe?"

"That he was sent into exile."

"Why not?"

"When in history has any citizen of the Foundation been sent into exile?" demanded Thoobing. "He is arrested or not arrested. If he is arrested, he is tried or not tried. If he is tried, he is convicted or not convicted. If he is convicted, he is fined, demoted, disgraced, imprisoned, or executed. No one is sent into exile."

"There is always a first time."

"Nonsense. In an advanced naval vessel? What fool can fail to see that he is on a special mission for your old woman? Whom can she possibly expect to deceive?"

"What would the mission be?"

"Supposedly to find the planet Gaia."

Some of the cheerfulness left Kodell's face. An unaccustomed hardness entered his eyes. He said, "I know that you feel no overwhelming impulse to believe my statements, Mr. Ambassador, but I make a special plea that you believe me in this one case. Neither the Mayor nor I had ever heard of Gaia at the time that Trevize was sent into exile. We have heard of Gaia, for the first time, just the other day. If you believe that, this conversation may continue."

"I will suspend my tendency toward skepticism long enough to accept that, Director, though it is difficult to do so."

"it is quite true, Mr. Ambassador, and if I have suddenly adopted a formal note to my statements it is because when this is done, you will find that you have questions to answer and that you will not find the occasion joyful. You speak as though Gaia is a world familiar to you. How is it that you know something we did not know? Is it not your duty to see to it that we know everything that you know about the political unit to which you are assigned?"

Thoobing said softly, "Gaia is not part of the Sayshell Union. It, in fact, probably does not exist. Am I to transmit to Terminus all the fairy tales that the superstitious lower orders of Sayshell tell of Gaia? Some of them say that Gaia is located in hyperspace. According to others, it is a world that supernaturally protects Sayshell. According to still others, it sent forth the Mule to prey on the Galaxy. If you are planning to tell the Sayshellian government that Trevize has been sent out to find Gaia and that five advanced ships of the Foundation Navy have been sent out to back him in this search, they will never believe you. The people may believe fairy tales about Gaia, but the government does not—and they will not be convinced that the Foundation does. They will feel that you intend to force Sayshell into the Foundation Federation."

"And what if we do plan that?"

"It would be fatal. Come, Kodell, in the five-century history of the Foundation, when have we fought a war of conquest? We have fought wars to prevent our own conquest—and failed once—but no war has ended with an extension of our territory. Accessions to the Federation have been through peaceful agreements. We have been joined by those who saw benefits in joining."

"Isn't it possible that Sayshell may see benefits in joining?"

"They will never do so while our ships remain on their borders. Withdraw them."

"It can't be done."

"Kodell, Sayshell is a marvelous advertisement for the benevolence of the Foundation Federation. It is nearly enclosed by our territory, it is in an utterly vulnerable position, and yet until now it has been safe, has gone its own way, has even been able to maintain an anti-Foundation foreign policy freely. How better can we show the Galaxy that we force no one, that we come in friendship to all? —If we take over Sayshell, we take that which, in essence, we already have. After all, we dominate it economically—if quietly. But if we take it over by military force, we advertise to all the Galaxy that we have become expansionist."

"And if I tell you that we are really interested only in Gaia?"

"Then I will believe it no more than the Sayshell Union will. This man, Trevize, sends me a message that he is on his way to Gaia and asks me to transmit it to Terminus. Against my better judgment, I do so because I must and, almost before the hyperspatial line is cool, the Foundation Navy is in motion. How will you get to Gaia, without penetrating Sayshellian space?"

"My dear Thoobing, surely you are not listening to yourself. Did you not tell me just a few minutes ago that Gaia, if it exists at all, is not part of the Sayshell Union? And I presume you know that hyperspace is free to all and is part of no world's territory. How then can Sayshell complain if we move from Foundation territory (where our ships stand right now), through hyperspace, into Gaian territory, and never in the process occupy a single cubic centimeter of Sayshellian territory?"

"Sayshell will not interpret events like that, Kodell. Gaia, if it exists at all, is totally enclosed by the Sayshell Union, even if it is not a political part of it, and there are precedents that make such enclaves virtual parts of the enclosing territory, as far as enemy warships are concerned."

"Ours are not enemy warships. We are at peace with Sayshell."

"I tell you that Sayshell may declare war. They won't expect to win such a war through military superiority, but the fact is, war will set off a wave of anti-Foundation activity throughout the Galaxy. The new expansionist policies of the Foundation will encourage the growth of alliances against us. Some of the members of the Federation will begin to rethink their ties to us. We may well lose the war through internal disarray and we will then certainly reverse the process of growth that has served the Foundation so well for five hundred years."

"Come, come, Thoobing," said Kodell indifferently, "You speak as though five hundred years is nothing, as though we are still the Foundation of Salvor Hardin's time, fighting the pocket-kingdom of Anacreon. We are far stronger now than the Galactic Empire ever was at its very height. A squadron of our ships could defeat the entire Galactic Navy, occupy any Galactic sector, and never know it had been in a fight."

"We are not fighting the Galactic Empire. We fight planets and sectors of our own time."

"Who have not advanced as we have. We could gather in all the Galaxy now."

"According to the Seldon Plan, we can't do that for another five hundred years."

"The Seldon Plan underestimates the speed of technological advance. We can do it now! —Understand me, I don't say we will do it now or even should do it now. I merely say we can do it now."

"Kodell, you have lived all your life on Terminus. You don't know the Galaxy. Our Navy and our technology can beat down the Armed Forces of other worlds, but we cannot yet govern an entire rebellions, hate-ridden Galaxy—and that is what it will be if we take it by force. Withdraw the ships!"

"It can't be done, Thoobing. Consider— What if Gaia is not a myth?"

Thoobing paused, scanning the other's face as though anxious to read his mind. "A world in hyperspace not a myth?"

"A world in hyperspace is superstition, but even superstitions may be built around kernels of truth. This man, Trevize, who was exiled, speaks of it as though it were a real world in real space. What if he is right?"

"Nonsense. I don't believe it."

"No? Believe it for just a moment. A real world that has lent Sayshell safety against the Mule and against the Foundation!"

"But you refute yourself. How is Gaia keeping the Sayshellians safe from the Foundation? Are we not sending ships against it?"

"Not against it, but against Gaia, which is so mysteriously unknown—which is so careful to avoid notice that while it is in real space it somehow convinces its neighbor worlds that it is in hyperspace—and which even manages to remain outside the computerized data of the best and most unabridged of Galactic maps."

"It must be a most unusual world, then, for it must be able to manipulate minds."

"And did you not say a moment ago that one Sayshellian tale is that Gaia sent forth the Mule to prey upon the Galaxy? And could not the Mule manipulate minds?"

"And is Gaia a world of Mules, then?"

"Are you sure it might not be?"

"Why not a world of a reborn Second Foundation, in that case."

"Why not indeed? Should it not be investigated?"

Thoobing grew sober. He had been smiling scornfully during the last exchanges, but now he lowered his head and stared up from under his eyebrows. "If you are serious, is such an investigation not dangerous?"

"Is it?"

"You answer my questions with other questions because you have no reasonable answers. Of what use will ships be against Mules or Second Foundationers? Is it not likely, in fact, that if they exist they are luring you into destruction? See here, you tell me that the Foundation can establish its Empire now, even though the Seldon Plan has reached only its midway point, and I have warned you that you would be racing too far ahead and that the intricacies of the Plan would slow you down by force. Perhaps, if Gaia exists and is what you say it is, all this is a device to bring about that slowdown. Do voluntarily now what you may soon be constrained to do. Do peacefully and without bloodshed now what you may be forced to do by woeful disaster. Withdraw the ships."

"It can't be done. In fact, Thoobing, Mayor Branno herself plans to join the ships, and scoutships have already flitted through hyperspace to what is supposedly Gaian territory."

Thoobing's eyes bulged. "There will surely be war, I tell you."

"You are our ambassador. Prevent that. Give the Sayshellians whatever assurances they need. Deny any ill will on our part. Tell them, if you have to, that it will pay them to sit quietly and wait for Gaia to destroy us. Say anything you want to, but keep them quiet."

He paused, searching Thoobing's stunned expression, and said, "Really, that's all. As far as I know, no Foundation ship will land on any world of the Sayshell Union or penetrate any point in real space that is part of that Union. However, any Sayshellian ship that attempts to challenge us outside Union territory—and therefore inside Foundation territory—will promptly be reduced to dust. Make that perfectly clear, too, and keep the Sayshellians quiet. You will be held to strict account if you fail. You have had an easy job

so far, Thoobing, but hard times are upon you and the next few weeks decide all. Fail us and no place in the Galaxy will be safe for you."

There was neither merriment nor friendliness in Kodell's face as contact was broken and as his image disappeared.

Thoobing stared open-mouthed at the place where he had been.

Golan Trevize clutched at his hair as though he were trying, by feel, to judge the condition of his thinking. He said to Pelorat abruptly, "What is your state of mind?"

"State of mind?" said Pelorat blankly.

"Yes. Here we are, trapped—with our ship under outside control and being drawn inexorably to a world we know nothing about. Do you feel panic?"

Pelorat's long face registered a certain melancholia. "No," he said.

"I don't feel joyful. I do feel a little apprehensive, but I'm not panicky."

"Neither am I. Isn't that odd? Why aren't we more upset than we are?"

"This is something we expected, Golan. Something like this."

Trevize turned to the screen. It remained firmly focused on the space station. It was larger now, which meant they were closer.

It seemed to him that it was not an impressive space station in design. There was nothing to it that bespoke superscience. In fact, it seemed a bit primitive. —Yet it had the ship in its grip.

He said, "I'm being very analytical, Janov. Cool! —I like to think that I am not a coward and that I can behave well under pressure, but I tend to flatter myself. Everyone does. I should be jumping up and down right now and sweating a little. We may have expected something, but that doesn't change the fact that we are helpless and that we may be killed."

Pelorat said, "I don't think so, Golan. If the Gaians could take over the ship at a distance, couldn't they kill us at a distance? If we're still alive—"

"But we're not altogether untouched. We're too calm, I tell you. I think they've tranquilized us."

"Why?"

"To keep us in good shape mentally, I think. It's possible they wish to question us. After that, they may kill us."

"If they are rational enough to want to question us, they may be rational enough not to kill us for no good reason."

Trevize leaned back in his chair (it bent back at least—they hadn't deprived the chair of its functioning) and placed his feet on the desk where ordinarily his hands made contact with the computer. He said, "They may be quite ingenious enough to work up what they consider a good reason. —Still, if they've touched our minds, it hasn't been by much. If it were the Mule, for instance, he would have made us eager to go—exalted, exultant, every fiber of ourselves crying out for arrival there." He pointed to the space station. "Do you feel that way, Janov?"

"Certainly not."

"You see that I'm still in a state where I can indulge in cool, analytical reasoning. Very odd! Or can I tell? Am I in a panic, incoherent, mad—and merely under the illusion that I am indulging in cool, analytical reasoning?"

Pelorat shrugged. "You seem sane to me. Perhaps I am as insane as you and am under the same illusion, but that sort of argument gets us nowhere. All humanity could share a common insanity and be immersed in a common illusion while living in a common chaos. That can't be disproved, but we have no choice but to follow our senses." And then, abruptly, he said, "In fact, I've been doing some reasoning myself."

"Yes?"

"Well, we talk about Gaia as a world of Mules, possibly, or as the Second Foundation reborn. Has it occurred to you that a third alternative exists, one that is more reasonable than either of the first two."

"What third alternative?"

Pelorat's eyes seemed concentrating inward. He did not look at Trevize and his voice was low and thoughtful. "We have a world— Gaia—that has done its best, over an indefinite period of time, to maintain a strict isolation. It has in no way attempted to establish contact with any other world—not even the nearby worlds of the Sayshell Union. It has an advanced science, in some ways, if the stories of their destruction of fleets is true and certainly their ability to control us right now bespeaks it—and yet they have made no attempt to expand their power. They ask only to be left alone."

Trevize narrowed his eyes. "So?"

"It's all very inhuman. The more than twenty thousand years of human history in space has been an uninterrupted tale of expansion and attempted expansion. Just about every known world that can be inhabited is inhabited. Nearly every world has been quarreled over in the process and nearly every world has jostled each of its neighbors at one time or another. If Gaia is so inhuman as to be so different in this respect, it may be because it really is—inhuman."

Trevize shook his head. "Impossible."

"Why impossible?" said Pelorat warmly. "I've told you what a puzzle it is that the human race is the only evolved intelligence in the Galaxy. What if it isn't? Might there not be one more—on one planet—that lacked the human expansionist drive? In fact," Pelorat grew more excited, "what if there are a million intelligences in the Galaxy, but only one that is expansionist—ourselves? The others would all remain at home, unobtrusive, hidden—"

"Ridiculous!" said Trevize. "We'd come across them. We'd land on their worlds. They would come in all types and stages of technology and most of them would be unable to stop us. But we've never come across any of them. Space! We've never even come across the ruins or relics of a nonhuman civilization, have we? You're the historian, so you tell me. Have we?"

Pelorat shook his head. "We haven't. —But Golan, there could be one! This one!"

"I don't believe it. You say the name is Gaia, which is some ancient dialectical version of the name 'Earth.' How can that be nonhuman?"

"The name 'Gaia' is given the planet by human beings—and who knows why? The resemblance to an ancient word might be coincidental. —Come to think of it, the very fact that we've been lured to Gaia—as you explained in great detail some time ago—and are now being drawn in against our will is an argument in favor of the nonhumanity of the Gaians."

"Why? What has that to do with nonhumanity?"

"They're curious about us—about humans."

Trevize said, "Janov, you're mad. They've been living in a Galaxy surrounded by humans for thousands of years. Why should they be curious right now? Why not long before? And if right now, why us? If they want to study human beings and human culture, why not the Sayshell worlds? Why would they reach all the way to Terminus for us?"

"They may be interested in the Foundation."

"Nonsense," said Trevize violently. "Janov, you want a nonhuman intelligence and you will have one. Right now, I think that if you thought you were going to encounter nonhumans, you wouldn't worry about having been captured, about being helpless, about being killed even—if they but gave you a little time to sate your curiosity."

Pelorat began to stutter an indignant negative, then stopped, drew a deep breath, and said, "Well, you may be right, Golan, but I'll hold to my belief for a while just the same. I don't think we'll have to wait very long to see who's right. —Look!"

He pointed to the screen. Trevize—who had, in his excitement, ceased watching—now looked back. "What is it?" he said.

"Isn't that a ship taking off from the station?"

"It's something," admitted Trevize reluctantly. "I can't make out the details yet and I can't magnify the view any further. It's at maximum magnification." After awhile he said, "It seems to be approaching us and I suppose it's a ship. Shall we make a bet?"

"What sort of bet?"

Trevize said sardonically, "If we ever get back to Terminus, let's have a big dinner for ourselves and any guests we each care to invite, up to, say, four—and it will be on me if that ship approaching us carries nonhumans and on you if it carries humans."

"I'm willing," said Pelorat.

"Done, then," and Trevize peered at the screen, trying to make out details and wondering if any details could reasonably be expected to give away, beyond question, the nonhumanity (or humanity) of the beings on board.

Branno's iron-gray hair lay immaculately in place and she might have been in the Mayoral Palace, considering her equanimity. She showed no sign that she was deep in space for only the second time in her life. (And the first time—when she accompanied her parents on a holiday tour to Kalgan—could scarcely count. She had been only three at the time.)

She said to Kodell with a certain weary heaviness, "It is Thoobing's job, after all, to express his opinion and to warn me. Very well, he has warned me. I don't hold it against him."

Kodell, who had boarded the Mayor's ship in order to speak to her without the psychological difficulty of imaging, said, "He's been at his post too long. He's beginning to think like a Sayshellian."

"That's the occupational hazard of an ambassadorship, Liono. Let us wait till this is over and we'll give him a long sabbatical and then send him on to another assignment elsewhere. He's a capable man.

—After all, he did have the wit to forward Trevize's message without delay."

Kodell smiled briefly. "Yes, he told me he did it against his better judgment. 'I do so because I must' he said. You see, Madam Mayor, he had to, even against his better judgment, because as soon as Trevize entered the space of the Sayshell Union, I informed Ambassador Thoobing to forward, at once, any and all information concerning him?'

"Oh?" Mayor Branno turned in her seat to see his face more clearly. "And what made you do that?"

"Elementary considerations, actually. Trevize was using a latemodel Foundation naval vessel and the Sayshellians would be bound to notice that. He's an undiplomatic young jackass and they would be bound to notice that. Therefore, he might get into trouble—and if there's one thing a Founder knows, it is that if he gets into trouble anywhere in the Galaxy, he can cry out for the nearest Foundation representative. Personally I wouldn't mind seeing Trevize in trouble—it might help him grow up and that would do him a great deal of good—but you've sent him out as your lightning rod and I wanted you to be able to estimate the nature of any lightning that might strike, so I made sure that the nearest Foundation representative would keep watch over him, that's all."

"I see! Well, I understand now why Thoobing reacted so strenuously. I had sent him a similar warning. Since he heard from us both independently, one can scarcely blame him for thinking that the approach of a few Foundation vessels might mean a great deal more than it actually does. —How is it, Liono, you did not consult me on the matter before sending the warning?"

Kodell said coolly, "If I involved you in everything I do, you would have no time to be Mayor. How is it that you did not inform me of your intention?"

Branno said sourly, "If I informed you of all my intentions, Liono, you would know far too much. —But it is a small matter, and so is Thoobing's alarm, and, for that matter, so is any fit that the Sayshellians throw. I am more interested in Trevize."

"Our scouts have located Compor. He is following Trevize and both are moving very cautiously toward Gaia."

"I have the full reports of those scouts, Liono. Apparently both Trevize and Compor are taking Gaia seriously."

"Everyone sneers at the superstitions concerning Gaia, Madam Mayor, but everyone thinks, 'Yet what if—' Even Ambassador Thoobing manages to be a little uneasy about it. It could be a very shrewd policy on the part of the Sayshellians. A kind of protective coloration. If one spreads stories of a mysterious and invincible world, people will shy away not only from the world, but from any other worlds close by—such as the Sayshell Union."

"You think that is why the Mule turned away from Sayshell?"

"Possibly."

"Surely you don't think the Foundation has held its hand from Sayshell because of Gaia, when there is no record that we have ever heard of the world?"

"I admit there's no mention of Gaia in our archives, but neither is there any other reasonable explanation for our moderation with respect to the Sayshell Union."

"Let us hope, then, that the Sayshellian government, despite Thoobing's opinion to the contrary, has convinced itself—even just a little bit-of Gaia's might and of its deadly nature."

"Why so?"

"Because then the Sayshell Union will raise no objections to our moving toward Gaia. The more they resent that movement, the more they will persuade themselves that it should be permitted so that Gaia will swallow us. The lesson, they will imagine, will be a salutary one and will not be lost on future invaders."

"Yet what if they should be right in such a belief, Mayor? What if Gaia is deadly?"

Branno smiled. "You raise the 'Yet what if—' yourself, do you, Liono?"

"I must raise all possibilities, Mayor. It is my job."

"If Gaia is deadly, Trevize will be taken by them. That is his job as my lightning rod. And so may Comporg, I hope."

"You hope? Why?"

"Because it will make them overconfident, which should be useful to us. They will underestimate our power and be the easier to handle."

"But what if it is we who are overconfident?"

"We are not," said Branno flatly.

"These Gaians—whatever they are—may be something we have no concept of and cannot properly estimate the danger of. I merely suggest that, Mayor, because even that possibility should be weighed."

"Indeed? Why does such a notion fall into your head, Liono?"

"Because I think you feel that, at the worst, Gaia is the Second Foundation. I suspect you think they are the Second Foundation. However, Sayshell has an interesting history, even under the Empire. Sayshell alone had a measure of self-rule. Sayshell alone was spared some of the worst taxations under the so-called 'Bad Emperors.' In short, Sayshell seems to have had the protection of Gaia, even in Imperial times."

"Well then?"

"But the Second Foundation was brought into existence by Hari Seldon at the same time our Foundation was. The Second Foundation did not exist in Imperial times—and Gaia did. Gaia, therefore, is not the Second Foundation. It is something else—and, just possibly, something worse."

"I don't propose to be terrified by the unknown, Liono. There are only two possible sources of danger—physical weapons and mental weapons—and we are fully prepared for both. —You get back to your ship and keep the units on the Sayshellian outskirts. This ship will move toward Gaia alone, but will stay in contact with you at all times and will

expect you to come to us in one Jump, if necessary. —Go, Liono, and get that perturbed look off your face."

"One last question? Are you sure you know what you're doing?"

"I do," she said grimly. "I, too, have studied the history of Sayshell and have seen that Gaia cannot be the Second Foundation, but, as I told you, I have the full report of the scouts and from that—"

"Yes?"

"Well, I know where the Second Foundation is located and we will take care of both, Liono. We will take care of Gaia first and then Trantor."

17. GAIA

IT TOOK HOURS FOR THE SKIP FROM THE SPACE STATION TO REACH THE vicinity of the Far Star—very long hours for Trevize to endure.

Had the situation been normal, Trevize would have tried to signal and would have expected a response. If there had been no response, he would have taken evasive action.

Since he was unarmed and there had been no response, there was nothing to do but wait. The computer would not respond to any direction he could give it that involved anything outside the ship.

Internally, at least, everything worked well. The life-support systems were in perfect order, so that he and Pelorat were physically comfortable. Somehow, that didn't help. Life dragged on and the uncertainty of what was to come was wearing him down. He noticed with irritation that Pelorat seemed calm. As though to make it worse, while Trevize felt no sense of hunger at all, Pelorat opened a small container of chicken-bits, which on opening had rapidly and automatically warmed itself. Now he was eating it methodically.

Trevize said irritably, "Space, Janov! That stinks!"

Pelorat looked startled and sniffed at the container. "It smells all right to me, Golan."

Trevize shook his head. "Don't mind me. I'm just upset. But do use a fork. Your fingers will smell of chicken all day."

Pelorat looked at his fingers with surprise. "Sorry! I didn't notice. I was thinking of something else."

Trevize said sarcastically, "Would you care to guess at what type of nonhumans the creatures on the approaching ship must be?" He was ashamed that he was less calm than Pelorat was. He was a Navy veteran (though he had never seen battle, of course) and Pelorat was a historian. Yet his companion sat there quietly.

Pelorat said, "It would be impossible to imagine what direction evolution would take under conditions differing from those of Earth. The possibilities may not be infinite, but they would be so vast that they might as well be. However, I can predict that they are not senselessly violent and they will treat us in a civilized fashion. If that wasn't true, we would be dead by now."

"At least you can still reason, Janov, my friend—you can still be tranquil. My nerves seem to be forcing their way through whatever tranquilization they have put us under. I have an extraordinary desire to stand up and pace. Why doesn't that blasted ship arrive?"

Pelorat said, "I am a man of passivity, Golan. I have spent my life doubled over records while waiting for other records to arrive. I do nothing but wait. You are a man of action and you are in deep pain when action is impossible."

Trevize felt some of his tension leave. He muttered, "I underestimate your good sense, Janov."

"No, you don't," said Pelorat placidly, "but even a naïve academic can sometimes make sense out of life."

"And even the cleverest politician can sometimes fail to do so."

"I didn't say that, Golan." -

"No, but I did. —So let me become active. I can still observe. The approaching ship is close enough to seem distinctly primitive."

"Seem?"

Trevize said, "If it's the product of nonhuman minds and hands, what may seem primitive may, in actual fact, be merely nonhuman."

"Do you think it might be a nonhuman artifact?" asked Pelorat, his face reddening slightly.

"I can't tell. I suspect that artifacts, however much they may vary from culture to culture, are never quite as plastic as products of genetic differences might be."

"That's just a guess on your part. All we know are different cultures. We don't know different intelligent species and therefore have no way of judging how different artifacts might be."

"Fish, dolphins, penguins, squids, even the ambiflexes, which are not of Earthly origin—assuming the others are—all solve the problem of motion through a viscous medium by streamlining, so that their appearances are not as different as their genetic makeup might lead one to believe. It might be so with artifacts."

"The squid's tentacles and the ambiflex's helical vibrators," responded Pelorat, "are enormously different from each other, and from the fins, flippers, and limbs of vertebrates. It might be so with artifacts."

"In any case," said Trevize, "I feel better. Talking nonsense with you, Janov, quiets my nerves. And I suspect we'll know what we're getting into soon, too. The ship is not going to be able to dock with ours and whatever is on it will come across on an old-fashioned tether—or we will somehow be urged to cross to it on one—since the unlock will be useless. —Unless some nonhuman will use some other system altogether."

"How big is the ship?"

"Without being able to use the ship's computer to calculate the distance of the ship by radar, we can't possibly know the size."

A tether snaked out toward the Far Star.

Trevize said, "Either there's a human aboard or nonhumans use the same device. Perhaps nothing but a tether can possibly work."

"They might use a tube," said Pelorat, "or a horizontal ladder."

"Those are inflexible things. It would be far too complicated to try to make contact with those. You need something that combines strength and flexibility."

The tether made a dull clang on the Far Star as the solid hull (and consequently the air within) was set to vibrating. There was the usual slithering as the other ship made the fine adjustments of speed required to bring the two into a common velocity. The tether was motionless relative to both.

A black dot appeared on the hull of the other ship and expanded like the pupil of an eye.

Trevize grunted. "An expanding diaphragm, instead of a sliding panel."

"Nonhuman?"

"Not necessarily, I suppose. But interesting."

A figure emerged.

Pelorat's lips tightened for a moment and then he said in a disappointed voice, "Too bad. Human."

"Not necessarily," said Trevize calmly. "All we can make out is that there seem to be five projections. That could be a head, two arms, and two legs—but it might not be. —Wait!"

"What?"

"It moves more rapidly and smoothly than I expected. —Ah!"

"What?"

"There's some sort of propulsion. It's not rocketry, as nearly as I can tell, but neither is it hand over hand. Still, not necessarily human."

There seemed an incredibly long wait despite the quick approach of the figure along the tether, but there was finally the noise of contact.

Trevize said, "It's coming in, whatever it is. My impulse is to tackle it the minute it appears." He balled a fist.

"I think we had better relax," said Pelorat. "It may be stronger than we. It can control our minds. There are surely others on the ship. We had better wait till we know more about what we are facing."

"You grow more and more sensible by the minute, Janov," said Trevize, "and I, less and less."

They could hear the airlock moving into action and finally the figure appeared inside the ship.

"About normal size," muttered Pelorat. "The space suit could fit a human being."

"I never saw or heard of such a design, but it doesn't fall outside the limits of human manufacture, it seems to me. —It doesn't say anything."

The space-suited figure stood before them and a forelimb rose to the rounded helmet, which—if it were made of glass—possessed oneway transparency only. Nothing could be seen inside.

The limb touched something with a quick motion that Trevize did not clearly make out and the helmet was at once detached from the rest of the suit. It lifted off.

What was exposed was the face of a young and undeniably pretty woman.

Pelorat's expressionless face did what it could to look stupefied. He said hesitantly, "Are you human?"

The woman's eyebrows shot up and her lips pouted. There was no way of telling from the action whether she was faced with a strange language and did not understand or whether she understood and wondered at the question.

Her hand moved quickly to the left side of her suit, which opened in one piece as though it were on a set of hinges. She stepped out and the suit remained standing without content for a moment. Then, with a soft sigh that seemed almost human, it collapsed.

She looked even younger, now that she had stepped out. Her clothing was loose and translucent, with the skimpy items beneath visible as shadows. The outer robe reached to her knees.

She was small-breasted and narrow-waisted, with hips rounded and full. Her thighs, which were seen in shadow, were generous, but her legs narrowed to graceful ankles. Her hair was dark and shoulderlength, her eyes brown and large, her lips full and slightly asymmetric.

She looked down at herself and then solved the problem of her understanding of the language by saying, "Don't I look human?"

She spoke Galactic Standard with just a trifle of hesitation, as though she were straining a bit to get the pronunciation quite right.

Pelorat nodded and said with a small smile, "I can't deny it. Quite human. Delightfully human."

The young woman spread her arms as though inviting closer examination. "I should hope so, gentleman. Men have died for this body."

"I would rather live for it," said Pelorat, finding a vein of gallantry which faintly surprised him.

"Good choice," said the woman solemnly. "Once this body is attained, all sighs become sighs of ecstasy."

She laughed and Pelorat laughed with her.

Trevize, whose forehead had puckered into a frown through this exchange, rapped out, "How old are you?"

The woman seemed to shrink a little. "Twenty-three— gentleman."

"Why have you come? What is your purpose here?"

"I have come to escort you to Gaia." Her command of Galactic Standard was slipping slightly and her vowels tended to round into diphthongs. She made "come" sound like "comb" and "Gaia" like "Gay-uh."

"A girl to escort us."

The woman drew herself up and suddenly she had the bearing of one in charge. "I," she said, "am Gaia, as well as another. It was my stint on the station."

"Your stint? Were you the only one on board?"

Proudly. "I was all that was needed."

"And is it empty now?"

"I am no longer on it, gentleman, but it is not empty. It is there."

"It? To what do you refer?"

"To the station. It is Gaia. It doesn't need me. It holds your ship."

"Then what are you doing on the station?"

"It is my stint."

Pelorat had taken Trevize by the sleeve and had been shaken off. He tried again. "Golan," he said in an urgent half-whisper. "Don't shout at her. She's only a girl. Let me deal with this."

Trevize shook his head angrily, but Pelorat said, "Young woman, what is your name?"

The woman smiled with sudden sunniness, as though responding to the softer tone. She said, "Bliss."

"Bliss?" said Pelorat. "A very nice name. Surely that's not all there is."

"Of course not. A fine thing it would be to have one syllable. It would be duplicated on every section and we wouldn't tell one from another, so that the men would be dying for the wrong body. Bussenobiarella is my name in full."

"Now that's a mouthful."-

"What? Seven syllables? That's not much. I have friends with fifteen syllables in their names and they never get done trying combinations for the friend-name. I've stuck with Bliss now ever since I turned fifteen. My mother called me 'Nobby,' if you can imagine such a thing."

"In Galactic Standard, 'bliss' means 'ecstasy' or 'extreme happiness,'" said Pelorat.

"In Gaian language, too. It's not very different from Standard, and 'ecstasy' is the impression I intend to convey."

"My name is Janov Pelorat."

"I know that. And this other gentleman—the shouter—is Golan Trevize. We received word from Sayshell."

Trevize said at once, his eyes narrow, "How did you receive word?"

Bliss turned to look at him and said calmly, "I didn't. Gaia did."

Pelorat said, "Miss Bliss, may my partner and myself speak Privately for a moment?"

"Yes, certainly, but we have to get on with it, you know."

"I won't take long." He pulled hard at Trevize's elbow and was reluctantly followed into the other room.

Trevize said in a whisper, "What's all this? I'm sure she can hear us in here. She can probably read our minds, blast the creature."

"Whether she can or can't, we need a bit of psychological isolation for just a moment. Look, old chap, leave her alone. There's nothing we can do, and there's no use taking that out on her. There's probably nothing she can do either. She's just a messenger girl. Actually, as long as she's on board, we're probably safe; they wouldn't have put her on board if they intended to destroy the ship. Keep bullying and perhaps they will destroy it—and us—after they take her off."

"I don't like being helpless," said Trevize grumpily.

"Who does? But acting like a bully doesn't make you less helpless. It just makes you a helpless bully. Oh, my dear chap, I don't mean to be bullying you like this and you must forgive me if I'm excessively critical of you, but the girl is not to be blamed."

"Janov, she's young enough to be your youngest daughter."

Pelorat straightened. "All the more reason to treat her gently. Nor do I know what you imply by the statement."

Trevize thought a moment, then his face cleared. "Very well. You're right. I'm wrong. It is irritating, though, to have them send a girl. They might have sent a military officer, for instance, and given us a sense of some value, so to speak. Just a girl? And she keeps placing responsibility on Gaia?"

"She's probably referring to a ruler who takes the name of the planet as an honorific—or else she's referring to the planetary council. We'll find out, but probably not by direct questioning."

"Men have died for her body!" said Trevize. "Huh! —She's bottom-heavy!"

"No one is asking you to die for it, Golan," said Pelorat gently. "Come! Allow her a sense of self-mockery. I consider it amusing and good-natured, myself."

They found Bliss at the computer, bending down and staring at its component parts with her hands behind her back as though she feared touching it.

She looked up as they entered, ducking their heads under the low lintel. "This is an amazing ship," she said. "I don't understand half of what I see, but if you're going to give me a greeting-present, this is it. It's beautiful. It makes my ship look awful."

Her face took on a look of ardent curiosity. "Are you really from the Foundation?"

"How do you know about the Foundation?" asked Pelorat.

"We learn about it in school. Mostly because of the Mule."

"Why because of the Mule, Bliss?"

"He's one of us, gentle— What syllable of your name may I use, gentleman?"

Pelorat said, "Either Jan or Pel. Which do you prefer?"

"He's one of us, Pel," said Bliss with a comradely smile. "He was born on Gaia, but no one seems to know where exactly."

Trevize said, "I imagine he's a Gaian hero, Bliss, eh?" He had become determinedly, almost aggressively, friendly and cast a placating glance in Pelorat's direction. "Call me Trev," he added.

"Oh no," she said at once. "He's a criminal. He left Gaia without permission, and no one should do that. No one knows how he did it. But he left, and I guess that's why he came to a bad end. The Foundation beat him in the end."

"The Second Foundation?" said Trevize.

"Is there more than one? I suppose if I thought about it I would know, but I'm not interested in history, really. The way I look at it is, I'm interested in what Gaia thinks best. If history just goes past me, it's because there are enough historians or that I'm not well adapted to it. I'm probably being trained as a space technician myself. I keep being assigned to stints like this and I seem to like it and it stands to reason I wouldn't like it if—"

She was speaking rapidly, almost breathlessly, and Trevize had to make an effort to insert a sentence. "Who's Gaia?"

Bliss looked puzzled at that. "Just Gaia. —Please, Pel and Trev, let's get on with it. We've got to get to the surface."

"We're going there, aren't we?"

"Yes, but slowly. Gaia feels you can move much more rapidly if you use the potential of your ship. Would you do that?"

"We could," said Trevize grimly. "But if I get the control of the ship back, wouldn't I be more likely to zoom off in the opposite direction?"

Bliss laughed. "You're funny. Of course, you can't go in any direction Gaia doesn't want you to go. But you can go faster in the direction Gaia does want you to go. See?"

"We see," said Trevize, "and I'll try to control my sense of humor. Where do I land on the surface?"

"It doesn't matter. You just head downward and you'll land at the right place. Gain will see to that."

Pelorat said, "And will you stay with us, Bliss, and see that we are treated well?"

"I suppose I can do that. Let's see now, the usual fee for my services—I mean that kind of services—can be entered on my balancecard."

"And the other kind of services?"

Bliss giggled. "You're a nice old man." Pelorat winced.

Bliss reacted to the swoop down to Gaia with a naïve excitement. She said, "There's no feeling of acceleration."

"It's a gravitic drive," said Pelorat. "Everything accelerates together, ourselves included, so we don't feel anything."

"But how does it work, Pel?"

Pelorat shrugged. "I think Trev knows," he said, "but I don't think he's really in a mood to talk about it."

Trevize had dropped down Gaia's gravity-well almost recklessly. The ship responded to his direction, as Bliss had warned him, in a partial manner. An attempt to cross the lines of gravitic force obliquely was accepted—but only with a certain hesitation. An attempt to rise upward was utterly ignored.

The ship was still not his.

Pelorat said mildly, "Aren't you going downward rather rapidly, Golan?"

Trevize, with a kind of flatness to his voice, attempting to avoid anger (more for Pelorat's sake, than anything else) said, "The young lady says that Gaia will take care of us."

Bliss said, "Surely, Pel. Gaia wouldn't let this ship do anything that wasn't safe. Is there anything to eat on board?"

"Yes indeed," said Pelorat. "What would you like?"

"No meat, Pel," said Bliss in a businesslike way, "but I'll take fish or eggs, along with any vegetables you might have."

"Some of the food we have is Sayshellian, Bliss," said Pelorat. "I'm not sure I know what's in it, but you might like it."

"Well, I'll taste some," said Bliss dubiously.

"Are the people on Gaia vegetarian?" asked Pelorat.

"A lot are." Bliss nodded her head vigorously. "It depends on what nutrients the body needs in particular cases. Lately I haven't been hungry for meat, so I suppose I don't need any. And I haven't been aching for anything sweet. Cheese tastes good, and shrimp. I think I probably need to lose weight." She slapped her right buttock with a resounding noise. "I need to lose five or six pounds right here."

"I don't see why," said Pelorat. "It gives you something comfortable to sit on."

Bliss twisted to look down at her rear as best she might. "Oh well, it doesn't matter. Weight goes up or down as it ought. I shouldn't concern myself."

Trevize was silent because he was struggling with the Far Star. He had hesitated a bit too long for orbit and the lower limits of the planetary exosphere were now screaming past the ship. Little by little, the ship was escaping from his control altogether. It was as though something else had learned to handle the gravitic engines. The Far Star, acting apparently by itself, curved upward into thinner air and slowed rapidly. It then took up a path on its own that brought it into a gentle downward curve.

Bliss had ignored the edgy sound of air resistance and sniffed delicately at the steam rising from the container. She said, "It must be all right, Pd, because if it weren't, it wouldn't smell right and I wouldn't want to eat it." She put a slim finger into it and then licked at the finger. "You guessed correctly, Pd. It's shrimp or something like it. Good!"

With a gesture of dissatisfaction, Trevize abandoned the computer.

"Young woman," he said, as though seeing her for the first time.

"My name is Bliss," said Bliss firmly.

"Bliss, then! You knew our names."

"Yes, Trev."

"How did you know them?"

"It was important that I know them, in order for me to do my job. So I knew them."

"Do you know who Munn Li Compdor is?"

"I would—if it were important for me to know who he is. Since I do not know who he is, Mr. Compdor is not coming here. For that matter," she paused a moment, "no one is coming here but you two."

"We'll see."

He was looking down. It was a cloudy planet. There wasn't a solid layer of cloud, but it was a broken layer that was remarkably evenly scattered and offered no clear view of any part of the planetary surface.

He switched to microwave and the radarscope glittered. The surface was almost an image of the sky. It seemed a world of islands—rather like Terminus, but more so. None of the islands was very large and none was very isolated. It was something of an approach to a planetary archipelago. The ship's orbit was well inclined to the equatorial plane, but he saw no sign of ice caps.

Neither were there the unmistakable marks of uneven population distribution, as would be expected, for instance, in the illumination of the night side.

"Will I be coming down near the capital city, Bliss?" asked Trevize.

Bliss said indifferently, "Gaia will put you down somewhere convenient."

"I'd prefer a big city."

"Do you mean a large people-grouping?"

"Yes."

"It's up to Gaia."

The ship continued its downward path and Trevize tried to find amusement in guessing on which island it would land.

Whichever it might be, it appeared they would be landing within the hour.

The ship landed in a quiet, almost feathery manner, without a moment of jarring, without one anomalous gravitational effect. They stepped out, one by one: first Bliss, then Pelorat, and finally Trevize.

The weather was comparable to early summer at Terminus City. There was a mild breeze and with what seemed to be a late-morning sun shining brightly down from a mottled sky. The ground was green underfoot and in one direction there were the serried rows of trees that bespoke an orchard, while in the other there was the distant line of seashore.

There was the low hum of what might have been insect life, a flash of bird—or some small flying creature—above and to one side, and the clack-clack of what might have been some farm instrument.

Pelorat was the first to speak and he mentioned nothing he either saw or heard. Instead, he drew in his breath raspily and said, "Ah, it smells good, like fresh-made applesauce."

Trevize said, "That's probably an apple orchard we're looking at and, for all we know, they're making applesauce."

"On your ship, on the other hand," said Bliss, "it smelled like— Well, it smelled terrible."

"You didn't complain when you were on it," growled Trevize.

"I had to be polite. I was a guest on your ship."

"What's wrong with staying polite?"

"I'm on my own world now. You're the guest. You be polite."

Pelorat said, "She's probably right about the smell, Golan. Is there any way of airing out the ship?"

"Yes," said Trevize with a snap. "It can be done—if this little creature can assure us that the ship will not be disturbed. She has already shown us she can exert unusual power over the ship."

Bliss drew herself up to her full height. "I'm not exactly little and if leaving your ship alone is what it takes to get it cleaned up, I assure you leaving it alone will be a pleasure."

"And then can we be taken to whoever it is that you speak of as Gaia?" said Trevize.

Bliss looked amused. "I don't know if you're going to believe this, Trev. I'm Gaia."

Trevize stared. He had often heard the phrase "collect one's thoughts" used metaphorically. For the first time in his life, he felt as though he were engaged in the process literally. Finally he said, "You?"

"Yes. And the ground. And those trees. And that rabbit over there in the grass. And the man you can see through the trees. The whole planet and everything on it is Gaia. We're all individuals—we're all separate organisms—but we all share an overall consciousness. The inanimate planet does so least of all, the various forms of life to a varying degree, and human beings most of all—but we all share."

Pelorat said, "I think, Trevize, that she means Gaia is some sort of group consciousness."

Trevize nodded. "I gathered that. —In that case, Bliss, who runs this world?"

Bliss said, "It runs itself. Those trees grow in rank and file of their own accord. They multiply only to the extent that is needed to replace those that for any reason die. Human beings harvest the apples that are needed; other animals, including insects, eat their share— and only their share."

"The insects know what their share is, do they?" said Trevize.

"Yes, they do—in a way. It rains when it is necessary and occasionally it rains rather hard when that is necessary—and occasionally there's a siege of dry weather when that is necessary."

"And the rain knows what to do, does it?"

"Yes, it does," said Bliss very seriously. "In your own body, don't all the different cells know what to do? When to grow and when to stop growing? When to form certain substances and when not to— and when they form them, just how much to form, neither more nor less? Each cell is, to a certain extent, an independent chemical factory, but all draw from a common fund of raw materials brought to it by a common transportation system, all deliver wastes into common channels, and all contribute to an overall group consciousness."

Pelorat said with a certain enthusiasm, "But that's remarkable. You are saying that the planet is a superorganism and that you are a cell of that superorganism."

"I'm making an analogy, not an identity. We are the analog of cells, but we are not identical with cells—do you understand?"

"In what way," said Trevize, "are you not cells?"

"We are ourselves made up of cells and have a group consciousness, as far as cells are concerned. This group consciousness, this consciousness of an individual organism—a human being, in my case—"

"With a body men die for."

"Exactly. My consciousness is far advanced beyond that of any individual cell—incredibly far advanced. The fact that we, in turn, are part of a still greater group consciousness on a higher level does not reduce us to the level of cells. I remain a human being—but above us is a group consciousness as far beyond my grasp as my consciousness is beyond that of one of the muscle cells of my biceps."

Trevize said, "Surely someone ordered our ship to be taken."

"No, not someone! Gaia ordered it. All of us ordered it."

"The trees and the ground, too, Bliss?"

"They contributed very little, but they contributed. Look, if a musician writes a symphony, do you ask which particular cell in his body ordered the symphony written and supervised its construction?"

Pelorat said, "And, I take it, the group mind, so to speak, of the group consciousness is much stronger than an individual mind, just as a muscle is much stronger than an individual muscle cell. Consequently Gaia can capture our ship at a distance by controlling our computer, even though no individual mind on the planet could have done so."

"You understand perfectly, Pel," said Bliss.

"And I understand it, too," said Trevize. "It is not that hard to understand. But what do you want of us? We have not come to attack you. We have come seeking information. Why have you seized us?"

"To talk to you."

"You might have talked to us on the ship."

Bliss shook her head gravely, "I am not the one to do it."

"Aren't you part of the group mind?"

"Yes, but I cannot fly like a bird, buzz like an insect, or grow as tall as a tree. I do what it is best for me to do and it is not best that I give you the information—though the knowledge could easily be assigned to me."

"Who decided not to assign it to you?"

"We all did."

"Who will give us the information?"

"And who is Dom?"

"Well," said Bliss. "His full name is Endomandiovizamarondeyaso—and so on. Different people call him different syllables at different times, but I know him as Dom and I think you two will use that syllable as well. He probably has a larger share of Gaia than anyone on the planet and he lives on this island. He asked to see you and it was allowed."

"Who allowed it?" asked Trevize—and answered himself at once, "Yes, I know; you all did."

Bliss nodded.

Pelorat said, "When will we be seeing Dom, Bliss?"

"Right away. If you follow me, I'll take you to him now, Pel. And you, too, of course, Trev."

"And will you leave, then?" asked Pelorat.

"You don't want me to, Pel?"

"Actually, no."

"There you are," said Bliss as they followed her along a smoothly paved road that skirted the orchard. "Men grow addicted to me on short order. Even dignified elderly men are overcome with boyish ardor."

Pelorat laughed. "I wouldn't count on much boyish ardor, Bliss, but if I had it I could do worse than have it on your account, I think."

Bliss said, "Oh, don't discount your boyish ardor. I work wonders."

Trevize said impatiently, "Once we get to where we're going, how long will we have to wait for this Dom?"

"He will be waiting for you. After all, Dom-through-Gaia has worked for years to bring you here."

Trevize stopped in midstep and looked quickly at Pelorat, who quietly mouthed: You were right.

Bliss, who was looking straight ahead, said calmly, "I know, Trev, that you have suspected that I/we/Gaia was interested in you."

"I/we/Gaia'?" said Pelorat softly.

She turned to smile at him. "We have a whole complex of different pronouns to express the shades of individuality that exist on Gaia. I could explain them to you, but till then 'I/we/Gaia' gets across what I mean in a groping sort of way. —Please move on, Trev. Dom is waiting and I don't wish to force your legs to move against your will. It is an uncomfortable feeling if you're not used to it."

Trevize moved on. His glance at Bliss was compounded of the deepest suspicion.

Dom was an elderly man. He recited the two hundred and fiftythree syllables of his name in a musical flowing of tone and emphasis.

"In a way," he said, "it is a brief biography of myself. It tells the hearer—or reader, or senser—who I am, what part I have played in the whole, what I have accomplished. For fifty years and more, however, I have been satisfied to be referred to as Dom. When there are other Doms at issue, I can be called Domandio—and in my various professional relationships other variants are used. Once a Gaian year —on my birthday—my full name is recited-in-mind, as I have just recited it for you in voice. It is very effective, but it is personally embarrassing."

He was tall and thin—almost to the point of emaciation. His deep-set eyes sparkled with anomalous youth, though he moved rather slowly. His jutting nose was thin and long and flared at the nostrils. His hands, prominently veined though they were, showed no signs of arthritic disability. He wore a long robe that was as gray as his hair. It descended to his ankles and his sandals left his toes bare.

Trevize said, "How old are you, sir?"

"Please address me as Dom, Trev. To use other modes of address induces formality and inhibits the free exchange of ideas between you and me. In Galactic Standard Years, I am just past ninety-three, but the real celebration will come not very many months from now, when I reach the ninetieth anniversary of my birth in Gaian years."

"I would not have guessed you at more than seventy-five, s—Dom," said Trevize.

"By Gaian standards I am not remarkable, either in years or in appearance of years, Trev. —But come, have we eaten?"

Pelorat looked down at his plate, on which perceptible remnants of a most unremarkable and indifferently prepared meal remained, and said in a diffident manner, "Dom, may I attempt to ask an embarrassing question? Of course, if it's offensive, you will please say so, and I will withdraw it."

"Go ahead," said Dom, smiling. "I am anxious to explain to you anything about Gaia which arouses your curiosity."

"Why?" said Trevize at once.

"Because you are honored guests— May I have Pel's question?"

Pelorat said, "Since all things on Gaia share in the group consciousness, how is it that you—one element of the group—can eat this, which was clearly another element?"

"True! But all things recycle. We must eat and everything we can eat, plant as well as animal—even the inanimate seasonings—are part of Gaia. But, then, you see, nothing is killed for pleasure or sport, nothing is killed with unnecessary pain. And I'm afraid we make no attempt to glorify our meal preparations, for no Gaian would eat except that one must. You did not enjoy this meal, Pel? Trev? Well, meals are not to enjoy.

"Then, too, what is eaten remains, after all, part of the planetary consciousness. Insofar as portions of it are incorporated into my body, it will participate in a larger share of the total consciousness. When I die, I, too, will be eaten—even if only by decay bacteria— and I will then participate in a far smaller share of the total. But someday, parts of me will be parts of other human beings, parts of many."

Pelorat said, "A sort of transmigration of souls."

"Of what, Pel?"

"I speak of an old myth that is current on some worlds."

"Ah, I don't know of it. You must tell me on some occasion."

Trevize said, "But your individual consciousness—whatever it is about you that is Dom—will never fully reassemble."

"No, of course not. But does that matter? I will still be part of Gaia and that is what counts. There are mystics among us who wonder if we should take measures to develop group memories of past existences, but the sense-of-Gaia is that this cannot be done in any practical way and would serve no useful purpose. It would merely blur present consciousness. —Of course, as conditions change, the sense-of-Gaia may change, too, but I find no chance of that in the foreseeable future."

"Why must you die, Dom?" asked Trevize. "Look at you in your nineties. Could not the group consciousness—"

For the first time, Dom frowned. "Never," he said. "I can contribute only so much. Each new individual is a reshuffling of molecules and genes into something new. New talents, new abilities, new contributions to Gaia. We must have them—and the only way we can is to make room. I have done more than most, but even I have my limit and it is approaching. There is no more desire to live past one's time than to die before it."

And then, as if realizing he had lent a suddenly somber note to the evening, he rose and stretched his arms out to the two. "Come, Trev—Pel—let us move into my

studio where I can show you some of my personal art objects. You won't blame an old man for his little vanities, I hope."

He led the way into another room where, on a small circular table, there were a group of smoky lenses connected in pairs.

"These," said Dom, "are Participations I have designed. I am not one of the masters, but I specialize in inanimates, which few of the masters bother with."

Pelorat said, "May I pick one up? Are they fragile?"

"No, no. Bounce them on the floor if you like. —Or perhaps you had better not. Concussion could dull the sharpness of the vision."

"How are they used, Dom?"

"You put them over your eyes. They'll cling. They do not transmit light. Quite the contrary. They obscure light that might otherwise distract you—though the sensations do reach your brain by way of the optic nerve. Essentially your consciousness is sharpened and is allowed to participate in other facets of Gaia. In other words, if you look at that wall, you will experience that wall as it appears to itself."

"Fascinating," muttered Pelorat. "may I try that?"

"Certainly, Pel. You may take one at random. Each is a different construct that shows the wall—or any other inanimate object you look at—in a different aspect of the object's consciousness."

Pelorat placed one pair over his eyes and they clung there at once. He started at the touch and then remained motionless for a long time.

Dom said, "When you are through, place your hands on either side of the Participation and press them toward each other. It will come right off."

Pelorat did so, blinked his eyes rapidly, then rubbed them.

Dom said, "What did you experience?"

Pelorat said, "It's hard to describe. The wall seemed to twinkle and glisten and, at times, it seemed to turn fluid. It seemed to have ribs and changing symmetries. I—I'm sorry, Dom, but I did not find it attractive."

Dom sighed. "You do not participate in Gaia, so you would not see what we see. I had rather feared that. Too bad! I assure you that although these Participations are enjoyed primarily for their aesthetic value, they have their practical uses, too. A happy wall is a long-lived wall, a practical wall, a useful wall."

"A happy wall?" said Trevize, smiling slightly.

Dom said, "There is a dim sensation that a wall experiences that is analogous to what 'happy' means to us. A wall is happy when it is well designed, when it rests firmly on its foundation, when its symmetry balances its parts and produces no unpleasant stresses. Good design can be worked out on the mathematical principles of mechanics, but the use of a proper Participation can fine tune it down to virtually atomic dimensions. No sculptor can possibly produce a first-class work of art here on Gaia without a well-crafted Participation and the ones I produce of this particular type are considered excellent—if I do say so myself."

"Animate Participations, which are not my field," and Dom was going on with the kind of excitement one expects in someone riding his hobby, "give us, by analogy, a direct experience of ecological balance. The ecological balance on Gaia is rather simple, as it is on all worlds, but here, at least, we have the hope of making it more complex and thus enriching the total consciousness enormously."

Trevize held up his hand in order to forestall Pelorat and wave him into silence. He said, "How do you know that a planet can bear a more complex ecological balance if they all have simple ones?"

"Ah," said Dom, his eyes twinkling shrewdly, "you are testing the old man. You know as well as I do that the original home of humanity, Earth, had an enormously complex ecological balance. It is only the secondary worlds—the derived worlds—that are simple."

Pelorat would not be kept silent. "But that is the problem I have set myself in life. Why was it only Earth that bore a complex ecology? What distinguished it from other worlds? Why did millions upon millions of other worlds in the Galaxy—worlds that were capable of bearing life—develop only an undistinguished vegetation, together with small and unintelligent animal life-forms?"

Dom said, "We have a tale about that—a fable, perhaps. I cannot vouch for its authenticity. In fact, on the face of it, it sounds like fiction."

It was at this point that Bliss—who had not participated in the meal—entered, smiling at Pelorat. She was wearing a silvery blouse, very sheer.

Pelorat rose at once. "I thought you had left us."

"Not at all. I had reports to make out, work to do. May I join you now, Dom?"

Dom had also risen (though Trevize remained seated). "You are entirely welcome and you ravish these aged eyes."

"It is for your ravishment that I put on this blouse. Pel is above such things and Trev dislikes them."

Pelorat said, "If you think I am above such things, Bliss, I may surprise you someday."

"What a delightful surprise that would be," Bliss said, and sat down. The two men did as well. "Please don't let me interrupt you."

Dom said, "I was about to tell our guests the story of Eternity. —To understand it, you must first understand that there are many different Universes that can exist—virtually an infinite number. Every single event that takes place can take place or not take place, or can take place in this fashion or in that fashion, and each of an enormous number of alternatives will result in a future course of events that are distinct to at least some degree.

"Bliss might not have come in just now; or she might have been with us a little earlier; or much earlier; or having come in now, she might have worn a different blouse; or even in this blouse, she might not have smiled roguishly at elderly men as is her kindhearted custom. In each of these alternatives—or in each of a very large number of other alternatives of this one event—the Universe would have taken a different track

thereafter, and so on for every other variation of every other event, however minor."

Trevize stirred restlessly. "I believe this is a common speculation in quantum mechanics—a very ancient one, in fact."

"Ah, you've heard of it. But let us go on. Imagine it is possible for human beings to freeze all the infinite number of Universes, to step from one to another at will, and to choose which one should be made 'real'—whatever that word means in this connection."

Trevize said, "I hear your words and can even imagine the concept you describe, but I cannot make myself believe that anything like this could ever happen."-

"Nor I, on the whole," said Dom, "which is why I say that it would all seem to be a fable. Nevertheless, the fable states that there were those who could step out of time and examine the endless strands of potential reality. These people were called the Eternals and when they were out of time they were said to be in Eternity.

"It was their task to choose a Reality that would be most suitable to humanity. They modified endlessly—and the story goes into great detail, for I must tell you that it has been written in the form of an epic of inordinate length. Eventually they found (so it is said) a Universe in which Earth was the only planet in the entire Galaxy on which could be found a complex ecological system, together with the development of an intelligent species capable of working out a high technology.

"That, they decided, was the situation in which humanity could be most secure. They froze that strand of events as Reality and then ceased operations. Now we live in a Galaxy that has been settled by human beings only, and, to a large extent, by the plants, animals, and microscopic life that they carry with them—voluntarily or inadvertently—from planet to planet and which usually overwhelm the indigenous life.

"Somewhere in the dim mists of probability there are other Realities in which the Galaxy is host to many intelligences, but they are unreachable. We in our Reality are alone. From every action and every event in our Reality, there are new branches that set off, with only one in each separate case being a continuation of Reality, so that there are vast numbers of potential Universes—perhaps an infinite number—stemming from ours, but all of them are presumably alike in containing the one-intelligence Galaxy in which we live. —Or perhaps I should say that all but a vanishingly small percentage are alike in this way, for it is dangerous to rule out anything where the possibilities approach the infinite."

He stopped, shrugged slightly, and added, "At least, that's the story. It dates back to before the founding of Gaia. I don't vouch for its truth."

The three others had listened intently. Bliss nodded her head, as though it were something she had heard before and she were checking the accuracy of Dom's account.

Pelorat reacted with a silent solemnity for the better part of a minute and then balled his fist and brought it down upon the arm of his chair.

"No," he said in a strangled tone, "that affects nothing. There's no way of demonstrating the truth of the story by observation or by reason, so it can't ever be anything but a piece of speculation, but aside from that— Suppose it's true! The Universe we live in is still one in which only Earth has developed a rich life and an intelligent

species, so that in this Universe—whether it is the all-in-all or only one out of an infinite number of possibilities—there must be something unique in the nature of the planet Earth. We should still want to know what that uniqueness is."

In the silence that followed, it was Trevize who finally stirred and shook his head.

"No, Janov," he said, "that's not the way it works. Let us say that the chances are one in a billion trillion—one in 10^{21} —that out of the billion of habitable planets in the Galaxy only Earth—through the workings of sheer chance—would happen to develop a rich ecology and, eventually, intelligence. If that is so, then one in 10^{21} of the various strands of potential Realities would represent such a Galaxy and the Eternals picked it. We live, therefore, in a Universe in which Earth is the only planet to develop a complex ecology, an intelligent species, a high technology—not because there is something special about Earth, but because simply by chance it developed on Earth and nowhere else.

"I suppose, in fact," Trevize went on thoughtfully, "that there are strands of Reality in which only Gaia has developed an intelligent species, or only Sayshell, or only Terminus, or only some planet which in this Reality happens to bear no life at all. And all of these very special cases are a vanishingly small percentage of the total number of Realities in which there is more than one intelligent species in the Galaxy. —I suppose that if the Eternals had looked long enough they would have found a potential strand of Reality in which every single habitable planet had developed an intelligent species."

Pelorat said, "Might you not also argue that a Reality had been found in which Earth was for some reason not as it was in other strands, but specially suited in some way for the development of intelligence? In fact, you can go further and say that a Reality had been found in which the whole Galaxy was not as it was in other strands, but was somehow in such a state of development that only Earth could produce intelligence."

Trevize said, "You might argue so, but I would suppose that my version makes more sense."

"That's a purely subjective decision, of course—" began Pelorat with some heat, but Dom interrupted, saying "This is logic-chopping. Come, let us not spoil what is proving, at least for me, a pleasant and leisurely evening."

Pelorat endeavored to relax and to allow his heat to drain away. He smiled finally and said, "As you say, Dom."

Trevize, who had been casting glances at Bliss, who sat with mocking demurity, hands in her lap, now said, "And how did this world come to be, Dom? Gaia, with its group consciousness?"

Dom's old head leaned back and he laughed in a high-pitched manner. His face crinkled as he said, "Fables again! I think about that sometimes, when I read what records we have on human history. No matter how carefully records are kept and filed and computerized, they grow fuzzy with time. Stories grow by accretion. Tales accumulate—like dust. The longer the time lapse, the dustier the history—until it degenerates into fables."

Pelorat said, "We historians are familiar with the process, Dom. There is a certain preference for the fable. 'The falsely dramatic drives out the truly dull,' said Liebel Gennerat about fifteen centuries ago. It's called Gennerat's Law now."

"Is it?" said Dom. "And I thought the notion was a cynical invention of my own. Well, Gennerat's Law fills our past history with glamour and uncertainty. —Do you know what a robot is?"

"We found out on Sayshell," said Trevize dryly.

"You saw one?"

"No. We were asked the question and, when we answered in the negative, it was explained to us."

"I understand. —Humanity once lived with robots, you know, but it didn't work well."

"So we were told."

"The robots were deeply indoctrinated with what are called the Three Laws of Robotics, which date back into prehistory. There are several versions of what those Three Laws might have been. The orthodox view has the following reading: '1) A robot may not harm a human being or, through inaction, allow a human being to come to harm; 2) A robot must obey the orders given it by human beings, except where such orders would conflict with the First Law; 3) A robot must protect its own existence, as long as such protection does not conflict with the First or Second Law.'

"As robots grew more intelligent and versatile, they interpreted these Laws, especially the all-overriding First, more and more generously and assumed, to a greater and greater degree, the role of protector of humanity. The protection stifled people and grew unbearable.

"The robots were entirely kind. Their labors were clearly humane and were meant entirely for the benefit of all—which somehow made them all the more unbearable.

"Every robotic advance made the situation worse. Robots were developed with telepathic capacity, but that meant that even human thought could be monitored, so that human behavior became still more dependent on robotic oversight.

"Again robots grew steadily more like human beings in appearance, but they were unmistakably robots in behavior and being humanoid made them more repulsive. So, of course, it had to come to an end."

"Why 'of course'?" asked Pelorat, who had been listening intently.

Dom said, "It's a matter of following the logic to the bitter end. Eventually the robots grew advanced enough to become just sufficiently human to appreciate why human beings should resent being deprived of everything human in the name of their own good. In the long run, the robots were forced to decide that humanity might be better off caring for themselves, however carelessly and ineffectively.

"Therefore, it is said, it was the robots who established Eternity somehow and became the Eternals. They located a Reality in which they felt that human beings could be as secure as possible—alone in the Galaxy. Then, having done what they could to guard us and in order to fulfill the First Law in the truest sense, the robots of their own accord

ceased to function and ever since we have been human beings—advancing, however we can, alone."

Dom paused. He looked from Trevize to Pelorat, and then said, "Well, do you believe all that?"

Trevize shook his head slowly. "No. There is nothing like this in any historical record I have ever heard of. How about you, Janov?"

Pelorat said, "There are myths that are similar in some ways."

"Come, Janov, there are myths that would match anything that any of us can make up, given sufficiently ingenious interpretation. I'm talking about history—reliable records."

"Oh well. Nothing there, as far as I know."

Dom said, "I'm not surprised. Before the robots withdrew, many parties of human beings left to colonize robotless worlds in deeper space, in order to take their own measures for freedom. They came particularly from overcrowded Earth, with its long history of resistance to robots. The new worlds were founded fresh and they did not even want to remember their bitter humiliation as children under robot nursemaids. They kept no records of it and they forgot."

Trevize said, "This is unlikely."

Pelorat turned to him. "No, Golan. It's not at all unlikely. Societies create their own history and tend to wipe out lowly beginnings, either by forgetting them or inventing totally fictitious heroic rescues. The Imperial government made attempts to suppress knowledge of the pre-Imperial past in order to strengthen the mystic aura of eternal rule. Then, too, there are almost no records of the days before hyperspatial travel—and you know that the very existence of Earth is unknown to most people today."

Trevize said, "You can't have it both ways, Janov. If the Galaxy has forgotten the robots, how is it that Gaia remembers?"

Bliss intervened with a sudden lilt of soprano laughter. "We're different."

"Yes?" said Trevize. "In what way?"

Dom said, "Now, Bliss, leave this to me. We are different, men of Terminus. Of all the refugee groups fleeing from robotic domination, we who eventually reached Gaia (following in the track of others who reached Sayshell) were the only ones who had learned the craft of telepathy from the robots.

"It is a craft, you know. It is inherent in the human mind, but it must be developed in a very subtle and difficult manner. It takes many generations to reach its full potential, but once well begun, it feeds on itself. We have been at it for over twenty thousand years and the sense-of-Gaia is that full potential has even now not been reached. It was long ago that our development of telepathy made us aware of group consciousness—first only of human beings; then animals; then plants; and finally, not many centuries ago, the inanimate structure of the planet itself.

"Because we traced this back to the robots, we did not forget them. We considered them not our nursemaids but our teachers. We felt they had opened our mind to something we would never for one moment want them closed to. We remember them with gratitude."

Trevize said, "But just as once you were children to the robots, now you are children to the group consciousness. Have you not lost humanity now, as you had then?"

"It is different, Trev. What we do now is our own choice—our own choice. That is what counts. It is not forced on us from outside, but is developed from the inside. It is something we never forget. And we are different in another way, too. We are unique in the Galaxy. There is no world like Gaia."

"How can you be sure?"

"We would know, Trev. We would detect a world consciousness such as ours even at the other end of the Galaxy. We can detect the beginnings of such a consciousness in your Second Foundation, for instance, though not until two centuries ago."

"At the time of the Mule?"

"Yes. One of ours." Dom looked grim. "He was an aberrant and he left us. We were naïve enough to think that was not possible, so we did not act in time to stop him. Then, when we turned our attention to the Outside Worlds, we became aware of what you call the Second Foundation and we left it to them."

Trevize stared blankly for several moments, then muttered, "There go our history books!" He shook his head and said in a louder tone of voice, "That was rather cowardly of Gaia, wasn't it, to do so?" said Trevize. "He was your responsibility."

"You are right. But once we finally turned our eyes upon the Galaxy, we saw what until then we had been blind to, so that the tragedy of the Mule proved a life-saving matter to us. It was then that we recognized that eventually a dangerous crisis would come upon us. And it has—but not before we were able to take measures, thanks to the incident of the Mule."

"What sort of crisis?"

"One that threatens us with destruction?"

"I can't believe that. You held off the Empire, the Mule, and Sayshell. You have a group consciousness that can pluck a ship out of space at a distance of millions of kilometers. What can you have to fear? —Look at Bliss. She doesn't look the least bit perturbed. She doesn't think there's a crisis."

Bliss had placed one shapely leg over the arm of the chair and wriggled her toes at him. "Of course I'm not worried, Trev. You'll handle it."

Trev said forcefully, "Me?"

Dom said, "Gaia has brought you here by means of a hundred gentle manipulations. It is you who must face our crisis."

Trev stared at him and slowly his face turned from stupefaction into gathering rage. "Me? 'Why, in all of space, me? I have nothing to do with this."

"Nevertheless, Trev," said Dom with an almost hypnotic calmness, "you. Only you. In all of space, only you."

18. COLLISION

STOR GENDEBAL WAS EDGING TOWARD GAIA ALMOST AS CAUTIOUSLY AS Trevize had—and now that its star was a perceptible disc and could be viewed only through strong filters, he paused to consider.

Sura Novi sat to one side, looking up at him now and then in a timorous manner. She said softly, "Master?"

"What is it, Novi?" he asked abstractedly.

"Are you unhappy?"

He looked up at her quickly. "No. Concerned. Remember that word? I am trying to decide whether to move in quickly or to wait longer. Shall I be very brave, Novi?"

"I think you are very brave all times, Master."

"To be very brave is sometimes to be foolish."

Novi smiled. "How can a master scholar be foolish? —That is a sun, is it not, Master?" She pointed to the screen.

Gendibal nodded.

Novi said, after an irresolute pause, "Is it the sun that shines on Trantor? Is it the Hamish sun?"

Gendibal said, "No, Novi. It is a far different sun. There are many suns, billions of them."

"Ah! I had known this with my head. I could not make myself believe, however. How is it, Master, that one can know with the head—and yet not believe?"

Gendibal smiled faintly, "In your head, Novi—" he began and, automatically, as he said that, he found himself in her head. He stroked it gently, as he always did, when he found himself there—just a soothing touch of mental tendrils to keep her calm and untroubled—and he would then have left again, as he always did, had not something drawn him back.

What he sensed was indescribable in any but mentalic terms but, metaphorically, Novi's brain glowed. It was the faintest possible glow.

It would not be there except for the existence of a mentalic field imposed from without—a mentalic field of an intensity so small that the finest receiving function of Gendibal's own well-trained mind could just barely detect it, even against the utter smoothness of Novi's mentalic structure.

He said sharply, "Novi, how do you feel?"

Her eyes opened wide. "I feel well, Master."

"Are you dizzy, confused? Close your eyes and sit absolutely still until I say, 'Now.'"

Obediently she closed her eyes. Carefully Gendibal brushed away all extraneous sensations from her mind, quieted her thought, soothed her emotions, stroked—stroked—He left nothing but the glow and it was so faint that he could almost persuade himself it was not there.

"Now," he said and Novi opened her eyes.

"How do you feel, Novi?"

"Very calm, Master. Rested."

It was clearly too feeble for it to have any noticeable effect on her. He turned to the computer and wrestled with it. He had to admit to himself that he and the computer did not mesh very well together. Perhaps it was because he was too used to using his mind directly to be able to work through an intermediary. But he was looking for a ship, not a mind, and the initial search could be done more efficiently with the help of the computer.

And he found the sort of ship he suspected might be present. It was half a million kilometers away and it was much like his own in design, but it was much larger and more elaborate.

Once it was located with the computer's help, Gendibal could allow his mind to take over directly. He sent it outward—tightbeamed—and with it felt (or the mentalic equivalent of "felt") the ship, inside and out.

He then sent his mind toward the planet Gaia, approaching it more closely by several millions of kilometers of space—and withdrew. Neither process was sufficient in itself to tell him, unmistakably, which—if either—was the source of the field.

He said, "Novi, I would like you to sit next to me for what is to follow."

"Master, is there danger?"

"You are not to be in any way concerned, Novi. I will see to it that you are safe and secure."

"Master, I am not concerned that I be safe and secure. If there is danger, I want to be able to help you."

Gendibal softened. He said, "Novi, you have already helped. Because of you, I became aware of a very small thing it was important to be aware of. Without you, I might have blundered rather deeply into a bog and might have had to pull out only through a great deal of trouble."

"Have I done this with my mind, Master, as you once explained?" asked Novi, astonished.

"Quite so, Novi. No instrument could have been more sensitive. My own mind is not; it is too full of complexity."

Delight filled Novi's face. "I am so grateful I can help."

Gendibal smiled and nodded—and then subsided into the somber knowledge that he would need other help as well. Something childish within him objected. The job was his—his alone.

Yet it could not be his alone. The odds were climbing—

On Trantor, Quindor Shandess felt the responsibility of First Speakerhood resting upon him with a suffocating weight. Since Gendibal's ship had vanished into the darkness beyond the atmosphere, he had called no meetings of the Table. He had been lost in his own thoughts.

Had it been wise to allow Gendibal to go off on his Own? Gendibal was brilliant, but not so brilliant that it left no room for overconfidence. Gendibal's great fault was arrogance, as Shandess's own great fault (he thought bitterly) was the weariness of age.

Over and over again, it occurred to him that the precedent of Preem Palver, flitting over the Galaxy to set things right, was a dangerous one. Could anyone else be a Preem Palver? Even Gendibal? And Palver had had his wife with him.

To be sure, Gendibal had this Hamishwoman, but she was of no consequence. Palver's wife had been a Speaker in her own right.

Shandess felt himself aging from day to day as he waited for word from Gendibal—and with each day that word did not come, he felt an increasing tension.

It should have been a fleet of ships, a flotilla— No. The Table would not have allowed it.

And yet— 'When the call finally came, he was asleep—an exhausted sleep that was bringing him no relief. The night had been windy and he had had trouble falling asleep to begin with. Like a child, he had imagined voices in the wind.

His last thoughts before falling into an exhausted slumber had been a wistful building of the fancy of resignation, a wish he could do so together with the knowledge he could not, for at this moment Delarmi would succeed him.

And then the call came and he sat up in bed, instantly awake.

"You are well?" he said.

"Perfectly well, First Speaker," said Gendibal. "Should we have visual connection for more condensed communication?"

"Later, perhaps," said Shandess. "First, what is the situation?" Gendibal spoke carefully, for he sensed the other's recent arousal and he perceived a deep weariness. He said, "I am in the neighborhood of an inhabited planet called Gaia, whose existence is not hinted at in any of the Galactic records, as far as I know."

"The world of those who have been working to perfect the Plan? The Anti-Mules?"

"Possibly, First Speaker. There is the reason to think so. First, the ship bearing Trevize and Pelorat has moved far in toward Gaia and has probably landed there. Second, there is, in space, about half a million kilometers from me, a First Foundation warship."

"There cannot be this much interest for no reason."

"First Speaker, this may not be independent interest. I am here only because I am following Trevize—and the warship may be here for the same reason. It remains only to be asked why Trevize is here."

"Do you plan to follow him in toward the planet, Speaker?"

"I had considered that a possibility, but something has come up. I am now a hundred million kilometers from Gaia and I sense in the space about me a mentalic field—a homogeneous one that is excessively faint. I would not have been aware of it at all, but for the focusing effect of the mind of the Hainishwoman. It is an unusual mind; I agreed to take her with me for that very purpose."

"You were right, then, in supposing it would be so— Did Speaker Delarmi know this, do you think?"

"When she urged me to take the woman? I scarcely think so—but I gladly took advantage of it, First Speaker."

"I am pleased that you did. Is it your opinion, Speaker Gendibal, that the planet is the focus of the field?"

"To ascertain that, I would have to take measurements at widely spaced points in order to see if there is a general spherical symmetry to the field. My unidirectional mental probe made this seem likely but not certain. Yet it would not be wise to investigate further in the presence of the First Foundation warship."

"Surely it is no threat."

"It may be. I cannot as yet be sure that it is not itself the focus of the field, First Speaker."

"But they—"

"First Speaker, with respect, allow me to interrupt. We do not know what technological advances the First Foundation has made. They are acting with a strange self-confidence and may have unpleasant surprises for us. It must be decided whether they have learned to handle mentalics by means of some of their devices. In short, First Speaker, I am facing either a warship of mentalics or a planet of them.

"If it is the warship, then the mentalics may be far too weak to immobilize me, but they might be enough to slow me—and the purely physical weapons on the warship may then suffice to destroy me. On the other hand, if it is the planet that is the focus, then to have the field detectable at such a distance could mean enormous intensity at the surface—more than even I can handle.

"In either case, it will be necessary to set up a network—a total network—in which, at need, the full resources of Trantor can be placed at my disposal."

The First Speaker hesitated. "A total network. This has never been used, never even suggested—except in the time of the Mule."

"This crisis may well be even greater than that of the Mule, First Speaker."

"I do not know that the Table would agree."

"I do not think you should ask them to agree, First Speaker. You should invoke a state of emergency."

"What excuse can I give?"

"Tell them what I have told you, First Speaker."

"Speaker Delarmi will say that you are an incompetent coward, driven to madness by your own fears."

Gendibal paused before answering. Then he said, "I imagine she will say something like that, First Speaker, but let her say whatever she likes and I will survive it. What is at stake now is not my pride or self-love but the actual existence of the Second Foundation."

Harla Branno smiled grimly, her lined face setting more deeply into its fleshy crags. She said, "I think we can push on with it. I'm ready for them."

Kodell said, "Do you still feel sure you know what you're doing?"

"If I were as mad as you pretend you think I am, Liono, would you have insisted on remaining on this ship with me?"

Kodell shrugged and said, "Probably. I would then be here on the off chance, Madam Mayor, that I might stop you, divert you, at least slow you, before you went too far. And, of course, if you're not mad—"

"Yes?" -

"Why, then I wouldn't want to have the histories of the future give you all the mention. Let them state that I was here with you and wonder, perhaps, to whom the credit really belongs, eh, Mayor?"

"Clever, Liono, clever—but quite futile. I was the power behind the throne through too many Mayoralties for anyone to believe I would permit such a phenomenon in my own administration."

"We shall see."

"No, we won't, for such historical judgments will come after we are dead. However, I have no fears. Not about my place in history and not about that," and she pointed to the screen.

"Compor's ship," said Kodell.

"Compor's ship, true," said Branno, "but without Compor aboard. One of our scoutships observed the changeover. Compor's ship was stopped by another. Two people from the other ship boarded that one and Compor later moved off and entered the other."

Branno rubbed her hands. "Trevize fulfilled his role perfectly. I cast him out into space in order that he might serve as lightning rod and so he did. He drew the lightning. The ship that stopped Compor was Second Foundation."

"How can you be sure of that, I wonder?" said Kodell, taking out his pipe and slowly beginning to pack it with tobacco.

"Because I always wondered if Compor might not be under Second Foundation control. His life was too smooth. Things always broke right for him—and he was such an expert at hyperspatial tracking. His betrayal of Trevize might easily have been the simple politics of an ambitious man—but he did it with such unnecessary thoroughness, as though there were more than personal ambition to it."

"All guesswork, Mayor."

"The guesswork stopped when he followed Trevize through multiple Jumps as easily as if there had been but one."

"He had the computer to help, Mayor."

But Branno leaned her head back and laughed. "My dear Liono, you are so busy devising intricate plots that you forget the efficacy of simple procedures. I sent Compor to follow Trevize, not because I needed to have Trevize followed. What need was there for that? Trevize, however much he might want to keep his movements secret, could not help but call attention to himself in any non-Foundation world he visited. His advanced Foundation vessel—his strong Terminus accent—his Foundation credits—would automatically surround him with a glow of notoriety. And in case of any emergency, he

would automatically turn to Foundation officials for help, as he did on Sayshell, where we knew all that he did as soon as he did it—and quite independently of Compor.

"No," she went on thoughtfully, "Compor was sent out to test Compor. And that succeeded, for we gave him a defective computer quite deliberately; not one that was defective enough to make the ship unmaneuverable, but certainly one that was insufficiently agile to aid him in following a multiple Jump. Yet Compor managed that without trouble."

"I see there's a great deal you don't tell me, Mayor, until you decide you ought to."

"I only keep those matters from you, Liono, that it will not hurt you not to know. I admire you and I use you, but there are sharp limits to my trust, as there is in yours for me—and please don't bother to deny it."

"I won't," said Kodell dryly, "and someday, Mayor, I will take the liberty of reminding you of that. —Meanwhile, is there anything else that I ought to know now? What is the nature of the ship that stopped them? Surely, if Compor is Second Foundation, so was that ship."

"It is always a pleasure to speak to you, Liono. You see things quickly. The Second Foundation, you see, doesn't bother to hide its tracks. It has defenses that it relies on to make those tracks invisible, even when they are not. It would never occur to a Second Foundationer to use a ship of alien manufacture, even if they knew how neatly we could identify the origin of a ship from the pattern of its energy use. They could always remove that knowledge from any mind that had gained it, so why bother taking the trouble to hide? Well, our scout ship was able to determine the origin of the ship that approached Compor within minutes of sighting it."

"And now the Second Foundation will wipe that knowledge from our minds, I suppose."

"If they can," said Branno, "but they may find that things have changed."

Kodell said, "Earlier you said you knew where the Second Foundation was. You would take care of Gaia first, then Trantor. I deduce from this that the other ship was of Trantorian origin."

"You suppose correctly. Are you surprised?"

Kodell shook his head slowly. "Not in hindsight. Ebling Mis, Toran Darell and Bayta Darell were all on Trantor during the period when the Mule was stopped. Arkady Darell, Bayta's granddaughter, was born on Trantor and was on Trantor again when the Second Foundation was itself supposedly stopped. In her account of events, there is a Preem Palver who played a key role, appearing at convenient times, and he was a Trantorian trader. I should think it was obvious that the Second Foundation was on Trantor, where, incidentally, Hari Seldon himself lived at the time he founded both Foundations."

"Quite obvious, except that no one ever suggested the possibility. The Second Foundation saw to that. It is what I meant when I said they didn't have to cover their tracks, when they could so easily arrange to have no one look in the direction of those tracks—or wipe out the memory of those tracks after they had been seen."

Kodell said, "In that case, let us not look too quickly in the direction in which they may simply be wanting us to look. How is it, do you suppose, that Trevize was able to decide the Second Foundation existed? Why didn't the Second Foundation stop him?"

Branno held up her gnarled fingers and counted on them. "First, Trevize is a very unusual man who, for all his obstreperous inability to use caution, has something about him that I have not been able to penetrate. He may be a special case. Second, the Second Foundation was not entirely ignorant. Comporg was on Trevize's tail at once and reported him to me. I was relied on to stop Trevize without the Second Foundation having to risk open involvement. Third, when I didn't quite react as expected—no execution, no imprisonment, no memory erasure, no Psychic Probe of his brain—when I merely sent him out into space, the Second Foundation went further. They made the direct move of sending one of their own ships after him."

And she added with tight-lipped pleasure, "Oh, excellent lightning rod."

Kodell said, "And our next move?"

"We are going to challenge that Second Foundationer we now face. In fact, we're moving toward him rather sedately right now."

Gendibal and Novi sat together, side by side, watching the screen.

Novi was frightened. To Gendibal, that was quite apparent, as was the fact that she was desperately trying to fight off that fright. Nor could Gendibal do anything to help her in her struggle, for he did not think it wise to touch her mind at this moment, lest he obscure the response she displayed to the feeble mentalic field that surrounded them.

The Foundation warship was approaching slowly—but deliberately. It was a large warship, with a crew of perhaps as many as six, judging from past experience with Foundation ships. Her weapons, Gendibal was certain, would be sufficient in themselves to hold off and, if necessary, wipe out a fleet made up of every ship available to the Second Foundation—if those ships had to rely on physical force alone.

As it was, the advance of the warship, even against a single ship manned by a Second Foundationer, allowed certain conclusions to be drawn. Even if the ship possessed mentalic ability, it would not be likely to advance into the teeth of the Second Foundation in this manner. More likely, it was advancing out of ignorance—and this might exist in any of several degrees.

It could mean that the captain of the warship was not aware that Comporg had been replaced, or—if aware—did not know the replacement was a Second Foundationer, or perhaps was not even aware what a Second Foundationer might be.

Or (and Gendibal intended to consider everything) what if the ship did possess mentalic force and, nevertheless, advanced in this self-confident manner? That could only mean it was under the control of a megalomaniac or that it possessed powers far beyond any that Gendibal could bring himself to consider possible.

But what he considered possible was not the final judgment— Carefully he sensed Novi's mind. Novi could not sense mentalic fields consciously, whereas Gendibal, of course, could—yet Gendibal's mind could not do so as delicately or detect as feeble a mental field as could Novi's. This was a paradox that would have to be studied in future

and might produce fruit that would in the long run prove of far greater importance than the immediate problem of an approaching spaceship.

Gendibal had grasped the possibility of this, intuitively, when he first became aware of the unusual smoothness and symmetry of Novi's mind—and he felt a somber pride in this intuitive ability he possessed. Speakers had always been proud of their intuitive powers, but how much was this the product of their inability to measure fields by straightforward physical methods and their failure, therefore, to understand what it was that they really did? It was easy to cover up ignorance by the mystical word "intuition." And how much of this ignorance of theirs might arise from their underestimation of the importance of physics as compared to mentalics?

And how much of that was blind pride? When he became First Speaker, Gendibal thought, this would change. There would have to be some narrowing of the physical gap between the Foundations. The Second Foundation could not face forever the possibility of destruction any time the mentalic monopoly slipped even slightly.

—Indeed, the monopoly might be slipping now. Perhaps the First Foundation had advanced or there was an alliance between the First Foundation and the Anti-Mules. (That thought occurred to him now for the first time and he shivered.)

His thoughts on the subject slipped through his mind with a rapidity common to a Speaker—and while he was thinking, he also remained sensitively aware of the glow in Novi's mind, the response to the gently pervasive mentalic field about them. It was not growing stronger as the Foundation warship drew nearer.

This was not, in itself, an absolute indication that the warship was not equipped with mentalics. It was well known that the mentalic field did not obey the inverse-square law. It did not grow stronger precisely as the square of the extent to which distance between emitter and receiver lessened. It differed in this way from the electromagnetic and the gravitational fields. Still, although mentalic fields varied less with distance than the various physical fields did, it was not altogether insensitive to distance, either. The response of Novi's mind should show a detectable increase as the warship approached—some increase.

(How was it that no Second Foundationer in five centuries—from Hari Seldon on—had ever thought of working out a mathematical relationship between mentalic intensity and distance? This shrugging off of physics must and would stop, Gendibal silently vowed.)

If the warship possessed mentalics and if it felt quite certain it was approaching a Second Foundationer, would it not increase the intensity of its field to maximum before advancing? And in that case, would not Novi's mind surely register an increased response of some kind?

—Yet it did not!

Confidently Gendibal eliminated the possibility that the warship possessed mentalics. It was advancing out of ignorance and, as a menace, it could be downgraded.

The mentalic field, of course, still existed, but it had to originate on Gaia. This was disturbing enough, but the immediate problem was the ship. Let that be eliminated and he could then turn his attention to the world of the Anti-Mules.

He waited. The warship would make some move or it would come close enough for him to feel confident that he could pass over to an effective offense.

The warship still approached—quite rapidly now—and still did nothing. Finally Gendibal calculated that the strength of his push would be sufficient. There would be no pain, scarcely any discomfort—all those on board would merely find that the large muscles of their backs and limbs would respond but sluggishly to their desires.

Gendibal narrowed the mentalic field controlled by his mind. It intensified and leaped across the gap between the ships at the speed of light. (The two ships were close enough to make hyperspatial contact—with its inevitable loss of precision—unnecessary.)

And Gendibal then fell back in numbed surprise.

The Foundation warship was possessed of an efficient mentalic shield that gained in density in proportion as his own field gained in intensity. —The warship was not approaching out of ignorance after all—and it had an unexpected if passive weapon.

"Ah," said Branno. "He has attempted an attack, Liono. See!"

The needle on the psychometer moved and trembled in its irregular rise.

The development of the mentalic shield had occupied Foundation scientists for a hundred and twenty years in the most secret of all scientific projects, except perhaps for Hari Seldon's lone development of psychohistorical analysis. Five generations of human beings had labored in the gradual improvement of a device backed by no satisfactory theory.

But no advance would have been possible without the invention of the psychometer that could act as a guide, indicating the direction and amount of advance at every stage. No one could explain how it worked, yet all indications were that it measured the immeasurable and gave numbers to the indescribable. Branno had the feeling (shared by some of the scientists themselves) that if ever the Foundation could explain the workings of the psychometer, they would be the equal of the Second Foundation in mind control.

But that was for the future. At present, the shield would have to be enough, backed as it was by an overwhelming preponderance in physical weapons.

Branno sent out the message, delivered in a male voice from which all overtones of emotion had been removed, till it was flat and deadly.

"Calling the ship Bright Star and its occupants. You have forcibly taken a ship of the Navy of the Foundation Federation in an act of piracy. You are directed to surrender the ship and yourselves at once or face attack."

The answer came in natural voice: "Mayor Branno of Terminus, I know you are on the ship. The Bright Star was not taken by piratical action. I was freely invited on board by its legal captain, Munn Li Compbor of Terminus. I ask a period of truce that we may discuss matters of importance to each of us alike."

Kodell whispered to Branno, "Let me do the speaking, Mayor."

She raised her arm contemptuously, "The responsibility is mine, Liono."

Adjusting the transmitter, she spoke in tones scarcely less forceful and unemotional than the artificial voice that had spoken before:

"Man of the Second Foundation, understand your position. If you do not surrender forthwith, we can blow your ship out of space in the time it takes light to travel from our ship to yours—and we are ready to do that. Nor will we lose by doing this, for you have no knowledge for which we need keep you alive. We know you are from Trantor and, once we have dealt with you, we will be ready to deal with Trantor. We are willing to allow you a period in which to have your say, but since you cannot have much of worth to tell us, we are not prepared to listen long."

"In that case," said Gendibal, "let me speak quickly and to the point. Your shield is not perfect and cannot be. You have overestimated it and underestimated me. I can handle your mind and control it. Not as easily, perhaps, as if there were no shield, but easily enough. The instant you attempt to use any weapon, I will strike you—and there is this for you to understand: Without a shield, I can handle your mind smoothly and do it no harm. With the shield, however, I must smash through, which I can do, and I will be unable then to handle you either smoothly or deftly. Your mind will be as smashed as the shield and the effect will be irreversible. In other words, you cannot stop me and I, on the other hand, can stop you by being forced to do worse than killing you. I will leave you a mindless hulk. Do you wish to risk that?"

Branno said, "You know you cannot do as you say."

"Do you, then, wish to risk the consequences I have described?" asked Gendibal with an air of cool indifference.

Kodell leaned over and whispered, "For Seldon's sake, Mayor—"

Gendibal said (not exactly at once, for it took light—and everything at light-speed—a little over one second to travel from one vessel to the other), "I follow your thoughts, Kodell. No need to whisper. I also follow the Mayor's thoughts. She is irresolute, so you have no need to panic just yet. And the mere fact that I know this is ample evidence that your shield leaks."

"It can be strengthened," said the Mayor defiantly.

"So can my mentalic force," said Gendibal.

"But I sit here at my ease, consuming merely physical energy to maintain the shield, and I have enough to maintain that shield for very long periods of time. You must use mentalic energy to penetrate the shield and you will tire."

"I am not tired," said Gendibal. "At the present moment, neither of you is capable of giving any order to any member of the crew of your ship or to any crewman on any other ship. I can manage so much without any harm to you, but do not make any unusual effort to escape this control, for if I match that by increasing my own force, as I will have to do, you will be damaged as I have said."

"I will wait," said Branno, placing her hands in her lap with every sign of solid patience. "You will tire and when you do, the orders that will go out will not be to destroy you, for you will then be harmless. The orders will be to send the main Foundation Fleet

against Trantor. If you wish to save your world—surrender. A second orgy of destruction will not leave your organization untouched, as the first one did at the time of the Great Sack."

"Don't you see that if I feel myself tiring, Mayor, which I won't, I can save my world very simply by destroying you before my strength to do so is gone?"

"You won't do that. Your main task is to maintain the Seldon Plan. To destroy the Mayor of Terminus and thus to strike a blow at the prestige and confidence of the First Foundation, producing a staggering setback to its power and encouraging its enemies everywhere, will produce such a disruption to the Plan that it will be almost as bad for you as the destruction of Trantor. You might as well surrender."

"Are you willing to gamble on my reluctance to destroy you?"

Branno's chest heaved as she took a deep breath and let it out slowly. She then said firmly, "Yes!"

Kodell, sitting at her side, paled.

Gendibal stared at the figure of Branno, superimposed upon the volume of room just in front of the wall. It was a little flickery and hazy thanks to the interference of the shield. The man next to her was almost featureless with haze, for Gendibal had no energy to waste on him. He had to concentrate on the Mayor.

To be sure, she had no image of him in return. She had no way of knowing that he too had a companion, for instance. She could make no judgment from his expressions, from his body language. In this respect, she was at a disadvantage.

Everything he had said was true. He could smash her at the cost of an enormous expenditure of mentalic force—and in so doing, he could scarcely avoid disrupting her mind irreparably.

Yet everything she had said was true as well. Destroying her would damage the Plan as much as the Mule himself had damaged it. Indeed, the new damage might be more serious, since it was now later in the game and there would be less time to retrieve the misstep.

Worse still, there was Gaia, which was still an unknown quantity—with its mentalic field remaining at the faint and tantalizing edge of detection.

For a moment, he touched Novi's mind to make sure that the flow was still there. It was, and it was unchanged.

She could not have sensed that touch in any way, but she turned to him and in an awed whisper said, "Master, there is a faint mist there. Is it to that you talk?"

She must have sensed the mist through the small connection between their two minds. Gendibal put a finger to his lips. "Have no fear, Novi. Close your eyes and rest."

He raised his voice. "Mayor Branno, your gamble is a good one in this respect. I do not wish to destroy you at once, since I think that if I explain something to you, you will listen to reason and there will then be no need to destroy in either direction.

"Suppose, Mayor, that you win out and that I surrender. What follows? In an orgy of self-confidence and in undue reliance on your mentalic shield, you and your successors

will attempt to spread your power over the Galaxy with undue haste. In doing so, you will actually postpone the establishment of the Second Empire, because you will also destroy the Seldon Plan."

Branno said, "I am not surprised that you do not wish to destroy me at once and I think that, as you sit there, you will be forced to realize that you do not dare to destroy me at all."

Gendibal said, "Do not deceive yourself with self-congratulatory folly. Listen to me. The majority of the Galaxy is still non-Foundation and, to a great extent, anti-Foundation. There are even portions of the Foundation Federation itself that have not forgotten their days of independence. If the Foundation moves too quickly in the wake of my surrender, it will deprive the rest of the Galaxy of its greatest weakness—its disunity and indecision. You will force them to unite by fear and you will feed the tendency toward rebellion within."

"You are threatening with clubs of straw," said Branno. "We have the power to win easily against all enemies, even if every world in the non-Foundation Galaxy combined against us, and even if these were helped by a rebellion in half the worlds of the Federation itself. There would be no problem."

"No immediate problem, Mayor. Do not make the mistake of seeing only the results that appear at once. You can establish a Second Empire merely by proclaiming it, but you will not be able to maintain it. You will have to reconquer it every ten years."

"Then we will do so until the worlds tire, as you are tiring."

"They will not tire, any more than I will. Nor will the process continue for a very long time, for there is a second and greater danger to the Pseudo-Empire you would proclaim. Since it can be temporarily maintained only by an ever-stronger military force which will be ever-exercised, the generals of the Foundation will, for the first time, become more important and more powerful than the civilian authorities. The Pseudo-Empire will break up into military regions within which individual commanders will be supreme. There will be anarchy—and a slide back into a barbarism that may last longer than the thirty thousand years forecast by Seldon before the Seldon Plan was implemented."

"Childish threats. Even if the mathematics of the Seldon Plan predicted all this, it predicts only probabilities—not inevitabilities."

"Mayor Branno," said Gendibal earnestly. "Forget the Seldon Plan. You do not understand its mathematics and you cannot visualize its pattern. But you do not have to, perhaps. You are a tested politician; and a successful one, to judge from the post you hold; even more so, a courageous one, to judge from the gamble you are now taking. Therefore, use your political acumen. Consider the political and military history of humanity and consider it in the light of what you know of human nature—of the manner in which people, politicians, and military officers act, react, and interact—and see if I'm not right."

Branno said, "Even if you were right, Second Foundationer, it is a risk we must take. With proper leadership and with continuing technological advance—in mentalics, as

well as in physics—we can overcome. Hari Seldon never calculated such advances properly. He couldn't. Where in the Plan does it allow for the development of a mentalic shield by the First Foundation? Why should we want the Plan, in any case? We will risk founding a new Empire without it. Failure without it would, after all, be better than success with it. We do not want an Empire in which we play puppets to the hidden manipulators of the Second Foundation."

"You say that only because you do not understand what failure will be like for the people of the Galaxy."

"Perhaps!" said Branno stonily. "Are you beginning to weary, Second Founder?"

"Not at all. —Let me propose an alternative action that you have not considered—one in which I need not surrender to you, nor you to me. —We are in the vicinity of a planet called Gaia."

"I am aware of that."

"Are you aware that it was probably the birthplace of the Mule?"

"I would want more evidence than resides in your mere statement to that effect."

"The planet is surrounded by a mentalic field. It is the home of many Mules. If you accomplish your dream of destroying the Second Foundation, you will make yourselves the slaves of this planet of Mules. What harm have Second Founders ever done you— specific, rather than imagined or theorized harm? Now ask yourself what harm a single Mule has done you."

"I still have nothing more than your statements."

"As long as we remain here, I can give you nothing more. —I propose a truce, therefore. Keep your shield up, if you don't trust me, but be prepared to co-operate with me. Let us, together, approach this planet—and when you are convinced that it is dangerous, then I will nullify its mentalic field and you will order your ships to take possession of it."

"And then?"

"And then, at least, it will be the First Foundation against the Second Foundation, with no outside forces to be considered. The fight will then be clear whereas now, you see, we dare not fight, for both Foundations are at bay."

"Why did you not say this before?"

"I thought I might convince you that we were not enemies, so that we might co-operate. Since I have apparently failed at that, I suggest co-operation in any case."

Branno paused, her head bent in thought. Then she said, "You are trying to put me to sleep with lullabies. How will you, by yourself, nullify the mentalic field of a whole planet of Mules? The thought is so ludicrous that I cannot trust in the truth of your proposition."

"I am not alone," said Gendibal. "Behind me is the full force of the Second Foundation—and that force, channeled through me, will take care of Gaia. 'What's more, it can, at any time, brush aside your shield as though it were thin fog."

"If so, why do you need my help?"

"First, because nullifying the field is not enough. The Second Foundation cannot devote itself, now and forever, to the eternal task of nullifying, any more than I can spend the rest of my life dancing this conversational minuet with you. We need the physical action your ships can supply. —And besides, if I cannot convince you by reason that the two Foundations should look upon each other as allies, perhaps a co-operative venture of the greatest importance can be convincing. Deeds may do the job where words fail."

A second silence and then Branno said, "I am willing to approach Gaia more closely, if we can approach co-operatively. I make no promises beyond that."

"That will be enough," said Gendibal, leaning toward his computer.

Novi said, "No, Master, up to this point, it didn't matter, but please make no further move. We must wait for Councilman Trevize of Terminus."

19. DECISION

JANOV PELORAT SAID, WITH A SMALL TRACE OF PETULANCE IN HIS voice, "Really, Golan, no one seems to care for the fact that this is the first time in a moderately long life—not too long, I assure you, Bliss—in which I have been traveling through the Galaxy. Yet each time I come to a world, I am off it again and back in space before I can really have a chance to study it. It has happened twice now."

"Yes," said Bliss, "but if you had not left the other one so quickly, you would not have met me until who knows when. Surely that justifies the first time."

"It does. Honestly, my—my dear, it does."

"And this time, Pel, you may be off the planet, but you have me—and I am Gaia, as much as any particle of it, as much as all of it."

"You are, and surely I want no other particle of it."

Trevize, who had been listening to the exchange with a frown, said, "This is disgusting. Why didn't Dom come with us?—Space, I'll never get used to this monosyllabization. Two hundred fifty syllables to a name and we use just one of them.—Why didn't he come, together with all two hundred fifty syllables? If all this is so important—if the very existence of Gaia depends on it—why didn't he come with us to direct us?"

"I am here, Trev," said Bliss, "and I am as much Gaia as he is." Then, with a quick sideways and upward look from her dark eyes, "Does it annoy you, then, to have me call you 'Trev'?"

"Yes, it does. I have as much right to my ways as you to yours. My name is Trevize. Two syllables. Tre-vize."

"Gladly. I do not wish to anger you, Trevize."

"I am not angry. I am annoyed." He rose suddenly, walked from one end of the room to the other, stepping over the outstretched legs of Pelorat (who drew them in quickly), and then back again. He stopped, turned, and faced Bliss.

He pointed a finger at her. "Look! I am not my own master! I have been maneuvered from Terminus to Gaia—and even when I began to suspect that this was so, there seemed no way to break the grip. And then, when I get to Gaia, I am told that the whole purpose for my arrival was to save Gaia. Why? How? What is Gaia to me—or I to Gaia—that I should save it? Is there no other of the quintillion human beings in the Galaxy who could do the job?"

"Please, Trevize," said Bliss—and there was a sudden downcast air about her, all of the gamine affectation disappearing. "Do not be angry. You see, I use your name properly and I will be very serious. Dom asked you to be patient."

"By every planet in the Galaxy, habitable or not, I don't want to be patient. If I am so important, do I not deserve an explanation? To begin with, I ask again why Dom did

not come with us? Is it not sufficiently important for him to be here on the Far Star with us?"

"He is here, Trevize," said Bliss. "While I am here, he is here, and everyone on Gaia is here, and every living thing, and every speck of the planet."

"You are satisfied that that is so, but it's not my way of thinking. I'm not a Gaian. We can't squeeze the whole planet on to my ship, we can only squeeze one person on to it. We have you, and Dom is part of you. Very well. Why couldn't we have taken Dom, and let you be part of him?"

"For one thing," said Bliss, "Pel—I mean, Pel-o-rat—asked that I be on the ship with you. I, not Dom."

"He was being gallant. Who would take that seriously?"

"Oh, now, my dear fellow," said Pelorat, rising to his feet with his face reddening, "I was quite serious. I don't want to be dismissed like that. I accept the fact that it doesn't matter which component of the Gaian whole is on board, and it is more pleasant for me to have Bliss here than Dom, and it should be for you as well. Come, Golan, you are behaving childishly."

"Am I? Am I?" said Trevize, frowning darkly. "All right, then, I am. Just the same," again he pointed at Bliss, "whatever it is I am expected to do, I assure you that I won't do it if I am not treated like a human being. Two questions to begin with—What am I supposed to do? And why me?"

Bliss was wide-eyed and backing away. She said, "Please, I can't tell you that now. All of Gaia can't tell you. You must come to the place without knowing anything to begin with. You must learn it all there. You must then do what you must do—but you must do it calmly and unemotionally. If you remain as you are, nothing will be of use and, one way or another, Gaia will come to an end. You must change this feeling of yours and I do not know how to change it."

"Would Dom know if he were here?" said Trevize remorselessly.

"Dom is here," said Bliss. "He/I/we do not know how to change you or calm you. We do not understand a human being who cannot sense his place in the scheme of things, who does not feel like part of a greater whole."

Trevize said, "That is not so. You could seize my ship at a distance of a million kilometers and more—and keep us calm while we were helpless. Well, calm me now. Don't pretend you are not capable of doing it."

"But we mustn't. Not now. If we changed you or adjusted you in any way now, then you would be no more valuable to us than any other person in the Galaxy and we could not use you. We can only use you because you are you—and you must remain you. If we touch you at this moment in any way, we are lost. Please. You must be calm of your own accord."

"Not a chance, miss, unless you tell me some of what I want to know."

Pelorat said, "Bliss, let me try. Please go into the other room."

Bliss left, backing slowly out. Pelorat closed the door behind her.

Trevize said, "She can hear and see—sense everything. What difference does this make?"

Pelorat said, "It makes a difference to me. I want to be alone with you, even if isolation is an illusion. —Golan, you're afraid."

"Don't be a fool."

"Of course you are. You don't know where you're going, what you'll be facing, what you'll be expected to do. You have a right to be afraid."

"But I'm not."

"Yes, you are. Perhaps you're not afraid of physical danger in the way that I am. I've been afraid of venturing out into space, afraid of each new world I see, afraid of every new thing I encounter. After all, I've lived half a century of a constricted, withdrawn and limited life, while you have been in the Navy and in politics, in the thick and hurly-burly at home and in space. Yet I've tried not to be afraid and you've helped me. In this time that we've been together, you've been patient with me, you've been kind to me and understanding, and because of you, I've managed to master my fears and behave well. Let me, then, return the favor and help you."

"I'm not afraid, I tell you."

"Of course you are. If nothing else, you're afraid of the responsibility you'll be facing. Apparently there's a whole world depending on you—and you will therefore have to live with the destruction of a whole world if you fail. Why should you have to face that possibility for a world that means nothing to you? 'What right have they to place this load upon you? You're not only afraid of failure, as any person would be in your place, but you're furious that they should put you in the position where you have to be afraid.'"

"You're all wrong."

"I don't think so. Consequently let me take your place. I'll do it. Whatever it is they expect you to do, I volunteer as substitute. I assume that it's not something that requires great physical strength or vitality, since a simple mechanical device would outdo you in that respect. I assume it's not something that requires mentalics, for they have enough of that themselves. It's something that—well, I don't know, but if it requires neither brawn nor brain, then I have everything else as well as you—and I am ready to take the responsibility."

Trevize said sharply, "Why are you so willing to bear the load?"

Pelorat looked down at the floor, as though fearing to meet the other's eyes. He said, "I have had a wife, Golan. I have known women. Yet they have never been very important to me. Interesting. Pleasant. Never very important. Yet, this one—"

"Who? Bliss?"

"She's different, somehow—to me."

"By Terminus, Janov, she knows every word you're saying."

"That makes no difference. She knows anyhow. —I want to please her. I will undertake this task, whatever it is; run any risk, take any responsibility, on the smallest chance that it will make her—think well of me."

"Janov, she's a child."

"She's not a child—and what you think of her makes no difference to me."

"Don't you understand what you must seem to her?"

"An old man? What's the difference? She's part of a greater whole and I am not—and that alone builds an insuperable wall between us. Don't you think I know that? But I don't ask anything of her but that she—"

"Think well of you?"

"Yes. Or whatever else she can make herself feel for me."

"And for that you will do my job? —But Janov, haven't you been listening. They don't want you; they want me for some space-ridden reason I can't understand."

"If they can't have you and if they must have someone, I will be better than nothing, surely."

Trevize shook his head. "I can't believe that this is happening. Old age is overtaking you and you have discovered youth. Janov, you're trying to be a hero, so that you can die for that body."

"Don't say that, Golan. This is not a fit subject for humor." Trevize tried to laugh, but his eyes met Pelorat's grave face and he cleared his throat instead. He said, "You're right. I apologize. Call her in, Janov. Call her in."

Bliss entered, shrinking a little. She said in a small voice, "I'm sorry, Pel. You cannot substitute. It must be Trevize or no one."

Trevize said, "Very well. I'll be calm. Whatever it is, I'll try to do it. Anything to keep Janov from trying to play the romantic hero at his age."

"I know my age," muttered Pelorat.

Bliss approached him slowly, placed her hand on his shoulder. "Pel, I—I think well of you."

Pelorat looked away. "It's all right, Bliss. You needn't be kind."

"I'm not being kind, Pel. I think—very well of you."

Dimly, then more strongly, Sura Novi knew that she was Suranovirembastiran and that when she was a child, she had been known as Su to her parents and Vito her friends.

She had never really forgotten, of course, but the facts were, on occasion, buried deep within her. Never had it been buried as deeply or for as long as in this last month, for never had she been so close for so long to a mind so powerful.

But now it was time. She did not will it herself. She had no need to. The vast remainder of her was pushing her portion of itself to the surface, for the sake of the global need.

Accompanying that was a vague discomfort, a kind of itch that was rapidly overwhelmed by the comfort of selfness unmasked. Not in years had she been so close to the globe of Gaia.

She remembered one of the life-forms she had loved on Gaia as a child. Having understood its feelings then as a dim part of her own, she recognized her own sharper ones now. She was a butterfly emerging from a cocoon.

Stor Gendibal stared sharply and penetratingly at Novi—and with such surprise that he came within a hair of loosening his grip upon Mayor Branno. That he did not do

so was, perhaps, the result of a sudden support from without that steadied him and that, for the moment, he ignored.

He said, "What do you Know of Councilman Trevize, Novi?" And then, in cold disturbance at the sudden and growing complexity of her mind, he cried out, "What are you?"

He attempted to seize hold of her mind and found it impenetrable. At that moment, he recognized that his hold on Branno was supported by a grip stronger than his own. He repeated, "What are you?"

There was a hint of the tragic on Novi's face. "Master," she said, "Speaker Gendibal. My true name is Suranovirembastiran and I am Gaia."

It was all she said in words, but Gendibal, in sudden fury, had intensified his own mental aura and with great skill, now that his blood was up, evaded the strengthening bar and held Branno on his own and more strongly than before, while he gripped Novi's mind in a tight and silent struggle.

She held him off with equal skill, but she could not keep her mind closed to him—or perhaps she did not wish to.

He spoke to her as he would to another Speaker. "You have played a part, deceived me, lured me here, and you are one of the species from which the Mule was derived."

"The Mule was an aberration, Speaker. I/we are not Mules. I/we are Gaia."

The whole essence of Gaia was described in what she complexly communicated, far more than it could have been in any number of words.

"A whole planet alive," said Gendibal.

"And with a mentalic field greater as a whole than is yours as an individual. Please do not resist with such force. I fear the danger of harming you, something I do not wish to do."

"Even as a living planet, you are not stronger than the sum of my colleagues on Trantor. We, too, are, in a way, a planet alive."

"Only some thousands of people in mentalic co-operation, Speaker, and you cannot draw upon their support, for I have blocked it off. Test that and you will see."

"What is it you plan to do, Gaia?"

"I would hope, Speaker, that you would call me Novi. What I do now I do as Gaia, but I am Novi also—and with reference to you, I am only Novi."

"What is it you plan to do, Gaia?"

There was the trembling mentalic equivalent of a sigh and Novi said, "We will remain in triple stalemate. You will hold Mayor Branno through her shield, and I will help you do so, and we will not tire. You, I suppose, will maintain your grip on me, and I will maintain mine on you, and neither one of us will tire there either. And so it will stay."

"To what end?"

"As I have told you— We are waiting for Councilman Trevize of Terminus. It is he who will break the stalemate—as he chooses."

The computer on board the Far Star located the two ships and Golan Trevize displayed them together on the split screen.

They were both Foundation vessels. One was precisely like the Far Star and was undoubtedly Compor's ship. The other was larger and far more powerful.

He turned toward Bliss and said, "Well, do you know what's going on? Is there anything you can now tell me?"

"Yes! Do not be alarmed! They will not harm you."

"Why is everyone convinced I'm sitting here all a-tremble with panic?" Trevize demanded petulantly.

Pelorat said hastily, "Let her talk, Golan. Don't snap at her."

Trevize raised his arms in a gesture of impatient surrender. "I will not snap. Speak, lady."

Bliss said, "On the large ship is the ruler of your Foundation. With her—"

Trevize said in astonishment, "The ruler? You mean Old Lady Branno?"

"Surely that is not her title," said Bliss, her lips twitching a little in amusement. "But she is a woman, yes." She paused a little, as though listening intently to the rest of the general organism of which she was part. "Her name is Harlabranno. It seems odd to have only four syllables when one is so important on her world, but I suppose non-Gaians have their own ways."

"I suppose," said Trevize dryly. "You would call her Brann, I think. But what is she doing here? Why isn't she back on— I see. Gaia has maneuvered her here, too. Why?"

Bliss did not answer that question. She said, "With her is Lionokodell, five syllables, though her underling. It seems a lack of respect. He is an important official of your world. With them are four others who control the ship's weapons. Do you want their names?"

"No. I take it that on the other ship there is one man, Munn Li Compor, and that he represents the Second Foundation. You've brought both Foundations together, obviously. Why?"

"Not exactly, Trev—I mean, Trevize—"

"Oh, go ahead and say Trev. I don't give a puff of comet gas."

"Not exactly, Trev. Compor has left that ship and has been replaced by two people. One is Storgendibal, an important official of the Second Foundation. He is called a Speaker."

"An important official? He's got mentalic power, I imagine."

"Oh yes. A great deal."

"Will you be able to handle that?"

"Certainly. The second person, on the ship with him, is Gaia."

"One of your people?"

"Yes. Her name is Suranovirembastiran. It should be much longer, but she has been away from me/us/rest so long."

"Is she capable of holding a high official of the Second Foundation?"

"It is not she, it is Gaia who holds him. She/I/we/all are capable of crushing him."

"Is that what she's going to do? She's going to crush him and Branno? What is this? Is Gaia going to destroy the Foundations and set up a Galactic Empire of its own? The Mule back again? A greater Mule—"

"No no, Trev. Do not become agitated. You must not. All three are in a stalemate. They are waiting."

"For what?"

"For your decision."

"Here we go again. What decision? Why me?"

"Please, Trev," said Bliss. "It will soon be explained. I/we/she have said as much as I/we/she can for now."

Branno said wearily, "It is clear I have made a mistake, Liono, perhaps a fatal one."

"Is this something that ought to be admitted?" muttered Kodell through motionless lips.

"They know what I think. It will do no further harm to say so. Nor do they know less about what you think if you do not move your lips. —I should have waited until the shield was further strengthened."

Kodell said, "How could you have known, Mayor? If we waited until assurance was doubly and triply and quadruply and endlessly sure, we would have waited forever. —To be sure, I wish we had not gone ourselves. It would have been well to have experimented with someone else—with your lightning rod, Trevize, perhaps."

Branno sighed. "I wanted to give them no warning, Liono. Still, there you put the finger on the nub of my mistake. I might have waited until the shield was reasonably impenetrable. Not ultimately impenetrable but reasonably so. I knew there was perceptible leakage now, but I could not bear to wait longer. To wipe out the leakage would have meant waiting past my term of office and I wanted it done in my time—and I wanted to be on the spot. So like a fool, I forced myself to believe the shield was adequate. I would listen to no caution—to your doubts, for instance."

"We may still win out if we are patient."

"Can you give the order to fire on the other ship?"

"No, I cannot, Mayor. The thought is, somehow, not something I can endure."

"Nor I. And if you or I managed to give the order, I am certain that the men on board would not follow it, that they would not be able to."

"Not under present circumstances, Mayor, but circumstances might change. As a matter of fact, a new actor appears on the scene."

He pointed to the screen. The ship's computer had automatically split the screen as a new ship came within its ken. The second ship appeared on the right-hand side.

"Can you magnify the image, Liono?"

"No trouble. The Second Founder is skillful. We are free to do anything he is not troubled by."

"Well," said Branno, studying the screen, "that's the Far Star, I'm sure. And I imagine Trevize and Pelorat are on board. Then, bitterly, "Unless they too have been

replaced by Second Foundationers. My lightning rod has been very efficient indeed. —If only my shield had been stronger."

"Patience!" said Kodell.

A voice rang out in the confines of the ship's control room and Branno could somehow tell it did not consist of sound waves. She heard it in her mind directly and a glance at Kodell was sufficient to tell her that he had heard it, too.

It said, "Can you hear me, Mayor Branno? If you can, don't bother saying so. It will be enough if you think so."

Branno said calmly, "What are you?"

"I am Gaia."

The three ships were each essentially at rest, relative to the other two. All three were turning very slowly about the planet Gaia, as a distant three-part satellite of the planet. All three were accompanying Gaia on its endless journey about its sun.

Trevize sat, watching the screen, tired of guessing what his role might be—what he had been dragged across a thousand parsecs to do.

The sound in his mind did not startle him. It was as though he had been waiting for it.

It said, "Can you hear me, Golan Trevize? If you can, don't bother saying so. It will be enough if you think it."

Trevize looked about. Pelorat, clearly startled, was looking in various directions, as though trying to find the source. Bliss sat quietly, her hands held loosely in her lap. Trevize had no doubt, for a moment, that she was aware of the sound.

He ignored the order to use thoughts and spoke with deliberate clarity of enunciation. "If I don't find out what this is about, I will do nothing I am asked to do."

And the voice said, "You are about to find out."

Novi said, "You will all hear me in your mind. You are all free to respond in thought. I will arrange it so that all of you can hear each other. And, as you are all aware, we are all close enough so that at the normal light-speed of the spatial mentalic field, there will be no inconvenient delays. To begin with, we are all here by arrangement."

"In what manner?" came Branno's voice.

"Not by mental tampering," said Novi. "Gaia has interfered with no one's mind. It is not our way. We merely took advantage of ambition. Mayor Branno wanted to establish a Second Empire at once; Speaker Gendibal wanted to be First Speaker. It was enough to encourage these desires and to ride the wind, selectively and with judgment."

"I know how I was brought here," said Gendibal stiffly. And indeed he did. He knew why he had been so anxious to move out into space, so anxious to pursue Trevize, so sure he could handle it all. —It was all Novi. —Oh, Novi!

"You were a particular case, Speaker Gendibal. Your ambition was powerful, but there were softnesses about you that offered a shortcut. You were a person who would be kind to someone whom you had been trained to think of as beneath you in every respect. I took advantage of this in you and turned it against you. I/we am/are deeply ashamed. The excuse is that the future of the Galaxy is in hazard."

Novi paused and her voice (though she was not speaking by way of vocal cords) grew more somber, her face more drawn.

"This was the time. Gaia could wait no longer. For over a century, the people of Terminus had been developing a mentalic shield. Left to themselves another generation, it would have been impervious even to Gaia and they would have been free to use their physical weapons at will. The Galaxy would not have been able to resist them and a Second Galactic Empire, after the fashion of Terminus, would have been established at once, despite the Seldon Plan, despite the people of Trantor, and despite Gaia. Mayor Branno had to be somehow maneuvered into making her move while the shield was still imperfect.

"Then there is Trantor. The Seldon Plan was working perfectly, for Gaia itself labored to keep it on track with precision. And for over a century, there had been quietist First Speakers, so that Trantor vegetated. Now, however, Stor Gendibal was rising quickly. He would certainly become First Speaker and under him Trantor would take on an activist role. It would surely concentrate on physical power and would recognize the danger of Terminus and take action against it. If he could act against Terminus before its shield was perfected, then the Seldon Plan would be worked out to its conclusion in a Second Galactic Empire—after the fashion of Trantor—despite the people of Terminus and despite Gaia. Consequently Gendibal had to be somehow maneuvered into making his move before he became First Speaker.

"Fortunately, because Gaia has been working carefully for decades, we have brought both Foundations to the proper place at the proper time. I repeat all this primarily so that Councilman Golan Trevize of Terminus may understand."

Trevize cut in at once and again ignored the effort to converse by thought. He spoke words firmly, "I do not understand. What is wrong with either version of the Second Galactic Empire?"

Novi said, "The Second Galactic Empire—worked out after the fashion of Terminus—will be a military Empire, established by strife, maintained by strife, and eventually destroyed by strife. It will be nothing but the First Galactic Empire reborn. That is the view of Gaia.

"The Second Galactic Empire—worked out after the fashion of Trantor—will be a paternalistic Empire, established by calculation, maintained by calculation, and in perpetual living death by calculation. It will be a dead end. That is the view of Gaia."

Trevize said, "And what does Gaia have to offer as an alternative?"

"Greater Gaia! Galaxia! Every inhabited planet as alive as Gaia. Every living planet combined into a still greater hyperspatial life. Every uninhabited planet participating. Every star. Every scrap of interstellar gas. Perhaps even the great central black hole. A living galaxy and one that can be made favorable for all life in ways that we yet cannot foresee. A way of life fundamentally different from all that has gone before and repeating none of the old mistakes."

"Originating new ones," muttered Gendibal sarcastically.

"We have had thousands of years of Gaia to work those out."

"But not on a Galactic scale."

Trevize, ignoring the short exchange and driving to his point, said, "And what is my role in all this?"

The voice of Gaia—channeled through Novi's mind—thundered, "Choose! Which alternative is it to be?"

There was a vast silence that followed and finally, in that silence, Trevize's voice—mental at last, for he was too taken aback to speak—sounded small and still defiant. "Why me?"

Novi said, "Though we recognized the moment had come when either Terminus or Trantor would become too powerful to stop—or worse yet, when both might become so powerful that a deadly stalemate would develop that would devastate the Galaxy—we still could not move. For our purposes, we needed someone—a particular someone—with the talent for rightness. We found you, Councilman. —No, we cannot take the credit. The people of Trantor found you through the man named Compur, though even they did not know what they had. The act of finding you attracted our attention to you. Golan Trevize, you have the gift of knowing the right thing to do."

"I deny it," said Trevize.

"You are, every once in a while, sure. And we want you to be sure this time on behalf of the Galaxy. You do not wish the responsibility, perhaps. You may do your best not to have to choose. Nevertheless, you will realize that it is right to do so. You will be sure! And you will then choose. Once we found you, we knew the search was over and for years we have labored to encourage a course of action that would, without direct mentalic interference, so influence events that all three of you—Mayor Branno, Speaker Gendibal, and Councilman Trevize—would be in the neighborhood of Gaia at the same time. We have done it."

Trevize said, "At this point in space, under present circumstances, is it not true, Gaia—if that is what you want me to call you—that you can overpower both the Mayor and the Speaker? Is it not true that you can establish this living Galaxy you speak of without my doing anything? Why, then, do you not?"

Novi said, "I do not know if I can explain this to your satisfaction. Gaia was formed thousands of years ago with the help of robots that once, for a brief time, served the human species and now serve them no more. They made it quite clear to us that we could survive only by a strict application of the Three Laws of Robotics as applied to life generally. The First Law, in those terms, is: 'Gaia may not harm life or, through inaction, allow life to come to harm.' We have followed this rule through all of our history and we can do no other.

"The result is that we are now helpless. We cannot force our vision of the living Galaxy upon a quintillion human beings and countless other forms of life and perhaps do harm to vast numbers. Nor can we do nothing and watch the Galaxy half-destroy itself in a struggle that we might have prevented. We do not know whether action or inaction will cost the Galaxy less; nor, if we choose action, do we know whether supporting Terminus

or Trantor will cost the Galaxy less. Let Councilman Trevize decide then—and whatever that decision is, Gaia will follow it."

Trevize said, "How do you expect me to make a decision? What do I do?"

Novi said, "You have your computer. The people of Terminus did not know that when they made it, they made it better than they knew. The computer on board your ship incorporates some of Gaia. Place your hands on the terminals and think. You may think Mayor Branno's shield impervious, for instance. If you do, it is possible that she will at once use her weapons to disable or destroy the other two ships, establish physical rule over Gaia and, later on, Trantor."

"And you will do nothing to stop that?" said Trevize with astonishment.

"Not a thing. If you are sure that domination by Terminus will do the Galaxy less harm than any other alternative, we will gladly help that domination along—even at the cost of our own destruction.

"On the other hand, you may find Speaker Gendibal's mentalic field and you may then join your computer-magnified push to his. He will, in that case, surely break free of me and push me back. He may then adjust the Mayor's mind and, in combination with her ships, establish physical domination over Gaia and assure the continued supremacy of the Seldon Plan. Gaia will not move to stop that.

"Or you may find my mentalic field and join that—and then the living Galaxy will be set in motion to reach its fulfillment, not in this generation or the next, but after centuries of labor during which the Seldon Plan will continue. The choice is yours."

Mayor Branno said, "Wait! Do not make a decision just yet. May I speak?"

Novi said, "You may speak freely. So may Speaker Gendibal."

Branno said, "Councilman Trevize. The last time we met on Terminus, you said, 'The time may come, Madam Mayor, when you will ask me for an effort, and I will then do as I choose, and I will remember the past two days.' I don't know whether you foresaw this, or intuitively felt it would happen, or simply had what this woman who speaks of a living Galaxy calls a talent for rightness. In any case, you were right. I am asking you for an effort on behalf of the Federation.

"You may, I suppose, feel that you would like to even the score with me for having arrested and exiled you. I ask you to remember that I did it for what I considered the good of the Foundation Federation. Even if I were wrong or even if I acted out of callous self-interest, remember that it was I who did it—and not the Federation. Do not now destroy the entire Federation out of a desire to balance what I alone have done to you. Remember that you are a Founder and a human being, that you do not want to be a cipher in the plans of the bloodless mathematicians of Trantor or less than a cipher in a Galactic mish-mash of life and nonlife. You want yourself, your descendants, your fellow-people to be independent organisms, possessing free will. Nothing else matters.

"These others may tell you that our Empire will lead to bloodshed and misery—but it need not. It is our free-will choice whether this should be so or not. We may choose otherwise. And, in any case, it is better to go to defeat with free will than to live in meaningless security as a cog in a machine. Observe that you are now being asked to

make a decision as a free-will human being. These things of Gaia are unable to make a decision because their machinery will not allow them to, so that they depend on you. And they will destroy themselves if you bid them to. Is this what you want for all the Galaxy?"

Trevize said, "I do not know that I have free will, Mayor. My mind may have been subtly dealt with, so that I will give the answer that is desired."

Novi said, "Your mind is totally untouched. If we could bring ourselves to adjust you to suit our purposes, this whole meeting would be unnecessary. Were we that unprincipled, we could have proceeded with what we would find most pleasing to ourselves with no concern for the greater needs and good of humanity as a whole."

Gendibal said, "I believe it is my turn to speak. Councilman Trevize, do not be guided by narrow parochialism. The fact that you are Terminus-born should not lead you to believe that Terminus comes before the Galaxy. For five centuries now, the Galaxy has been operating in accordance with the Seldon Plan. In and out of the Foundation Federation, that operation has been proceeding.

"You are, and have been, part of the Seldon Plan above and beyond your lesser role as Founder. Do not do anything to disrupt the Plan, either on behalf of a narrow concept of patriotism or out of a romantic longing for the new and untried. The Second Founders will in no way hamper the free will of humanity. We are guides, not despots.

"And we offer a Second Galactic Empire fundamentally different from the First. Throughout human history, no decade in all the tens of thousands of years during which hyperspatial travel has existed has been completely free of bloodshed and violent death throughout the Galaxy, even in those periods when the Foundation itself was at peace. Choose Mayor Branno and that will continue endlessly into the future. The same dreary, deadly round. The Seldon Plan offers release from that at last—and not at the price of becoming one more atom in a Galaxy of atoms, being reduced to equality with grass, bacteria, and dust."

Novi said, "What Speaker Gendibal says of the First Foundation's Second Empire, I agree with. What he says of his own, I do not. The Speakers of Trantor are, after all, independent free-will human beings and are the same as they have always been. Are they free of destructive competition, of politics, of clawing upward at all costs? Are there no quarrels and even hatreds at the Speaker's Table—and will they always be guides you dare follow? Put Speaker Gendibal on his honor and ask him this."

"No need to put me on my honor," said Gendibal. "I freely admit we have our hatreds, competitions, and betrayals at the Table. But once a decision is reached, it is obeyed by all. There has never been an exception to this."

Trevize said, "What if I will not make a choice?"

"You must," said Novi. "You will know that it is right to do so and you will therefore make a choice."

"What if I try to make a choice and cannot?"

"You must."

Trevize said, "How much time do I have?"

Novi said, "Until you are sure, however much time that takes."

Trevize sat silently.

Though the others were silent too, it seemed to Trevize that he could hear the pulsing of his bloodstream.

He could hear Mayor Branno's voice say firmly, "Free will!" Speaker Gendibal's voice said peremptorily, "Guidance and peace!"

Novi's voice said wistfully, "Life."

Trevize turned and found Pelorat looking at him intently. He said, "Janov. Have you heard all this?"

"Yes, I have, Golan."

"What do you think?"

"The decision is not mine."

"I know that. But what do you think?"

"I don't know. I am frightened by all three alternatives. And yet a peculiar thought comes to me—"

"Yes?"

"When we first went out into space, you showed me the Galaxy. Do you remember?"

"Of course."

"You speeded time and the Galaxy rotated visibly. And I said, as though anticipating this very time, 'The Galaxy looks like a living thing, crawling through space.' Do you think that, in a way, it is alive already?"

And Trevize, remembering that moment, was suddenly sure. He remembered suddenly his feeling that Pelorat, too, would have a vital role to play. He turned in haste, anxious not to have time to think, to doubt, to grow uncertain.

He placed his hands on the terminals and thought with an intensity he had never known before.

He had made his decision—the decision on which the fate of the Galaxy hung.

20. CONCLUSION

MAYOR HARLA BRANNO HAD EVERY REASON FOR SATISFACTION. THE state visit had not lasted long, but it had been thoroughly productive.

She said, as though in deliberate attempt to avoid hubris, "We can't, of course, trust them completely."

She was watching the screen. The ships of the Fleet were, one by one, entering hyperspace and returning to their normal stations.

There was no question but that Sayshell had been impressed by their presence, but they could not have failed to notice two things: one, that the ships had remained in Foundation space at all times; two, that once Branno had indicated they would leave, they were indeed leaving with celerity.

On the other hand, Sayshell would not forget either that those ships could be recalled to the border at a day's notice—or less. It was a maneuver that had combined both a demonstration of power and a demonstration of goodwill.

Kodell said, "Quite right, we can't trust them completely, but then no one in the Galaxy can be trusted completely and it is in the self-interest of Sayshell to observe the terms of the agreement. We have been generous."

Branno said, "A lot will depend on working out the details and I predict that will take months. The general brushstrokes can be accepted in a moment, but then come the shadings: just how we arrange for quarantine of imports and exports, how we weigh the value of their grain and cattle compared to ours, and so on."

"I know, but it will be done eventually and the credit will be yours, Mayor. It was a bold stroke and one, I admit, whose wisdom I doubted."

"Come, Liono. It was just a matter of the Foundation recognizing Sayshellian pride. They've retained a certain independence since early Imperial times. It's to be admired, actually."

"Yes, now that it will no longer inconvenience us."

"Exactly, so it was only necessary to bend our own pride to the point of making some sort of gesture to theirs. I admit it took an effort to decide that I, as Mayor of a Galaxy-straddling Federation, should condescend to visit a provincial star-grouping, but once the decision was made it didn't hurt too much. And it pleased them. We had to gamble that they would agree to the visit once we moved our ships to the border, but it meant being humble and smiling very broadly."

Kodell nodded. "We abandoned the appearance of power to preserve the essence of it."

"Exactly. —Who first said that?"

"I believe it was in one of Eriden's plays, but I'm not sure. We can ask one of our literary lights back home."

"If I remember. We must speed the return visit of Sayshellians to Terminus and see to it that they are given the full treatment as equals. And I'm afraid, Liono, you will have to organize tight security for them. There is bound to be some indignation among our hotheads and it would not be wise to subject them to even slight and transient humiliation through protest demonstrations."

"Absolutely," said Kodell. "It was a clever stroke, by the way, sending out Trevize."

"My lightning rod? He worked better than I thought he would, to be honest. He blundered his way into Sayshell and drew their lightning in the form of protests with a speed I could not have believed. Space! What an excellent excuse that made for my visit—concern lest a Foundation national in any way disturbed then and gratitude for their forbearance."

"Shrewd! —You don't think it would have been better, though, to have brought Trevize back with us?"

"No. On the whole, I prefer him anywhere but at home. He would be a disturbing factor on Terminus. His nonsense about the Second Foundation served as the perfect excuse for sending him out and, of course, we counted on Pelorat to lead him to Sayshell, but I don't want him back, continuing to spread the nonsense. We can never tell what that might lead to."

Kodell chuckled. "I doubt that we can ever find anyone more gullible than an intellectual academic. I wonder how much Pelorat would have swallowed if we had encouraged him."

"Belief in the literal existence of the mythical Sayshellian Gaia was quite enough—but forget it. We will have to face the Council when we return and we will need their votes for the Sayshellian treaty. Fortunately we have Trevize's statement—voiceprint and all — to the effect that he left Terminus voluntarily. I will offer official regrets as to Trevize's brief arrest and that will satisfy the Council."

"I can rely on you for the soft soap, Mayor," said Kodell dryly. "Have you considered, though, that Trevize may continue to search for the Second Foundation?"

"Let him," said Branno, shrugging, "as long as he doesn't do it on Terminus. It will keep him busy and get him nowhere. The Second Foundation's continued existence is our myth of the century, as Gaia is Sayshell's myth."

She leaned back and looked positively genial. "And now we have Sayshell in our grip—and by the time they see that, it will be too late for them to break the grip. So the Foundation's growth continues and will continue, smoothly and regularly."

"And the credit will be entirely yours, Mayor."

"That has not escaped my notice," said Branno, and their ship slipped into hyperspace and reappeared in the neighborhood space of Terminus.

Speaker Stor Gendibal, on his own ship again, had every reason for satisfaction. The encounter with the First Foundation had not lasted long, but it had been thoroughly productive.

He had sent back his message of carefully muted triumph. It was only necessary—for the moment—to let the First Speaker know that all had gone well (as, indeed, he

might guess from the fact that the general force of the Second Foundation had never had to be used after all). The details could come later on.

He would describe how a careful—and very minor—adjustment to Mayor Branno's mind had turned her thoughts from imperialistic grandiosity to the practicality of commercial treaty; how a careful—and rather long-distance—adjustment of the leader of the Sayshell Union had led to an invitation to the Mayor of a parley and how, thereafter, a rapprochement had been reached with no further adjustments at all with Compor returning to Terminus on his own ship, to see that the agreement would be kept. It had been, Gendibal thought complacently, almost a storybook example of large results brought about by minutely crafted mentalics.

It would, he was sure, squash Speaker Delarmi flat and bring about his own elevation to First Speaker very soon after the presentation of the details at a formal meeting of the Table.

And he did not deny to himself the importance of Sum Novi's presence, though that would not need to be stressed to the Speakers generally. Not only had she been essential to his victory, but she gave him the excuse he now needed for indulging his childish (and very human, for even Speakers are very human) need to exult before what he knew to be a guaranteed admiration.

She did not understand anything that had happened, he knew, but she was aware that he had arranged matters to his liking and she was bursting with pride over that. He caressed the smoothness of her mind and felt the warmth of that pride.

He said, "I could not have done it without you, Novi. It was because of you I could tell that the First Foundation—the people on the large ship—"

"Yes, Master, I know whom you mean."

"I could tell, because of you, that they had a shield, together with weak powers of the mind. From the effect on your mind, I could tell, exactly, the characteristics of both. I could tell how most efficiently to penetrate the one and deflect the other."

Novi said tentatively, "I do not understand exactly what it is you say, Master, but I would have done much more to help, if I could."

"I know that, Novi. But what you did was enough. It is amazing how dangerous they might have been. But caught now, before either their shield or their field had been developed more strongly, they could be stopped. The Mayor goes back now, the shield and the field forgotten, satisfied over the fact that she has obtained a commercial treaty with Sayshell that will make it a working part of the Federation. I don't deny that there is much more to do to dismantle the work they have done on shield and field—it is something concerning which we have been remiss—but it will be done."

He brooded about the matter and went on in a lower voice, "We took far too much for granted with the First Foundation. We must place them under closer supervision. We must knit the Galaxy closer together somehow. We must make use of mentalics to build a closer co-operation of consciousness. That would fit the Plan. I'm convinced of that and I'll see to it."

Novi said anxiously, "Master?"

Gendibal smiled suddenly. "I'm sorry. I'm talking to myself. —Novi, do you remember Rufirant?"

"That bone-skulled farmer who attacked you? I should say I do."

"I'm convinced that First Foundation agents, armed with personal shields, arranged that, together with all the other anomalies that have plagued us. Imagine being blind to a thing like that. But then, I was bemused into overlooking the First Foundation altogether by this myth of a mysterious world, this Sayshellian superstition concerning Gaia. There, too, your mind came in handy. It helped me determine that the source of that mentalic field was the warship and nothing else."

He rubbed his hands.

Novi said timidly, "Master?"

"Yes, Novi?"

"Will you not be rewarded for what you have done?"

"Indeed I will. Shandess will retire and I will be First Speaker. Then will come my chance to make us an active factor in revolutionizing the Galaxy."

"First Speaker?"

"Yes, Novi. I will be the most important and the most powerful scholar of them all."

"The most important?" She looked woebegone.

"Why do you make a face, Novi? Don't you want me to be rewarded?"

"Yes, Master, I do. —But if you are the most important scholar of them all, you will not want a Hamishwoman near you. It would not be fitting."

"Won't I, though? Who will stop me?" He felt a gush of affection for her. "Novi, you'll stay with me wherever I go and whatever I am. Do you think I would risk dealing with some of the wolves we occasionally have at the Table without your mind always there to tell me, even before they know themselves, what their emotions might be—your own innocent, absolutely smooth mind. Besides—" He seemed startled by a sudden revelation, "Even aside from that, I—I like having you with me and I intend having you with me. —That is, if you are willing."

"Oh, Master," whispered Novi and, as his arm moved around her waist, her head sank to his shoulder.

Deep within, where the enveloping mind of Novi could scarcely be aware of it, the essence of Gaia remained and guided events, but it was that impenetrable mask that made the continuance of the great task possible.

And that mask—the one that belonged to a Hamishwoman—was completely happy. It was so happy that Novi was almost reconciled for the distance she was from herself/them/all, and she was content to be, for the indefinite future, what she seemed to be.

Pelorat rubbed his hands and said, with carefully controlled enthusiasm, "How glad I am to be back on Gaia."

"Umm," said Trevize abstractedly.

"You know what Bliss has told me? The Mayor is going back to Terminus with a commercial treaty with Sayshell. The Speaker from the Second Foundation is going back

to Trantor convinced that he has arranged it—and that woman, Novi, is going with him to see to it that the changes that will bring about Galaxia are initiated. And neither Foundation is in the least aware that Gaia exists. It's absolutely amazing."

"I know," said Trevize. "I was told all this, too. But we know that Gaia exists and we can talk."

"Bliss doesn't think so. She says no one would believe us, and we would know that. Besides, I, for one, have no intention of ever leaving Gaia."

Trevize was pulled out of his inner musing. He looked up and said, "What?"

"I'm going to stay here. —You know, I can't believe it. Just weeks ago, I was living a lonely life on Terminus, the same life I had lived for decades, immersed in my records and my thoughts and never dreaming anything but that I would go to my death, whenever it might be, still immersed in my records and my thoughts and still living my lonely life—contentedly vegetating. Then, suddenly and unexpectedly, I became a Galactic traveler; I was involved with a Galactic crisis; and—do not laugh, Golan—I have found Bliss."

"I'm not laughing, Janov," said Trevize, "but are you sure you know what you're doing?"

"Oh yes. This matter of Earth is no longer important to me. The fact that it was the only world with a diverse ecology and with intelligent life has been adequately explained. The Eternals, you know."

"Yes, I know. And you're going to stay on Gaia?"

"Absolutely. Earth is the past and I'm tired of the past. Gaia is the future."

"You're not part of Gaia, Janov. Or do you think you can become part of it?"

"Bliss says that I can become somewhat a part of it—intellectually if not biologically. She'll help, of course."

"But since she is part of it, how can you two find a common life, a common point of view, a common interest—"

They were in the open and Trevize looked gravely at the quiet, fruitful island, and beyond it the sea, and on the horizon, purpled by distance, another island—all of it peaceful, civilized, alive, and a unit.

He said, "Janov, she is a world; you are a tiny individual. What if she gets tired of you? She is young—"

"Golan, I've thought of that. I've thought of nothing but that for days. I expect her to grow tired of me; I'm no romantic idiot. But whatever she gives me till then will be enough. She has already given me enough. I have received more from her than I dreamed existed in life. If I saw her no more from this moment on, I have ended the winner."

"I don't believe it," said Trevize gently. "I think you are a romantic idiot and, mind you, I wouldn't want you any other way. Janov, we haven't known each other for long, but we've been together every moment for weeks and—I'm sorry if it sounds silly—I like you a great deal."

"And I, you, Golan," said Pelorat.

"And I don't want you hurt. I must talk to Bliss."

"No, no. Please don't. You'll lecture her."

"I won't lecture her. It's not entirely to do with you—and I want to talk to her privately. Please, Janov, I don't want to do it behind your back, so grant me your willingness to have me talk to her and get a few things straight. If I am satisfied, I will give you my heartiest congratulations and goodwill—and I will forever hold my peace, whatever happens."

Pelorat shook his head. "You'll ruin things."

"I promise I won't I beg you—"

"Well— But do be careful, my dear fellow, won't you?"

"You have my solemn word."

Bliss said, "Pel says you want to see me."

Trevize said, "Yes."

They were indoors, in the small apartment allotted to him.

She sat down gracefully, crossed her legs, and looked up at him shrewdly, her beautiful brown eyes luminous and her long, dark hair glistening.

She said, "You disapprove of me, don't you? You have disapproved of me from the start."

Trevize remained standing. He said, "You are aware of minds and of their contents. You know what I think of you and why."

Slowly Bliss shook her head. "Your mind is out of bounds to Gaia. You know that. Your decision was needed and it had to be the decision of a clear and untouched mind. When your ship was first taken, I placed you and Pel within a soothing field, but that was essential. You would have been damaged—and perhaps rendered useless for a crucial time—by panic or rage. And that was all. I could never go beyond that and I haven't—so I don't know what you're thinking."

Trevize said, "The decision I had to make has been made. I decided in favor of Gaia and Galaxia. Why, then, all this talk of a clear and untouched mind? You have what you want and you can do with me now as you wish."

"Not at all, Trev. There are other decisions that may be needed in the future. You remain what you are and, while you are alive, you are a rare natural resource of the Galaxy. Undoubtedly there are others like you in the Galaxy and others like you will appear in the future, but for now we know of you—and only you. We still cannot touch you."

Trevize considered. "You are Gaia and I don't want to talk to Gaia. I want to talk to you as an individual, if that has any meaning at all."

"It has meaning. We are far from existing in a common melt. I can block off Gaia for a period of time."

"Yes," said Trevize. "I think you can. Have you now done so?"

"I have now done so."

"Then, first, let me tell you that you have played games. You did not enter my mind to influence my decision, perhaps, but you certainly entered Janov's mind to do so, didn't you?"

"Do you think I did?"

"I think you did. At the crucial moment, Pelorat reminded me of his own vision of the Galaxy as alive and the thought drove me on to make my decision at that moment. The thought may have been his, but yours was the mind that triggered it, was it not?"

Bliss said, "The thought was in his mind, but there were many thoughts there. I smoothed the path before that reminiscence of his about the living Galaxy—and not before any other thought of his. That particular thought, therefore, slipped easily out of his consciousness and into words. Mind you, I did not create the thought. It was there."

"Nevertheless, that amounted to an indirect tampering with the perfect independence of my decision, did it not?"

"Gaia felt it necessary."

"Did it? —Well, it may make you feel better—or nobler—to know that although Janov's remark persuaded me to make the decision at that moment, it was the decision I think I would have made even if he had said nothing or if he had tried to argue me into a decision of a different kind. I want you to know that."

"I am relieved," said Bliss coolly. "Is that what you wanted to tell me when you asked to see me?"

"No."

"What else is there?"

Now Trevize sat down in a chair he had drawn opposite her so that their knees nearly touched. He leaned toward her.

"When we approached Gaia, it was you on the space station. It was you who trapped us; you who came out to get us; you who have remained with us ever since—except for the meal with Dom, which you did not share with us. In particular, it was you on the Far Star with us, when the decision was made. Always you."

"I am Gaia."

"That does not explain it. A rabbit is Gaia. A pebble is Gaia. Everything on the planet is Gaia, but they are not all equally Gaia. Some are more equal than others. Why you?"

"Why do you think?"

Trevize made the plunge. He said, "Because I don't think you're Gaia. I think you're more than Gaia."

Bliss made a derisive sound with her lips.

Trevize kept to his course. "At the time I was making the decision, the woman with the Speaker—"

"He called her Novi."

"This Novi, then, said that Gaia was set on its course by the robots that no longer exist and that Gaia was taught to follow a version of the Three Laws of Robotics."

"That is quite true."

"And the robots no longer exist?"

"So Novi said."

"So Novi did not say. I remember her exact words. She said: 'Gaia was formed thousands of years ago with the help of robots that once, for a brief time, served The human species and now serve them no more.'"

"Well, Trev, doesn't that mean they exist no more?"

"No, it means they serve no more. Might they not rule instead?"

"Ridiculous!"

"Or supervise? Why were you there at the time of the decision? You did not seem to be essential. It was Novi who conducted matters and she was Gaia. What need of you? Unless—"

"Well? Unless?"

"Unless you are the supervisor whose role it is to make certain that Gaia does not forget the Three Laws. Unless you are a robot, so cleverly made that you cannot be told from a human being."

"If I cannot be told from a human being, how is it you think that you can tell?" asked Bliss with a trace of sarcasm.

Trevize sat back. "Do you not all assure me I have the faculty of being sure; of making decisions, seeing solutions, drawing correct conclusions. I don't claim this; it is what you say of me. Well, from the moment I saw you I felt uneasy. There was something wrong with you. I am certainly as susceptible to feminine allure as Pelorat is—more so, I should think—and you are an attractive woman in appearance. Yet not for one moment did I feel the slightest attraction."

"You devastate me."

Trevize ignored that. He said, "When you first appeared on our ship, Janov and I had been discussing the possibility of a nonhuman civilization on Gaia, and when Janov saw you, he asked, in his innocence, 'Are you human?' Perhaps a robot must answer the truth, but I suppose it can be evasive. You merely said, 'Don't I look human?' Yes, you look human, Bliss, but let me ask you again. Are you human?"

Bliss said nothing and Trevize continued. "I think that even at that first moment, I felt you were not a woman. You are a robot and I could somehow tell. And because of my feeling, all the events that followed had meaning for me—particularly your absence from the dinner."

Bliss said, "Do you think I cannot eat, Trev? Have you forgotten I nibbled a shrimp dish on your ship? I assure you that I am able to eat and perform any of the other biological functions. —Including, before you ask, sex. And yet that in itself, I might as well tell you, does not prove that I am not a robot. Robots had reached the pitch of perfection, even thousands of years ago, where only by their brains were they distinguishable from human beings, and then only by those able to handle mentalic fields. Speaker Gendibal might have been able to tell whether I were robot or human, if he had bothered even once to consider me. Of course, he did not."

"Yet, though I am without mentalics, I am nevertheless convinced you are a robot"

Bliss said, "But what if I am? I admit nothing, but I am curious. What if I am?"

"You have no need to admit anything. I know you are a robot. If I needed a last bit of evidence, it was your calm assurance that you could block off Gaia and speak to me as an individual. I don't think you could do that if you were part of Gaia—but you are not. You are a robot supervisor and, therefore, outside of Gaia. I wonder, come to think of it, how many robot supervisors Gaia requires and possesses?"

"I repeat: I admit nothing, but I am curious. What if I am a robot?"

"In that case, what I want to know is: What do you want of Janov Pelorat? He is my friend and he is, in some ways, a child. He thinks he loves you; he thinks he wants only what you are willing to give and that you have already given him enough. He doesn't know—and cannot conceive—the pain of the loss of love or, for that matter, the peculiar pain of knowing that you are not human—"

"Do you know the pain of lost love?"

"I have had my moments. I have not led the sheltered life of Janov. I have not had my life consumed and anesthetized by an intellectual pursuit that swallowed up everything else, even wife and child. He has. Now suddenly, he gives it all up for you. I do not want him hurt. I will not have him hurt. If I have served Gaia, I deserve a reward—and my reward is your assurance that Janov Pelorat's well-being will be preserved."

"Shall I pretend I am a robot and answer you?"

Trevize said, "Yes. And right now."

"Very well, then. Suppose I am a robot, Trev, and suppose I am in a position of supervision. Suppose there are a few, a very few, who have a similar role to myself and suppose we rarely meet. Suppose that our driving force is the need to care for human beings and suppose there are no true human beings on Gaia, because all are part of an overall planetary being.

"Suppose that it fulfills us to care for Gaia—but not entirely. Suppose there is something primitive in us that longs for a human being in the sense that existed when robots were first formed and designed. Don't mistake me; I do not claim to be age-old (assuming I am a robot). I am as old as I told you I was or, at least, (assuming I am a robot) that has been the term of my existence. Still, (assuming I am a robot) my fundamental design would be as it always was and I would long to care for a true human being.

"Pel is a human being. He is not part of Gaia. He is too old to ever become a true part of Gaia. He wants to stay on Gaia with me, for he does not have the feelings about me that you have. He does not think that I am a robot. Well, I want him, too. If you assume that I am a robot, you see that I would. I am capable of all human reactions and I would love him. If you were to insist I was a robot, you might not consider me capable of love in some mystic human sense, but you would not be able to distinguish my reactions from that which you would call love—so what difference would it make?"

She stopped and looked at him—intransigently proud. Trevize said, "You are telling me that you would not abandon him?"

"If you assume that I am a robot, then you can see for yourself that by First Law I could never abandon him, unless he ordered me to do so and I were, in addition,

convinced that he meant it and that I would be hurting him more by staying than by leaving."

"Would not a younger man—"

"What younger man? You are a younger man, but I do not conceive you as needing me in the same sense that Pel does, and, in fact, you do not want me, so that the First Law would prevent me from attempting to cling to you."

"Not me. Another younger man—"

"There is no other. Who is there on Gaia other than Pel and yourself that would qualify as human beings in the non-Gaian sense?"

Trevize said, more softly, "And if you are not a robot?"

"Make up your mind," said Bliss.

"I say, if you are not a robot?"

"Then I say that, in that case, you have no right to say anything at all. It is for myself and for Pel to decide."

Trev said, "Then I return to my first point. I want my reward and that reward is that you will treat him well. I won't press the point of your identity. Simply assure me, as one intelligence to another, that you will treat him well."

And Bliss said softly, "I will treat him well—not as a reward to you, but because I wish to. It is my earnest desire. I will treat him well." She called "Pel!" And again, "Pel!"

Pelorat entered from outside, "Yes, Bliss."

Bliss held out her hand to him. "I think Trev wants to say something."

Pelorat took her hand and Trevize then took the doubled hand in his two. "Janov," he said, "I am happy for both of you."

Pelorat said, "Oh, my dear fellow."

Trevize said, "I will probably be leaving Gaia. I go now to speak to Dom about that. I don't know when or if we will meet again, Janov, but, in any case, we did well together."

"We did well," said Pelorat, smiling.

"Good-bye, Bliss, and, in advance, thank you."

"Good-bye, Trev."

And Trevize, with a wave of his hand, left the house.

Dom said, "You did well, Trev. —But then, you did as I thought you would."

They were once more sitting over a meal, as unsatisfactory as the first had been, but Trevize did not mind. He might not be eating on Gaia again.

He said, "I did as I thought you would, but not, perhaps, for the reason you thought I would."

"Surely you were sure of the correctness of your decision."

"Yes, I was, but not because of any mystic grip I have on certainty. If I chose Galaxia, it was through ordinary reasoning—the sort of reasoning that anyone else might have used to come to a decision. Would you care to have me explain?"

"I most certainly would, Trev."

Trevize said, "There were three things I might have done. I might have joined the First Foundation, or joined the Second Foundation, or joined Gaia.

"If I had joined the First Foundation, Mayor Branno would have taken immediate action to establish domination over the Second Foundation and over Gaia. If I had joined the Second Foundation, Speaker Gendibal would have taken immediate action to establish domination over the First Foundation and over Gaia. In either case, what would have taken place would have been irreversible—and if either were the wrong solution, it would have been irreversibly catastrophic.

"If I joined with Gaia, however, then the First Foundation and the Second Foundation would each have been left with the conviction of having won a relatively minor victory. All would then have continued as before, since the building of Galaxia, I had already been told, would take generations, even centuries.

"Joining with Gaia was my way of temporizing, then, and of making sure that there would remain time to modify matters—or even reverse them—if my decision were wrong."

Dom raised his eyebrows. His old, almost cadaverous face remained otherwise expressionless. He said in his piping voice, "And is it your opinion that your decision may turn out wrong?"

Trevize shrugged. "I don't think so, but there is one thing I must do in order that I might know. It is my intention to visit Earth, if I can find that world."

"We will certainly not stop you if you wish to leave us, Trev—"

"I do not fit on your world."

"No more than Pel does, yet you are as welcome to remain as he is. Still, we will not hold you. —But tell me, why do you wish to visit Earth?"

Trevize said, "I rather think you understand."

"I do not."

"There is a piece of information you withheld from me, Dom. Perhaps you had your reasons, but I wish you had not."

Dom said, "I do not follow you."

"Look, Dom, in order to make my decision, I used my computer and for a brief moment I found myself in touch with the minds of those about me—Mayor Branno, Speaker Gendibal, Novi. I caught glimpses of a number of matters that, in isolation, meant little to me, as, for example, the various effects Gaia, through Novi, had produced on Trantor—effects that were intended to maneuver the Speaker into going to Gaia."

"Yes?"

"And one of those things was the clearing from Trantor's library of all references to Earth."

"The clearing of references to Earth?"

"Exactly. So Earth must be important—and not only does it appear that the Second Foundation must know nothing about it, but that I must not, either. And if I am to take the responsibility for the direction of Galactic development, I do not willingly accept

ignorance. Would you consider telling me why it was so important to keep knowledge of Earth hidden?"

Dom said solemnly, "Trev, Gaia knows nothing about such clearance. Nothing!"

"Are you telling me that Gaia is not responsible?"

"It is not responsible."

Trevize thought for a while, the tip of his tongue moving slowly and meditatively over his lips. "Who was responsible, then?"

"I don't know. I can see no purpose in it."

The two men stared at each other and then Dom said, "You are right. We had seemed to have reached a most satisfactory conclusion, but while this point remains unsettled, we dare not rest. —Stay a while with us and let us see what we can reason out. Then you can leave, with our full help."

"Thank you," said Trevize.

THE END

(for now)

AFTERWORD BY THE AUTHOR

This BOOK WHILE SELF-CONTAINED, IS A CONTINUATION OF The Foundation Trilogy, which is made up of three books: Foundation, Foundation and Empire, and Second Foundation.

In addition, there are other books I have written which, while not dealing with the Foundations directly, are set in what we might call "the Foundation universe. "

Thus, the events in The Stars, Like Dust and The Currents of Space take place in the years when Trantor was expanding toward Empire, while the events in Pebble in the Sky take place when the First Galactic Empire was at the height of its power. In Pebble, Earth is central and some of the material in it is alluded to tangentially in this new book.

In none of the earlier books of the Foundation universe were robots mentioned. In this new book, however, there are references to robots. In this connection, you may wish to read my robot stories. The short stories are to be found in The Complete Robot, while the two novels, The Caves of Steel and The Naked Sun, describe the robotic period of the colonization of the Galaxy.

If you wish an account of the Eternals and the way in which they adjusted human history, you will find it (not entirely consistent with the references in this new book) in The End of Eternity.

All the books mentioned existed as Doubleday hardcovers, to begin with. The Foundation Trilogy and The Complete Robot are still in print in hardcover. Of the others, Pebble in the Sky and The End of Eternity are included in the omnibus volume The Far Ends of Time and Earth, while The Stars, Like Dust and The Currents of Space are in the omnibus volume Prisoners of the Stars. Both omnibus volumes are in print in hardcover. As for The Caves of Steel and The Naked Sun, they are included in the omnibus volume The Robot Novels, still available from the Science Fiction Book Club. And all are in print in softcover editions, of course.

FOUNDATION AND EARTH

1983

THE STORY BEHIND THE FOUNDATION

ON August 1, 1941, when I was a lad of twenty-one, I was a graduate student in chemistry at Columbia University and had been writing science fiction professionally for three years. I was hastening to see John Campbell, editor of *Astounding*, to whom I had sold five stories by then. I was anxious to tell him a new idea I had for a science fiction story.

It was to write a historical novel of the future; to tell the story of the fall of the Galactic Empire. My enthusiasm must have been catching, for Campbell grew as excited as I was. He didn't want me to write a single story. He wanted a series of stories, in which the full history of the thousand years of turmoil between the fall of the First Galactic Empire and the rise of the Second Galactic Empire was to be outlined. It would all be illuminated by the science of "psychohistory" that Campbell and I thrashed out between us.

The first story appeared in the May 1942 *Astounding* and the second story appeared in the June 1942 issue. They were at once popular and Campbell saw to it that I wrote six more stories before the end of the decade. The stories grew longer, too. The first one was only twelve thousand words long. Two of the last three stories were fifty thousand words apiece.

By the time the decade was over, I had grown tired of the series, dropped it, and went on to other things. By then, however, various publishing houses were beginning to put out hardcover science fiction books. One such house was a small semiprofessional firm, Gnome Press. They published my Foundation series in three volumes: *Foundation* (1951); *Foundation and Empire* (1952); and *Second Foundation* (1953). The three books together came to be known as *The Foundation Trilogy*.

The books did not do very well, for Gnome Press did not have the capital with which to advertise and promote them. I got neither statements nor royalties from them.

In early 1961, my then-editor at Doubleday, Timothy Seldes, told me he had received a request from a foreign publisher to reprint the Foundation books. Since they were not Doubleday books, he passed the request on to me.

I shrugged my shoulders. "Not interested, Tim. I don't get royalties on those books."

Seldes was horrified, and instantly set about getting the rights to the books from Gnome Press (which was, by that time, moribund) and in August of that year, the books (along with *I, Robot*) became Doubleday property.

From that moment on, the Foundation series took off and began to earn increasing royalties. Doubleday published the Trilogy in a single volume and distributed them through the Science Fiction Book Club. Because of that the Foundation series became enormously well-known.

In the 1966 World Science Fiction Convention, held in Cleveland, the fans were asked to vote on a category of "The Best All-Time Series." It was the first time (and, so far, the last) the category had been included in the nominations for the Hugo Award. The Foundation Trilogy won the award, which further added to the popularity of the series.

Increasingly, fans kept asking me to continue the series. I was polite but I kept refusing. Still, it fascinated me that people who had not yet been born when the series was begun had managed to become caught up in it.

Doubleday, however, took the demands far more seriously than I did. They had humored me for twenty years but as the demands kept growing in intensity and number, they finally lost patience. In 1981, they told me that I simply had to write another Foundation novel and, in order to sugar-coat the demand, offered me a contract at ten times my usual advance.

Nervously, I agreed. It had been thirty-two years since I had written a Foundation story and now I was instructed to write one 140,000 words long, twice that of any of the earlier volumes and nearly three times as long as any previous individual story. I re-read The Foundation Trilogy and, taking a deep breath, dived into the task.

The fourth book of the series, Foundation's Edge, was published in October 1982, and then a very strange thing happened. It appeared in the New York Times bestseller list at once. In fact, it stayed on that list for twenty-five weeks, much to my utter astonishment. Nothing like that had ever happened to me.

Doubleday at once signed me up to do additional novels and I wrote two that were part of another series, The Robot Novels -And then it was time to return to the Foundation.

So I wrote Foundation and Earth, which begins at the very moment that Foundation's. Edge ends, and that is the book you now hold. It might help if you glanced over Foundation's Edge just to refresh your memory, but you don't have to. Foundation and Earth stands by itself. I hope you enjoy it.

-ISAAC ASIMOV,
New York City, 1986

PART ONE – GAIA

1. THE SEARCH BEGINS

1.

"WHY DID I do it?" asked Golan Trevize.

It wasn't a new question. Since he had arrived at Gaia, he had asked it of himself frequently. He would wake up from a sound sleep in the pleasant coolness of the night and find the question sounding noiselessly in his mind, like a tiny drumbeat: Why did I do it? Why did I do it?

Now, though, for the first time, he managed to ask it of Dom, the ancient of Gaia.

Dom was well aware of Trevize's tension for he could sense the fabric of the Councilman's mind. He did not respond to it. Gaia must in no way ever touch Trevize's mind, and the best way of remaining immune to the temptation was to painstakingly ignore what he sensed.

"Do what, Trev?" he asked. He found it difficult to use more than one syllable in addressing a person, and it didn't matter. Trevize was growing somewhat used to that.

"The decision I made," said Trevize. "Choosing Gaia as the future."

"You were right to do so," said Dom, seated, his aged deep-set eyes looking earnestly up at the man of the Foundation, who was standing.

"You say I am right," said Trevize impatiently.

"I/we/Gaia know you are. That's your worth to us. You have the capacity for making the right decision on incomplete data, and you have made the decision. You chose Gaia! You rejected the anarchy of a Galactic Empire built on the technology of the First Foundation, as well as the anarchy of a Galactic Empire built on the mentalics of the Second Foundation. You decided that neither could be long stable. So you chose Gaia."

"Yes," said Trevize. "Exactly! I chose Gaia, a superorganism; a whole planet with a mind and personality in common, so that one has to say 'I/we/ Gaia' as an invented pronoun to express the inexpressible." He paced the floor restlessly. "And it will become eventually Galaxia, a super-superorganism embracing all the swarm of the Milky Way."

He stopped, turned almost savagely on Dom, and said, "I feel I'm right, as you feel it, but you want the coming of Galaxia, and so are satisfied with the Id on. There's something in me, however, that doesn't want it, and for that reason I'm not satisfied to accept the rightness so easily. I want to know why I Made the decision, I want to weigh and judge the rightness and be satisfied with it. Merely feeling right isn't enough. How can I know I am right? What b the device that makes me right?"

"I/we/Gaia do not know how it is that you come to the right decision. Is it important to know that as long as we have the decision?"

"You speak for the whole planet, do you? For the common consciousness of every dewdrop, of every pebble, of even the liquid central core of the planet?"

"I do, and so can any portion of the planet in which the intensity of the common consciousness is great enough."

"And is all this common consciousness satisfied to use me as a black box? Since the black box works, is it unimportant to know what is inside? -That doesn't suit me. I don't enjoy being a black box. I want to know what's inside. I want to know how and why I chose Gaia and Galaxia as the future, so that I can rest and be at peace."

"But why do you dislike or distrust your decision so?"

Trevize drew a deep breath and said slowly, in a low and forceful voice, "Because I don't want to be part of a superorganism. I don't want to be a dispensable part to be done away with whenever the superorganism judges that doing away would be for the good of the whole."

Dom looked at Trevize thoughtfully. "Do you want to change your decision, then, Trev? You can, you know."

"I long to change the decision, but I can't do that merely because I dislike it. To do something now, I have to know whether the decision is wrong or right. It's not enough merely to feel it's right."

"If you feel you are right, you are right." Always that slow, gentle voice that somehow made Trevize feel wilder by its very contrast with his own inner turmoil.

Then Trevize said, in half a whisper, breaking out of the insoluble oscillation between feeling and knowing, "I must find Earth."

"Because it has something to do with this passionate need of yours to know?"

"Because it is another problem that troubles me unbearably and because I feel there is a connection between the two. Am I not a black box? I feel there is a connection. Isn't that enough to make you accept it as a fact?"

"Perhaps," said Dom, with equanimity.

"Granted it is now thousands of years-twenty thousand perhaps-since the people of the Galaxy have concerned themselves with Earth, how is it possible that we have all forgotten our planet of origin?"

"Twenty thousand years is a longer time than you realize. There are many aspects of the early Empire we know little of; many legends that are almost surely fictitious but that we keep repeating, and even believing, because of lack of anything to substitute. And Earth is older than the Empire."

"But surely there are some records. My good friend, Pelorat, collects myths and legends of early Earth; anything he can scrape up from any source. It is his profession and, more important, his hobby. Those myths and legends are all there are. There are no actual records, no documents."

"Documents twenty thousand years old? Things decay, perish, are destroyed through inefficiency or war."

"But there should be records of the records; copies, copies of the copies, and copies of the copies of the copies; useful material much younger than twenty millennia. They have been removed. The Galactic Library at Trantor must have had documents concerning Earth. Those documents are referred to in known historical records, but the

documents no longer exist in the Galactic Library. The references to them may exist, but any quotations from them do not exist."

"Remember that Trantor was sacked a few centuries ago,"

"The Library was left untouched. It was protected by the personnel of the Second Foundation. And it was those personnel who recently discovered that material related to Earth no longer exists. The material was deliberately removed in recent times. Why?"

Trevize ceased his pacing and looked intently at Dom. "If I find Earth, I will find out what it is hiding-

"Hiding?"

"Hiding or being hidden. Once I find that out, I have the feeling I will know why I have chosen Gaia and Galaxia over our individuality. Then, I presume, I will know, not feel, that I am correct, and if I am correct"-he lifted his shoulders hopelessly-"then so be it."

"If you feel that is so," said Dom, "and if you feel you must hunt for Earth, then, of course, we will help you do as much as we can. That help, however, is limited. For instance, I/we/Gaia do not know where Earth may be located among the immense wilderness of worlds that make up the Galaxy."

"Even so," said Trevize, "I must search. -Even if the endless powdering of stars in the Galaxy makes the quest seem hopeless, and even if I must do it alone.

2.

TREVIZE WAS surrounded by the tameness of Gaia. The temperature, as always, was comfortable, and the air moved pleasantly, refreshing but not chilling. Clouds drifted across the sky, interrupting the sunlight now and then, and, no doubt, if the water vapor level per meter of open land surface dropped sufficiently in this place or that, there would be enough rain to restore it.

The trees grew in regular spacings, like an orchard, and did so, no doubt, all over the world. The land and sea were stocked with plant and animal life in proper numbers and in the proper variety to provide an appropriate ecological balance, and all of them, no doubt, increased and decreased in numbers in a slow sway about the recognized optimum. -As did the number of human beings, too.

Of all the objects within the purview of Trevize's vision, the only wild card in the deck was his ship, the Far Star.

The ship had been cleaned and refurbished efficiently and well by a number of the human components of Gaia. It had been restocked with food and drink, its furnishings had been renewed or replaced, its mechanical workings rechecked. Trevize himself had checked the ship's computer carefully.

Nor did the ship need refueling, for it was one of the few gravitic ships of the Foundation, running on the energy of the general gravitational field of the Galaxy, and

that was enough to supply all the possible fleets of humanity for all the eons of their likely existence without measurable decrease of intensity.

Three months ago, Trevize had been a Councilman of Terminus. He had, in other words, been a member of the Legislature of the Foundation and, *ex officio*, a great one of the Galaxy. Was it only three months ago? It seemed it was half his thirty-two-year-old lifetime since that had been his post and his only concern had been whether the great Seldon Plan had been valid or not; whether the smooth rise of the Foundation from planetary village to Galactic greatness had been properly charted in advance, or not.

Yet in some ways, there was no change. He was still a Councilman. His status and his privileges remained unchanged, except that he didn't expect he would ever return to Terminus to claim that status and those privileges. He would no more fit into the huge chaos of the Foundation than into the small orderliness of Gaia. He was at home nowhere, an orphan everywhere.

His jaw tightened and he pushed his fingers angrily through his black hair. Before he wasted time bemoaning his fate, he must find Earth. If he survived the search, there would then be time enough to sit down and weep. He might have even better reason then.

With determined stolidity, then, he thought back-

Three months before, he and Janov Pelorat, that able, naive scholar, had left Terminus. Pelorat had been driven by his antiquarian enthusiasms to discover the site of long-lost Earth, and Trevize had gone along, using Pelorat's goal as a cover for what he thought his own real aim was. They did not find Earth, but they did find Gaia, and Trevize had then found himself forced to make his fateful decision.

Now it was he, Trevize, who had turned half-circle-about-face-and was searching for Earth.

As for Pelorat, he, too, had found something he didn't expect. He had found the black-haired, dark-eyed Bliss, the young woman who was Gaia, even as Dom was-and as the nearest grain of sand or blade of grass was. Pelorat, with the peculiar ardor of late middle age, had fallen in love with a woman less than half his years, and the young woman, oddly enough, seemed content with that.

It was odd-but Pelorat was surely happy and Trevize thought resignedly that each person must find happiness in his or her own manner. That was the point of individuality-the individuality that Trevize, by his choice, was abolishing (given time) over all the Galaxy.

The pain returned. That decision he had made, and had had to make, continued to excoriate him at every moment and was-

"Golan!"

The voice intruded on Trevize's thoughts and he looked up in the direction of the sun, blinking his eyes.

"Ah, Janov," he said heartily-the more heartily because he did not want Pelorat guessing at the sourness of his thoughts. He even managed a jovial, "You've managed to tear yourself away from Bliss, I see."

Pelorat shook his head. The gentle breeze stirred his silky white hair, and his long solemn face retained its length and solemnity in full. "Actually, old chap, it was she that suggested I see you-about-about what I want to discuss. Not that I wouldn't have wanted to see you on my own, of course, but she seems to think more quickly than I do."

Trevize smiled. "It's all right, Janov. You're here to say good-bye, I ta1i1 it.

"Well, no, not exactly. In fact, more nearly the reverse. Golan, when w1 left Terminus, you and I, I was intent on finding Earth. I've spent virtually my entire adult life at that task."

"And I will carry on, Janov. The task is mine now."

"Yes, but it's mine, also; mine, still."

"But-" Trevize lifted an arm in a vague all-inclusive gesture of the world about them.

Pelorat said, in a sudden urgent gasp, "I want to go with you."

Trevize felt astonished. "You can't mean that, Janov. You have Gala now."

"I'll come back to Gaia someday, but I cannot let you go alone."

"Certainly you can. I can take care of myself."

"No offense, Golan, but you don't know enough. It is I who know the myths and legends. I can direct you."

"And you'll leave Bliss? Come, now."

A faint pink colored Pelorat's cheeks. "I don't exactly want to do that, old chap, but she said-"

Trevize frowned. "Is it that she's trying to get rid of you, Janov. She promised me-"

"No, you don't understand. Please listen to me, Golan. You do have this uncomfortable explosive way of jumping to conclusions before you hear one out. It's your specialty, I know, and I seem to have a certain difficulty in expressing myself concisely, but-"

"Well," said Trevize gently, "suppose you tell me exactly what it is that Bliss has on her mind in just any way you please, and I promise to be very patient."

"Thank you, and as long as you're going to be patient, I think I can come out with it right away. You see, Bliss wants to come, too."

"Bliss wants to come?" said Trevize. "No, I'm exploding again. I won't explode. Tell me, Janov, why would Bliss want to come along? I'm asking it quietly."

"She didn't say. She said she wants to talk to you."

"Then why isn't she here, eh?"

Pelorat said, "I think-I say I think-that she is rather of the opinion that you are not fond of her, Golan, and she rather hesitates to approach you. I have done my best, old man, to assure her that you have nothing against her. I cannot believe anyone would think anything but highly of her. Still, she wanted me to broach the subject with you, so to speak. May I tell her that you'll be willing to see her, Golan?"

"Of course, I'll see her right now."

"And you'll be reasonable? You see, old man, she's rather intense about it. She said the matter was vital and she must go with you."

"She didn't tell you why, did she?"

"No, but if she thinks she must go, so must Gaia. "

"Which means I mustn't refuse. Is that right, Janov?"

"Yes, I think you mustn't, Golan."

3.

FOR THE FIRST time during his brief stay on Gaia, Trevize entered Bliss's house-which now sheltered Pelorat as well.

Trevize looked about briefly. On Gaia, houses tended to be simple. With the all-but-complete absence of violent weather of any kind, with the temperature mild at all times in this particular latitude, with even the tectonic plates slipping smoothly when they had to slip, there was no point in building houses designed for elaborate protection, or for maintaining a comfortable environment within an uncomfortable one. The whole planet was a house, so to speak, designed to shelter its inhabitants.

Bliss's house within that planetary house was small, the windows screened ether than glassed, the furniture sparse and gracefully utilitarian. There were holographic images on the walls; one of them of Pelorat looking rather astonished and self-conscious. Trevize's lips twitched but he tried not to let his amusement show, and he fell to adjusting his waist-sash meticulously.

Bliss watched him. She wasn't smiling in her usual fashion. Rather, she looked serious, her fine dark eyes wide, her hair tumbling to her shoulders in a gentle black wave. Only her full lips, touched with red, lent a bit of color to her face.

"Thank you for coming to see me, Trev."

"Janov was very urgent in his request, Blissenobiarella."

Bliss smiled briefly. "Well returned. If you will call me Bliss, a decent monosyllable, I will try to say your name in full, Trevize." She stumbled, almost unnoticeably, over the second syllable.

Trevize held up his right hand. "That would be a good arrangement. I recognize the Gaian habit of using one-syllable name-portions in the common interchange of thoughts, so if you should happen to call me Trev now and then I will not be offended. Still, I will be more comfortable if you try to say Trevize as often as you can-and I shall say Bliss."

Trevize studied her, as he always did when he encountered her. As an individual, she was a young woman in her early twenties. As part of Gait, however, she was thousands of years old. It made no difference in her appearance, but it made a difference in the way she spoke sometimes, and in the atmosphere that inevitably surrounded her. Did he want it this way for everyone who existed? No! Surely, no, and yet-

Bliss said, "I will get to the point. You stressed your desire to find Earth-

"I spoke to Dom," said Trevize, determined not to give in to Gaia without a perpetual insistence on his own point of view.

"Yes, but in speaking to Dom, you spoke to Gaia and to every part of it, so that you spoke to me, for instance."

"Did you hear me as I spoke?"

"No, for I wasn't listening, but if, thereafter, I paid attention, I could remember what you said. Please accept that and let us go on. -You stressed your desire to find Earth and insisted on its importance. I do not see that importance but you have the knack of being right so I/we/Gaia must accept what you say. If the mission is crucial to your decision concerning Gaia, it is of crucial importance to Gaia, and so Gaia must go with you, if only to try to protect you."

"When you say Gaia must go with me, you mean you must go with me. Am I correct?"

"I am Gaia," said Bliss simply.

"But so is everything else on and in this planet. Why, then, you? Why not some other portion of Gaia?"

"Because Pel wishes to go with you, and if he goes with you, he would not be happy with any other portion of Gaia than myself."

Pelorat, who sat rather unobtrusively on a chair in another corner (with his back, Trevize noted, to his own image) said softly, "That's true, Golan. Bliss is my portion of Gaia."

Bliss smiled suddenly. "It seems rather exciting to be thought of in that way. It's very alien, of course."

"Well, let's see." Trevize put his hands behind his head and began to lean backward in his chair. The thin legs creaked as he did so, so that he quickly decided the chair was not sturdy enough to endure that game and brought it down to all four feet.

"Will you still be part of Gaia if you leave her?"

"I need not be. I can isolate myself, for instance, if I seem in danger of serious harm, so that harm will not necessarily spill over into Gaia, or if there is any other overriding reason for it. That, however, is a matter of emergency only. Generally, I will remain part of Gaia."

"Even if we Jump through hyperspace?"

"Even then, though that will complicate matters somewhat."

"Somehow I don't find that comforting."

"Why not?"

Trevize wrinkled his nose in the usual metaphoric response to a bad smell. "It means that anything that is said and done on my ship that you hear and see will be heard and seen by all of Gaia."

"I am Gaia so what I see, hear, and sense, Gaia will see, hear, and sense."

"Exactly. Even that wall will see, hear, and sense."

Bliss looked at the wall he pointed to and shrugged. "Yes, that wall, too. It has only an infinitesimal consciousness so that it senses and understands only infinitesimally, but I presume there are some subatomic shifts in response to what we are saying right now, for

instance, that enable it to fit into Gaia with more purposeful intent for the good of the whole."

"But what if I wish privacy? I may not want the wall to be aware of what I say or do."

Bliss looked exasperated and Pelorat broke in suddenly. "You know, Golan, I don't want to interfere, since I obviously don't know much about Gaia. Still, I've been with Bliss and I've gathered somehow some of what it's all about. -If you walk through a crowd on Terminus, you see and hear a great many things, and you may remember some of it. You might even be able to recall all of it under the proper cerebral stimulation, but mostly you don't care. You let it go. Even if you watch some emotional scene between strangers and even if you're interested; still, if it's of no great concern to you-you let it go-you forget. It must be so on Gaia, too. Even if all of Gaia knows your business intimately, that doesn't mean that Gaia necessarily cares. -Isn't that so, Bliss dear?"

"I've never thought of it that way, Pel, but there is something in what you say. Still, this privacy Trev talks about-I mean, Trevize-is nothing we value at all. In fact, I/we/Gaia find it incomprehensible. To want to be not part-to have your voice unheard-your deeds unwitnessed-your thoughts unsensed-" Bliss shook her head vigorously. "I said that we can block ourselves off in emergencies, but who would want to live that way, even for an hour?"

"I would," said Trevize. "That is why I must find Earth-to find out the overriding reason, if any, that drove me to choose this dreadful fate for humanity."

"It is not a dreadful fate, but let us not debate the matter. I will be with you, not as a spy, but as a friend and helper. Gaia will be with you not as a spy, but as a friend and helper."

Trevize said, somberly, "Gaia could help me best by directing me to Earth."

Slowly, Bliss shook her head. "Gaia doesn't know the location of Earth. Dom has already told you that."

"I don't quite believe that. After all, you must have records. Why have I never been able to see those records during my stay here? Even if Gaia honestly doesn't know where Earth might be located, I might gain some knowledge from the records. I know the Galaxy in considerable detail, undoubtedly much better than Gaia does. I might be able to understand and follow hints in your records that Gaia, perhaps, doesn't quite catch."

"But what records are these you talk of, Trevize?"

"Any records. Books, films, recordings, holographs, artifacts, whatever it is you have. In the time I've been here I haven't seen one item that I would consider in any way a record. -Have you, Janov?"

"No," said Pelorat hesitantly, "but I haven't really looked."

"Yet I have, in my quiet way," said Trevize, "and I've seen nothing. Nothing! I can only suppose they're being hidden from me. Why, I wonder? Would you tell me that?"

Bliss's smooth young forehead wrinkled into a puzzled frown. "Why didn't you ask before this? I/we/Gaia hide nothing, and we tell no lies. An Isolate - an individual in isolation-might tell lies. He is limited, and is fearful because he is limited. Gaia, however,

is a planetary organism of great mental ability and has no fear. For Gaia to tell lies, to create descriptions that are at variance with reality, is totally unnecessary."

Trevize snorted. "Then why have I carefully been kept from seeing any records? Give me a reason that makes sense."

"Of course." She held out both hands, palms up before her. "We don't have any records."

4.

PELORAT recovered first, seeming the less astonished of the two.

"My dear," he said gently, "that is quite impossible. You cannot have a reasonable civilization without records of some kind."

Bliss raised her eyebrows. "I understand that. I merely mean we have no records of the type that Trev-Trevize-is talking about, or was at all likely to come across. I/we/Gaia have no writings, no printings, no films, no computer data banks, nothing. We have no carvings on stone, for that matter. That's all I'm saying. Naturally, since we have none of these, Trevize found none of these."

Trevize said, "What do you have, then, if you don't have any records that I would recognize as records?"

Bliss said, enunciating carefully, as though she were speaking to a child. "I/we/Gaia have a memory. I remember."

"What do you remember?" asked Trevize.

"Everything."

"You remember all reference data?"

"Certainly."

"For how long? For how many years back?"

"For indefinite lengths of time."

"You could give me historical data, biographical, geographical, scientific? Even local gossip?"

"Everything."

"All in that little head." Trevize pointed sardonically at Bliss's right temple.

"No," she said. "Gala's memories are not limited to the contents of my particular skull. See here"-for the moment she grew formal and even a little stern, as she ceased being Bliss solely and took on an amalgam of other units = "there must have been a time before the beginning of history when human beings were so primitive that, although they could remember events, they could not speak. Speech was invented and served to express memories and to transfer them from person to person. Writing was eventually invented in order to record memories and transfer them across time from generation to generation. All technological advance since then has served to make more room for the transfer and storage of memories and to make the recall of desired items easier. However, once individuals joined to form Gaia, all that became obsolete. We can return

to memory, the basic system of record-keeping on which all else is built. Do you see that?"

Trevize said, "Are you saying that the sum total of all brains on Gaia can remember far more data than a single brain can?"

"Of course."

"But if Gaia has all the records spread through the planetary memory, what good is that to you as an individual portion of Gaia?"

"All the good you can wish. Whatever I might want to know is in an individual mind somewhere, maybe in many of them. If it is very fundamental, such as the meaning of the word 'chair,' it is in every mind. But even if it is something esoteric that is in only one small portion of Gala's mind, I can call it up if I need it, though such recall may take a bit longer than if the memory is more widespread. -Look, Trevize, if you want to know something that isn't in your mind, you look at some appropriate book-film, or make use of a computer's data banks. I scan Gala's total mind."

Trevize said, "How do you keep all that information from pouring into your mind and bursting your cranium?"

"Are you indulging in sarcasm, Trevize?"

Pelorat said, "Come, Golan, don't be unpleasant."

Trevize looked from one to the other and, with a visible effort, allowed tightness about his face to relax. "I'm sorry. I'm borne down by a responsibility I don't want and don't know how to get rid of. That may make me sound unpleasant when I don't intend to be. Bliss, I really wish to know. How do you draw upon the contents of the brains of others without then storing it in your own brain and quickly overloading its capacity?"

Bliss said, "I don't know, Trevize; any more than you know the detailed workings of your single brain. I presume you know the distance from your sun to a neighboring star, but you are not always conscious of it. You store it somewhere and can retrieve the figure at any time if asked. If not asked, you may with time forget it, but you can then always retrieve it from some data bank. If you consider Gala's brain a vast data bank, it is one I can call on, but there is no need for me to remember consciously any particular item I have made use of. Once I have made use of a fact or memory, I can allow it to pass out of memory. For that matter, I can deliberately put it back, so to speak, in the place I got it from."

"How many people on Gaia, Bliss? How many human beings?"

"About a billion. Do you want the exact figure as of now?"

Trevize smiled ruefully. "I quite see you can call up the exact figure if you wish, but I'll take the approximation."

"Actually," said Bliss, "the population is stable and oscillates about a particular number that is slightly in excess of a billion. I can tell by how much the number exceeds or falls short of the mean by extending my consciousness and well-feeling the boundaries. I can't explain it better than that to someone who has never shared the experience."

"it seems to me, however, that a billion human minds-a number of them being those of children-are surely not enough to hold in memory all the data needed by a complex society."

"But human beings are not the only living things on Gaia, Trev."

"Do you mean that animals remember, too?"

"Nonhuman brains can't store memories with the same density human brains can, and much of the room in all brains, human and nonhuman alike, must be given over to personal memories which are scarcely useful except to the particular component of the planetary consciousness that harbors them. However, significant quantities of advanced data can be, and are, stored in animal brains, also in plant tissue, and in the mineral structure of the planet."

"In the mineral structure? The rocks and mountain range, you mean?"

"And, for some kinds of data, the ocean and atmosphere. All that is Gaia, too."

"But what can nonliving systems hold?"

"A great deal. The intensity is low but the volume is so great that a large majority of Gaia's total memory is in its rocks. It takes a little longer to retrieve and replace rock memories so that it is the preferred place for storing dead data, so to speak-items that, in the normal course of events, would rarely be called upon."

"What happens when someone dies whose brain stores data of considerable value?"

"The data is not lost. It is slowly crowded out as the brain disorganizes after death, but there is ample time to distribute the memories into other parts of Gaia. And as new brains appear in babies and become more organized with growth, they not only develop their personal memories and thoughts but are fed appropriate knowledge from other sources. What you would call education is entirely automatic with me/us/Gaia."

Pelorat said, "Frankly, Golan, it seems to me that this notion of a living world has a great deal to be said for it."

Trevize gave his fellow-Founder a brief, sidelong glance. "I'm sure of that, Janov, but I'm not impressed. The planet, however big and however diverse, represents one brain. One! Every new brain that arises is melted into the whole. Where's the opportunity for opposition, for disagreement? When you think of human history, you think of the occasional human being whose minority view may be condemned by society but who wins out in the end and changes the world. What chance is there on Gaia for the great rebels of history?"

"There is internal conflict," said Bliss. "Not every aspect of Gaia necessarily accepts the common view."

"It must be limited," said Trevize. "You cannot have too much turmoil within a single organism, or it would not work properly. If progress and development are not stopped altogether, they must certainly be slowed. Can we take the chance of inflicting that on the entire Galaxy? On all of humanity?"

Bliss said, without open emotion, "Are you now questioning your own decision? Are you changing your mind and are you now saying that Gaia is an undesirable future for humanity?"

Trevize tightened his lips and hesitated. Then, he said, slowly, "I would like to, but not yet. I made my decision on some basis--some unconscious basis--and until I find out what that basis was, I cannot truly decide whether I am to maintain or change my decision. Let us therefore return to the matter of Earth."

"Where you feel you will learn the nature of the basis on which you made your decision. Is that it, Trevize?"

"That is the feeling I have. -Now Dom says Gaia does not know the location of Earth. And you agree with him, I believe."

"Of course I agree with him. I am no less Gaia than he is."

"And do you withhold knowledge from me? Consciously, I mean?"

"Of course not. Even if it were possible for Gaia to lie, it would not lie to you. Above all, we depend upon your conclusions, and we need them to be accurate, and that requires that they be based on reality."

"In that case," said Trevize, "let's make use of your world-memory. Probe backward and tell me how far you can remember."

There was a small hesitation. Bliss looked blankly at Trevize, as though, for a moment, she was in a trance. Then she said, "Fifteen thousand years."

"Why did you hesitate?"

"It took time. Old memories--really old--are almost all in the mountain roots where it takes time to dig them out."

"Fifteen thousand years ago, then? Is that when Gaia was settled?"

"No, to the best of our knowledge that took place some three thousand years before that."

"Why are you uncertain? Don't you--or Gaia--remember?"

Bliss said, "That was before Gaia had developed to the point where memory became a global phenomenon."

"Yet before you could rely on your collective memory, Gaia must have kept records, Bliss. Records in the usual sense--recorded, written, filmed, and so on."

"I imagine so, but they could scarcely endure all this time."

"They could have been copied or, better yet, transferred into the global memory, once that was developed."

Bliss frowned. There was another hesitation, longer this time. "I find no sign of these earlier records you speak of."

"Why is that?"

"I don't know, Trevize. I presume that they proved of no great importance. I imagine that by the time it was understood that the early nonmemory records were decaying, it was decided that they had grown archaic and were not needed."

"You don't know that. You presume and you imagine, but you don't know that. Gaia doesn't know that."

Bliss's eyes fell. "It must be so."

"Must be? I am not a part of Gaia and therefore I need not presume what Gaia presumes-which gives you an example of the importance of isolation. I, as an Isolate, presume something else."

"What do you presume?"

"First, there is something I am sure of. A civilization in being is not likely to destroy its early records. Far from judging them to be archaic and unnecessary, they are likely to treat them with exaggerated reverence and would labor to preserve them. If Gaia's preglobal records were destroyed, Bliss, that destruction is not likely to have been voluntary."

"How would you explain it, then?"

"In the Library at Trantor, all references to Earth were removed by someone or some force other than that of the Trantorian Second Foundationers themselves. Isn't it possible, then, that on Gaia, too, all references to Earth were removed by something other than Gaia itself?"

"How do you know the early records involved Earth?"

"According to you, Gaia was founded at least eighteen thousand years ago. That brings us back to the period before the establishment of the Galactic Empire, to the period when the Galaxy was being settled and the prime source of Settlers was Earth. Pelorat will confirm that."

Pelorat, caught a little by surprise by suddenly being called on, cleared his throat. "So go the legends, my dear. I take those legends seriously and I think, as Golan Trevize does, that the human species was originally confined to a single planet and that planet was Earth. The earliest Settlers came from Earth."

"If, then," said Trevize, "Gaia was founded in the early days of hyperspatial travel, then it is very likely to have been colonized by Earthmen, or possibly by natives of a not very old world that had not long before been colonized by Earthmen. For that reason, the records of Gaia's settlement and of the first few millennia thereafter must clearly have involved Earth and Earthmen and those records are gone. Something seems to be seeing to it that Earth is not mentioned anywhere in the records of the Galaxy. And if so, there must be some reason for it."

Bliss said indignantly, "This is conjecture, Trevize. You have no evidence for this."

"But it is Gaia that insists that my special talent is that of coming to correct conclusions on the basis of insufficient evidence. If, then, I come to a firm conclusion, don't tell me I lack evidence."

Bliss was silent.

Trevize went on, "All the more reason then for finding Earth. I intend to leave as soon as the Far Star is ready. Do you two still want to come?"

"Yes," said Bliss at once, and "Yes," said Pelorat.

2. TOWARD COMPORELLON

5.

IT WAS RAINING lightly. Trevize looked up at the sky, which was a solid grayish white.

He was wearing a rain hat that repelled the drops and sent them flying well away from his body in all directions. Pelorat, standing out of range of the flying drops, had no such protection.

Trevize said, "I don't see the point of your letting yourself get wet, Janov."

"The wet doesn't bother me, my dear chap," said Pelorat, looking as solemn as he always did. "It's a light and warm rain. There's no wind to speak of. And besides, to quote the old saying: 'In Anacreon, do as the Anacreonians do.'" He indicated the few Gaians standing near the Far Star, watching quietly. They were well scattered, as though they were trees in a Gaian grove, and none wore rain hats.

"I suppose," said Trevize, "they don't mind being wet, because all the rest of Gaia is getting wet. The trees-the grass-the soil-all wet, and all equally part of Gaia, along with the Gaians."

"I think it makes sense," said Pelorat. "The sun will come out soon enough and everything will dry quickly. The clothing won't wrinkle or shrink, there's no chilling effect, and, since there aren't any unnecessary pathogenic microorganisms, no one will get colds, or flu, or pneumonia. Why worry about a bit of damp then?"

Trevize had no trouble in seeing the logic of that, but he hated to let go of his grievance. He said, "Still, there is no need for it to rain as we are leaving. After all, the rain is voluntary. Gaia wouldn't rain if it didn't want to. It's almost as though it were showing its contempt for us."

"Perhaps"-and Pelorat's lip twitched a bit "Gaia is weeping with sorrow at our leaving."

Trevize said, "That may be, but I'm not."

"Actually," Pelorat went on, "I presume that the soil in this region needs a wetting down, and that need is more important than your desire to have the sun shine."

Trevize smiled. "I suspect you really like this world, don't you? Even aside from Bliss, I mean."

"Yes, I do," said Pelorat, a trace defensively. "I've always led a quiet, orderly life, and think how I could manage here, with a whole world laboring to keep it quiet and orderly. -After all, Golan, when we build a house-or that ship-we try to create a perfect shelter. We equip it with everything we need; we arrange to have its temperature, air quality, illumination, and everything else of importance, controlled by us and manipulated in a way to make it perfectly accommodating to us. Gaia is just an extension of the desire for comfort and security extended to an entire planet. What's wrong with that?"

"What's wrong with that," said Trevize, "is that my house or my ship is engineered to suit me. I am not engineered to suit it. If I were part of Gaia, then no matter how ideally the planet was devised to suit me, I would be greatly disturbed over the fact that I was also being devised to suit it."

Pelorat pursed his lips. "One could argue that every society molds its population to fit itself. Customs develop that make sense within the society, and that chain every individual firmly to its needs."

"In the societies I know, one can revolt. There are eccentrics, even criminals."

"Do you want eccentrics and criminals?"

"Why not? You and I are eccentrics. We're certainly not typical of the people living on Terminus. As for criminals, that's a matter of definition. And if criminals are the price we must pay for rebels, heretics, and geniuses, I'm willing to pay it. I demand the price be paid."

"Are criminals the only possible payment? Can't you have genius without criminals?"

"You can't have geniuses and saints without having people far outside the norm, and I don't see how you can have such things on only one side of the norm. There is bound to be a certain symmetry. -In any case, I want a better reason for my decision to make Gaia the model for the future of humanity than that it is a planetary version of a comfortable house."

"Oh, my dear fellow. I wasn't trying to argue you into being satisfied with your decision. I was just making an observa-

He broke off. Bliss was striding toward them, her dark hair wet and her robe clinging to her body and emphasizing the rather generous width of her hips. She was nodding to them as she came.

"I'm sorry I delayed you," she said, panting a little. "It took longer to check with Dom than I had anticipated."

"Surely," said Trevize, "you know everything he knows."

"Sometimes it's a matter of a difference in interpretation. We are not identical, after all, so we discuss. Look here," she said, with a touch of asperity, "you have two hands. They are each part of you, and they seem identical except for one being the mirror-image of the other. Yet you do not use them entirely alike, do you? There are some things you do with your right hand most of the time, and some with your left. Differences in interpretation, so to speak."

"She's got you," said Pelorat, with obvious satisfaction.

Trevize nodded. "It's an effective analogy, if it were relevant, and I'm not at all sure it is. In any case, does this mean we can board the ship now? It is raining."

"Yes, yes. Our people are all off it, and it's in perfect shape." Then, with a sudden curious look at Trevize, "You're keeping dry. The raindrops are missing you."

"Yes, indeed," said Trevize. "I am avoiding wetness."

"But doesn't it feel good to be wet now and then?"

"Absolutely. But at my choice, not the rain's."

Bliss shrugged. "Well, as you please. All our baggage is loaded so let's board."

The three walked toward the Far Star. The rain was growing still lighter, but the grass was quite wet. Trevize found himself walking gingerly, but Bliss had kicked off her slippers, which she was now carrying in one hand, and was slogging through the grass barefoot.

"It feels delightful," she said, in response to Trevize's downward glance.

"Good," he said absently. Then, with a touch of irritation, "Why are those other Gaians standing about, anyway?"

Bliss said, "They're recording this event, which Gaia finds momentous. You are important to us, Trevize. Consider that if you should change your mind as a result of this trip and decide against us, we would never grow into Galaxia, or even remain as Gaia."

"Then I represent life and death for Gaia; for the whole world."

"We believe so."

Trevize stopped suddenly, and took off his rain hat. Blue patches were appearing in the sky. He said, "But you have my vote in your favor now. If you kill me, I'll never be able to change it."

"Golan," murmured Pelorat, shocked. "That is a terrible thing to say."

"Typical of an Isolate," said Bliss calmly. "You must understand, Trevize, that we are not interested in you as a person, or even in your vote, but in the truth, in the facts of the matter. You are only important as a conduit to the truth, and your vote as an indication of the truth. That is what we want from you, and if we kill you to avoid a change in your vote, we would merely be hiding the truth from ourselves."

"If I tell you the truth is non-Gaia, will you all then cheerfully agree to die?"

"Not entirely cheerfully, perhaps, but it's what it would amount to in the end."

Trevize shook his head. "If anything ought to convince me that Gaia is a horror and should die, it might be that very statement you've just made." Then he said, his eyes returning to the patiently watching (and, presumably, listening) Gaians, "Why are they spread out like that? And why do you need so many? If one of them observes this event and stores it in his or her memory, isn't it available to all the rest of the planet? Can't it be stored in a million different places if you want it to be?"

Bliss said, "They are observing this each from a different angle, and each is storing it in a slightly different brain. When all the observations are studied, it will be seen that what is taking place will be far better understood from all the observations together than from any one of them, taken singly."

"The whole is greater than the sum of the parts, in other words."

"Exactly. You have grasped the basic justification of Gaia's existence. You, as a human individual, are composed of perhaps fifty trillion cells, but you, as a multicellular individual, are far more important than those fifty trillion as the sum of their individual importance. Surely you would agree with that."

"Yes," said Trevize. "I agree with that."

He stepped into the ship, and turned briefly for one more look at Gaia. The brief rain had lent a new freshness to the atmosphere. He saw a green, lush, quiet, peaceful world; a garden of serenity set amid the turbulence of the weary Galaxy.

-And Trevize earnestly hoped he would never see it again.

6.

WHEN THE airlock closed behind them, Trevize felt as though he had shut out not exactly a nightmare, but something so seriously abnormal that it had prevented him from breathing freely.

He was fully aware that an element of that abnormality was still with him in the person of Bliss. While she was there, Gaia was there-and yet he was also convinced that her presence was essential. It was the black box working again, and earnestly he hoped he would never begin believing in that black box too much.

He looked about the vessel and found it beautiful. It had been his only since Mayor Harla Branno of the Foundation had forced him into it and sent him out among the stars-a living lightning rod designed to draw the fire of those she considered enemies of the Foundation. That task was done but the ship was still his, and he had no plans to return it.

It had been his for merely a matter of a few months, but it seemed like home to him and he could only dimly remember what had once been his home in Terminus.

Terminus! The off-center hub of the Foundation, destined, by Seldon's Plan, to form a second and greater Empire in the course of the next five centuries, except that he, Trevize, had now derailed it. By his own decision he was converting the Foundation to nothing, and was making possible instead, a new society, a new scheme of life, a frightening revolution that would be greater than any since the development of multicellular life.

Now he was engaged in a journey designed to prove to himself (or to disprove) that what he had done was right.

He found himself lost in thought and motionless, so that he shook himself in self-irritation. He hastened to the pilot-room and found his computer still there.

It glistened; everything glistened. There had been a most careful cleaning. The contacts he closed, nearly at random, worked perfectly, and, it surely seemed, with greater ease than ever. The ventilating system was so noiseless that he had to put his hand over the vents to make sure he felt air currents.

The circle of light on the computer glowed invitingly. Trevize touched it and the light spread out to cover the desk top and the outline of a right and left hand appeared on it. He drew a deep breath and realized that he had stopped breathing for a while. The Gaians knew nothing about Foundation technology and they might easily have damaged the computer without meaning any malice. Thus far they had not-the hands were still there.

The crucial test came with the laying on of his own hands, however, and, for a moment, he hesitated. He would know, almost at once, if anything were wrong-but if something was, what could he do? For repairs, he would have to go back to Terminus, and if he did, he felt quite confident that Mayor Branno would not let him leave again. And if he did not-

He could feel his heart pounding, and there was clearly no point in deliberately lengthening the suspense.

He thrust his hands out, right, left, and placed them on the outlines upon the desk. At once, he had the illusion of another pair of hands holding his. His senses extended, and he could see Gaia in all directions, green and moist, the Gaians still watching. When he willed himself to look upward, he saw a largely cloudy sky. Again, at his will, the clouds vanished and he looked at an unbroken blue sky with the orb of Gaia's sun filtered out.

Again he willed and the blue parted and he saw the stars.

He wiped them out, and willed and saw the Galaxy, like a foreshortened pinwheel. He tested the computerized image, adjusting its orientation, altering the apparent progress of time, making it spin first in one direction, then the other. He located the sun of Sayshell, the nearest important star to Gaia; then the sun of Terminus; then of Trantor; one after the other. He traveled from star to star in the Galactic map that dwelt in the bowels of the computer.

Then he withdrew his hands and let the world of reality surround him again-and realized he had been standing all this time, half-bowing over the computer to make the hand contact. He felt stiff and had to stretch his back muscles before sitting down.

He stared at the computer with warm relief. It had worked perfectly. It had been, if anything, more responsive, and what he felt for it he could only describe as love. After all, while he held its hands (he resolutely refused to admit to himself that he thought of it as her hands) they were part of each other, and his will directed, controlled, experienced, and was part of a greater self. He and it must feel, in a small way (he suddenly, and disturbingly, thought), what Gaia did in a much larger way.

He shook his head. No! In the case of the computer and himself, it was he -Trevize- who was in entire control. The computer was a thing of total submission.

He rose and moved out to the compact galley and dining area. There was plenty of food of all kinds, with proper refrigeration and easy-heating facilities. He had already noted that the book-films in his room were in the proper order, and he was reasonably sure-no, completely sure-that Pelorat had his personal library in safe storage. He would otherwise surely have heard from him by now.

Pelorat! That reminded him. He stepped into Pelorat's room. "Is there room for Bliss here, Janov?"

"Oh yes, quite."

"I can convert the common room into her bedroom."

Bliss looked up, wide-eyed. "I have no desire for a separate bedroom. I am quite content to stay here with Pel. I suppose, though, that I may use the other rooms when needed. The gym, for instance."

"Certainly. Any room but mine."

"Good. That's what I would have suggested be the arrangement, if I had had the making of it. Naturally, you will stay out of ours."

"Naturally," said Trevize, looking down and realizing that his shoes overlapped the threshold. He took a half-step backward and said grimly, "These are not honeymoon quarters, Bliss."

"I should say, in view of its compactness, that it is exactly that even though Gaia extended it to half again as wide as it was."

Trevize tried not to smile. "You'll have to be very friendly."

"We are," said Pelorat, clearly ill at ease at the topic of conversation, "but really, old chap, you can leave it to us to make our own arrangements."

"Actually, I can't," said Trevize slowly. "I still want to make it clear that these are not honeymoon accommodations. I have no objection to anything you do by mutual consent, but you must realize that you will have no privacy. I hope you understand that, Bliss."

"There is a door," said Bliss, "and I imagine you will not disturb us who it is locked-short of a real emergency, that is."

"Of course I won't. However, there is no soundproofing."

"What you are trying to say, Trevize," said Bliss, "is that you will hear, quite clearly, any conversation we may have, and any sounds we may make in the course of sex."

"Yes, that is what I am trying to say. With that in mind, I expect you may find you will have to limit your activities here. This may discommode you, and I'm sorry, but that's the situation as it is."

Pelorat cleared his throat, and said gently, "Actually, Golan, this is a problem I've already had to face. You realize that any sensation Bliss experiences, when together with me, is experienced by all of Gaia."

"I have thought of that, Janov," said Trevize, looking as though he were repressing a wince. "I didn't intend to mention it just in case the thought had not occurred to you."

"But it did, I'm afraid," said Pelorat.

Bliss said, "Don't make too much of that, Trevize. At any given moment, there may be thousands of human beings on Gaia who are engaged in sex; millions who are eating, drinking, or engaged in other pleasure-giving activities. This gives rise to a general aura of delight that Gaia feels, every part of it. The lower animals, the plants, the minerals have their progressively milder pleasures that also contribute to a generalized joy of consciousness that Gaia feels in all its parts always, and that is unfelt in any other world."

"We have our own particular joys," said Trevize, "which we can share after a fashion, if we wish; or keep private, if we wish."

"If you could feel ours, you would know how poverty-stricken you Isolates are in that respect."

"How can you know what we feel?"

"Without knowing how you feel, it is still reasonable to suppose that a world of common pleasures must be more intense than those available to a single isolated individual."

"Perhaps, but even if my pleasures were poverty-stricken, I would keep my own joys and sorrows and be satisfied with them, thin as they are, and be me and not blood brother to the nearest rock."

"Don't sneer," said Bliss. "You value every mineral crystal in your bones and teeth and would not have one of them damaged, though they have no more consciousness than the average rock crystal of the same size."

"That's true enough," said Trevize reluctantly, "but we've managed to get off the subject. I don't care if all Gaia shares your joy, Bliss, but I don't want to share it. We're living here in close quarters and I do not wish to be forced to participate in your activities even indirectly."

Pelorat said, "This is an argument over nothing, my dear chap. I am no more anxious than you to have your privacy violated. Nor mine, for that matter. Bliss and I will be discreet; won't we, Bliss?"

"It will be as you wish, Pel."

"After all," said Pelorat, "we are quite likely to be planet-bound for considerably longer periods than we will space-borne, and on planets, the opportunities for true privacy-

"I don't care what you do on planets," interrupted Trevize, "but on this ship, I am master."

"Exactly," said Pelorat.

"Then, with that straightened out, it is time to take off."

"But wait." Pelorat reached out to tug at Trevize's sleeve. "Take off for where? You don't know where Earth is, nor do I, nor does Bliss. Nor does your computer, for you told me long ago that it lacks any information on Earth. What do you intend doing, then? You can't simply drift through space at random, my dear chap."

At that, Trevize smiled with what was almost joy. For the first time since he had fallen into the grip of Gaia, he felt master of his own fate.

"I assure you," he said, "that it is not my intention to drift, Janov. I know exactly where I am going."

7.

PELORAT walked quietly into the pilot-room after he had waited long moments while his small tap on the door had gone unanswered. He found Trevize looking with keen absorption at the starfield.

Pelorat said, "Golan-" and waited.

Trevize looked up. "Janov! Sit down. -Where's Bliss?"

"Sleeping. -We're out in space, I see."

"You see correctly." Trevize was not surprised at the other's mild surprise. In the new gravitic ships, there was simply no way of detecting takeoff. There were no inertial effects; no accelerational push; no noise; no vibration.

Possessing the capacity to insulate itself from outside gravitational fields to any degree up to total, the Far Star lifted from a planetary surface as though it were floating on some cosmic sea. And while it did so, the gravitational effect within the ship, paradoxically, remained normal.

While the ship was within the atmosphere, of course, there was no need to accelerate so that the whine and vibration of rapidly passing air would be absent. As the atmosphere was left behind, however, acceleration could take place, and at rapid rates, without affecting the passengers.

It was the ultimate in comfort and Trevize did not see how it could be improved upon until such time as human beings discovered a way of whisking through hyperspace without ships, and without concern about nearby gravitational fields that might be too intense. Right now, the Far Star would have to speed away from Gala's sun for several days before the gravitational intensity was weak enough to attempt the Jump.

"Golan, my dear fellow," said Pelorat. "May I speak with you for a moment or two? You are not too busy?"

"Not at all busy. The computer handles everything once I instruct it properly. And sometimes it seems to guess what my instructions will be, and satisfies them almost before I can articulate them." Trevize brushed the top of the desk lovingly.

Pelorat said, "We've grown very friendly, Golan, in the short time we've known each other, although I must admit that it scarcely seems a short time to me. So much has happened. It's really peculiar when I stop to think of my moderately long life, that half of all the events I have experienced were squeezed into the last few months. Or so it would seem. I could almost suppose-

Trevize held up a hand "Janov, you're spinning outward from your original point, I'm sure. You began by saying we've grown very friendly in a very short time. Yes, we have, and we still are. For that matter, you've known Bliss an even shorter time and have grown even friendlier."

"That's different, of course," said Pelorat, clearing his throat in some embarrassment.

"Of course," said Trevize, "but what follows from our brief but enduring friendship?"

"If, my dear fellow, we still are friends, as you've just said, then I must pass on to Bliss, whom, as you've also just said, is peculiarly dear to me."

"I understand. And what of that?"

"I know, Golan, that you are not fond of Bliss, but for my sake, I wish-

Trevize raised a hand. "One moment, Janov. I am not overwhelmed by Bliss, but neither is she an object of hatred to me. Actually, I have no animosity toward her at all. She's an attractive young woman and, even if she weren't, then, for your sake, I would be prepared to find her so. It's Gaia I dislike."

"But Bliss is Gaia."

"I know, Janov. That's what complicates things so. As long as I think of Bliss as a person, there's no problem. If I think of her as Gaia, there is."

"But you haven't given Gaia a chance, Golan. -Look, old chap, let me admit something. When Bliss and I are intimate, she sometimes lets me share her mind for a minute or so. Not for more than that because she says I'm too old to adapt to it. -Oh, don't grin, Golan, you would be too old for it, too. If an Isolate, such as you or I, were to remain part of Gaia for more, than a minute or two, there might be brain damage and if it's as much as five or ten minutes, it would be irreversible. -If you could only experience it, Golan."

"What? Irreversible brain damage? No, thanks."

"Golan, you're deliberately misunderstanding me. I mean, just that small moment of union. You don't know what you're missing. It's indescribable. Bliss says there's a sense of joy. That's like saying there's a sense of joy when you finally drink a bit of water after you have all but died of thirst. I couldn't even begin to tell you what it's like. You share all the pleasures that a billion people separately experience. It isn't a steady joy; if it were you would quickly stop feeling it. It vibrates-twinkles-has a strange pulsing rhythm that doesn't let you go. It's more joy-no, not more-it's a better joy than you could ever experience separately. I could weep when she shuts the door on me-"

Trevize shook his head. "You are amazingly eloquent, my good friend, but you sound very much as though you're describing pseudendorphin addiction, or that of some other drug that admits you to joy in the short term at the price of leaving you permanently in horror in the long term. Not for me! I am reluctant to sell my individuality for some brief feeling of joy."

"I still have my individuality, Golan."

"But for how long will you have it if you keep it up, Janov? You'll beg for more and more of your drug until, eventually, your brain will be damaged. Janov, you mustn't let Bliss do this to you. -Perhaps I had better speak to her about it."

"No! Don't! You're not the soul of tact, you know, and I don't want her hurt. I assure you she takes better care of me in that respect than you can imagine. She's more concerned with the possibility of brain damage than I am. You can be sure of that."

"Well, then, I'll speak to you. Janov, don't do this anymore. You've lived for fifty-two years with your own kind of pleasure and joy, and your brain is adapted to withstanding that. Don't be snapped up by a new and unusual vice. There is a price for it; if not immediately, then eventually."

"Yes, Golan," said Pelorat in a low voice, looking down at the tips of his shoes. Then he said, "Suppose you look at it this way. What if you were a one-celled creature-"

"I know what you're going to say, Janov. Forget it. Bliss and I have already referred to that analogy."

"Yes, but think a moment. Suppose we imagine single-celled organisms with a human level of consciousness and with the power of thought and imagine them faced with the possibility of becoming a multicellular organism. Would not the single-celled

organisms mourn their loss of individuality, and bitterly resent their forthcoming enforced regimentation into the personality of an overall organism? And would they not be wrong? Could an individual cell even imagine the power of the human brain?"

Trevize shook his head violently. "No, Janov, it's a false analogy. Singlecelled organisms don't have consciousness or any power of thought-or if they do it is so infinitesimal it might as well be considered zero. For such objects to combine and lose individuality is to lose something they have never really had. A human being, however, is conscious and does have the power of thought. He has an actual consciousness and an actual independent intelligence to lose, so the analogy fails."

There was silence between the two of them for a moment; an almost oppressive silence; and finally Pelorat, attempting to wrench the conversation in a new direction, said, "Why do you stare at the viewscreen?"

"Habit," said Trevize, smiling wryly. "The computer tells me that there are no Gaian ships following me and that there are no Sayshellian fleets coming to meet me. Still I look anxiously, comforted by my own failure to see such ships, when the computer's sensors are hundreds of times keener and more piercing than my eyes. What's more, the computer is capable of sensing some properties of space very delicately, properties that my senses can't perceive under any conditions. -Knowing all that, I still stare."

Pelorat said, "Golan, if we are indeed friends-

"I promise you I will do nothing to grieve Bliss; at least, nothing I can help."

"It's another matter now. You keep your destination from me, as though you don't trust me with it. Where are we going? Are you of the opinion you know where Earth is?"

Trevize looked up, eyebrows lifted. "I'm sorry. I have been hugging the secret to my own bosom, haven't I?"

"Yes, but why?"

Trevize said, "Why, indeed. I wonder, my friend, if it isn't a matter of Bliss."

"Bliss? Is it that you don't want her to know. Really, old fellow, she is completely to be trusted."

"It's not that. What's the use of not trusting her? I suspect she can tweak any secret out of my mind if she wishes to. I think I have a more childish reason than that. I have the feeling that you are paying attention only to her and that I no longer really exist."

Pelorat looked horrified. "But that's not true, Golan."

"I know, but I'm trying to analyze my own feelings. You came to me just now with fears for our friendship, and thinking about it, I feel as though I've had the same fears. I haven't openly admitted it to myself, but I think I have felt cut out by Bliss. Perhaps I seek to 'get even' by petulantly keeping things from you. Childish, I suppose."

"Golan!"

"I said it was childish, didn't I? But where is the person who isn't childish now and then? However, we are friends. We've settled that and therefore I will play no further games. We're going to Comporellon."

"Comporellon?" said Pelorat, for the moment not remembering.

"Surely you recall my friend, the traitor, Munn Li Compor. We three met on Sayshell."

Pelorat's face assumed a visible expression of enlightenment. "Of course I remember. Comporellon was the world of his ancestors."

"If it was. I don't necessarily believe anything Compor said. But Comporellon is a known world, and Compor said that its inhabitants knew of Earth. Well, then, we'll go there and find out. It may lead to nothing but it's the only starting point we have."

Pelorat cleared his throat and looked dubious. "Oh, my dear fellow, are you sure?"

"There's nothing about which to be either sure or not sure. We have one starting point and, however feeble it might be, we have no choice but to follow it up."

"Yes, but if we're doing it on the basis of what Compor told us, then perhaps we ought to consider everything he told us. I seem to remember that he told us, most emphatically, that Earth did not exist as a living planet-that its surface was radioactive and that it was utterly lifeless. And if that is so, then we are going to Comporellon for nothing."

8.

THE THREE were lunching in the dining room, virtually filling it as they did so.

"This is very good," said Pelorat, with considerable satisfaction. "Is this part of our original Terminus supply?"

"No, not at all," said Trevize. "That's long gone. This is part of the supplies we bought on Sayshell, before we headed out toward Gaia. Unusual, isn't it? Some sort of seafood, but rather crunchy. As for this stuff-I was under the impression it was cabbage when I bought it, but it doesn't taste anything like it."

Bliss listened but said nothing. She picked at the food on her own plate gingerly.

Pelorat said gently, "You've got to eat, dear."

"I know, Pel, and I'm eating."

Trevize said, with a touch of impatience he couldn't quite suppress, "We do have Gaian food, Bliss."

"I know," said Bliss, "but I would rather conserve that. We don't know how long we will be out in space and eventually I must learn to eat Isolate food. "

"Is that so bad? Or must Gaia eat only Gaia."

Bliss sighed. "Actually, there's a saying of ours that goes: 'When Gaia eats Gaia, there is neither loss nor gain.' It is no more than a transfer of consciousness up and down the scale. Whatever I eat on Gaia is Gaia and when much of it is metabolized and becomes me, it is still Gaia. In fact, by the fact that I eat, some of what I eat has a chance to participate in a higher intensity of consciousness, while, of course, other portions of it are turned into waste of one sort or another and therefore sink in the scale of consciousness."

She took a firm bite of her food, chewed vigorously for a moment, swallowed, and said, "It represents a vast circulation. Plants grow and are eaten by animals. Animals eat and are eaten. Any organism that dies is incorporated into the cells of molds, decay bacteria, and so on-still Gaia. In this vast circulation of consciousness, even inorganic matter participates, and everything in the circulation has its chance of periodically participating in a high intensity of consciousness."

"All this," said Trevize, "can be said of any world. Every atom in me has a long history during which it may have been part of many living things, including human beings, and during which it may also have spent long periods as part of the sea, or in a lump of coal, or in a rock, or as a portion of the wind blowing upon us."

"On Gaia, however," said Bliss, "all atoms are also continually part of a higher planetary consciousness of which you know nothing."

"Well, what happens, then," said Trevize, "to these vegetables from Sayshell that you are eating? Do they become part of Gaia?"

"They do-rather slowly. And the wastes I excrete as slowly cease being part of Gaia. After all, what leaves me is altogether lacking in contact with Gaia. It lacks even the less-direct hyperspatial contact that I can maintain, thanks to my high level of conscious intensity. It is this hyperspatial contact that causes non-Gaian food to become part of Gaia-slowly-once I eat it."

"What about the Gaian food in our stores? Will that slowly become nonGaian? If so, you had better eat it while you can."

"There is no need to be concerned about that," said Bliss. "Our Gaian stores have been treated in such a way that they will remain part of Gaia over a long interval."

Pelorat said, suddenly, "But what will happen when we eat the Gaian food. For that matter, what happened to us when we ate Gaian food on Gaia itself. Are we ourselves slowly turning into Gaia?"

Bliss shook her head and a peculiarly disturbed expression crossed her face. "No, what you ate was lost to us. Or at least the portions that were metabolized into your tissues were lost to us. What you excreted stayed Gaia or very slowly became Gaia so that in the end the balance was maintained, but numerous atoms of Gaia became non-Gaia as a result of your visit to us."

"Why was that?" asked Trevize curiously.

"Because you would not have been able to endure the conversion, even a very partial one. You were our guests, brought to our world under compulsion, in a manner of speaking, and we had to protect you from danger, even at the cost of the loss of tiny fragments of Gaia. It was a willing price we paid, but not a happy one."

"We regret that," said Trevize, "but are you sure that non-Gaian food, or some kinds of non-Gaian food, might not, in their turn, harm you?"

"No," said Bliss. "What is edible for you would be edible to me. I merely have the additional problem of metabolizing such food into Gaia as well as into my own tissues. It represents a psychological barrier that rather spoils my enjoyment of the food and causes me to eat slowly, but I will overcome that with time."

"What about infection?" said Pelorat, in high-pitched alarm. "I can't understand why I didn't think of this earlier. Bliss! Any world you land on is likely to have microorganisms against which you have no defense and you will die of some simple infectious disease. Trevize, we must turn back."

"Don't be panicked, Pel dear," said Bliss, smiling. "Microorganisms, too, are assimilated into Gaia when they are part of my food, or when they enter my body in any other way. If they seem to be in the process of doing harm, they will be assimilated the more quickly, and once they are Gaia, they will do me no harm."

The meal drew to its end and Pelorat sipped at his spiced and heated mixture of fruit juices. "Dear me," he said, licking his lips, "I think it is time to change the subject again. It does seem to me that my sole occupation on board ship is subject-changing. Why is that?"

Trevize said solemnly, "Because Bliss and I cling to whatever subjects we discuss, even to the death. We depend upon you, Janov, to save our sanity. What subject do you want to change to, old friend?"

"I've gone through my reference material on Comporellon and the entire sector of which it is part is rich in legends of age. They set their settlement far back in time, in the first millennium of hyperspatial travel. Comporellon even speaks of a legendary founder named Benbally, though they don't say when he came from. They say that the original name of their planet was Benbally World."

"And how much truth is there in that, in your opinion, Janov?"

"A kernel, perhaps, but who can guess what the kernel might be."

"I never heard of anyone named Benbally in actual history. Have you?"

"No, I haven't, but you know that in the late Imperial era there was a deliberate suppression of pre-Imperial history. The Emperors, in the turbulent last centuries of the Empire, were anxious to reduce local patriotism since they considered it, with ample justification, to be a disintegrating influence. In almost every sector of the Galaxy, therefore, true history, with complete records and accurate chronology, begins only with the days when Trantor's influence made itself felt and the sector in question had allied itself to the Empire or been annexed by it."

"I shouldn't think that history would be that easy to eradicate," said Trevize.

"In many ways, it isn't," said Pelorat, "but a determined and powerful government can weaken it greatly. If it is sufficiently weakened, early history comes to depend on scattered material and tends to degenerate into folk tales. Invariably such folk tales will fill with exaggeration and come to show the sector to be older and more powerful than, in all likelihood, it ever really was. And no matter how silly a particular legend is, or how impossible it might be on the very face of it, it becomes a matter of patriotism among the locals to believe it. I can show you tales from every corner of the Galaxy that speak of original colonization as having taken place from Earth itself, though that is not always the name they give the parent planet."

"What else do they call it?"

"Any of a number of names. They call it the Only, sometimes; and sometimes, the Oldest. Or they call it the Mooned World, which, according to some authorities is a reference to its giant satellite. Others claim it means 'Lost World' and that 'Mooned' is a version of 'Marooned,' a pre-Galactic word meaning 'lost' or 'abandoned.'"

Trevize said gently, "Janov, stop! You'll continue forever with your authorities and counterauthorities. These legends are everywhere, you say?"

"Oh yes, my dear fellow. Quite. You have only to go through them to gain a feel for this human habit of beginning with some seed of truth and layering about it shell after shell of pretty falsehood-in the fashion of the oysters of Rhampora that build pearls about a piece of grit. I came across just exactly that metaphor once when-

"Janov! Stop again! Tell me, is there anything about Comporellon's legends that is different from others?"

"Oh!" Pelorat gazed at Trevize blankly for a moment. "Different? Well, they claim that Earth is relatively nearby and that's unusual. On most worlds that speak of Earth, under whatever name they choose, there is a tendency to be vague about its location-placing it indefinitely far away or in some never-never land."

Trevize said, "Yes, as some on Sayshell told us that Gaia was located in hyperspace."

Bliss laughed.

Trevize cast her a quick glance. "It's true. That's what we were told."

"I don't disbelieve it. It's amusing, that's all. It is, of course, what we want them to believe. We only ask to be left alone right now, and where can we be safer and more secure than in hyperspace? If we're not there, we're as good as there, if people believe that to be our location."

"Yes," said Trevize dryly, "and in the same way there is something that causes people to believe that Earth doesn't exist, or that it is far away, or that it has a radioactive crust."

"Except," said Pelorat, "that the Comporellians believe it to be relatively close to themselves."

"But nevertheless give it a radioactive crust. One way or another every people with an Earth-legend consider Earth to be unapproachable."

"That's more or less right," said Pelorat.

Trevize said, "Many on Sayshell believed Gaia to be nearby; some even identified its star correctly; and yet all considered it unapproachable. There may be some Comporellians who insist that Earth is radioactive and dead, but who can identify its star. We will then approach it, unapproachable though they may consider it. We did exactly that in the case of Gaia."

Bliss said, "Gaia was willing to receive you, Trevize. You were helpless in our grip but we had no thought of harming you. What if Earth, too, is powerful, but not benevolent. What then?"

"I must in any case try to reach it, and accept the consequences. However, that is my task. Once I locate Earth and head for it, it will not be too late for you to leave. I will

put you off on the nearest Foundation world, or take you back to Gaia, if you insist, and then go on to Earth alone."

"My dear chap," said Pelorat, in obvious distress. "Don't say such things. I wouldn't dream of abandoning you."

"Or I of abandoning Pel," said Bliss, as she reached out a hand to touch Pelorat's cheek.

"Very well, then. It won't be long before we're ready to take the Jump to Comporellon and thereafter, let us hope, it will be---on to Earth."

PART TWO - COMPORELLON

3. AT THE ENTRY STATION

9.

BLISS, entering their chamber, said, "Did Trevize tell you that we are going make the Jump and go through hyperspace any moment now?"

Pelorat, who was bent over his viewing disk, looked up, and said, "Actually, he just looked in and told me 'within the half-hour.'"

"I don't like the thought of it, Pel. I've never liked the Jump. I get a funny inside-out feeling."

Pelorat looked a bit surprised. "I had not thought of you as a space traveler, Bliss dear."

"I'm not particularly, and I don't mean that this is so only in my aspect as a component. Gaia itself has no occasion for regular space travel. By my/our/Gaia's very nature, I/we/Gaia don't explore, trade, or space junket. Still, there is the necessity of having someone at the entry stations-

"As when we were fortunate enough to meet you."

"Yes, Pel." She smiled at him affectionately. "Or even to visit Sayshell and other stellar regions, for various reasons-usually clandestine. But, clandestine or not, that always means the Jump and, of course, when any part of Gaia Jumps, all of Gaia feels it."

"That's too bad," said Pel.

"It could be worse. The large mass of Gaia is not undergoing the jump, so the effect is greatly diluted. However, I seem to feel it much more than most of Gaia. As I keep trying to tell Trevize, though all of Gaia is Gaia, the individual components are not identical. We have our differences, and my makeup is, for some reason, particularly sensitive to the Jump."

"Wait!" said Pelorat, suddenly remembering. "Trevize explained that to me once. It's in ordinary ships that you have the worst of the sensation. In ordinary ships, one leaves the Galactic gravitational field on entering hyperspace, and comes back to it on returning to ordinary space. It's the leaving and returning that produces the sensation. But the Far Star is a gravitic ship. It is independent of the gravitational field, and does not truly leave it or return to it. For that reason, we won't feel a thing. I can assure you of that, dear, out of personal experience."

"But that's delightful. I wish I had thought to discuss the matter earlier. I would have saved myself considerable apprehension."

"That's an advantage in another way," said Pelorat, feeling an expansion of spirit in his unusual role as explainer of matters astronomic. "The ordinary ship has to recede from large masses such as stars for quite a long distance through ordinary space in order to make the Jump. Part of the reason is that the closer to a star, the more intense the gravitational field, and the more pronounced are the sensations of a Jump. Then, too, the

more intense the gravitational field the more complicated the equations that must be solved in order to conduct the Jump safely and end at the point in ordinary space you wish to end at.

"In a gravitic ship, however, there is no Jump-sensation to speak of. In addition, this ship has a computer that is a great deal more advanced than ordinary computers and it can handle complex equations with unusual skill and speed. The result is that instead of having to move away from a star for a couple of weeks just to reach a safe and comfortable distance for a Jump, the Far Star need travel for only two or three days. This is especially so since we are not subject to a gravitational field and, therefore, to inertial effects-I admit I don't understand that, but that's what Trevize tells me-and can accelerate much more rapidly than an ordinary ship could."

Bliss said, "That's fine, and it's to Trev's credit that he can handle this unusual ship."

Pelorat frowned slightly. "Please, Bliss. Say 'Trevize.'"

"I do. I do. In his absence, however, I relax a little."

"Don't. You don't want to encourage the habit even slightly, dear. He's so sensitive about it."

"Not about that. He's sensitive about me. He doesn't like me."

"That's not so," said Pelorat earnestly. "I talked to him about that. -Now, now, don't frown. I was extraordinarily tactful, dear child. He assured me he did not dislike you. He is suspicious of Gaia and unhappy over the fact that he has had to make it into the future of humanity. We have to make allowances for that. He'll get over it as he gradually comes to understand the advantages of Gaia."

"I hope so, but it's not just Gaia. Whatever he may tell you, Pel-and remember that he's very fond of you and doesn't want to hurt your feelings-he dislikes me personally."

"No, Bliss. He couldn't possibly."

"Not everyone is forced to love me simply because you do, Pel. Let me explain. Trev-all right, Trevize-thinks I'm a robot."

A look of astonishment suffused Pelorat's ordinarily stolid features. He said, "Surely he can't think you're an artificial human being."

"Why is that so surprising? Gaia was settled with the help of robots. That's a known fact."

"Robots might help, as machines might, but it was people who settled Gaia; people from Earth. That's what Trevize thinks. I know he does."

"There is nothing in Gaia's memory about Earth as I told you and Trevize. However, in our oldest memories there are still some robots, even after three thousand years, working at the task of completing the modification of Gaia into a habitable world. We were at that time also forming Gaia as a planetary consciousness-that took a long time, Pel dear, and that's another reason why our early memories are dim, and perhaps it wasn't a matter of Earth wiping them out, as Trevize thinks-"

"Yes, Bliss," said Pelorat anxiously, "but what of the robots?"

"Well, as Gaia formed, the robots left. We did not want a Gaia that included robots, for we were, and are, convinced that a robotic component is, in the long run, harmful to a human society, whether Isolate in nature or Planetary. I don't know how we came to that conclusion but it is possible that it is based on events dating back to a particularly early time in Galactic history, so that Gaia's memory does not extend back to it."

"If the robots left-"

"Yes, but what if some remained behind? What if I am one of them-fifteen thousand years old perhaps. Trevize suspects that."

Pelorat shook his head slowly. "But you're not."

"Are you sure you believe that?"

"Of course I do. You're not a robot."

"How do you know?"

"Bliss, I know. There's nothing artificial about you. If I don't know that, no one does."

"Isn't it possible I may be so cleverly artificial that in every respect, from largest to smallest, I am indistinguishable from the natural. If I were, how could you tell the difference between me and a true human being?"

Pelorat said, "I don't think it's possible for you to be so cleverly artificial."

"What if it were possible, despite what you think?"

"I just don't believe it."

"Then let's just consider it is a hypothetical case. If I were an indistinguishable robot, how would you feel about it?"

"Well, I-I"

"To be specific. How would you feel about making love to a robot?"

Pelorat snapped the thumb and mid-finger of his right hand, suddenly. "You know, there are legends of women falling in love with artificial men, and vice versa. I always thought there was an allegorical significance to that and never imagined the tales could represent literal truth. -Of course, Golan and I never even heard the word 'robot' till we landed on Sayshell, but, now that I think of it, those artificial men and women must have been robots. Apparently, such robots did exist in early historic times. That means the legends should be reconsidered-"

He fell into silent thought, and, after Bliss had waited a moment, she suddenly clapped her hands sharply. Pelorat jumped.

"Pel dear," said Bliss. "You're using your mythography to escape the question. The question is: How would you feel about making love to a robot?"

He stared at her uneasily. "A truly undistinguishable one? One that you couldn't tell from a human being?"

"Yes."

"It seems to me, then, that a robot that can in no way be distinguished from a human being is a human being. If you were such a robot, you would be nothing but a human being to me."

"That's what I wanted to hear you say, Pel."

Pelorat waited, then said, "Well, then, now that you've heard me say it, dear, aren't you going to tell me that you are a natural human being and that I don't have to wrestle with hypothetical situations?"

"No. I will do no such thing. You've defined a natural human being as an object that has all the properties of a natural human being. If you are satisfied that I have all those properties, then that ends the discussion. We've got the operational definition and need no other. After all, how do I know that you're not just a robot who happens to be indistinguishable from a human being?"

"Because I tell you that I am not."

"Ah, but if you were a robot that was indistinguishable from a human being, you might be designed to tell me you were a natural human being, and you might even be programmed to believe it yourself. The operational definition is all we have, and all we can have."

She put her arms about Pelorat's neck and kissed him. The kiss grew more passionate, and prolonged itself until Pelorat managed to say, in somewhat muffled fashion, "But we promised Trevize not to embarrass him by converting this ship into a honeymooners' haven."

Bliss said coaxingly, "Let's be carried away and not leave ourselves any time to think of promises."

Pelorat, troubled, said, "But I can't do that, dear. I know it must irritate you, Bliss, but I am constantly thinking and I am constitutionally averse to letting myself be carried away by emotion. It's a lifelong habit, and probably very annoying to others. I've never lived with a woman who didn't seem to object to it sooner or later. My first wife-but I suppose it would be inappropriate to discuss that-

"Rather inappropriate, yes, but not fatally so. You're not my first lover either."

"Oh!" said Pelorat, rather at a loss, and then, aware of Bliss's small smile, he said, "I mean, of course not. I wouldn't expect myself to have been-Anyway, my first wife didn't like it."

"But I do. I find your endless plunging into thought attractive."

"I can't believe that, but I do have another thought. Robot or human, that doesn't matter. We agree on that. However, I am an Isolate and you know it. I am not part of Gaia, and when we are intimate, you're sharing emotions outside Gaia even when you let me participate in Gaia for a short period, and it may not be the same intensity of emotion then that you would experience if it were Gaia loving Gaia."

Bliss said, "Loving you, Pel, has its own delight. I look no farther than that."

"But it's not just a matter of you loving me. You aren't merely you. What if Gaia considers it a perversion?"

"If it did, I would know, for I am Gaia. And since I have delight in you, Gaia does. When we make love, all of Gaia shares the sensation to some degree or other. When I say I love you, that means Gaia loves you, although it is only the part that I am that is assigned the immediate role. -You seem confused."

"Being an Isolate, Bliss, I don't quite grasp it."

"One can always form an analogy with the body of an Isolate. When you whistle a tune, your entire body, you as an organism, wishes to whistle the tune, but the immediate task of doing so is assigned to your lips, tongue, and lungs. Your right big toe does nothing."

"It might tap to the tune."

"But that is not necessary to the act of whistling. The tapping of the big toe is not the action itself but is a response to the action, and, to be sure, all parts of Gaia might well respond in some small way or other to my emotion, as I respond to theirs."

Pelorat said, "I suppose there's no use feeling embarrassed about this."

"None at all."

"But it does give me a queer sense of responsibility. When I try to make you happy, I find that I must be trying to make every last organism on Gaia happy."

"Every last atom-but you do. You add to the sense of communal joy that I let you share briefly. I suppose your contribution is too small to be easily measurable, but it is there, and knowing it is there should increase your joy."

Pelorat said, "I wish I could be sure that Golan is sufficiently busy with his maneuvering through hyperspace to remain in the pilot-room for quite a while."

"You wish to honeymoon, do you?"

"I do."

"Than get a sheet of paper, write 'Honeymoon Haven' on it, affix it to the outside of the door, and if he wants to enter, that's his problem."

Pelorat did so, and it was during the pleasurable proceedings that followed that the Far Star made the Jump. Neither Pelorat nor Bliss detected the action, nor would they have, had they been paying attention.

10.

IT HAD BEEN ONLY a matter of a few months since Pelorat had met Trevize and had left Terminus for the first time. Until then, for the more than halfcentury (Galactic Standard) of his life, he had been utterly planet-bound.

In his own mind, he had in those months become an old space dog. He had seen three planets from space: Terminus itself, Sayshell, and Gaia. And on the viewscreen, he now saw a fourth, albeit through a computer-controlled telescopic device. The fourth was Comporellon.

And again, for the fourth time, he was vaguely disappointed. Somehow, he continued to feel that looking down upon a habitable world from space meant seeing an outline of its continents against a surrounding sea; or, if it were a dry world, the outline of its lakes against a surrounding body of land.

It was never so.

If a world was habitable, it had an atmosphere as well as a hydrosphere. And if it had both air and water, it had clouds; and if it had clouds, it had an obscured view. Once again, then, Pelorat found himself looking down on white swirls with an occasional glimpse of pale blue or rusty brown.

He wondered gloomily if anyone could identify a world if a view of it from, say, three hundred thousand kilometers, were cast upon a screen. How does one tell one cloud swirl from another?

Bliss looked at Pelorat with some concern. "What is it, Pel? You seem to be unhappy."

"I find that all planets look alike from space."

Trevize said, "What of that, Janov? So does every shoreline on Terminus, when it is on the horizon, unless you know what you're looking for—a particular mountain peak, or a particular offshore islet of characteristic shape."

"I dare say," said Pelorat, with clear dissatisfaction, "but what do you look for in a mass of shifting clouds? And even if you try, before you can decide, you're likely to be moving into the dark side."

"Look a little more carefully, Janov. If you follow the shape of the clouds, you see that they tend to fall into a pattern that circles the planet and that moves about a center. That center is more or less at one of the poles."

"Which one?" asked Bliss with interest.

"Since, relative to ourselves, the planet is rotating in clockwise fashion, we are looking down, by definition, upon the south pole. Since the center seems to be about fifteen degrees from the terminator—the planet's line of shadow—and the planetary axis is tilted twenty-one degrees to the perpendicular of its plane of revolution, we're either in mid-spring or mid-summer depending on whether the pole is moving away from the terminator or toward it. The computer can calculate its orbit and tell me in short order if I were to ask it. The capital is on the northern side of the equator so it is either in mid-fall or mid-winter."

Pelorat frowned. "You can tell all that?" He looked at the cloud layer as though he thought it would, or should, speak to him now, but, of course, it didn't.

"Not only that," said Trevize, "but if you'll look at the polar regions, you'll see that there are no breaks in the cloud layer as there are away from the poles. Actually, there are breaks, but through the breaks you see ice, so it's a matter of white on white."

"Ah," said Pelorat. "I suppose you expect that at the poles."

"Of habitable planets, certainly. Lifeless planets might be airless or waterless, or might have certain stigmata showing that the clouds are not water clouds, or that the ice is not water ice. This planet lacks those stigmata, so we know we are looking at water clouds and water ice."

"The next thing we notice is the size of the area of unbroken white on the day side of the terminator, and to the experienced eye it is at once seen $\sqrt{2}$ larger than average. Furthermore, you can detect a certain orange glint, a quite faint one, to the reflected light, and that means Comporellon's sun is rather cooler than Terminus's sun. Although

Comporellon is closer to its sun than Terminus is to hers, it is not sufficiently closer to make up for its star's lower temperature. Therefore, Comporellon is a cold world as habitable worlds go."

"You read it like a film, old chap," said Pelorat admiringly.

"Don't be too impressed," said Trevize, smiling affectionately. "The computer has given me the applicable statistics of the world, including its slightly low average temperature. It is easy to deduce something you already know. In fact, Comporellon is at the edge of an ice age and would be having one, if the configuration of its continents were more suitable to such a condition."

Bliss bit at her lower lip. "I don't like a cold world."

"We've got warm clothing," said Trevize.

"That doesn't matter. Human beings aren't adapted to cold weather, rally. We don't have thick coats of hair or feathers, or a subcutaneous layer of blubber. For a world to have cold weather seems to indicate a certain indifference to the welfare of its own parts."

Trevize said, "Is Gaia a uniformly mild world?"

"Most of it, yes. There are some cold areas for cold-adapted plants and animals, and some hot areas for heat-adapted plants and animals, but most parts are uniformly mild, never getting uncomfortably hot or uncomfortably cold, for those between, including human beings, of course."

"Human beings, of course. All parts of Gaia are alive and equal in that respect, but some, like human beings, are obviously more equal than other,"

"Don't be foolishly sarcastic," said Bliss, with a trace of waspishness. "The level and intensity of consciousness and awareness are important. A human being is a more useful portion of Gaia than a rock of the same weight would be, and the properties and functions of Gaia as a whole are necessarily weighted in the direction of the human being-not as much so as on your Isolate worlds, however. What's more, there are times when it is weighted in other directions, when that is needed for Gaia as a whole. It might even, at long intervals, be weighted in the direction of the rocky interior. That, too, demands attention or, in the lack of that attention all parts of Gaia might suffer. We wouldn't want an unnecessary volcanic eruption, would we?"

"No," said Trevize. "Not an unnecessary one."

"You're not impressed, are you?"

"Look," said Trevize. "We have worlds that are colder than average and worlds that are warmer; worlds that are tropical forests to a large extent, and worlds that are vast savannahs. No two worlds are alike, and every one of them is home to those who are used to it. I am used to the relative mildness of Terminus-we've tamed it to an almost Gaian moderation, actually-but I like to get away, at least temporarily, to something different. What we have, Bliss, that Gaia doesn't have, is variation. If Gaia expands into Galaxia, will every world in the Galaxy be forced into mildness? The sameness would be unbearable."

Bliss said, "If that is so, and if variety seems desirable, variety will be maintained."

"As a gift from the central committee, so to speak?" said Trevize dryly. "And as little of it as they can bear to part with? I'd rather leave it to nature."

"But you haven't left it to nature. Every habitable world in the Galaxy has been modified. Every single one was found in a state of nature that was uncomfortable for humanity, and every single one was modified until it was as mild as could be managed. If this world here is cold, I am certain that is because its inhabitants couldn't warm it any further without unacceptable expense. And even so, the portions they actually inhabit we can be sure are artificially warmed into mildness. So don't be so loftily virtuous about leaving it to nature."

Trevize said, "You speak for Gaia, I suppose."

"I always speak for Gaia. I am Gaia."

"Then if Gaia is so certain of its own superiority, why did you require my decision? Why have you not gone ahead without me?"

Bliss paused, as though to collect her thoughts. She said, "Because it is not wise to trust one's self overmuch. We naturally see our virtues with clearer eyes than we see our defects. We are anxious to do what is right; not necessarily what seems right to us, but what is right, objectively, if such a thing as objective right exists. You seem to be the nearest approach to objective right that we can find, so we are guided by you."

"So objectively right," said Trevize sadly, "that I don't even understand my own decision and I seek its justification."

"You'll find it," said Bliss.

"I hope so," said Trevize.

"Actually, old chap," said Pelorat, "it seems to me that this recent exchange was won rather handily by Bliss. Why don't you recognize the fact that her arguments justify your decision that Gaia is the wave of the future for humanity?"

"Because," said Trevize harshly, "I did not know those arguments at the time I made my decision. I knew none of these details about Gaia. Something else influenced me, at least unconsciously, something that doesn't depend upon Gaian detail, but must be more fundamental. It is that which I must find out."

Pelorat held up a placating hand. "Don't be angry, Golan."

"I'm not angry. I'm just under rather unbearable tension. I don't want to be the focus of the Galaxy."

Bliss said, "I don't blame you for that, Trevize, and I'm truly sorry that your own makeup has somehow forced you into the post. -When will we be landing on Comporellon?"

"In three days," said Trevize, "and only after we stop at one of the entry stations in orbit about it."

Pelorat said, "There shouldn't be any problem with that, should there?"

Trevize shrugged. "It depends on the number of ships approaching the world, the number of entry stations that exist, and, most of all, on the particular rules for permitting and refusing admittance. Such rules change from time to time."

Pelorat said indignantly, "What do you mean refusing admittance? 1 can they refuse admittance to citizens of the Foundation? Isn't Comporellan part of the Foundation dominion?"

"Well, yes-and no. There's a delicate matter of legalism about the point and I'm not sure how Comporellon interprets it. I suppose there's a chance we'll be refused admission, but I don't think it's a large chance."

"And if we are refused, what do we do?"

"I'm not sure," said Trevize. "Let's wait and see what happens before we wear ourselves out making contingency plans."

11.

THEY WERE close enough to Comporellon now for it to appear as a substantial globe without telescopic enlargement. When such enlargement was added, however, the entry stations themselves could be seen. They were farther out than most of the orbiting structures about the planet and they were well lit.

Approaching as the Far Star was from the direction of the planet's southern pole, half its globe was sunlit constantly. The entry stations on its night side were naturally more clearly seen as sparks of light. They were evenly spaced in an arc about the planet. Six of them were visible (plus six on the day side undoubtedly) and all were circling the planet at even and identical speeds.

Pelorat, a little awed at the sight, said, "There are other lights closer to the planet. What are they?"

Trevize said, "I don't know the planet in detail so I can't tell you. Some might be orbiting factories or laboratories or observatories, or even populated townships. Some planets prefer to keep all orbiting objects outwardly dark, except for the entry stations. Terminus does, for instance. Comporellon conducts itself on a more liberal principle, obviously."

"Which entry station do we go to, Golan?"

"It depends on them. I've sent in my request to land on Comporellon and we'll eventually get our directions as to which entry station to go to, and when. Much depends on how many incoming ships are trying to make entry at present. If there are a dozen ships lined up at each station, we will have no choice but to be patient."

Bliss said, "I've only been at hyperspatial distances from Gaia twice before, and those were both when I was at or near Sayshell. I've never been at anything like this distance."

Trevize looked at her sharply. "Does it matter? You're still Gaia, aren't you?"

For a moment, Bliss looked irritated, but then dissolved into what was almost an embarrassed titter. "I must admit you've caught me this time, Trevize. There is a double meaning in the word 'Gaia.' It can be used to refer to the physical planet as a solid globular object in space. It can also be used to refer to the living object that includes that

globe. Properly speaking, we should use two different words for these two different concepts, but Gaians always know from the context what is being referred to. I admit that an Isolate might be puzzled at times."

"Well, then," said Trevize, "admitting that you are many thousands of parsecs from Gaia as globe, are you still part of Gaia as organism?"

"Referring to the organism, I am still Gaia."

"No attenuation?"

"Not in essence. I'm sure I've already told you there is some added complexity in remaining Gaia across hyperspace, but I remain Gaia."

Trevize said, "Does it occur to you that Gaia may be viewed as a Galactic kraken-the tentacled monster of the legends-with its tentacles reaching everywhere. You have but to put a few Gaians on each of the populated worlds and you will virtually have Galaxia right there. In fact, you have probably done exactly that. Where are your Gaians located? I presume that one or more are on Terminus and one or more are on Trantor. How much farther does this go?"

Bliss looked distinctly uncomfortable. "I have said I won't lie to you, Trevize, but that doesn't mean I feel compelled to give you the whole truth. There are some things you have no need to know, and the position and identity of individual bits of Gaia are among them."

"Do I need to know the reason for the existence of those tentacles, Bliss, even if I don't know where they are?"

"It is the opinion of Gaia that you do not."

"I presume, though, that I may guess. You believe you serve as the guardians of the Galaxy."

"We are anxious to have a stable and secure Galaxy; a peaceful and prosperous one. The Seldon Plan, as originally worked out by Hari Seldon at least, is designed to develop a Second Galactic Empire, one that is more stable and more workable than the First was. The Plan, which has been continually modified and improved by the Second Foundation, has appeared to be working well so far."

"But Gaia doesn't want a Second Galactic Empire in the classic sense, does it? You want Galaxia-a living Galaxy."

"Since you permit it, we hope, in time, to have Galaxia. If you had not permitted it, we would have striven for Seldon's Second Empire and made it as secure as we could."

"But what is wrong with-"

His ear caught the soft, burring signal. Trevize said, "The computer is signaling me. I suppose it is receiving directions concerning the entry station. I'll be back."

He stepped into the pilot-room and placed his hands on those marked out on the desk top and found that there were directions for the specific entry station he was to approach-its coordinates with reference to the line from Comporellon's center to its north pole-the prescribed route of approach.

Trevize signaled his acceptance, and then sat back for a moment.

The Seldon Plan! He had not thought of it for quite a time. The Fire Galactic Empire had crumbled and for five hundred years the Foundation had grown, first in competition with that Empire, and then upon its ruins—all in accordance with the Plan.

There had been the interruption of the Mule, which, for a time, had threatened to shiver the Plan into fragments, but the Foundation had pulled through—probably with the help of the ever-hidden Second Foundation—possibly with the help of the even-better-hidden Gaia.

Now the Plan was threatened by something more serious than the Mule had ever been. It was to be diverted from a renewal of Empire to something utterly different from anything in history—Galaxia. And he himself had agreed to that.

But why? Was there a flaw in the Plan? A basic flaw?

For one flashing moment, it seemed to Trevize that this flaw did indeed exist and that he knew what it was, that he had known what it was when he made his decision—but the knowledge . . . if that were what it was . . . vanished as fast as it came, and it left him with nothing.

Perhaps it was all only an illusion; both when he had made his decision, and now. After all, he knew nothing about the Plan beyond the basic assumptions that validated psychohistory. Apart from that, he knew no detail, and certainly not a single scrap of its mathematics.

He closed his eyes and thought—

There was nothing.

Might it be the added power he received from the computer? He placed his hands on the desk top and felt the warmth of the computer's hands embracing them. He closed his eyes and once more he thought—

There was still nothing.

12.

THE COMPORELLIAN who boarded the ship wore a holographic identity card. It displayed his chubby, lightly bearded face with remarkable fidelity, and underneath it was his name, A. Kendray.

He was rather short, and his body was as softly rounded as his face was. He had a fresh and easygoing look and manner, and he stared about the ship with clear amazement.

He said, "How did you get down this fast? We weren't expecting you for two hours."

"It's a new-model ship," said Trevize, with noncommittal politeness.

Kendray was not quite the young innocent he looked, however. He stepped into the pilot-room and said at once, "Gravitic?"

Trevize saw no point in denying anything that was apparently that obvious. He said tonelessly, "Yes."

"Very interesting. You hear of them, but you never see them somehow. Motors in the hull?"

"That's so."

Kendray looked at the computer. "Computer circuits, likewise?"

"That's so. Anyway, I'm told so. I've never looked."

"Oh well. What I need is the ship's documentation; engine number, place of manufacture, identification code, the whole patty-cake. It's all in the computer, I'm sure, and it can probably turn out the formal card I need in half a second."

It took very little more than that. Kendray looked about again. "You three all the people on board?"

Trevize said, "That's right."

"Any live animals? Plants? State of health?"

"No. No. And good," said Trevize crisply.

"Um!" said Kendray, making notes. "Could you put your hand in here? Just routine. -Right hand, please."

Trevize looked at the device without favor. It was being used more and more commonly, and was growing quickly more elaborate. You could almost tell the backwardness of a world at a glance by the backwardness of its microdetector. There were now few worlds, however backward, that didn't have one at all. The start had come with the final breakup of the Empire, as each fragment of the whole grew increasingly anxious to protect itself from the diseases and alien microorganisms of all the others.

"What is that?" asked Bliss, in a low and interested voice, craning her head to see it first on one side, then the other.

Pelorat said, "A microdetector, I believe they call it."

Trevize added, "It's nothing mysterious. It's a device that automatically checks a portion of your body, inside and out, for any microorganism capable of transmitting disease."

"This will classify the microorganisms, too," said Kendray, with rather more than a hint of pride. "It's been worked out right here on Comporellon. -And if you don't mind, I still want your right hand."

Trevize inserted his right hand, and watched as a series of small red markings danced along a set of horizontal lines. Kendray touched a contact and a facsimile in color appeared at once. "If you'll sign that, sir," he said.

Trevize did so. "How badly off am I?" he asked. "I'm not in any great danger, am I?"

Kendray said, "I'm not a physician, so I can't say in detail, but it shows none of the marks that would require you to be turned away or to be put in quarantine. That's all I'm interested in."

"What a lucky break for me," said Trevize dryly, shaking his hand to rid himself of the slight tingle he felt.

"You, sir," said Kendray.

Pelorat inserted his hand with a certain hesitancy, then signed the facsimile.

"And you, ma'am?"

A few moments later, Kendray was staring at the result, saying, "I never saw anything like this before." He looked up at Bliss with an expression of awe. "You're negative. Altogether."

Bliss smiled engagingly. "How nice."

"Yes, ma'am. I envy you." He looked back at the first facsimile, and said, "Your identification, Mr. Trevize."

Trevize presented it. Kendray, glancing at it, again looked up in surprise.

"Councilman of the Terminus Legislature?"

"That's right."

"High official of the Foundation?"

Trevize said coolly, "Exactly right. So let's get through with this quickly, shall we?"

"You're captain of the ship?"

"Yes, I am."

"Purpose of visit?"

"Foundation security, and that's all the answer I'm going to give you. Do you understand that?"

"Yes, sir. How long do you intend to stay?"

"I don't know. Perhaps a week."

"Very well, sir. And this other gentleman?"

"He is Dr. Janov Pelorat," said Trevize. "You have his signature there and I vouch for him. He is a scholar of Terminus and he is my assistant in this business of my visit."

"I understand, sir, but I must see his identification. Rules are rules, I'm afraid. I hope you understand, sir."

Pelorat presented his papers.

Kendray nodded. "And you, miss?"

Trevize said quietly, "No need to bother the lady. I vouch for her, too."

"Yes, sir. But I need the identification."

Bliss said, "I'm afraid I don't have any papers, sir."

Kendray frowned. "I beg your pardon."

Trevize said, "The young lady didn't bring any with her. An oversight. It's perfectly all right. I'll take full responsibility."

Kendray said, "I wish I could let you do that, but I'm not allowed. The responsibility is mine. Under the circumstances, it's not terribly important. There should be no difficulty getting duplicates. The young woman, I presume, is from Terminus."

"No, she's not."

"From somewhere in Foundation territory, then?"

"As a matter of fact, she isn't."

Kendray looked at Bliss keenly, then at Trevize. "That's a complication, Councilman. It may take additional time to obtain a duplicate from some non-Foundation world. Since you're not a Foundation citizen, Miss Bliss, I must have the name of your

world of birth and of the world of which you're a citizen. You will then have to wait for duplicate papers to arrive."

Trevize said, "See here, Mr. Kendray. I see no reason why there need be any delay whatever. I am a high official of the Foundation government and I am here on a mission of great importance. I must not be delayed by a matter of trivial paperwork."

"The choice isn't mine, Councilman. If it were up to me, I'd let you down to Comporellon right now, but I have a thick book of rules that guides my every action. I've got to go by the book or I get it thrown at me. --Of course,

I presume there must be some Comporellian government figure who's waiting for you. If you'll tell me who it is, I will contact him, and if he orders me to let you through, then that's it."

Trevize hesitated a moment. "That would not be politic, Mr. Kendray. May I speak with your immediate superior?"

"You certainly may, but you can't just see him off-hand--"

"I'm sure he will come at once when he understands he's speaking to a Foundation official--"

"Actually," said Kendray, "just between us, that would make matters worse. We're not part of the Foundation metropolitan territory, you know. We come under the heading of an Associated Power, and we take it seriously. The people are anxious not to appear to be Foundation puppets--I'm using the popular expression only, you understand--and they bend backward to demonstrate independence. My superior would expect to get extra points if he resists doing a special favor for a Foundation official."

Trevize's expression darkened. "And you, too?"

Kendray shook his head. "I'm below politics, sir. No one gives me extra points for anything. I'm just lucky if they pay my salary. And though I don't get extra points, I can get demerits, and quite easily, too. I wish that were not so."

"Considering my position, you know, I can take care of you."

"No, sir. I'm sorry if that sounds impertinent, but I don't think you can. --And, sir, it's embarrassing to say this, but please don't offer me anything valuable. They make examples of officials who accept such things and they're pretty good at digging them out, these days."

"I wasn't thinking of bribing you. I'm only thinking of what the Mayor of Terminus can do to you if you interfere with my mission."

"Councilman, I'll be perfectly safe as long as I can hide behind the rulebook. If the members of the Comporellian Presidium get some sort of Foundation discipline, that is their concern, and not mine. --But if it will help, sir, I can let you and Dr. Pelorat through on your ship. If you'll leave Miss Bliss behind at the entry station, we'll hold her for a time and send her down to the surface as soon as her duplicate papers come through. If her papers should not be obtainable, for any reason, we will send her back to her world on commercial transportation. I'm afraid, though, that someone will have to pay her fare, in that ease."

Trevize caught Pelorat's expression at that, and said, "Mr. Kendray, may I speak to you privately in the pilot-room?"

"Very well, but I can't remain on board very much longer, or I'll be questioned."

"This won't take long," said Trevize.

In the pilot-room, Trevize made a show of closing the door tightly, then said, in a low voice, "I've been many places, Mr. Kendray, but I've never been anyplace where there has been such harsh emphasis on the minutiae of the rules of immigration, particularly for Foundation people and Foundation officials "

"But the young woman is not from the Foundation."

"Even so."

Kendray said, "These things go in rhythms. We've had some scandals and, right now, things are tough. If you'll come back next year, you might not have any trouble at all, but right now, I can do nothing."

"Try, Mr. Kendray," said Trevize, his voice growing mellow. "I'm going to throw myself on your mercy and appeal to you, man to man. Pelorat and I have been on this mission for quite a while. He and I. Just he and I. We're good friends, but there's something lonely about it, if you get me. Some time ago, Pelorat found this little lady. I don't have to tell you what happened, but we decided to bring her along. It keeps us healthy to make use of her now and then.

"Now the thing is Pelorat's got a relationship back on Terminus. I'm clear, you understand, but Pelorat is an older man and he's got to the age when they get a little-desperate. They need their youth back, or something. He can't give her up. At the same time, if she's even mentioned, officially, there's going to be misery galore on Terminus for old Pelorat when he gets back.

"There's no harm being done, you understand. Miss Bliss, as she calls herself-a good name considering her profession-is not exactly a bright kid; that's not what we want her for. Do you have to mention her at all? Can't you just list me and Pelorat on the ship? Only we were originally listed when we left Terminus. There need be no official notice of the woman. After all, she's absolutely free of disease. You noted that yourself."

Kendray made a face. "I don't really want to inconvenience you. I understand the situation and, believe me, I sympathize. Listen, if you think holding down a shift on this station for months at a time is any fun, think again. And it isn't co-educational, either; not on Comporellon." He shook his head. "And I have a wife, too, so I understand. -But, look, even if I let you through, as soon as they find out that the-uh-lady is without papers, she's in prison, you and Mr. Pelorat are in the kind of trouble that will get back to Terminus. And I myself will surely be out of a job."

"Mr. Kendray," said Trevize, "trust me in this. Once I'm on Comporellon, I'll be safe. I can talk about my mission to some of the right people and, when that's done, there'll be no further trouble. I'll take full responsibility for what has happened here, if it ever comes up-which I doubt. What's more, I will recommend your promotion, and you will get it, because I'll see to it that Terminus leans all over anyone who hesitates. -And we can give Pelorat a break."

Kendray hesitated, then said, "All right. I'll let you through-but take a word of warning. I start from this minute figuring out a way to save my butt if the matter comes up. I don't intend to do one thing to save yours. What's more I know how these things work on Comporellon and you don't, and Comporellon isn't an easy world for people who step out of line."

"Thank you, Mr. Kendray," said Trevize. "There'll be no trouble. I assure you of that."

4. ON COMPORELLON

13.

THEY WERE through. The entry station had shrunk to a rapidly dimming star behind them, and in a couple of hours they would be crossing the cloud layer.

A gravitic ship did not have to brake its path by a long route of slow spiral contraction, but neither could it swoop downward too rapidly. Freedom from gravity did not mean freedom from air resistance. The ship could descend in a straight line, but it was still a matter for caution; it could not be too fast.

"Where are we going to go?" asked Pelorat, looking confused. "I can't tell one place in the clouds from another, old fellow."

"No more can I," said Trevize, "but we have an official holographic map of Comporellon, which gives the shape of the land masses and an exaggerated relief for both land heights and ocean depths-and political subdivisions, too. The map is in the computer and that will do the work. It will match the planetary land-sea design to the map, thus orienting the ship properly, and it will then take us to the capital by a cycloidal pathway."

Pelorat said, "If we go to the capital, we plunge immediately into the political vortex. If the world is anti-Foundation, as the fellow at the entry station implied, we'll be asking for trouble."

"On the other hand, it's bound to be the intellectual center of the planet, and if we want information, that's where we'll find it, if anywhere. As for being anti-Foundation, I doubt that they will be able to display that too openly. The Mayor may have no great liking for me, but neither can she afford to have a Councilman mistreated. She would not care to allow the precedent to be established."

Bliss had emerged from the toilet, her hands still damp from scrubbing. She adjusted her underclothes with no sign of concern and said, "By the way, I trust the excreta is thoroughly recycled."

"No choice," said Trevize. "How long do you suppose our water supply would last without recycling of excreta? On what do you think those choicely flavored yeast cakes that we eat to lend spice to our frozen staples grow? -I hope that doesn't spoil your appetite, my efficient Bliss."

"Why should it? Where do you suppose food and water come from on Gaia, or on this planet, or on Terminus?"

"On Gaia," said Trevize, "the excreta is, of course, as alive as you are."

"Not alive. Conscious. There is a difference. The level of consciousness is, naturally, very low."

Trevize sniffed in a disparaging way, but didn't try to answer. He said, "I'm going into the pilot-room to keep the computer company. Not that it needs me."

Pelorat said, "May we come in and help you keep it company? I can't quite get used to the fact that it can get us down all by itself; that it can sense other ships, or storms, or-whatever?"

Trevize smiled broadly. "Get used to it, please. The ship is far safer under the computer's control than it ever would be under mine. -But certainly, come on. It will do you good to watch what happens."

They were over the sunlit side of the planet now for, as Trevize explained, the map in the computer could be more easily matched to reality in the sunlight than in the dark.

"That's obvious," said Pelorat.

"Not at all obvious. The computer will judge just as rapidly by the infrared light which the surface radiates even in the dark. However, the longer waves of infrared don't allow the computer quite the resolution that visible light would. That is, the computer doesn't see quite as finely and sharply by infrared, and where necessity doesn't drive, I like to make things as easy as possible for the computer."

"What if the capital is on the dark side?"

"The chance is fifty-fifty," said Trevize, "but if it is, once the map is matched by daylight, we can skim down to the capital quite unerringly even if it is in the dark. And long before we come anywhere near the capital, we'll be intersecting microwave beams and will be receiving messages directing us to the most convenient spaceport. -There's nothing to worry about."

"Are you sure?" said Bliss. "You're bringing me down without papers and without any native world that these people here will recognize--and I'm bound and determined not to mention Gaia to them in any case. So what do we do, if I'm asked for my papers once we're on the surface?"

Trevize said, "That's not likely to happen. Everyone will assume that was taken care of at the entry station."

"But if they ask?"

"Then, when that time comes, we'll face the problem. Meanwhile, let's not manufacture problems out of air."

"By the time we face the problems that may arise, it might well be too late to solve them."

"I'll rely on my ingenuity to keep it from being too late."

"Talking about ingenuity, how did you get us through the entry station?"

Trevize looked at Bliss, and let his lips slowly expand into a smile that made him seem like an impish teenager. "Just brains."

Pelorat said, "What did you do, old man?"

Trevize said, "It was a matter of appealing to him in the correct manner. I'd tried threats and subtle bribes. I had appealed to his logic and his loyalty to the Foundation. Nothing worked, so I fell back on the last resort. I said that you were cheating on your wife, Pelorat."

"My wife? Hut, my dear fellow, I don't have a wife at the moment."

"I know that, but he didn't."

Bliss said, "By 'wife,' I presume you mean a woman who is a particular man's regular companion."

Trevize said, "A little more than that, Bliss. A legal companion, one with enforceable rights in consequence of that companionship."

Pelorat said nervously, "Bliss, I do not have a wife. I have had one now and then in the past, but I haven't had one for quite a while. If you would care to undergo the legal ritual-

"Oh, Pel," said Bliss, making a sweeping-away movement with her right hand, "what would I care about that? I have innumerable companions that are as close to me as your arm is close companion to your other arm. It is only Isolates who feel so alienated that they have to use artificial conventions to enforce a feeble substitute for true companionship."

"But I am an Isolate, Bliss dear."

"You will be less Isolate in time, Pel. Never truly Gaia, perhaps, but less Isolate, and you will have a flood of companions."

"I only want you, Bliss," said Pel.

"That's because you know nothing about it. You'll learn."

Trevize was concentrating on the viewscreen during that exchange with a look of strained tolerance on his face. The cloud cover had come up close and, for a moment, all was gray fog.

Microwave vision, he thought, and the computer switched at once to the detection of radar echoes. The clouds disappeared and the surface of Comporellon appeared in false color, the boundaries between sectors of different constitution a little fuzzy and wavering.

"Is that the way it's going to look from now on?" asked Bliss, with some astonishment.

"Only till we drift below the clouds. Then it's back to sunlight." Even as he spoke, the sunshine and normal visibility returned.

"I see," said Bliss. Then, turning toward him, "But what I don't see is why it should matter to that official at the entry station whether Pel was deceiving his wife or not?"

"If that fellow, Kendray, had held you back, the news, I said, might reach Terminus and, therefore, Pelorat's wife. Pelorat would then be in trouble. I didn't specify the sort of trouble he would be in, but I tried to sound a1 though it would be bad. -There is a kind of free-masonry among males,"

Trevize was grinning, now, "and one male doesn't betray another fellow male. He would even help, if requested. The reasoning, I suppose, is that it might be the helper's turn next to be helped. I presume," he added, turning a bit graver, "that there is a similar free-masonry among women, but, not being a woman, I have never had an opportunity to observe it closely."

Bliss's face resembled a pretty thundercloud. "Is this a joke?" she demanded.

"No, I'm serious," said Trevize. "I don't say that that Kendray fellow let us through only to help Janov avoid angering his wife. The masculine free-masonry may simply have added the last push to my other arguments."

"But that is horrible. It is its rules that hold society together and bind it into a whole. Is it such a light thing to disregard the rules for trivial reasons?"

"Well," said Trevize, in instant defensiveness, "some of the rules are themselves trivial. Few worlds are very particular about passage in and out of their space in times of peace and commercial prosperity, such as we have now, thanks to the Foundation. Comporellon, for some reason, is out of step-probably because of an obscure matter of internal politics. Why should we suffer over that?"

"That is beside the point. If we only obey those rules that we think are just and reasonable, then no rule will stand, for there is no rule that some will not think is unjust and unreasonable. And if we wish to push our own individual advantage, as we see it, then we will always find reason to believe that some hampering rule is unjust and unreasonable. What starts, then, as a shrewd trick ends in anarchy and disaster, even for the shrewd trickster, since he, too, will not survive the collapse of society."

Trevize said, "Society will not collapse that easily. You speak as Gaia, and Gaia cannot possibly understand the association of free individuals. Rules, established with reason and justice, can easily outlive their usefulness as circumstances change, yet can remain in force through inertia. It is then not only right, but useful, to break those rules as a way of advertising the fact that they have become useless-or even actually harmful."

"Then every thief and murderer can argue he is serving humanity."

"You go to extremes. In the superorganism of Gaia, there is automatic consensus on the rules of society and it occurs to no one to break them. Opt might as well say that Gaia vegetates and fossilizes. There is admittedly an element of disorder in free association, but that is the price one must pay for the ability to induce novelty and change. -On the whole, it's a reasonable price."

Bliss's voice rose a notch. "You are quite wrong if you think Gaia vegetates and fossilizes. Our deeds, our ways, our views are under constant self-examination. They do not persist out of inertia, beyond reason. Gaia learns by experience and thought; and therefore changes when that is necessary."

"Even if what you say is so, the self-examination and learning must be slow, because nothing but Gaia exists on Gaia. Here, in freedom, even when almost everyone agrees, there are bound to be a few who disagree and, in some cases, those few may be right, and if they are clever enough, enthusiastic enough, right enough, they will win out in the end and be heroes in future ages-like Hari Seldon, who perfected psychohistory, pitted his own thoughts against the entire Galactic Empire, and won."

"He has won only so far, Trevize. The Second Empire he planned for will not come to pass. There will be Galaxia instead."

"Will there?" said Trevize grimly.

"It was your decision, and, however much you argue with me in favor of Isolates and of their freedom to be foolish and criminal, there is something in the hidden recesses of your mind that forced you to agree with me/us/Gaia when you made your choice."

"What is present in the hidden recesses of my mind," said Trevize, more grimly still, "is what I seek. -There, to begin with," he added, pointing to the viewscreen where a great city spread out to the horizon, a cluster of low structures climbing to occasional heights, surrounded by fields that were brown under a light frost.

Pelorat shook his head. "Too bad. I meant to watch the approach, but I got caught up in listening to the argument."

Trevize said, "Never mind, Janov. You can watch when we leave. I'll promise to keep my mouth shut then, if you can persuade Bliss to control her own."

And the Far Star descended a microwave beam to a landing at the spaceport.

14.

KENDRAY looked grave when he returned to the entry station and watched the Far Star pass through. He was still clearly depressed at the close of his shift.

He was sitting down to his closing meal of the day when one of his mates, a gangling fellow with wide-set eyes, thin light hair, and eyebrows so blond they seemed absent, sat down next to him.

"What's wrong, Ken?" said the other.

Kendray's lips twisted. He said, "That was a gravitic ship that just passed through, Gatis."

"The odd-looking one with zero radioactivity?"

"That's why it wasn't radioactive. No fuel. Gravitic."

Gatis nodded his head. "What we were told to watch for, right?"

"Right."

"And you got it. Leave it to you to be the lucky one."

"Not so lucky. A woman without identification was on it-and I didn't report her."

"What? Look, don't tell me. I don't want to know about it. Not another word. You may be a pal, but I'm not going to make myself an accomplice after the fact."

"I'm not worried about that. Not very much. I had to send the ship down. They want that gravitic---or any gravitic. You know that."

"Sure, but you could at least have reported the woman."

"Didn't like to. She's not married. She was just picked up for-for use."

"How many men on board?"

"Two."

"And they just picked her up for-for that. They must be from Terminus."

"That's right."

"They don't care what they do on Terminus."

"That's right."

"Disgusting. And they get away with it."

"One of them was married, and he didn't want his wife to know. If I reported her, his wife would find out."

"Wouldn't she be back on Terminus?"

"Of course, but she'd find out anyway."

"Serve the fellow right if his wife did find out."

"I agree-but I can't be the one to be responsible for it."

"They'll hammer you for not reporting it. Not wanting to make trouble for a guy is no excuse."

"Would you have reported him?"

"I'd have had to, I suppose."

"No, you wouldn't. The government wants that ship. If I had insisted on putting the woman on report, the men on the ship would have changed their minds about landing and would have pulled away to some other planet. The government wouldn't have wanted-that."

"But will they believe you?"

"I think so. -A very cute-looking woman, too. Imagine a woman like that being willing to come along with two men, and married men with the nerve to take advantage. - You know, it's tempting."

"I don't think you'd want the missus to know you said that--or even thought that."

Kendray said defiantly, "Who's going to tell her? You?"

"Come on. You know better than that." Gatis's look of indignation faded quickly, and he said, "It's not going to do those guys any good, you know, you letting them through."

"I know."

"The people down surface-way will find out soon enough, and even if you get away with it, they won't."

"I know," said Kendray, "but I'm sorry for them. Whatever trouble the woman will make for them will be as nothing to what the ship will make for them. The captain made a few remarks-"

Kendray paused, and Gatis said eagerly, "Like what?"

"Never mind," said Kendray. "If it comes out, it's my butt."

"I'm not going to repeat it."

"Neither am I. But I'm sorry for those two men from Terminus."

15.

To ANYONE who has been in space and experienced its changelessness, the real excitement of space flight comes when it is time to land on a new planet. The ground speeds backward under you as you catch glimpses of land and water, of geometrical areas and lines that might represent fields and roads. You become aware of the green of

growing things, the gray of concrete, the brown of bare ground, the white of snow. Most of all, there is the excitement of populated conglomerates; cities which, on each world, have their own characteristic geometry and architectural variants.

In an ordinary ship, there would have been the excitement of touching down and skimming across a runway. For the Far Star, it was different. It floated through the air, was slowed by skillfully balancing air resistance and gravity, and finally made to come to rest above the spaceport. The wind was gusty and that introduced an added complication. The Far Star, when adjusted to low response to gravitational pull, was not only abnormally low in weight, but in mass as well. If its mass were too close to zero, the wind would blow it away rapidly. Hence, gravitational response had to be raised and jetthrusters had to be delicately used not only against the planet's pull but against the wind's push, and in a manner that matched the shift in wind intensity closely. Without an adequate computer, it could not possibly have been done properly.

Downward and downward, with small unavoidable shifts in this direction and that, drifted the ship until it finally sank into the outlined area that marked its assigned position in the port.

The sky was a pale blue, intermingled with flat white, when the Far Star landed. The wind remained gusty even at ground level and though it was now no longer a navigational peril, it produced a chill that Trevize winced at. He realized at once that their clothing supply was totally unsuited to Comporellian weather.

Pelorat, on the other hand, looked about with appreciation and drew his breath deeply through his nose with relish, liking the bite of the cold, at least for the moment. He even deliberately unseamed his coat in order to feel the wind against his chest. In a little while, he knew, he would seam up again and adjust his scarf, but for now he wanted to feel the existence of an atmosphere. One never did aboard ship.

Bliss drew her coat closely about herself, and, with gloved hands, dragged her hat down to cover her ears. Her face was crumpled in misery and seemed close to tears.

She muttered, "This world is evil. It hates and mistreats us."

"Not at all, Bliss dear," said Pelorat earnestly. "I'm sure the inhabitant; like this world, and that it-uh-likes them, if you want to put it that way. We'll be indoors soon enough, and it will be warm there."

Almost as an afterthought, he flipped one side of his coat outward curved it about her, while she snuggled against his shirtfront.

Trevize did his best to ignore the temperature. He obtained a map card from the port authority, checking it on his pocket computer to sure that it gave the necessary details-his aisle and lot number, the and engine number of his ship, and so on. He checked once more to sure that the ship was tightly secured, and then took out the maximum insurance allowed against the chance of misadventure (useless, actually, the Far Star should be invulnerable at the likely Comporellian level of technology, and was entirely irreplaceable at whatever price, if it were not). !

Trevize found the taxi-station where it ought to be. (A number of facilities at spaceports were standardized in position, appearance, and manner of use. They had to be, in view of the multiworld nature of the clientele.)

He signaled for a taxi, punching out the destination merely as "City."

A taxi glided up to them on diamagnetic skis, drifting slightly under the impulse of the wind, and trembling under the vibration of its not-quite-silent engine. It was a dark gray in color and bore its white taxi-insignia on tell doors. The taxi-driver was wearing a dark coat and a white, furred hat.

Pelorat, becoming aware, said softly, "The planetary decor seem to be black and white."

Trevize said, "It may be more lively in the city proper."

The driver spoke into a small microphone, perhaps in order to avoid opening the window. "Going to the city, folks?"

There was a gentle singsong to his Galactic dialect that was rather attractive, and he was not hard to understand-always a relief on a new world,

Trevize said, "That's right," and the rear door slid open.

Bliss entered, followed by Pelorat, and then by Trevize. The door Wood and warm air welled upward.

Bliss rubbed her hands and breathed a long sigh of relief.

The taxi pulled out slowly, and the driver said, "That ship you came in is gravitic, isn't it?"

Trevize said dryly, "Considering the way it came down, would you doubt it?"

The driver said, "Is it from Terminus, then?"

Trevize said, "Do you know any other world that could build one?"

The driver seemed to digest that as the taxi took on speed. He then said, "Do you always answer a question with a question?"

Trevize couldn't resist. "Why not?"

"In that case, how would you answer me if I asked if your name were Golan Trevize?"

"I would answer: What makes you ask?"

The taxi came to a halt at the outskirts of the spaceport and the driver said, "Curiosity! I ask again: Are you Golan Trevize?"

Trevize's voice became stiff and hostile. "What business is that of yours?"

"My friend," said the driver, "We're not moving till you answer the question. And if you don't answer in a clear yes or no in about two seconds, I'm turning the heat off in the passenger compartment and we'll keep on waiting. Are you Golan Trevize, Councilman of Terminus? If your answer is in the negative, you will have to show me your identification papers."

Trevize said, "Yes, I am Golan Trevize, and as a Councilman of the Foundation, I expect to be treated with all the courtesy due my rank. Your failure to do so will have you in hot water, fellow. Now what?"

"Now we can proceed a little more lightheartedly." The taxi began to move again. "I choose my passengers carefully, and I had expected to pick up two men only. The woman was a surprise and I might have made a mistake. As it is, if I have you, then I can leave it to you to explain the woman when you reach your destination."

"You don't know my destination."

"As it happens, I do. You're going to the Department of Transportation."

"That's not where I want to go."

"That matters not one little bit, Councilman. If I were a taxi-driver, I'd take you where you want to go. Since I'm not, I take you where I want you to go."

"Pardon me," said Pelorat, leaning forward, "you certainly seem to be a taxi-driver. You're driving a taxi."

"Anyone might drive a taxi. Not everyone has a license to do so. And not every car that looks like a taxi is a taxi."

Trevize said, "Let's stop playing games. Who are you and what are you doing? Remember that you'll have to account for this to the Foundation."

"Not I," said the driver, "My superiors, perhaps. I'm an agent of the Comporellian Security Force. I am under orders to treat you with all due respect to your rank, but you must go where I take you. And be very careful how you react, for this vehicle is armed, and I am under orders to defend myself against attack."

16.

THE VEHICLE, having reached cruising speed, moved with absolute, smooth quiet, and Trevize sat there in quietness as frozen. He was aware, without actually looking, of Pelorat glancing at him now and then with a look of uncertainty on his face, a "What do we do now? Please tell me" look.

Bliss, a quick glance told him, sat calmly, apparently unconcerned. Of course, she was a whole world in herself. All of Gaia, though it might be at Galactic distances, was wrapped up in her skin. She had resources that could be called on in a true emergency.

But, then, what had happened?

Clearly, the official at the entry station, following routine, had sent down his report-omitting Bliss-and it had attracted the interest of the security people and, of all things, the Department of Transportation. Why?

It was peacetime and he knew of no specific tensions between Comporellon and the Foundation. He himself was an important Foundation official-

Wait, he had told the official at the entry station-Kendray, his name had been-that he was on important business with the Comporellian government. He had stressed that in his attempt to get through. Kendray must have reported that as well and that would rouse all sorts of interest.

He hadn't anticipated that, and he certainly should have.

What, then, about his supposed gift of rightness? Was he beginning to believe that he was the black box that Gaia thought he was-or said it thought he was. Was he being led into a quagmire by the growth of an overconfidence built on superstition?

How could he for one moment be trapped in that folly? Had he never in his life been wrong? Did he know what the weather would be tomorrow? Did he win large amounts in games of chance? The answers were no, no, and no.

Well, then, was it only in the large, inchoate things that he was always right? How could he tell?

Forget that! -After all, the mere fact that he had stated he had important state business-no, it was "Foundation security" that he had said-

Well, then, the mere fact that he was there on a matter of Foundation security, coming, as he had, secretly and unheralded, would surely attract their attention. -Yes, but until they knew what it was all about they would surely act with the utmost circumspection. They would be ceremonious and treat him as a high dignitary. They would not kidnap him and make use of threats.

Yet that was exactly what they had done. Why?

What made them feel strong enough and powerful enough to treat a Councilman of Terminus in such a fashion?

Could it be Earth? Was the same force that hid the world of origin so effectively, even against the great mentalists of the Second Foundation, now working to circumvent his search for Earth in the very first stage of that search? Was Earth omniscient? Omnipotent?

Trevize shook his head. That way lay paranoia. Was he going to blame Earth for everything? Was every quirk of behavior, every bend in the road, every twist of circumstance, to be the result of the secret machinations of Earth? As soon as he began to think in that fashion, he was defeated.

At that point, he felt the vehicle decelerating and was brought back to reality at a stroke.

It occurred to him that he had never, even for one moment, looked at the city through which they had been passing. He looked about now, a touch wildly. The buildings were low, but it was a cold planet-most of the structures were probably underground.

He saw no trace of color and that seemed against human nature.

Occasionally, he could see a person pass, well bundled. But, then, the people, like the buildings themselves, were probably mostly underground.

The taxi had stopped before a low, broad building, set in a depression, the bottom of which Trevize could not see. Some moments passed and it continued to remain there, the driver himself motionless as well. His tall, white hat nearly touched the roof of the vehicle.

Trevize wondered fleetingly how the driver managed to step in and out of the vehicle without knocking his hat off, then said, with the controlled anger one would expect of a haughty and mistreated official, "Well, driver, what now?"

The Comporellian version of the glittering field-partition that separated the driver from the passengers was not at all primitive. Sound waves could pass through-though Trevize was quite certain that material objects, at reasonable energies, could not.

The driver said, "Someone will be up to get you. Just sit back and take it easy."

Even as he said this, three heads appeared in a slow, smooth ascent from the depression in which the building rested. After that, there came the rest of the bodies. Clearly, the newcomers were moving up the equivalent of an escalator, but Trevize could not see the details of the device from where he sat.

As the three approached, the passenger door of the taxi opened and a flood of cold air swept inward.

Trevize stepped out, seaming his coat to the neck. The other two followed him-Bliss with considerable reluctance.

The three Comporellians were shapeless, wearing garments that ballooned outward and were probably electrically heated. Trevize felt scorn at that. There was little use for such things on Terminus, and the one time he had borrowed a heat-coat during winter on the nearby planet of Anacreon, he discovered it had a tendency to grow warmer at a slow rate so that by the time he realized he was too warm he was perspiring uncomfortably.

As the Comporellians approached, Trevize noted with a distinct sense of indignation that they were armed. Nor did they try to conceal the fact. Quite the contrary. Each had a blaster in a holster attached to the outer garment.

One of the Comporellians, having stepped up to confront Trevize, said gruffly, "Your pardon, Councilman," and then pulled his coat open with rough movement. He had inserted questing hands which moved quickly up and down Trevize's sides, back, chest, and thighs. The coat was shaken and felt. Trevize was too overcome by confused astonishment to realize he had been rapidly and efficiently searched till it was over.

Pelorat, his chin drawn down and his mouth in a twisted grimace, was undergoing a similar indignity at the hands of a second Comporellian.

The third was approaching Bliss, who did not wait to be touched. She, at least, knew what to expect, somehow, for she whipped off her coat and, for a moment, stood there in her light clothing, exposed to the whistle of the wind.

She said, freezingly enough to match the temperature, "You can see I'm not armed."

And indeed anyone could. The Comporellian shook the coat, as though by its weight he could tell if it contained a weapon--perhaps he could--and retreated.

Bliss put on her coat again, huddling into it,- and for a moment Trevize admired her gesture. He knew how she felt about the cold, but she had not allowed a tremor or shiver to escape her as she had stood there in thin blouse and slacks. (Then he wondered if, in the emergency, she might not have drawn warmth from the rest of Gaia.)

One of the Comporellians gestured, and the three Outworlders followed him. The other two Comporellians fell behind. The one or two pedestrians who were on the street did not bother to watch what was happening. Either they were too accustomed to the

sight or, more likely, had their minds occupied with getting to some indoor destination as soon as possible.

Trevize saw now that it was a moving ramp up which the Comporellians had ascended. They were descending now, all six of them, and passed through a lock arrangement almost as complicated as that on a spaceship-to keep heat inside, no doubt, rather than-air.

And then, at once, they were inside a huge building.

5. STRUGGLE FOR THE SHIP

17.

TREVIZE'S first impression was that he was on the set of a hyperdrama—specifically, that of a historical romance of Imperial days. There was a particular set, with few variations (perhaps only one existed and was used by every hyperdrama producer, for all he knew), that represented the great worldgirdling planet-city of Trantor in its prime.

There were the large spaces, the busy scurry of pedestrians, the small vehicles speeding along the lanes reserved for them.

Trevize looked up, almost expecting to see air-taxis climbing into dim vaulted recesses, but that at least was absent. In fact, as his initial astonishment subsided, it was clear that the building was far smaller than one would expect on Trantor. It was only a building and not part of a complex that stretched unbroken for thousands of miles in every direction.

The colors were different, too. On the hyperdramas, Trantor was always depicted as impossibly garish in coloring and the clothing was, if taken literally, thoroughly impractical and unserviceable. However, all those colors and frills were meant to serve a symbolic purpose for they indicated the decadence (a view that was obligatory, these days) of the Empire, and of Trantor particularly.

If that were so, however, Comporellon was the very reverse of decadent, for the color scheme that Pelorat had remarked upon at the spaceport was here borne out.

The walls were in shades of gray, the ceilings white, the clothing of the population in black, gray, and white. Occasionally, there was an all-black costume; even more occasionally, an all-gray; never an all-white that Trevize could see. The pattern was always different, however, as though people, deprived of color, still managed, irrepressibly, to find ways of asserting individuality.

Faces tended to be expressionless or, if not that, then grim. Women wore their hair short; men longer, but pulled backward into short queues. No one looked at anyone else as he or she passed. Everyone seemed to breathe a purposefulness, as though there was definite business on each mind and room for nothing else. Men and women dressed alike, with only length of hair and the slight bulge of breast and width of hip marking the difference.

The three were guided into an elevator that went down five levels. There they emerged and were moved on to a door on which there appeared in small and unobtrusive lettering, white on gray, "Mitza Lizalor, MinTrans."

The Comporellian in the lead touched the lettering, which, after a moment, glowed in response. The door opened and they walked in.

It was a large room and rather empty, the bareness of content serving, perhaps, as a kind of conspicuous consumption of space designed to show the power of the occupant.

Two guards stood against the far wall, faces expressionless and eyes firmly fixed on those entering. A large desk filled the center of the room, set perhaps just a little back of center. Behind the desk was, presumably, Mitza Lizalor, large of body, smooth of face, dark of eyes. Two strong and capable hands with long, square-ended fingers rested on the desk.

The MinTrans (Minister of Transportation, Trevize assumed) had the lapels of the outer garment a broad and dazzling white against the dark gray of the rest of the costume. The double bar of white extended diagonally below the lapels, across the garment itself and crossing at the center of the chest. Trevize could see that although the garment was cut in such a fashion as to obscure the swelling of a woman's breasts on either side, the white X called attention to them.

The Minister was undoubtedly a woman. Even if her breasts were ignored, her short hair showed it, and though there was no makeup on her face, her features showed it, too.

Her voice, too, was indisputably feminine, a rich contralto.

She said, "Good afternoon. It is not often that we are honored by a visit of men from Terminus. -And of an unreported woman as well." Her eyes passed from one to another, then settled on Trevize, who was standing stiffly and frowningly erect. "And one of the men a member of the Council, too."

"A Councilman of the Foundation," said Trevize, trying to make his voice ring. "Councilman Golan Trevize on a mission from the Foundation."

"On a mission?" The Minister's eyebrows rose.

"On a mission," repeated Trevize. "Why, then, are we being treated as felons? Why have we been taken into custody by armed guards and brought here as prisoners? The Council of the Foundation, I hope you understand, will not be pleased to hear of this."

"And in any case," said Bliss, her voice seeming a touch shrill in comparison with that of the older woman, "are we to remain standing indefinitely?"

The Minister gazed coolly at Bliss for a long moment, then raised an arm and said, "Three chairs! Now!"

A door opened and three men, dressed in the usual somber Comporellian fashion, brought in three chairs at a semitrot. The three people standing before the desk sat down.

"There," said the Minister, with a wintry smile, "are we comfortable?"

Trevize thought not. The chairs were uncushioned, cold to the touch, flat of surface and back, making no compromise with the shape of the body. He said, "Why are we here?"

The Minister consulted papers lying on her desk. "I will explain as soon as I am certain of my facts. Your ship is the Far Star out of Terminus. Is that correct, Councilman?"

"It is."

The Minister looked up. "I used your title, Councilman. Will you, as a courtesy, use mine?"

"Would Madam Minister be sufficient? Or is there an honorific?"

"No honorific, sir, and you need not double your words. 'Minister' is sufficient, or 'Madam' if you weary of repetition."

"Then my answer to your question is: It is, Minister."

"The captain of the ship is Golan Trevize, citizen of the Foundation and member of the Council on Terminus—a freshman Councilman, actually. And you are Trevize. Am I correct in all this, Councilman?"

"You are, Minister. And since I am a citizen of the Foundation—"

"I am not yet done, Councilman. Save your objections till I am. Accompanying you is Janov Pelorat, scholar, historian, and citizen of the Foundation. And that is you, is it not, Dr. Pelorat?"

Pelorat could not suppress a slight start as the Minister turned her keen glance on him. He said, "Yes, it is, my d—" He paused, and began again, "Yes, it is, Minister."

The Minister clasped her hands stiffly. "There is no mention in the report that has been forwarded to me of a woman. Is this woman a member of the ship's complement?"

"She is, Minister," said Trevize.

"Then I address myself to the woman. Your name?"

"I am known as Bliss," said Bliss, sitting erectly and speaking with calm clarity, "though my full name is longer, madam. Do you wish it all?"

"I will be content with Bliss for the moment. Are you a citizen of the Foundation, Bliss?"

"I am not, madam."

"Of what world are you a citizen, Bliss?"

"I have no documents attesting to citizenship with respect to any world, madam."

"No papers, Bliss?" She made a small mark on the papers before her. "That fact is noted. What is it you are doing on board the ship?"

"I am a passenger, madam."

"Did either Councilman Trevize or Dr. Pelorat ask to see your papers before you boarded, Bliss?"

"No, madam."

"Did you inform them that you were without papers, Bliss?"

"No, madam."

"What is your function on board ship, Bliss? Does your name suit your function?"

Bliss said proudly, "I am a passenger and have no other function."

Trevize broke in. "Why are you badgering this woman, Minister? What law has she broken?"

Minister Lizalor's eyes shifted from Bliss to Trevize. She said, "You are an Outworlder, Councilman, and do not know our laws. Nevertheless, you are subject to

them if you choose to visit our world. You do not bring your laws with you; that is a general rule of Galactic law, I believe."

"Granted, Minister, but that doesn't tell me which of your laws she has broken."

"It is a general rule in the Galaxy, Councilman, that a visitor from a world outside the dominions of the world she is visiting have her identification papers with her. Many worlds are lax in this respect, valuing tourism, or indifferent to the rule of order. We of Comporellon are not. We are a world of law and rigid in its application. She is a worldless person, and as such, breaks our law."

Trevize said, "She had no choice in the matter. I was piloting the ship, and I brought it down to Comporellon. She had to accompany us, Minister, or do you suggest she should have asked to be jettisoned in space?"

"This merely means that you, too, have broken our law, Councilman."

"No, that is not so, Minister. I am not an Outworlder. I am a citizen of the Foundation, and Comporellon and the worlds subject to it are an Associated Power of the Foundation. As a citizen of the Foundation, I can travel freely here."

"Certainly, Councilman, as long as you have documentation to prove that you are indeed a citizen of the Foundation."

"Which I do, Minister."

"Yet even as citizen of the Foundation, you do not have the right to break our law by bringing a worldless person with you."

Trevize hesitated. Clearly, the border guard, Kendray, had not kept faith with him, so there was no point in protecting him. He said, "We were not stopped at the immigration station and I considered that implicit permission to bring this woman with me, Minister."

"It is true you were not stopped, Councilman. It is true the woman was not reported by the immigration authorities and was passed through. I can suspect, however, that the officials at the entry station decided-and quite correctly-that it was more important to get your ship to the surface than to worry about a worldless person. What they did was, strictly speaking, an infraction of the rules, and the matter will have to be dealt with in the proper fashion, but I have no doubt that the decision will be that the infraction was justified. We are a world of rigid law, Councilman, but we are not rigid beyond the dictates of reason."

Trevize said at once, "Then I call upon reason to bend your rigor now, Minister. If, indeed, you received no information from the immigration station to the effect that a worldless person was on board ship, then you had no knowledge that we were breaking any law at the time we landed. Yet it is quite apparent that you were prepared to take us into custody the moment we landed, and you did, in fact, do so. Why did you do so, when you had no reason to think any law was being broken?"

The Minister smiled. "I understand your confusion, Councilman. Please let me assure you that whatever knowledge we had gained-or had not gained-as to the worldless condition of your passenger had nothing to do with your being taken into custody. We

are acting on behalf of the Foundation, of which, as you point out, we are an Associated Power."

Trevize stared at her. "But that's impossible, Minister. It's even worse. It's ridiculous."

The Minister's chuckle was like the smooth flow of honey. She said, "I am interested in the way you consider it worse to be ridiculous than impossible, Councilman. I agree with you there. Unfortunately for you, however, it is neither. Why should it be?"

"Because I am an official of the Foundation government, on a mission for them, and it is absolutely inconceivable that they would wish to arrest me, or that they would even have the power to do so, since I have legislative immunity."

"Ah, you omit my title, but you are deeply moved and that is perhaps forgivable. Still, I am not asked to arrest you directly. I do so only that I may carry out what I am asked to do, Councilman."

"Which is, Minister?" said Trevize, trying to keep his emotion under control in the face of this formidable woman.

"Which is to commandeer your ship, Councilman, and return it to the Foundation."

"What?"

"Again you omit my title, Councilman. That is very slipshod of you and no way to press your own case. The ship is not yours, I presume. Was it designed by you, or built by you, or paid for by you?"

"Of course not, Minister. It was assigned to me by the Foundation government."

"Then, presumably, the Foundation government has the right to cancel that assignment, Councilman. It is a valuable ship, I imagine."

Trevize did not answer.

The Minister said, "It is a gravitic ship, Councilman. There cannot be many and even the Foundation must have but a very few. They must regret having assigned one of those very few to you. Perhaps you can persuade them, to assign you another and less valuable ship that will nevertheless amply suffice for your mission. -But we must have the ship in which you have arrived."

"No, Minister, I cannot give up the ship. I cannot believe the Foundation asks it of you."

The Minister smiled. "Not of me solely, Councilman. Not of Comporellon, specifically. We have reason to believe that the request was sent out to ever; one of the many worlds and regions under Foundation jurisdiction or association. From this, I deduce that the Foundation does not know your itinerary and is seeking you with a certain angry vigor. From which I further deduce that you have no mission to deal with Comporellon on behalf of the Foundation--since in that case they would know where you were and deal with us specifically. In short, Councilman, you have been lying to me."

Trevize said, with a certain difficulty, "I would like to see a copy of request you have received from the Foundation government, Minister. I entitled, I think, to that."

"Certainly, if all this comes to legal action. We take our legal forms very seriously, Councilman, and your rights will be fully protected, I assure you. It would be better and

easier, however, if we come to an agreement here without the publicity and delay of legal action. We would prefer that, and, I am certain, so would the Foundation, which cannot wish the Galaxy at large to know of a runaway Legislator. That would put the Foundation in a ridiculous light, and, by your estimate and mine, that would be worse than impossible."

Trevize was again silent.

The Minister waited a moment, then went on, as imperturbable as ever. "Come, Councilman, either way, by informal agreement or by legal action, we intend to have the ship. The penalty for bringing in a worldless passenger will depend on which route we take. Demand the law and she will represent an additional point against you and you will all suffer the full punishment for the crime, and that will not be light, I assure you. Come to an agreement, and your passenger can be sent away by commercial flight to any destination she wishes, and, for that matter, you two can accompany her, if you wish. Or, if the Foundation is willing, we can supply you with one of our own ships, a perfectly adequate one, provided, of course, that the Foundation will replace it with an equivalent ship of their own. Or, if, for any reason, you do not wish to return to Foundation-controlled territory, we might be willing to offer you refuge here and, perhaps, eventual Comporellian citizenship. You see, you have many possibilities of gain if you come to a friendly arrangement, but none at all if you insist on your legal rights."

Trevize said, "Minister, you are too eager. You promise what you cannot do. You cannot offer me refuge in the face of a Foundation request that I be delivered to them."

The Minister said, "Councilman, I never promise what I cannot do. The Foundation's request is only for the ship. They make no request concerning you as an individual, or for anyone else on the ship. Their sole request is for the vessel."

Trevize glanced quickly at Bliss, and said, "May I have your permission, Minister, to consult with Dr. Pelorat and Miss Bliss for a short while?"

"Certainly, Councilman. You may have fifteen minutes."

"Privately, Minister."

"You will be led to a room and, after fifteen minutes, you will be led back, Councilman. You will not be interfered with while you are there nor will we attempt to monitor your conversation. You have my word on that and I keep my word. However, you will be adequately guarded so do not be so foolish as to think of escaping."

"We understand, Minister."

"And when you come back, we will expect your free agreement to give up the ship. Otherwise, the law will take its course, and it will be much the worse for all of you, Councilman. Is that understood?"

"That is understood, Minister," said Trevize, keeping his rage under tight control, since its expression would do him no good at all.

18.

IT was a small room, but it was well lighted. It contained a couch and two chairs, and one could hear the soft sound of a ventilating fan. On the whole, it was clearly more comfortable than the Minister's large and sterile office.

A guard had led them there, grave and tall, his hand hovering near the butt of his blaster. He remained outside the door as they entered and said, in a heavy voice, "You have fifteen minutes."

He had no sooner said that than the door slid shut, with a thud.

Trevize said, "I can only hope that we can't be overheard."

Pelorat said, "She did give us her word, Golan."

"You judge others by yourself, Janov. Her so-called 'word' will not suffice. She will break it without hesitation if she wants to."

"It doesn't matter," said Bliss. "I can shield this place."

"You have a shielding device?" asked Pelorat.

Bliss smiled, with a sudden flash of white teeth. "Gaia's mind is a shielding device, Pel. It's an enormous mind."

"We are here," said Trevize angrily, "because of the limitations of that enormous mind."

"What do you mean?" said Bliss.

"When the triple confrontation broke up, you withdrew me from the minds of both the Mayor and that Second Founder, Gendibal. Neither was to think of me again, except distantly and indifferently. I was to be left to myself."

"We had to do that," said Bliss. "You are our most important resource."

"Yes. Golan Trevize, the ever-right. But you did not withdraw my ship from their minds, did you? Mayor Branno did not ask for me; she had no interest in me, but she did ask for the ship. She has not forgotten the ship."

Bliss frowned.

Trevize said, "Think about it. Gaia casually assumed that I included my ship; that we were a unit. If Branno didn't think of me, she wouldn't think of the ship. The trouble is that Gaia doesn't understand individuality. It thought of the ship and me as a single organism, and it was wrong to think that."

Bliss said softly, "That is possible."

"Well, then," said Trevize flatly, "it's up to you to rectify that mistake. I must have my gravitic ship and my computer. Nothing else will do. Therefore, Bliss, make sure that I keep the ship. You can control minds."

"Yes, Trevize, but we do not exercise that control lightly. We did it in connection with the triple confrontation, but do you know how long that confrontation was planned? Calculated? Weighed? It took-literally-many years. I cannot simply walk up to a woman and adjust the mind to suit someone's convenience."

"Is this a time-"

Bliss went on forcefully. "If I began to follow such a course of action, where do we stop? I might have influenced the agent's mind at the entry station and we would have passed through at once. I might have influenced the agent's mind in the vehicle, and he would have let us go."

"Well, since you mention it, why didn't you do these things?"

"Because we don't know where it would lead. We don't know the side effects, which may well turn out to make the situation worse. If I adjust the Minister's mind now, that will affect her dealings with others with whom she will come in contact and, since she is a high official in her government, it may affect interstellar relations. Until such time as the matter is thoroughly worked out, we dare not touch her mind."

"Then why are you with us?"

"Because the time may come when your life is threatened. I must protect your life at all costs, even at the cost of my Pel or of myself. Your life was not threatened at the entry station. It is not threatened now. You must work this out for yourself, and do so at least until Gaia can estimate the consequence of some sort of action and take it."

Trevize fell into a period of thought. Then he said, "In that case, I have to try something. It may not work."

The door moved open, thwacking into its socket as noisily as it had closed.

The guard said, "Come out."

As they emerged, Pelorat whispered, "What are you going to do, Golan?"

Trevize shook his head and whispered, "I'm not entirely sure. I will have to improvise."

19.

MINISTER Lizalor was still at her desk when they returned to her office. Her face broke into a grim smile as they walked in.

She said, "I trust, Councilman Trevize, that you have returned to tell me that you are giving up this Foundation ship you have."

"I have come, Minister," said Trevize calmly, "to discuss terms."

"There are no terms to discuss, Councilman. A trial, if you insist on one, can be arranged very quickly and would be carried through even more quickly. I guarantee your conviction even in a perfectly fair trial since your guilt in bringing in a worldless person is obvious and indisputable. After that, we will be legally justified in seizing the ship and you three would suffer heavy penalties. Don't force those penalties on yourself just to delay us for a day."

"Nevertheless, there are terms to discuss, Minister, because no matter how quickly you convict us, you cannot seize the ship without my consent. Any attempt you make to force your way into the ship without me will destroy it, and the spaceport with it, and every human being in the spaceport. This will surely infuriate the Foundation, something you dare not do. Threatening us or mistreating us in order to force me to open the ship is

surely against your law, and if you break your own law in desperation and subject us to torture or even to a period of cruel and unusual imprisonment, the Foundation will find out about it and they will be even more furious. However much they want the ship they cannot allow a precedent that would permit the mistreatment of Foundation citizens. - Shall we talk terms?"

"This is all nonsense," said the Minister, scowling. "If necessary, we will call in the Foundation itself. They will know how to open their own ship, or they will force you to open it."

Trevize said, "You do not use my title, Minister, but you are emotionally moved, so that is perhaps forgivable. You know that the very last thing you will do is call in the Foundation, since you have no intention of delivering the ship to them."

The smile faded from the Minister's face. "What nonsense is this, Councilman?"

"The kind of nonsense, Minister, that others, perhaps, ought not to hear. Let my friend and the young woman go to some comfortable hotel room and obtain the rest they need so badly and let your guards leave, too. They can remain just outside and you can have them leave you a blaster. You are not a small woman and, with a blaster, you have nothing to fear from me. I am unarmed."

The Minister leaned toward him across the desk. "I have nothing to fear from you in any case."

Without looking behind her, she beckoned to one of the guards, who approached at once and came to a halt at her side with a stamp of his feet. said, "Guard, take that one and that one to Suite 5. They are to stay there and to be made comfortable and to be well guarded. You will be held responsible for any mistreatment they may receive, as well as for any breach of security."

She stood up, and not all of Trevize's determination to maintain an absolute composure sufficed to keep him from flinching a little. She was tall; a1. tall, at least, as Trevize's own 1.85 meters, perhaps a centimeter or so taller. She had a narrow waistline, with the two white strips across her chest continuing into an encirclement of her waist, making it look even narrower, There was a massive grace about her and Trevize thought ruefully that her statement that she had nothing to fear from him might well be correct. In a rough-and-tumble, he thought, she would have no trouble pinning his shoulders to the mat.

She said, "Come with me, Councilman. If you are going to talk nonsense then, for your own sake, the fewer who hear you, the better."

She led the way in a brisk stride, and Trevize followed, feeling shrunken in her massive shadow, a feeling he had never before had with a woman.

They entered an elevator and, as the door closed behind them, she said, "We are alone now and if you are under the illusion, Councilman, that You can use force with me in order to accomplish some imagined purpose, please forget that." The singsong in her voice grew more pronounced as she said, with clear amusement, "You look like a reasonably strong specimen, but I assure you I will have no trouble in breaking your arm or your back, if I must. I am armed, but I will not have to use any weapon."

Trevize scratched at his cheek as his eyes drifted first down, then up her body. "Minister, I can hold my own in a wrestling match with any man my weight, but I have already decided to forfeit a bout with you. I know when I am outclassed."

"Good," said the Minister, and looked pleased.

Trevize said, "Where are we going, Minister?"

"Down! Quite far down. Don't be upset, however. In the hyperdramas, this would be a preliminary to taking you to a dungeon, I suppose, but we have no dungeons on Comporellon-only reasonable prisons. We are going to my private apartment; not as romantic as a dungeon in the bad old Imperial days, but more comfortable."

Trevize estimated that they were at least fifty meters below the surface of the planet, when the elevator door slid to one side and they stepped out.

20.

TREVIZE looked about the apartment with clear surprise.

The Minister said grimly, "Do you disapprove of my living quarters, Councilman?"

"No, I have no reason to, Minister. I am merely surprised. I find it unexpected. The impression I had of your world from what little I saw and heard since arriving was that it was an-an abstemious one, eschewing useless luxury."

"So it is, Councilman. Our resources are limited, and our life must be as harsh as our climate."

"But this, Minister," and Trevize held out both hands as though to embrace the room where, for the first time on this world, he saw color, where the couches were well cushioned, where the light from the illuminated walls was soft, and where the floor was force-carpeted so that steps were springy and silent. "This is surely luxury."

"We eschew, as you say, Councilman, useless luxury; ostentatious luxury; wastefully excessive luxury. This, however, is private luxury, which has its use. I work hard and bear much responsibility. I need a place where I can forget, for a while, the difficulties of my post."

Trevize said, "And do all Comporellians live like this when the eyes of others are averted, Minister?"

"It depends on the degree of work and responsibility. Few can afford to, or deserve to, or, thanks to our code of ethics, want to."

"But you, Minister, can afford to, deserve to-and want to?"

The Minister said, "Rank has its privileges as well as its duties. And now sit down, Councilman, and tell me of this madness of yours." She sat down on the couch, which gave slowly under her solid weight, and pointed to an equally soft chair in which Trevize would be facing her at not too great a distance."

Trevize sat down. "Madness, Minister?"

The Minister relaxed visibly, leaning her right elbow on a pillow. "In private conversation, we need not observe the rules of formal discourse too punctiliously. You

may call me Lizalor. I will call you, Trevize. -Tell me what is on your mind, Trevize, and let us inspect it."

Trevize crossed his legs and sat back in his chair. "See here, Lizalor, you gave me the choice of either agreeing to give up the ship voluntarily, or of being subjected to a formal trial. In both cases, you would end up with the ship. -Yet you have been going out of your way to persuade me to adopt the former alternative. You are willing to offer me another ship to replace mine, so that my friends and I might go anywhere we chose. We might even stay here on Comporellon and qualify for citizenship, if we chose. In smaller things, you were willing to allow me fifteen minutes to consult with my friends. You were even willing to bring me here to your private apartment, while my friends are now, presumably, in comfortable quarters. In short, you are bribing me, Lizalor, rather desperately, to grant you the ship without the necessity of a trial."

"Come, Trevize, are you in no mood to give me credit for humane impulses?"

"None."

"Or the thought that voluntary surrender would be quicker and more convenient than a trial would be?"

"No! I would offer a different suggestion."

"Which is?"

"A trial has one thing in its strong disfavor; it is a public affair. You have several times referred to this world's rigorous legal system, and I suspect it would be difficult to arrange a trial without its being fully recorded. If were so, the Foundation would know of it and you would have to hand the ship to it once the trial was over."

"Of course," said Lizalor, without expression. "It is the Foundation owns the ship."

"But," said Trevize, "a private agreement with me would not have to be placed on formal record. You could have the ship and, since the foundation would not know of the matter-they don't even know that we are on this world-Comporellon could keep the ship. That, I am sure, is what you intend to do."

"Why should we do that?" She was still without expression. "Are we not part of the Foundation Confederation?"

"Not quite. Your status is that of an Associated Power. In any map on which the member worlds of the Federation are shown in red, Comporellon and its dependent worlds would show up as a patch of pale pink."

"Even so, as an Associated Power, we would surely co-operate with the Foundation."

"Would you? Might not Comporellon be dreaming of total independence; even leadership? You are an old world. Almost all worlds claim to be older than they are, but Comporellon is an old world."

Minister Lizalor allowed a cold smile to cross her face. "The oldest, if some of our enthusiasts are to be believed."

"Might there not have been a time when Comporellon was indeed the leading world of a relatively small group of worlds? Might you not still dream of recovering that lost position of power?"

"Do you think we dream of so impossible a goal? I called it madness before I knew your thoughts, and it is certainly madness now that I do."

"Dreams may be impossible, yet still be dreamed. Terminus, located at the very edge of the Galaxy and with a five-century history that is briefer than that of any other world, virtually rules the Galaxy. And shall Comporellon not? Eh?" Trevize was smiling.

Lizalor remained grave. "Terminus reached that position, we are given to understand, by the working out of Hari Seldon's Plan."

"That is the psychological buttress of its superiority and it will hold only as long, perhaps, as people believe it. It may be that the Comporellian government does not believe it. Even so, Terminus also enjoys a technological buttress. Terminus's hegemony over the Galaxy undoubtedly rests on its advanced technology-of which the gravitic ship you are so anxious to have is an example. No other world but Terminus disposes of gravitic ships. If Comporellon could have one, and could learn its workings in detail, it would be bound to have taken a giant technological step forward. I don't think it would be sufficient to help you overcome Terminus's lead, but your government might think so."

Lizalor said, "You can't be serious in this. Any government that kept the ship in the face of the Foundation's desire to have it would surely experience the Foundation's wrath, and history shows that the Foundation can be quite uncomfortably wrathful."

Trevize said, "The Foundation's wrath would only be exerted if the Foundation knew there was something to be wrathful about."

"In that case; Trevize-if we assume your analysis of the situation is something other than mad-would it not be to your benefit to give us the ship and drive a hard bargain? We would pay well for the chance of having it quietly, according to your line of argument."

"Could you then rely on my not reporting the matter to the Foundation?"

"Certainly. Since you would have to report your own part in it."

"I could report having acted under duress."

"Yes. Unless your good sense told you that your Mayor would never believe that. - Come, make a deal."

Trevize shook his head. "I will not, Madam Lizalor. The ship is mine and it must stay mine. As I have told you, it will blow up with extraordinary power if you attempt to force an entry. I assure you I am telling you the truth. Don't rely on its being a bluff."

"You could open it, and reinstruct the computer."

"Undoubtedly, but I won't do that."

Lizalor drew a heavy sigh. "You know we could make you change your mind-if not by what we could do to you, then by what we could do to your friend, Dr. Pelorat, or to the young woman."

"Torture, Minister? Is that your law?"

"No, Councilman. But we might not have to do anything so crude. There is always the Psychic Probe."

For the first time since entering the Minister's apartment, Trevize felt an inner chill.

"You can't do that either. The use of the Psychic Probe for anything but medical purposes is outlawed throughout the Galaxy."

"But if we are driven to desperation—"

"I am willing to chance that," said Trevize calmly, "for it would do you no good. My determination to retain my ship is so deep that the Psychic Probe would destroy my mind before it twisted it into giving it to you." (That was a bluff, he thought, and the chill inside him deepened.) "And even if you were so skillful as to persuade me without destroying my mind and if I were to open the ship and disarm it and hand it over to you, it would still do you no good. The ship's computer is even more advanced than the ship is, and it is designed somehow—I don't know how-to work at its full potential only with me. It is what I might call a one-person computer."

"Suppose, then, you retained your ship, and remained its pilot. Would you consider piloting it for us—as an honored Comporellian citizen? A large salary. Considerable luxury. Your friends, too."

"No."

"What is it you suggest? That we simply let you and your friends launch your ship and go off into the Galaxy? I warn you that before we allow you to do this, we might simply inform the Foundation that you are here with your ship, and leave all to them."

"And lose the ship yourself?"

"If we must lose it, perhaps we would rather lose it to the Foundation than to an impudent Outworlder."

"Then let me suggest a compromise of my own."

"A compromise? Well, I will listen. Proceed."

Trevize said carefully, "I am on an important mission. It began with Foundation support. That support seems to have been suspended, but the mission remains important. Let me have Comporellian support instead and if I complete the mission successfully, Comporellon will benefit."

Lizalor wore a dubious expression. "And you will not return the ship to the Foundation?"

"I have never planned to do that. The Foundation would not be searching for the ship so desperately if they thought there was any intention of my casually returning it to them."

"That is not quite the same thing as saying that you will give the ship to us."

"Once I have completed the mission, the ship may be of no further use to me. In that case, I would not object to Comporellon having it."

The two looked at each other in silence for a few moments.

Lizalor said, "You use the conditional. The ship 'may be.' That is of no value to us."

"I could make wild promises, but of what value would that be to you? The fact that my promises are cautious and limited should show you that they are at least sincere."

"Clever," said Lizalor, nodding. "I like that. Well, what is your mission and how might it benefit Comporellon?"

Trevize said, "No, no, it is your turn. Will you support me if I show you that the mission is of importance to Comporellon?"

Minister Lizalor rose from the couch, a tall, overpowering presence. "I am hungry, Councilman Trevize, and I will get no further on an empty stomach. I will offer you something to eat and drink-in moderation. After that, we will finish the matter."

And it seemed to Trevize that there was a rather carnivorous look of anticipation about her at that moment, so that he tightened his lips with just a bit of unease.

21.

THE MEAL might have been a nourishing one, but it was not one to delight the palate. The main course consisted of boiled beef in a mustardy sauce, resting on a foundation of a leafy vegetable Trevize did not recognize. Nor did he like it for it had a bitter-salty taste he did not enjoy. He found out later it was a form of seaweed.

There was, afterward, a piece of fruit that tasted something like an apple tainted by peach (not bad, actually) and a hot, dark beverage that was bitter enough for Trevize to leave half behind and ask if he might have some cold water instead. The portions were all small, but, under the circumstances, Trevize did not mind.

The meal had been private, with no servants in view. The Minister had herself heated and served the food, and herself cleared away the dishes and cutlery.

"I hope you found the meal pleasant," said Lizalor, as they left the dining room.

"Quite pleasant," said Trevize, without enthusiasm.

The Minister again took her seat on the couch. "Let us return then," she said, "to our earlier discussion. You had mentioned that Comporellon might resent the Foundation's lead in technology and its overlordship of the Galaxy. In a way that's true, but that aspect of the situation would interest only those who are interested in interstellar politics, and they are comparatively few. What is much more to the point is that the average Comporellian is horrified at the immorality of the Foundation. There is immorality in most worlds, but it seems most marked in Terminus. I would say that any anti-Terminus animus that exists on this world is rooted in that, rather than in more abstract matters."

"Immorality?" said Trevize, puzzled. "Whatever the faults of the Foundation you have to admit it runs its part of the Galaxy with reasonable efficiency and fiscal honesty. Civil rights are, by and large, respected and-"

"Councilman Trevize, I speak of sexual morality."

"In that case, I certainly don't understand you. We are a thoroughly moral society, sexually speaking. Women are well represented in every facet of social life. Our Mayor is a woman and nearly half the Council consists of-"

The Minister allowed a look of exasperation to fleet across her face. "Councilman, are you mocking me? Surely you know what sexual morality meant. Is, or is not, marriage a sacrament upon Terminus?"

"What do you mean by sacrament?"

"Is there a formal marriage ceremony binding a couple together?"

"Certainly, if people wish it. Such a ceremony simplifies tax problems and inheritance."

"But divorce can take place."

"Of course. It would certainly be sexually immoral to keep people tied to, each other, when-

"Are there no religious restrictions?"

"Religious? There are people who make a philosophy out of ancient cults, but what has that to do with marriage?"

"Councilman, here on Comporellon, every aspect of sex is strongly controlled. It may not take place out of marriage. Its expression is limited even within marriage. We are sadly shocked at those worlds, at Terminus, particularly, where sex seems to be considered a mere social pleasure of no great importance to be indulged in when, how, and with whom one pleases without regard to the values of religion."

Trevize shrugged. "I'm sorry, but I can't undertake to reform the Galaxy, or even Terminus-and what has this to do with the matter of my ship?"

"I'm talking about public opinion in the matter of your ship and how it limits my ability to compromise the matter. The people of Comporellon would be horrified if they found you had taken a young and attractive woman on board to serve the lustful urges of you and your companion. It is out consideration for the safety of the three of you that I have been urging you to accept peaceful surrender in place of a public trial."

Trevize said, "I see you have used the meal to think of a new type of persuasion by threat. Am I now to fear a lynch mob?"

"I merely point out dangers. Will you be able to deny that the woman you have taken on board ship is anything other than a sexual convenience?"

"Of course I can deny it. Bliss is the companion of my friend, Dr. Pelorat. He has no other competing companion. You may not define their state as marriage, but I believe that in Pelorat's mind, and in the woman's, too, there is a marriage between them."

"Are you telling me you are not involved yourself?"

"Certainly not," said Trevize. "What do you take me for?"

"I cannot tell. I do not know your notions of morality."

"Then let me explain that my notions of morality tell me that I don't trifle with my friend's possessions-or his companionships."

"You are not even tempted?"

"I can't control the fact of temptation, but there's no chance of my giving in to it."

"No chance at all? Perhaps you are not interested in women."

"Don't you believe that. I am interested."

"How long has it been since you have had sex with a woman?"

"Months. Not at all since I left Terminus."

"Surely you don't enjoy that."

"I certainly don't," said Trevize, with strong feeling, "but the situation is such that I have no choice."

"Surely your friend, Pelorat, noting your suffering, would be willing to share his woman."

"I show him no evidence of suffering, but if I did, he would not be willing to share Bliss. Nor, I think, would the woman consent. She is not attracted to me."

"Do you say that because you have tested the matter?"

"I have not tested it. I make the judgment without feeling the need to test it. In any case, I don't particularly like her."

"Astonishing! She is what a man would consider attractive."

"Physically, she is attractive. Nevertheless, she does not appeal to me. For one thing, she is too young, too child-like in some ways."

"Do you prefer women of maturity, then?"

Trevize paused. Was there a trap here? He said cautiously, "I am old enough to value some women of maturity. And what has this to do with my ship?"

Lizalor said, "For a moment, forget your ship. -I am forty-six years old, and I am not married. I have somehow been too busy to marry."

"In that case, by the rules of your society, you must have remained continent all your life. Is that why you asked how long it had been since I have had sex? Are you asking my advice in the matter? -If so, I say it is not food and drink. It is uncomfortable to do without sex, but not impossible."

The Minister smiled and there was again that carnivorous look in her eyes. "Don't mistake me, Trevize. Rank has its privileges and it is possible to be discreet. I am not altogether an abstainer. Nevertheless, Comporellian men are unsatisfying. I accept the fact that morality is an absolute good, but it does tend to burden the men of this world with guilt, so that they become unadventurous, unenterprising, slow to begin, quick to conclude, and, in general, unskilled."

Trevize said, very cautiously, "There is nothing I can do about that, either."

"Are you implying that the fault may be mine? That I am uninspiring?"

Trevize raised a hand. "I don't say that at all."

"In that case, how would you react, given the opportunity? You, a man from an immoral world, who must have had a vast variety of sexual experiences of all kinds, who is under the pressure of several months of enforced abstinence even though in the constant presence of a young and charming woman. How would you react in the presence of a woman such as myself; who is the mature type you profess to like?"

Trevize said, "I would behave with the respect and decency appropriate to your rank and importance."

"Don't be a fool!" said the Minister. Her hand went to the right side of her waist. The strip of white that encircled it came loose and unwound from her chest and neck. The bodice of her black gown hung noticeably looser.

Trevize sat frozen. Had this been in her mind since--when? Or was it a bribe to accomplish what threats had not?

The bodice flipped down, along with its sturdy reinforcement at the breasts. The Minister sat there, with a look of proud disdain on her face, and bare from the waist up. Her breasts were a smaller version of the woman herself-massive, firm, and overpoweringly impressive.

"Well?" she said.

Trevize said, in all honesty, "Magnificent!"

"And what will you do about it?"

"What does morality dictate on Comporellon, Madam Lizalor?"

"What is that to a man of Terminus? What does your morality dictate? -And begin. My chest is cold and wishes warmth."

Trevize stood up and began to disrobe.

6. THE NATURE OF EARTH

22.

TREVIZE felt almost drugged, and wondered how much time had elapsed.

Beside him lay Mitza Lizalor, Minister of Transportation. She was on her stomach, head to one side, mouth open, snoring distinctly. Trevize was relieved that she was asleep. Once she woke up, he hoped she would be quite aware that she had been asleep.

Trevize longed to sleep himself, but he felt it important that he not do so. She must not wake to find him asleep. She must realize that while she had been ground down to unconsciousness, he had endured. She would expect such endurance from a Foundation-reared immoralist and, at this point, it was better she not be disappointed.

In a way, he had done well. He had guessed, correctly, that Lizalor, given her physical size and strength, her political power, her contempt for the Comporellian men she had encountered, her mingled horror and fascination with tales (what had she heard? Trevize wondered) of the sexual feats of the decadents of Terminus, would want to be dominated. She might even expect to be, without being able to express her desire and expectation.

He had acted on that belief and, to his good fortune, found he was correct. (Trevize, the ever-right, he mocked himself.) It pleased the woman and it enabled Trevize to steer activities in a direction that would tend to wear her out while leaving himself relatively untouched.

It had not been easy. She had a marvelous body (forty-six, she had said, but it would not have shamed a twenty-five-year-old athlete) and enormous stamina—a stamina exceeded only by the careless zest with which she had spent it.

Indeed, if she could be tamed and taught moderation; if practice (but could he himself survive the practice?) brought her to a better sense of her own capacities, and, even more important, his, it might be pleasant to—

The snoring stopped suddenly and she stirred. He placed his hand on the shoulder nearest him and stroked it lightly—and her eyes opened. Trevize was leaning on his elbow, and did his best to look unworn and full of life.

"I'm glad you were sleeping, dear," he said. "You needed your rest."

She smiled at him sleepily and, for one queasy moment, Trevize thought she might suggest renewed activity, but she merely heaved herself about till she was resting on her back. She said, in a soft and satisfied voice, "I had you judged correctly from the start. You are a king of sexuality."

Trevize tried to look modest. "I must be more moderate."

"Nonsense. You were just right. I was afraid that you had been kept active and drained by that young woman, but you assured me you had not. That it true, isn't it?"

"Have I acted like someone who was half-sated to begin with?"

"No, you did not," and her laughter boomed.

"Are you still thinking of Psychic Probes?"

She laughed again. "Are you mad? Would I want to lose you now?"

"Yet it would be better if you lost me temporarily-"

"What!" She frowned.

"If I were to stay here permanently, my-my dear, how long would it be before eyes would begin to watch, and mouths would begin to whisper? If I went off on my mission, however, I would naturally return periodically to, report, and it would then be only natural that we should be closeted together for a while-and my mission is important."

She thought about that, scratching idly at her right hip. Then she said, "I suppose you're right. I hate the thought but-I suppose you're right."

"And you need not think I would not come back," said Trevize. "I am not so witless as to forget what I would have waiting for me here."

She smiled at him, touched his cheek gently, and said, looking into his eyes, "Did you find it pleasant, love?"

"Much more than pleasant, dear."

"Yet you are a Foundationer. A man in the prime of youth from Terminus itself. You must be accustomed to all sorts of women with all soul skills-"

"I have encountered nothing-nothing-in the least like you," said Trevize, with a forcefulness that came easily to someone who was but telling the truth, after all.

Lizalor said complacently, "Well, if you say so. Still, old habits die hard, you know, and I don't think I could bring myself to trust a man's word without some sort of surety. You and your friend, Pelorat, might conceivably go on this mission of yours once I hear about it and approve, but I will keep the young woman here. She will be well treated, never fear, but I presume your Dr. Pelorat will want her, and he will see to it that there are frequent returns to Comporellon, even if your enthusiasm for this mission you to stay away too long."

"But, Lizalor, that's impossible."

"Indeed?" Suspicion at once seeped into her eyes. "Why impossible? For what purpose would you need the woman?"

"Not for sex. I told you that, and I told you truthfully. She is Pelorat's and I have no interest in her. Besides, I'm sure she'd break in two if she attempted what you so triumphantly carried through."

Lizalor almost smiled, but repressed it and said severely, "What is it to you, then, if she remains on Comporellon?"

"Because she is of essential importance to our mission. That is why we must have her."

"Well, then, what is your mission? It is time you told me."

Trevize hesitated very briefly. It would have to be the truth. He could think of no lie as effective.

"Listen to me," he said. "Comporellon may be an old world, even among the oldest, but it can't be the oldest. Human life did not originate here. The earliest human beings reached here from some other world, and perhaps human life didn't originate there either, but came from still another and still older world. Eventually, though, those probings back into time must stop, and we must reach the first world, the world of human origins. I am seeking Earth."

The change that suddenly came over Mitza Lizalor staggered him.

Her eyes had widened, her breathing took on a sudden urgency, and every muscle seemed to stiffen as she lay there in bed. Her arms shot upward rigidly, and the first two fingers of both hands crossed.

"You named it," she whispered hoarsely.

23.

SHE DIDN'T say anything after that; she didn't look at him. Her arms slowly came down, her legs swung over the side of the bed, and she sat up, back to him. Trevize lay where he was, frozen.

He could hear, in memory, the words of Munn Li Comporellon, as they stood there in the empty tourist center at Sayshell. He could hear him saying of his own ancestral planet—the one that Trevize was on now—"They're superstitious about it. Every time they mention the word, they lift up both hands with first and second fingers crossed to ward off misfortune."

How useless to remember after the fact.

"What should I have said, Mitza?" he muttered.

She shook her head slightly, stood up, stalked toward and then through a door. It closed behind her and, after a moment, there was the sound of water running.

He had no recourse but to wait, bare, undignified, wondering whether to join her in the shower, and then quite certain he had better not. And because, in a way, he felt the shower denied him, he at once experienced a growing need for one.

She emerged at last and silently began to select clothing.

He said, "Do you mind if I—"

She said nothing, and he took silence for consent. He tried to stride into the room in a strong and masculine way but he felt uncommonly as he had in those days when his mother, offended by some misbehavior on his part, offered him no punishment but silence, causing him to shrivel in discomfort.

He looked about inside the smoothly walled cubicle that was bare—completely bare. He looked more minutely. —There was nothing.

He opened the door again, thrust his head out, and said, "Listen, how are you supposed to start the shower?"

She put down the deodorant (at least, Trevize guessed that was its function), strode to the shower-room and, still without looking at him, pointed. Trevize followed the

finger and noted a spot on the wall that was round and faintly pink, barely colored, as though the designer resented having to spoil the starkness of the white, for no reason more important than to give a hint of function.

Trevize shrugged lightly, leaned toward the wall, and touched the spot. Presumably that was what one had to do, for in a moment a deluge of fine-sprayed water struck him from every direction. Gasping, he touched the spot again and it stopped.

He opened the door, knowing he looked several degrees more undignified still as he shivered hard enough to make it difficult to articulate words. He croaked, "How do you get hot water?"

Now she looked at him and, apparently, his appearance overcame her anger (or fear, or whatever emotion was victimizing her) for she snickered and then, without warning, boomed her laughter at him.

"What hot water?" she said. "Do you think we're going to waste the energy to heat water for washing? That's good mild water you had, water with the chill taken off. What more do you want? You sludge-soft Terminians! -Get back in there and wash!"

Trevize hesitated, but not for long, since it was clear he had no choice in the matter.

With remarkable reluctance he touched the pink spot again and this time steeled his body for the icy spray. Mild water? He found suds forming on his body and he rubbed hastily here, there, everywhere, judging it to be the wash cycle and suspecting it would not last long.

Then came the rinse cycle. Ah, warm- Well, perhaps not warm, but not quite as cold, and definitely feeling warm to his thoroughly chilled body. Then, even as he was considering touching the contact spot again to stop the water, and was wondering how Lizalor had come out dry when there was absolutely no towel or towel-substitute in the place-the water stopped. It was followed by a blast of air that would have certainly bowled him over if it had not come from various directions equally.

It was hot; almost too hot. It took far less energy, Trevize knew, to heat air than to heat water. The hot air steamed the water off him and, in a few minutes, he was able to step out as dry as though he had never encountered water in his life.

Lizalor seemed to have recovered completely. "Do you feel well?"

"Pretty well," said Trevize. Actually, he felt astonishingly comfortable. "All I had to do was prepare myself for the temperature. You didn't tell me-

"Sludge-soft," said Lizalor, with mild contempt.

He borrowed her deodorant, then began to dress, conscious of the fact that she had fresh underwear and he did not. He said, "What should I have called -that world?"

She said, "We refer to it as the Oldest."

He said, "How was I to know the name I used was forbidden? Did you tell me?"

"Did you ask?"

"How was I to know to ask?"

"You know now."

"I'm bound to forget."

"You had better not."

"What's the difference?" Trevize felt his temper rising. "It's just a word, a sound."

Lizalor said darkly, "There are words one doesn't say. Do you say every word you know under all circumstances?"

"Some words are vulgar, some are inappropriate, some under particular circumstances would be hurtful. Which is-that word I used?"

Lizalor said, "It's a sad word, a solemn word. It represents a world that was ancestor to us all and that now doesn't exist. It's tragic, and we feel it because it was near to us. We prefer not to speak of it or, if we must, not to use its name."

"And the crossing of fingers at me? How does that relieve the hurt and sadness?"

Lizalor's face flushed. "That was an automatic reaction, and I don't thank you for forcing it on me. There are people who believe that the word, even the thought, brings on misfortune-and that is how they ward it off."

"Do you, too, believe crossing fingers wards off misfortune?"

"No. -Well, yes, in a way. It makes me uneasy if I don't do it." She didn't look at him. Then, as though eager to shift the subject, she said quickly, "And how is that black-haired woman of yours of the essence with respect to your mission to reach-that world you mentioned."

"Say 'the Oldest.' Or would you rather not even say that?"

"I would rather not discuss it at all, but I asked you a question."

"I believe that her people reached their present world as emigrants from the Oldest."

"As we did," said Lizalor proudly.

"But her people have traditions of some sort which she says are the key to understanding the Oldest, but only if we reach it and can study its records."

"She is lying."

"Perhaps, but we must check it out."

"If you have this woman with her problematical knowledge, and if you want to reach the Oldest with her, why did you come to Comporellon?"

"To find the location of the Oldest. I had a friend once, who, like myself, was a Founder. He, however, was descended from Comporellian ancestors and he assured me that much of the history of the Oldest was well known, on Comporellon."

"Did he indeed? And did he tell you any of its history?"

"Yes," said Trevize, reaching for the truth again. "He said that the Oldest was a dead world, entirely radioactive. He did not know why, but he thought that it might be the result of nuclear explosions. In a war, perhaps."

"No!" said Lizalor explosively.

"No, there was no war? Or no, the Oldest is not radioactive?"

"It is radioactive, but there was no war."

"Then how did it become radioactive? It could not have been radioactive to begin with since human life began on the Oldest. There would have been no life on it ever."

Lizalor seemed to hesitate. She stood erect, and was breathing deeply, ' almost gasping. She said, "It was a punishment. It was a world that used robots. Do you know what robots are?"

"Yes."

"They had robots and for that they were punished. Every world that has had robots has been punished and no longer exists."

"Who punished them, Lizalor?"

"He Who Punishes. The forces of history. I don't know." She looked away from him, uncomfortable, then said, in a lower voice, "Ask others."

"I would like to, but whom do I ask? Are there those on Comporellon who have studied primeval history?"

"There are. They are not popular with us-with the average Comporellian -but the Foundation, your Foundation, insists on intellectual freedom, 11 they call it."

"Not a bad insistence, in my opinion," said Trevize. "All is bad that is imposed from without," said Lizalor.

Trevize shrugged. There was no purpose in arguing the matter. He Bald, x My friend, Dr. Pelorat, is himself a primeval historian of a sort. He would, I'm sure, like to meet his Comporellian colleagues. Can you arrange that, Lizalor?"

She nodded. "There is a historian named Vasil Deniador, who is based at the University here in the city. He does not teach class, but he may be able to tell you what you want to know."

"Why doesn't he teach class?"

"It's not that he is forbidden; it's just that students do not elect his course."

"I presume," said Trevize, trying not to say it sardonically, "that the students are encouraged not to elect it."

"Why should they want to? He is a Skeptic. We have them, you know. There are always individuals who pit their minds against the general modes of thought and who are arrogant enough to feel that they alone are right and that the many are wrong."

"Might it not be that that could actually be so in some cases?"

"Never!" snapped Lizalor, with a firmness of belief that made it quite clear that no further discussion in that direction would be of any use. "And for all his Skepticism, he will be forced to tell you exactly what any Comporellian would tell you."

"And that is?"

"That if you search for the Oldest, you will not find it."

24.

IN THE PRIVATE quarters assigned them, Pelorat listened to Trevize thoughtfully, his long solemn face expressionless, then said, "Vasil Deniador? I do not recall having heard of him, but it may be that back on the ship I will find papers by him in my library."

"Are you sure you haven't heard of him? Think!" said Trevize.

"I don't recall, at the moment, having heard of him," said Pelorat cautiously, "but after all, my dear chap, there must be hundreds of estimable scholars I haven't heard of; or have, but can't remember."

"Still, he can't be first-class, or you would have heard of him."

"The study of Earth-

"Practice saying 'the Oldest,' Janov. It would complicate matters otherwise."

"The study of the Oldest," said Pelorat, "is not a well-rewarded niche in the corridors of learning, so that first-class scholars, even in the field of primeval history, would not tend to find their way there. Or, if we put it the other way around, those who are already there do not make enough of a name for themselves in an uninterested world to be considered first-class, even if they were. -I am not first-class in anyone's estimation, I am sure."

Bliss said tenderly, "In mine, Pel."

"Yes, certainly in yours, my dear," said Pelorat, smiling slightly, "but you are not judging me in my capacity as scholar."

It was almost night now, going by the clock, and Trevize felt himself grow slightly impatient, as he always did when Bliss and Pelorat traded endearments.

He said, "I'll try to arrange our seeing this Deniador tomorrow, but if he knows as little about the matter as the Minister does, we're not going to be much better off than we are now."

Pelorat said, "He may be able to lead us to someone more useful."

"I doubt it. This world's attitude toward Earth-but I had better practice speaking of it elliptically, too. This world's attitude toward the Oldest is a foolish and superstitious one." He turned away. "But it's been a rough day and we ought to think of an evening meal-if we can face their uninspired cookery-and then begin thinking of getting some sleep. Have you two learned how to use the shower?"

"My dear fellow," said Pelorat, "we have been very kindly treated. We've received all sorts of instructions, most of which we didn't need."

Bliss said, "Listen, Trevize. What about the ship?"

"What about it?"

"Is the Comporellian government confiscating it?"

"No. I don't think they will."

"Ah. Very pleasant. Why aren't they?"

"Because I persuaded the Minister to change her mind."

Pelorat said, "Astonishing. She didn't seem a particularly persuadable individual to me."

Bliss said, "I don't know. It was clear from the texture of her mind that 1b1 was attracted to Trevize."

Trevize looked at Bliss with sudden exasperation. "Did you do that, Bliss?",

"What do you mean, Trevize?"

"I mean tamper with her-"

"I didn't tamper. However, when I noted that she was attracted to you, I couldn't resist just snapping an inhibition or two. It was a very small thing to do. Those inhibitions might have snapped anyway, and it seemed to be important to make certain that she was filled with good will toward you."

"Good will? It was more than that! She softened, yes, but post-coitally." Pelorat said, "Surely you don't mean, old man-"

"Why not?" said Trevize testily. "She may be past her first youth, but she knew the art well. She was no beginner, I assure you. Nor will I play the gentleman and lie on her behalf. It was her idea-thanks to Bliss's fiddling with her inhibitions-and I was not in a position to refuse, even if that thought had occurred to me, which it didn't. --Come, Janov, don't stand there looking puritanical. It's been months since I've had an opportunity. You've-" And he waved his hand vaguely in Bliss's direction.

"Believe me, Golan," said Pelorat, embarrassed, "if you are interpreting my expression as puritanical, you mistake me. I have no objection."

Bliss said, "But she is puritanical. I meant to make her warm toward you; I did not count on a sexual paroxysm."

Trevize said, "But that is exactly what you brought on, my little interfering Bliss. It may be necessary for the Minister to play the puritan in public, but if so, that seems merely to stoke the fires."

"And so, provided you scratch the itch, she will betray the Foundation-"

"She would have done that in any case," said Trevize. "She wanted the ship-" He broke off, and said in a whisper, "Are we being overheard?"

Bliss said, "No!"

"Are you sure?"

"It is certain. It is impossible to impinge upon the mind of Gaia in any unauthorized fashion without Gaia being aware of it."

"In that case, Comporellon wants the ship for itself-a valuable addition to its fleet."

"Surely, the Foundation would not allow that."

"Comporellon does not intend to have the Foundation know."

Bliss sighed. "There are your Isolates. The Minister intends to betray the Foundation on behalf of Comporellon and, in return for sex, will promptly betray Comporellon, too. -And as for Trevize, he will gladly sell his body's services as a way of inducing the betrayal. What anarchy there is in this Galaxy of yours. What chaos."

Trevize said coldly, "You are wrong, young woman-"

"In what I have just said, I am not a young woman, I am Gaia. I am all of Gaia."

"Then you are wrong, Gaia I did not sell my body's services. I gave them gladly. I enjoyed it and did no one harm. As for the consequences, they turned out well from my standpoint and I accept that. And if Comporellon wants the ship for its own purposes, who is to say who is right in this matter? It is a Foundation ship, but it was given to me to search for Earth. It is mine then until I complete the search and I feel that the Foundation has no right to go back on its agreement. As for Comporellon, it does not enjoy Foundation domination, so it dreams of independence. In its own eyes, it is correct to do

so and to deceive the Foundation, for that is not an act of treason to them but an act of patriotism. Who knows?"

"Exactly. Who knows? In a Galaxy of anarchy, how is it possible to sort out reasonable actions from unreasonable ones? How decide between right and wrong, good and evil, justice and crime, useful and useless? And how do you explain the Minister's betrayal of her own government, when she lets you keep the ship? Does she long for personal independence from an oppressive world? Is she a traitor or a personal one-woman self-patriot?"

"To be truthful," said Trevize, "I don't know that she was willing to let me have my ship simply because she was grateful to me for the pleasure I gave: her. I believe she made that decision only when I told her I was searching for the Oldest. It is a world of ill-omen to her and we and the ship that carries u1, by searching for it, have become ill-omened, too. It is my feeling that she feels she incurred the ill-omen for herself and her world by attempting to take the ship, which she may, by now, be viewing with horror. Perhaps she feels that by allowing us and our ship to leave and go about our business, she is averting the misfortune from Comporellon and is, in that way, performing a patriotic act."

"If that were so, which I doubt, Trevize, superstition is the spring of the action. Do you admire that?"

"I neither admire nor condemn. Superstition always directs action in the absence of knowledge. The Foundation believes in the Seldon Plan, though no one in our realm can understand it, interpret its details, or use it to predict. We follow blindly out of ignorance and faith, and isn't that superstition?"

"Yes, it might be."

"And Gaia, too. You believe I have given the correct decision in judging that Gaia should absorb the Galaxy into one large organism, but you do not know why I should be right, or how safe it would be for you to follow that . decision. You are willing to go along only out of ignorance and faith, and are even annoyed with me for trying to find evidence that will remove the ignorance and make mere faith unnecessary. Isn't that superstition?"

"I think he has you there, Bliss," said Pelorat.

Bliss said, "Not so. He will either find nothing at all in this search, or he will find something that confirms his decision."

Trevize said, "And to back up that belief, you have only ignorance and faith. In other words, superstition!"

25.

VASIL DENIADOR was a small man, little of feature, with a way of looking up by raising his eyes without raising his head. This, combined with the brief smiles that periodically lit his face, gave him the appearance of laughing silently at the world.

His office was long and narrow, filled with tapes that seemed to be in wild disorder, not because there was any definite evidence for that, but because they were not evenly placed in their recesses so that they gave the shelves a snaggle-toothed appearance. The three seats he indicated for his visitors were not matched and showed signs of having been recently, and imperfectly, dusted.

He said, "Janov Pelorat, Golan Trevize, and Bliss. -I do not have your second name, madam."

"Bliss," she said, "is all I am usually called," and sat down.

"It is enough after all," said Deniador, twinkling at her. "You are attractive enough to be forgiven if you had no name at all."

All were sitting now. Deniador said, "I have heard of you, Dr. Pelorat, though we have never corresponded. You are a Foundationer, are you not? From Terminus?"

"Yes, Dr. Deniador."

"And you, Councilman Trevize. I seem to have heard that recently you were expelled from the Council and exiled. I don't think I have ever understood why."

"Not expelled, sir. I am still a member of the Council although I don't know when I will take up my duties again. Nor exiled, quite. I was assigned a mission, concerning which we wish to consult you."

"Happy to try to help," said Deniador. "And the blissful lady? Is she from Terminus, too?"

Trevize interposed quickly. "She is from elsewhere, Doctor."

"Ah, a strange world, this Elsewhere. A most unusual collection of human beings are native to it. -But since two of you are from the Foundation's capital at Terminus, and the third is an attractive young woman, and Mitza Lizalor is not known for her affection for either category, how is it that she recommends you to my care so warmly?"

"I think," said Trevize, "to get rid of us. The sooner you help us, you see, the sooner we will leave Comporellon."

Deniador eyed Trevize with interest (again the twinkling smile) and said, "Of course, a vigorous young man such as yourself might attract her whatever his origin. She plays the role of cold vestal well, but not perfectly."

"I know nothing about that," said Trevize stiffly.

"And you had better not. In public, at least. But I am a Skeptic and I am professionally unattuned to believing in surfaces. So come, Councilman, what is your mission? Let me find out if I can help you."

Trevize said, "In this, Dr. Pelorat is our spokesman."

"I have no objection to that," said Deniador. "Dr. Pelorat?"

Pelorat said, "To put it at the simplest, dear Doctor, I have all my mature life attempted to penetrate to the basic core of knowledge concerning the world on which the human species originated, and I was sent out along with my good friend, Golan Trevize-although, to be sure, I did not know him at the time-to find, if we could, the-uh- Oldest, I believe you call it."

"The Oldest?" said Deniador. "I take it you mean Earth."

Pelorat's jaw dropped. Then he said, with a slight stutter, "I was under the impression-that is, I was given to understand-that one did not-"

He looked at Trevize, rather helplessly.

Trevize said, "Minister Lizalor told me that that word was not used on Comporellon."

"You mean she did this?" Deniador's mouth turned downward, his nose screwed up, and he thrust his arms vigorously forward, crossing the first two fingers on each hand.

"Yes," said Trevize. "That's what I mean."

Deniador relaxed and laughed. "Nonsense, gentlemen. We do it as a matter of habit, and in the backwoods they may be serious about it but, on the whole, it doesn't matter. I don't know any Comporellian who wouldn't say 'Earth' when annoyed or startled. It's the most common vulgarism we have."

"Vulgarism?" said Pelorat faintly.

"Or expletive, if you prefer."

"Nevertheless," said Trevize, "the Minister seemed quite upset when I used the word."

"Oh well, she's a mountain woman."

"What does that mean, sir?"

"What it says. Mitza Lizalor is from the Central Mountain Range. The children out there are brought up in what is called the good old-fashioned way, which means that no matter how well educated they become you can never knock those crossed fingers out of them."

"Then the word 'Earth' doesn't bother you at all, does it, Doctor?" said Bliss.

"Not at all, dear lady. I am a Skeptic."

Trevize said, "I know what the word 'skeptic' means in Galactic, but how. do you use the word?"

"Exactly as you do, Councilman. I accept only what I am forced to accept by reasonably reliable evidence, and keep that acceptance tentative pending the arrival of further evidence. That doesn't make us popular."

"Why not?" said Trevize.

"We wouldn't be popular anywhere. Where is the world whose people don't prefer a comfortable, warm, and well-worn belief, however illogical, to the chilly winds of uncertainty? -Consider how you believe in the Seldon Plan without evidence."

"Yes," said Trevize, studying his finger ends. "I put that forward yesterday as an example, too."

Pelorat said, "May I return to the subject, old fellow? What is known about Earth that a Skeptic would accept?"

Deniador said, "Very little. We can assume that there is a single planet on which the human species developed, because it is unlikely in the extreme that the same species, so nearly identical as to be interfertile, would develop on a number of worlds, or even on just two, independently. We can choose to call this world of origin Earth. The belief is general, here, that Earth exists in this corner of the Galaxy, for the worlds here are

unusually old and it is likely that the first worlds to be settled were close to Earth rather than far from it."

"And has the Earth any unique characteristics aside from being the planet of origin?" asked Pelorat eagerly.

"Do you have something in mind?" said Deniador, with his quick smile.

"I'm thinking of its satellite, which some call the moon. That would be unusual, wouldn't it?"

"That's a leading question, Dr. Pelorat. You may be putting thoughts into my mind."

"I do not say what it is that would make the moon unusual."

"Its size, of course. Am I right? -Yes, I see I am. All the legends of Earth speak of its vast array of living species and of its vast satellite-one that is some three thousand to three thousand five hundred kilometers in diameter. The vast array of life is easy to accept since it would naturally have come about through biological evolution, if what we know of the process is accurate. A giant satellite is more difficult to accept. No other inhabited world in the Galaxy has such a satellite. Large satellites are invariably associated with the uninhabited and uninhabitable gas-giants. As a Skeptic, then, I prefer not to accept the existence of the moon."

Pelorat said, "If Earth is unique in its possession of millions of species, might it not also be unique in its possession of a giant satellite? One uniqueness might imply the other."

Deniador smiled. "I don't see how the presence of millions of species on Earth could create a giant satellite out of nothing."

"But the other way around- Perhaps a giant satellite could help create the millions of species."

"I don't see how that could be either."

Trevize said, "What about the story of Earth's radioactivity?"

"That is universally told; universally believed."

"But," said Trevize, "Earth could not have been so radioactive as to preclude life in the billions of years when it supported life. How did it become radioactive? A nuclear war?"

"That is the most common opinion, Councilman Trevize."

"From the manner in which you say that, I gather you don't believe it."

"There is no evidence that such a war took place. Common belief, even universal belief, is not, in itself, evidence."

"What else might have happened?"

"There is no evidence that anything happened. The radioactivity might be as purely invented a legend as the large satellite."

Pelorat said, "What is the generally accepted story of Earth's history? I have, during my professional career, collected a large number of origin-legends, many of them involving a world called Earth, or some name very much like that. I have none from

Comporellon, nothing beyond the vague mention of a Benbally who might have come from nowhere for all that Comporellian legends say."

"That's not surprising. We don't usually export our legends and I'm astonished you have found references even to Benbally. Superstition, again."

"But you are not superstitious and you would not hesitate to talk about it, would you?"

"That's correct," said the small historian, casting his eyes upward at Pelorat. "It would certainly add greatly, perhaps even dangerously, to my unpopularity if I did, but you three are leaving Comporellon soon and I take it you will never quote me as a source."

"You have our word of honor," said Pelorat quickly.

"Then here is a summary of what is supposed to have happened, shorn of any supernaturalism or moralizing. Earth existed as the sole world of human beings for an immeasurable period and then, about twenty to twenty-five thousand years ago, the human species developed interstellar travel by way of the hyperspatial Jump and colonized a group of planets.

"The Settlers on these planets made use of robots, which had first been devised on Earth before the days of hyperspatial travel and-do you know what robots are, by the way?"

"Yes," said Trevize. "We have been asked that more than once. We know what robots are."

"The Settlers, with a thoroughly roboticized society, developed a high technology and unusual longevity and despised their ancestral world. According to more dramatic versions of their story, they dominated and oppressed the ancestral world.

"Eventually, then, Earth sent out a new group of Settlers, among whom robots were forbidden. Of the new worlds, Comporellon was among the first. Our own patriots insist it was the first, but there is no evidence of that that a Skeptic can accept. The first group of Settlers died out, and-

Trevize said, "Why did the first set die out, Dr. Deniador?"

"Why? Usually they are imagined by our romantics as having been punished for their crimes by He Who Punishes, though no one bothers to say why He waited so long. But one doesn't have to resort to fairy tales. It is easy to argue that a society that depends totally on robots becomes soft and decadent, dwindling and dying out of sheer boredom or, more subtly, by losing the will to live.

"The second wave of Settlers, without robots, lived on and took over the entire Galaxy, but Earth grew radioactive and slowly dropped out of sight. The reason usually given for this is that there were robots on Earth, too, since the first wave had encouraged that."

Bliss, who had listened to the account with some visible impatience, said, "Well, Dr. Deniador, radioactivity or not, and however many waves of settlers there might have been, the crucial question is a simple one. Exactly where is Earth? What are its coordinates?"

Deniador said, "The answer to that question is: I don't know. -But come, it is time for lunch. I can have one brought in, and we can discuss Earth over it for as long as you want."

"You don't know?" said Trevize, the sound of his voice rising in pitch and intensity.

"Actually, as far as I know, no one knows."

"But that is impossible."

"Councilman," said Deniador, with a soft sigh, "if you wish to call the truth impossible, that is your privilege, but it will get you nowhere."

7. LEAVING COMPORELLON

26.

LUNCHEON consisted of a heap of soft, crusty balls that came in different shades and that contained a variety of fillings.

Deniador picked up a small object which unfolded into a pair of thin, ' , transparent gloves, and put them on. His guests followed suit.

Bliss said, "What is inside these objects, please?"

Deniador said, "The pink ones are filled with spicy chopped fish, a great Comporellian delicacy. These yellow ones contain a cheese filling that is very mild. The green ones contain a vegetable mixture. Do eat them while they are a quite warm. Later we will have hot almond pie and the usual beverages. I might recommend the hot cider. In a cold climate, we have a tendency to heat our foods, even desserts."

"You do yourself well," said Pelorat.

"Not really," said Deniador. "I'm being hospitable to guests. For myself, I, get along on very little. I don't have much body mass to support, as you have probably noticed."

Trevize bit into one of the pink ones and found it very fishy indeed, with all overlay of spices that was pleasant to the taste but which, he thought, along with the fish itself, would remain with him for the rest of the day and, perhaps, into the night.

When he withdrew the object with the bite taken out of it, he found that the crust had closed in over the contents. There was no squirt, no leakage, and, for a moment, he wondered at the purpose of the gloves. These seemed no chance of getting his hands moist and sticky if he didn't use them, so he decided it was a matter of hygiene. The gloves substituted for a washing of the hands if that were inconvenient and custom, probably, now dictated their use even if the hands were washed. (Lizalor hadn't used gloves when he had eaten with her the day before. -Perhaps that was because she was a mountain woman.)

He said, "Would it be unmannerly to talk business over lunch?"

"By Comporellian standards, Councilman, it would be, but you are my guests, and we will go by your standards. If you wish to speak seriously, and do not think-or care-that that might diminish your pleasure in the food, please do so, and I will join you."

Trevize said, "Thank you. Minister Lizalor implied-no, she stated quite bluntly-that Skeptics were unpopular on this world. Is that so?"

Deniador's good humor seemed to intensify. "Certainly. How hurt we'd be if we weren't. Comporellon, you see, is a frustrated world. Without any knowledge of the details, there is the general mythic belief, that once, many millennia ago, when the inhabited Galaxy was small, Comporellon was the leading world. We never forget that,

and the fact that in known history we have not been leaders irks us, fills us-the population in general, that is-with a feeling of injustice.

"Yet what can we do? The government was forced to be a loyal vassal of the Emperor once, and is a loyal Associate of the Foundation now. And the more we are made aware of our subordinate position, the stronger the belief in the great, mysterious days of the past become.

"What, then, can Comporellon do? They could never defy the Empire in older times and they can't openly defy the Foundation now. They take refuge, therefore, in attacking and hating us, since we don't believe the legends and laugh at the superstitions.

"Nevertheless, we are safe from the grosser effects of persecution. We control the technology, and we fill the faculties of the Universities. Some of us, who are particularly outspoken, have difficulty in teaching classes openly. I have that difficulty, for instance, though I have my students and hold meetings quietly off-campus. Nevertheless, if we were really driven out of public life, the technology would fail and the Universities would lose accreditation with the Galaxy generally. Presumably, such is the folly of human beings, the prospects of intellectual suicide might not stop them from indulging their hatred, but the Foundation supports us. Therefore, we are constantly scolded and sneered at and denounced-and never touched."

Trevize said, "Is it popular opposition that keeps you from telling us where Earth is? Do you fear that, despite everything, the anti-Skeptic feeling might turn ugly if you go too far?"

Deniador shook his head. "No. Earth's location is unknown. I am not hiding anything from you out of fear-or for any other reason."

"But look," said Trevize urgently. "There are a limited number of planets in this sector of the Galaxy that possess the physical characteristics associated with habitability, and almost all of them must be not only inhabitable, but inhabited, and therefore well known to you. How difficult would it be to explore the sector for a planet that would be habitable were it not for the fact that it was radioactive? Besides that, you would look for such a planet with a large, satellite in attendance. Between radioactivity and a large satellite, Earth would be absolutely unmistakable and could not be missed even with only a casual search. It might take some time but that would be the only difficulty."

Deniador said, "The Skeptic's view is, of course, that Earth's radioactivity and its large satellite are both simply legends. If we look for them, we look for sparrow-milk and rabbit-feathers."

"Perhaps, but that shouldn't stop Comporellon from at least taking on the search. If they find a radioactive world of the proper size for habitability, with a large satellite, what an appearance of credibility it would lend to Comporellian legendry in general."

Deniador laughed. "It may be that Comporellon doesn't search for that very reason. If we fail, or if we find an Earth obviously different from the legends, the reverse would take place. Comporellian legendry in general would be blasted and made into a laughingstock. Comporellon wouldn't risk that."

Trevize paused, then went on, very earnestly, "Besides, even if we discount those two unquities-if there is such a word in Galactic-of radioactivity and a large satellite, there is a third that, by definition, must exist, without any reference to legends. Earth must have upon it either a flourishing life of incredible diversity, or the remnants of one, or, at the very least, the fossil record of such a one."

Deniador said, "Councilman, while Comporellon has sent out no organized search party for Earth, we do have occasion to travel through space, and we occasionally have reports from ships that have strayed from their intended routes for one reason or another. Jumps are not always perfect, as perhaps you know. Nevertheless, there have been no reports of any planets with properties resembling those of the legendary Earth, or any planet that is bursting with life. Nor is any ship likely to land on what seems an uninhabited planet in order that the crew might go fossil-hunting. If, then, in thousands of years nothing of the sort has been reported, I am perfectly willing to believe that locating Earth is impossible, because Earth is not there to be located."

Trevize said, in frustration, "But Earth must be somewhere. Somewhere there is a planet on which humanity and all the familiar forms of life associated with humanity evolved. If Earth is not in this section of the Galaxy, it must be elsewhere."

"Perhaps," said Deniador cold-bloodedly, "but in all this time, it hasn't turned up anywhere."

"People haven't really looked for it."

"Well, apparently you are. I wish you luck, but I would never bet on your success."

Trevize said, "Have there been attempts to determine the possible position of Earth by indirect means, by some means other than a direct search?"

"Yes," said two voices at once. Deniador, who was the owner of one of the voices, said to Pelorat, "Are you thinking of Yariffs project?"

"I am," said Pelorat.

"Then would you explain it to the Councilman? I think he would more readily believe you than me."

Pelorat said, "You see, Golan, in the last days of the Empire, there was a time when the Search for Origins, as they called it, was a popular pastime, perhaps to get away from the unpleasantness of the surrounding reality. The Empire was in a process of disintegration at that time, you know."

"It occurred to a Livian historian, Humbal Yariff, that whatever the planet of origin, it would have settled worlds near itself sooner than it would settle planets farther away. In general, the farther a world from the point of origin the later it would have been settled."

"Suppose, then, one recorded the date of settlement of all habitable planets in the Galaxy, and made networks of all that were a given number of Millennia old. There could be a network drawn through all planets ten thousand years old; another through those twelve thousand years old, still another through those fifteen thousand years old. Each network would, in theory, be roughly spherical and they should be roughly concentric. The older networks would form spheres smaller in radius than the younger ones, and if

one worked out all the centers they should fall within a comparatively small volume of space that would include the planet of origin-Earth."

Pelorat's face was very earnest as he kept drawing spherical surfaces with his cupped hands. "Do you see my point, Golan?"

Trevize nodded. "Yes. But I take it that it didn't work."

"Theoretically, it should have, old fellow. One trouble was that times of origin were totally inaccurate. Every world exaggerated its own age to one degree or another and there was no easy way of determining age independently of legend."

Bliss said, "Carbon-14 decay in ancient timber."

"Certainly, dear," said Pelorat, "but you would have had to get co-operation from the worlds in question, and that was never given. No world wanted its own exaggerated claim of age to be destroyed and the Empire was then in no position to override local objections in a matter so unimportant. It had other things on its mind."

"All that Yariff could do was to make use of worlds that were only two thousand years old at most, and whose founding had been meticulously recorded under reliable circumstances. There were few of those, and while they were distributed in roughly spherical symmetry, the center was relatively close to Trantor, the Imperial capital, because that was where the colonizing expeditions had originated for those relatively few worlds."

"That, of course, was another problem. Earth was not the only point of origin of settlement for other worlds. As time went on, the older worlds sent out settlement expeditions of their own, and at the time of the height of Empire, Trantor was a rather copious source of those. Yariff was, rather unfairly, laughed at and ridiculed and his professional reputation was destroyed."

Trevize said, "I get the story, Janov. -Dr. Deniador, is there then nothing at all you could give me that represents the faintest possibility of hope? Is there any other world where it is conceivable there may be some information concerning Earth?"

Deniador sank into doubtful thought for a while. "We-e-ell," he said at last, drawing out the word hesitantly, "as a Skeptic I must tell you that I'm not sure that Earth exists, or has ever existed. However-" He fell silent again.

Finally, Bliss said, "I think you've thought of something that might be important, Doctor."

"Important? I doubt it," said Deniador faintly. "Perhaps amusing, however. Earth is not the only planet whose position is a mystery. There are the worlds of the first group of Settlers; the Spacers, as they are called in our legends. Some call the planets they inhabited the 'Spacer worlds'; others call them the 'Forbidden Worlds.' The latter name is now the usual one."

"In their pride and prime, the legend goes, the Spacers had lifetimes stretching out for centuries, and refused to allow our own short-lived ancestors to land on their worlds. After we had defeated them, the situation was reversed. We scorned to deal with them and left them to themselves, forbidding our own ships and Traders to deal with them. Hence those planets became the Forbidden Worlds. We were certain, so the

legend states, that He Who Punishes would destroy them without our intervention, and, apparently, He did. At least, no Spacer has appeared in the Galaxy to our knowledge, in many millennia."

"Do you think that the Spacers would know about Earth?" said Trevize.

"Conceivably, since their worlds were older than any of ours. That is, if any Spacers exist, which is extremely unlikely."

"Even if they don't exist, their worlds do and may contain records."

"If you can find the worlds."

Trevize looked exasperated. "Do you mean to say that the key to Earth, the location of which is unknown, may be found on Spacer worlds, the location of which is also unknown?"

Deniador shrugged. "We have had no dealings with them for twenty thousand years. No thought of them. They, too, like Earth, have receded into the mists."

"How many worlds did the Spacers live on?"

"The legends speak of fifty such worlds-,a suspiciously round number. There were probably far fewer."

"And you don't know the location of a single one of the fifty?"

"Well, now, I wonder-"

"What do you wonder?"

Deniador said, "Since primeval history is my hobby, as it is Dr. Pelorat's, I have occasionally explored old documents in search of anything that might refer to early time; something more than legends. Last year, I came upon the records of an old ship, records that were almost indecipherable. It dated back to the very old days when our world was not yet known as Comporellon. The name 'Baleyworld' was used, which, it seems to me, may be an even earlier form of the 'Benbally world' of our legends."

Pelorat said, excitedly, "Have you published?"

"No," said Deniador. "I do not wish to dive until I am sure there is water in the swimming pool, as the old saying has it. You see, the record says that the captain of the ship had visited a Spacer world and taken off with him a Spacer woman."

Bliss said, "But you said that the Spacers did not allow visitors."

"Exactly, and that is the reason I don't publish the material. It sounds incredible. There are vague tales that could be interpreted as referring to the Spacers and to their conflict with the Settlers-our own ancestors. -Such tales exist not only on Comporellon but on many worlds in many variations, but all are in absolute accord in one respect. The two groups, Spacers and Settlers, did not mingle. There was no social contact, let alone sexual contact, and yet apparently the Settler captain and the Spacer woman were held together by bonds of love. This is so incredible that I see no chance of the story being accepted as anything but, at best, a piece of romantic historical fiction."

Trevize looked disappointed. "Is that all?"

"No, Councilman, there is one more matter. I came across some figures in what was left of the log of the ship that might-or might not-represent spatial coordinates. If they were-and I repeat, since my Skeptic's honor compels me to, that they might not be-

then internal evidence made me conclude they were the spatial coordinates of three of the Spacer worlds. One of them might be the Spacer world where the captain landed and from which he withdrew his Spacer love."

Trevize said, "Might it not be that even if the tale is fiction, the coordinates are real?"

"It might be," said Deniador. "I will give you the figures, and you are free to use them, but you might get nowhere. -And yet I have an amusing notion." His quick smile made its appearance.

"What is that?" said Trevize.

"What if one of those sets of coordinates represented Earth?"

27.

COMPORELLON'S sun, distinctly orange, was larger in appearance than the sun of Terminus, but it was low in the sky and gave out little heat. The wind, fortunately light, touched Trevize's cheek with icy fingers.

He shivered inside the electrified coat he had been given by Mitza Lizalor, who now stood next to him. He said, "It must warm up sometime, Mitza."

She glanced up at the sun briefly, and stood there in the emptiness of the spaceport, showing no signs of discomfort-tall, large, wearing a lighter coat than Trevize had on, and if not impervious to the cold, at least scornful of it.

She said, "We have a beautiful summer. It is not a long one but our food crops are adapted to it. The strains are carefully chosen so that they grow quickly in the sun and do not frostbite easily. Our domestic animals are well furred, and Comporellian wool is the best in the Galaxy by general admission. Then, too, we have farm settlements in orbit about Comporellon that grow ' tropical fruit. We actually export canned pineapples of superior flavor. Most people who know us as a cold world don't know that."

Trevize said, "I thank you for coming to see us off, Mitza, and for being willing to co-operate with us on this mission of ours. For my own peace of mind, however, I must ask whether you will find yourself in serious trouble over this."

"No!" She shook her head proudly. "No trouble. In the first place, I will not be questioned. I am in control of transportation, which means I alone set the rules for this spaceport and others, for the entry stations, for the ships that come and go. The Prime Minister depends on me for all that and is only too delighted to remain ignorant of its details. -And even if I were questioned, I have but to tell the truth. The government would applaud me for not turning the ship over to the Foundation. So would the people if it were safe to let them know. And the Foundation itself would not know of it."

Trevize said, "The government might be willing to keep the ship from the Foundation, but would they be willing to approve your letting us take it away?"

Lizalor smiled. "You are a decent human being, Trevize. You have fought tenaciously to keep your ship and now that you have it you take the trouble to concern

yourself with my welfare." She reached toward him tentatively as though tempted to give some sign of affection and then, with obvious difficulty, controlled the impulse.

She said, with a renewed brusqueness, "Even if they question my decision, I have but to tell them that you have been, and still are, searching for the Oldest, and they will say I did well to get rid of you as quickly as I did, ship and all, And they will perform the rites of atonement that you were ever allowed to land in the first place, though there was no way we might have guessed what you were doing."

"Do you truly fear misfortune to yourself and the world because of my presence?"

"Indeed," said Lizalor stolidly. Then she said, more softly, "You have brought misfortune to me, already, for now that I have known you, Comporellian men will seem more sapless still. I will be left with an unappeasable longing. He Who Punishes has already seen to that."

Trevize hesitated, then said, "I do not wish you to change your mind on this matter, but I do not wish you to suffer needless apprehension, either. You must know that this matter of my bringing misfortune on you is simply superstition."

"The Skeptic told you that, I presume."

"I know it without his telling me."

Lizalor brushed her face, for a thin rime was gathering on her prominent eyebrows and said, "I know there are some who think it superstition. That the Oldest brings misfortune is, however, a fact. It has been demonstrated many times and all the clever Skeptical arguments can't legislate the truth out of existence."

She thrust out her hand suddenly. "Good-bye, Golan. Get on the ship and join your companions before your soft Terminian body freezes in our cold, but kindly wind."

"Good-bye, Mitza, and I hope to see you when I return."

"Yes, you have promised to return and I have tried to believe that you would. I have even told myself that I would come out and meet you at your ship in space so that misfortune would fall only on me and not upon my world-but you will not return."

"Not so! I will! I would not give you up that easily, having had pleasure of you." And at that moment, Trevize was firmly convinced that he meant it.

"I do not doubt your romantic impulses, my sweet Foundationer, but those who venture outward on a search for the Oldest will never come back-anywhere. I know that in my heart."

Trevize tried to keep his teeth from chattering. It was from cold and he didn't want her to think it was from fear. He said, "That, too, is superstition."

"And yet," she said, "that, too, is true."

28.

IT WAS GOOD TO be back in the pilot-room of the Far Star. It might be cramped for room. It might be a bubble of imprisonment in infinite space. Nevertheless, it was familiar, friendly, and warm.

Bliss said, "I'm glad you finally came aboard. I was wondering how long you would remain with the Minister."

"Not long," said Trevize. "It was cold."

"It seemed to me," said Bliss, "that you were considering remaining with her and postponing the search for Earth. I do not like to probe your mind even lightly, but I was concerned for you and that temptation under which you labored seemed to leap out at me."

Trevize said, "You're quite right. Momentarily at least, I felt the temptation. The Minister is a remarkable woman and I've never met anyone quite like her. -Did you strengthen my resistance, Bliss?"

She said, "I've told you many times I must not and will not tamper with your mind in any way, Trevize. You beat down the temptation, I imagine, through your strong sense of duty."

"No, I rather think not." He smiled wryly. "Nothing so dramatic and noble. My resistance was strengthened, for one thing, by the fact that it was cold, and for another, by the sad thought that it wouldn't take many sessions with her to kill me. I could never keep up the pace."

Pelorat said, "Well, anyway, you are safely aboard. What are we going to do next?"

"In the immediate future, we are going to move outward through the planetary system at a brisk pace until we are far enough from Comporellon's sun to make a Jump."

"Do you think we will be stopped or followed?"

"No, I really think that the Minister is anxious only that we go away as rapidly as possible and stay away, in order that the vengeance of He Who Punishes not fall upon the planet. In fact-

"She believes the vengeance will surely fall on us. She is under the firm conviction that we will never return. This, I hasten to add, is not an estimate of my probable level of infidelity, which she has had no occasion to measure. She meant that Earth is so terrible a bearer of misfortune that anyone who seeks it must die in the process."

Bliss said, "How many have left Comporellon in search of Earth that she can make such a statement?"

"I doubt that any Comporellian has ever left on such a search. I told her that her fears were mere superstition."

"Are you sure you believe that, or have you let her shake you?"

"I know her fears are the purest superstition in the form she expresses them, but they may be well founded just the same."

"You mean, radioactivity will kill us if we try to land on it?"

"I don't believe that Earth is radioactive. What I do believe is that Earth protects itself. Remember that all reference to Earth in the Library on Trantor has been removed. Remember that Gaia's marvelous memory, in which all the planet takes part down to the rock strata of the surface and the molten metal at the core, stops short of penetrating far enough back to tell us anything of Earth."

"Clearly, if Earth is powerful enough to do that, it might also be capable of adjusting minds in order to force belief in its radioactivity, and thus preventing any search for it. Perhaps because Comporellon is so close that it represents a particular danger to Earth, there is the further reinforcement of a curious blankness. Deniador, who is a Skeptic and a scientist, is utterly convinced that there is no use searching for Earth. He says it cannot be found. -And that is why the Minister's superstition may be well founded. If Earth is so intent on concealing itself, might it not kill us, or distort us, rather than allow us to find it?"

Bliss frowned and said, "Gaia-"

Trevize said quickly, "Don't say Gaia will protect us. Since Earth was able to remove Gaia's earliest memories, it is clear that in any conflict between the two Earth will win."

Bliss said coldly, "How do you know that the memories were removed? It might be that it simply took time for Gaia to develop a planetary memory and that we can now probe backward only to the time of the completion of that development. And if the memory was removed, how can you be sure that it was Earth that did it?"

Trevize said, "I don't know. I merely advance my speculations."

Pelorat put in, rather timidly, "If Earth is so powerful, and so intent on preserving its privacy, so to speak, of what use is our search? You seem to think Earth won't allow us to succeed and will kill us if that will be what it takes to keep us from succeeding. In that case, is there any sense in not abandoning this whole thing?"

"It might seem we ought to give up, I admit, but I have this powerful conviction that Earth exists, and I must and will find it. And Gaia tells me that when I have powerful convictions of this sort, I am always right."

"But how can we survive the discovery, old chap?"

"It may be," said Trevize, with an effort at lightness, "that Earth, too, will recognize the value of my extraordinary rightness and will leave me to myself. But-and this is what I am finally getting at-I cannot be certain that you two will survive and that is of concern to me. It always has been, but it is increasing now and it seems to me that I ought to take you two back to Gaia and then proceed on my own. It is I, not you, who first decided I must search for Earth; it is I, not you, who see value in it; it is I, not you, who am driven. Let it be I, then, not you, who take the risk. Let me go on alone. -Janov?"

Pelorat's long face seemed to grow longer as he buried his chin in his neck. "I won't deny I feel nervous, Golan, but I'd be ashamed to abandon you. I would disown myself if I did so."

"Bliss?"

"Gaia will not abandon you, Trevize, whatever you do. If Earth should prove dangerous, Gaia will protect you as far as it can. And in any case, in my role as Bliss, I will not abandon Pel, and if he clings to you, then I certainly cling to him."

Trevize said grimly, "Very well, then. I've given you your chance. We go on together."

"Together," said Bliss.

Pelorat smiled slightly, and gripped Trevize's shoulder. "Together. Always."

29.

BLISS SAID, "Look at that, Pel."

She had been making use of the ship's telescope by hand, almost aimlessly, as a change from Pelorat's library of Earth-legendry.

Pelorat approached, placed an arm about her shoulders and looked at the viewscreen. One of the gas giants of the Comporellian planetary system was in sight, magnified till it seemed the large body it really was.

In color it was a soft orange streaked with paler stripes. Viewed from the planetary plane, and more distant from the sun than the ship itself was, it was almost a complete circle of light.

"Beautiful," said Pelorat.

"The central streak extends beyond the planet, Pel."

Pelorat furrowed his brow and said, "You know, Bliss, I believe it does,"

"Do you suppose it's an optical illusion?"

Pelorat said, "I'm not sure, Bliss. I'm as much a space-novice as you am ---Golan!"

Trevize answered the call with a rather feeble "What is it?" and entered the pilot-room, looking a bit ruffled, as though he had just been napping on his bed with his clothes on-which was exactly what he had been doing.

He said, in a rather peevish way, "Please! Don't be handling the instruments."

"It's just the telescope," said Pelorat. "Look at that."

Trevize did. "It's a gas giant, the one they call Gallia, according to the information I was given."

"How can you tell it's that one, just looking?"

"For one thing," said Trevize, "at our distance from the sun, and because of the planetary sizes and orbital positions, which I've been studying in plotting our course, that's the only one you could magnify to that extent at this time. For another thing, there's the ring."

"Ring?" said Bliss, mystified.

"All you can see is a thin, pale marking, because we're viewing it almost edge-on. We can zoom up out of the planetary plane and give you a better view. Would you like that?"

Pelorat said, "I don't want to make you have to recalculate positions and courses, Golan. "

"Oh well, the computer will do it for me with little trouble." He sat down at the computer as he spoke and placed his hands on the markings that received them. The computer, finely attuned to his mind, did the rest.

The Far Star, free of fuel problems or of inertial sensations, accelerated rapidly, and once again, Trevize felt a surge of love for a computer-and-ship that responded in such a way to him-as though it was his thought that powered and directed it, as though it were a powerful and obedient extension of his will.

It was no wonder the Foundation wanted it back; no wonder Comporellon had wanted it for itself. The only surprise was that the force of superstition had been strong enough to cause Comporellon to be willing to give it up.

Properly armed, it could outrun or outfight any ship in the Galaxy, or any combination of ships-provided only that it did not encounter another ship like itself.

Of course, it was not properly armed. Mayor Branno, in assigning him the ship, had at least been cautious enough to leave it unarmed.

Pelorat and Bliss watched intently as the planet, Gallia, slowly, slowly, tipped toward them. The upper pole (whichever it was) became visible, with turbulence in a large circular region around it, while the lower pole retired behind the bulge of the sphere.

At the upper end, the dark side of the planet invaded the sphere of orange light, and the beautiful circle became increasingly lopsided.

What seemed more exciting was that the central pale streak was no longer straight but had come to be curved, as were the other streaks to the north and south, but more noticeably so.

Now the central streak extended beyond the edges of the planet very distinctly and did so in a narrow loop on either side. There was no question of illusion; its nature was apparent. It was a ring of matter, looping about the planet, and hidden on the far side.

"That's enough to give you the idea, I think," said Trevize. "If we were to move over the planet, you would see the ring in its circular form, concentric about the planet, touching it nowhere. You'll probably see that it's not one ring either but several concentric rings."

"I wouldn't have thought it possible," said Pelorat blankly. "What keeps it in space?"

"The same thing that keeps a satellite in space," said Trevize. "The rings consist of tiny particles, every one of which is orbiting the planet. The rings are so close to the planet that tidal effects prevent it from coalescing into a single body."

Pelorat shook his head. "It's horrifying when I think of it, old man. How is it possible that I can have spent my whole life as a scholar and yet know so little about astronomy?"

"And I know nothing at all about the myths of humanity. No one can encompass all of knowledge. -The point is that these planetary rings aren't unusual. Almost every single gas giant has them, even if it's only a thin curve of dust. As it happens, the sun of Terminus has no true gas giant in its planetary family, so unless a Terminian is a space traveler, or has taken University instruction in astronomy, he's likely to know nothing about planetary rings. What is unusual is a ring that is sufficiently broad to be bright and

noticeable, like that one. It's beautiful. It must be a couple of hundred kilometers wide, at least."

At this point, Pelorat snapped his fingers. "That's what it meant."

Bliss looked startled. "What is it, Pel?"

Pelorat said, "I came across a scrap of poetry once, very ancient, and in an archaic version of Galactic that was hard to make out but that was good evidence of great age. - Though I shouldn't complain of the archaism, old chap. My work has made me an expert on various varieties of Old Galactic, which is quite gratifying even if it is of no use to me whatever outside my work. -What was I talking about?"

Bliss said, "An old scrap of poetry, Pel dear."

"Thank you, Bliss," he said. And to Trevize, "She keeps close track of what I say in order to pull me back whenever I get off-course, which is most of the time."

"It's part of your charm, Pel," said Bliss, smiling.

"Anyway, this scrap of poetry purported to describe the planetary system of which Earth was part. Why it should do so, I don't know, for the poem as a whole does not survive; at least, I was never able to locate it. Only this one portion survived, perhaps because of its astronomical content. In any case, it spoke of the brilliant triple ring of the sixth planet 'both brade and large, sae the woruld shronk in comparisoun.' I can still quote it, you see. I didn't understand what a planet's ring could be. I remember thinking of three circles on one side of the planet, all in a row. It seemed so nonsensical, I didn't bother to include it in my library. I'm sorry now I didn't inquire." He shook his head. "Being a mythologist in today's Galaxy is so solitary a job, one forgets the good of inquiring."

Trevize said consolingly, "You were probably right to ignore it, Janov. It's a mistake to take poetic chatter literally."

"But that's what was meant," said Pelorat, pointing at the screen. "That's what the poem was speaking of. Three wide rings, concentric, wider than the planet itself."

Trevize said, "I never heard of such a thing. I don't think rings can be that wide. Compared to the planet they circle, they are always very narrow."

Pelorat said, "We never heard of a habitable planet with a giant satellite, either. Or one with a radioactive crust. This is uniqueness .number three. If we find a radioactive planet that might be otherwise habitable, with a giant satellite, and with another planet in the system that has a huge ring, there would be no doubt at all that we had encountered Earth."

Trevize smiled. "I agree, Janov. If we find all three, we will certainly have found Earth."

"If!" said Bliss, with a sigh.

30.

THEY WERE beyond the main worlds of the planetary system, plunging outward between the positions of the two outermost planets so that there was now no significant mass within 1.5 billion kilometers. Ahead lay only the vast cometary cloud which, gravitationally, was insignificant.

The Far Star had accelerated to a speed of 0.1 *c*, one tenth the speed of light. Trevize knew well that, in theory, the ship could be accelerated to nearly the speed of light, but he also knew that, in practice, 0.1 *c* was the reasonable limit.

At that speed, any object with appreciable mass could be avoided, but there was no way of dodging the innumerable dust particles in space, and, to a far greater extent even, individual atoms and molecules. At very fast speeds, even such small objects could do damage, scouring and scraping the ship's hull. At speeds near the speed of light, each atom smashing into the hull had the properties of a cosmic ray particle. Under that penetrating cosmic radiation, anyone on board ship would not long survive.

The distant stars showed no perceptible motion in the viewscreen, and even though the ship was moving at thirty thousand kilometers per second, there was every appearance of its standing still.

The computer scanned space to great distances for any oncoming object of small but significant size that might be on a collision course, and the ship veered gently to avoid it, in the extremely unlikely case that that would be necessary. Between the small size of any possible oncoming object, the speed with which it was passed, and the lack of inertial effect as the result of the course change, there was no way of telling whether anything ever took place in the nature of what might be termed a "close call."

Trevize, therefore, did not worry about such things, or even give it the most casual thought. He kept his full attention on the three sets of coordinates he had been given by Deniador, and, particularly, on the set which indicated the object closest to themselves.

"Is there something wrong with the figures?" asked Pelorat anxiously.

"I can't tell yet," said Trevize. "Co-ordinates in themselves aren't useful, unless you know the zero point and the conventions used in setting them up -the direction in which to mark off the distance, so to speak, what the equivalent of a prime meridian is, and so on."

"How do you find out such things?" said Pelorat blankly.

"I obtained the coordinates of Terminus and a few other known points, relative to Comporellon. If I put them into the computer, it will calculate what the conventions must be for such coordinates if Terminus and the other points are to be correctly located. I'm only trying to organize things in my mind so that I can properly program the computer for this. Once the conventions are determined, the figures we have for the Forbidden Worlds might possibly have meaning."

"Only possibly?" said Bliss.

"Only possibly, I'm afraid," said Trevize. "These are old figures after all-presumably Comporellian, but not definitely. What if they are based on other conventions?"

"In that case?"

"In that case, we have only meaningless figures. But-we just have to find out."

His hands flickered over the softly glowing keys of the computer, feeding it the necessary information. He then placed his hands on the handmarks on the desk. He waited while the computer worked out the conventions of the known coordinates, paused a moment, then interpreted the coordinates of the nearest Forbidden World by the same conventions, and finally located those coordinates on the Galactic map in its memory.

A starfield appeared on the screen and moved rapidly as it adjusted itself. When it reached stasis, it expanded with stars bleeding off the edges in all directions until they were almost all gone. At no point could the eye follow the rapid change; it was all a speckled blur. Until finally, a space one tenth of a parsec on each side (according to the index figures below the screen) " all that remained. There was no further change, and only half a dozen dial sparks relieved the darkness of the screen.

"Which one is the Forbidden World?" asked Pelorat softly.

"None of them," said Trevize. "Four of them are red dwarfs, one a near-red dwarf, and the last a white dwarf. None of them can possibly have a habitable world in orbit about them."

"How do you know they're red dwarfs just by looking at them?"

Trevize said, "We're not looking at real stars; we're looking at a section of the Galactic map stored in the computer's memory. Each one is labeled. You can't see it and ordinarily I couldn't see it either, but as long as my hands are making contact, as they are, I am aware of a considerable amount of data on any star on which my eyes concentrate."

Pelorat said in a woebegone tone, "Then the coordinates are useless."

Trevize looked up at him, "No, Janov. I'm not finished. There's still the matter of time. The coordinates for the Forbidden World are those of twenty thousand years ago. In that time, both it and Comporellon have been revolving about the Galactic Center, and they may well be revolving at different speeds and in orbits of different inclinations and eccentricities. With time, therefore, the two worlds may be drifting closer together or farther apart and, in twenty thousand years, the Forbidden World may have drifted anywhere from one-half to five parsecs off the mark. It certainly wouldn't be included in that tenth-parsec square."

"What do we do, then?"

"We have the computer move the Galaxy twenty thousand years back in time relative to Comporellon."

"Can it do that?" asked Bliss, sounding rather awe-struck.

"Well, it can't move the Galaxy itself back in time, but it can move the map in its memory banks back in time."

Bliss said, "Will we see anything happen?"

"Watch," said Trevize.

Very slowly, the half-dozen stars crawled over the face of the screen. A new star, not hitherto on the screen, drifted in from the left hand edge, and Pelorat pointed in excitement. "There! There!"

Trevize said, "Sorry. Another red dwarf. They're very common. At least three fourths of all the stars in the Galaxy are red dwarfs."

The screen settled down and stopped moving.

"Well?" said Bliss.

Trevize said, "That's it. That's the view of that portion of the Galaxy as it would have been twenty thousand years ago. At the very center of the screen is a point where the Forbidden World ought to be if it had been drifting at some average velocity."

"Ought to be, but isn't," said Bliss sharply.

"It isn't," agreed Trevize, with remarkably little emotion.

Pelorat released his breath in a long sigh. "Oh, too bad, Golan."

Trevize said, "Wait, don't despair. I wasn't expecting to see the star there."

"You weren't?" said Pelorat, astonished.

"No. I told you that this isn't the Galaxy itself, but the computer's map of the Galaxy. If a real star is not included in the map, we don't see it. If the planet is called 'Forbidden' and has been called so for twenty thousand years, the chances are it wouldn't be included in the map. And it isn't, for we don't see it."

Bliss said, "We might not see it because it doesn't exist. The Comporellian legends may be false, or the coordinates may be wrong."

"Very true. The computer, however, can now make an estimate as to what the coordinates ought to be at this time, now that it has located the spot where it may have been twenty thousand years ago. Using the coordinates corrected for time, a correction I could only have made through use of the star map, we can now switch to the real starfield of the Galaxy itself."

Bliss said, "But you only assumed an average velocity for the Forbidden World. What if its velocity was not average? You would not now have the correct coordinates."

"True enough, but a correction, assuming average velocity, is almost certain to be closer to its real position, than if we had made no time correction at all."

"You hope!" said Bliss doubtfully.

"That's exactly what I do," said Trevize. "I hope. -And now let's look at the real Galaxy."

The two onlookers watched tensely, while Trevize (perhaps to reduce his own tensions and delay the zero moment) spoke softly, almost as though he were lecturing.

"It's more difficult to observe the real Galaxy," he said. "The map in the computer is an artificial construction, with irrelevancies capable of being eliminated. If there is a nebula obscuring the view, I can remove it. If the angle of view is inconvenient for what I have in mind, I can change the angle, and so on. The real Galaxy, however, I must take as I find it, and if I want a change I must move physically through space, which will take far more time than it would take to adjust a map."

And as he spoke, the screen showed a star cloud so rich in individual stars as to seem an irregular heap of powder.

Trevize said, "That's a large angle view of a section of the Milky Way, and I want the foreground, of course. If I expand the foreground, the background will tend to fade in

comparison. The coordinate spot is close enough to Comporellon so that I should be able to expand it to about the situation I had on the view of the map. Just let me put in the necessary instructions, if I can hold on to my sanity long enough. Now. "

The starfield expanded with a rush so that thousands of stars pushed off every edge, giving the watchers so real a sensation of moving toward the screen that all three automatically leaned backward as though in response to a forward rush.

The old view returned, not quite as dark as it had been on the map, but with the half-dozen stars shown as they had been in the original view. And there, close to the center, was another star, shining far more brightly than the others.

"There it is," said Pelorat, in an awed whisper.

"It may be. I'll have the computer take its spectrum and analyze it." There was a moderately long pause, then Trevize said, "Spectral class, G-4, which makes it a trifle dimmer and smaller than Terminus's sun, but rather brighter than Comporellon's sun. And no G-class star should be omitted from the computer's Galactic map. Since this one is, that is a strong indication that it may be the sun about which the Forbidden World revolves."

Bliss said, "Is there any chance of its turning out that there is no habitable planet revolving about this star after all?"

"There's a chance, I suppose. In that case, we'll try to find the other two Forbidden Worlds." Bliss persevered. "And if the other two are false alarms, too?"

"Then we'll try something else."

"Like what?"

"I wish I knew," said Trevize grimly.

PART THREE - AURORA

8. FORBIDDEN WORLD

31.

"GOLAN," said Pelorat. "Does it bother you if I watch?"

"Not at all, Janov," said Trevize.

"If I ask questions?"

"Go ahead."

Pelorat said, "What are you doing?"

Trevize took his eyes off the viewscreen. "I've got to measure the distance of each star that seems to be near the Forbidden World on the screen, so that I can determine how near they really are. Their gravitational fields must be known and for that I need mass and distance. Without that knowledge, one can't be sure of a clean Jump."

"How do you do that?"

"Well, each star I see has its coordinates in the computer's memory bank! and these can be converted into coordinates on the Comporellian system. That can, in turn, be slightly corrected for the actual position of the For Star in space relative to Comporellon's sun, and that gives me the distance of each. Those red dwarfs all look quite near the Forbidden World on the screen, but some might be much closer and some much farther. We need their three-dimensional position, you see."

Pelorat nodded, and said, "And you already have the coordinates of the Forbidden World-"

"Yes, but that's not enough. I need the distances of the other stars to within a percent or so. Their gravitational intensity in the neighborhood of the Forbidden World is so small that a slight error makes no perceptible difference. The sun about which the Forbidden World revolves-or might revolve-possesses an enormously intense gravitational field in the neighborhood of the Forbidden World and I must know its distance with perhaps a thousand times the accuracy of that of the other stars. The coordinates alone won't do."

"Then what do you do?"

"I measure the apparent separation of the Forbidden World-or, rather, its star-from three nearby stars which are so dim it takes considerable magnification to make them out at all. Presumably, those three are very far away. We then keep one of those three stars centered on the screen and Jump a tenth of a parsec in a direction at right angles to the line of vision to the Forbidden World. We can do that safely enough even without knowing distances to comparatively far-off stars.

"The reference star which is centered would still be centered after the Jump. The two other dim stars, if all three are truly very distant, do not change their positions measurably. The Forbidden World, however, is close enough to change its apparent

position in parallactic shift. From the size of the shift, we can determine its distance. If I want to make doubly certain, I choose three other stars and try again."

Pelorat said, "How long does all that take?"

"Not very long. The computer does the heavy work. I just tell it what to do. What really takes the time is that I have to study the results and make sure they look right and that my instructions aren't at fault somehow. If I were one of those daredevils with utter faith in themselves and the computer, it could all be done in a few minutes."

Pelorat said, "It's really astonishing. Think how much the computer does for us."

"I think of it all the time."

"What would you do without it?"

"What would I do without a gravitic ship? What would I do without my astronautic training? What would I do without twenty thousand years of hyperspatial technology behind me? The fact is that I'm myself-here-now. Suppose we were to imagine ourselves twenty thousand additional years into the future. What technological marvels would we have to be grateful for? Or might it be that twenty thousand years hence humanity would not exist?"

"Scarcely that," said Pelorat. "Scarcely not exist. Even if we don't become part of Galaxia, we would still have psychohistory to guide us."

Trevize turned in his chair, releasing his handhold on the computer. "Let it work out distances," he said, "and let it check the matter a number of times. There's no hurry."

He looked quizzically at Pelorat, and said, "Psychohistory! You know, Janov, twice that subject came up on Comporellon, and twice it was described as a superstition. I said so once, and then Deniador said it also. After all, how can you define psychohistory but as a superstition of the Foundation? Isn't it a belief without proof or evidence? What do you think, Janov? It's more your field than mine."

Pelorat said, "Why do you say there's no evidence, Golan? The simulacrum of Hari Seldon has appeared in the Time Vault many times and has discussed events as they happened. He could not have known what those events would be, in his time, had he not been able to predict them psychohistorically."

Trevize nodded. "That sounds impressive. He was wrong about the Mule, but even allowing for that, it's impressive. Still, it has an uncomfortable magical feel to it. Any conjurer can do tricks."

"No conjurer could predict centuries into the future."

"No conjurer could really do what he makes you think he does."

"Come, Golan. I can't think of any trick that would allow me to predict what will happen five centuries from now."

"Nor can you think of a trick that will allow a conjurer to read the contents of a message hidden in a pseudo-tesseract on an unmanned orbiting satellite. Just the same, I've seen a conjurer do it. Has it ever occurred to you that the Time Capsule, along with the Hari Seldon simulacrum, may be rigged by the government?"

Pelorat looked as though he were revolted by the suggestion. "They wouldn't do that."

Trevize made a scornful sound.

Pelorat said, "And they'd be caught if they tried."

"I'm not at all sure of that. The point is, though, that we don't know how psychohistory works at all."

"I don't know how that computer works, but I know it works."

"That's because others know how it works. How would it be if no one knew how it worked? Then, if it stopped working for any reason, we would be helpless to do anything about it. And if psychohistory suddenly stopped working-

"The Second Foundationers know the workings of psychohistory."

"How do you know that, Janov?"

"So it is said."

"Anything can be said. -Ah, we have the distance of the Forbidden World's star, and, I hope, very accurately. Let's consider the figures."

He stared at them for a long time, his lips moving occasionally, as though he were doing some rough calculations in his head. Finally, he said, without lifting his eyes, "What's Bliss doing?"

"Sleeping, old chap," said Pelorat. Then, defensively, "She needs sleep, Golan. Maintaining herself as part of Gaia across hyperspace is energy-consuming."

"I suppose so," said Trevize, and turned back to the computer. He placed his hands on the desk and muttered, "I'll let it go in several Jumps and have it recheck each time." Then he withdrew them again and said, "I'm serious, Janov. What do you know about psychohistory?"

Pelorat looked taken aback. "Nothing. Being a historian, which I am, after a fashion, is worlds different from being a psychohistorian. -Of course, I know the two fundamental basics of psychohistory, but everyone knows that."

"Even I do. The first requirement is that the number of human beings involved must be large enough to make statistical treatment valid. But how large is 'large enough'?"

Pelorat said, "The latest estimate of the Galactic population is something like ten quadrillion, and that's probably an underestimate. Surely, that's large enough."

"How do you know?"

"Because psychohistory does work, Golan. No matter how you chop logic, it does work."

"And the second requirement," said Trevize, "is that human beings not be aware of psychohistory, so that the knowledge does not skew their reactions. -But they are aware of psychohistory."

"Only of its bare existence, old chap. That's not what counts. The second requirement is that human beings not be aware of the predictions of psychohistory and that they are not-except that the Second Foundationers are supposed to be aware of them, but they're a special case."

"And upon those two requirements alone, the science of psychohistory has been developed. That's hard to believe."

"Not out of those two requirements alone, " said Pelorat. "There are advanced mathematics and elaborate statistical methods. The story is--if you want tradition--that Hari Seldon devised psychohistory by modeling it upon the kinetic theory of gases. Each atom or molecule in a gas moves randomly so that we can't know the position or velocity of any one of them. Nevertheless, using statistics, we can work out the rules governing their overall behavior with great precision. In the same way, Seldon intended to work out the overall behavior of human societies even though the solutions would not apply to the behavior of individual human beings."

"Perhaps, but human beings aren't atoms."

"True," said Pelorat. "A human being has consciousness and his behavior is sufficiently complicated to make it appear to be free will. How Seldon handled that I haven't any idea, and I'm sure I couldn't understand it even if someone who knew tried to explain it to me--but he did it."

Trevize said, "And the whole thing depends on dealing with people who are both numerous and unaware. Doesn't that seem to you a quicksandish foundation on which to build an enormous mathematical structure? If those requirements are not truly met, then everything collapses."

"But since the Plan hasn't collapsed--"

"Or, if the requirements are not exactly false or inadequate but simply weaker than they should be, psychohistory might work adequately for centuries and then, upon reaching some particular crisis, would collapse,--as it did temporarily in the time of the Mule. --Or what if there is a third requirement?"

"What third requirement?" asked Pelorat, frowning slightly.

"I don't know," said Trevize. "An argument may seem thoroughly logical and elegant and yet contain unexpressed assumptions. Maybe the third requirement is an assumption so taken for granted that no one ever thinks of mentioning it."

"An assumption that is so taken for granted is usually valid enough, or it wouldn't be so taken for granted."

Trevize snorted. "If you knew scientific history as well as you know traditional history, Janov, you would know how wrong that is. --But I see that we are now in the neighborhood of the sun of the Forbidden World."

And, indeed, centered on the screen, was a bright star--one so bright that the screen automatically filtered its light to the point where all other stars were washed out.

32.

FACILITIES for washing and for personal hygiene on board the Far Star were compact, and the use of water was always held to a reasonable minimum to avoid overloading the recycling facilities. Both Pelorat and Bliss had been sternly reminded of this by Trevize.

Even so, Bliss maintained an air of freshness at all times and her dark, long hair could be counted on to be glossy, her fingernails to sparkle.

She walked into the pilot-room and said, "There you are!"

Trevize looked up and said, "No need for surprise. We could scarcely have left the ship, and a thirty-second search would be bound to uncover us inside the ship, even if you couldn't detect our presence mentally."

Bliss said, "The expression was purely a form of greeting and not meant to be taken literally, as you well know. Where are we? -And don't say, 'In the pilot-room.' "

"Bliss dear," said Pelorat, holding out one arm, "we're at the outer regions of the planetary system of the nearest of the three Forbidden Worlds."

She walked to his side, placing her hand lightly on his shoulder, while his arm moved about her waist. She said, "It can't be very Forbidden. Nothing has stopped us."

Trevize said, "It is only Forbidden because Comporellon and the other worlds of the second wave of settlement have voluntarily placed the worlds of the first wave-the Spacers-out of bounds. If we ourselves don't feel bound by that voluntary agreement, what is to stop us?"

"The Spacers, if any are left, might have voluntarily placed the worlds of the second wave out of bounds, too. Just because we don't mind intruding upon them doesn't mean that they don't mind it."

"True," said Trevize, "If they exist. But so far we don't even know if any planet exists for them to live on. So far, all we see are the usual gas giants. Two of them, and not particularly large ones."

Pelorat said hastily, "But that doesn't mean the Spacer world doesn't exist. Any habitable world would be much closer to the sun and much smaller and very hard to detect in the solar glare from this distance. We'll have to microJump inward to detect such a planet." He seemed rather proud to be speaking like a seasoned space traveler.

"In that case," said Bliss, "why aren't we moving inward?"

"Not just yet," said Trevize. "I'm having the computer check as far as it can for any sign of an artificial structure. We'll move inward by stages-a dozen, if necessary-checking at each stage. I don't want to be trapped this time as we were when we first approached Gaia. Remember, Janov?"

"Traps like that could catch us every day. The one at Gaia brought me Bliss." Pelorat gazed at her fondly.

Trevize grinned. "Are you hoping for a new Bliss every day?"

Pelorat looked hurt, and Bliss said, with a trace of annoyance, "My good chap-or whatever it is that Pel insists on calling you-you might as well move in more quickly. While I am with you, you will not be trapped."

"The power of Gaia?"

"To detect the presence of other minds? Certainly."

"Are you sure you are strong enough, Bliss? I gather you must sleep quite a bit to regain strength expended at maintaining contact with the main body of Gaia. How far can I rely on the perhaps narrow limits of your abilities at this distance from the source?"

Bliss flushed. "The strength of the connection is ample."

Trevize said, "Don't be offended. I'm simply asking. -Don't you see this as a disadvantage of being Gaia? I am not Gaia. I am a complete and independent individual. That means I can travel as far as I wish from my world and my people, and remain Golan Trevize. What powers I have, and such as they are, I continue to have, and they remain wherever I go. If I were alone in space, parsecs away from any human being, and unable, for some reason, to communicate with anyone in any way, or even to see the spark of a single star in the sky, I would be and remain Golan Trevize. I might not be able to survive, and I might die, but I would die Golan Trevize."

Bliss said, "Alone in space and far from all others, you would be unable to call on the help of your fellows, on their different talents and knowledge. Alone, as an isolated individual, you would be sadly diminished as compared with yourself as part of an integrated society. You know that."

Trevize said, "There would nevertheless not be the same diminution as in your case. There is a bond between you and Gaia that is far stronger than the one between me and my society, and that bond stretches through hyperspace and requires energy for maintenance, so that you must gasp, mentally, with the effort, and feel yourself to be a diminished entity far more than I must."

Bliss's young face set hard and, for a moment, she looked young no more or, rather, she appeared ageless-more Gaia than Bliss, as though to refute Trevize's contention. She said, "Even if everything you say is so, Golan Trevize-that is, was, and will be, that cannot perhaps be less, but certainly cannot be more-even if everything you say is so, do you expect there is no price to be paid for a benefit gained? Is it not better to be a warm-blooded creature such as yourself than a cold-blooded creature such as a fish, or whatever?"

Pelorat said, "Tortoises are cold-blooded. Terminus doesn't have any, but some worlds do. They are shelled creatures, very slow-moving but long-living. "

"Well, then, isn't it better to be a human being than a tortoise; to move quickly whatever the temperature, rather than slowly? Isn't it better to support high-energy activities, quickly contracting muscles, quickly working nerve fibers, intense and long-sustained thought-than to creep slowly, and sense gradually, and have only a blurred awareness of the immediate surroundings? Isn't it?"

"Granted," said Trevize. "It is. What of it?"

"Well, don't you know you must pay for warm-bloodedness? To maintain your temperature above that of your surroundings, you must expend energy far more wastefully than a tortoise must. You must be eating almost constantly so that you can pour energy into your body as quickly as it leaks out. You would starve far more quickly than a tortoise would, and die more quickly, too. Would you rather be a tortoise, and live more slowly and longer? Or would you rather pay the price and be a quick-moving, quick-sensing, thinking organism?"

"Is this a true analogy, Bliss?"

"No, Trevize, for the situation with Gaia is more favorable. We don't expend unusual quantities of energy when we are compactly together. It is only when part of Gaia is at hyperspatial distances from the rest of Gaia that energy expenditure rises. -And remember that what you have voted for is not merely a larger Gaia, not just a larger individual world. You have decided for Galaxia, for a vast complex of worlds. Anywhere in the Galaxy, you will be part of Galaxia and you will be closely surrounded by parts of something that extends from each interstellar atom to the central black hole. It would then require small amounts of energy to remain a whole. No part would be at any great distance from all other parts. It is all this you have decided for, Trevize. How can you doubt that you have chosen well?"

Trevize's head was bent in thought. Finally, he looked up and said, "I may have chosen well, but I must be convinced of that. The decision I have made it the most important in the history of humanity and it is not enough that it be a good one. I must know it to be a good one."

"What more do you need than what I have told you?"

"I don't know, but I will find it on Earth." He spoke with absolute conviction.

Pelorat said, "Golan, the star shows a disc."

It did. The computer, busy about its own affairs and not the least concerned with any discussion that might swirl about it, had been approaching the star in stages, and had reached the distance Trevize had set for it.

They continued to be well outside the planetary plane and the computer split the screen to show each of three small inner planets.

It was the innermost that had a surface temperature in the liquid-water range, and that had an oxygen atmosphere as well. Trevize waited for its orbit to be computed and the first crude estimate seemed reasonable. He kept that computation going, for the longer the planetary movement was observed, the more accurate the computation of its orbital elements.

Trevize said quite calmly, "We have a habitable planet in view. Very likely habitable."

"Ah." Pelorat looked as nearly delighted as his solemn expression would allow.

"I'm afraid, though," said Trevize, "that there's no giant satellite. In fact, no satellite of any kind has been detected so far. So it isn't Earth. At least, not if we go by tradition."

"Don't worry about that, Golan." said Pelorat. "I rather suspected we weren't going to encounter Earth here when I saw that neither of the gas giants had an unusual ring system."

"Very well, then," said Trevize. "The next step is to find out the nature of the life inhabiting it. From the fact that it has an oxygen atmosphere, we can be absolutely certain that there is plant life upon it, but-

"Animal life, too," said Bliss abruptly. "And in quantity."

"What?" Trevize turned to her.

"I can sense it. Only faintly at this distance, but the planet is unquestionably not only habitable, but inhabited."

33.

THE Far Star was in polar orbit about the Forbidden World, at a distance great enough to keep the orbital period at a little in excess of six days. Trevize seemed in no hurry to come out of orbit.

"Since the planet is inhabited," he explained, "and since, according to Deniador, it was once inhabited by human beings who were technologically advanced and who represent a first wave of Settlers-the so-called Spacers-they may be technologically advanced still and may have no great love for us of the second wave who have replaced them. I would like them to show themselves, so that we can learn a little about them before risking a landing."

"They may not know we are here," said Pelorat.

"We would, if the situation were reversed. I must assume, then, that, if they exist, they are likely to try to make contact with us. They might even want to come out and get us."

"But if they did come out after us and were technologically advanced, we might be helpless to-"

"I can't believe that," said Trevize. "Technological advancement is not necessarily all one piece. They might conceivably be far beyond us in some ways, but it's clear they don't indulge in interstellar travel. It is we, not they, who have settled the Galaxy, and in all the history of the Empire, I know of nothing that would indicate that they left their worlds and made themselves evident to us. If they haven't been space traveling, how could they be expected to have made serious advances in astronautics? And if they haven't, they can't possibly have anything like a gravitic ship. We may be essentially unarmed but even if they come lumbering after us with a battleship, they couldn't possibly catch us. -No, we wouldn't be helpless."

"Their advance may be in mentalics. It may be that the Mule was a Spacer-"

Trevize shrugged in clear irritation. "The Mule can't be everything. The Gaians have described him as an aberrant Gaian. He's also been considered a random mutant."

Pelorat said, "To be sure, there have also been speculations-not taken very seriously, of course-that he was a mechanical artifact. A robot, in other words, though that word wasn't used."

"If there is something that seems mentally dangerous, we will have to depend on Bliss to neutralize that. She can- Is she asleep now, by the way?"

"She has been," said Pelorat, "but she was stirring when I came out here."

"Stirring, was she? Well, she'll have to be awake on short notice if anything starts happening. You'll have to see to that, Janov."

"Yes, Golan," said Pelorat quietly.

Trevize shifted his attention to the computer. "One thing that bothers me are the entry stations. Ordinarily, they are a sure sign of a planet inhabited by human beings with a high technology. But these-

"Is there something wrong with them?"

"Several things. In the first place, they're very archaic. They might be thousands of years old. In the second, there's no radiation but thermals."

"What are thermals?"

"Thermal radiation is given off by any object warmer than its surroundings. It's a familiar signature that everything yields and it consists of a broad band of radiation following a fixed pattern depending on temperature. That is what the entry stations are radiating. If there are working human devices aboard the stations, there is bound to be a leakage of nonthermal, nonrandom radiation. Since only thermals are present we can assume that either the stations are empty, and have been, perhaps, for thousands of years; or, if occupied, it is by people with a technology so advanced in this direction that they leak no radiation."

"Perhaps," said Pelorat, "the planet has a high civilization, but the entry stations are empty because the planet has been left so strictly alone for so long by our kind of Settlers that they are no longer concerned about any approach."

"Perhaps. --Or perhaps it is a lure of some sort."

Bliss entered, and Trevize, noting her out of the corner of his eyes, said grumpily, "Yes, here we are."

"So I see," said Bliss, "and still in an unchanged orbit. I can tell that much."

Pelorat explained hastily. "Golan is being cautious, dear. The entry stations seem unoccupied and we're not sure of the significance of that."

"There's no need to worry about it," said Bliss indifferently. "There are no detectable signs of intelligent life on the planet we're orbiting."

Trevize bent an astonished glare at her. "What are you talking about? You said-

"I said there was animal life on the planet, and so there is, but where in the Galaxy were you taught that animal life necessarily implies human life?"

"Why didn't you say this when you first detected animal life?"

"Because at that distance, I couldn't tell. I could barely detect the unmistakable wash of animal neural activity, but there was no way I could, at that intensity, tell butterflies from human beings."

"And now?"

"We're much closer now, and you may have thought I was asleep, but I wasn't-or, at least, only briefly. I was, to use an inappropriate word, listening as hard as I could for any sign of mental activity complex enough to signify the presence of intelligence."

"And there isn't any?"

"I would suppose," said Bliss, with sudden caution, "that if I detect nothing at this distance, there can't possibly be more than a few thousand human beings on the planet. If we come closer, I can judge it still more delicately."

"Well, that changes things," said Trevize, with some confusion.

"I suppose," said Bliss, who looked distinctly sleepy and, therefore, irritable. "You can now discard all this business of analyzing radiation and inferring and deducing and who knows what else you may have been doing. My Gaian senses do the job much more efficiently and surely. Perhaps you see what I mean when I say it is better to be a Gaian than an Isolate."

Trevize waited before answering, clearly laboring to hold his temper. When he spoke, it was with a polite, and almost formal tone, "I am grateful to you for the information. Nevertheless, you must understand that, to use an analogy, the thought of the advantage of improving my sense of smell would be insufficient motive for me to decide to abandon my humanity and become a bloodhound."

34.

THEY COULD see the Forbidden World now, as they moved below the cloud layer and drifted through the atmosphere. It looked curiously moth-eaten.

The polar regions were icy, as might be expected, but they were not large in extent. The mountainous regions were barren, with occasional glaciers, but they were not large in extent, either. There were small desert areas, well scattered.

Putting all that aside, the planet was, in potential, beautiful. Its continental areas were quite large, but sinuous, so that there were long shorelines, and rich coastal plains of generous extent. There were lush tracts of both tropical and temperate forests, rimmed by grasslands--and yet the moth-eaten nature of it all was evident.

Scattered through the forests were semibarren areas, and parts of the grasslands were thin and sparse.

"Some sort of plant disease?" said Pelorat wonderingly.

"No," said Bliss slowly. "Something worse than that, and more permanent."

"I've seen a number of worlds," said Trevize, "but nothing like this."

"I have seen very few worlds," said Bliss, "but I think the thoughts of Gaia and this is what you might expect of a world from which humanity has disappeared."

"Why?" said Trevize.

"Think about it," said Bliss tartly. "No inhabited world has a true ecological balance. Earth must have had one originally, for if that was the world on which humanity evolved, there must have been long ages when humanity did not exist, or any species capable of developing an advanced technology and the ability to modify the environment. In that case, a natural balance--everchanging, of course--must have existed. On all other inhabited worlds, however, human beings have carefully terraformed their new environments and established plant and animal life, but the ecological system they introduce is bound to be unbalanced. It would possess only a limited number of species and only those that human beings wanted, or couldn't help introducing--"

Pelorat said, "You know what that reminds me of? -Pardon me, Bliss, for interrupting, but it so fits that I can't resist telling you right now before I forget. There's an old creation myth I once came across; a myth in which life was formed on a planet and consisted of only a limited assortment of species, just those useful to or pleasant for humanity. The first human beings then did something silly-never mind what, old fellow, because those old myths are usually symbolic and only confusing if they are taken literally-and the planet's soil was cursed. 'Thorns also and thistles shall it bring forth to thee,' is the way the curse was quoted though the passage sounds much better in the archaic Galactic in which it was written. The point is, though, was it really a curse? Things human beings don't like and don't want, such as thorns and thistles, may be needed to balance the ecology."

Bliss smiled. "It's really amazing, Pel, how everything reminds you of a legend, and how illuminating they are sometimes. Human beings, in terraforming a world, leave out the thorns and thistles, whatever they may be, and human beings then have to labor to keep the world going. It isn't a self-supporting organism as Gaia is. It is rather a miscellaneous collection of Isolates and the collection isn't miscellaneous enough to allow the ecological balance to persist indefinitely. If humanity disappears, and if its guiding hands are removed, the world's pattern of life inevitably begins to fall apart. The planet unterraforms itself."

Trevize said skeptically, "If that's what's happening, it doesn't happen quickly. This world may have been free of human beings for twenty thousand years and yet most of it still seems to be very much a going concern."

"Surely," said Bliss, "that depends on how well the ecological balance was set up in the first place. If it is a fairly good balance to begin with, it might last for a long time without human beings. After all, twenty thousand years, though very long in terms of human affairs, is just overnight when compared to a planetary lifetime."

"I suppose," said Pelorat, staring intently at the planetary vista, "that if the planet is degenerating, we can be sure that the human beings are gone."

Bliss said, "I still detect no mental activity at the human level and I am willing to suppose that the planet is safely free of humanity. There is the steady hum and buzz of lower levels of consciousness, however, levels high enough to represent birds and mammals. Just the same, I'm not sure that unterraforming is enough to show human beings are gone. A planet might deteriorate even if human beings existed upon it, if the society were itself abnormal and did not understand the importance of preserving the environment."

"Surely," said Pelorat, "such a society would quickly be destroyed. I don't think it would be possible for human beings to fail to understand the importance of retaining the very factors that are keeping them alive."

Bliss said, "I don't have your pleasant faith in human reason, Pel. It seems to me to be quite conceivable that when a planetary society consists only of Isolates, local and even individual concerns might easily be allowed to overcome planetary concerns."

"I don't think that's conceivable," said Trevize, "anymore than Pelorat does. In fact, since human-occupied worlds exist by the million and none of them have deteriorated in an unterraforming fashion, your fear of Isolatism may be exaggerated, Bliss."

The ship now moved out of the daylit hemisphere into the night. The effect was that of a rapidly deepening twilight, and then utter darkness outside, except for starlight where the sky was clear.

The ship maintained its height by accurately monitoring the atmospheric pressure and gravitational intensity. They were at a height too great to encounter any upthrusting mountainous massifs, for the planet was at a stage when mountain-building had not recently taken place. Still, the computer felt its way forward with its microwave finger-tips, just in case.

Trevize regarded the velvety darkness and said, thoughtfully, "Somehow what I find most convincing as the sign of a deserted planet is the absence of visible light on the dark side. No technological society could possibly endure darkness. -As soon as we get into the dayside, we'll go lower."

"What would be the use of that?" said Pelorat. "There's nothing there."

"Who said there's nothing there?"

"Bliss did. And you did."

"No, Janov. I said there's no radiation of technological origin and Bliss said there's no sign of human mental activity, but that doesn't mean there's nothing there. Even if there are no human beings on the planet, there would surely be relics of some sort. I'm after information, Janov, and the remainders of a technology may have its uses in that direction."

"After twenty thousand years?" Pelorat's voice climbed in pitch. "What do you think can survive twenty thousand years? There will be no films, no paper, no print; metal will have rusted, wood will have decayed, plastic will be in shattered grains. Even stone will have crumbled and eroded."

"It may not be twenty thousand years," said Trevize patiently. "I mentioned that time as the longest period the planet may have been left empty of human beings because Comporellian legend has this world flourishing at that time. But suppose the last human beings had died or vanished or fled only a thousand years ago."

They arrived at the other end of the nightside and the dawn came and brightened into sunlight almost instantaneously.

The Far Star sank downward and slowed its progress until the details of the land surface were clearly visible. The small islands that dotted the continental shores could now be clearly seen. Most were green with vegetation.

Trevize said, "It's my idea that we ought to study the spoiled areas particularly. It seems to me that those places where human beings were most concentrated would be where the ecological balance was most lacking. Those areas might be the nucleus of the spreading blight of unterraforming. What do you think, Bliss?"

"It's possible. In any case, in the absence of definite knowledge, we might as well look where it's easiest to see. The grasslands and forest would have swallowed most signs of human habitation so that looking there might prove a waste of time."

"It strikes me," said Pelorat, "that a world might eventually establish a balance with what it has; that new species might develop; and that the bad areas might be recolonized on a new basis."

"Possibly, Pel," said Bliss. "It depends on how badly out of balance the world was in the first place. And for a world to heal itself and achieve a new balance through evolution would take far more than twenty thousand years. We'd be talking millions of years."

The Far Star was no longer circling the world. It was drifting slowly across a five-hundred-kilometer-wide stretch of scattered heath and furze, with occasional clumps of trees.

"What do you think of that?" said Trevize suddenly, pointing. The ship came to a drifting halt and hovered in mid-air. There was a low, but persistent, hum as the gravitic engines shifted into high, neutralizing the planetary gravitational field almost entirely.

There was nothing much to see where Trevize pointed. Tumbled mounds bearing soil and sparse grass were all that was visible.

"It doesn't look like anything to me," said Pelorat.

"There's a straight-line arrangement to that junk. Parallel lines, and you can make out some faint lines at right angles, too. See? See? You can't get that in any natural formation. That's human architecture, marking out foundations and walls, just as clearly as though they were still standing there to be looked at."

"Suppose it is," said Pelorat. "That's just a ruin. If we're going to do archeological research, we're going to have to dig and dig. Professionals would take years to do it properly--"

"Yes, but we can't take the time to do it properly. That may be the faint outline of an ancient city and something of it may still be standing. Let's follow those lines and see where they take us."

It was toward one end of the area, at a place where the trees were somewhat more thickly clumped, that they came to standing walls-or partially standing ones.

Trevize said, "Good enough for a beginning. We're landing."

9. FACING THE PACK

35.

THE Far Star came to rest at the bottom of a small rise, a hill in the generally fiat countryside. Almost without thought, Trevize had taken it for granted that it would be best for the ship not to be visible for miles in every direction.

He said, "The temperature outside is 24 C., the wind is about eleven kilometers per hour from the west, and it is partly cloudy. The computer does not know enough about the general air circulation to be able to predict the weather. However, since the humidity is some forty percent, it seems scarcely about to rain. On the whole, we seem to have chosen a comfortable latitude or season of the year, and after Comporellon that's a pleasure."

"I suppose," said Pelorat, "that as the planet continues to unterraform, the weather will become more extreme."

"I'm sure of that," said Bliss.

"Be as sure as you like," said Trevize. "We have thousands of years of leeway. Right now, it's still a pleasant planet and will continue to be so for our lifetimes and far beyond."

He was clasping a broad belt about his waist as he spoke, and Bliss said sharply, "What's that, Trevize?"

"Just my old navy training," said Trevize. "I'm not going into an unknown world unarmed."

"Are you seriously intending to carry weapons?"

"Absolutely. Here on my right"-he slapped a holster that contained a massive weapon with a broad muzzle-"is my blaster, and here on my left"-a smaller weapon with a thin muzzle that contained no opening-"is my neuronc whip."

"Two varieties of murder," said Bliss, with distaste.

"Only one. The blaster kills. The neuronc whip doesn't. It just stimulates the pain nerves, and it hurts so that you can wish you were dead, I'm told. Fortunately, I've never been at the wrong end of one."

"Why are you taking them?"

"I told you. It's an enemy world."

"Trevize, it's an empty world."

"Is it? There's no technological society, it would seem, but what if there are post-technological primitives. They may not possess anything worse than clubs or rocks, but those can kill, too."

Bliss looked exasperated, but lowered her voice in an effort to be reasonable. "I detect no human neuronc activity, Trevize. That eliminates primitives of any type, post-technological or otherwise."

"Then I won't have to use my weapons," said Trevize. "Still, what harm would there be in carrying them? They'll just make me a little heavier, and since the gravitational pull at the surface is about ninety-one percent that of Terminus, I can afford the weight. - Listen, the ship may be unarmed as a ship, but it has a reasonable supply of hand-weapons. I suggest that you two also-"

"No," said Bliss at once. "I will not make even a gesture in the direction of killing-or of inflicting pain, either."

"It's not a question of killing, but of avoiding being killed, if you see what I mean."

"I can protect myself in my own way."

"Janov?"

Pelorat hesitated. "We didn't have arms on Comporellon."

"Come, Janov, Comporellon was a known quantity, a world associated with the Foundation. Besides we were at once taken into custody. If we had had weapons, they would have been taken away. Do you want a blaster?"

Pelorat shook his head. "I've never been in the Navy, old chap. I wouldn't know how to use one of those things and, in an emergency, I would never think of it in time. I'd just run and-and get killed."

"You won't get killed, Pel," said Bliss energetically. "Gaia has you in my/our/its protection, and that posturing naval hero as well."

Trevize said, "Good. I have no objection to being protected, but I am not posturing. I am simply making assurance doubly sure, and if I never have to make a move toward these things, I'll be completely pleased, I promise you. Still I must have them."

He patted both weapons affectionately and said, "Now let's step out on this world which may not have felt the weight of human beings upon its surface for thousands of years."

36.

"I HAVE a feeling," said Pelorat, "that it must be rather late in the day, but the sun is high enough to make it near noon, perhaps."

"I suspect," said Trevize, looking about the quiet panorama, "that your feeling originates out of the sun's orange tint, which gives it a sunset feel. If we're still here at actual sunset and the cloud formations are proper, we ought to experience a deeper red than we're used to. I don't know whether you'll find it beautiful or depressing. -For that matter it was probably even more extreme on Comporellon, but there we were indoors virtually all the time."

He turned slowly, considering the surroundings in all directions. In addition to the almost subliminal oddness of the light, there was the distinctive smell of the world-or this section of it. It seemed a little musty, but far from actively unpleasant.

The trees nearby were of middling height, and looked old, with gnarled bark and trunks a little off the vertical, though because of a prevailing wind or something off-color

about the soil he couldn't tell. Was it the trees that lent a somehow menacing ambience to the world or was it something else-less material?

Bliss said, "What do you intend to do, Trevize? Surely we didn't come all this distance to enjoy the view?"

Trevize said, "Actually, perhaps that ought to be my part of it just now. I would suggest that Janov explore this place. There are ruins off in that direction and he's the one who can judge the value of any records he might find. I imagine he can understand writings or films in archaic Galactic and I know quite well I wouldn't. And I suppose, Bliss, you want to go with him in order to protect him. As for me, I will stay here as a guard on the outer rim."

"A guard against what? Primitives with rocks and clubs?"

"Perhaps." And then the smile that had hovered about his lips faded and he said, "Oddly enough, Bliss, I'm a little uneasy about this place. I can't say why."

Pelorat said, "Come, Bliss. I've been a home-body collector of old tales all my life, so I've never actually put my hands on ancient documents. Just imagine if we could find-

Trevize watched them walk away, Pelorat's voice fading as he walked eagerly toward the ruins; Bliss swinging along at his side.

Trevize listened absently and then turned back to continue his study of the surroundings. What could there be to rouse apprehension?

He had never actually set foot upon a world without a human population, but he had viewed many from space. Usually, they were small worlds, not large enough to hold either water or air, but they had been useful as marking a meeting site during naval maneuvers (there had been no war in his lifetime, or for a century before his birth but maneuvers went on), or as an exercise in simulated emergency repairs. Ships he had been on had been in orbit about such worlds, or had even rested on them, but he had never had occasion to step off the ships at those times.

Was it that he was now actually standing on an empty world? Would he have felt the same if he had been standing on one of the many small, airless worlds he had encountered in his student days-and even since?

He shook his head. It wouldn't have bothered him. He was sure of that. He would have been in a space suit, as he had been innumerable times when he was free of his ship in space. It was a familiar situation and contact with a mere lump of rock would have produced no alteration in the familiarity. Surely!

Of course- He was not wearing a space suit now.

He was standing on a habitable world, as comfortable to the feel as Terminus would be-far more comfortable than Comporellon had been. He experienced the wind against his cheek, the warmth of the sun on his back, the rustle of vegetation in his ears. Everything was familiar, except that there were no human beings on it-at least, not any longer.

Was that it? Was it that that made the world seem so eerie? Was it that it was not merely an uninhabited world, but a deserted one?

He had never been on a deserted world before; never heard of a deserted world before; never thought a world could be deserted. All the worlds he had known of till now, once they had been populated by human beings, remained so populated forever.

He looked up toward the sky. Nothing else had deserted it. An occasional bird flew across his line of vision, seeming more natural, somehow, than the slate-blue sky between the orange-tinted fair-weather clouds. (Trevize was certain that, given a few days on the planet, he would become accustomed to the off-color so that sky and clouds would grow to seem normal to him.)

He heard birdsongs from the trees, and the softer noise of insects. Bliss had mentioned butterflies earlier and here they were-in surprising numbers and in several colorful varieties.

There were also occasional rustlings in the clumps of grass that surrounded the trees, but he could not quite make out what was causing them.

Nor did the obvious presence of life in his vicinity rouse fear in him. As Bliss had said, terraformed worlds had, from the very first, lacked dangerous animals. The fairy tales of childhood, and the heroic fantasies of his teenage years were invariably set on a legendary world that must have been derived from the vague myths of Earth. The hyperdrama holoscreen had been filled with monsters-lions, unicorns, dragons, whales, brontosaurus, bears. There were dozens of them with names he could not remember; some of them surely mythical, and perhaps all of them. There were smaller animals that bit and stung, even plants that were fearful to the touch-but only in fiction. He had once heard that primitive honeybees were able to sting, but certainly no red bees were in any way harmful.

Slowly, he walked to the right, skirting the border of the hill. The grass was tall and rank, but sparse, growing in clumps. He made his way among the trees, also growing in clumps.

Then he yawned. Certainly, nothing exciting was happening, and he wondered if he might not retreat to the ship and take a nap. No, unthinkable. Clearly, he had to stand on guard.

Perhaps he ought to do sentry duty-marching, one, two, one two, swinging about with a snap and performing complicated maneuverings with a parade electro-rod. (It was a weapon no warrior had used in three centuries, but it was still absolutely essential at drill, for no reason anyone could ever advance.)

He grinned at the thought of it, then wondered if he ought to join Pelorat and Bliss in the ruins. Why? What good would he do?

Suppose he saw something that Pelorat had happened to overlook? -Well, time enough to make the attempt after Pelorat returned. If there was anything that might be found easily, by all means let Pelorat make the discovery.

Might the two be in trouble? Foolish! What possible kind of trouble?

And if there were trouble, they would call out.

He stopped to listen. He heard nothing.

And then the irresistible thought of sentry duty recurred to him and he found himself marching, feet moving up and down with a stamp, an imaginary electro-rod coming off one shoulder, whirling, and being held out straight before him, exactly vertical-whirling again, end over end, and back over the other shoulder. Then, with a smart about-face, he was looking toward the ship (rather far-off now) once more.

And when he did that, he froze in reality, and not in sentry make-believe.

He was not alone.

Until then, he had not seen any living creature other than plant growl insects, and an occasional bird. He had neither seen nor heard anything approach-but now an animal stood between him and the ship.

Sheer surprise at the unexpected event deprived him, for a moment, of the ability to interpret what he saw. It was not till after a perceptible interval that he knew what he was looking at.

It was only a dog.

Trevize was not a dog person. He had never owned a dog and he felt no surge of friendliness toward one when he encountered it. He felt no such surge this time, either. He thought, rather impatiently, that there was no world on which these creatures had not accompanied men. They existed in countless varieties and Trevize had long had the weary impression that each world had at least one variety characteristic of itself. Nevertheless, all varieties were constant in this: whether they were kept for entertainment, show, or some form of useful work-they were bred to love and trust human beings.

It was a love and trust Trevize had never appreciated. He had once lived with a woman who had had a dog. That dog, whom Trevize tolerated for the sake of the woman, conceived a deep-seated adoration for him, followed him about, leaned against him when relaxing (all fifty pounds of him), covered him with saliva and hair at unexpected moments, and squatted outside the door and moaned whenever he and the woman were trying to engage in sex.

From that experience, Trevize had emerged with the firm conviction that for some reason known only to the canine mind and its odor-analyzing ability, he was a fixed object of doggish devotion.

Therefore, once the initial surprise was over, he surveyed the dog without concern. It was a large dog, lean and rangy, and with long legs. It was staring at him with no obvious sign of adoration. Its mouth was open in what might have been taken as a welcoming grin, but the teeth displayed were somehow large and dangerous, and Trevize decided that he would be more comfortable without the dog in his line of view.

It occurred to him, then, that the dog had never seen a human being, and that countless canine generations preceding had never seen one. The dog might have been as astonished and uncertain at the sudden appearance of a human being as Trevize had been at that of the dog. Trevize, at least, had quickly recognized the dog for what it was, but the dog did not have that advantage. It was still puzzled, and perhaps alarmed.

Clearly, it would not be safe to leave an animal that large, and with such teeth, in an alarmed state. Trevize realized that it would be necessary to establish a friendship at once.

Very slowly, he approached the dog (no sudden motions, of course). He held out his hand, ready to allow it to be sniffed, and made soft, soothing sounds, most of which consisted of "Nice doggy"-something he found intensely embarrassing.

The dog, eyes fixed on Trevize, backed away a step or two, as though in distrust, and then its upper lip wrinkled into a snarl and from its mouth there issued a rasping growl. Although Trevize had never seen a dog behave so, there was no way of interpreting the action as representing anything but menace.

Trevize therefore stopped advancing and froze. His eyes caught motion to one side, and his head turned slowly. There were two other dogs advancing from that direction. They looked just as deadly as the first.

Deadly? That adjective occurred to him only now, and its dreadful appropriateness was unmistakable.

His heart was suddenly pounding. The way to the ship was blocked. He could not run aimlessly, for those long canine legs would reach him in yards. If he stood his ground and used his blaster, then while he killed one, the other two would be upon him. Off in the distance, he could see other dogs approaching. Was there some way in which they communicated? Did they hunt in packs?

Slowly, he shifted ground leftward, in a direction in which there were no dogs-as yet. Slowly. Slowly.

The dogs shifted ground with him. He felt certain that all that saved him from instant attack was the fact that the dogs had never seen or smelled anything like himself before. They had no established behavior pattern they could follow in his case.

If he ran, of course, that would represent something familiar to the dogs. They would know what to do if something the size of Trevize showed fear and ran. They would run, too. Faster.

Trevize kept sidling toward a tree. He had the wildest desire to move upward where the dogs could not follow. They moved with him, snarling softly, coming closer. All three had their eyes fixed unwinkingly upon him. Two more were joining them and, farther off, Trevize could see still other dogs approaching. At some point, when he was close enough, he would have to make the dash. He could not wait too long, or run too soon. Either might be fatal.

Now!

He probably set a personal record for acceleration and even so it was a near thing. He felt the snap of jaws close on the heel of one foot, and for just moment he was held fast before the teeth slid off the tough ceramoid.

He was not skilled at climbing trees. He had not climbed one since he was ten and, as he recalled, that had been a clumsy effort. In this case, though, the trunk was not quite vertical, and the bark was gnarled and offered handholds. What was more, he was driven by necessity, and it is remarkable what one can do if the need is great enough.

Trevize found himself sitting in a crotch, perhaps ten meters above ground. For the moment he was totally unaware that he had scraped hand and that it was oozing blood. At the base of the tree, five dogs now on their haunches, staring upward, tongues lolling, all looking patiently expectant.

What now?

37.

TREVIZE was not in a position to think about the situation in logical detail. Rather, he experienced flashes of thought in odd and distorted sequence which, if he had eventually sorted them out, would have come to this--

Bliss had earlier maintained that in terraforming a planet, human Man would establish an unbalanced economy, which they would be able to keep from falling apart only by unending effort. For instance, no Settlers had brought with them any of the large predators. Small ones could not be helped. Insects, parasites-even small hawks, shrews, and so on.

Those dramatic animals of legend and vague literary accounts-tigers, grizzly bears, orcs, crocodiles? Who would carry them from world to world even if there were sense to it? And where would there be sense to it?

It meant that human beings were the only large predators, and it was up to them to cull those plants and animals that, left to themselves, would smother in their own overplenty.

And if human beings somehow vanished, then other predators must take their place. But what predators? The most sizable predators tolerated by human beings were dogs and cats, tamed and living on human bounty.

What if no human beings remained to feed them? They must then find their own food-for their survival and, in all truth, for the survival of those they preyed on, whose numbers had to be kept in check lest overpopulation do a hundred times the damage that predations would do.

So dogs would multiply, in their variations, with the large ones attacking the large, untended herbivores; the smaller ones preying on birds and rodents. Cats would prey by night as dogs did by day; the former singly, the latter in packs.

And perhaps evolution would eventually produce more varieties, to fill additional environmental niches. Would some dogs eventually develop seagoing characteristics to enable them to live on fish; and would some cats develop gliding abilities to hunt the clumsier birds in the air as well as on the ground?

In flashes, all this came to Trevize while he struggled with more systematic thought to tell him what he might do.

The number of dogs kept growing. He counted twenty-three now surrounding the tree and there were others approaching. How large was the pack? What did it matter? It was large enough already.

He withdrew his blaster from its holster, but the solid feel of the butt in his hand did not give him the sense of security he would have liked. When had he last inserted an energy unit into it and how many charges could he fire? Surely not twenty-three.

What about Pelorat and Bliss? If they emerged, would the dogs turn on them? Were they safe even if they did not emerge? If the dogs sensed the presence of two human beings inside the ruins, what could stop them from attacking them there? Surely there would be no doors or barriers to hold them off.

Could Bliss stop them, and even drive them away? Could she concentrate her powers through hyperspace to the desired pitch of intensity? For how long could she maintain them?

Should he call for help then? Would they come running if he yelled, and would the dogs flee under Bliss's glare? (Would it take a glare or was it simply a mental action undetectable to onlookers without the ability?) Or, if they appeared, would they then be torn apart under the eyes of Trevize, who would be forced to watch, helplessly, from the relative safety of his post in the tree?

No, he would have to use his blaster. If he could kill one dog and frighten them off for just a while, he could scramble down the tree, yell for Pelorat and Bliss, kill a second dog if they showed signs of returning, and all three could then hustle into the ship.

He adjusted the intensity of the microwave beam to the three-quartet mark. That should be ample to kill a dog with a loud report. The report would serve to frighten the dogs away, and he would be conserving energy.

He aimed carefully at a dog in the middle of the pack, one who seemed (in Trevize's own imagination, at least) to exude a greater malignancy than the rest-perhaps only because he sat more quietly and, therefore, seemed more cold-bloodedly intent on his prey. The dog was staring directly at the weapon now, as though it scorned the worst Trevize could do.

It occurred to Trevize that he had never himself fired a blaster at a human being, or seen anyone else do it. There had been firing at water-filled dummies of leather and plastic during training; with the water almost instantaneously heated to the boiling point, and shredding the covering as it exploded.

But who, in the absence of war, would fire at a human being? And what human being would withstand a blaster and force its use? Only here, on world made pathological by the disappearance of human beings-

With that odd ability of the brain to note something utterly beside the point, Trevize was aware of the fact that a cloud had hidden the sun-and then he fired.

There was an odd shimmer of the atmosphere on a straight line from the muzzle of the blaster to the dog; a vague sparkle that might have gone unnoticed if the sun were still shining unhindered.

The dog must have felt the initial surge of heat, and made the smallest motion as though it were about to leap. And then it exploded, as a portion its blood and cellular contents vaporized.

The explosion made a disappointingly small noise, for the dog's integument was simply not as tough as that of the dummies they had practiced on. Flesh, skin, blood, and bone were scattered, however, and Trevize felt his stomach heave.

The dogs started back, some having been bombarded with uncomfortably warm fragments. That was only a momentary hesitation, however. They crowded against each other suddenly, in order to eat what had been provided. Trevize felt his sickness increase. He was not frightening them; he was feeding them. At that rate, they would never leave. In fact, the smell of fresh blood and warm meat would attract still more dogs, and perhaps other smaller predators as well.

A voice called out, "Trevize. What--"

Trevize looked outward. Bliss and Pelorat had emerged from the ruins. Bliss had stopped short, her arms thrown out to keep Pelorat back. She stared at the dogs. The situation was obvious and clear. She had to ask nothing.

Trevize shouted, "I tried to drive them off without involving you and Janov. Can you hold them off?"

"Barely," said Bliss, not shouting, so that Trevize had trouble hearing her even though the dogs' snarling had quieted as though a soothing soundabsorbent blanket had been thrown over them.

Bliss said, "There are too many of them, and I am not familiar with their pattern of neuron activity. We have no such savage things on Gaia."

"Or on Terminus. Or on any civilized world," shouted Trevize. "I'll shoot as many of them as I can and you try to handle the rest. A smaller number will give you less trouble."

"No, Trevize. Shooting them will just attract others. -Stay behind me, Pel. There's no way you can protect me. -Trevize, your other weapon."

"The neuron whip?"

"Yes. That produces pain. Low power. Low power!"

"Are you afraid of hurting them?" called out Trevize in anger. "Is this a time to consider the sacredness of life?"

"I'm considering Pel's. Also mine. Do as I say. Low power, and shoot at one of the dogs. I can't hold them much longer."

The dogs had drifted away from the tree and had surrounded Bliss and Pelorat, who stood with their backs to a crumbling wall. The dogs nearest the two made hesitant attempts to come closer still, whining a bit as though trying to puzzle out what it was that held them off when they could sense nothing that would do it. Some tried uselessly to scramble up the wall and attack from behind.

Trevize's hand was trembling as he adjusted the neuron whip to low power. The neuron whip used much less energy than the blaster did, and a single power-cartridge could produce hundreds of whip-like strokes but, come to think of it, he didn't remember when he had last charged this weapon, either.

It was not so important to aim the whip. Since conserving energy was not as critical, he could use it in a sweep across the mass of dogs. That was the traditional method of controlling crowds that showed signs of turning dangerous.

However, he followed Bliss's suggestion. He aimed at one dog and fired. The dog fell over, its legs twitching. It emitted loud, high-pitched squeals.

The other dogs backed away from the stricken beast, ears flattening backward against their heads. Then, squealing in their turn, they turned and left, at first slowly, then more rapidly, and finally, at a full race. The dog who had been hit, scrambled painfully to its legs, and limped away whimpering, much the last of them.

The noise vanished in the distance, and Bliss said, "We had better get into the ship. They will come back. Or others will."

Trevize thought that never before had he manipulated the ship's entry mechanism so rapidly. And it was possible he might never do so again.

38.

NIGHT HAD fallen before Trevize felt something approaching the normal. The small patch of syntho-skin on the scrape on his hand had soothed the physical pain, but there was a scrape on his psyche for which soothing was not so easy. It was not the mere exposure to danger. He could react to that as well as any ordinarily brave person might. It was the totally unlooked-for direction from which the danger had come. It was the feeling of the ridiculous. How would it look if people were to find out he had been treed by snarling dogs? It would scarcely be worse if he had been put to flight by the whirring of angry canaries.

For hours, he kept listening for a new attack on the part of the dogs, for the sound of howls, for the scratch of claws against the outer hull.

Pelorat, by comparison, seemed quite cool. "There was no question in my mind, old chap, that Bliss would handle it, but I must say you fired the weapon well."

Trevize shrugged. He was in no mood to discuss the matter.

Pelorat was holding his library-the one compact disc on which his lifetime of research into myths and legends were stored-and with it he retreated into his bedroom where he kept his small reader.

He seemed quite pleased with himself. Trevize noticed that but didn't follow it up. Time for that later when his mind wasn't quite as taken up with dogs.

Bliss said, rather tentatively, when the two were alone, "I presume you were taken by surprise."

"Quite," said Trevize gloomily. "Who would think that at the sight of a dog-a dog-I should run for my life."

"Twenty thousand years without men and it would not be quite a dog. Those beasts must now be the dominant large predators."

Trevize nodded. "I figured that out while I was sitting on the tree bramb being a dominated prey. You were certainly right about an unbalanced ecology."

"Unbalanced, certainly, from the human standpoint-but considering how efficiently the dogs seem to be going about their business, I wonder if Pel may be right in his

suggestion that the ecology could balance itself, with various environmental niches being filled by evolving variations of the relatively few species that were once brought to the world."

"Oddly enough," said Trevize, "the same thought occurred to me."

"Provided, of course, the unbalance is not so great that the process of righting itself takes too long. The planet might become completely nonviable before that."

Trevize grunted.

Bliss looked at him thoughtfully, "How is it that you thought of arming yourself?"

Trevize said, "It did me little good. It was your ability-"

"Not entirely. I needed your weapon. At short notice, with only hyperspatial contact with the rest of Gaia, with so many individual minds of so unfamiliar a nature, I could have done nothing without your neuronc whip."

"My blaster was useless. I tried that."

"With a blaster, Trevize, a dog merely disappears. The rest may be surprised, but not frightened."

"Worse than that," said Trevize. "They ate the remnants. I was bribing them to stay."

"Yes, I see that might be the effect. The neuronc whip is different. It inflicts pain, and a dog in pain emits cries of a kind that are well understood by other dogs who, by conditioned reflex, if nothing else, begin to feel frightened themselves. With the dogs already disposed toward fright, I merely nudged their minds, and off they went."

"Yes, but you realized the whip was the more deadly of the two in this case. I did not."

"I am accustomed to dealing with minds. You are not. That's why I insisted on low power and aiming at one dog. I did not want so much pain that it killed a dog and left him silent. I did not want the pain so dispersed as to cause mere whimpering. I wanted strong pain concentrated at one point."

"And you got it, Bliss," said Trevize. "It worked perfectly. I owe you considerable gratitude."

"You begrudge that," said Bliss thoughtfully, "because it seems to you that you played a ridiculous role. And yet, I repeat, I could have done nothing without your weapons. What puzzles me is how you can explain your arming yourself in the face of my assurance that there were no human beings on this world, something I am still certain is a fact. Did you foresee the dogs?"

"No," said Trevize. "I certainly didn't. Not consciously, at least. And I don't habitually go armed, either. It never even occurred to me to put on weapons at Comporellon. -But I can't allow myself to trip into the trap of feeling it was magic, either. It couldn't have been. I suspect that once we began talking about unbalanced ecologies earlier, I somehow had an unconscious glimpse of animals grown dangerous in the absence of human beings.

That is clear enough in hindsight, but I might have had a whiff of it in foresight. Nothing more than that."

Bliss said, "Don't dismiss it that casually. I participated in the same conversation concerning unbalanced ecologies and I didn't have that same foresight. It is that special trick of foresight in you that Gaia values. I can see, too, that it must be irritating to you to have a hidden foresight the nature of which you cannot detect; to act with decision, but without clear reason."

"The usual expression on Terminus is 'to act on a hunch.'"

"On Gaia we say, 'to know without thought.' You don't like knowing without thought, do you?"

"It bothers me, yes. I don't like being driven by hunches. I assume hunch has reason behind it, but not knowing the reason makes me feel I'm not in control of my own mind—a kind of mild madness."

"And when you decided in favor of Gaia and Galaxia, you were acting on a hunch, and now you seek the reason."

"I have said so at least a dozen times."

"And I have refused to accept your statement as literal truth. For that sorry. I will oppose you in this no longer. I hope, though, that I may continue to point out items in Gaia's favor."

"Always," said Trevize, "if you, in turn, recognize that them."

"Does it occur to you, then, that this Unknown World is reverting to a kind of savagery, and perhaps to eventual desolation and uninhabitability, because of the removal of a single species that is capable of acting as a guiding intelligence? If the world were Gaia, or better yet, a part of Galaxia, this could not happen. The guiding intelligence would still exist in the form of the Galaxy V a whole, and ecology, whenever unbalanced, and for whatever reason, would move toward balance again."

"Does that mean that dogs would no longer eat?"

"Of course they would eat, just as human beings do. They would however, with purpose, in order to balance the ecology under deliberate direction, and not as a result of random circumstance."

Trevize said, "The loss of individual freedom might not matter to dogs, but it must matter to human beings. -And what if all human beings were removed from existence, everywhere, and not merely on one world or on Severa1? What if Galaxia were left without human beings at all? Would there still be a guiding intelligence? Would all other life forms and inanimate matter be able to put together a common intelligence adequate for the purpose?"

Bliss hesitated. "Such a situation," she said, "has never been experienced. Nor does there seem any likelihood that it will ever be experienced in the future."

Trevize said, "Hut doesn't it seem obvious to you, that the human mind is qualitatively different from everything else, and that if it were absent, the sum total of all other consciousness could not replace it. Would it not be true, then, that human beings are a special case and must be treated as such? They should not be fused even with one another, let alone with nonhuman objects."

"Yet you decided in favor of Galaxia."

"For an overriding reason I cannot make out."

"Perhaps that overriding reason was a glimpse of the effect of unbalanced ecologies? Might it not have been your reasoning that every world in the Galaxy is on a knife-edge, with instability on either side, and that only Galaxia could prevent such disasters as are taking place on this world-to say nothing of the continuing interhuman disasters of war and administrative failure."

"No. Unbalanced ecologies were not in my mind at the time of my decision."

"How can you be sure?"

"I may not know what it is I'm foreseeing, but if something is suggested afterward, I would recognize it if that were indeed what I foresaw. -As it seems to me I may have foreseen dangerous animals on this world."

"Well," said Bliss soberly, "we might have been dead as a result of those dangerous animals if it had not been for a combination of our powers, your foresight and my mentalism. Come, then, let us be friends."

Trevize nodded. "If you wish."

There was a chill in his voice that caused Bliss's eyebrows to rise, but at this point Pelorat burst in, nodding his head as though prepared to shake it off its foundations.

"I think," he said, "we have it."

39.

TREVIZE did not, in general, believe in easy victories, and yet it was only human to fall into belief against one's better judgment. He felt the muscles in his chest and throat tighten, but managed to say, "The location of Earth? Have you discovered that, Janov?"

Pelorat stared at Trevize for a moment, and deflated. "Well, no," he said, visibly abashed. "Not quite that. -Actually, Golan, not that at all. I had forgotten about that. It was something else that I discovered in the ruins. I suppose it's not really important."

Trevize managed a long breath and said, "Never mind, Janov. Every finding is important. What was it you came in to say?"

"Well," said Pelorat, "it's just that almost nothing survived, you understand. Twenty thousand years of storm and wind don't leave much. What's more, plant life is gradually destructive and animal life- But never mind all that. The point is that 'almost nothing' is not the same as 'nothing.'

"The ruins must have included a public building, for there was some fallen stone, or concrete, with incised lettering upon it. There was hardly anything visible, you understand, old chap, but I took photographs with one of those cameras we have on board ship, the kind with built-in computer enhancement -I never got round to asking permission to take one, Golan, but it was important, and I-

Trevize waved his hand in impatient dismissal. "Go on!"

"I could make out some of the lettering, which was very archaic. Even with computer enhancement and with my own fair skill at reading Archaic, it was impossible to

make out much except for one short phrase. The letters there were larger and a bit clearer than the rest. They may have been incised more deeply because they identified the world itself. The phrase reads, 'Planet Aurora,' so I imagine this world we rest upon is named Aurora, or was named Aurora."

"It had to be named something," said Trevize.

"Yes, but names are very rarely chosen at random. I made a careful search of my library just now and there are two old legends, from two widely spaced worlds, as it happens, so that one can reasonably suppose them to be of independent origin, if one remembers that. -But never mind that. In both legends, Aurora is used as a name for the dawn. We can suppose that Aurora may have actually meant dawn in some pre-Galactic language.

"As it happens, some word for dawn or daybreak is often used as a name for space stations or other structures that are the first built of their kind. If this world is called Dawn in whatever language, it may be the first of its kind, too."

Trevize said, "Are you getting ready to suggest that this planet is Earth and that Aurora is an alternate name for it because it represents the dawn of life and of man?"

Pelorat said, "I couldn't go that far, Golan."

Trevize said, with a trace of bitterness, "There is, after all, no radioactive surface, no giant satellite, no gas giant with huge rings."

"Exactly. But Deniador, back on Comporellon, seemed to think this was one of the worlds that was once inhabited by the first wave of Settlers-the Spacers. If it were, then its name, Aurora, might indicate it to have been the first of those Spacer worlds. We might, at this very moment, be resting on the oldest human world in the Galaxy except for Earth itself. Isn't that exciting?"

"Interesting, at any rate, Janov, but isn't that a great deal to infer merely from the name, Aurora?"

"There's more," said Pelorat excitedly. "As far as I could check in my records there is no world in the Galaxy today with the name of 'Aurora,' and I'm sure your computer will verify that. As I said, there are all sorts of world and other objects named 'Dawn' in various ways, but no one uses the actual word 'Aurora.'"

"Why should they? If it's a pre-Galactic word, it wouldn't be likely to be popular."

"But names do remain, even when they're meaningless. If this were the first settled world, it would be famous; it might even, for a while, have been the dominant world of the Galaxy. Surely, there would be other worlds calling themselves 'New Aurora,' or 'Aurora Minor,' or something like that. And then others-"

Trevize broke in. "Perhaps it wasn't the first settled world. Perhaps it was never of any importance."

"There's a better reason in my opinion, my dear chap."

"What would that be, Janov?"

"If the first wave of settlements was overtaken by a second wave to which all the worlds of the Galaxy now belong-as Deniador said-then there is very likely to have been a period of hostility between the two waves. The second wave-making up the worlds that

now exist-would not use the names given to any of the worlds of the first wave. In that way, we can infer from the fact that the name 'Aurora' has never been repeated that there were two waves of Settlers, and that this is a world of the first wave."

Trevize smiled. "I'm getting a glimpse of how you mythologists work, Janov. You build a beautiful superstructure, but it may be standing on air. The legends tell us that the Settlers of the first wave were accompanied by numerous robots, and that these were supposed to be their undoing. Now if we could find a robot on this world, I'd be willing to accept all this first-wave supposition, but we can't expect after twenty thou-

Pelorat, whose mouth had been working, managed to find his voice. "But, Golan, haven't I told you? -No, of course, I haven't. I'm so excited I can't put things in the right order. There was a robot."

40.

TREVIZE rubbed his forehead, almost as though he were in pain. He said, "A robot? There was a robot?"

"Yes," said Pelorat, nodding his head emphatically.

"How do you know?"

"Why, it was a robot. How could I fail to know one if I see one?"

"Have you ever seen a robot before?"

"No, but it was a metal object that looked like a human being. Head, arms, legs, torso. Of course, when I say metal, it was mostly rust, and when I walked toward it, I suppose the vibration of my tread damaged it further, so that when I reached to touch it-

"Why should you touch it?"

"Well, I suppose I couldn't quite believe my eyes. It was an automatic response. As soon as I touched it, it crumbled. But-

"Yes?"

"Before it quite did, its eyes seemed to glow very faintly and it made a sound as though it were trying to say something."

"You mean it was still functioning?"

"Just barely, Golan. Then it collapsed."

Trevize turned to Bliss. "Do you corroborate all this, Bliss?"

"It was a robot, and we saw it," said Bliss.

"And was it still functioning?"

Bliss said tonelessly, "As it crumbled, I caught a faint sense of neuronc activity."

"How can there have been neuronc activity? A robot doesn't have an organic brain built of cells."

"It has the computerized equivalent, I imagine," said Bliss, "and I would detect that."

"Did you detect a robotic rather than a human mentality?"

Bliss pursed her lips and said, "It was too feeble to decide anything about it except that it was there."

Trevize looked at Bliss, then at Pelorat, and said, in a tone of exasperation, "This changes everything."

PART FOUR - SOLARIA

10. ROBOTS

41.

TREVIZE seemed lost in thought during dinner, and Bliss concentrated on the food.

Pelorat, the only one who seemed anxious to speak, pointed out that if the world they were on was Aurora and if it was the first settled world, it ought to be fairly close to Earth.

"It might pay to scour the immediate stellar neighborhood," he said. "It would only mean sifting through a few hundred stars at most."

Trevize muttered that hit-and-miss was a last resort and he wanted as much information about Earth as possible before attempting to approach it even if he found it. He said no more and Pelorat, clearly squelched, dwindled into silence as well.

After the meal, as Trevize continued to volunteer nothing, Pelorat said tentatively, "Are we to be staying here, Golan?"

"Overnight, anyway," said Trevize. "I need to do a bit more thinking."

"Is it safe?"

"Unless there's something worse than dogs about," said Trevize, "we're quite safe here in the ship."

Pelorat said, "How long would it take to lift off, if there is something worse than dogs about?"

Trevize said, "The computer is on launch alert. I think we can manage to take off in between two and three minutes. And it will warn us quite effectively if anything unexpected takes place, so I suggest we all get some sleep. Tomorrow morning, I'll come to a decision as to the next move."

Easy to say, thought Trevize, as he found himself staring at the darkness. He was curled up, partly dressed, on the floor of the computer room. It was quite uncomfortable, but he was sure that his bed would be no more conducive to sleep at this time and here at least he could take action at once if the computer sounded an alarm.

Then he heard footsteps and automatically sat up, hitting his head against the edge of the desk-not hard enough to do damage, but hard enough to make rubbing and grimacing a necessity.

"Janov?" he said in a muffled voice, eyes tearing.

"No. It's Bliss."

Trevize reached over the edge of the table with one hand to make at least semicontact with the computer, and a soft light showed Bliss in a light pink wraparound.

Trevize said, "What is it?"

"I looked in your bedroom and you weren't there. There was no mistaking your neuronic activity, however, and I followed it. You were clearly awake so I walked in."

"Yes, but what is it you want?"

She sat down against the wall, knees up, and cradled her chin against them. She said, "Don't be concerned. I have no designs on what's left of your virginity."

"I don't imagine you do," said Trevize sardonically. "Why aren't you asleep? You need it more than we do."

"Believe me," she said in a low, heartfelt tone, "that episode with the dogs was very draining."

"I believe that."

"But I had to talk to you when Pel was sleeping."

"About what?"

Bliss said, "When he told you about the robot, you said that that changes everything. What did you mean?"

Trevize said, "Don't you see that for yourself? We have three sets of coordinates; three Forbidden Worlds. I want to visit all three to learn as much as possible about Earth before trying to reach it."

He edged a bit closer so that he could speak lower still, then drew away sharply. He said, "Look, I don't want Janov coming in here looking for us. I don't know what he'd think."

"It's not likely. He's sleeping and I've encouraged that just a bit. If he stirs, I'll know. -Go on. You want to visit all three. What's changed?"

"It wasn't part of my plan to waste time on any world needlessly. If this world, Aurora, had been without human occupation for twenty thousand years, then it is doubtful that any information of value has survived. I don't want to spend weeks or months scrabbling uselessly about the planetary surface, fighting off dogs and cats and bulls or whatever else may have become wild and dangerous, just on the hope of finding a scrap of reference material amid the dust, rust, and decay. It may be that on one or both of the other Forbidden Worlds there may be human beings and intact libraries. --So it was my intention to leave this world at once. We'd be out in space now, if I had done so, sleeping in perfect security."

"But?"

"But if there are robots still functioning on this world, they may have important information that we could use. They would be safer to deal with than human beings would be, since, from what I've heard, they must follow orders and can't harm human beings."

"So you've changed your plan and now you're going to spend time on this world searching for robots."

"I don't want to, Bliss. It seems to me that robots can't last twenty thousand years without maintenance. -Yet since you've seen one with a spark of activity still, it's clear I can't rely on my commonsense guesses about robots. I mustn't lead out of ignorance. Robots may be more enduring than I imagine, or they may have a certain capacity for self-maintenance."

Bliss said, "Listen to me, Trevize, and please keep this confidential."

"Confidential?" said Trevize, raising his voice in surprise. "From whom?"

"Sh! From Pel, of course. Look, you don't have to change your plans. You were right the first time. There are no functioning robots on this world. I detect nothing."

"You detected that one, and one is as good as-

"I did not detect that one. It was nonfunctioning; long nonfunctioning."

"You said-

"I know what I said. Pel thought he saw motion and heard sound. Pel is a romantic. He's spent his working life gathering data, but that is a difficult way of making one's mark in the scholarly world. He would dearly love to make an important discovery of his own. His finding of the word 'Aurora' was legitimate and made him happier than you can imagine. He wanted desperately to find more."

Trevize said, "Are you telling me he wanted to make a discovery so badly he convinced himself he had come upon a functioning robot when he hadn't?"

"What he came upon was a lump of rust containing no more consciousness than the rock against which it rested."

"But you supported his story."

"I could not bring myself to rob him of his discovery. He means so much to me."

Trevize stared at her for a full minute; then he said, "Do you mind explaining why he means so much to you? I want to know. I really want to know. To you he must seem an elderly man with nothing romantic about him. He's an Isolate, and you despise Isolates. You're young and beautiful and there must be 61 other parts of Gaia that have the bodies of vigorous and handsome young men. With them you can have a physical relationship that can resonate through Gaia and bring peaks of ecstasy. So what do you do in Janov?"

Bliss looked at Trevize solemnly. "Don't you love him?"

Trevize shrugged and said, "I'm fond of him. I suppose you could say, in a nonsexual way, that I love him."

"You haven't known him very long, Trevize. Why do you love him, in that nonsexual way of yours?"

Trevize found himself smiling without being aware of it. "He's such an odd fellow. I honestly think that never in his life has he given a single thought to himself. He was ordered to go along with me, and he went. No objection. He wanted me to go to Trantor, but when I said I wanted to go to Gaia, he never argued. And now he's come along with me in this search for Earth, though he must know it's dangerous. I feel perfectly confident that if he had to sacrifice his life for me-or for anyone-he would, and without repining."

"Would you give your life for him, Trevize?"

"I might, if I didn't have time to think. If I did have time to think, I would hesitate and I might funk it. I'm not as good as he is. And because of that, I have this terrible urge to protect and keep him good. I don't want the Galaxy to teach him not to be good. Do you understand? And I have to protect him from you particularly. I can't bear the thought of you tossing him aside when whatever nonsense amuses you now is done with."

"Yes, I thought you'd think something like that. Don't you suppose I see in Pel what you see in him-and even more so, since I can contact his mind directly? Do I act as though I want to hurt him? Would I support his fantasy of having seen a functioning robot,

if it weren't that I couldn't bear to hurt him? Trevize, I am used to what you would call goodness, for every part of Gaia is ready to be sacrificed for the whole. We know and understand no other course of action. But we give up nothing in so doing, for each part is the whole, though I don't expect you to understand that. Pel is something different."

Bliss was no longer looking at Trevize. It was as though she were talking to herself. "He is an Isolate. He is not selfless because he is a part of a greater whole. He is selfless because he is selfless. Do you understand me? He has all to lose and nothing to gain, and yet he is what he is. He shames me for being what I am without fear of loss, when he is what he is without hope of gain."

She looked up at Trevize again now, very solemnly. "Do you know how much more I understand about him than you possibly can? And do you think I would harm him in any way?"

Trevize said, "Bliss, earlier today, you said, 'Come, let us be friends,' and all I replied was, 'If you wish.' That was grudging of me, for I was thinking of what you might do to Janov. It is my turn, now. Come, Bliss, let us be friends. You can keep on pointing out the advantage of Galaxia and I may keep on refusing to accept your arguments, but even so, and despite that, let us be friends." And he held out his hand.

"Of course, Trevize," she said, and their hands gripped each other strongly.

42.

TREVIZE grinned quietly to himself. It was an internal grin, for the line of his mouth didn't budge.

When he had worked with the computer to find the star (if any) of the first set of coordinates, both Pelorat and Bliss had watched intently and had asked questions. Now they stayed in their room and slept or, at any rate, relaxed, and left the job entirely to Trevize.

In a way, it was flattering, for it seemed to Trevize that by now they had simply accepted the fact that Trevize knew what he was doing and required no supervision or encouragement. For that matter, Trevize had gained enough experience from the first episode to rely more thoroughly on the computer and to feel that it needed, if not none, then at least less supervision.

Another star-luminous and unrecorded on the Galactic map-showed up. This second star was more luminous than the star about which Aurora circled, and that made it all the more significant that the star was unrecorded in the computer.

Trevize marveled at the peculiarities of ancient tradition. Whole centuries might be telescoped or dropped out of consciousness altogether. Entire civilizations might be banished into forgetfulness. Yet out of the midst of these centuries, snatched from those civilizations, might be one or two factual items that would be remembered undistorted-such as these coordinates.

He had remarked on this to Pelorat some time before, and Pelorat had at once told him that it was precisely this that made the study of myths and legends so rewarding. "The trick is," Pelorat had said, "to work out or decide which particular components of a legend represent accurate underlying truth. That isn't easy and different mythologists are likely to pick different components, depending, usually, on which happen to suit their particular interpretations." .

In any case, the star was right where Deniador's coordinates, corrected for time, said it would be. Trevize was prepared, at this moment, to wager a considerable sum that the third star would be in place as well. And if it was, Trevize was prepared to suspect that the legend was further correct in stating that there were fifty Forbidden Worlds altogether (despite the suspiciously even number) and to wonder where the other forty-seven might be.

A habitable world, Forbidden World, was found circling the star-and by this time its presence didn't cause even a ripple of surprise in Trevize's bosom. He had been absolutely sure it would be there. He set the Far Star into a slow orbit about it.

The cloud layer was sparse enough to allow a reasonable view of the surface from space. The world was a watery one, as almost all habitable worlds were. There was an unbroken tropical ocean and two unbroken polar oceans.

In one set of middle latitudes, there was a more or less serpentine continent encircling the world with bays on either side producing an occasional narrow isthmus. In the other set of middle latitudes, the land surface was broken into three large parts and each of the three were thicker north-south than the opposite continent was.

Trevize wished he knew enough climatology to be able to predict, from what he saw, what the temperatures and seasons might be like. For a moment, he toyed with the idea of having the computer work on the problem. The trouble was that climate was not the point at issue.

Much more important was that, once again, the computer detected no radiation that might be of technological origin. What his telescope told him was that the planet was not moth-eaten and that there were no signs of desert. The land moved backward in various shades of green, but there were no signs of urban areas on the dayside, no lights on the nightside.

Was this another planet filled with every kind of life but human?

He rapped at the door of the other bedroom.

"Bliss?" he called out in a loud whisper, and rapped again.

There was a rustling, and Bliss's voice said, "Yes?"

"Could you come out here? I need your help-"

"If you wait just a bit, I'll make myself a bit presentable."

When she finally appeared, she looked as presentable as Trevize had ever seen her. He felt a twinge of annoyance at having been made to wait, however, for it made little difference to him what she looked like. But they were friends now, and he suppressed the annoyance.

She said with a smile and in a perfectly pleasant tone, "What can I do for you, Trevize?"

Trevize waved at the viewscreen. "As you can see, we're passing over the surface of what looks like a perfectly healthy world with a quite solid vegetation cover over its land area. No lights at night, however, and no technological radiation. Please listen and tell me if there's any animal life. There was one point at which I thought I could see herds of grazing animals, but I wasn't sure. It might be a case of seeing what one desperately wants to see."

Bliss "listened." At least, a curiously intent look came across her face. She said, "Oh yes- rich in animal life."

"Mammalian?"

"Must be."

"Human?"

Now she seemed to concentrate harder. A full minute passed, and then another, and finally she relaxed. "I can't quite tell. Every once in a while it seemed to me that I detected a whiff of intelligence sufficiently intense to be considered human. But it was so feeble and so occasional that perhaps I, too, was only sensing what I desperately wanted to sense. You see-"

She paused in thought, and Trevize nudged her with a "Well?"

She said, "The thing is I seem to detect something else. It is not something I'm familiar with, but I don't see how it can be anything but-"

Her face tightened again as she began to "listen" with still greater intensity.

"Well?" said Trevize again.

She relaxed. "I don't see how it can be anything but robots."

"Robots!"

"Yes, and if I detect them, surely I ought to be able to detect human beings, too. But I don't."

"Robots!" said Trevize again, frowning.

"Yes," said Bliss, "and I should judge, in great numbers."

43.

PELORAT also said "Robots!" in almost exactly Trevize's tone when he was told of them. Then he smiled slightly. "You were right, Golan, and I was wrong to doubt you."

"I don't remember your doubting me, Janov."

"Oh well, old man, I didn't think I ought to express it. I just thought, in my heart, that it was a mistake to leave Aurora while there was a chance we might interview some surviving robot. But then it's clear you knew there would be a richer supply of robots here."

"Not at all, Janov. I didn't know. I merely chanced it. Bliss tells me their mental fields seem to imply they are fully functioning, and it seems to me they can't very well be

fully functioning without human beings about for care and maintenance. However, she can't spot anything human so we're still looking. »

Pelorat studied the viewscreen thoughtfully. "It seems to be all forest, doesn't it?"

"Mostly forest. But there are clear patches that may be grasslands. The thing is that I see no cities, or any lights at night, or anything but thermal radiation at any time."

"So no human beings after all?"

"I wonder. Bliss is in the galley trying to concentrate. I've set up an arbitrary prime meridian for the planet which means that it's divided into latitude and longitude in the computer. Bliss has a little device which she presses whenever she encounters what seems an unusual concentration of robotic mental activity-I suppose you can't say 'neuronic activity' in connection with robots-or any whiff of human thought. The device is linked to the computer, which thus gets a fix on all the latitudes and longitudes, and we'll let it make the choice among them and pick a good place for landing."

Pelorat looked uneasy. "Is it wise to leave the matter of choice to the computer?"

"Why not, Janov? It's a very competent computer. Besides, when you have no basis on which to make a choice yourself, where's the harm in at least considering the computer's choice?"

Pelorat brightened up. "There's something to that, Golan. Some of the oldest legends include tales of people making choices by tossing cubes to the ground."

"Oh? What does that accomplish?"

"Each face of the cube has some decision on it-yes-no-perhaps-postpone-and so on. Whichever face happens to come upward on landing would be taken as bearing the advice to be followed. Or they would set a ball rolling about a slotted disc with different decisions scattered among the slots. The decision written on the slot in which the ball ends is to be taken. Some mythologists think such activities represented games of chance rather than lotteries, but the two are much the same thing in my opinion."

"In a way," said Trevize, "we're playing a game of chance in choosing our place of landing."

Bliss emerged from the galley in time to hear the last comment. She said, "No game of chance. I pressed several 'maybes' and then one sure-fire 'yes,' and it's to the 'yes' that we'll be going."

"What made it a 'yes'?" asked Trevize.

"I caught a whiff of human thought. Definite. Unmistakable."

44.

IT HAD been raining, for the grass was wet. Overhead, the clouds were scudding by and showing signs of breaking up.

The Far Star had come to a gentle rest near a small grove of trees. (In case of wild dogs, Trevize thought, only partly in jest.) All about was what looked like pasture land, and coming down from the greater height at which a better and wider view had been

possible, Trevize had seen what looked like orchards and grain fields-and this time, an unmistakable view of grazing animals.

There were no structures, however. Nothing artificial, except that the regularity of the trees in the orchard and the sharp boundaries that separated fields were themselves as artificial as a microwave-receiving power station would have been.

Could that level of artificiality have been produced by robots, however? Without human beings?

Quietly, Trevize was putting on his holsters. This time, he knew that both weapons were in working order and that both were fully charged. For a moment, he caught Bliss's eye and paused.

She said, "Go ahead. I don't think you'll have any use for them, but I thought as much once before, didn't I?"

Trevize said, "Would you like to be armed, Janov?"

Pelorat shuddered. "No, thank you. Between you and your physical defense, and Bliss and her mental defense, I feel in no danger at all. I suppose it is cowardly of me to hide in your protective shadows, but I can't feel proper shame when I'm too busy feeling grateful that I needn't be in a position of possibly having to use force."

Trevize said, "I understand. Just don't go anywhere alone. If Bliss and I separate, you stay with one of us and don't dash off somewhere under the spur of a private curiosity."

"You needn't worry, Trevize," said Bliss. "I'll see to that."

Trevize stepped out of the ship first. The wind was brisk and just a trifle cool in the aftermath of the rain, but Trevize found that welcome. It had probably been uncomfortably warm and humid before the rain.

He took in his breath with surprise. The smell of the planet was delightful. Every planet had its own odor, he knew, an odor always strange and usually distasteful-perhaps only because it was strange. Might not strange be pleasant as well? Or was this the accident of catching the planet just after the rain at a particular season of the year. Whichever it was-

"Come on," he called. "It's quite pleasant out here."

Pelorat emerged and said, "Pleasant is definitely the word for it. Do you suppose it always smells like this?"

"It doesn't matter. Within the hour, we'll be accustomed to the aroma, and our nasal receptors will be sufficiently saturated, for us to smell nothing."

"Pity," said Pelorat.

"The grass is wet," said Bliss, with a shade of disapproval.

"Why not? After all, it rains on Gaia, too!" said Trevize, and as he said that a shaft of yellow sunlight reached them momentarily through a small break in the clouds. There would soon be more of it.

"Yes," said Bliss, "but we know when and we're prepared for it."

"Too bad," said Trevize; "you lose the thrill of the unexpected."

Bliss said, "You're right. I'll try not to be provincial."

Pelorat looked about and said, in a disappointed tone, "There seems to be nothing about."

"Only seems to be," said Bliss. "They're approaching from beyond that rise." She looked toward Trevize. "Do you think we ought to go to meet them?"

Trevize shook his head. "No. We've come to meet them across many parsecs. Let them walk the rest of the way. We'll wait for them here."

Only Bliss could sense the approach until, from the direction of her pointing finger, a figure appeared over the brow of the rise. Then a second, and a third.

"I believe that is all at the moment," said Bliss.

Trevize watched curiously. Though he had never seen robots, there was not a particle of doubt in him that that was what they were. They had the schematic and impressionistic shape of human beings and yet were not obviously metallic in appearance. The robotic surface was dull and gave the illusion of softness, as though it were covered in plush.

But how did he know the softness was an illusion? Trevize felt a sudden desire to feel those figures who were approaching so stolidly. If it were true that this was a Forbidden World and that spaceships never approached it-and surely that must be so since the sun was not included in the Galactic map -then the Far Star and the people it carried must represent something the robots had never experienced. Yet they were reacting with steady certainty, as though they were working their way through a routine exercise.

Trevize said, in a low voice, "Here we may have information we can get nowhere else in the Galaxy. We could ask them for the location of Earth with reference to this world, and if they know, they will tell us. Who knows how long these things have functioned and endured? They may answer out of personal memory. Think of that."

"On the other hand," said Bliss, "they may be recently manufactured and may know nothing."

"Or," said Pelorat, "they may know, but may refuse to tell us."

Trevize said, "I suspect they can't refuse unless they've been ordered not to tell us, and why should such orders be issued when surely no one on this planet could have expected our coming?"

At a distance of about three meters, the robots stopped. They said nothing and made no further movement.

Trevize, his hand on his blaster, said to Bliss, without taking his eyes from the robot, "Can you tell whether they are hostile?"

"You'll have to allow for the fact that I have no experience whatsoever with their mental workings, Trevize, but I don't detect anything that seems hostile."

Trevize took his right hand away from the butt of the weapon, but kept it near. He raised his left hand, palm toward the robots, in what he hoped would be recognized as a gesture of peace and said, speaking slowly, "I greet you. We come to this world as friends."

The central robot of the three ducked his head in a kind of abortive bow that might also have been taken as a gesture of peace by an optimist, and replied.

Trevize's jaw dropped in astonishment. In a world of Galactic communication, one did not think of failure in so fundamental a need. However, the robot did not speak in Galactic Standard or anything approaching it. In fact, Trevize could not understand a word.

45.

PELORAT'S surprise was as great as that of Trevize, but there was an obvious element of pleasure in it, too.

"Isn't that strange?" he said.

Trevize turned to him and said, with more than a touch of asperity in his voice, "It's not strange. It's gibberish."

Pelorat said, "Not gibberish at all. It's Galactic, but very archaic. I catch a few words. I could probably understand it easily if it were written down. It's the pronunciation that's the real puzzle."

"Well, what did it say?"

"I think it told you it didn't understand what you said."

Bliss said, "I can't tell what it said, but what I sense is puzzlement, which fits. That is, if I can trust my analysis of robotic emotion-or if there is such a thing as robotic emotion."

Speaking very slowly, and with difficulty, Pelorat said something, and the three robots ducked their head in unison.

"What was that?" said Trevize.

Pelorat said, "I said I couldn't speak well, but I would try. I asked for a little time. Dear me, old chap, this is fearfully interesting."

"Fearfully disappointing," muttered Trevize.

"You see," said Pelorat, "every habitable planet in the Galaxy manages to work out its own variety of Galactic so that there are a million dialects that are sometimes barely intercomprehensible, but they're all pulled together by the development of Galactic Standard. Assuming this world to have been isolated for twenty thousand years, the language would ordinarily drift so far from that of the rest of the Galaxy as to be an entirely different language. That it isn't may be because the world has a social system that depends upon robots which can only understand the language as spoken in the fashion in which they were programmed. Rather than keep reprogramming, the language remained static and we now have what is to us merely a very archaic form of Galactic."

"There's an example," said Trevize, "of how a robotized society can be held static and made, to turn degenerate."

"But, my dear fellow," protested Pelorat, "keeping a language relatively unchanged is not necessarily a sign of degeneration. There are advantages to it."

Documents preserved for centuries and millennia retain their meaning and give greater longevity and authority to historical records. In the rest of the Galaxy, the language of Imperial edicts of the time of Hari Seldon already begins to sound quaint."

"And do you know this archaic Galactic?"

"Not to say know, Golan. It's just that in studying ancient myths and legends I've picked up the trick of it. The vocabulary is not entirely different, but it is inflected differently, and there are idiomatic expressions we don't use any longer and, as I have said, the pronunciation is totally changed. I can act as interpreter, but not as a very good one."

Trevize heaved a tremulous sigh. "A small stroke of good fortune is better than none. Carry on, Janov."

Pelorat turned to the robots, waited a moment, then looked back at Trevize. "What am I supposed to say?"

"Let's go all the way. Ask them where Earth is."

Pelorat said the words one at a time, with exaggerated gestures of his hands.

The robots looked at each other and made a few sounds. The middle one then spoke to Pelorat, who replied while moving his hands apart as though he were stretching a length of rubber. The robot responded by spacing his words as carefully as Pelorat had.

Pelorat said to Trevize, "I'm not sure I'm getting across what I mean by 'Earth.' I suspect they think I'm referring to some region on their planet and they say they don't know of any such region."

"Do they use the name of this planet, Janov?"

"The closest I can come to what I think they are using as the name is 'Solaria.' "

"Have you ever heard of it in your legends?"

"No-any more than I had ever heard of Aurora."

"Well, ask them if there is any place named Earth in the sky-among the stars. Point upward."

Again an exchange, and finally Pelorat turned and said, "All I can get from them, Golan, is that there are no places in the sky."

Bliss said, "Ask those robots how old they are; or rather, how long they have been functioning."

"I don't know how to say 'functioning,'" said Pelorat, shaking his head. In fact, I'm not sure if I can say 'how old.' I'm not a very good interpreter."

"Do the best you can, Pel dear," said Bliss.

And after several exchanges, Pelorat said, "They've been functioning for twenty-six years."

"Twenty-six years," muttered Trevize in disgust. "They're hardly older than you are, Bliss."

Bliss said, with sudden pride, "It so happens-"

"I know. You're Gaia, which is thousands of years old. -In any case, these robots cannot talk about Earth from personal experience, and their memorybanks clearly do not

include anything not necessary to their functioning. So they know nothing about astronomy."

Pelorat said, "There may be other robots somewhere on the planet that are primordial, perhaps."

"I doubt it," said Trevize, "but ask them, if you can find the words for it, Janov."

This time there was quite a long conversation and Pelorat eventually broke it off with a flushed face and a clear air of frustration.

"Golan," he said, "I don't understand part of what they're trying to say, but I gather that the older robots are used for manual labor and don't know anything. If this robot were a human, I'd say he spoke of the older robots with contempt. These three are house robots, they say, and are not allowed to grow old before being replaced. They're the ones who really know things-their words, not mine."

"They don't know much," growled Trevize. "At least of the things we want to know."

"I now regret," said Pelorat, "that we left Aurora so hurriedly. If we had found a robot survivor there, and we surely would have, since the very first one I encountered still had a spark of life left in it, they would know of Earth through personal memory."

"Provided their memories were intact, Janov," said Trevize. "We can always go back there and, if we have to, dog packs or not, we will. -But if these robots are only a couple of decades old, there must be those who manufacture them, and the manufacturers must be human, I should think." He turned to Bliss. "Are you sure you sensed-"

But she raised a hand to stop him and there was a strained and intent look on her face. "Coming now," she said, in a low voice.

Trevize turned his face toward the rise and there, first appearing from behind it, and then striding toward them, was the unmistakable figure of a human being. His complexion was pale and his hair light and long, standing out slightly from the sides of his head. His face was grave but quite young in appearance. His bare arms and legs were not particularly muscled.

The robots stepped aside for him, and he advanced till he stood in their midst.

He then spoke in a clear, pleasant voice and his words, although used archaically, were in Galactic Standard, and easily understood.

"Greetings, wanderers from space," he said. "What would you with my robots?"

46.

TREVIZE did not cover himself with glory.. He said foolishly, "You speak Galactic?"

The Solarian said, with a grim smile, "And why not, since I am not mute?"

"But these?" Trevize gestured toward the robots.

"These are robots. They speak our language, as I do. But I am Solarian and hear the hyperspatial communications of the worlds beyond so that I have learned your way of

speaking, as have my predecessors. My predecessors have left descriptions of the language, but I constantly hear new words and expressions that change with the years, as though you Settlers can settle worlds, but not words. How is it you are surprised at my understanding of your language?"

"I should not have been," said Trevize. "I apologize. It was just that speaking to the robots, I had not thought to hear Galactic on this world."

He studied the Solarian. He was wearing a thin white robe, draped loosely over his shoulder, with large openings for his arms. It was open in front, exposing a bare chest and loincloth below. Except for a pair of light sandals, he wore nothing else.

It occurred to Trevize that he could not tell whether the Solarian was male or female. The breasts were male certainly but the chest was hairless and the thin loincloth showed no bulge of any kind.

He turned to Bliss and said in a low voice, "This might still be a robot, but very like a human being in-

Bliss said, her lips hardly moving, "The mind is that of a human being, not a robot."

The Solarian said, "Yet you have not answered my original question. I shall excuse the failure and put it down to your surprise. I now ask again and you must not fail a second time. What would you with my robots?"

Trevize said, "We are travelers who seek information to reach our destination. We asked your robots for information that would help us, but they lacked the knowledge."

"What is the information you seek? Perhaps I can help you."

"We seek the location of Earth. Could you tell us that?"

The Solarian's eyebrows lifted. "I would have thought that your first object of curiosity would have been myself. I will supply that information although you have not asked for it. I am Sarton Bander and you stand upon the Bander estate, which stretches as far as your eye can see in every direction and far beyond. I cannot say that you are welcome here, for in coming here, you have violated a trust. You are the first Settlers to touch down upon Solaria in many thousands of years and, as it turns out, you have come here merely to inquire as to the best way of reaching another world. In the old days, Settlers, you and your ship would have been destroyed on sight."

"That would be a barbaric way of treating people who mean no harm and offer none," said Trevize cautiously.

"I agree, but when members of an expanding society set foot upon an inoffensive and static one, that mere touch is filled with potential harm. While we feared that harm, we were ready to destroy those who came at the instant of their coming. Since we no longer have reason to fear, we are, as you see, ready to talk."

Trevize said, "I appreciate the information you have offered us so freely, and yet you failed to answer the question I did ask. I will repeat it. Could you tell us the location of the planet Earth?"

"By Earth, I take it you mean the world on which the human species, and the various species of plants and animals"-his hand moved gracefully about as though to indicate all the surroundings about them-"originated."

"Yes, I do, sir."

A queer look of repugnance flitted over the Solarian's face. He said, "Please address me simply as Bander, if you must use a form of address. Do not address me by any word that includes a sign of gender. I am neither male nor female. I am whole."

Trevize nodded (he had been right). "As you wish, Bander. What, then, is the location of Earth, the world of origin of all of us?"

Bander said, "I do not know. Nor do I wish to know. If I did know, or if I could find out, it would do you no good, for Earth no longer exists as a world. -Ah," he went on, stretching out his arms. "The sun feels good. I am not often on the surface, and never when the sun does not show itself. My robots were sent to greet you while the sun was yet hiding behind the clouds. I followed only when the clouds cleared."

"Why is it that Earth no longer exists as a world?" said Trevize insistently, steeling himself for the tale of radioactivity once again.

Bander, however, ignored the question or, rather, put it to one side carelessly. "The story is too long," he said. "You told me that you came with no intent of harm."

"That is correct."

"Why then did you come armed?"

"That is merely a precaution. I did not know what I might meet."

"It doesn't matter. Your little weapons represent no danger to me. Yet I am curious. I have, of course, heard much of your arms, and of your curiously barbaric history that seems to depend so entirely upon arms. Even so, I have never actually seen a weapon. May I see yours?"

Trevize took a step backward. "I'm afraid not, Bander."

Bander seemed amused. "I asked only out of politeness. I need not have asked at all."

It held out its hand and from Trevize's right holster, there emerged his blaster, while from his left holster, there rose up his neuronic whip. Trevize snatched at his weapons but felt his arms held back as though by stiffly elastic bonds. Both Pelorat and Bliss started forward and it was clear that they were held as well.

Bander said, "Don't bother trying to interfere. You cannot." The weapons flew to its hands and it looked them over carefully. "This one," it said, indicating the blaster, "seems to be a microwave beamer that produces heat, thus exploding any fluid-containing body. The other is more subtle, and, I must confess, I do not see at a glance what it is intended to do. However, since you mean no harm and offer no harm, you don't need arms. I can, and I do, bleed the energy content of the units of each weapon. That leaves them harmless unless you use one or the other as a club, and they would be clumsy indeed if used for that purpose."

The Solarian released the weapons and again they drifted through the air, this time back toward Trevize. Each settled neatly into its holster.

Trevize, feeling himself released, pulled out his blaster, but there was no need to use it. The contact hung loosely, and the energy unit had clearly been totally drained. That was precisely the case with the neuronc whip as well.

He looked up at Bander, who said, smiling, "You are quite helpless, Outworlder. I can as easily, if I so desired, destroy your ship and, of course, you."

11. UNDERGROUND

47.

TREVIZE felt frozen. Trying to breathe normally, he turned to look at Bliss. She was standing with her arm protectively about Pelorat's waist, and, to all appearances, was quite calm. She smiled slightly and, even more slightly, nodded her head.

Trevize turned back to Bander. Having interpreted Bliss's actions as signifying confidence, and hoping with dreadful earnestness that he was correct, he said grimly, "How did you do that, Bander?"

Bander smiled, obviously in high good humor. "Tell me, little Outworlders, do you believe in sorcery? In magic?"

"No, we do not, little Solarian," snapped Trevize.

Bliss tugged at Trevize's sleeve and whispered, "Don't irritate him. He's dangerous."

"I can see he is," said Trevize, keeping his voice low with difficulty. "You do something, then."

Her voice barely heard, Bliss said, "Not yet. He will be less dangerous if he feels secure."

Bander paid no attention to the brief whispering among the Outworlders. It moved away from them uncaringly, the robots separating to let it pass.

Then it looked back and crooked a finger languidly. "Come. Follow me. All three of you. I will tell you a story that may not interest you, but that interests me." It continued to walk forward leisurely.

Trevize remained in place for a while, uncertain as to the best course of action. Bliss walked forward, however, and the pressure of her arm led Pelorat forward as well. Eventually, Trevize moved; the alternative was to be left standing alone with the robots.

Bliss said lightly, "If Bander will be so kind as to tell the story that may not interest us-"

Bander turned and looked intently at Bliss as though he were truly aware of her for the first time. "You are the feminine half-human," he said, "aren't you? The lesser half?"

"The smaller half, Bander. Yes."

"These other two are masculine half-humans, then?"

"So they are."

"Have you had your child yet, feminine?"

"My name, Bander, is Bliss. I have not yet had a child. This is Trevize. This is Pel."

"And which of these two masculines is to assist you when it is your time? Or will it be both? Or neither?"

"Pel will assist me, Bander."

Bander turned his attention to Pelorat. "You have white hair, I see."

Pelorat said, "I have."

"Was it always that color?"

"No, Bander, it became so with age."

"And how old are you?"

"I am fifty-two years old, Bander," Pelorat said, then added hastily, "That's Galactic Standard Years."

Bander continued to walk (toward the distant mansion, Trevize assumed), but more slowly. It said, "I don't know how long a Galactic Standard Year is, but it can't be very different from our year. And how old will you be when you die, Pel?"

"I can't say. I may live thirty more years."

"Eighty-two years, then. Short-lived, and divided in halves. Unbelievable, and yet my distant ancestors were like you and lived on Earth. -But some of them left Earth to establish new worlds around other stars, wonderful worlds, well organized, and many."

Trevize said loudly, "Not many. Fifty."

Bander turned a lofty eye on Trevize. There seemed less humor in it now. "Trevize. That's your name."

"Golan Trevize in full. I say there were fifty Spacer worlds. Our worlds number in the millions."

"Do you know, then, the story that I wish to tell you?" said Bander softly.

"If the story is that there were once fifty Spacer worlds, we know it."

"We count not in numbers only, little half-human," said Bander. "We count the quality, too. There were fifty, but such a fifty that not all your millions could make up one of them. And Solaria was the fiftieth and, therefore, the best. Solaria was as far beyond the other Spacer worlds, as they were beyond Earth.

"We of Solaria alone learned how life was to be lived. We did not herd and flock like animals, as they did on Earth, as they did on other worlds, as they did even on the other Spacer worlds. We lived each alone, with robots to help us, viewing each other electronically as often as we wished, but coming within natural sight of one another only rarely. It is many years since I have gazed at human beings as I now gaze at you but, then, you are only half-humans and your presence, therefore, does not limit my freedom any more than a cow would limit it, or a robot.

"Yet we were once half-human, too. No matter how we perfected our freedom; no matter how we developed as solitary masters over countless robots; the freedom was never absolute. In order to produce young there had to be two individuals in co-operation. It was possible, of course, to contribute sperm cells and egg cells, to have the fertilization process and the consequent embryonic growth take place artificially in automated fashion. It was possible for the infant to live adequately under robotic care. It could all be done, but the half-humans would not give up the pleasure that went with biological impregnation. Perverse emotional attachments would develop in consequence and freedom vanished. Do you see that that had to be changed?"

Trevize said, "No, Bander, because we do not measure freedom by your standards."

"That is because you do not know what freedom is. You have never lived but in swarms, and you know no way of life but to be constantly forced, in even the smallest things, to bend your wills to those of others or, which is equally vile, to spend your days struggling to force others to bend their wills to yours. Where is any possible freedom there? Freedom is nothing if it is not to live as you wish! Exactly as you wish!

"Then came the time when the Earthpeople began to swarm outward once more, when their clinging crowds again swirled through space. The other Spacers, who did not flock as the Earthpeople did, but who flocked nevertheless, if to a lesser degree, tried to compete.

"We Solarians did not. We foresaw inevitable failure in swarming. We moved underground and broke off all contact with the rest of the Galaxy. We were determined to remain ourselves at all costs. We developed suitable robots and weapons to protect our apparently empty surface, and they did the job admirably. Ships came and were destroyed, and stopped coming. The planet was considered deserted, and was forgotten, as we hoped it would be.

"And meanwhile, underground, we worked to solve our problems. We adjusted our genes gingerly, delicately. We had failures, but some successes, and we capitalized on the successes. It took us many centuries, but we finally became whole human beings, incorporating both the masculine and feminine principles in one body, supplying our own complete pleasure at will, and producing, when we wished, fertilized eggs for development under skilled robotic care."

"Hermaphrodites," said Pelorat.

"Is that what it is called in your language?" asked Bander indifferently. "I have never heard the word."

"Hermaphroditism stops evolution dead in its tracks," said Trevize. "Each child is the genetic duplicate of its hermaphroditic parent."

"Come," said Bander, "you treat evolution as a hit-and-miss affair. We can design our children if we wish. We can change and adjust the genes and, on occasion, we do. - But we are almost at my dwelling. Let us enter. It grows late in the day. The sun already fails to give its warmth adequately and we will be more comfortable indoors."

They passed through a door that had no locks of any kind but that opened as they approached and closed behind them as they passed through. There were no windows, but as they entered a cavernous room, the walls glowed to luminous life and brightened. The floor seemed bare, but was soft and springy to the touch. In each of the four corners of the room, a robot stood motionless.

"That wall," said Bander, pointing to the wall opposite the door—a wall that seemed no different in any way from the other three—is my visionscreen. The world opens before me through that screen but it in no way limits my freedom for I cannot be compelled to use it."

Trevize said, "Nor can you compel another to use his if you wish to see him through that screen and he does not."

"Compel?" said Bander haughtily. "Let another do as it pleases, if it is but content that I do as I please. Please note that we do not use gendered pronouns in referring to each other."

There was one chair in the room, facing the vision-screen, and Bander sat down in it.

Trevize looked about, as though expecting additional chairs to spring from the floor. "May we sit, too?" he said.

"If you wish," said Bander.

Bliss, smiling, sat down on the floor. Pelorat sat down beside her. Trevize stubbornly continued to stand.

Bliss said, "Tell me, Bander, how many human beings live on this planet?"

"Say Solarians, half-human Bliss. The phrase 'human being' is contaminated by the fact that half-humans call themselves that. We might call ourselves whole-humans, but that is clumsy. Solarian is the proper term."

"How many Solarians, then, live on this planet?"

"I am not certain. We do not count ourselves. Perhaps twelve hundred."

"Only twelve hundred on the entire world?"

"Fully twelve hundred. You count in numbers again, while we count in quality. -Nor do you understand freedom. If one other Solarian exists to dispute my absolute mastery over any part of my land, over any robot or living thing or object, my freedom is limited. Since other Solarians exist, the limitation on freedom must be removed as far as possible by separating them all to the point where contact is virtually nonexistent. Solaria will hold twelve hundred Solarians under conditions approaching the ideal. Add more, and liberty will be palpably limited so that the result will be unendurable."

"That means each child must be counted and must balance deaths," said Pelorat suddenly.

"Certainly. That must be true of any world with a stable population-even yours, perhaps."

"And since there are probably few deaths, there must therefore be few children."

"Indeed."

Pelorat nodded his head and was silent.

Trevize said, "What I want to know is how you made my weapons fly through the air. You haven't explained that."

"I offered you sorcery or magic as an explanation. Do you refuse to accept that?"

"Of course I refuse. What do you take me for?"

"Will you, then, believe in the conservation of energy, and in the necessary increase of entropy?"

"That I do. Nor can I believe that even in twenty thousand years you have changed these laws, or modified them a micrometer."

"Nor have we, half-person. But now consider. Outdoors, there is sunlight." There was its oddly graceful gesture, as though marking out sunlight all about. "And there is

shade. It is warmer in the sunlight than in the shade, and heat flows spontaneously from the sunlit area into the shaded area."

"You tell me what I know," said Trevize.

"But perhaps you know it so well that you no longer think about it. And at night, Solaria's surface is warmer than the objects beyond its atmosphere, so that heat flows spontaneously from the planetary surface into outer space."

"I know that, too."

"And day or night, the planetary interior is warmer than the planetary surface. Heat therefore flows spontaneously from the interior to the surface. I imagine you know that, too."

"And what of all that, Bander?"

"The flow of heat from hotter to colder, which must take place by the second law of thermodynamics, can be used to do work."

"In theory, yes, but sunlight is dilute, the heat of the planetary surface is even more dilute, and the rate at which heat escapes from the interior makes that the most dilute of all. The amount of heat-flow that can be harnessed would probably not be enough to lift a pebble."

"It depends on the device you use for the purpose," said Bander. "Our own tool was developed over a period of thousands of years and it is nothing less than a portion of our brain."

Bander lifted the hair on either side of its head, exposing that portion of its skull behind its ears. It turned its head this way and that, and behind each ear was a bulge the size and shape of the blunt end of a hen's egg.

"That portion of my brain, and its absence in you, is what makes the difference between a Solarian and you."

48.

TREVIZE glanced now and then at Bliss's face, which seemed entirely concentrated on Bander. Trevize had grown quite certain he knew what was going on.

Bander, despite its paeon to freedom, found this unique opportunity irresistible. There was no way it could speak to robots on a basis of intellectual equality, and certainly not to animals. To speak to its fellow-Solarians would be, to it, unpleasant, and what communication there must be would be forced, and never spontaneous.

As for Trevize, Bliss, and Pelorat, they might be half-human to Bander, and it might regard them as no more an infringement on its liberty than a robot or a goat would be—but they were its intellectual equals (or near equals) and the chance to speak to them was a unique luxury it had never experienced before.

No wonder, Trevize thought, it was indulging itself in this way. And Bliss (Trevize was doubly sure) was encouraging this, just pushing Bander's mind ever so gently in order to urge it to do what it very much wanted to do in any case.

Bliss, presumably, was working on the supposition that if Bander spoke enough, it might tell them something useful concerning Earth. That made sense to Trevize, so that even if he had not been truly curious about the subject under discussion, he would nevertheless have endeavored to continue the conversation.

"What do those brain-lobes do?" Trevize asked.

Bander said, "They are transducers. They are activated by the flow of heat and they convert the heat-flow into mechanical energy."

"I cannot believe that. The flow of heat is insufficient."

"Little half-human, you do not think. If there were many Solarians crowded together, each trying to make use of the flow of heat, then, yes, the supply would be insufficient. I, however, have over forty thousand square kilometers that are mine, mine alone. I can collect heat-flow from any quantity of those square kilometers with no one to dispute me, so the quantity is sufficient. Do you see?"

"Is it that simple to collect heat-flow over a wide area? The mere act of concentration takes a great deal of energy."

"Perhaps, but I am not aware of it. My transducer-lobes are constantly concentrating heat-flow so that as work is needed, work is done. When I drew your weapons into the air, a particular volume of the sunlit atmosphere lost some of its excess heat to a volume of the shaded area, so that I was using solar energy for the purpose. Instead of using mechanical or electronic devices to bring that about, however, I used a neuronic device." It touched one of the transducer-lobes gently. "It does it quickly, efficiently, constantly-and effortlessly."

"Unbelievable," muttered Pelorat.

"Not at all unbelievable," said Bander. "Consider the delicacy of the eye and ear., and how they can turn small quantities of photons and air vibrations into information. That would seem unbelievable if you had never come across it before. The transducer-lobes are no more unbelievable, and would not be so to you, were they not unfamiliar."

Trevize said, "What do you do with these constantly operating transducerlobes?"

"We run our world," said Bander. "Every robot on this vast estate obtains its energy from me; or, rather, from natural heat-flow. Whether a robot is adjusting a contact, or felling a tree, the energy is derived from mental transduction-my mental transduction."

"And if you are asleep?"

"The process of transduction continues waking or sleeping, little half-human," said Bander. "Do you cease breathing when you sleep? Does your heart stop beating? At night, my robots continue working at the cost of cooling Solaria's interior a bit. The change is immeasurably small on a global scale and there are only twelve hundred of us, so that all the energy we use does not appreciably shorten our sun's life or drain the world's internal heat."

"Has it occurred to you that you might use it as a weapon?"

Bander stared at Trevize as though he were something peculiarly incomprehensible. "I suppose by that," he said, "you mean that Solaria might confront other worlds with energy weapons based on transduction? Why should we? Even if we

could beat their energy weapons based on other principles-which is anything but certain-what would we gain? The control of other worlds? What do we want with other worlds when we have an ideal world of our own? Do we want to establish our domination over half-humans and use them in forced labor? We have our robots that are far better than half-humans for the purpose. We have everything. We want nothing-except to be left to ourselves. See here-I'll tell you another story."

"Go ahead," said Trevize.

"Twenty thousand years ago when the half-creatures of Earth began to swarm into space and we ourselves withdrew underground, the other Spacer worlds were determined to oppose the new Earth-settlers. So they struck at Earth."

"At Earth," said Trevize, trying to hide his satisfaction over the fact that the subject had come up at last.

"Yes, at the center. A sensible move, in a way. If you wish to kill a person, you strike not at a finger or a heel, but at the heart. And our fellow-Spacers, not too far removed from human beings themselves in passions, managed to set Earth's surface radioactively aflame, so that the world became largely uninhabitable."

"Ah, that's what happened," said Pelorat, clenching a fist and moving it rapidly, as though nailing down a thesis. "I knew it could not be a natural phenomenon. How was it done?"

"I don't know how it was done," said Bander indifferently, "and in any case it did the Spacers no good. That is the point of the story. The Settlers continued to swarm and the Spacers-died out. They had tried to compete, and vanished. We Solarians retired and refused to compete, and so we are still here."

"And so are the Settlers," said Trevize grimly.

"Yes, but not forever. Swarmers must fight, must compete, and eventually must die. That may take tens of thousands of years, but we can wait. And when it happens, we Solarians, whole, solitary, liberated, will have the Galaxy to ourselves. We can then use, or not use, any world we wish to in addition to our own."

"But this matter of Earth," said Pelorat, snapping his fingers impatiently. "Is what you tell us legend or history?"

"How does one tell the difference, half-Pelorat?" said Bander. "All history is legend, more or less."

"But what do your records say? May I see the records on the subject, Bander? - Please understand that this matter of myths, legends, and primeval history is my field. I am a scholar dealing with such matters and particularly with those matters as related to Earth."

"I merely repeat what I have heard," said Bander. "There are no records on the subject. Our records deal entirely with Solarian affairs and other worlds are mentioned in them only insofar as they impinge upon us."

"Surely, Earth has impinged on you," said Pelorat.

"That may be, but, if so, it was long, long ago, and Earth, of all worlds, was most repulsive to us. If we had any records of Earth, I am sure they were destroyed out of sheer revulsion."

Trevize gritted his teeth in chagrin. "By yourselves?" he asked.

Bander turned its attention to Trevize. "There is no one else to destroy them."

Pelorat would not let go of the matter. "What else have you heard concerning Earth?"

Bander thought. It said, "When I was young, I heard a tale from a robot about an Earthman who once visited Solaria; about a Solarian woman who left with him and became an important figure in the Galaxy. That, however, was, in my opinion, an invented tale."

Pelorat bit at his lip. "Are you sure?"

"How can I be sure of anything in such matters?" said Bander. "Still, it passes the bounds of belief that an Earthman would dare come to Solaria, or that Solaria would allow the intrusion. It is even less likely that a Solarian woman—we were half-humans then, but even so—should voluntarily leave this world. —But come, let me show you my home."

"Your home?" said Bliss, looking about. "Are we not in your home?"

"Not at all," said Bander. "This is an anteroom. It is a viewing room. In it I see my fellow-Solarians when I must. Their images appear on that wall, or three-dimensionally in the space before the wall. This room is a public assembly, therefore, and not part of my home. Come with me,"

It walked on ahead, without turning to see if it were followed, but the four robots left their corners, and Trevize knew that if he and his companions did not follow spontaneously, the robots would gently coerce them into doing so.

The other two got to their feet and Trevize whispered lightly to Bliss, "Have you been keeping it talking?"

Bliss pressed his hand, and nodded. "Just the same, I wish I knew what its intentions were," she added, with a note of uneasiness in her voice.

49.

THEY followed Bander. The robots remained at a polite distance, but their presence was a constantly felt threat.

They were moving through a corridor, and Trevize mumbled low-spiritedly, "There's nothing helpful about Earth on this planet. I'm sure of it. Just another variation on the radioactivity theme." He shrugged. "We'll have to go on to the third set of coordinates."

A door opened before them, revealing a small room. Bander said, "Come, half-humans, I want to show you how we live."

Trevize whispered, "It gets infantile pleasure out of display. I'd love to knock it down."

"Don't try to compete in childishness," said Bliss.

Bander ushered all three into the room. One of the robots followed as well. Bander gestured the other robots away and entered itself. The door closed behind it.

"It's an elevator," said Pelorat, with a pleased air of discovery.

"So it is," said Bander. "Once we went underground, we never truly emerged. Nor would we want to, though I find it pleasant to feel the sunlight on occasion. I dislike clouds or night in the open, however. That gives one the sensation of being underground without truly being underground, if you know what I mean. That is cognitive dissonance, after a fashion, and I find it very unpleasant."

"Earth built underground," said Pelorat. "The Caves of Steel, they called their cities. And Trantor built underground, too, even more extensively, in the old Imperial days. And Comporellon builds underground right now. It is a common tendency, when you come to think of it."

"Half-humans swarming underground and we living underground in isolated splendor are two widely different things," said Bander.

Trevize said, "On Terminus, dwelling places are on the surface."

"And exposed to the weather," said Bander. "Very primitive."

The elevator, after the initial feeling of lower gravity that had given away its nature to Pelorat, gave no sensation of motion whatsoever. Trevize was wondering how far down it would penetrate, when there was a brief feeling of higher gravity and the door opened.

Before them was a large and elaborately furnished room. It was dimly lit, though the source of the light was not apparent. It almost seemed as though the air itself were faintly luminous.

Bander pointed its finger and where it pointed the light grew a bit more intense. It pointed it elsewhere and the same thing happened. It placed its left hand on a stubby rod to one side of the doorway and, with its right hand, made an expansive circular gesture so that the whole room lit up as though it were in sunlight, but with no sensation of heat.

Trevize grimaced and said, half-aloud, "The man's a charlatan."

Bander said sharply. "Not 'the man,' but 'the Solarian.' I'm not sure what the word 'charlatan' means, but if I catch the tone of voice, it is opprobrious."

Trevize said, "It means one who is not genuine, who arranges effects to make what is done seem more impressive than it really is."

Bander said, "I admit that I love the dramatic, but what I have shown you is not an effect. It is real."

It tapped the rod on which its left hand was resting. "This heat-conducting rod extends several kilometers downward, and there are similar rods in many convenient places throughout my estate. I know there are similar rods on other estates. These rods increase the rate at which heat leaves Solaria's lower regions for the surface and eases its conversion into work. I do not need the gestures of the hand to produce the light, but it does lend an air of drama or, perhaps, as you point out, a slight touch of the not-genuine, I enjoy that sort of thing."

Bliss said, "Do you have much opportunity to experience the pleasure of such little dramatic touches?"

"No," said Bander, shaking its head. "My robots are not impressed with such things. Nor would my fellow-Solarians be. This unusual chance of meeting half-humans and displaying for them is most-amusing."

Pelorat said, "The light in this room shone dimly when We entered. Does it shine dimly at all times?"

"Yes, a small drain of power-like keeping' the robots working. My entire estate is always running, and those parts of it not engaged in active labor are idling."

"And you supply the power constantly for all this vast estate?"

"The sun and the planet's core supply the power. I am merely the conduit. Nor is all the estate productive. I keep most of it as wilderness and well stocked with a variety of animal life; first, because that protects my boundaries, and second, because I find esthetic value in it. In fact, my fields and factories are small. They need only supply my own needs, plus some specialties to exchange for those of others. I have robots, for instance, that can manufacture and install the heat-conducting rods at need. Many Solarians depend upon me for that."

"And your home?" asked Trevize. "How large is that?"

It must have been the right question to ask, for Bander beamed. "Very large. One of the largest on the planet, I believe. It goes on for kilometers in every direction. I have as many robots caring for my home underground, as I have in all the thousands of square kilometers of surface."

"You don't live in all of it, surely," said Pelorat.

"It might conceivably be that there are chambers I have never entered, but what of that?" said Bander. "The robots keep every room clean, well ventilated, and in order. But come, step out here."

They emerged through a door that was not the one through which they had entered and found themselves in another corridor. Before them was a little topless ground-car that ran on tracks.

Bander motioned them into it, and one by one they clambered aboard. There was not quite room for all four, plus the robot, but Pelorat and Bliss squeezed together tightly to allow room for Trevize. Bander sat in the front with an air of easy comfort, the robot at its side, and the car moved along with no sign of overt manipulation of controls other than Bander's smooth hand motions now and then.

"This is a car-shaped robot, actually," said Bander, with an air of negligent indifference. -

They progressed at a stately pace, very smoothly past doors that opened as they approached, and closed as they receded. The decorations in each were of widely different kinds as though robots had been ordered to devise combinations at random.

Ahead of them the corridor was gloomy, and behind them as well. At whatever point they actually found themselves, however, they were in the equivalent of cool

sunlight. The rooms, too, would light as the doors opened. And each time, Bander moved its hand slowly and gracefully.

There seemed no end to the journey. Now and then they found themselves curving in a way that made it plain that the underground mansion spread out in two dimensions. (No, three, thought Trevize, at one point, as they moved steadily down a shallow declivity.)

Wherever they went, there were robots, by the dozens--scores-hundreds -engaged in unhurried work whose nature Trevize could not easily divine. They passed the open door of one large room in which rows of robots were bent quietly over desks.

Pelorat asked, "What are they doing, Bander?"

"Bookkeeping," said Bander. "Keeping statistical records, financial accounts, and all sorts of things that, I am very glad to say, I don't have to bother with. This isn't just an idle estate. About a quarter of its growing area is given over to orchards. An additional tenth are grain fields, but it's the orchards that are really my pride. We grow the best fruit in the world and grow them in the largest number of varieties, too. A Bander peach is the peach on Solaria. Hardly anyone else even bothers to grow peaches. We have twenty-seven varieties of apples and-and so on. The robots could give you full information."

"What do you do with all the fruit?" asked Trevize. "You can't eat it all yourself."

"I wouldn't dream of it. I'm only moderately fond of fruit. It's traded to the other estates."

"Traded for what?"

"Mineral material mostly. I have no mines worth mentioning on my estates. Then, too, I trade for whatever is required to maintain a healthy ecological balance. I have a very large variety of plant and animal life on the estate."

"The robots take care of all that, I suppose," said Trevize.

"They do. And very well, too."

"All for one Solarian."

"All for the estate and its ecological standards. I happen to be the only Solarian who visits the various parts of the estate-when I choose-but that is part of my absolute freedom."

Pelorat said, "I suppose the others-the other Solarians-also maintain a local ecological balance and have marshlands, perhaps, or mountainous areas or seafront estates."

Bander said, "I suppose so. Such things occupy us in the conferences that world affairs sometimes make necessary."

"How often do you have to get together?" asked Trevize. (They were going through a rather narrow passageway, quite long, and with no rooms on either side. Trevize guessed that it might have been built through an area that did not easily allow anything wider to be constructed, so that it served as a connecting link between two wings that could each spread out more widely.)

"Too often. It's a rare month when I don't have to pass some time in conference with one of the committees I am a member of. Still, although I may not have mountains or

marshlands on my estate, my orchards, my fishponds, and my botanical gardens are the best in the world."

Pelorat said, "But, my dear fellow-I mean, Bander-I would assume you have never left your estate and visited those of others-"

"Certainly nor, " said Bander, with an air of outrage.

"I said I assumed that," said Pelorat mildly. "But in that case, how can you be certain that yours are best, never having investigated, or even seen the others?"

"Because," said Bander, "I can tell from the demand for my products in interstate trade."

Trevize said, "What about manufacturing?"

Bander said, "There are estates where they manufacture tools and machinery. As I said, on my estate we make the heat-conducting rods, but those are rather simple."

"And robots?"

"Robots are manufactured here and there. Throughout history, Solaria has led all the Galaxy in the cleverness and subtlety of robot design."

"Today also, I imagine," said Trevize, carefully having the intonation make the remark a statement and not a question.

Bander said, "Today? With whom is there to compete today? Only Solaria makes robots nowadays. Your worlds do not, if I interpret what I hear on the hyperwave correctly."

"But the other Spacer worlds?"

"I told you. They no longer exist."

"At all?"

"I don't think there is a Spacer alive anywhere but on Solaria."

"Then is there no one who knows the location of Earth?"

"Why would anyone want to know the location of Earth?"

Pelorat broke in, "I want to know. It's my field of study."

"Then," said Bander, "you will have to study something else. I know nothing about the location of Earth, nor have I heard of anyone who ever did, nor do I care a sliver of robot-metal about the matter."

The car came to a halt, and, for a moment, Trevize thought that Bander was offended. The halt was a smooth one, however, and Bander, getting out of the car, looked its usual amused self as it motioned the others to get out also.

The lighting in the room they entered was subdued, even after Bander had brightened it with a gesture. It opened into a side corridor, on both sides of which were smaller rooms. In each one of the smaller rooms was one or two ornate vases, sometimes flanked by objects that might have been film projectors.

"What is all this, Bander?" asked Trevize.

Bander said, "The ancestral death chambers, Trevize."

50.

PELORAT looked about with interest. "I suppose you have the ashes of your ancestors interred here?"

"If you mean by 'interred,'" said Bander, "buried in the ground, you are not quite right. We may be underground, but this is my mansion, and the ashes are in it, as we are right now. In our own language we say that the ashes are 'inhoused.'" It hesitated, then said, "'House' is an archaic word for 'mansion.'" "

Trevize looked about him perfunctorily. "And these are all your ancestors? How many?"

"Nearly a hundred," said Bander, making no effort to hide the pride in its voice. "Ninety-four, to be exact. Of course, the earliest are not true Solarians -not in the present sense of the word. They were half-people, masculine and feminine. Such half-ancestors were placed in adjoining urns by their immediate descendants. I don't go into those rooms, of course. It's rather 'shamiferous.' At least, that's the Solarian word for it; but I don't know your Galactic equivalent. You may not have one."

"And the films?" asked Bliss. "I take it those are film projectors?"

"Diaries," said Bander, "the history of their lives. Scenes of themselves in their favorite parts of the estate. It means they do not die in every sense. Part of them remains, and it is part of my freedom that I can join them whenever I choose; I can watch this bit of film or that, as I please."

"But not into the--shamiferous ones."

Bander's eyes slithered away. "No," it admitted, "but then we all have that as part of the ancestry. It is a common wretchedness."

"Common? Then other Solarians also have these death chambers?" asked Trevize.

"Oh yes, we all do, but mine is the best, the most elaborate, the most perfectly preserved."

Trevize said, "Do you have your own death chamber already prepared?"

"Certainly. It is completely constructed and appointed. That was done as my first duty when I inherited the estate. And when I am laid to ash-to be poetic-my successor will go about the construction of its own as its first duty."

"And do you have a successor?"

"I will have when the time comes. There is as yet ample scope for life. When I must leave, there will be an adult successor, ripe enough to enjoy the estate, and well lobed for power-transduction."

"It will be your offspring, I imagine."

..Oh yes."

"But what if," said Trevize, "something untoward takes place? I presume accidents and misfortunes take place even on Solaria. What happens if a Solarian is laid to ash prematurely and it has no successor to take its place, or at least not one who is ripe enough to enjoy the estate?"

"That rarely happens. In my line of ancestors, that happened only once. When it does, however, one need only remember that there are other successors waiting for other estates. Some of those are old enough to inherit, and yet have parents who are young enough to produce a second descendant and to live on till that second descendant is ripe enough for the succession. One of these old/young successors, as they are called, would be assigned to the succession of my estate."

"Who does the assigning?"

"We have a ruling board that has this as one of its few functions-the assignment of a successor in case of premature aching. It is all done by holovision, of course."

Pelorat said, "Hut see here, if Solarians never see each other, how would anyone know that some Solarian somewhere has unexpectedly-or expectedly, for that matter-been laid to ash."

Bander said, "When one of us is laid to ash, all power at the estate ceases. If no successor takes over at once, the abnormal situation is eventually noticed and corrective measures are taken. I assure you that our social system works smoothly."

Trevize said, "Would it be possible to view some of these films you have here?"

Bander froze. Then it said, "It is only your ignorance that excuses you. What you have said is crude and obscene."

"I apologize for that," said Trevize. "I do not wish to intrude on you, but we've already explained that we are very interested in obtaining information on Earth. It occurs to me that the earliest films you have would date back to a time before Earth was radioactive. Earth might therefore be mentioned. There might be details given about it. We certainly do not wish to intrude on your privacy, but would there be any way in which you yourself could explore those films, or have a robot do so, perhaps, and then allow any relevant information to be passed on to us? Of course, if you can respect our motives and understand that we will try our best to respect your feelings in return, you might allow us to do the viewing ourselves."

Bander said frigidly, "I imagine you have no way of knowing that you are becoming more and more offensive. However, we can end all this at once, for I can tell you that there are no films accompanying my early half-human ancestors."

"None?" Trevize's disappointment was heart-felt.

"They existed once. But even you can imagine what might have been on them. Two half-humans showing interest in each other or, even," Bander cleared its throat, and said, with an effort, "interacting. Naturally, all halfhuman films were destroyed many generations ago."

"What about the records of other Solarians?"

"All destroyed."

"Can you be sure?"

"It would be mad not to destroy them."

"It might be that some Solarians were mad, or sentimental, or forgetful. We presume you will not object to directing us to neighboring estates."

Bander looked at Trevize in surprise. "Do you suppose others will be as tolerant of you as I have been?"

"Why not, Bander?"

"You'll find they won't be."

"It's a chance we'll have to take."

"No, Trevize. No, any of you. Listen to me."

There were robots in the background, and Bander was frowning.

"What is it, Bander?" said Trevize, suddenly uneasy.

Bander said, "I have enjoyed speaking to all of you, and observing you in all your strangeness. It was a unique experience, which I have been delighted with, but I cannot record it in my diary, nor memorialize it in film."

"Why not?"

"My speaking to you; my listening to you; my bringing you into my mansion; my bringing you here into the ancestral death chambers; are shameful acts."

"We are not Solarians. We matter to you as little as these robots do, do we not?"

"I excuse the matter to myself in that way. It may not serve as an excuse to others."

"What do you care? You have absolute liberty to do as you choose, don't you?"

"Even as we are, freedom is not truly absolute. If I were the only Solarian on the planet, I could do even shameful things in absolute freedom. But there are other Solarians on the planet, and, because of that, ideal freedom, though approached, is not actually reached. There are twelve hundred Solarians on the planet who would despise me if they knew what I had done."

"There is no reason they need know about it."

"That is true. I have been aware of that since you've arrived. I've been aware of it all this time that I've been amusing myself with you. The others must not find out."

Pelorat said, "If that means you fear complications as a result of our visits to other estates in search of information about Earth, why, naturally, we will mention nothing of having visited you first. That is clearly understood."

Bander shook its head. "I have taken enough chances. I will not speak of this, of course. My robots will not speak of this, and will even be instructed not to remember it. Your ship will be taken underground and explores for what information it can give us--"

"Wait," said Trevize, "how long do you suppose we can wait here while you inspect our ship? That is impossible."

"Not at all impossible, for you will have nothing to say about it. I am sorry. I would like to speak to you longer and to discuss many other things with you, but you see the matter grows more dangerous."

"No, it does not," said Trevize emphatically.

"Yes, it does, little half-human. I'm afraid the time has come when I must do what my ancestors would have done at once. I must kill you, all three."

12. TO THE SURFACE

51.

TREVIZE turned his head at once to look at Bliss. Her face was expressionless, but taut, and her eyes were fixed on Bander with an intensity that made her seem oblivious to all else.

Pelorat's eyes were wide, disbelieving.

Trevize, not knowing what Bliss would-or could-do, struggled to fight down an overwhelming sense of loss (not so much at the thought of dying, as of dying without knowing where Earth was, without knowing why he had chosen Gaia as humanity's future). He had to play for time.

He said, striving to keep his voice steady, and his words clear, "You have shown yourself a courteous and gentle Solarian, Bander. You have not grown angry at our intrusion into your world. You have been kind enough to show us over your estate and mansion, and you have answered our questions. It would suit your character better to allow us to leave now. No one need ever know we were on this world and we would have no cause to return. We arrived in all innocence, seeking merely information."

"What you say is so," said Bander lightly, "and, so far, I have given you life. Your lives were forfeit the instant you entered our atmosphere. What I might have done-and should have done-on making close contact with you, would be to have killed you at once. I should then have ordered the appropriate robot to dissect your bodies for what information on Outworlders that might yield me.

"I have not done that. I have pampered my own curiosity and given in to my own easygoing nature, but it is enough. I can do it no longer. I have, in fact, already compromised the safety of Solaria, for if, through some weakness, I were to let myself be persuaded to let you go, others of your kind would surely follow, however much you might promise that they would not.

"There is, however, at least this. Your death will be painless. I will merely heat your brains mildly and drive them into inactivation. You will experience no pain. Life will merely cease. Eventually, when dissection and study are over, I will convert you to ashes in an intense flash of heat and all will be over."

Trevize said, "If we must die, then I cannot argue against a quick painless death, but why must we die at all, having given no offense?"

"Your arrival was an offense."

"Not on any rational ground, since we could not know it was an offense. "

"Society defines what constitutes an offense. To you, it may seem irrational and arbitrary, but to us it is not, and this is our world on which we have the full right to say that in this and that, you have done wrong and deserve to die. "

Bander smiled as though it were merely making pleasant conversation and went on, "Nor have you any right to complain on the ground of your own superior virtue. You have a blaster which uses a beam of microwaves to induce intense killing heat. It does what I intend to do, but does it, I am sure, much more crudely and painfully. You would have no hesitation in using it on me right now, had I not drained its energy, and if I were to be so foolish as to allow you the freedom of movement that would enable you to remove the weapon from its holster."

Trevize said despairingly, afraid even to glance again at Bliss, lest Bander's attention be diverted to her, "I ask you, as an act of mercy, not to do this."

Bandar said, turning suddenly grim, "I must first be merciful to myself and to my world, and to do that, you must die."

He raised his hand and instantly darkness descended upon Trevize.

52.

For a moment, Trevize felt the darkness choking him and thought wildly, Is this death?

And as though his thoughts had given rise to an echo, he heard a whispered, "Is this death?" It was Pelorat's voice.

Trevize tried to whisper, and found he could. "Why ask?" he said, with a sense of vast relief. "The mere fact that you can ask shows it is not death."

"Mere are old legends that there is life after death."

"Nonsense," muttered Trevize. "Bliss? Are you here, Bliss?"

There was no answer to that.

Again Pelorat echoed, "Bliss? Bliss? What happened, Golan?"

Trevize said, "Bender must be dead. He would, in that case, be unable to supply the power for his estate. The lights would go out."

"But how could? You mean Bliss did it?"

"I suppose so. I hope she did not come to harm in the process." He was on his hands and knees crawling about in the total darkness of the underground (if one did not count the occasional subvisible flashing of a radioactive atom breaking down in the walls).

Then his hand came on something warm and soft. He felt along it and recognized a leg, which he seized. It was clearly too small to be Bander's. "Bliss?"

The leg kicked out, forcing Trevize to let go.

He said, "Bliss? Say something!"

"I am alive," came Bliss's voice, curiously distorted.

Trevize said, "But are you well?"

"No." And, with that, light returned to their surroundings-weakly. The walls gleamed faintly, brightening and dimming erratically.

Bander lay crumpled in a shadowy heap. At its side, holding its head, was Bliss.

She looked up at Trevize and Pelorat. "The Solarian is dead," she said, and her cheeks glistened with tears in the weak light.

Trevize was dumbfounded. "Why are you crying?"

"Should I not cry at having killed a living thing of thought and intelligence? That was not my intention."

Trevize leaned down to help her to her feet, but she pushed him away.

Pelorat knelt in his turn, saying softly, "Please, Bliss, even you can't bring it back to life. Tell us what happened."

She allowed herself to be pulled upward and said dully, "Gaia can do what Bander could do. Gaia can make use of the unevenly distributed energy of the Universe and translate it into chosen work by mental power alone."

"I knew that," said Trevize, attempting to be soothing without quite knowing how to go about it. "I remember well our meeting in space when you-or Gaia, rather-held our spaceship captive. I thought of that when Bander held me captive after it had taken my weapons. It held you captive, too, but I was confident you could have broken free if you had wished."

"No. I would have failed if I had tried. When your ship was in my/our/ Gaia's grip," she said sadly, "I and Gaia were truly one. Now there is a hyperspatial separation that limits my/our/Gaia's efficiency. Besides, Gaia does what it does by the sheer power of massed brains. Even so, all those brains together lack the transducer-lobes this one Solarian has. We cannot make use of energy as delicately, as efficiently, as tirelessly as he could. -You see that I cannot make the lights gleam more brightly, and I don't know how long I can make them gleam at all before tiring. Bander could supply the power for an entire vast estate, even when it was sleeping."

"But you stopped it," said Trevize.

"Because it didn't suspect my powers," said Bliss, "and because I did nothing that would give it evidence of them. It was therefore without suspicion of me and gave me none of its attention. It concentrated entirely on you, Trevize, because it was you who bore the weapons-again, how well it has served that you armed yourself-and I had to wait my chance to stop Hander with one quick and unexpected blow. When it was on the point of killing us, when its whole mind was concentrated on that, and on you, I was able to strike."

"And it worked beautifully."

"How can you say something so cruel, Trevize? It was only my intention to stop it. I merely wished to block its use of its transducer. In the moment of surprise when it tried to blast us and found it could not, but found, instead, that the very illumination about us was fading into darkness, I would tighten my grip and send it into a prolonged normal sleep and release the transducer. The power would then remain on, and we could get out of this mansion, into our ship, and leave the planet. I hoped to so arrange things that, when Bander finally woke, it would have forgotten all that had happened from the instant of its sighting us. Gaia has no desire to kill in order to accomplish what can be brought about without killing."

"What went wrong, Bliss?" said Pelorat softly.

"I had never encountered any such thing as those transducer-lobes and I lacked any time to work with them and learn about them. I merely struck out forcefully with my blocking maneuver and, apparently, it didn't work correctly. It was not the entry of energy into the lobes that was blocked, but the exit of that energy. Energy is always pouring into those lobes at a reckless rate but, ordinarily, the brain safeguards itself by pouring out that energy just as quickly. Once I blocked the exit, however, energy piled up within the lobes at once and, in a tiny fraction of a second, the temperature had risen to the point where the brain protein inactivated explosively and it was dead. The lights went out and I removed my block immediately, but, of course, it was too late."

"I don't see that you could have done anything other than that which you did, dear," said Pelorat.

"Of what comfort is that, considering that I have killed."

"Bander was on the point of killing us," said Trevize.

"That was cause for stopping it, not for killing it."

Trevize hesitated. He did not wish to show the impatience he felt for he was unwilling to offend or further upset Bliss, who was, after all, their only defense against a supremely hostile world.

He said, "Bliss, it is time to look beyond Bander's death. Because it is dead, all power on the estate is blanked out. This will be noticed, sooner or later, probably sooner, by other Solarians. They will be forced to investigate. I don't think you will be able to hold off the perhaps combined attack of several. And, as you have admitted yourself, you won't be able to supply for very long the limited power you are managing to supply now. It is important, therefore, that we get back to the surface, and to our ship, without delay."

"But, Golan," said Pelorat, "how do we do that? We came for many kilometers along a winding path. I imagine it's quite a maze down here and, for myself, I haven't the faintest idea of where to go to reach the surface. I've always had a poor sense of direction."

Trevize, looking about, realized that Pelorat was correct. He said, "I imagine there are many openings to the surface, and we needn't find the one we entered."

"But we don't know where any of the openings are. How do we find them?"

Trevize turned again to Bliss. "Can you detect anything, mentally, that will help us find our way out?"

Bliss said, "The robots on this estate are all inactive. I can detect a thin whisper of subintelligent life straight up, but all that tells us is that the surface is straight up, which we know."

"Well, then," said Trevize, "we'll just have to look for some opening."

"Hit-and-miss," said Pelorat, appalled. "We'll never succeed."

"We might, Janov," said Trevize. "If we search, there will be a chance, however small. The alternative is simply to stay here, and if we do that then we will never succeed. Come, a small chance is better than none."

"Wait," said Bliss. "I do sense something."

"What?" said Trevize.

"A mind."

"Intelligence?"

"Yes, but limited, I think. What reaches me most clearly, though, is something else."

"What?" said Trevize, again fighting impatience.

"Fright! Intolerable fright!" said Bliss, in a whisper.

53.

TREVIZE looked about ruefully. He knew where they had entered but he had no illusion on the score of being able to retrace the path by which they had come. He had, after all, paid little attention to the turnings and windings. Who would have thought they'd be in the position of having to retrace the route alone and without help, and with only a flickering, dim light to be guided by?

He said, "Do you think you can activate the car, Bliss?"

Bliss said, "I'm sure I could, Trevize, but that doesn't mean I can run it."

Pelorat said, "I think that Bander ran it mentally. I didn't see it touch anything when it was moving."

Bliss said gently, "Yes, it did it mentally, Pel, but how, mentally? You might as well say that it did it by using the controls. Certainly, but if I don't know the details of using the controls, that doesn't help, does it?"

"You might try," said Trevize.

"If I try, I'll have to put my whole mind to it, and if I do that, then I doubt that I'll be able to keep the lights on. The car will do us no good in the dark even if I learn how to control it."

"Then we must wander about on foot, I suppose?"

"I'm afraid so."

Trevize peered at the thick and gloomy darkness that lay beyond the dim light in their immediate neighborhood. He saw nothing, heard nothing.

He said, "Bliss, do you still sense this frightened mind?"

"Yes, I do."

"Can you tell where it is? Can you guide us to it?"

"The mental sense is a straight line. It is not refracted sensibly by ordinary matter, so I can tell it is coming from that direction."

She pointed to a spot on the dusky wall, and said, "But we can't walk through the wall to it. The best we can do is follow the corridors and try to find our way in whatever direction will keep the sensation growing stronger. In short, we will have to play the game of hot-and-cold."

"Then let's start right now."

Pelorat hung back. "Wait, Golan; are we sure we want to find this thing, whatever it is? If it is frightened, it may be that we will have reason to be frightened, too."

Trevize shook his head impatiently. "We have no choice, Janov. It's a mind, frightened or not, and it may be willing to-or may be made to-direct us to the surface."

"And do we just leave Bander lying here?" said Pelorat uneasily.

Trevize took his elbow. "Come, Janov. We have no choice in that, either. Eventually some Solarian will reactivate the place, and a robot will find Bander and take care of it-I hope not before we are safely away."

He allowed Bliss to lead the way. The light was always strongest in her immediate neighborhood and she paused at each doorway, at each fork in the corridor, trying to sense the direction from which the fright came. Sometimes she would walk through a door, or move around a curve, then come back and try an alternate path, while Trevize watched helplessly.

Each time Bliss came to a decision and moved firmly in a particular direction, the light came on ahead of her. Trevize noticed that it seemed a bit brighter now-either because his eyes were adapting to the dimness, or because Bliss was learning how to handle the transduction more efficiently. At one point, when she passed one of the metal rods that were inserted into the ground, she put her hand on it and the lights brightened noticeably. She nodded her head as though she were pleased with herself.

Nothing looked in the least familiar; it seemed certain they were wandering through portions of the rambling underground mansion they had not passed through on the way in.

Trevize kept looking for corridors that led upward sharply, and he varied that by studying the ceilings for any sign of a trapdoor. Nothing of the sort appeared, and the frightened mind remained their only chance of getting out.

They walked through silence, except for the sound of their own steps; through darkness, except for the light in their immediate vicinity; through death, except for their own lives. Occasionally, they made out the shadowy bulk of a robot, sitting or standing in the dusk, with no motion. Once they saw a robot lying on its side, with legs and arms in queer frozen positions. It had been caught off-balance, Trevize thought, at the moment when power had been turned off, and it had fallen. Bander, either alive or dead, could not affect the force of gravity. Perhaps all over the vast Bander estate, robots were standing and lying inactive and it would be that that would quickly be noted at the borders.

Or perhaps not, he thought suddenly. Solarians would know when one of their number would be dying of old age and physical decay. The world would be alerted and ready. Bander, however, had died suddenly, without possible foreknowledge, in the prime of its existence. Who would know? Who would expect? Who would be watching for inactivation?

But no (and Trevize thrust back optimism and consolation as dangerous lures into overconfidence). The Solarians would note the cessation of all activity on the Bander

estate and take action at once. They all had too great an interest in the succession to estates to leave death to itself.

Pelorat murmured unhappily, "Ventilation has stopped. A place like this, underground, must be ventilated, and Bander supplied the power. Now it has stopped."

"It doesn't matter, Janov," said Trevize. "We've got enough air down in this empty underground place to last us for years."

"It's close just the same. It's psychologically bad."

"Please, Janov, don't get claustrophobic. -Bliss, are we any closer?"

"Much, Trevize," she replied. "The sensation is stronger and I am clearer as to its location."

She was stepping forward more surely, hesitating less at points of choice of direction.

"There! There!" she said. "I can sense it intensely."

Trevize said dryly, "Even I can hear it now."

All three stopped and, automatically, held their breaths. They could hear a soft moaning, interspersed with gasping sobs.

They walked into a large room and, as the lights went on, they saw that, unlike all those they had hitherto seen, it was rich and colorful in furnishings.

In the center of the room was a robot, stooping slightly, its arms stretched out in what seemed an almost affectionate gesture and, of course, it was absolutely motionless.

Behind the robot was a flutter of garments. A round frightened eye edged to one side of it, and there was still the sound of a brokenhearted sobbing.

Trevize darted around the robot and, from the other side, a small figure shot out, shrieking. It stumbled, fell to the ground, and lay there, covering its eyes, kicking its legs in all directions, as though to ward off some threat from whatever angle it might approach, and shrieking, shrieking-Bliss said, quite unnecessarily, "It's a child!"

54.

TREVIZE drew back, puzzled. What was a child doing here? Bander had been so proud of its absolute solitude, so insistent upon it.

Pelorat, less apt to fall back on iron reasoning in the face of an obscure event, seized upon the solution at once, and said, "I suppose this is the successor."

"Bander's child," said Bliss, agreeing, "but too young, I think, to be a successor. The Solarians will have to find one elsewhere."

She was gazing at the child, not in a fixed glare, but in a soft, mesmerizing way, and slowly the noise the child was making lessened. It opened its eyes and looked at Bliss in return. Its outcry was reduced to an occasional soft whimper.

Bliss made sounds of her own, now, soothing ones, broken words that made little sense in themselves but were meant only to reinforce the calming effect of her thoughts.

It was as though she were mentally fingering the child's unfamiliar mind and seeking to even out its disheveled emotions.

Slowly, never taking its eyes off Bliss, the child got to its feet, stood there swaying a moment, then made a dash for the silent, frozen robot. It threw its arms about the sturdy robotic leg as though avid for the security of its touch.

Trevize said, "I suppose that the robot is its-nursemaid-or caretaker. I suppose a Solarian can't care for another Solarian, not even a parent for a child."

Pelorat said, "And I suppose the child is hermaphroditic."

"It would have to be," said Trevize.

Bliss, still entirely preoccupied with the child, was approaching it slowly, hands held half upward, palms toward herself, as though emphasizing that there was no intention of seizing the small creature. The child was now silent, watching the approach, and holding on the more tightly to the robot.

Bliss said, "There, child-warm, child-soft, warm, comfortable, safe, child--safe-safe."

She stopped and, without looking round, said in a low voice, "Pel, speak to it in its language. Tell it we're robots come to take care of it because the power failed."

"Robots!" said Pelorat, shocked.

"We must be presented as robots. It's not afraid of robots. And it's never seen a human being, maybe can't even conceive of them."

Pelorat said, "I don't know if I can think of the right expression. I don't know the archaic word for 'robot.' "

"Say 'robot,' then, Pel. If that doesn't work, say 'iron thing.' Say whatever you can."

Slowly, word by word, Pelorat spoke archaically. The child looked at him, frowning intensely, as though trying to understand.

Trevize said, "You might as well ask it how to get out, while you're at it."

Bliss said, "No. Not yet. Confidence first, then information."

The child, looking now at Pelorat, slowly released its hold on the robot and spoke in a high-pitched musical voice.

Pelorat said anxiously, "It's speaking too quickly for me."

Bliss said, "Ask it to repeat more slowly. I'm doing my best to calm it and remove its fears."

Pelorat, listening again to the child, said, "I think it's asking what made Jemby stop. Jemby must be the robot."

"Check and make sure, Pel."

Pelorat spoke, then listened, and said, "Yes, Jemby is the robot. The child calls itself Fallom."

"Good!" Bliss smiled at the child, a luminous, happy smile, pointed to it, and said, "Fallom. Good Fallom. Brave Fallom." She placed a hand on her chest and said, "Bliss."

The child smiled. It looked very attractive when it smiled. "Bliss," it said, hissing the "s" a bit imperfectly.

Trevize said, "Bliss, if you can activate the robot, Jemby, it might be able to tell us what we want to know. Pelorat can speak to it as easily as to the child."

"No," said Bliss. "That would be wrong. The robot's first duty is to protect the child. If it is activated and instantly becomes aware of us, aware of strange human beings, it may as instantly attack us. No strange human beings belong here. If I am then forced to inactivate it, it can give us no information, and the child, faced with a second inactivation of the only parent it knows-Well, I just won't do it."

"But we were told," said Pelorat mildly, "that robots can't harm human beings."

"So we were," said Bliss, "but we were not told what kind of robots these Solarians have designed. And even if this robot were designed to do no harm, it would have to make a choice between its child, or the nearest thing to a child it can have, and three objects whom it might not even recognize as human beings, merely as illegal intruders. Naturally, it would choose the child and attack us."

She turned to the child again. "Fallow," she said, "Bliss." She pointed, "Pel-Trev."

"Pel. Trev," said the child obediently.

She came closer to the child, her hands reaching toward it slowly. It watched her, then took a step backward.

"Calm, Fallom," said Bliss. "Good, Fallom. Touch, Fallom. Nice, Fallom."

It took a step toward her, and Bliss sighed. "Good, Fallom."

She touched Fallom's bare arm, for it wore, as its parent had, only a long robe, open in front, and with a loincloth beneath. The touch was gentle. She removed her arm, waited, and made contact again, stroking softly.

The child's eyes half-closed under the strong, calming effect of Bliss's mind.

Bliss's hands moved up slowly, softly, scarcely touching, to the child's shoulders, its neck, its ears, then under its long brown hair to a point just above and behind its ears.

Her hands dropped away then, and she said, "The transducer-lobes are still small. The cranial bone hasn't developed yet. There's just a tough layer of skin there, which will eventually expand outward and be fenced in with bone after the lobes have fully grown. - Which means it can't, at the present time, control the estate or even activate its own personal robot. -Ask it how old it is, Pel."

Pelorat said, after an exchange, "It's fourteen years old, if I understand it rightly."

Trevize said, "It looks more like eleven."

Bliss said, "The length of the years used on this world may not correspond closely to Standard Galactic Years. Besides, Spacers are supposed to have extended lifetimes and, if the Solarians are like the other Spacers in this, they may also have extended developmental periods. We can't go by years, after all."

Trevize said, with an impatient click of his tongue, "Enough anthropology. We must get to the surface and since we are dealing with a child, we may be wasting our time uselessly. It may not know the route to the surface. It may not ever have been on the surface."

Bliss said, "Pel!"

Pelorat knew what she meant and there followed the longest conversation he had yet had with Fallom.

Finally, he said, "The child knows what the sun is. It says it's seen it. I think it's seen trees. It didn't act as though it were sure what the word meant -or at least what the word I used meant-"

"Yes, Janov," said Trevize, "but do get to the point."

"I told Fallom that if it could get us out to the surface, that might make it possible for us to activate the robot. Actually, I said we would activate the robot. Do you suppose we might?"

Trevize said, "We'll worry about that later. Did it say it would guide us?"

"Yes. I thought the child would be more anxious to do it, you see, if I made that promise. I suppose we're running the risk of disappointing it-"

"Come," said Trevize, "let's get started. All this will be academic if we are caught underground."

Pelorat said something to the child, who began to walk, then stopped and looked back at Bliss.

Bliss held out her hand and the two then walked hand in hand.

"I'm the new robot," she said, smiling slightly.

"It seems reasonably happy over that," said Trevize.

Fallom skipped along and, briefly, Trevize wondered if it were happy simply because Bliss had labored to make it so, or if, added to that, there was the excitement of visiting the surface and of having three new robots, or whether it was excitement at the thought of having its Jemby foster-parent back. Not that it mattered-as long as the child led them.

There seemed no hesitation in the child's progress. It turned without pause whenever there was a choice of paths. Did it really know where it was going, or was it all simply a matter of a child's indifference? Was it simply playing a game with no clear end in sight?

But Trevize was aware, from the slight burden on his progress, that he was moving uphill, and the child, bouncing self-importantly forward, was pointing ahead and chattering.

Trevize looked at Pelorat, who cleared his throat and said, "I think what it's saying is 'doorway.'"

"I hope your thought is correct," said Trevize.

The child broke away from Bliss, and was running now. It pointed to a portion of the flooring that seemed darker than the sections immediately neighboring it. The child stepped on it, jumping up and down a few times, and then turned with a clear expression of dismay, and spoke with shrill volubility.

Bliss said, with a grimace, "I'll have to supply the power. -This is wearing me out."

Her face reddened a bit and the lights dimmed, but a door opened just ahead of Fallom, who laughed in soprano delight.

The child ran out the door and the two men followed. Bliss came last, and looked back as the lights just inside darkened and the door closed. She then paused to catch her breath, looking rather worn out.

"Well," said Pelorat, "we're out. Where's the ship?"

All of them stood bathed in the still luminous twilight.

Trevize muttered, "It seems to me that it was in that direction."

"It seems so to me, too," said Bliss. "Let's walk," and she held out her hand to Fallom.

There was no sound except those produced by the wind and by the motions and calls of living animals. At one point they passed a robot standing motionless near the base of a tree, holding some object of uncertain purpose.

Pelorat took a step toward it out of apparent curiosity, but Trevize said, "Not our business, Janov. Move on."

They passed another robot, at a greater distance, who had tumbled.

Trevize said, "There are robots littered over many kilometers in all directions, I suppose." And then, triumphantly, "Ah, there's the ship."

They hastened their steps now, then stopped suddenly. Fallom raised its voice in an excited squeak.

On the ground near the ship was what appeared to be an air-vessel of primitive design, with a rotor that looked energy-wasteful, and fragile besides. Standing next to the air-vessel, and between the little party of Outworlders and their ship, stood four human figures.

"Too late," said Trevize. "We wasted too much time. Now what?"

Pelorat said wonderingly, "Four Solarians? It can't be. Surely they wouldn't come into physical contact like that. Do you suppose those are holoimages?"

"They are thoroughly material," said Bliss. "I'm sure of that. They're not Solarians either. There's no mistaking the minds. They're robots."

55.

"WELL, THEN," said Trevize wearily, "onward!" He resumed his walk toward the ship at a calm pace and the others followed.

Pelorat said, rather breathlessly, "What do you intend to do?"

"If they're robots, they've got to obey orders."

The robots were awaiting them, and Trevize watched them narrowly as they came closer.

Yes, they must be robots. Their faces, which looked as though they were made of skin underlain with flesh, were curiously expressionless. They were dressed in uniforms that exposed no square centimeter of skin outside the face. Even the hands were covered by thin, opaque gloves.

Trevize gestured casually, in a fashion that was unquestionably a brusque request that they step aside.

The robots did not move.

In a low voice, Trevize said to Pelorat, "put it into words, Janov. Be firm."

Pelorat cleared his throat and, putting an unaccustomed baritone into his voice, spoke slowly, gesturing them aside much as Trevize had done. At that, one of the robots, who was perhaps a shade taller than the rest, said something in a cold and incisive voice.

Pelorat turned to Trevize. "I think he said we were Outworlders."

"Tell him we are human beings and must be obeyed."

The robot spoke then, in peculiar but understandable Galactic. "I understand you, Outworlder. I speak Galactic. We are Guardian Robots."

"Then you have heard me say that we are human beings and that you must therefore obey us."

"We are programmed to obey Rulers only, Outworlder. You are not Rulers and not Solarian. Ruler Bander has not responded to the normal moment of Contact and we have come to investigate at close quarters. It is our duty to do so. We find a spaceship not of Solarian manufacture, several Outworlders present, and all Bander robots inactivated. Where is Ruler Bander?"

Trevize shook his head and said slowly and distinctly, "We know nothing of what you say. Our ship's computer is not working well. We found ourselves near this strange planet against our intentions. We landed to find our location. We found all robots inactivated. We know nothing of what might have happened."

"That is not a credible account. If all robots on the estate are inactivated and all power is off, Ruler Bander must be dead. It is not logical to suppose that by coincidence it died just as you landed. There must be some sort of causal connection."

Trevize said, with no set purpose but to confuse the issue and to indicate his own foreigner's lack of understanding and, therefore, his innocence, "But the power is not off. You and the others are active."

The robot said, "We are Guardian Robots. We do not belong to any Ruler. We belong to all the world. We are not Ruler-controlled but are nuclearpowered. I ask again, where is Ruler Bander?"

Trevize looked about him. Pelorat appeared anxious; Bliss was tight-lipped but calm. Fallom was trembling, but Bliss's hand touched the child's shoulder and it stiffened somewhat and lost facial expression. (Was Bliss sedating it?)

The robot said, "Once again, and for the last time, where is Ruler Bander?"

"I do not know," said Trevize grimly.

The robot nodded and two of his companions left quickly. The robot said, "My fellow Guardians will search the mansion. Meanwhile, you will be held for questioning. Hand me those objects you wear at your side."

Trevize took a step backward. "They are harmless."

"Do not move again. I do not question their nature, whether harmful or harmless. I ask for them."

"No."

The robot took a quick step forward, and his arm flashed out too quickly for Trevize to realize what was happening. The robot's hand was on his shoulder; the grip tightened and pushed downward. Trevize went to his knees.

The robot said, "Those objects." It held out its other hand.

"No," gasped Trevize.

Bliss lunged forward, pulled the blaster out of its holster before Trevize, clamped in the robot's grip, could do anything to prevent her, and held it out toward the robot. "Here, Guardian," she said, "and if you'll give me a moment-here's the other. Now release my companion."

The robot, holding both weapons, stepped back, and Trevize rose slowly to his feet, rubbing his left shoulder vigorously, face wincing with pain.

(Fallow whimpered softly, and Pelorat picked it up in distraction, and held it tightly.)

Bliss said to Trevize, in a furious whisper, "Why are you fighting him? He can kill you with two fingers."

Trevize groaned and said, between gritted teeth, "Why don't you handle him.

"I'm trying to. It takes time. His mind is tight, intensely programmed, and leaves no handle. I must study it. You play for time."

"Don't study his mind. Just destroy it," said Trevize, almost soundlessly.

Bliss looked quickly toward the robot. It was studying the weapons intently, while the one other robot that still remained with it watched the Outworlders. Neither seemed interested in the whispering that was going on between Trevize and Bliss.

Bliss said, "No. No destruction. We killed one dog and hurt another on the first world. You know what happened on this world." (Another quick glance at the Guardian Robots.) "Gaia does not needlessly butcher life or intelligence. I need time to work it out peacefully."

She stepped back and stared at the robot fixedly.

The robot said, "These are weapons."

"No," said Trevize.

"Yes," said Bliss, "but they are no longer useful. They are drained of energy."

"Is that indeed so? Why should you carry weapons that are drained of energy? Perhaps they are not drained." The robot held one of the weapons in its fist and placed its thumb accurately. "Is this the way it is activated?"

"Yes," said Bliss; "if you tighten the pressure, it would be activated, if it contained energy-but it does not."

"Is that certain?" The robot pointed the weapon at Trevize. "Do you still say that if I activate it now, it will not work?"

"It will not work," said Bliss.

Trevize was frozen in place and unable to articulate. He had tested the blaster after Hander had drained it and it was totally dead, but the robot was holding the neuronics whip. Trevize had not tested that.

If the whip contained even a small residue of energy, there would be enough for a stimulation of the pain nerves, and what Trevize would feel would make the grip of the robot's hand seem to have been a pat of affection.

When he had been at the Naval Academy, Trevize had been forced to take a mild neuronically induced whipblow, as all cadets had had to. That was just to know what it was like. Trevize felt no need to know anything more.

The robot activated the weapon and, for a moment, Trevize stiffened painfully-and then slowly relaxed. The whip, too, was thoroughly drained.

The robot stared at Trevize and then tossed both weapons to one side. "How do these come to be drained of energy?" it demanded. "If they are of no use, why do you carry them?"

Trevize said, "I am accustomed to the weight and carry them even when drained."

The robot said, "That does not make sense. You are all under custody. You will be held for further questioning, and, if the Rulers so decide, you will then be inactivated. - How does one open this ship? We must search it."

"It will do you no good," said Trevize. "You won't understand it."

"If not I, the Rulers will understand."

"They will not understand, either."

"Then you will explain so that they will understand."

"I will not."

"Then you will be inactivated."

"My inactivation will give you no explanation, and I think I will be inactivated even if I explain."

Bliss muttered, "Keep it up. I'm beginning to unravel the workings of its brain."

The robot ignored Bliss. (Did she see to that? thought Trevize, and hoped savagely that she had.)

Keeping its attention firmly on Trevize, the robot said, "If you make difficulties, then we will partially inactivate you. We will damage you and you will then tell us what we want to know."

Suddenly, Pelorat called out in a half-strangled cry. "Wait, you cannot do this. - Guardian, you cannot do this."

"I am under detailed instructions," said the robot quietly. "I can do this. Of course, I shall do as little damage as is consistent with obtaining information."

"But you cannot. Not at all. I am an Outworlder, and so are these two companions of mine. But this child," and Pelorat looked at Fallom, whom he was still carrying, "is a Solarian. It will tell you what to do and you must obey it."

Fallom looked at Pelorat with eyes that were open, but seemed empty.

Bliss shook her head, sharply, but Pelorat looked at her without any sign of understanding.

The robot's eyes rested briefly on Fallom. It said, "The child is of no importance. It does not have transducer-lobes."

"It does not yet have fully developed transducer-lobes," said Pelorat, panting, "but it will have them in time. It is a Solarian child."

"It is a child, but without fully developed transducer-lobes it is not a Solarian. I am not compelled to follow its orders or to keep it from harm."

"But it is the offspring of Ruler Bander."

"Is it? How do you come to know that?"

Pelorat stuttered, as he sometimes did when overearnest. "What other child would be on this estate?"

"How do you know there aren't a dozen?"

"Have you seen any others?"

"It is I who will ask the questions."

At this moment, the robot's attention shifted as the second robot touched its arm. The two robots who had been sent to the mansion were returning at a rapid run that, nevertheless, had a certain irregularity to it.

There was silence till they arrived and then one of them spoke in the Solarian language-at which all four of the robots seemed to lose their elasticity. For a moment, they appeared to wither, almost to deflate.

Pelorat said, "They've found Bander," before Trevize could wave him silent.

The robot turned slowly and said, in a voice that slurred the syllables, "Ruler Bander is dead. By the remark you have just made, you show us you were aware of the fact. How did that come to be?"

"How can I know?" said Trevize defiantly.

"You knew it was dead. You knew it was there to be found. How could you know that, unless you had been there-unless it was you that had ended the life?" The robot's enunciation was already improving. It had endured and was absorbing the shock.

Then Trevize said, "How could we have killed Bander? With its transducer-lobes it could have destroyed us in a moment."

"How do you know what, or what not, transducer-lobes could do?"

"You mentioned the transducer-lobes just now."

"I did no more than mention them. I did not describe their properties or abilities."

"The knowledge came to us in a dream."

"That is not a credible answer."

Trevize said, "To suppose that we have caused the death of Bander is not credible, either."

Pelorat added, "And in any case, if Ruler Bander is dead, then Ruler Fallom now controls this estate. Here the Ruler is, and it is it whom you must obey."

"I have already explained," said the robot, "that an offspring with undeveloped transducer-lobes is not a Solarian. It cannot be a Successor, therefore, Another Successor, of the appropriate age, will be flown in as soon as we report this sad news."

"What of Ruler Fallom?"

"There is no Ruler Fallom. There is only a child and we have an excess of children. It will be destroyed."

Bliss said forcefully, "You dare not. It is a child!"

"It is not I," said the robot, "who will necessarily do the act and it is certainly not I who will make the decision. That is for the consensus of the Rulers. In times of child-excess, however, I know well what the decision will in."

"No. I say no."

"It will be painless. -But another ship is coming. It is important that we go into what was the Bander mansion and set up a holovision Council that will supply a Successor and decide on what to do with you. -Give me the child."

Bliss snatched the semicomatose figure of Fallom from Pelorat. Holding it tightly and trying to balance its weight on her shoulder, she said, "Do not touch this child."

Once again, the robot's arm shot out swiftly and it stepped forward, reaching for Fallom. Bliss moved quickly to one side, beginning her motion well before the robot had begun its own. The robot continued to move forward, however, as though Bliss were still standing before it. Curving stiffly downward, with the forward tips of its feet as the pivot, it went down on its face. The other three stood motionless, eyes unfocused.

Bliss was sobbing, partly with rage. "I almost had the proper method of control, and it wouldn't give me the time. I had no choice but to strike and now all four are inactivated. -Let's get on the ship before the other ship lands. I am too ill to face additional robots, now."

PART FIVE - MELPOMENIA

13. AWAY FROM SOLARIA

56.

THE LEAVING was a blur. Trevize had gathered up his futile weapons, had opened the airlock, and they had tumbled in. Trevize didn't notice until they were off the surface that Fallom had been brought in as well.

They probably would not have made it in time if the Solarian use of airflight had not been so comparatively unsophisticated. It took the approaching Solarian vessel an unconscionable time to descend and land. On the other hand, it took virtually no time for the computer of the Far Star to take the gravitic ship vertically upward.

And although the cut-off of the gravitational interaction and, therefore, of inertia wiped out the otherwise unbearable effects of acceleration that would have accompanied so speedy a takeoff, it did not wipe out the effects of air resistance. The outer hull temperature rose at a distinctly more rapid rate than navy regulations (or ship specifications, for that matter) would have considered suitable.

As they rose, they could see the second Solarian ship land and several more approaching. Trevize wondered how many robots Bliss could have handled, and decided they would have been overwhelmed if they had remained on the surface fifteen minutes longer.

Once out in space (or space enough, with only tenuous wisps of the planetary exosphere around them), Trevize made for the night side of the planet. It was a hop away, since they had left the surface as sunset was approaching. In the dark, the Far Star would have a chance to cool more rapidly, and there the ship could continue to recede from the surface in a slow spiral.

Pelorat came out of the room he shared with Bliss. He said, "The child is sleeping normally now. We've showed it how to use the toilet and it had no trouble understanding."

"That's not surprising. It must have had similar facilities in the mansion."

"I didn't see any there and I was looking," said Pelorat feelingly. "We didn't get back on the ship a moment too soon for me."

"Or any of us. But why did we bring that child on board?"

Pelorat shrugged apologetically. "Bliss wouldn't let go. It was like saving a life in return for the one she took. She can't bear-

"I know," said Trevize.

Pelorat said, "It's a very oddly shaped child."

"Being hermaphroditic, it would have to be," said Trevize.

"It has testicles, you know."

"It could scarcely do without them."

"And what I can only describe as a very small vagina."

Trevize made a face. "Disgusting."

"Not really, Golan," said Pelorat, protesting. "It's adapted to its needs. It only delivers a fertilized egg-cell, or a very tiny embryo, which is then developed under laboratory conditions, tended, I dare say, by robots."

"And what happens if their robot-system breaks down? If that happens, they would no longer be able to produce viable young."

"Any world would be in serious trouble if its social structure broke down completely."

"Not that I would weep uncontrollably over the Solarians."

"Well," said Pelorat, "I admit it doesn't seem a very attractive world-to us, I mean. But that's only the people and the social structure, which are not our type at all, dear chap. But subtract the people and the robots, and you have a world which otherwise-

"Might fall apart as Aurora is beginning to do," said Trevize. "How's Bliss, Janov?"

"Worn out, I'm afraid. She's sleeping now. She had a very bad time, Golan."

"I didn't exactly enjoy myself either."

Trevize closed his eyes, and decided he could use some sleep himself and would indulge in that relief as soon as he was reasonably certain the Solarians had no space capability-and so far the computer had reported nothing of artifactitious nature in space.

He thought bitterly of the two Spacer planets they had visited-hostile wild dogs on one-hostile hermaphroditic loners on the other-and in neither place the tiniest hint as to the location of Earth. All they had to show for the double visit was Fallom.

He opened his eyes. Pelorat was still sitting in place at the other side of the computer, watching him solemnly.

Trevize said, with sudden conviction, "We should have left that Solarian child behind."

Pelorat said, "The poor thing. They would have killed it."

"Even so," said Trevize, "it belonged there. It's part of that society. Being put to death because of being superfluous is the sort of thing it's born to."

"Oh, my dear fellow, that's a hardhearted way to look at it."

"It's a rational way. We don't know how to care for it, and it may suffer more lingeringly with us and die anyway. What does it eat?"

"Whatever we do, I suppose, old man. Actually, the problem is what do we eat? How much do we have in the way of supplies?"

"Plenty. Plenty. Even allowing for our new passenger."

Pelorat didn't look overwhelmed with happiness at this remark. He said, "It's become a pretty monotonous diet. We should have taken some items on board on Comporellon-not that their cooking was excellent."

"We couldn't. We left, if you remember, rather hurriedly, as we left Aurora, and as we left, in particular, Solaria. -But what's a little monotony? It spoils one's pleasure, but it keeps one alive."

"Would it be possible to pick up fresh supplies if we need to?"

"Anytime, Janov. With a gravitic ship and hyperspatial engines, the Galaxy is a small place. In days, we can be anywhere. It's just that half the worlds in the Galaxy are alerted to watch for our ship and I would rather stay out of the way for a time."

": suppose that's so. -Bander didn't seem interested in the ship."

"It probably wasn't even consciously aware of it. I suspect that the Solarians long ago gave up space flight. Their prime desire is to be left completely alone and they can scarcely enjoy the security of isolation if they are forever moving about in space and advertising their presence."

"What are we going to do next, Golan?"

Trevize said, "We have a third world to visit."

Pelorat shook his head. "Judging from the first two, I don't expect much from that."

"Nor do I at the moment, but just as soon as I get a little sleep, I'm going to get the computer to plot our course to that third world."

57.

TREVIZE slept considerably longer than he had expected to, but that scarcely mattered. There was neither day nor night, in any natural -sense, on board ship, and the circadian rhythm never worked absolutely perfectly. The hours were what they were made to be, and it wasn't uncommon for Trevize and Pelorat (and particularly Bliss) to be somewhat out-of-sync as far as the natural rhythms of eating and sleeping were concerned.

Trevize even speculated, in the course of his scrapedown (the importance of conserving water made it advisable to scrape off the suds rather than rinse them off), about sleeping another hour or two, when he turned and found himself staring at Fallom, who was as undressed as he was.

He could not help jumping back, which, in the restricted area of the Personal, was bound to bring part of his body against something hard. He grunted-

Fallom was staring curiously at him and was pointing at Trevize's penis. What it said was incomprehensible but the whole bearing of the child seemed to bespeak a sense of disbelief. For his own peace of mind, Trevize had no choice but to put his hands over his penis.

Then Fallom said, in its high-pitched voice, "Greetings."

Trevize started slightly at the child's unexpected use of Galactic, but the word had the sound of having been memorized.

Fallom continued, a painstaking word at a time, "Bliss---say-you-wash -me.

"Yes?" said Trevize. He put his hands on Fallom's shoulders. "You-stay -here."

He pointed downward at the floor and Fallom, of course, looked instantly at the place to which the finger pointed. It showed no comprehension of the phrase at all.

"Don't move," said Trevize, holding the child tightly by both arms, pressing them toward the body as though to symbolize immobility. He hastily dried himself and put on his shorts, and over them his trousers.

He stepped out and roared, "Bliss!"

It was difficult for anyone to be more than four meters from any one else on the ship and Bliss came to the door of her room at once. She said, smiling, "Are you calling me, Trevize; or was that the soft breeze sighing through the waving grass?"

"Let's not be funny, Bliss. What is that?" He jerked his thumb over his shoulder.

Bliss looked past him and said, "Well, it looks like the young Solarian we brought on board yesterday."

"You brought on board. Why do you want me to wash it?"

"I should think you'd want to. It's a very bright creature. It's picking up Galactic words quickly. It never forgets once I explain something. Of course, I'm helping it do so."

"Naturally."

"Yes. I keep it calm. I kept it in a daze during most of the disturbing events on the planet. I saw to it that it slept on board ship and I'm trying to divert its mind just a little bit from its lost robot, Jemby, that, apparently, it loved very much."

"So that it ends up liking it here, I suppose."

"I hope so. It's adaptable because it's young, and I encourage that by as much as I dare influence its mind. I'm going to teach it to speak Galactic."

"Then you wash it. Understood?"

Bliss shrugged. "I will, if you insist, but I would want it to feel friendly with each of us. It would be useful to have each of us perform functions. Surely you can co-operate in that."

"Not to this extent. And when you finish washing it, get rid of it. I want to talk to you."

Bliss said, with a sudden edge of hostility, "How do you mean, get rid of it?"

"I don't mean dump it through the airlock. I mean, put it in your room. Sit it down in a corner. I want to talk at you."

"I'll be at your service," she said coldly.

He stared after her, nursing his wrath for the moment, then moved into the pilot-room, and activated the viewscreen.

Solaria was a dark circle with a curving crescent of light at the left. Trevize placed his hands on the desk to make contact with the computer and found his anger cooling at once. One had to be calm to link mind and computer effectively and, eventually, conditioned reflex linked handhold and serenity.

There were no artifactitious objects about the ship in any direction, out as far as the planet itself. The Solarians (or their robots, most likely) could not, or would not, follow.

Good enough. He might as well get out of the night-shadow, then. If he continued to recede, it would, in any case, vanish as Solaria's disc grew smaller than that of the more distant, but much larger, sun that it circled.

He set the computer to move the ship out of the planetary plane as well, since that would make it possible to accelerate with greater safety. They would then more quickly reach a region where space curvature would be low enough to make the Jump secure.

And, as often on such occasions, he fell to studying the stars. They were almost hypnotic in their quiet changelessness. All their turbulence and instability were wiped out by the distance that left them only dots of light.

One of those dots might well be the sun about which Earth revolved—the original sun, under whose radiation life began, and under whose beneficence humanity evolved.

Surely, if the Spacer worlds circled stars that were bright and prominent members of the stellar family, and that were nevertheless unlisted in the computer's Galactic map, the same might be true of the sun.

Or was it only the suns of the Spacer worlds that were omitted because of some primeval treaty agreement that left them to themselves? Would Earth's sun be included in the Galactic map, but not marked off from the myriads of stars that were sun-like, yet had no habitable planet in orbit about itself?

There were after all, some thirty billion sun-like stars in the Galaxy, and only about one in a thousand had habitable planets in orbits about them. There might be a thousand such habitable planets within a few hundred parsecs of his present position. Should he sift through the sun-like stars one by one, searching for them?

Or was the original sun not even in this region of the Galaxy? How many other regions were convinced the sun was one of their neighbors, that they were primeval Settlers—?

He needed information, and so far he had none.

He doubted strongly whether even the closest examination of the millennial ruins on Aurora would give information concerning Earth's location. He doubted even more strongly that the Solarians could be made to yield information.

Then, too, if all information about Earth had vanished out of the great Library at Trantor; if no information about Earth remained in the great Collective Memory of Gaia; there seemed little chance that any information that might have existed on the lost worlds of the Spacers would have been overlooked.

And if he found Earth's sun and, then, Earth itself, by the sheerest good fortune—would something force him to be unaware of the fact? Was Earth's defense absolute? Was its determination to remain in hiding unbreakable?

What was he looking for anyway?

Was it Earth? Or was it the flaw in Seldon's Plan that he thought (for no clear reason) he might find on Earth?

Seldon's Plan had been working for five centuries now, and would bring the human species (so it was said) to safe harbor—at last in the womb of a Second Galactic Empire, greater than the First, a nobler and a freer one—and yet he, Trevize, had voted against it, and for Galaxia.

Galaxia would be one large organism, while the Second Galactic Empire would, however great in size and variety, be a mere union of individual organisms of microscopic

size in comparison with itself. The Second Galactic Empire would be another example of the kind of union of individuals that humanity had set up ever since it became humanity. The Second Galactic Empire might be the largest and best of the species, but it would still be but one more member of that species.

For Galaxia, a member of an entirely different species of organization, to be better than the Second Galactic Empire, there must be a flaw in the Plan, something the great Hari Seldon had himself overlooked.

But if it were something Seldon had overlooked, how could Trevize correct the matter? He was not a mathematician; knew nothing, absolutely nothing, about the details of the Plan; would understand nothing, furthermore, even if it were explained to him.

All he knew were the assumptions-that a great number of human beings be involved and that they not be aware of the conclusions reached. The first assumption was self-evidently true, considering the vast population of the Galaxy, and the second had to be true since only the Second Foundationers knew the details of the Plan, and they kept it to themselves securely enough.

That left an added unacknowledged assumption, a taken-for-granted assumption, one so taken for granted it was never mentioned nor thought of-and yet one that might be false. An assumption that, if it were false, would alter the grand conclusion of the Plan and make Galaxia preferable to Empire.

But if the assumption was so obvious and so taken for granted that it was never even expressed, how could it be false? And if no one ever mentioned it, or thought of it, how could Trevize know it was there, or have any idea of its nature even if he guessed its existence?

Was he truly Trevize, the man with the flawless intuition-as Gaia insisted? Did he know the right thing to do even when he didn't know why he was doing it?

Now he was visiting every Spacer world he knew about. -Was that the right thing to do? Did the Spacer worlds hold the answer? Or at least the beginning of the answer?

What was there on Aurora but ruins and wild dogs? (And, presumably, other feral creatures. Raging bulls? Overgrown rats? Stalking green-eyed cats?) Solaria was alive, but what was there on it but robots and energy-transducing human beings? What had either world to do with Seldon's Plan unless they contained the secret of the location of the Earth?

And if they did, what had Earth to do with Seldon's Plan? Was this all madness? Had he listened too long and too seriously to the fantasy of his own infallibility?

An overwhelming weight of shame came over him and seemed to press upon him to the point where he could barely breathe. He looked at the stars -remote, uncaring-and thought: I must be the Great Fool of the Galaxy.

58.

BLISS'S voice broke in on him. "Well, Trevize, why do you want to see- Is anything wrong?" Her voice had twisted into sudden concern.

Trevize looked up and, for a moment, found it momentarily difficult to brush away his mood. He stared at her, then said, "No, no. Nothing's wrong. I-I was merely lost in thought. Every once in a while, after all, I find myself thinking." .

He was uneasily aware that Bliss could read his emotions. He had only her word that she was voluntarily abstaining from any oversight of his mind.

She seemed to accept his statement, however. She said, "Pelorat is with Fallom, teaching it Galactic phrases. The child seems to eat what we do without undue objection. -But what do you want to see me about?"

"Well, not here," , said Trevize. "The computer doesn't need me at the moment. If you want to come into my room, the bed's made and you can sit on it while I sit on the chair. Or vice versa, if you prefer."

"It doesn't matter." They walked the short distance to Trevize's room. She eyed him narrowly. "You don't seem furious anymore."

"Checking my mind?"

"Not at all. Checking your face."

"I'm not furious. I may lose my temper momentarily, now and then, but that's not the same as furious. If you don't mind, though, there are questions I must ask you."

Bliss sat down on Trevize's bed, holding herself erect, and with a solemn expression on her wide-cheeked face and in her dark brown eyes. Her shoulder-length black hair was neatly arranged and her slim hands were clasped loosely in her lap. There was a faint trace of perfume about her.

Trevize smiled. "You've dolled yourself up. I suspect you think I won't yell quite so hard at a young and pretty girl."

"You can yell and scream all you wish if it will make you feel better. I just don't want you yelling and screaming at Fallom."

"I don't intend to. In fact, I don't intend to yell and scream at you. Haven't we decided to be friends?"

"Gaia has never had anything but feelings of friendship toward you, Trevize."

"I'm not talking about Gaia. I know you're part of Gaia and that you are Gaia. Still there's part of you that's an individual, at least after a fashion. I'm talking to the individual. I'm talking to someone named Bliss without regard -or with as little regard as possible-to Gaia. Haven't we decided to be friends, Bliss?"

"Yes, Trevize."

"Then how is it you delayed dealing with the robots on Solaria after we had left the mansion and reached the ship? I was humiliated and physically hurt, yet you did nothing. Even though every moment might bring additional robots to the scene and the number might overwhelm us, you did nothing."

Bliss looked at him seriously, and spoke as though she were intent on explaining her actions rather than defending them. "I was not doing nothing, Trevize. I was studying the Guardian Robots' minds, and trying to learn how to handle them."

"I know that's what you were doing. At least you said you were at the time. I just don't see the sense of it. Why handle the minds when you were perfectly capable of destroying them-as you finally did?"

"Do you think it so easy to destroy an intelligent being?"

Trevize's lips twisted into an expression of distaste. "Come, Bliss. An intelligent being? It was just a robot."

"Just a robot?" A little passion entered her voice. "That's the argument always. Just. Just! Why should the Solarian, Bander, have hesitated to kill us? We were just human beings without transducers. Why should there be any hesitation about leaving Fallom to its fate? It was just a Solarian, and an immature specimen at that. If you start dismissing anyone or anything you want to do away with as just a this or just a that, you can destroy anything you wish. There are always categories you can find for them."

Trevize said, "Don't carry a perfectly legitimate remark to extremes just to make it seem ridiculous. The robot was just a robot. You can't deny that. It was not human. It was not intelligent in our sense. It was a machine mimicking an appearance of intelligence."

Bliss said, "How easily you can talk when you know nothing about it. I am Gaia. Yes, I am Bliss, too, but I am Gaia. I am a world that finds every atom of itself precious and meaningful, and every organization of atoms even more precious and meaningful. I/we/Gaia would not lightly break down an organization, though we would gladly build it into something still more complex, provided always that that would not harm the whole."

"The highest form of organization we know produces intelligence, and to be willing to destroy intelligence requires the sorest need. Whether it is machine intelligence or biochemical intelligence scarcely matters. In fact, the Guardian Robot represented a kind of intelligence I/we/Gaia had never encountered. To study it was wonderful. To destroy it, unthinkable-except in a moment of crowning emergency."

Trevize said dryly, "There were three greater intelligences at stake: your own, that of Pelorat, the human being you love, and, if you don't mind my mentioning it, mine."

"Four! You still keep forgetting to include Fallom. -They were not yet at stake. So I judged. See here- Suppose you were faced with a painting, a great artistic masterpiece, the existence of which meant death to you. All you had to do was to bring a wide brush of paint slam-bang, and at random, across the face of that painting and it would be destroyed forever, and you would be safe. But suppose, instead, that if you studied the painting carefully, and added just a touch of paint here, a speck there, scraped off a minute portion in a third place, and so on, you would alter the painting enough to avoid death, and yet leave it a masterpiece. Naturally, the revision couldn't be done except with the most painstaking care. It would take time, but surely, if that time existed, you would try to save the painting as well as your life."

Trevize said, "Perhaps. But in the end you destroyed the painting past redemption. The wide paintbrush came down and wiped out-all the wonderful little touches of color

and subtleties of form and shape. And you did that instantly when a little hermaphrodite was at risk, where our danger and your own had not moved you."

"We Outworlders were still not at immediate risk, while Fallom, it seemed to me, suddenly was. I had to choose between the Guardian Robots and Fallom, and, with no time to lose, I had to choose Fallom."

"Is that what it was, Bliss? A quick calculation weighing one mind against another, a quick judging of the greater complexity and the greater worth?"

"Yes."

Trevize said, "Suppose I tell you, it was just a child that was standing before you, a child threatened with death. An instinctive maternalism gripped you then, and you saved it where earlier you were all calculation when only three adult lives were at stake."

Bliss reddened slightly. "There might have been something like that in it; but it was not after the fashion of the mocking way in which you say it. It had rational thought behind it, too."

"I wonder. If there had been rational thought behind it, you might have considered that the child was meeting the common fate inevitable in its own society. Who knows how many thousands of children had been cut down to maintain the low number these Solarians think suitable to their world?"

"There's more to it than that, Trevize. The child would be killed because it was too young to be a Successor, and that was because it had a parent who had died prematurely, and that was because I had killed that parent."

"At a time when it was kill or be killed."

"Not important. I killed the parent. I could not stand by and allow the child to be killed for my deed. -Besides, it offers for study a brain of a kind that has never been studied by Gaia."

"A child's brain."

"It will not remain a child's brain. It will further develop the two transducer-lobes on either side of the brain. Those lobes give a Solarian abilities that all of Gaia cannot match. Simply to keep a few lights lit, just to activate a device to open a door, wore me out. Bander could have kept all the power going over an estate as great in complexity and greater in size than that city we saw on Comporellon-and do it even while sleeping."

Trevize said, "Then you see the child as an important bit of fundamental brain research."

"In a way, yes."

"That's not the way I feel. To me, it seems we have taken danger aboard. Great danger."

"Danger in what way? It will adapt perfectly-with my help. It is highly intelligent, and already shows signs of feeling affection for us. It will eat what we eat, go where we go, and I/we/Gala will gain invaluable knowledge concerning its brain."

"What if it produces young? It doesn't need a mate. It is its own mate."

"It won't be of child-bearing age for many years. The Spacers lived for centuries and the Solarians had no desire to increase their numbers. Delayed reproduction is probably bred into the population. Fallom will have no children for a long time."

"How do you know this?"

"I don't know it. I'm merely being logical."

"And I tell you Fallom will prove dangerous."

"You don't know that. And you're not being logical, either."

"I feel it Bliss, without reason. -At the moment. And it is you, not I, who insists my intuition is infallible."

And Bliss frowned and looked uneasy.

59.

PELORAT paused at the door to the pilot-room and looked inside in a rather ill-at-ease manner. It was as though he were trying to decide whether Trevize was hard at work or not.

Trevize had his hands on the table, as he always did when he made himself part of the computer, and his eyes were on the viewscreen. Pelorat judged, therefore, he was at work, and he waited patiently, trying not to move or, in any way, disturb the other.

Eventually, Trevize looked up at Pelorat. It was not a matter of total awareness. Trevize's eyes always seemed a bit glazed and unfocused when he was in computer-communion, as though he were looking, thinking, living in some other way than a person usually did.

But he nodded slowly at Pelorat, as though the sight, penetrating with difficulty, did, at last, sluggishly impress itself on the optic lobes. Then, after a while, he lifted his hands and smiled and was himself again.

Pelorat said apologetically, "I'm afraid I'm getting in your way, Golan."

"Not seriously, Janov. I was just testing to see if we were ready for the Jump. We are, just about, but I think I'll give it a few more hours, just for luck."

"Does luck-or random factors-have anything to do with it?"

"An expression only," said Trevize, smiling, "but random factors do have something to do with it, in theory. -What's on your mind?"

"May I sit down?"

"Surely, but let's go into my room. How's Bliss?"

"Very well." He cleared his throat. "She's sleeping again. She must have her sleep, you understand."

"I understand perfectly. It's the hyperspatial separation."

"Exactly, old chap."

"And Fallom?" Trevize reclined on the bed, leaving Pelorat the chair.

"Those books out of my library that you had your computer print up for me? The folk tales? It's reading them. Of course, it understands very little Galactic, but it seems to

enjoy sounding out the words. He's-I keep wanting to use the masculine pronoun for it. Why do you suppose that is, old fellow?"

Trevize shrugged. "Perhaps because you're masculine yourself."

"Perhaps. It's fearfully intelligent, you know."

"I'm sure."

Pelorat hesitated. "I gather you're not very fond of Fallom."

"Nothing against it personally, Janov. I've never had children and I've never been particularly fond of them generally. You've had children, I seem to remember."

"One son. -It was a pleasure, I recall, having my son when he was a little boy. Maybe that's why I want to use the masculine pronoun for Fallom. It takes me back a quarter of a century or so."

"I've no objection to your liking it, Janov."

"You'd like him, too, if you gave yourself a chance."

"I'm sure I would, Janov, and maybe someday I will give myself a chance to do so."

Pelorat hesitated again. "I also know that you must get tired of arguing with Bliss."

"Actually, I don't think we'll be arguing much, Janov. She and I are actually getting along quite well. We even had a reasonable discussion just the other day-no shouting, no recrimination-about her delay in inactivating the Guardian Robots. She keeps saving our lives, after all, so I can't very well offer her less than friendship, can I?"

"Yes, I see that, but I don't mean arguing, in the sense of quarreling. I mean this constant wrangle about Galaxia as opposed to individuality."

"Oh, that! I suppose that will continue-politely."

"Would you mind, Golan, if I took up the argument on her behalf?"

"Perfectly all right. Do you accept the idea of Galaxia on your own, or is it that you simply feel happier when you agree with Bliss?"

"Honestly, on my own. I think that Galaxia is what should be forthcoming. You yourself chose that course of action and I am constantly becoming more convinced that that is correct."

"Because I chose it? That's no argument. Whatever Gaia says, I may be wrong, you know. So don't let Bliss persuade you into Galaxia on that basis."

"I don't think you are wrong. Solaria showed me that, not Bliss."

"How?"

"Well, to begin with, we are Isolates, you and I"

"Her term, Janov. I prefer to think of us as individuals."

"A matter of semantics, old chap. Call it what you will, we are enclosed in our private skins surrounding our private thoughts, and we think first and foremost of ourselves. Self-defense is our first law of nature, even if that means harming everyone else in existence."

"People have been known to give their lives for others."

"A rare phenomenon. Many more people have been known to sacrifice the dearest needs of others to some foolish whim of their own."

"And what has that to do with Solaria?"

"Why, on Solaria, we see what Isolates-or individuals, if you prefer-can become. The Solarians can hardly bear to divide a whole world among themselves. They consider living a life of complete isolation to be perfect liberty.

They have no yearning for even their own offspring, but kill them if there are too many. They surround themselves with robot slaves to which they supply the power, so that if they die, their whole huge estate symbolically dies as well. Is this admirable, Golan? Can you compare it in decency, kindness, and mutual concern with Gaia? -Bliss has not discussed this with me at all. It is my own feeling."

Trevize said, "And it is like you to have that feeling, Janov. I share it. I think Solarian society is horrible, but it wasn't always like that. They are descended from Earthmen, and, more immediately, from Spacers who lived a much more normal life. The Solarians chose a path, for one reason or another, which led to an extreme, but you can't judge by extremes. In all the Galaxy, with its millions of inhabited worlds, is there one you know that now, or in the past, has had a society like that of Solaria, or even remotely like that of Solaria? And would even Solaria have such a society if it were not riddled with robots? Is it conceivable that a society of individuals could evolve to such a pitch of Solarian horror without robots?"

Pelorat's face twitched a little. "You punch holes in everything, Golan or at least I mean you don't ever seem to be at a loss in defending the type of Galaxy you voted against."

"I won't knock down everything. There is a rationale for Galaxia and when I find it, I'll know it, and I'll give in. Or perhaps, more accurately, if I find it.

"Do you think you might not?"

Trevize shrugged. "How can I say? -Do you know why I'm waiting a few hours to make the Jump, and why I'm in danger of talking myself into waiting a few days?"

"You said it would be safer if we waited."

"Yes, that's what I said, but we'd be safe enough now. What I really fear is that those Spacer worlds for which we have the coordinates will fail us altogether. We have only three, and we've already used up two, narrowly escaping death each time. In doing so, we have still not gained any hint as to Earth's location, or even, in actual fact, Earth's existence. Now I face the third and last chance, and what if it, too, fails us?"

Pelorat sighed. "You know there are old folk tales-one, in -fact, exists among those I gave Fallom to practice upon-in which someone is allowed three wishes, but only three. Three seems to be a significant number in these things, perhaps because it is the first odd number so that it is the smallest decisive number. You know, two out of three wins. -The point is that in these stories, the wishes are of no use. No one ever wishes correctly, which, I have always supposed, is ancient wisdom to the effect that the satisfaction of your wants must be earned, and not-"

He fell suddenly silent and abashed. "I'm sorry, old man, but I'm wasting your time. I do tend to rattle on when I get started on my hobby."

"I find you always interesting, Janov. I am willing to see the analogy. We have been given three wishes, and we have had two and they have done us no good. Now only one is left. Somehow, I am sure of failure again and so I wish to postpone it. That is why I am putting off the Jump as long as possible."

"What will you do if you do fail again? Go back to Gaia? To Terminus?"

"Oh no," said Trevize in a whisper, shaking his head. "The search must continue-if I only knew how."

14. DEAD PLANET

60.

TREVIZE felt depressed. What few victories he had had since the search began had never been definitive; they had merely been the temporary staving off of defeat.

Now he had delayed the Jump to the third of the Spacer worlds till he had spread his unease to the others. When he finally decided that he simply must tell the computer to move the ship through hyperspace, Pelorat was standing solemnly in the doorway to the pilot-room, and Bliss was just behind him and to one side. Even Fallom was standing there, gazing at Trevize owlshly, while one hand gripped Bliss's hand tightly.

Trevize had looked up from the computer and had said, rather churlishly, "Quite the family group!" but that was only his own discomfort speaking.

He instructed the computer to Jump in such a way as to reenter space at a further distance from the star in question than was absolutely necessary. He told himself that that was because he was learning caution as a result of events on the first two Spacer worlds, but he didn't believe that. Well underneath, he knew, he was hoping that he would arrive in space at a great enough distance from the star to be uncertain as to whether it did or did not have a habitable planet. That would give him a few more days of in-space travel before he could find out, and (perhaps) have to stare bitter defeat in the face.

So now, with the "family group" watching, he drew a deep breath, held it, then expelled it in a between-the-lips whistle as he gave the computer its final instruction.

The star-pattern shifted in a silent discontinuity and the viewscreen became barer, for he had been taken into a region in which the stars were somewhat sparser. And there, nearly in the center, was a brightly gleaming star.

Trevize grinned broadly, for this was a victory of sorts. After all, the third set of coordinates might have been wrong and there might have been no appropriate G-type star in sight. He glanced toward the other three, and said, "That's it. Star number three."

"Are you sure?" asked Bliss softly.

"Watch!" said Trevize. "I will switch to the equi-centered view in the computer's Galactic map, and if that bright star disappears, it's not recorded on the map, and it's the one we want."

The computer responded to his command, and the star blinked out without any prior dimming. It was as though it had never been, but the rest of the starfield remained as it was, in sublime indifference.

"We've got it," said Trevize.

And yet he sent the Far Star forward at little more than half the speed he might easily have maintained. There was still the question of the presence or absence of a habitable planet, and he was in no hurry to find out. Even after three days of approach, there was still nothing to be said about that, either way.

Or, perhaps, not quite nothing. Circling the star was a large gas giant. It was very far from its star and it gleamed a very pale yellow on its daylight side, which they could see, from their position, as a thick crescent.

Trevize did not like its looks, but he tried not to show it and spoke as matter-of-factly as a guidebook. "There's a big gas giant out there," he said. "It's rather spectacular. It has a thin pair of rings and two sizable satellites that can be made out at the moment."

Bliss said, "Most systems include gas giants, don't they?"

"Yes, but this is a rather large one. Judging from the distance of its satellites, and their periods of revolution, that gas giant is almost two thousand times as massive as a habitable planet would be."

"What's the difference?" said Bliss. "Gas giants are gas giants and it doesn't matter what size they are, does it? They're always present at great distances from the star they circle, and none of them are habitable, thanks to their size and distance. We just have to look closer to the star for a habitable planet."

Trevize hesitated, then decided to place the facts on the table. "The thing is," he said, "that gas giants tend to sweep a volume of planetary space clean. What material they don't absorb into their own structures will coalesce into fairly large bodies that come to make up their satellite system. They prevent other coalescences at even a considerable distance from themselves, so that the larger the gas giant, the more likely it is to be the only sizable planet of a particular star. There'll just be the gas giant and asteroids."

"You mean there is no habitable planet here?"

"The larger the gas giant, the smaller the chance of a habitable planet and that gas giant is so massive it is virtually a dwarf star."

Pelorat said, "May we see it?"

All three now stared at the screen (Fallom was in Bliss's room with the j books).

The view was magnified till the crescent filled the screen. Crossing that crescent a distance above center was a thin dark line, the shadow of the ring system which could itself be seen a small distance beyond the planetary surface as a gleaming curve that stretched into the dark side a short distance before it entered the shadow itself.

Trevize said, "The planet's axis of rotation is inclined about thirty-five degrees to its plane of revolution, and its ring is in the planetary equatorial plane, of course, so that the star's light comes in from below, at this point in its orbit, and casts the ring's shadow well above the equator."

Pelorat watched raptly. "Those are thin rings."

"Rather above average size, actually," said Trevize.

"According to legend, the rings that circle a gas giant in Earth's planetary system are much wider, brighter, and more elaborate than this one. The rings actually dwarf the gas giant by comparison."

"I'm not surprised," said Trevize. "When a story is handed on from person to person for thousands of years, do you suppose it shrinks in the telling?"

Bliss said, "It's beautiful. If you watch the crescent, it seems to writhe and wriggle before your eyes."

"Atmospheric storms," said Trevize. "You can generally see that more clearly if you choose an appropriate wavelength of light. Here, let me try." He placed his hands on the desk and ordered the computer to work its way through the spectrum and stop at the appropriate wavelength.

The mildly lit crescent went into a wilderness of color that shifted so rapidly it almost dazed the eyes that tried to follow. Finally, it settled into a red-orange, and, within the crescent, clear spirals _ drifted, coiling and uncoiling as they moved.

"Unbelievable," muttered Pelorat.

"Delightful," said Bliss.

Quite believable, thought Trevize bitterly, and anything but delightful. Neither Pelorat nor Bliss, lost in the beauty, bothered to think that the planet they admired lowered the chances of solving the mystery Trevize was trying to unravel. But, then, why should they? Both were satisfied that Trevize's decision had been correct, and they accompanied him in his' search for certainty without an emotional bond to it. It was useless to blame them for that.

He said, "The dark side seems dark, but if our eyes were sensitive to the range just a little beyond the usual long-wave limit, we would see it as a dull, deep, angry red. The planet is pouring infrared radiation out into space in great quantities because it is massive enough to be almost red-hot. It's more than a gas giant; it's 4 sub-star."

He waited a little longer and then said, "And now let's put that object out of our mind and look for the habitable planet that may exist."

"Perhaps it does," said Pelorat, smiling. "Don't give up, old fellow."

"I haven't given up," said Trevize, without true conviction. "The formation of planets is too complicated a matter for rules to be hard and fast. We speak only of probabilities. With that monster out in space, the probabilities decrease, but not to zero."

Bliss said, "Why don't you think of it this way? Since the first two sets of coordinates each gave you a habitable planet of the Spacers, then this third set, which has already given you an appropriate star, should give you a habitable planet as well. Why speak of probabilities?"

"I certainly hope you're right," said Trevize, who did not feel at all consoled. "Now we will shoot out of the planetary plane and in toward the star."

The computer took care of that almost as soon as he had spoken his intention. He sat back in his pilot's chair and decided, once again, that the one evil of piloting a gravitic ship with a computer so advanced was that one could never-never-pilot any other type of ship again.

Could he ever again bear to do the calculations himself? Could he bear to have to take acceleration into account, and limit it to a reasonable level? -In all likelihood, he would forget and pour on the energy till he and everyone on board were smashed against one interior wall or another.

Well, then, he would continue to pilot this one ship-or another exactly like it, if he could even bear to make so much of a change-always.

And because he wanted to keep his mind off the question of the habitable planet, yes or no, he mused on the fact that he had directed the ship to move above the plane, rather than below. Barring any definite reason to go below a plane, pilots almost always chose to go above. Why?

For that matter, why be so intent on considering one direction above and the other below? In the symmetry of space that was pure convention.

Just the same, he was always aware of the direction in which any planet under observation rotated about its axis and revolved about its star. When both were counterclockwise, then the direction of one's raised arm was north, and the direction of one's feet was south. And throughout the Galaxy, north was pictured as above and south as below.

It was pure convention, dating back into the primeval mists, and it was followed slavishly. If one looked at a familiar map with south above, one didn't recognize it. It had to be turned about to make sense. And all things being equal, one turned north-and "above."

Trevize thought of a battle fought by Bel Riose, the Imperial general of three centuries before, who had veered his squadron below the planetary plane at a crucial moment, and caught a squadron of vessels, waiting and unprepared. There were complaints that it had been an unfair maneuver-by the losers, of course.

A convention, so powerful and so primordially old, must have started on Earth-and that brought Trevize's mind, with a jerk, back to the question of the habitable planet.

Pelorat and Bliss continued to watch the gas giant as it slowly turned on the viewscreen in a slow, slow back-somersault. The sunlit portion spread and, as Trevize kept its spectrum fixed in the orange-red wavelengths, the storm-writhing of its surface became ever madder and more hypnotic.

Then Fallom came wandering in and Bliss decided it must take a nap and that so must she.

Trevize said to Pelorat, who remained, "I have to let go of the gas giant, Janov. I want to have the computer concentrate on the search for a gravitational blip of the right size."

"Of course, old fellow," said Pelorat.

But it was more complicated than that. It was not just a blip of the right size that the computer had to search for, it was one of the right size and at the right distance. It would still be several days before he could be sure.

61.

TREVIZE walked into his room, grave, solemn-indeed somber-and started perceptibly.

Bliss was waiting for him and immediately next to her was Fallow, with its loincloth and robe bearing the unmistakable fresh odor of steaming and vacupressing. The youngster looked better in that than in one of Bliss's foreshortened nightgowns.

Bliss said, "I didn't want to disturb you at the computer, but now listen. -Go on, Fallow."

Fallow said, in its high-pitched musical voice, "I greet you, Protector Trevize. It is with great pleasure that I am ap-ad-accompanying you on this ship through space. I am happy, too, for the kindness of my friends, Bliss and Pel."

Fallow finished and smiled prettily, and once again Trevize thought to himself: Do I think of it as a boy or as a girl or as both or as neither?

He nodded his head. "Very well memorized. Almost perfectly pronounced."

"Not at all memorized," said Bliss warmly. "Fallow composed this itself and asked if it would be possible to recite it to you. I didn't even know what Fallow would say till I heard it said."

Trevize forced a smile, "In that case, very good indeed." He noticed Bliss avoided pronouns when she could.

Bliss turned to Fallow and said, "I told you Trevize would like it. -Now go to Pel and you can have some more reading if you wish."

Fallow ran off, and Bliss said, "It's really astonishing how quickly Fallow is picking up Galactic. The Solarians must have a special aptitude for languages. Think how Bander spoke Galactic merely from hearing it on hyperspatial communications. Those brains may be remarkable in ways other than energy transduction."

Trevize grunted.

Bliss said, "Don't tell me you still don't like Fallom."

"I neither like nor dislike. The creature simply makes me uneasy. For one thing, it's a grisly feeling to be dealing with a hermaphrodite."

Bliss said, "Come, Trevize, that's ridiculous. Fallom is a perfectly acceptable living creature. To a society of hermaphrodites, think how disgusting you and I must seem- males and females generally. Each is half of a whole and, in order to reproduce, there must be a temporary and clumsy union."

"Do you object to that, Bliss?"

"Don't pretend to misunderstand. I am trying to view us from the hermaphroditic standpoint. To them, it must seem repellent in the extreme; to us, it seems natural. So Fallom seems repellent to you, but that's just a shortsighted parochial reaction."

"Frankly," said Trevize, "it's annoying not to know the pronoun to use in connection with the creature. It impedes thought and conversation to hesitate forever at the pronoun."

"But that's the fault of our language," said Bliss, "and not of Fallom. No human language has been devised with hermaphroditism in mind. And I'm glad you brought it up, because I've been thinking about it myself. -Saying 'it,' as Bander itself insisted on doing, is no solution. That is a pronoun intended for objects to which sex is irrelevant, and there is no pronoun at all for objects that are sexually active in both senses. Why not just

pick one of the pronouns arbitrarily, then? I think of Fallom as a girl. She has the high voice of one, for one thing, and she has the capacity of producing young, which is the vital definition of femininity. Pelorat has agreed; why don't you do so, too? Let it be 'she' and 'her.'"

Trevize shrugged. "Very well. It will sound peculiar to point out that she has testicles, but very well."

Bliss sighed. "You do have this annoying habit of trying to turn everything into a joke, but I know you are under tension and I'll make allowance for that. Just use the feminine pronoun for Fallom, please."

"I will." Trevize hesitated, then, unable to resist, said, "Fallom seems more your surrogate-child every time I see you together. Is it that you want a child and don't think Janov can give you one?"

Bliss's eyes opened wide. "He's not there for children! Do you think I use him as a handy device to help me have a child? It is not time for me to have a child, in any case. And when it is time, it will have to be a Gaian child, something for which Pel doesn't qualify."

"You mean Janov will have to be discarded?"

"Not at all. A temporary diversion, only. It might even be brought about by artificial insemination."

"I presume you can only have a child when Gaia's decision is that one is' necessary; when there is a gap produced by the death of an already-existing", Gaian human fragment."

"That is an unfeeling way of putting it, but it is true enough. Gaia must be well proportioned in all its parts and relationships."

"As in the case of the Solarians."

Bliss's lips pressed together and her face grew a little white. "Not at all. " The Solarians produce more than they need and destroy the excess. We produce just what we need and there is never a necessity of destroying-as you replace the dying outer layers of your skin by just enough new growth for renewal and by not one cell more."

"I see what you mean," said Trevize. "I hope, by the way, that you are considering Janov's feelings."

"In connection with a possible child for me? That has never come up for discussion; nor will it."

"No, I don't mean that. -It strikes me you are becoming more and more interested in Fallom. Janov may feel neglected."

"He's not neglected, and he is as interested in Fallom as I am. She is another point of mutual involvement that draws us even closer together. Can it be that you are the one who feels neglected?"

"I?" He was genuinely surprised.

"Yes, you. I don't understand Isolates any more than you understand Gaia, but I have a feeling that you enjoy being the central point of attention on this ship, and you may feel cut out by Fallom."

"That's foolish."

"No more foolish than your suggestion that I am' neglecting Pel."

"Then let's declare a truce and stop. I'll try to view Fallom as a girl, and I shall not worry excessively about you being inconsiderate of Janov's feelings."

Bliss smiled. "Thank you. All is well, then."

Trevize turned away, and Bliss then said, "Wait!"

Trevize turned back and said, just a bit wearily, "Yes?"

"It's quite clear to me, Trevize, that you're sad and depressed. I am not going to probe your mind, but you might be willing to tell me what's wrong. Yesterday, you said there was an appropriate planet in this system and you seemed quite pleased. -It's still there, I hope. The finding hasn't turned out to be mistaken, has it?"

"There's an appropriate planet in the system, and it's still there," said Trevize.

"Is it the right size?"

Trevize nodded. "Since it's appropriate, it's of the right size. And it's at the right distance from the star as well."

"Well, then, what's wrong?"

"We're close enough now to analyze the atmosphere. It turns out that it has none to speak of."

"No atmosphere?"

"None to speak of. It's a nonhabitable planet, and there is no other circling the sun that has even the remotest capacity for habitability. We have come up with zero on this third attempt."

62.

PELORAT, looking grave, was clearly unwilling to intrude on Trevize's unhappy silence. He watched from the door of the pilot-room, apparently hoping that Trevize would initiate a conversation.

Trevize did not. If ever a silence seemed stubborn, his did.

And finally, Pelorat could stand it no longer, and said, in a rather timid way, "What are we doing?"

Trevize looked up, stared at Pelorat for a moment, turned away, and then said, "We're zeroing in on the planet."

"But since there's no atmosphere-"

"The computer says there's no atmosphere. Till now, it's always told me what I've wanted to hear and I've accepted it. Now it has told me something I don't want to hear, and I'm going to check it. If the computer is ever going to be wrong, this is the time I want it to be wrong."

"Do you think it's wrong?"

"No; I don't."

"Can you think of any reason that might make it wrong?"

"No, I can't."

"Then why are you bothering, Golan?"

And Trevize finally wheeled in his seat to face Pelorat, his face twisted in near-despair, and said, "Don't you see, Janov, that I can't think of anything else to do? We drew blanks on the first two worlds as far as Earth's location is concerned, and now this world is a blank. What do I do now? Wander from world to world, and peer about and say, 'Pardon me. Where's Earth?' Earth has covered its tracks too well. Nowhere has it left any hint. I'm beginning to think that it will see to it that we're incapable of picking up a hint even if one exists."

Pelorat nodded, and said, "I've been thinking along those lines myself. Do you mind if we discuss it? I know you're unhappy, old chap, and don't want to talk, so if you want me to leave you alone, I will."

"Go ahead, discuss it," said Trevize, with something that was remarkably like a groan. "What have I got better to do than listen?"

Pelorat said, "That doesn't sound as though you really want me to talk, but perhaps it will do us good. Please stop me at any time if you decide you can stand it no longer. -It seems to me, Golan, that Earth need not take only passive and negative measures to hide itself. It need not merely wipe out references to itself. Might it not plant false evidence and work actively for obscurity in that fashion?"

"How do you mean?"

"Well, we've heard of Earth's radioactivity in several places, and that sort of thing would be designed to make anyone break off any attempt to locate it. If it were truly radioactive, it would be totally unapproachable. In all likelihood, we would not even be able to set foot on it. Even robot explorers, if we had any, might not survive the radiation. So why look? And if it is not radioactive, it remains inviolate, except for accidental approach, and even then it might have other means of masking itself."

Trevize managed a smile. "Oddly enough, Janov, that thought has occurred to me. It has even occurred to me that that improbable giant satellite has been invented and planted in the world's legends. As for the gas giant with the monstrous ring system, that is equally improbable and may be equally planted. It is all designed, perhaps, to have us look for something that doesn't exist, so that we go right through the correct planetary system, staring at Earth and dismissing it because, in actual fact, it lacks a large satellite or a triple-ringed cousin or a radioactive crust. We don't recognize it, therefore, and don't dream we are looking at it. -I imagine worse, too."

Pelorat looked downcast. "How can there be worse?"

"Easily-when your mind gets sick in the middle of the night and begins searching the vast realm of fantasy for anything that can deepen despair. What if Earth's ability to hide is ultimate? What if our minds can be clouded? What if we can move right past Earth, with its giant satellite and with its distant ringed gas giant, and never see any of it? What if we have already done so?"

"But if you believe that, why are we-?"

"I don't say I believe that. I'm talking about mad fancies. We'll keep on looking."

Pelorat hesitated, then said, "For how long, Trevize? At some point, surely, we'll have to give up."

"Never," said Trevize fiercely. "If I have to spend the rest of my life going from planet to planet and peering about and saying, 'Please, sir, where's Earth?' then that's what I'll do. At any time, I can take you and Bliss and even Fallom, if you wish, back to Gaia and then take off on my own."

"Oh no. You know I won't leave you, Golan, and neither will Bliss. We'll go planet-hopping with you, if we must. But why?"

"Because I must find Earth, and because I will. I don't know how, but I will. -Now, look, I'm trying to reach a position where I can study the sunlit side of the planet without its suit being too close, so just let me be for a while."

Pelorat fell silent, but did not leave. He continued to watch while Trevize studied the planetary image, more than half in daylight, on the screen. To Pelorat, it seemed featureless, but he knew that Trevize, bound to the computer, saw it under enhanced circumstances.

Trevize whispered, "There's a haze."

"Then there must be an atmosphere," blurted out Pelorat.

"Not necessarily much of one. Not enough to support life, but enough to support a thin wind that will raise dust. It's a well-known characteristic of planets with thin atmospheres. There may even be small polar ice caps. A little water-ice condensed at the poles, you know. This world is too warm for solid carbon dioxide. -I'll have to switch to radar-mapping. And if I do that I can work more easily on the nightside."

"Really?"

"Yes. I should have tried it first, but with a virtually airless and, therefore, cloudless planet, the attempt with visible light seems so natural."

Trevize was silent for a long time, while the viewscreen grew fuzzy with radar-reflections that produced almost the abstraction of a planet, something that an artist of the Cleonian period might have produced. Then he said, "Well-" emphatically, holding the sound for a while, and was silent again.

Pelorat said, at last, "What's the 'well' about?"

Trevize looked at him briefly. "No craters that I can see."

"No craters? Is that good?"

"Totally unexpected," said Trevize. His face broke into a grin, "And very good. In fact, possibly magnificent."

63.

FALLOM remained with her nose pressed against the ship's porthole, where a small segment of the Universe was visible in the precise form in which the eye saw it, without computer enlargement or enhancement.

Bliss, who had been trying to explain it all, sighed and said in a low voice to Pelorat, "I don't know how much she understands, Pel dear. To her, her father's mansion and a small section of the estate it stood upon was all the Universe. I don't think she was ever out at night, or ever saw the stars."

"Do you really think so?"

"I really do. I didn't dare show her any part of it until she had enough vocabulary to understand me just a little-and how fortunate it was that you could speak with her in her own language."

"The trouble is I'm not very good at it," said Pelorat apologetically. "And the Universe is rather hard to grasp if you come at it suddenly. She said to me that if those little lights are giant worlds, each one just like Solaria-they're much larger than Solaria, of course-that they couldn't hang in nothing. They ought to fall, she says."

"And she's right, judging by what she knows. She asks sensible questions, and little by little, she'll understand. At least she's curious and she's not frightened."

"The thing is, Bliss, I'm curious, too. Look how Golan changed as soon as he found out there were no craters on the world we're heading for. I haven't the slightest idea what difference that makes. Do you?"

"Not a bit. Still he knows much more planetology than we do. We can only assume he knows what he's doing."

"I wish I knew."

"Well, ask him."

Pelorat grimaced. "I'm always afraid I'll annoy him. I'm sure he thinks I ought to know these things without being told."

Bliss said, "That's silly, Pel. He has no hesitation in asking you about any aspect of the Galaxy's legends and myths which he thinks might be useful. You're always willing to answer and explain, so why shouldn't he be? You go ask him. If it annoys him, then he'll have a chance to practice sociability, and that will be good for him."

"Will you come with me?"

"No, of course not. I want to stay with Fallom and continue to try to get the concept of the Universe into her head. You can always explain it to me afterward-once he explains it to you."

64.

PELORAT entered the pilot-room diffidently. He was delighted to note that Trevize was whistling to himself and was clearly in a good mood.

"Golan," he said, as brightly as he could.

Trevize looked up. "Janov! You're always tiptoeing in as though you think it's against the law to disturb me. Close the door and sit down. Sit down! Look at that thing."

He pointed to the planet on the viewscreen, and said, "I haven't found more than two or three craters, each quite small."

"Does that make a difference, Golan? Really?"

"A difference? Certainly. How can you ask?"

Pelorat gestured helplessly. "It's all a mystery to me. I was a history major at college. I took sociology and psychology in addition to history, also languages and literature, mostly ancient, and specialized in mythology in graduate school. I never came near planetology, or any of the physical sciences."

"That's no crime, Janov. I'd rather you know what you know. Your facility in ancient languages and in mythology has been of enormous use to us. You know that. -And when it comes to a matter of planetology, I'll take care of that."

He went on, "You see, Janov, planets form through the smashing together of smaller objects. The last few objects to collide leave crater marks. Potentially, that is. If the planet is large enough to be a gas giant, it is essentially liquid under a gaseous atmosphere and the final collisions are just splashes and leave no marks.

"Smaller planets which are solid, whether icy or rocky, do show crater marks, and these remain indefinitely unless an agency for removal exists. There are three types of removals.

"First, a world may have an icy surface overlying a liquid ocean. In that case, any colliding object breaks through the ice and splashes water. Behind it the ice refreezes and heals the puncture, so to speak. Such a planet, or satellite, would have to be cold, and would not be what we would consider a habitable world.

"Second, if a planet is intensely active, volcanically, then a perpetual lava flow or ash fallout is forever filling in and obscuring any craters that form. However, such a planet or satellite is not likely to be habitable either.

"That brings us to habitable worlds as a third case. Such worlds may have polar ice caps, but most of the ocean must be freely liquid. They may have active volcanoes, but these must be sparsely distributed. Such worlds can neither heal craters, nor fill them in. There are, however, erosion effects. Wind and flowing water will erode craters, and if there is life, the actions of living things are strongly erosive as well. See?"

Pelorat considered that, then said, "But, Golan, I don't understand you at all. This planet we're approaching-"

"We'll be landing tomorrow," said Trevize cheerfully.

"This planet we're approaching doesn't have an ocean."

"Only some thin polar ice caps."

"Or much of an atmosphere."

"Only a hundredth the density of the atmosphere on Terminus."

"Or life."

"Nothing I can detect."

"Then what could have eroded away the craters?"

"An ocean, an atmosphere, and life," said Trevize. "Look, if this planet had been airless and waterless from the start, any craters that had been formed would still exist and the whole surface would be cratered. The absence of craters proves it can't have been airless and waterless from the start, and may even have had a sizable atmosphere and

ocean in the near past. Besides, there are huge basins, visible on this world, that must have held seas, and oceans once, to say nothing of the marks of rivers that are now dry. So you see there was erosion and that erosion has ceased so short a time ago, that new cratering has not yet had time to accumulate."

Pelorat looked doubtful. "I may not be a planetologist, but it seems to me that if a planet is large enough to hang on to a dense atmosphere for perhaps billions of years, it isn't going to suddenly lose it, is it?"

"I shouldn't think so," said Trevize. "But this world undoubtedly held life before its atmosphere vanished, probably human life. My guess is that it was a terraformed world as almost all the human-inhabited worlds of the Galaxy are. The trouble is that we don't really know what its condition was before human life arrived, or what was done to it in order to make it comfortable for human beings, or under what conditions, actually, life vanished. There may have been a catastrophe that sucked off the atmosphere and that brought about the end of human life. Or there may have been some strange imbalance on this planet that human beings controlled as long as they were here and that went into a vicious cycle of atmospheric reduction once they were gone. Maybe we'll find the answer when we land, or maybe we won't. It doesn't matter."

"But surely neither does it matter if there was life here once, if there isn't now. What's the difference if a planet has always been uninhabitable, or is only uninhabitable now?"

"If it is only uninhabitable now, there will be ruins of the one-time inhabitants."

"There were ruins on Aurora-

"Exactly, but on Aurora there had been twenty thousand years of rain and snow, freezing and thawing, wind and temperature change. And there was also life-don't forget life: There may not have been human beings there, but there was plenty of life. Ruins can be eroded just as craters can. Faster. And in twenty thousand years, not enough was left to do us any good. -Here on this planet, however, there has been a passage of time, perhaps twenty thousand years, perhaps less, without wind, or storm, or life. There has been temperature change, I admit, but that's all. The ruins will be in good shape."

"Unless," murmured Pelorat doubtfully, "there are no ruins. Is it possible that there was never any life on the planet, or never any human life at any rate, and that the loss of the atmosphere was due to some event that human beings had nothing to do with?"

"No, no," said Trevize. "You can't turn pessimist on me, because it won't work. Even from here, I've spotted the remains of what I'm sure was a city. -So we land tomorrow."

65.

BLISS said, in a worried tone, "Fallow is convinced we're going to take her back to Jemby, her' robot."

"Umm," said Trevize, studying the surface of the world as it slid back under the drifting ship. Then he looked up as though he had heard the remark only after a delay. "Well, it was the only parent she knew, wasn't it?"

"Yes, of course, but she thinks we've come back to Solaria."

"Does it look like Solaria?"

"How would she know?"

"Tell her it's not Solaria. Look, I'll give you one or two reference bookfilms with graphic illustrations. Show her close-ups of a number of different inhabited worlds and explain that there are millions of them. You'll have time for it. I don't know how long Janov and I will have to wander around, once we pick a likely target and land."

"You and Janov?"

"Yes. Fallom can't come with us, even if I wanted her to, which I would only want if I were a madman. This world requires space suits, Bliss. There's no breathable air. And we don't have a space suit that would fit Fallom. So she and you stay on the ship."

«Why IT'

Trevize's lips stretched into a humorless smile. "I admit," he said, "I would feel safer if you were along, but we can't leave Fallom on this ship alone. She can do damage even if she doesn't mean to. I must have Janov with me because he might be able to make out whatever archaic writing they have here. That means you will have to stay with Fallom. I should think you would want to."

Bliss looked uncertain.

Trevize said, "Look. You wanted Fallom along, when I didn't. I'm convinced she'll be nothing but trouble. So-her presence introduces constraints, and you'll have to adjust yourself to that. She's here, so you'll have to be here, too. That's the way it is."

Bliss sighed. "I suppose so."

"Good. Where's Janov?"

"He's with Fallom."

"Very well. Go and take over. I want to talk to him."

Trevize was still studying the planetary surface when Pelorat walked in, clearing his throat to announce his presence. He said, "Is anything wrong, Golan?"

"Not exactly wrong, Janov. I'm just uncertain. This is a peculiar world and I don't know what happened to it. The seas must have been extensive, judging from the basins left behind, but they were shallow. As nearly as I can tell from the traces left behind, this was a world of desalinization and canals-or perhaps the seas weren't very salty. If they weren't very salty, that would account for the absence of extensive salt flats in the basins. Or else, when the ocean was lost, the salt content was lost with it-which certainly makes it look like a human deed."

Pelorat said hesitantly, "Excuse my ignorance about such things, Golan, but does any of this matter as far as what we are looking for is concerned?"

"I suppose not, but I can't help being curious. If I knew just how this planet was terraformed into human habitability and what it was like before terraforming, then perhaps I would understand what has happened to it after it was abandoned-or just

before, perhaps. And if we did know what happened to it, we might be forewarned against unpleasant surprises."

"What kind of surprises? It's a dead world, isn't it?"

"Dead enough. Very little water; thin, unbreathable atmosphere; and Bliss detects no signs of mental activity."

"That should settle it, I should think."

"Absence of mental activity doesn't necessarily imply lack of life."

"It must surely imply lack of dangerous life."

"I don't know. -But that's not what I want to consult you about. There are two cities that might do for our first inspection. They seem to be in excellent shape; all the cities do. Whatever destroyed the air and oceans did not seem to touch the cities. Anyway, those two cities are particularly large. The larger, however, seems to be short on empty space. There are spaceports far in the outskirts but nothing in the city itself. The one not so large does have empty space, so it will be easier to come down in its midst, though not in formal spaceports-but then, who would care about that?"

Pelorat grimaced. "Do you want me to make the decision, Golan?"

"No, I'll make the decision. I just want your thoughts."

"For what they're worth, a large sprawling city is likely to be a commercial or manufacturing center. A smaller city with open space is likely to be an administrative center. It's the administrative center we'd want. Does it have monumental buildings?"

"What do you mean by a monumental building?"

Pelorat smiled his tight little stretching of the lips. "I scarcely know. Fashions change from world to world and from time to time. I suspect, though, that they always look large, useless, and expensive. -Like the place where we were on Comporellon."

Trevize smiled in his turn. "It's hard to tell looking straight down, and when I get a sideways glance as we approach or leave, it's too confusing. Why do you prefer the administrative center?"

"That's where we're likely to find the planetary museum, library, archives, university, and so on."

"Good. That's where we'll go, then; the smaller city. -And maybe we'll find something. We've had two misses, but maybe we'll find something this time."

"Perhaps it will be three times lucky."

Trevize raised his eyebrows. "Where did you get that phrase?"

"It's an old one," said Pelorat. "I found it in an ancient legend. It means success on the third try, I should think."

"That sounds right," said Trevize. "Very well, then-three times lucky, Janov."

15. MOSS

66.

TREVIZE looked grotesque in his space suit. The only part of him that remained outside were his holsters-not the ones that he strapped around his hips ordinarily, but more substantial ones that were part of his suit. Carefully, he inserted the blaster in the right-hand holster, the neuronc whip in the left. Again, they had been recharged and this time, he thought grimly, nothing would take them away from him.

Bliss smiled. "Are you going to carry weapons even on a world without air or- Never mind! I won't question your decisions."

Trer1 'O paid, "Good!" and turned to help Pelorat adjust his helmet, before donning his Own.

Pelorat, who had never worn a space suit before, said, rather plaintively, "Will I really be able to breathe in this thing, Golan?"

"I promise you," said Trevize.

Bliss watched as the final joints were sealed, her arm about Fallom's shoulder. The young Solarian stared at the two space-suited figures in obvious alarm. She was trembling, and Bliss's arm squeezed her gently and reassuringly.

The airlock door opened, and the two stepped inside, their bloated arms waving a farewell. It closed. The mainlock door opened and they stepped clumsily onto the soil of a dead world.

It was dawn. The sky was clear, of course, and purplish in color, but the sun had not yet risen. Along the lighter horizon where the sun would come, there was a slight haze.

Pelorat said, "It's cold."

"Do you feel cold?" said Trevize, with surprise. The suits were well insulated and if there was a problem, now and then, it was with the getting rid of body heat.

Pebrat said, "Not at all, but look---" His radioed voice sounded Trevize's ear, and his finger pointed.

In the purplish light of dawn, the crumbling stone front of the building they were approaching was sheathed in hoar frost.

Trevize said, "With a thin atmosphere, it would get colder at night than you would expect, and warmer in the day. Right now it's the coldest part of the day and it should take several hours before it gets too hot for us to remain in the sun."

As though the word had been a cabalistic incantation, the rim of the sun appeared above the horizon.

"Don't look at it," said Trevize conversationally. "Your face-plate is reflective and ultraviolet-opaque, but it would still be dangerous."

He turned his back to the rising sun and let his long shadow fall on the building. The sunlight was causing the frost to disappear, even as he watched. For a few moments, the wall looked dark with dampness and then that disappeared, too.

Trevize said, "The buildings don't look as good down here as they looked from the sky. They're cracked and crumbling. That's the result of the temperature change, I suppose, and of having the water traces freeze and melt each night and day for maybe as much as twenty thousand years."

Pelorat said, "There are letters engraved in the stone above the entrance, but crumbling has made them difficult to read."

"Can you make it out, Janov?"

"A financial institution of some sort. At least I make out a word which may be 'bank.'"

"What's that?"

"A building in which assets were stored, withdrawn, traded, invested, loaned-if it's what I think it is."

"A whole building devoted to it? No computers?"

"Without computers taking over altogether."

Trevize shrugged. He did not find the details of ancient history inspiring.

They moved about, with increasing haste, spending less time at sac building. The silence, the deadness, was completely depressing. The slow millennial-long collapse into which they had intruded made the place seem like the skeleton of a city, with everything gone but the bones.

They were well up in the temperate zone, but Trevize imagined he could feel the heat of the sun on his back.

Pelorat, about a hundred meters to his right, said sharply, "Look at that."

Trevize's ears rang. He said, "Don't shout, Janov. I can hear your whispers clearly no matter how far away you are. What is it?"

Pelorat, his voice moderating at once, said, "This building is the 'Hall of the Worlds.' At least, that's what I think the inscription reads."

Trevize joined him. Before them was a three-story structure, the line of its roof irregular and loaded with large fragments of rock, as though some sculptured object that had once stood there had fallen to pieces.

"Are you sure?" said Trevize.

"If we go in, we'll find out."

They climbed five low, broad steps, and crossed a space-wasting plaza. In the thin air, their metal-shod footsteps made a whispering vibration rather than a sound.

"I see what you mean by 'large, useless, and expensive,' " muttered Trevize.

They entered a wide and high hall, with sunlight shining through tall windows and illuminating the interior too harshly where it struck and yet leaving things obscure in the shadow. The thin atmosphere scattered little light.

In the center was a larger than life-size human figure in what seemed to be a synthetic stone. One arm had fallen off. The other arm was cracked at the shoulder and Trevize felt that if he tapped it sharply that arm, too, would break off. He stepped back as though getting too near might tempt him into such unbearable vandalism.

"I wonder who that is?" said Trevize. "No markings anywhere. I suppose those who set it up felt that his fame was so obvious he needed no identification, but now-" He felt himself in danger of growing philosophical and turned his attention away.

Pelorat was looking up, and Trevize's glance followed the angle of Pelorat's head. There were markings--carvings--on the wall which Trevize could not read.

"Amazing," said Pelorat. "Twenty thousand years old, perhaps, and, in here, protected somewhat from sun and damp, they're still legible."

"Not to me," said Trevize.

"It's in old script and ornate even for that. Let's see now-seven-one-two-" His voice died away in a mumble, and then he spoke up again. "There are fifty names listed and there are supposed to have been fifty Spacer worlds and this is 'The Hall of the Worlds.' I assume those are the names of the fifty Spacer worlds, probably in the order of establishment. Aurora is first and Solaria is last. If you'll notice, there are seven columns, with seven names in the first six columns and then eight names in the last. It is as though they had planned a seven-by-seven grid and then added Solaria after the fact. My guess, old chap, is that that list dates back to before Solaria was terraformed and populated."

"And which one is this planet we're standing on? Can you tell?"

Pelorat said, "You'll notice that the fifth one down in the third column, the nineteenth in order, is inscribed in letters a little larger than the others. The listers seem to have been self-centered enough to give themselves some pride of place. Besides-"

"What does the name read?"

"As near as I can make out, it says Melpomenia. It's a name I'm totally unfamiliar with."

"Could it represent Earth?"

Pelorat shook his head vigorously, but that went unseen inside his helmet. He said, "There are dozens of words used for Earth in the old legends. Gaia is one of them, as you know. So is Terra, and Erda, and so on. They're all short. I don't know of any long name used for it, or anything even resembling a short version of Melpomenia."

"Then we're standing on Melpomenia, and it's not Earth."

"Yes. And besides-as I started to say earlier-an even better indication than the larger lettering is that the coordinates of Melpomenia are given as 0, 0, 0, and you would expect coordinates to be referred to one's own planet."

"Co-ordinates?" Trevize sounded dumbfounded. "That list gives the coordinates, too?"

"They give three figures for each and I presume those are coordinates. What else can they be?"

Trevize did not answer. He opened a small compartment in the portion of the space suit that covered his right thigh and took out a compact device with wire

connecting it to the compartment. He put it up to his eyes and carefully focused it on the inscription on the wall, his sheathed fingers making a difficult job out of something that would ordinarily have been a moment's work.

"Camera?" asked Pelorat unnecessarily.

"It will feed the image directly into the ship's computer," said Trevize.

He took several photographs from different angles; then said, "Wait! I've got to get higher. Help me, Janov."

Pelorat clasped his hands together, stirrup-fashion, but Trevize shook his head.

"That won't support my weight. Get on your hands and knees."

Pelorat did so, laboriously, and, as laboriously, Trevize, having tucked the camera into its compartment again, stepped on Pelorat's shoulders and from them on to the pedestal of the statue. He tried to rock the statue carefully to judge its firmness, then placed his foot on one bent knee and used it as a base for pushing himself upward and catching the armless shoulder. Wedging his toes against some unevenness at the chest, he lifted himself and, finally, after several grunts, managed to sit on the shoulder. To those long-dead who had revered the statue and what it represented, what Trevize did would have seemed blasphemy, and Trevize was sufficiently influenced by that thought to try to sit lightly.

"You'll fall and hurt yourself," Pelorat called out anxiously.

"I'm not going to fall and hurt myself, but you might deafen me." Trevize unslung his camera and focused once more. Several more photographs were taken and then he replaced the camera yet again and carefully lowered himself till his feet touched the pedestal. He jumped to the ground and the vibration of his contact was apparently the final push, for the still intact arm crumbled, and produced a small heap of rubble at the foot of the statue. It made virtually no noise as it fell.

Trevize froze, his first impulse being that of finding a place to hide before the watchman came and caught him. Amazing, he thought afterward, how quickly one relives the days of one's childhood in a situation like that-when you've accidentally broken something that looks important. It lasted only a moment, but it cut deeply.

Pelorat's voice was hollow, as befitted one who had witnessed and even abetted an act of vandalism, but he managed to find words of comfort. "It's - it's all right, Golan. It was about to come down by itself, anyway."

He walked over to the pieces on the pedestal and floor as though he were going to demonstrate the point, reached out for one of the larger fragments, and then said, "Golan, come here."

Trevize approached and Pelorat, pointing at a piece of stone that had clearly been the portion of the arm that had been joined to the shoulder, said, "What is this?"

Trevize stared. There was a patch of fuzz, bright green in color. Trevize rubbed it gently with his suited finger. It scraped off without trouble.

"It looks a lot like moss," he said.

"The life-without-mind that you mentioned?"

"I'm not completely sure how far without mind. Bliss, I imagine, would insist that this had consciousness, too-but she would claim this stone also had it."

Pelorat said, "Do you suppose that moss stuff is what's crumbling the rock?"

Trevize said, "I wouldn't be surprised if it helped. The world has plenty of sunlight and it has some water. Half what atmosphere it has is water vapor. The rest is nitrogen and inert gases. Just a trace of carbon dioxide, which would lead one to suppose there's no plant life-but it could be that the carbon dioxide is low because it is virtually all incorporated into the rocky crust. Now if this rock has some carbonate in it, perhaps this moss breaks it down by secreting acid, and then makes use of the carbon dioxide generated. This may be the dominant remaining form of life on this planet."

"Fascinating," said Pelorat.

"Undoubtedly," said Trevize, "but only in a limited way. The coordinates of the Spacer worlds are rather more interesting but what we really want are the coordinates of Earth. If they're not here, they may be elsewhere in the building-or in another building. Come, Janov."

"But you know-"began Pelorat.

"No, no," said Trevize impatiently. "We'll talk later. We've got to see what else, if anything, this building can give us. It's getting warmer." He looked at the small temperature reading on the back of his left glove. "Come, Janov."

They tramped through the rooms, walking as gently as possible, not because they were making sounds in the ordinary sense, or because there was anyone to hear them, but because they were a little shy of doing further damage through vibration.

They kicked up some dust, which moved a short way upward and settled quickly through the thin air, and they left footmarks behind them.

Occasionally, in some dim corner, one or the other would silently point out more samples of moss that were growing. There seemed a little comfort in the presence of life, however low in the scale, something that lifted the deadly, suffocating feel of walking through a dead world, especially one in which artifacts all about showed that once, long ago, it had been an elaborately living one.

And then, Pelorat said, "I think this must be a library."

Trevize looked about curiously. There were shelves and, as he looked more narrowly, what the corner of his eye had dismissed as mere ornamentation, seemed as though they might well be book-films. Gingerly, he reached for one. They were thick and clumsy and then he realized they were only cases. He fumbled with his thick fingers to open one, and inside he saw several discs. They were thick, too, and seemed brittle, though he did not test that.

He said, "Unbelievably primitive."

"Thousands of years old," said Pelorat apologetically, as though defending the old Melpomenians against the accusation of retarded technology.

Trevize pointed to the spine of the film where there were dim curlicues of the ornate lettering that the ancients had used. "Is that the title? What does it say?"

Pelorat studied it. "I'm not really sure, old man. I think one of the words refers to microscopic life. It's a word for 'microorganism,' perhaps. I suspect these are technical microbiological terms which I wouldn't understand even in Standard Galactic."

"Probably," said Trevize morosely. "And, equally probably, it wouldn't do us any good even if we could read it. We're not interested in germs.-Do me a favor, Janov. Glance through some of these books and see if there's anything there with an interesting title. While you're doing that, I'll look over these book-viewers."

"Is that what they are?" said Pelorat, wondering. They were squat, cubical structures, topped by a slanted screen and a curved extension at the top that might serve as an elbow rest or a place on which to put an electro-notepad-if they had had such on Melpomenia.

Trevize said, "if this is a library, they must have book-viewers of one kind or another, and this seems as though it might suit."

He brushed the dust off the screen very gingerly and was relieved that the screen, whatever it might be made of, did not crumble at his touch. He manipulated the controls lightly, one after another. Nothing happened. He tried another book-viewer, then another, with the same negative results.

He wasn't surprised. Even if the device were to remain in working order for twenty millennia in a thin atmosphere and was resistant to water vapor, there was still the question of the power source. Stored energy had a way of leaking, no matter what was done to stop it. That was another aspect of the all embracing, irresistible second law of thermodynamics.

Pelorat was behind him. "Golan?"

"Yes."

"I have a book-film here-"

"What kind?"

"I think it's a history of space flight."

"Perfect but it won't do us any good if I can't make this viewer work."

His hands clenched in frustration.

"We could take the film back to the ship."

"I wouldn't know how to adapt it to our viewer. It wouldn't fit and our scanning system is sure to be incompatible."

"But is all that really necessary, Golan? If we-"

"It is really necessary, Janov. Now don't interrupt me. I'm trying to decide what to do. I can try adding power to the viewer. Perhaps that is all it needs."

"Where would you get the power?"

"Well-" Trevize drew his weapons, looked at them briefly, then settled his blaster back into its holster. He cracked open his neuronc whip, and studied the energy-supply level. It was at maximum.

Trevize threw himself prone upon the floor and reached behind the viewer (he kept assuming that was what it was) and tried to push it forward. It moved a small way and he studied what he found in the process.

One of those cables had to carry the power supply and surely it was the one that came out of the wall. There was no obvious plug or joining. (How does one deal with an alien and ancient culture where the simplest taken-for granted matters are made unrecognizable?)

He pulled gently at the cable, then harder. He turned it one way, then the other. He pressed the wall in the vicinity of the cable, and the cable in the vicinity of the wall. He turned his attention, as best he could, to the halfhidden back of the viewer and nothing he could do there worked, either.

He pressed one hand against the floor to raise himself and, as he stood up, the cable came with him. What he had done that had loosened it, he hadn't the slightest idea.

It didn't look broken or torn away. The end seemed quite smooth and it had left a smooth spot in the wall where it had been attached.

Pelorat said softly, "Golan, may I-"

Trevize waved a peremptory arm at the other. "Not now, Janov. Please!" He was suddenly aware of the green material caking the creases on his left glove. He must have picked up some of the moss behind the viewer and crushed it. His glove had a faint dampness to it, but it dried as he watched, and the greenish stain grew brown.

He turned his attention toward the cable, staring at the detached end carefully. Surely there were two small holes there. Wires could enter.

He sat on the floor again and opened the power unit of his neuronc whip. Carefully, he depolarized one of the wires and clicked it loose. He then, slowly and delicately, inserted it into the hole, pushing it in until it stopped. When he tried gently to withdraw it again, it remained put, as though it had been seized. He suppressed his first impulse to yank it out again by force. He depolarized the other wire and pushed it into the other opening. It was conceivable that that would close the circuit and supply the viewer with power.

"Janov," he said, "you've played about with book-films of all kinds. See if you can work out a way of inserting that book into the viewer."

"Is it really nece-"

"Please, Janov, you keep trying to ask unnecessary questions. We only have so much time. I don't want to have to wait far into the night for the building to cool off to the point where we can return."

"It must go in this way," said Janov, "but-"

"Good," said Trevize. "If it's a history of space flight, then it will have to begin with Earth, since it was on Earth that space flight was invented. Let's see if this thing works now."

Pelorat, a little fussily, placed the book-film into the obvious receptacle and then began studying the markings on the various controls for any hint as to direction.

Trevize spoke in a low voice, while waiting, partly to ease his own tension. "I suppose there must be robots on this world, too-here and there-in reasonable order to all appearances-glistening in the near-vacuum. The trouble is their power supply would long

since have been drained, too, and, even if repowered, what about their brains? Levers and gears might withstand the millennia, but what about whatever microswitches or subatomic gizmos they had in their brains? They would have to have deteriorated, and even if they had not, what would they know about Earth. What would they"

Pelorat said, "The viewer is working, old chap. See here."

In the dim light, the book-viewer screen began to flicker. It was only faint, but Trevize turned up the power slightly on his neuronc whip and it grew brighter. The thin air about them kept the area outside the shafts of sunlight comparatively dim, so that the room was faded and shadowy, and the screen seemed the brighter by contrast.

It continued to flicket, with occasional shadows drifting across the screen.

"It needs to be focused," said Trevize.

"I know," said Pelorat, "but this seems the best I can do. The film itself must have deteriorated."

The shadows came and went rapidly now, and periodically there seemed something like a faint caricature of print. Then, for a moment, there was sharpness and it faded again.

"Get that back and hold it, Janov," said Trevize.

Pelorat was already trying. He passed it going backward, then again forward, and then got it and held it.

Eagerly, Trevize tried to read it, then said, in frustration, "Can you make it out, Janov?"

"Not entirely," said Pelorat, squinting at the screen. "It's about Aurora. I can tell that much. I think it's dealing with the first hyperspatial expedition-the 'prime outpouring,' it says."

He went forward, and it blurred and shadowed again. He said finally, "All the pieces I can get seem to deal with the Spacer worlds, Golan. There's nothing I can find about Earth."

Trevize said bitterly, "No, there wouldn't be. It's all been wiped out on this world as it has on Trantor. Turn the thing off."

"But it doesn't matter-" began Pelorat, turning it off:

"Because we can try other libraries? It will be wiped out there, too. Everywhere. Do you know-" He had looked at Pelorat as he spoke, and now he stared at him with a mixture of horror and revulsion. "What's wrong with your face-plate?" he asked.

67.

PELORAT automatically lifted his gloved hand to his face-plate and then took it away and looked at it.

"What is it?" he said, puzzled. Then, he looked at Trevize and went on, rather squeakily, "There's something peculiar about your face-plate, Golan."

Trevize looked about automatically for a mirror. There was none and he would need a light if there were. He muttered, "Come into the sunlight, will you?"

He half-led, half-pulled Pelorat into the shaft of sunlight from the nearest window. He could feel its warmth upon his back despite the insulating effect of the space suit.

He said, "Look toward the sun, Janov, and close your eyes."

It was at once clear what was wrong with the face-plate. There was moss growing luxuriantly where the glass of the face-plate met the metallized fabric of the suit itself. The face-plate was rimmed with green fuzziness and Trevize knew his own was, too.

He brushed a finger of his glove across the moss on Pelorat's face-plate. Some of it came off, the crushed green staining the glove. Even as he watched it glisten in the sunlight, however, it seemed to grow stiffer and drier. He tried again, and this time, the moss crackled off. It was turning brown. He brushed the edges of Pelorat's face-plate again, rubbing hard.

"Do mine, Janov," he said. Then, later, "Do I look clean? Good, so do you. -Let's go. I don't think there's more to do here."

The sun was uncomfortably hot in the deserted airless city. The stone buildings gleamed brightly, almost achingly. Trevize squinted as he looked at them and, as far as possible, walked on the shady side of the thoroughfares. He stopped at a crack in one of the building fronts, one wide enough to stick his little finger into, gloved as it was. He did just that, looked at it, muttered, "Moss," and deliberately walked to the end of the shadow and held that finger out in the sunlight for a while.

He said, "Carbon dioxide is the bottleneck. Anywhere they can get carbon dioxide-decaying rock-anywhere-it will grow. We're a good source of carbon dioxide, you know, probably richer than anything else on this nearly dead planet, and I suppose traces of the gas leak out at the boundary of the face-plate."

"So the moss grows there."

"Yes."

It seemed a long walk back to the ship, much longer and, of course, hotter than the one they had taken at dawn. The ship was still in the shade when they got there, however; that much Trevize had calculated correctly, at least.

Pelorat said, "Look!"

Trevize saw. The boundaries of the mainlock were outlined in green moss.

"More leakage?" said Pelorat.

"Of course. Insignificant amounts, I'm sure, but this moss seems to be a better indicator of trace amounts of carbon dioxide than anything I ever heard of. Its spores must be everywhere and wherever a few molecules of carbon dioxide are to be found, they sprout." He adjusted his radio for ship's wavelength and said, "Bliss, can you hear me?"

Bliss's voice sounded in both sets of oars. "Yes. Are you ready to come in? Any luck?"

"We're just outside," said Trevize, "but don't open the lock. We'll open it from out here. Repeat, don't open the lock."

"Why not?"

"Bliss, just do as I ask, will you? We can have a long discussion afterward."

Trevize brought out his blaster and carefully lowered, its intensity to minimum, then gazed at it uncertainly. He had never used it at minimum. He looked about him. There was nothing suitably fragile to test it on.

In sheer desperation, he turned it on the rocky hillside in whose shadow the Fur Star lay. -The target didn't turn red-hot. Automatically, he felt the spot he had hit. Did 'it feel warm? He couldn't tell with any degree of certainty through the insulated fabric of his suit.

He hesitated again, then thought that the hull of the ship would be as resistant, within an order of magnitude at any rate, as the hillside. He turned the blaster on the rim of the lock and flicked the contact briefly, holding his breath.

Several centimeters of the moss-like growth browned at once. He waved his hand in the vicinity of the browning and even the mild breeze set up in the thin air in this way sufficed to set the light skeletal remnants that made up the brown material to scattering.

"Does it work?" said Pelorat anxiously.

"Yes, it does," said Trevize. "I turned the blaster into a mild heat ray."

He sprayed the heat all around the edge of the lock and the green vanished at the touch. All of it. He struck the mainlock to create a vibration that would knock off what remained and a brown dust fell to the ground-a dust so fine that it even lingered in the thin atmosphere, buoyed up by wisps of gas.

"I think we can open it now," said Trevize, and, using his wrist controls, he tapped out the emission of the radio-wave combination that activated the opening mechanism from inside. The lock gaped and had not opened more than halfway when Trevize said, "Don't dawdle, Janov, get inside. -Don't wait for the steps. Climb in."

Trevize followed, sprayed the rim of the lock with his toned-down blaster. He sprayed the steps, too, once they had lowered. He then signaled the close_ of the lock and kept on spraying till they were totally enclosed.

Trevize said, "We're in the lock, Bliss. We'll stay here a few minutes. Continue to do nothing!"

Bliss's voice said, "Give me a hint. Are you all right? How is Pel?"

Pel said, "I'm here, Bliss, and perfectly well. There's nothing to worry about."

"If you say so, Pel, but there'll have to be explanations later. I hope you know that."

"It's a promise," said Trevize, and activated the lock light.

The two space-suited figures faced each other.

Trevize said, "We're pumping out all the planetary air we can, so let's just wait till that's done."

"What about the ship air? Are we going to let that in?"

"Not for a while. I'm as anxious to get out of the space suit as you are, Janov. I just want to make sure that we get rid of any spores that have entered with us-or upon us."

By the not entirely satisfactory illumination of the lock light, Trevize turned his blaster on the inner meeting of lock and hull, spraying the heat methodically along the floor, up and around, and back to the floor.

"Now you, Janov."

Pelorat stirred uneasily, and Trevize said, "You may feel warm. It shouldn't be any worse than that. If it grows uncomfortable, just say so."

He played the invisible beam over the face-plate, the edges particularly, then, little by little, over the rest of the space suit.

He muttered, "Lift your arms, Janov." Then, "Rest your arms on my shoulder, and lift one foot- I've got to do the soles-now the other. -Are you getting too warm?"

Pelorat said, "I'm not exactly bathed in cool breezes, Golan."

"Well, then, give me a taste of my own medicine. Go over me."

"I've never held a blaster."

"You must hold it. Grip it so, and, with your thumb, push that little knob -and squeeze the holster tightly. Right. -Now play it over my face-plate. Move it steadily, Janov, don't let it linger in one place too long. Over the rest of the helmet, then down the cheek and neck."

He kept up the directions, and when he had been heated everywhere and was in an uncomfortable perspiration as a result, he took back the blaster and studied the energy level.

"More than half gone," he said, and sprayed the interior of the lock methodically, back and forth over the wall, till the blaster was emptied of its charge, having itself heated markedly through its rapid and sustained discharge. He then restored it to its holster.

Only then did he signal for entry into the ship. He welcomed the hiss and feel of air coming into the lock as the inner door opened. Its coolness and its convective powers would carry off the warmth of the space suit far more quickly than radiation alone would do. It might have been imagination, but he felt the cooling effect at once. Imagination or not, he welcomed that, too.

"Off with your suit, Janov, and leave it out here in the lock," said Trevize.

"If you don't mind," said Pelorat, "a shower is what I would like to have before anything else."

"Not before anything else. In fact, before that, and before you can empty your bladder, even, I suspect you will have to talk to Bliss."

Bliss was waiting for them, of course, and with a look of concern on her face. Behind her, peeping out, was Fallom, with her hands clutching firmly at Bliss's left arm.

"What happened?" Bliss asked severely. "What's been going on?"

"Guarding against infection," said Trevize dryly, "so I'll be turning on the ultraviolet radiation. Break out the dark glasses. Please don't delay."

With ultraviolet added to the wall illumination, Trevize took off his moist garments one by one and shook them out, turning them in one direction and another.

"Just a precaution," he said. "You do it, too, Janov. -And, Bliss, I'll have to peel altogether. If that will make you uncomfortable, step into the next room."

Bliss said, "It will neither make me uncomfortable, nor embarrass me. I have a good notion of what you look like, and it will surely present me with nothing new. -What infection?"

"Just a little something that, given its own way," said Trevize, with a deliberate air of indifference, "could do great damage to humanity, I think."

68.

IT was all done. The ultraviolet light had done its part. Officially, according to the complex films of information and instructions that had come with the Far Star when Trevize had first gone aboard back on Terminus, the light was there precisely for purposes of disinfection. Trevize suspected, however, that the temptation was always there, and sometimes yielded to, to use it for developing a fashionable tan for those who were from worlds where tans were fashionable. The light was, however, disinfecting, however used.

They took the ship up into space and Trevize maneuvered it as close to Melpomenia's sun as he might without making them all unpleasantly uncomfortable, turning and twisting the vessel so as to make sure that its entire surface was drenched in ultraviolet.

Finally, they rescued the two space suits that had been left in the lock and examined them until even Trevize was satisfied.

"All that," said Bliss, at last, "for moss. Isn't that what you said it was, Trevize? Moss?"

"I call it moss," said Trevize, "because that's what it reminded me of. I'm not a botanist, however. All I can say is that it's intensely green and can probably make do on very little light-energy."

"Why very little?"

"The moss is sensitive to ultraviolet and can't grow, or even survive, in direct illumination. Its spores are everywhere and it grows in hidden corners, in cracks in statuary, on the bottom surface of structures, feeding on the energy of scattered photons of light wherever there is a source of carbon dioxide."

Bliss said, "I take it you think they're dangerous."

"They might well be. If some of the spores were clinging to us when we entered, or swirled in with us, they would find illumination in plenty without the harmful ultraviolet. They would find ample water and an unending supply of carbon dioxide."

"Only 0.03 percent of our atmosphere," said Bliss.

"A great deal to them-and 4 percent in our exhaled breath. What if spores grew in our nostrils, and on our skin? What if they decomposed and destroyed our food? What if they produced toxins that killed us? Even if we labored to kill them but left some spores alive, they would be enough, when carried to another world by us, to infest it, and from there be carried to other worlds. Who knows what damage they might do?"

Bliss shook her head. "Life is not necessarily dangerous because it is different. You are so ready to kill."

"That's Gaia speaking," said Trevize.

"Of course it is, but I hope I make sense, nevertheless. The moss is adapted to the conditions of this world. Just as it makes use of light in small quantities but is killed by large; it makes use of occasional tiny whiffs of carbon dioxide and may be killed by large amounts. It may not be capable of surviving on any world but Melpomenia."

"Would you want me to take a chance on that?" demanded Trevize.

Bliss shrugged. "Very well. Don't be defensive. I see your point. Being an Isolate, you probably had no choice but to do what you did."

Trevize would have answered, but Fallom's clear high-pitched voice broke in, in her own language.

Trevize said to Pelorat, "What's she saying?"

Pelorat began, "What Fallom is saying-"

Fallom, however, as though remembering a moment too late that her own language was not easily understood, began again. "Was there Jemby there where you were?"

The words were pronounced meticulously, and Bliss beamed. "Doesn't she speak Galactic well? And in almost no time."

Trevize said, in a low voice, "I'll mess it up if I try, but you explain to her, Bliss, that we found no robots on the planet."

"I'll explain it," said Pelorat. "Come, Fallom." He placed a gentle arm about the youngster's shoulders. "Come to our room and I'll get you another book to read."

"A book? About Jemby?"

"Not exactly-" And the door closed behind them.

"You know," said Trevize, looking after them impatiently, "we waste our time playing nursemaid to that child."

"Waste? In what way does it interfere with your search for Earth, Trevize? -In no way. Playing nursemaid establishes communication, however, allays fear, supplies love. Are these achievements nothing?"

"That's Gaia speaking again."

"Yes," said Bliss. "Let us be practical, then. We have visited three of the old Spacer worlds and we have gained nothing."

Trevize nodded. "True enough."

"In fact, we have found each one dangerous, haven't we? On Aurora, there were feral dogs; on Solaria, strange and dangerous human beings; on Melpomenia, a threatening moss. Apparently, then, when a world is left to itself, whether it contains human beings or not, it becomes dangerous to the Interstellar community."

"You can't consider, that a general rule."

"Throe out of throe certainly seems impressive."

"And how does it impress you, Bliss?"

"I'll tell you. Please listen to me with an open mind. If you have millions of interacting worlds in the Galaxy, as is, of course, the affil case, and if. each is made up entirely of Isolates, as they are, then on each world, human beings are dominant and can force their will on nonhuman life-forms, on the inanimate geological background, and even on each other. The Galaxy is, then, a very primitive and fumbling and malfunctioning Galaxia. The beginnings of a unit. Do you see what I mean?"

"I see what you're trying to say-but that doesn't mean I'm going to agree with you when you're done saying it."

"Just listen to me. Agree or not, as you please, but listen. The only way the Galaxy will work .is as a proto-Galaxia, and the less proto and the more Galaxia, the better. The Galactic Empire was an attempt at a strong proto-Galaxia, and when it fell apart, times grew rapidly worse and there was the constant drive to strengthen the proto-Galaxia concept. The Foundation Confederation is such an attempt. So was the Mule's Empire. So is the Empire the Second Foundation is planning. But even if there were no such Empires or Confederations; even if -the entire Galaxy were in turmoil, it would be a connected turmoil, with each world interacting, even if only hostilely, with every other. That would, in itself, be a kind of union and it would not yet be the worst case."

"What would be the worst, then?"

"You know the answer to that, Trevize. You've seen it. If a human-inhabited world breaks up completely, is truly Isolate, and if it loses all interaction with other human worlds, it develops-malignantly."

"A cancer, then?"

"Yes. Isn't Solaria just that? Its hand is against all worlds. And on it, the hand of each individual is against those of all others. You've seen it. And if human beings disappear altogether, the last trace of discipline goes. The each-against-each becomes unreasoning, as with the dogs, or is merely an elemental force as with the moss. You see, I suppose, that the closer we are to Galaxia, the better the society. Why, then, stop at anything short of Galaxia?"

For a while, Trevize stared silently at Bliss. "I'm thinking about it. But why this assumption that dosage is a one-way thing; that if a little is good, a lot is better, and all there is is best of all? Didn't you yourself point out that it's possible the moss is adapted to very little carbon dioxide so that a plentiful supply might kill it? A human being two meters tall is better off than one who is one meter tall; but is also better off than one who is three meters tall. A mouse isn't better off, if it is expanded to the size of an elephant. He wouldn't live. Nor would an elephant be better off reduced to the size of a mouse.

"There's natural size, a natural complexity, some optimum quality for everything, whether star or atom, and it's certainly true of living things and living societies. I don't say the old Galactic Empire was ideal, and I csfa certainly see saws in the Foundation Confederation, but I'm not prey say that because total Isolation is bad, total Unification is good. The eats: may both be equally horrible, and an old-fashioned Galactic Empire, however imperfect, may be the best we can do."

Bliss shook her head. "I wonder if you believe yourself, Trevize. Are you going to argue that a virus and a human being are equally unsatisfactory, and wish to settle for something in-between-like a slime mold?"

"No. But I might argue that a virus and a superhuman being are equally unsatisfactory, and wish to settle for something in-between-like an ordinary person. - There is, however, no point in arguing. I will have my solution when I find Earth. On Melpomenia, we found the coordinates of forty-seven other Spacer worlds."

"And you'll visit them all?"

"Every one, if I have to."

"Risking the dangers on each."

"Yes, if that's what it takes to find Earth. "

Pelorat had emerged from the room within which he had left Fallow, and seemed about to say something when he was caught up in the rapid-fire exchange between Bliss and Trevize. He stared from one to the other as they spoke in turn.

"How long would it take?" asked Bliss.

"However long it takes," said Trevize, "and we ought find what we need on y the next one we visit."

"Or on none of them."

"That we cannot know till we search."

And now, at last, Pelorat managed to insert a word. "But why look, Golan? We have the answer."

Trevize waved an impatient hand in the direction of Pelorat, checked the motion, turned his head, and said blankly, "What?"

"I said we have the answer. I tried to tell you this on Melpomenia at least five times, but you were so wrapped up in what you were doing-

"What answer do we have? What are you talking about? "

"About Earth. I think we know where Earth is."

PART SIX - ALPHA

16. THE CENTER OF THE WORLDS

69.

TREVIZE stared at Pelorat for a long moment, and with an expression of clear displeasure. Then he said, "Is there something you saw that I did not, and that you did not tell me about?"

"No," answered Pelorat mildly. "You saw it and, as I just said, I tried to explain, but you were in no mood to listen to me."

"Well, try again."

Bliss said, "Don't bully him, Trevize."

"I'm not bullying him. I'm asking for information. And don't you baby him."

"Please," said Pelorat, "listen to me, will you, and not to each other. -Do you remember, Golan, that we discussed early attempts to discover the origin of the human species? Yariff's project? You know, trying to plot the times of settlement of various planets on the assumption that planets would be settled outward from the world of origin in all directions alike. Then, as we moved from newer to older planets, we would approach the world of origin from all directions."

Trevize nodded impatiently. "What I remember is that it didn't work because the dates of settlement were not reliable."

"That's right, old fellow. But the worlds that Yariff was working with were part of the second expansion of the human race. By then, hyperspatial travel was far advanced, and settlement must have grown quite ragged. Leapfrogging very long distances was very simple and settlement didn't necessarily proceed outward in radial symmetry. That surely added to the problem of unreliable dates of settlement.

"But just think for a moment, Golan, of the Spacer worlds. They were in the first wave of settlement. Hyperspatial travel was less advanced then, and there was probably little or no leapfrogging. Whereas millions of worlds were settled, perhaps chaotically, during the second expansion, only fifty were settled, probably in an orderly manner, in the first. Whereas the millions of worlds of the second expansion were settled over a period of twenty thousand years; the fifty of the first expansion were settled over a period of a few centuries-almost instantaneously, in comparison. Those fifty, taken together, should exist in roughly spherical symmetry about the world of origin.

"We have the coordinates of the fifty worlds. You photographed them, remember, from the statue. Whatever or whoever it is that is destroying information that concerns Earth, either overlooked those coordinates, or didn't stop to think that they would give us the information we need. All you have to do, Golan, is to adjust the coordinates to allow for the last twenty thousand years of stellar motions, then find the center of the sphere. You'll end up fairly close to Earth's sun, or at least to where it was twenty thousand years ago."

Trevize's mouth had fallen slightly open during the recital and it took a few moments for him to close it after Pelorat was done. He said, "Now why didn't I think of that?"

"I tried to tell you while we were still on Melpomenia."

"I'm sure you did. I apologize, Janov, for refusing to listen. The fact is it didn't occur to me that-" He paused in embarrassment.

Pelorat chuckled quietly, "That I could have anything of importance to say. I suppose that ordinarily I wouldn't, but this was something in my own field, you see. I am sure that, as a general rule, you'd be perfectly justified in not listening to me."

"Never," said Trevize. "That's not so, Janov. I feel like a fool, and I well deserve the feeling. My apologies again-and I must now get to the computer."

He and Pelorat walked into the pilot-room, and Pelorat, as always, watched with a combination of marveling and incredulity as Trevize's hands settled down upon the desk, and he became what was almost a single man computer organism.

"I'll have to make certain assumptions, Janov," said Trevize, rather blankfaced from computer-absorption. "I have to assume that the first number is a distance in parsecs, and that the other two numbers are angles in radians, the first being up and down, so to speak, and the other, right and left. I have to assume that the use of plus and minus in the case of the angles is Galactic Standard and that the zero-zero-zero mark is Melpomenia's sun."

"That sounds fair enough," said Pelorat.

"Does it? There are six possible ways of arranging the numbers, four possible ways of arranging the signs, distances may be in light-years rather than parsecs, the angles in degrees, rather than radians. That's ninety-six different variations right there. Add to that, the point that if the distances are lightyears, I'm uncertain as to the length of the year used. Add also the fact that I don't know the actual conventions used to measure the angles-from the Melpomenian equator in one case, I suppose, but what's their prime merid-

Pelorat frowned. "Now you make it sound hopeless."

"Not hopeless. Aurora and Solaria are included in the list, and I know where they are in space. I'll use the coordinates, and see if I can locate them. If I end up in the wrong place, I will adjust the coordinates until they give me the right place, and that will tell me what mistaken assumptions I am making as far as the standards governing the coordinates are concerned. Once my assumptions are corrected, I can look for the center of the sphere."

"With all the possibilities for change, won't it make it difficult to decide what to do?"

"What?" said Trevize. He was increasingly absorbed. Then, when Pelorat repeated the question, he said, "Oh well, chances are that the coordinates follow the Galactic Standard and adjusting for an unknown prime meridian isn't difficult. These systems for locating points in space were worked out long ago, and most astronomers are pretty

confident they even antedate interstellar travel. Human beings are very conservative in some ways and virtually never change numerical conventions once they grow used to them. They even come to mistake them for laws of nature, I think. -Which is just as well, for if every world had its own conventions of measurement that changed every century, I honestly think scientific endeavor would stall and come to a permanent stop."

He was obviously working while he was talking, for his words came haltingly. And now he muttered, "But quiet now." .

After that, his face grew furrowed and concentrated until, after several minutes, he leaned back and drew a long breath. He said quietly, "The conventions hold. I've located Aurora. There's no question about it. -See?"

Pelorat stared at the field of stars, and at the bright one near the center and said, "Are you sure?"

Trevize said, "My own opinion doesn't matter. The computer is sure. We've visited Aurora, after all. We have its characteristics-its diameter, mass, luminosity, temperature, spectral details, to say nothing of the pattern of neighboring stars. The computer says it's Aurora."

"Then I suppose we must take its word for it."

"Believe me, we must. Let me adjust the viewscreen and the computer can get to work. It has the fifty sets of coordinates and it will use them one at a time."

Trevize was working on the screen as he spoke. The computer worked in the four dimensions of space-time routinely, but, for human inspection, the viewscreen was rarely needed in more than two dimensions. Now the screen seemed to unfold into a dark volume as deep as it, was tall and broad. Trevize dimmed the room lights almost totally to make the view of star-shine easier to observe.

"It will begin now," he whispered.

A moment later, a star appeared-then another-then another. The view on the screen shifted with every addition so that all might be included. It was as though space was moving backward from the eye so that a more and more panoramic view could be taken.. Combine that with shifts up or down, right or left-

Eventually, fifty dots of light appeared, hovering in three-dimensional space.

Trevize said, "I would have appreciated a beautiful spherical arrangement, but this looks like the skeleton of a snowball that had been patted into shape in a big hurry, out of snow that was too hard and gritty."

"Does that ruin everything?"

"It introduces some difficulties, but that can't be helped, I suppose. The stars themselves aren't uniformly distributed, and certainly habitable planets aren't, so there are bound to be unevennesses in the establishment of new worlds. The computer will adjust each of those dots to its present position, allowing for its likely motion in the last twenty thousand years-even in that time it won't mean much of an adjustment-and then fit them all into a 'bestsphere.' It will find a spherical surface, in other words, from which the distance of all the dots is a minimum. Then we find the center of the sphere, and Earth should be fairly close to that center. Or so we hope. -It won't take long."

70.

IT DIDN'T. Trevize, who was used to accepting miracles from the computer, found himself astonished at how little time it took.

Trevize had instructed the computer to sound a soft, reverberating note upon deciding upon the coordinates of the best-center. There was no reason for that, except for the satisfaction of hearing it and knowing that perhaps the search had been ended.

The sound came in a matter of minutes, and was like the gentle stroking of a mellow gong. It swelled till they could feel the vibration physically, and then slowly faded.

Bliss appeared at the door almost at once. "What's that?" she asked, her eyes big. "An emergency?"

Trevize said, "Not at all."

Pelorat added eagerly, "We may have located Earth, Bliss. That sound was the computer's way of saying so."

She walked into the room. "I might have been warned."

Trevize said, "I'm sorry, Bliss. I didn't mean it to be quite that loud."

Fallom had followed Bliss into the room and said, "Why was there that sound, Bliss?"

"I see she's curious, too," said Trevize. He sat back, feeling drained. The next step was to try the finding on the real Galaxy, to focus on the coordinates of the center of the Spacer worlds and see if a G-type star was actually present. Once again, he was reluctant to take the obvious step, unable to make himself put the possible solution to the actual test.

"Yes," said Bliss. "Why shouldn't she? She's as human as we are."

"Her parent wouldn't have thought so," said Trevize abstractedly. "I worry about the kid. She's bad news."

"In what way has she proven so?" demanded Bliss.

Trevize spread his arms. "Just a feeling."

Bliss gave him a disdainful look, and turned to Fallom. "We are trying to locate Earth, Fallom."

"What's Earth?"

"Another world, but a special one. It's the world our ancestors came from. Do you know what the word 'ancestors' means from your reading, Fallom?"

"Does it mean?" But the last word was not in Galactic.

Pelorat said, "That's an archaic word for 'ancestors,' Bliss. Our word 'forebears' is closer to it."

"Very well," said Bliss, with a sudden brilliant smile. "Earth is the world where our forebears came from, Fallom. Yours and mine and Pel's and Trevize's."

"Yours, Bliss-and mine also." Fallom sounded puzzled. "Both of them?"

"There's just one set of forebears," said Bliss. "We had the same forebears, all of us."

Trevize said, "It sounds to me as though the child knows very well that she's different from us."

Bliss said to Trevize in a low voice, "Don't say that. She must be made to see she isn't. Not in essentials."

"Hermaphroditism is essential, I should think."

"I'm talking about the mind."

"Transducer-lobes are essential, too."

"Now, Trevize, don't be difficult. She's intelligent and human regardless of details."

She turned to Fallom, her voice rising to its normal level. "Think quietly about this, Fallom, and see what it means to you. Your forebears and mine were the same. All the people on all the worlds-many, many worlds-all had the same forebears, and those forebears lived originally on the world named Earth. That means we're all relatives, doesn't it? -Now go back to our room and think of that."

Fallom, after bestowing a thoughtful look on Trevize, turned and ran off, hastened on by Bliss's affectionate slap on her backside.

Bliss turned to Trevize, and said, "Please, Trevize, promise me you won't make any comments in her hearing that will lead her to think she's different from us."

Trevize said, "I promise. I have no wish to impede or subvert the educational procedure, but, you know, she is different from us."

"In ways. As I'm different from you, and as Pel is."

"Don't be naive, Bliss. The differences in Fallom's case are much greater."

"A little greater. The similarities are vastly more important. She, and her people, will be part of Galaxia some day, and a very useful part, I'm sure."

"All right. We won't argue." He turned to the computer with clear reluctance. "And meanwhile, I'm afraid I have to check the supposed position of Earth in real space."

"Afraid?"

"Well," Trevize lifted his shoulders in what he hoped was a half-humorous way, "what if there's no suitable star near the place?"

"Then there isn't," said Bliss.

"I'm wondering if there's any point in checking it out now. We won't be able to make a Jump for several days."

"And you'll be spending them agonizing over the possibilities. Find out now. Waiting won't change matters."

Trevize sat there with his lips compressed for a moment, then said, "You're right. Very well, then-here goes."

He turned to the computer, placed his hands on the handmarks on the desk, and the viewscreen went dark.

Bliss said, "I'll leave you, then. I'll make you nervous if I stay." She left, with a wave of her hand.

"The thing is," he muttered, "that we're going to be checking the computer's Galactic map first and even if Earth's sun is in the calculated position, the map should not include it. But we'll then-

His voice trailed off in astonishment as the viewscreen flashed with a background of stars. These were fairly numerous and dim, with an occasional brighter one sparkling here and there, well scattered over the face of the screen. But quite close to the center was a star that was brighter than all the rest.

"We've got it," said Pelorat jubilantly. "We've got it, old chap. Look how bright it is."

"Any star at centered coordinates would look bright," said Trevize, clearly trying to fight off any initial jubilation that might prove unfounded. "The view, after all, is presented from a distance of a parsec from the centered coordinates. Still, that centered star certainly isn't a red dwarf, or a red giant, or a hot blue-white. Wait for information; the computer is checking its data banks."

There was silence for a few seconds and then Trevize said, "Spectral class G-2." Another pause, then, "Diameter, 1.4 million kilometers-mass, 1.02 times that of Terminus's sun-surface temperature, 6,000 absolute-rotation slow, just under thirty days-no unusual activity or irregularity."

Pelorat said, "Isn't all that typical of the kind of star about which habitable planets are to be found?"

"Typical," said Trevize, nodding in the dimness. "And, therefore, what we'd expect Earth's sun to be like. If that is where life developed, the sun of Earth would have set the original standard."

"So there is a reasonable chance that there would be a habitable planet circling it."

"We don't have to speculate about that," said Trevize, who sounded puzzled indeed over the matter. "The Galactic map lists it as possessing a planet with human life-but with a question mark."

Pelorat's enthusiasm grew. "That's exactly what we would expect, Golan. The life-bearing planet is there, but the attempt to hide the fact obscures data concerning it and leaves the makers of the map the computer uses uncertain."

"No, that's what bothers me," said Trevize. "That's not what we should expect. We should expect far more than that. Considering the efficiency with which data concerning Earth has been wiped out, the makers of the map should not have known that life exists in the system, let alone human life. They should not even have known Earth's sun exists. The Spacer worlds aren't on the map. Why should Earth's sun be?"

"Well, it's there, just the same. What's the use of arguing the fact? What other information about the star is given?"

"A name." -

"Ah! What is it?"

"Alpha."

There was a short pause, then Pelorat said eagerly, "That's it, old man. That's the final bit of evidence. Consider the meaning."

"Does it have a meaning?" said Trevize. "It's just a name to me, and an odd one. It doesn't sound Galactic."

"It isn't Galactic. It's in a prehistoric language of Earth, the same one that gave us Gaia as the name of Bliss's planet."

"What does Alpha mean, then?"

"Alpha is the first letter of the alphabet of that ancient language. That is one of the most firmly attested scraps of knowledge we have about it. In ancient times, 'alpha' was sometimes used to mean the first of anything. To call a sun 'Alpha,' implies that it's the first sun. And wouldn't the first sun be the one around which a planet revolved that was the first planet to bear human, life-Earth?"

"Are you sure of that?"

"Absolutely," said Pelorat.

"Is there anything in early legends.-you're the mythologist, after all-that gives Earth's sun some very unusual attribute?"

"No, how can there be? It has to be standard by definition, and the characteristics the computer has given us are as standard as possible, I imagine. Aren't they?"

"Earth's sun is a single star, I suppose?"

Pelorat said, "Well, of course! As far as I know, all inhabited worlds orbit single stars."

"So I would have thought myself," said Trevize. "The trouble is that that star in the center of the viewscreen is not a single star, it is a binary. The brighter of the two stars making up the binary is indeed standard and it is that one for which the computer supplied us with data. Circling that star with a period of roughly eighty years, however, is another star with a mass four fifths that of the brighter one. We can't see the two as separate stars with the unaided eye, but if I were to enlarge the view, I'm sure we would."

"Are you certain of that, Golan?" said Pelorat, taken aback.

"It's what the computer is telling me. And if we are looking at a binary star, then it's not Earth's sun. It can't be."

71.

TREVIZE broke contact with the computer, and the lights brightened.

That was the signal, apparently, for Bliss to return, with Fallow tagging after her.

"Well, then, what are the results?" she asked.

Trevize said tonelessly, "Somewhat disappointing. Where I expected to find Earth's sun, I found a binary star, instead. Earth's sun is a single star, so the one centered is not it."

Pelorat said, "Now what, Golan?"

Trevize shrugged. "I didn't really expect to see Earth's sun centered. Even the Spacers wouldn't settle worlds in such a way as to set up an exact sphere. Aurora, the oldest of the Spacer worlds, might have sent out settlers of its own and that may have distorted the sphere, too. Then, too, Earth's sun may not have moved at precisely the average velocity of the Spacer worlds."

Pelorat said, "So the Earth can be anywhere. Is that what you're saying?"

"No. Not quite 'anywhere.' All these possible sources of error can't amount to much. Earth's sun must be in the vicinity of the coordinates. The star we've spotted almost exactly at the coordinates must be a neighbor of Earth's sun. It's startling that there should be a neighbor that so closely resembles Earth's sun-except for being a binary-but that must be the case."

"But we would see Earth's sun on the map, then, wouldn't we? I mean, near Alpha?"

"No, for I'm certain Earth's sun isn't on the map at all. It was that which shook my confidence when we first spied Alpha. Regardless of how much it might resemble Earth's sun, the mere fact that it was on the map made me suspect it was not the real thing."

"Well, then," said Bliss. "Why not concentrate on the same coordinates in real space? Then, if there is any bright star close to the center, a star that does not exist in the computer's map, and if it is very much like Alpha in its properties, but is single, might it not be Earth's sun?"

Trevize sighed. "If all that were so, I'd be willing to wager half my fortune, such as it is, that circling that star you speak of would be the planet Earth. -Again, I hesitate to try."

"Because you might fail?"

Trevize nodded. "However," he said, "just give me a moment or two to catch my breath, and I'll force myself to do so."

And while the three adults looked at each other, Fallow approached the computer-desk and stared curiously at the handmarks upon it. She reached out her own hand tentatively toward the markings, and Trevize blocked the motion with a swift outthrusting of his own arm and a sharp, "Mustn't touch, Fallow."

The young Solarian seemed startled, and retreated to the comfort of Bliss's encircling arm.

Pelorat said, "We must face it, Golan. What if you find nothing in real space?"

"Then we will be forced to go back to the earlier plan," said Trevize, "and visit each of the forty-seven Spacer worlds in turn."

"And if that yields nothing, Golan?"

Trevize shook his head in annoyance, as though to prevent that thought from taking too deep a root. Staring down at his knees, he said abruptly, "Then I will think of something else."

"But what if there is no world of forebears at all?"

Trevize looked up sharply at the treble voice. "Who said that?" he asked.

It was a useless question. The moment of disbelief faded, and he knew very well who the questioner was.

"I did," said Fallow.

Trevize looked at her with a slight frown. "Did you understand the conversation?"

Fallow said, "You are looking for the world of forebears, but you haven't found it yet. Maybe there isn't no such world."

"Any such world," said Bliss softly.

"No, Fallow," said Trevize seriously. "There has been a very big effort to hide it. To try so hard to hide something means there is something there to hide. Do you understand what I am saying?"

"Yes," said Fallow. "You do not let me touch the hands on the deck. Because you do not let me do that means it would be interesting to touch them."

"Ah, but not for you, Fallow. -Bliss, you are creating a monster that will destroy us all. Don't ever let her in here unless I'm at the desk. And even then, think twice, will you?"

The small byplay, however, seemed to have shaken him out of his irresolution. He said, "Obviously, I had better get to work. If I just sit here, uncertain as to what to do, that little fright will take over the ship."

The lights dimmed, and Bliss said in a low voice, "You promised, Trevize. Do not call her a monster or a fright in her hearing."

"Then keep an eye on her, and teach her some manners. Tell her children should be never heard and seldom seen."

Bliss frowned. "Your attitude toward children is simply appalling, Trevize."

"Maybe, but this is not the time to discuss the matter."

Then he said, in tones in which satisfaction and relief were equally represented, "There's Alpha again in real space. -And to its left, and slightly upward, is almost as bright a star and one that isn't in the computer's Galactic map. That is Earth's sun. I'll wager all my fortune on it."

72.

"WELL, Now," said Bliss, "we won't take any part of your fortune if you lose, so why not settle the matter in a forthright manner? Let's visit the star as soon as you can make the Jump."

Trevize shook his head. "No. This time it's not a matter of irresolution or fear. It's a matter of being careful. Three times we've visited an unknown world and three times we've come up against something unexpectedly dangerous. And three times, moreover, we've had to leave that world in a hurry. This time the matter is ultimately crucial and I will not play my cards in ignorance again; or at least in any more ignorance than I can help. So far, all we have are vague stories about radioactivity, and that is not enough. By an odd

chance that no one could have anticipated, there is a planet with human life about a parsec from Earth-

"Do we really know that Alpha has a planet with human life on it?" put in Pelorat. "You said the computer placed a question mark after that."

"Even so," said Trevize, "it's worth trying. Why not take a look at it? If it does indeed have human beings on it, let us find out what they know about Earth. For them, after all, Earth is not a distant thing of legend; it is a neighbor world, bright and prominent in their sky."

Bliss said thoughtfully, "It's not a bad idea. It occurs to me that if Alpha is inhabited and if the inhabitants are not your thoroughly typical Isolates, they may be friendly, and we might be able to get some decent food for a change."

"And meet some pleasant people," said Trevize. "Don't forget that. Will it be all right with you, Janov?"

Pelorat said, "You make the decision, old chap. Wherever you go, I will go, too."

Fallom said suddenly, "Will we find Jemby?"

Bliss said hastily, before Trevize could answer, "We will look for it, Fallom."

And then Trevize said, "It's settled then. On to Alpha."

73.

"Two BIG stars," said Fallom, pointing to the viewscreen.

"That's right," said Trevize. "Two of them. -Bliss, do keep an eye on her. I don't want her fiddling with anything."

"She's fascinated by machinery," said Bliss.

"Yes, I know she is," said Trevize, "but I'm not fascinated by her fascination. - Though to tell you the truth, I'm as fascinated as she is at seeing two stars that bright in the viewscreen at the same time."

The two stars were bright enough to seem to be on the point of showing a disc- each of them. The screen had automatically increased filtration density in order to remove the hard radiation and dim the light of the bright stars so as to avoid retinal damage. As a result, few other stars were bright enough to be noticeable, and the two that were reigned in haughty near-isolation.

"The thing is," said Trevize, "I've never been this close to a binary system before."

"You haven't?" said Pelorat, open astonishment in his voice. "How is that possible?"

Trevize laughed. "I've been around, Janov, but I'm not the Galactic rover you think I am."

Pelorat said, "I was never in space at all till I met you, Golan, but I always thought that anyone who did manage to get into space--"

"Would go everywhere. I know. That's natural enough. The trouble with planet-bound people is that no matter how much their mind may tell them otherwise, their imaginations just can't take in the true size of the Galaxy. We could travel all our lives and leave most of the Galaxy unpenetrated and untouched. Besides, no one ever goes to binaries."

"Why not?" said Bliss, frowning. "We on Gaia know little astronomy compared to the traveling Isolates of the Galaxy, but I'm under the impression that binaries aren't rare."

"They're not," said Trevize. "There are substantially more binaries than there are single stars. However, the formation of two stars in close association upsets the ordinary processes of planetary formation. Binaries have less planetary material than single stars do. Such planets as do form about them often have relatively unstable orbits and are very rarely of a type that is reasonably habitable."

"Early explorers, I imagine, studied many binaries at close range but, after a while, for settlement purposes, they sought out only singles. And, of course, once you have a densely settled Galaxy, virtually all travel involves trade and communications and is carried on between inhabited worlds circling single stars. In periods of military activity, I suppose bases were sometimes set up on small, otherwise-uninhabited worlds circling one of the stars of a binary that happened to be strategically placed, but as hyperspatial travel came to be perfected, such bases were no longer necessary."

Pelorat said humbly, ".It's amazing how much I don't know."

Trevize merely grinned. "Don't let that impress you, Janov. When I was in the Navy, we listened to an incredible number of lectures on outmoded military tactics that no one ever planned, or intended to use, and were just talked about out of inertia. I was just rattling off a bit of one of them. -Consider all you know about mythology, folklore, and archaic languages that I don't know, and that only you and a very few others do know."

Bliss said, "Yes, but those two stars make up a binary system and one of them has an inhabited planet circling it."

"We hope it does, Bliss," said Trevize. "Everything has its exceptions. And with an official question mark in this case, which makes it more puzzling. -No, Fallom, those knobs are not toys. -Bliss, either keep her in handcuffs, or take her out."

"She won't hurt anything," said Bliss defensively, but pulled the Solarian youngster to herself just the same. "If you're so interested in that habitable planet, why aren't we there already?"

"For one thing," said Trevize, "I'm just human enough to want to see this sight of a binary system at close quarters. Then, too, I'm just human enough to be cautious. As I've already explained, nothing has happened since we left Gaia that would encourage me to be anything but cautious."

Pelorat said, "Which one of those stars is Alpha, Golan?"

"We won't get lost, Janov. The computer knows exactly which one is Alpha, and, for that matter, so do we. It's the hotter and yellower of the two because it's the larger."

Now the one on the right has a distinct orange tinge to its light, rather like Aurora's sun, if you recall. Do you notice?"

"Yes, now that you call it to my attention."

"Very well. That's the smaller one. -What's the second letter of that ancient language you speak of?"

Pelorat thought a moment, and said, "Beta."

"Then let's call the orange one Beta and the yellow-white one Alpha, and it's Alpha we're heading for right now."

17. NEW EARTH

74.

"FOUR PLANETS," muttered Trevize. "All are small, plus a trailing off of asteroids. No gas giants."

Pelorat said, "Do you find that disappointing?"

"Not really. It's expected. Binaries that circle each other at small distances can have no planets circling one of the stars. Planets can circle the center of gravity of both, but it's very unlikely that they would be habitable-too far away.

"On the other hand if the binaries are reasonably separate, there can be planets in stable orbits about each, if they are close enough to one or the other of the stars. These two stars, according to the computer's data bank, have an average separation of 3.5 billion kilometers and even at periastron, when they are closest together, are about 1.7 billion kilometers apart. A planet in an orbit of less than 200 million kilometers from either star would be stably situated, but there can be no planet with a larger orbit. That means no gas giants since they would have to be farther away from a star, but what's the difference? Gas giants aren't habitable, anyway."

"But one of those four planets might be habitable."

"Actually the second planet is the only real possibility. For one thing, it's the only one of them large enough to have an atmosphere."

They approached the second planet rapidly and over a period of two days its image expanded; at first with a majestic and measured swelling. And then, when there was no sign of any ship emerging to intercept them, with increasing and almost frightening speed.

The Far Star was moving swiftly along a temporary orbit a thousand kilometers above the cloud cover, when Trevize said grimly, "I see why the computer's memory banks put a question mark after the notation that it was inhabited. There's no clear sign of radiation; either light in the night-hemisphere, or radio anywhere."

"The cloud cover seems pretty thick," said Pelorat.

"That should not blank out radio radiation."

They watched the planet wheeling below them, a symphony in swirling white clouds, through occasional gaps of which a bluish wash indicated ocean.

Trevize said, "The cloud level is fairly heavy for an inhabited world. It might be a rather gloomy one. -What bothers me most," he added, as they plunged once more into the night-shadow, "is that no space stations have hailed us."

"The way they did back at Comporellon, you mean?" said Pelorat.

"The way they would in any inhabited world. We would have to stop for the usual checkup on papers, freight, length of stay, and so on."

Bliss said, "Perhaps we missed the hail for some reason."

"Our computer would have received it at any wavelength they might have cared to use. And we've been sending out our own signals, but have roused no one and nothing as a result. Dipping under the cloud layer without communicating with station officials violates space courtesy, but I don't see that we have a choice."

The Far Star slowed, and strengthened its antigravity accordingly, so as to maintain its height. It came out into the sunlight again, and slowed further. Trevize, in coordination with the computer, found a sizable break in the clouds. The ship sank and passed through it. Beneath them heaved the ocean in what must have been a fresh breeze. It lay, wrinkled, several kilometers below, them, faintly striped in lines of froth.

They flew out of the sunlit patch and under the cloud cover. The expanse of water immediately beneath them turned a slate-gray, and the temperature dropped noticeably.

Fallom, staring at the viewscreen, spoke in her own consonant-rich language for a few moments, then shifted to Galactic. Her voice trembled. "What is that which I see beneath?"

"That is an ocean," said Bliss soothingly. "It is a very large mass of water."

"Why does it not dry up?"

Bliss looked at Trevize, who said, "There's too much water for it to dry up."

Fallom said in a half-choked manner, "I don't want all that water. Let us go away." And then she shrieked, thinly, as the Far Star moved through a patch of storm clouds so that the viewscreen turned milky and was streaked with the mark of raindrops.

The lights in the pilot-room dimmed and the ship's motion became slightly jerky.

Trevize looked up in surprise and cried out. "Bliss, your Fallom is old enough to transduce. She's using electric power to try to manipulate the controls. Stop her!"

Bliss put her arms about Fallom, and hugged her tightly, "It's all right, Fallom, it's all right. There's nothing to be afraid of. It's just another world, that's all. There are many like this."

Fallom relaxed somewhat but continued to tremble.

Bliss said to Trevize, "The child has never seen an ocean, and perhaps, for all I know, never experienced fog or rain. Can't you be sympathetic?"

"Not if she tampers with the ship. She's a danger to all of us, then. Take her into your room and calm her down."

Bliss nodded curtly.

Pelorat said, "I'll come with you, Bliss."

"No, no, Pel," she responded. "You stay here. I'll soothe Fallom and you soothe Trevize." And she left.

"I don't need soothing," growled Trevize to Pelorat. "I'm sorry if I flew off the handle, but we can't have a child playing with the controls, can we?"

"Of course we can't," said Pelorat, "but Bliss was caught by surprise. She can control Fallom, who is really remarkably well behaved for a child taken from her home and her-her robot, and thrown, willy-nilly, into a life she doesn't understand."

"I know. It wasn't I who wanted to take her along, remember. It was Bliss's idea."

"Yes, but the child would have been killed, if we hadn't taken her."

"Well, I'll apologize to Bliss later on. To the child, too."

But he was still frowning, and Pelorat said gently, "Golan, old chap, is there anything else bothering you?"

"The ocean," said Trevize. They had long emerged from the rain storm, but the clouds persisted.

"What's wrong with it?" asked Pelorat.

"There's too much of it, that's all."

Pelorat looked blank, and Trevize said, with a snap, "No land. We haven't seen any land. The atmosphere is perfectly normal, oxygen and nitrogen in decent proportions, so the planet has to be engineered, and there has to be plant life to maintain the oxygen level. In the natural state, such atmospheres do not occur--except, presumably, on Earth, where it developed, who knows how. But, then, on engineered planets there are always reasonable amounts of dry land, up to one third of the whole, and never less than a fifth. So how can this planet be engineered, and lack land?"

Pelorat said, "Perhaps, since this planet is part of a binary system, it is completely atypical. Maybe it wasn't engineered, but evolved an atmosphere in ways that never prevail on planets about single stars. Perhaps life developed independently here, as it once did on Earth, but only sea life."

"Even if we were to admit that," said Trevize, "it would do us no Good."

There's no way life in the sea can develop a technology. Technology is always based on fire, and fire is impossible in the sea. A life-bearing planet without technology is not what we're looking for."

"I realize that, but I'm only considering ideas. After all, as far as we know, technology only developed once--on Earth. Everywhere else, the Settlers brought it with them. You can't say technology is 'always' anything, if you only have one case to study."

"Travel through the sea requires streamlining. Sea life cannot have irregular outlines and appendages such as hands."

"Squids have tentacles."

Trevize said, "I admit we are allowed to speculate, but if you're thinking of intelligent squid-like creatures evolving independently somewhere in the Galaxy, and developing a technology not based on fire, you're supposing something not at all likely, in my opinion."

"In your opinion, " said Pelorat gently.

Suddenly, Trevize laughed. "Very well, Janov. I see you're logic-chopping in order to get even with me for speaking harshly to Bliss, and you're doing a good job. I promise you that if we find no land, we will examine the sea as best we can to see if we can find your civilized squids."

As he spoke, the ship plunged into the night-shadow again, and the viewscreen turned black.

Pelorat winced. "I keep wondering," he said. "Is this safe?"

"Is what safe, Janov?"

"Racing through the dark like this. We might dip, and dive into the ocean, and be destroyed instantly."

"Quite impossible, Janov. Really! The computer keeps us traveling along a gravitational line of force. In other words, it remains always at a constant intensity of the planetary gravitational force which means it keeps us at a nearly constant height above sea level."

"But how high?"

"Nearly five kilometers."

"That doesn't really console me, Golan. Might we not reach land and smash into a mountain we don't see?"

"We don't see, but ship's radar will see it, and the computer will guide the ship around or over the mountain."

"What if there's level land, then? We'll miss it in the dark."

"No, Janov, we won't. Radar reflected from water is not at all like radar reflected from land. Water is essentially flat; land is rough. For that reason, reflection from land is substantially more chaotic than reflection from water. The computer will know the difference and it will let me know if there's land in view. Even if it were day and the planet were sun-lit, the computer might well detect land before I would."

They fell silent and, in a couple of hours, they were back in daylight, with an empty ocean again rolling beneath them monotonously, but occasionally invisible when they passed through one of the numerous storms. In one storm, the wind drove the Far Star out of its path. The computer gave way, Trevize explained, in order to prevent an unnecessary waste of energy and to minimize the chance of physical damage. Then, when the turbulence had passed, the computer eased the ship back into its path.

"Probably the edge of a hurricane," said Trevize.

Pelorat said, "See here, old chap, we're just traveling west to east-or east to west. All we're examining is the equator."

Trevize said, "That would be foolish, wouldn't it? We're following a great-circle route northwest-southeast. That takes us through the tropics and both temperate zones and each time we repeat the circle, the path moves westward, as the planet rotates on its axis beneath us. We're methodically crisscrossing the world. By now, since we haven't hit land, the chances of a sizable continent are less than one in ten, according to the computer, and of a sizable island less than one in four, with the chances going down each circle we make."

"You know what I would have done," said Pelorat slowly, as the night hemisphere engulfed them again. "I'd have stayed well away from the planet and swept the entire hemisphere facing me with radar. The clouds wouldn't have mattered, would they?"

Trevize said, "And then zoom to the other side and do the same there. Or just let the planet turn once. -That's hindsight, Janov. Who would expect to approach a habitable planet without stopping at a station and being given a path-or being excluded? And if one went under the cloud layer without stopping at a station, who would expect not to find land almost at once? Habitable planets are-land!"

"Surely not all land," said Pelorat.

"I'm not talking about that," said Trevize, in sudden excitement. "I'm saying we've found land! Quiet!"

Then, with a restraint that did not succeed in hiding his excitement, Trevize placed his hands on the desk and became part of the computer. He said, "It's an island about two hundred and fifty kilometers long and sixty-five kilometers wide, more or less. Perhaps fifteen thousand square kilometers in area or thereabout. Not large, but respectable. More than a dot on the map. Wait-

The lights in the pilot-room dimmed and went out.

"What are we doing?" said Pelorat, automatically whispering as though darkness were something fragile that must not be shattered.

"Waiting for our eyes to undergo dark-adaptation. The ship is hovering over the island. Just watch. Do you see anything?"

"No- Little specks of light, maybe. I'm not sure."

"I see them, too. Now I'll throw in the telescopic lam."

And there was light! Clearly visible. Irregular patches of it.

"It's inhabited," said Trevize. "It may be the only inhabited portion of the pest-,"

"What do we do?"-

"We wait for daytime. That gives us a few hours in which we can rest."

"Might they not attack us?"

"With what? I detect almost no radiation except visible light and infrared. It's inhabited and the inhabitants are clearly intelligent. They have a technology, but obviously a preelectronic one, so I don't think there's anything to worry about up here. If I should be wrong, the computer will warn me in plenty of time."

"And once daylight comes?"

"We'll land, of course."

75.

THEY CAME down when the first rays of the morning sun shone through a break in the clouds to reveal part of the island-freshly green, with its interior marked by a line of low, rolling hills stretching into the purplish distance.

As they dropped closer, they could see isolated copses of trees and occasional orchards, but for the most part there were well-kept farms. Immediately below them, on the southeastern shore of the island was a silvery beach backed by a broken line of boulders, and beyond it was a stretch of lawn. They caught a glimpse of an occasional house, but these did not cluster into anything like a town.

Eventually, they made out a dim network of roads, sparsely lined by dwelling places, and then, in the cool morning air, they spied an air-car in the far distance. They could only tell it was an air-car, and not a bird, by the manner of its maneuvering. It was the first indubitable sign of intelligent life in action they had yet seen on the planet.

"It could be an automated vehicle, if they could manage that without electronics," said Trevize.

Bliss said, "It might well be. It seems to me that if there were a human being at the controls, it would be heading for us. We must be quite a sight—a vehicle sinking downward without the use of braking jets or rocket fire."

"A strange sight on any planet," said Trevize thoughtfully. "There can't be many worlds that have ever witnessed the descent of a gravitic space-vessel. The beach would make a fine landing place, but if the winds blow I don't want the ship inundated. I'll make for the stretch of grass on the other side of the boulders."

"At least," said Pelorat, "a gravitic ship won't scorch private property in descending."

Down they came gently on the four broad pads that had moved slowly outward during the last stage. These pressed down into the soil under weight of the ship.

Pelorat said, "I'm afraid we'll leave marks, though."

"At least," said Bliss, and there was that in her voice that was not approving, "the climate is evidently equable. —I would even say, warm."

A human being was on the grass, watching the ship descend and showing no evidence of fear or surprise. The look on her face showed only rapt interest.

She wore very little, which accounted for Bliss's estimate of the c Her sandals seemed to be of canvas, and about her hips was a wraparound skirt with a flowered pattern. There were no leg-coverings and there was nothing above her waist.

Her hair was black, long, and very glossy, descending almost to her waist; Her skin color was a pale brown and her eyes were narrow.

Trevize scanned the surroundings and there was no other human being in sight. He shrugged and said, "Well, it's early morning and the inhabitants may be mostly indoors, or even asleep. Still, I wouldn't say it was a well-populated area."

He turned to the others and said, "I'll go out and talk to the woman, if she speaks anything comprehensible. The rest of you—"

"I should think," said Bliss firmly, "that we might as well all step out. That woman looks completely harmless and, in any case, I want to stretch my legs and breathe planetary air, and perhaps arrange for planetary food. I want Fallow to get the feel of a world again, too, and I think Pel would like to examine the woman at closer range."

"Who? I?" said Pelorat, turning faintly pink. "Not at all, Bliss, but I am the linguist of our little party."

Trevize shrugged. "Come one, come all. Still, though she may look harmless, I intend to take my weapons with me."

"I doubt," said Bliss, "that you will be much tempted to use them on that young woman."

Trevize grinned. "She is attractive, isn't she?"

Trevize left the ship first, then Bliss, with one hand swung backward to enclose Fallom's, who carefully made her way down the ramp after Bliss. Pelorat was last.

The black-haired young woman continued to watch with interest. She did not back away an inch.

Trevize muttered, "Well, let's try."

He held his arms away from his weapons and said, "I greet you."

The young woman considered that for a moment, and said, "I greet thee and I greet thy companions."

Pelorat said joyfully, "How wonderful! She speaks Classical Galactic and with a correct accent."

"I understand her, too," said Trevize, oscillating one hand to indicate his understanding wasn't perfect. "I hope she understands me."

He said, smiling, and assuming a friendly expression, "We come from across space. We come from another world."

"That is well," said the young woman, in her clear soprano. "Comes thy ship from the Empire?"

"It comes from a far star, and the ship is named Far Star. "

The young woman looked up at the lettering on the ship. "Is that what that sayeth? If that be so, and if the first letter is an F, then, behold, it is imprinted backward."

Trevize was about to object, but Pelorat, in an ecstasy of joy, said, "She's right. The letter F did reverse itself about two thousand years ago. What a marvelous chance to study Classical Galactic in detail and as a living language."

Trevize studied the young woman carefully. She was not much more than 1.5 meters in height, and her breasts, though shapely, were small. Yet she did not seem unripe. The nipples were large and the areolae dark, though that might be the result of her brownish skin color.

He said, "My name is Golan Trevize; my friend is Janov Pelorat; the woman is Bliss; and the child is Fallom."

"Is it the custom, then, on the far star from which you come, that the men be given a double name? I am Hiroko, daughter of Hiroko."

"And your father?" interposed Pelorat suddenly.

To which Hiroko replied with an indifferent shrug of her shoulder, "His name, so sayeth my mother, is Smool, but it is of no importance. I know him not."

"And where are the others?" asked Trevize. "You seem to be the only one to be here to greet us."

Hiroko said, "Many men are aboard the fishboats; many women are in the fields. I take holiday these last two days and so am fortunate enough to see this great thing. Yet people are curious and the ship will have been seen as it descended, even from a distance. Others will be here soon."

"Are there many others on this island?"

"There are more than a score and five thousand," said Hiroko with obvious pride.

"And are there other islands in the ocean?"

"Other islands, good sir?" She seemed puzzled.

Trevize took that as answer enough. This was the one spot on the entire planet that was inhabited by human beings.

He said, "What do you call your world?"

"It is Alpha, good sir. We are taught that the whole name is Alpha Centauri, if that has more meaning to thee, but we call it Alpha only and, see, it is a fair-visaged world."

"A what world?" said Trevize, turning blankly to Pelorat.

"A beautiful world, she means," said Pelorat.

"That it is," said Trevize, "at least here, and at this moment." He looked up at the mild blue morning sky, with its occasional drift of clouds. "You have a nice sunny day, Hiroko, but I imagine there aren't many of those on Alpha."

Hiroko stiffened. "As many as we wish, sir. The clouds may come when we need rain, but on most days it seemeth good to us that the sky is fair above. Surely a goodly sky and a quiet wind are much to be desired on those days when the fishboats are at sea."

"Do your people control the weather, then, Hiroko?"

"Did we not, Sir Golan Trevize, we would be soggy with rain."

"But how do you do that?"

"Not being a trained engineer, sir, I cannot tell thee."

"And what might be the name of this island on which you and your people live?" said Trevize, finding himself trapped in the ornate sound of Classical Galactic (and wondering desperately if he had the conjugations right).

Hiroko said, "We call our heavenly island in the midst of the vast sea of waters New Earth."

At which Trevize and Pelorat stared at each other with surprise and delight.

THERE was no time to follow up on the statement. Others were arriving. Dozens. They must consist of those, Trevize thought, who were not on the ships or in the fields, and who were not from too far away. They came on foot for the most part, though two ground-cars were in evidence—rather old and clumsy.

Clearly, this was a low-technology society, and yet they controlled the weather.

It was well known that technology was not necessarily all of a piece; that lack of advance in some directions did not necessarily exclude considerable advance in others—but surely this example of uneven development was unusual.

Of those who were now watching the ship, at least half were elderly men and women; there were also three or four children. Of the rest, more were women than men. None showed any fear or uncertainty whatever.

Trevize said in a low voice to Bliss, "Are you manipulating them? They seem-serene."

"I'm not in the least manipulating them," said Bliss. "I never touch minds unless I must. It's Fallom I'm concerned with."

Few as the newcomers were to anyone who had experienced the crowds of curiosity-seekers on any normal world in the Galaxy, they were a mob to Fallom, to whom

the three adults on the Far Star had been something to grow accustomed to. Fallom was breathing rapidly and shallowly, and her eyes were half-closed. Almost, she seemed in shock.

Bliss was stroking her, softly and rhythmically, and making soothing sounds. Trevize was certain that she was delicately accompanying it all by an infinitely gentle rearrangement of mental fibrils.

Fallom took in a sudden deep breath, almost a gasp, and shook herself, in what was perhaps an involuntary shudder. She raised her head and looked at those present with something approaching normality and then buried her head in the space between Bliss's arm and body.

Bliss let her remain so, while her arm, encircling Fallom's shoulder, tightened periodically as though to indicate her own protective presence over and over.

Pelorat seemed rather awestruck, as his eyes went from one Alphan to another. He said, "Golan, they differ so among themselves."

Trevize had noticed that, too. There were various shades of skin and hair color, including one brilliant redhead with blue eyes and freckled skin. At least three apparent adults were as short as Hiroko, and one or two were taller than Trevize. A number of both sexes had eyes resembling those of Hiroko, and Trevize remembered that on the teeming commercial planets of the Fili sector, such eyes were characteristic of the population, but he had never visited that sector.

All the Alphans wore nothing above the waist and among the women the breasts all seemed to be small. That was the most nearly uniform of all the bodily characteristics that he could see.

Bliss said suddenly, "Miss Hiroko, my youngster is not accustomed to travel through space and she is absorbing more novelty than she can easily manage. Would it be possible for her to sit down and, perhaps, have something to eat and drink?"

Hiroko looked puzzled, and Pelorat repeated what Bliss had said in the more ornate Galactic of the mid-Imperial period.

Hiroko's hand then flew to her mouth and she sank to her knees gracefully. "I crave your pardon, respected madam," she said. "I have not thought of this child's needs, nor of thine. The strangeness of this event has too occupied me. Wouldst thou-would you all-as visitors and guests, enter the refectory for morning meal? May we join you and serve as hosts?"

Bliss said, "That is kind of you." She spoke slowly and pronounced the words carefully, hoping to make them easier to understand. "It would be better, though, if you alone served as hostess, for the sake of the comfort of the child who is unaccustomed to being with many people at once."

Hiroko rose to her feet. "It shall be as thou hast said."

She led them, in leisurely manner, across the grass. Other Alphans edged closer. They seemed particularly interested in the clothing of the newcomers. Trevize removed his light jacket, and handed it to a man who had sidled toward him and had laid a questing finger upon it.

"Here," he said, "look it over, but return it." Then he said to Hiroko. "See that I get it back, Miss Hiroko."

"Of a surety, it will be backhanded, respected sir." She nodded her head gravely.

Trevize smiled and walked on. He was more comfortable without the jacket in the light, mild breeze.

He had detected no visible weapons on the persons of any of those about him, and he found it interesting that no one seemed to show any fear or discomfort over Trevize's. They did not even show curiosity concerning them. It might well be that they were not aware of the objects as weapons at all. From what Trevize had so far seen, Alpha might well be a world utterly without violence.

A woman, having moved rapidly forward, so as to be a little ahead of Bliss, turned to examine her blouse minutely, then said, "Hast thou breasts, respected madam?"

And, as though unable to wait for an answer, she placed her hand lightly on Bliss's chest.

Bliss smiled and said, "As thou hast discovered, I have. They are perhaps not as shapely as thine, but I hide them not for that reason. On my world, it is not fitting that they be uncovered."

She whispered in an aside to Pelorat, "How do you like the way I'm getting the hang of Classical Galactic?"

"You did that very well, Bliss," said Pelorat.

The dining room was a large one with long tables to which were attached long benches on either side. Clearly, the Alphans ate community-fashion.

Trevize felt a pang of conscience. Bliss's request for privacy had reserved this space for five people and forced the Alphans generally to remain in exile outside. A number, however, placed themselves at a respectful distance from the windows (which were no more than gaps in the wall, unfilled even by screens), presumably so that they might watch the strangers eat.

Involuntarily, he wondered what would happen if it were to rain. Surely, the rain would come only when it was needed, light and mild, continuing without significant wind till enough had fallen. Moreover, it would always come at known times so that the Alphans would be ready for it, Trevize imagined.

The window he was facing looked out to sea, and far out at the horizon it seemed to Trevize that he could make out a bank of clouds similar to those that so nearly filled the skies everywhere but over this little spot of Eden.

There were advantages to weather control.

Eventually, they were served by a young woman on tiptoeing feet. They were not asked for their choice, but were merely served. There was a small glass of milk, a larger of grape juice, a still larger of water. Each diner received two large poached eggs, with slivers of white cheese on the side. Each also had a large platter of broiled fish and small roasted potatoes, resting on cool, green lettuce leaves.

Bliss looked with dismay at the quantity of food before her and was clearly at a loss where to begin. Fallom had no such trouble. She drank the grape juice thirstily and with

clear evidence of approval, then chewed away at the fish and potatoes. She was about to use her fingers for the purpose, but Bliss held up a large spoon with tined ends that could serve as a fork as well, and Fallom accepted it.

Pelorat smiled his satisfaction and cut into the eggs at once.

Trevize, saying, "Now to be reminded what real eggs taste like," followed suit.

Hiroko, forgetting to eat her own breakfast in her delight at the manner in which the others ate (for even Bliss finally began, with obvious relish), said, at last, "Is it well?"

"It is well," said Trevize, his voice somewhat muffled. "This island has no shortage of food, apparently. -Or do you serve us more than you should, out of politeness?"

Hiroko listened with intent eyes, and seemed to grasp the meaning, for she said, "No, no, respected sir. Our land is bountiful, our sea even more so. Our ducks give eggs, our goats both cheese and milk. And there are our grains. Above all, our sea is filled with countless varieties of fish in numberless quantity. The whole Empire could eat at our tables and consume not the fish of our sea."

Trevize smiled discreetly. Clearly, the young Alphan had not the smallest idea of the true size of the Galaxy.

He said, "You call this island New Earth, Hiroko. Where, then, might Old Earth be?"

She looked at him in bewilderment. "Old Earth, say you? I crave pardon, respected sir. I take not thy meaning."

Trevize said, "Before there was a New Earth, your people must have lived elsewhere. Where was this elsewhere from which they came?"

"I know naught of that, respected sir," she said, with troubled gravity. "This land has been mine all my life, and my mother's and grandmother's before me; and, I doubt not, their grandmother's and great-grandmother's before them. Of any other land, I know naught."

"But," said Trevize, descending to gentle argumentation, "you speak of this land as New Earth. Why do you call it that?"

"Because, respected sir," she replied, equally gentle, "that is what it is called by all since the mind of woman goeth not to the contrary."

"But it is New Earth, and therefore, a later Earth. There must be an Old Earth, a former one, for which it was named. Each morning there is a new day, and that implies that earlier there had existed an old day. Don't you see that this must be so?"

"Nay, respected sir. I know only what this land is called. I know of naught else, nor do I follow this reasoning of thine which sounds very much like what we call here chop-logic. I mean no offense."

And Trevize shook his head and felt defeated.

TREVIZE leaned toward Pelorat, and whispered, "Wherever we go, whatever we do, we get no information."

"We know where Earth is, so what does it matter?" said Pelorat, doing little more than move his lips.

"I want to know something about it."

"She's very young. Scarcely a repository of information."

Trevize thought about that, then nodded. "Right, Janov."

He turned to Hiroko and said, "Miss Hiroko, you haven't asked us why we are here in your land?"

Hiroko's eyes fell, and she said, "That would be but scant courtesy until you have all eaten and rested, respected sir."

"But we have eaten, or almost so, and we have recently rested, so I shall tell you why we are here. My friend, Dr. Pelorat, is a scholar on our world, a learned man. He is a mythologist. Do you know what that means?"

"Nay, respected sir, I do not."

"He studies old tales as they are told on different worlds. Old tales are known as myths or legends and they interest Dr. Pelorat. Are there learned ones on New Earth who know the old tales of this world?"

Hiroko's forehead creased slightly into a frown of thought. She said, "This is not a matter in which I am myself skilled. We have an old man in these parts who loves to talk of ancient days. Where he may have learned these things, I know not, and methinks he may have spun his notions out of air, or heard them from others who did so spin. This is perhaps the material which thy learned companion would hear, yet I would not mislead thee. It is in my mind," she looked to right and left as though unwilling to be overheard, "that the old man is but a prater, though many listen willingly to him."

Trevize nodded. "Such prating is what we wish. Would it be possible for you to take my friend to this old man-"

"Monolee he calls himself."

"-to Monolee, then. And do you think Monolee would be willing to speak to my friend?"

"He? Willing to speak?" said Hiroko scornfully. "Thou must ask, rather, if he be ever ready to cease from speaking. He is but a man, and will therefore speak, if allowed, till a fortnight hence, with no pause. I mean no offense, respected sir."

"No offense taken. Would you lead my friend to Monolee now?"

"That may anyone do at any time. The ancient is ever home and ever ready to greet an ear."

Trevize said, "And perhaps an older woman would be willing to come and sit with Madam Bliss. She has the child to care for and cannot move about too much. It would please her to have company, for women, as you know, are fond of-"

"Prating?" said Hiroko, clearly amused. "Why, so men say, although I have observed that men are always the greater babblers. Let the men return from their fishing, and one will vie with another in telling greater flights of fancy concerning their catches. None will mark them nor believe, but this will not stop them, either. But enough of my prating, too. -I will have a friend of my mother's, one whom I can see through the window, stay with Madam Bliss and the child, and before that she will guide your friend, the respected doctor, to the aged Monolee. If your friend will hear as avidly as Monolee will prate, thou wilt scarcely part them in this life. Wilt thou pardon my absence a moment?"

When she had left, Trevize turned to Pelorat and said, "Listen, get what you can out of the old man, and Bliss, you find out what you can from whoever stays with you. What you want is anything about Earth."

"And you?" said Bliss. "What will you do?"

"I will remain with Hiroko, and try to find a third source."

Bliss smiled. "Ah yes. Pel will be with this old man; I with an old woman. You will force yourself to remain with this fetchingly unclad young woman. It seems a reasonable division of labor."

"As it happens, Bliss, it is reasonable."

"But you don't find it depressing that the reasonable division of labor should work out so, I suppose."

"No, I don't. Why should I?"

"Why should you, indeed?"

Hiroko was back, and sat down again. "It is all arranged. The respected Dr. Pelorat will be taken to Monolee; and the respected Madam Bliss, together with her child, will have company. May I be granted, then, respected Sir Trevize, the boon of further conversation with thee, mayhap of this Old Earth of which thou-

"Pratest?" asked Trevize.

"Nay," said Hiroko, laughing. "But thou dost well to mock me. I showed thee but discourtesy ere now in answering thy question on this matter. I would fain make amends."

Trevize turned to Pelorat. "Fain?"

"Be eager," said Pelorat softly.

Trevize said, "Miss Hiroko, I felt no discourtesy, but if it will make you feel better, I will gladly speak with you."

"Kindly spoken. I thank thee," said Hiroko, rising.

Trevize rose, too. "Bliss," he said, "make sure Janov remains safe."

"Leave that to me. As for you, you have your-" She nodded toward his holsters.

"I don't think I'll need them," said Trevize uncomfortably.

He followed Hiroko out of the dining room. The sun was higher in the sky now and the temperature was still warmer. There was an otherworldly smell as always. Trevize remembered it had been faint on Comporellon, a little musty on Aurora, and rather delightful on Solaria. (On Melpomenia, they were in space suits where one is only aware

of the smell of one's own body.) In every case, it disappeared in a matter of hours as the osmic centers of the nose grew saturated.

Here, on Alpha, the odor was a pleasant grassy fragrance under the warming effect of the sun, and Trevize felt a bit annoyed, knowing that this, too, would soon disappear.

They were approaching a small structure that seemed to be built of a pale pink plaster.

"This," said Hiroko, "is my home. It used to belong to my mother's younger sister."

She walked in and motioned Trevize to follow. The door was open or, Trevize noticed as he passed through, it would be more accurate to say there was no door.

Trevize said, "What do you do when it rains?"

"We are ready. It will rain two days hence, for three hours ere dawn, when it is coolest, and when it will moisten the soil most powerfully. Then I have but to draw this curtain, both heavy and water-repellent, across the door."

She did so as she spoke. It seemed made of a strong canvas-like material.

"I will leave it in place now," she went on. "All will then know I am within but not available, for I sleep or am occupied in matters of importance."

"It doesn't seem much of a guardian of privacy."

"Why should it not be? See, the entrance is covered."

"But anyone could shove it aside."

"With disregard of the wishes of the occupant?" Hiroko looked shocked. "Are such things done on thy world? It would be barbarous."

Trevize grinned. "I only asked."

She led him into the second of two rooms, and, at her invitation, he seated himself in a padded chair. There was something claustrophobic about the blockish smallness and emptiness of the rooms, but the house seemed designed for little more than seclusion and rest. The window openings were small and near the ceiling, but there were dull mirror strips in a careful pattern along the walls, which reflected light diffusely. There were slits in the loor from which a gentle, cool breeze uplifted. Trevize saw no signs of artifinal lighting and wondered if Alphans had to wake at sunrise and go to bed at sunset.

He was about to ask, but Hiroko spoke first, saying, "Is Madam Bliss thy woman companion?"

Trevize said cautiously, "Do you mean by that, is she my sexual partner?"

Hiroko colored. "I pray thee, have regard for the decencies of polite conversation, but I do mean private pleasantry."

"No, she is the woman companion of my learned friend."

"But thou art the younger, and the more goodly."

"Well, thank you for your opinion, but it is not Bliss's opinion. She likes Dr. Pelorat much more than she does me."

"That much surprises me. Will he not share?"

"I have not asked him whether he would, but I'm sure he wouldn't. Nor would I want him to."

Hiroko nodded her head wisely. "I know. It is her fundament."

"Her fundament?"

"Thou knowest. This." And she slapped her own dainty rear end.

"Oh, that! I understand you. Yes, Bliss is generously proportioned in her pelvic anatomy." He made a curving gesture with his hands and winked. (And Hiroko laughed.)

Trevize said, "Nevertheless, a great many men enjoy that kind of generosity of figure."

"I cannot believe so. Surely it would be a sort of gluttony to wish excess of that which is pleasant in moderation. Wouldst thou think more of me if my breasts were massive and dangling, with nipples pointing to toes? I have, in good sooth, seen such, yet have I not seen men flock to them. The poor women so afflicted must needs cover their monstrosities-as Madam Bliss does."

"Such oversize wouldn't attract me, either, though I am sure that Bliss doesn't cover her breasts for any imperfection they may have."

"Thou dost not, then, disapprove of my visage or form?"

"I would be a madman to do so. You are beautiful."

"And what dost thou for pleasantries on this ship of thine, as thou flittest from one world to the next-Madam Bliss being denied thee?"

"Nothing, Hiroko. There's nothing to do. I think of pleasantries on occasion and that has its discomforts, but we who travel through space know well that there are times when we must do without. We make up for it at other times."

"If it be a discomfort, how may that be removed?"

"I experience considerably more discomfort since you've brought up the subject. I don't think it would be polite to suggest how I might be comforted."

"Would it be discourtesy, were I to suggest a way?"

"It would depend entirely on the nature of the suggestion."

"I would suggest that we be pleasant with each other."

"Did you bring me here, Hiroko, that it might come to this?"

Hiroko said, with a pleased smile, "Yes. It would be both my hostess-duty of courtesy, and it would be my wish, too."

"If that's the case, I will admit it is my wish, too. In fact, I would like very much to oblige you in this. I would be-uh fain to do thee pleasure."

18. THE MUSIC FESTIVAL

78.

LUNCH was in the same dining room in which they had had breakfast. It was full of Alphans, and with them were Trevize and Pelorat, made thoroughly welcome. Bliss and Fallom ate separately, and more or less privately, in a small annex.

There were several varieties of fish, together with soup in which there were strips of what might well have been boiled kid. Loaves of bread were there for the slicing, butter and jam for the spreading. A salad, large and diffuse, came afterward, and there was a notable absence of any dessert, although fruit juices were passed about in apparently inexhaustible pitchers. Both Foundationers were forced to be abstemious after their heavy breakfast, but everyone else seemed to eat freely.

"How do they keep from getting fat?" wondered Pelorat in a low voice.

Trevize shrugged. "Lots of physical labor, perhaps."

It was clearly a society in which decorum at meals was not greatly valued. There was a miscellaneous hubbub of shouting, laughing, and thumping on the table with thick, obviously unbreakable, cups. Women were as loud and raucous as men, albeit in higher pitch.

Pelorat winced, but Trevize, who now (temporarily, at least) felt no trace of the discomfort he had spoken of to Hiroko, felt both relaxed and good-natured.

He said, "Actually, it has its pleasant side. These are people who appear to enjoy life and who have few, if any, cares. Weather is what they make it and food is unimaginably plentiful. This is a golden age for them that simply continues and continues."

He had to shout to make himself heard, and Pelorat shouted back, "But it's so noisy."

"They're used to it."

"I don't see how they can understand each other in this riot."

Certainly, it was all lost on the two Foundationers. The queer pronunciation and the archaic grammar and word order of the Alphan language made it impossible to understand at the intense sound levels. To the Foundationers, it was like listening to the sounds of a zoo in fright.

It was not till after lunch that they rejoined Bliss in a small structure, which Trevize found to be rather inconsiderably different from Hiroko's quarters, and which had been assigned them as their own temporary living quarters. Fallom was in the second room, enormously relieved to be alone, according to Bliss, and attempting to nap.

Pelorat looked at the door-gap in the wall and said uncertainly, "There's very little privacy here. How can we speak freely?"

"I assure you," said Trevize, "that once we pull the canvas barrier across the door, we won't be disturbed. The canvas makes it impenetrable by all the force of social custom."

Pelorat glanced at the high, open windows. "We can be overheard."

"We need not shout. The Alphans won't eavesdrop. Even when they stood outside the windows of the dining room at breakfast, they remained at a respectful distance."

Bliss smiled. "You've learned so much about Alphan customs in the time you spent alone with gentle little Hiroko, and you've gained such confidence in their respect for privacy. What happened?"

Trevize said, "If you're aware that the tendrils of my mind have undergone a change for the better and can guess the reason, I can only ask you to leave my mind alone."

"You know very well that Gaia will not touch your mind under any circumstances short of life-crisis, and you know why. Still, I'm not mentally blind. I could sense what happened a kilometer away. Is this your invariable custom on space voyages, my erotomaniac friend?"

"Erotomaniac? Come, Bliss. Twice on this entire trip. Twice!"

"We were only on two worlds that had functioning human females on them. Two out of two, and we had only been a few hours on each."

"You are well aware I had no choice on Comporellon."

"That makes sense. I remember what she looked like." For a few moments, Bliss dissolved in laughter. Then she said, "Yet I don't think Hiroko held you helpless in her mighty grip, or inflicted her irresistible will on your cringing body."

"Of course not. I was perfectly willing. But it was her suggestion, just the same."

Pelorat said, with just a tinge of envy in his voice, "Does this happen to you all the time, Golan?"

"Of course it must, Pel," said Bliss. "Women are helplessly drawn to him."

"I wish that were so," said Trevize, "but it isn't. And I'm glad it isn't-I do have other things I want to do in life. Just the same, in this case I was irresistible. After all, -we were the first people from another world that Hiroko had ever seen or, apparently, that anyone now alive on Alpha had ever seen: I gathered from things she let slip, casual remarks, that she had the rather exciting notion that I might be different from Alphans, either anatomically or in my technique. Poor thing. I'm -afraid she was disappointed."

"Oh?" said Bliss. "Were you?"

"No," said Trevize. "I have been on a number of worlds and I have had my experiences. And what I had discovered is that people are people and sex is sex, wherever one goes. If there are noticeable differences, they are usually both trivial and unpleasant. The perfumes I've encountered in my time! I remember when a young woman simply couldn't manage unless there was music loudly played, music that consisted of a desperate screeching sound. So she played the music and then I couldn't manage. I assure you-if it's the same old thing, then I'm satisfied."

"Speaking of music," said Bliss, "we are invited to a musicale after dinner. A very formal thing, apparently, that is being held in our honor. I gather the Alphans are very proud of their music."

Trevize grimaced. "Their pride will in no way make the music sound better to our ears."

"Hear me out," said Bliss. "I gather that their pride is that they play expertly on very archaic instruments. Very archaic. We may get some information about Earth by way of them."

Trevize's eyebrows shot up. "An interesting thought. And that reminds me that both of you may already have information. Janov, did you see this Monolee that Hiroko told us about?"

"Indeed I did," said Pelorat. "I was with him for three hours and Hiroko did not exaggerate. It was a virtual monologue on his part and when I left to come to lunch, he clung to me and would not let me go until I promised to return whenever I could in order that I might listen to him some more."

"And did he say anything of interest?"

"Well, he, too-like everybody else-insisted that Earth was thoroughly and murderously radioactive; that the ancestors of the Alphans were the last to leave and that if they hadn't, they would have died. -And, Golan, he was so emphatic that I couldn't help believing him. I'm convinced that Earth is dead, and that our entire search is, after all, useless."

79.

TREVIZE sat back in his chair, staring at Pelorat, who was sitting on a narrow cot. Bliss, having risen from where she had been sitting next to Pelorat, looked from one to the other.

Finally, Trevize said, "Let me be the judge as to whether our search is useless or not, Janov. Tell me what the garrulous old man had to say to you in brief, of course."

Pelorat said, "I took notes as Monolee spoke. It helped reinforce my role a scholar, but I don't have to refer to them. He was quite stream-of-consciousness in his speaking. Each thing he said would remind him of something else, but, of course, I have spent my life trying to organize information in the search of the relevant and significant, so that it's second nature for me now to be able to condense a long and incoherent discourse-

Trevize said gently, "Into something just as long and incoherent? To the point, dear Janov."

Pelorat cleared his throat uneasily. "Yes, certainly, old chap. I'll try to make a connected and chronological tale out of it. Earth was the original home of humanity and of millions of species of plants and animals. It continued so for countless years until hyperspatial travel was invented. Then the Spacer worlds were founded. They broke away

from Earth, developed their own cultures, and came to despise and oppress the mother planet.

"After a couple of centuries of this, Earth managed to regain its freedom, though Monolee did not explain the exact manner in which this was done, and I dared not ask questions, even if he had given me a chance to interrupt, which he did not, for that might merely have sent him into new byways. He did mention a culture-hero named Elijah Baley, but the references were so characteristic of the habit of attributing to one figure the accomplishments of generations that there was little value in attempting to-

Bliss said, "Yes, Pel dear, we understand that part."

Again, Pelorat paused in midstream and reconsidered. "Of course. My apologies. Earth initiated a second wave of settlements, founding many new worlds in a new fashion. The new group of Settlers proved more vigorous than the Spacers, outpaced them, defeated them, outlasted them, and, eventually, established the Galactic Empire. During the course of the wars between the Settlers and the Spacers-no, not wars, for he used the word 'conflict,' being very careful about that-the Earth became radioactive."

Trevize said, with clear annoyance, "That's ridiculous, Janov. How can a world become radioactive? Every world is very slightly radioactive to one degree or another from the moment of formation, and that radioactivity slowly decays. It doesn't become radioactive."

Pelorat shrugged. "I'm only telling you what he said. And he was only telling me what he had heard-from someone who only told him what he had heard-and so on. It's folk-history, told and retold over the generations, with who knows what distortions creeping in at each retelling."

"I understand that, but are there no books, documents, ancient histories which have frozen the story at an early time and which could give us something more accurate than the present tale?"

"Actually, I managed to ask that question, and the answer is no. He said vaguely that there were books about it in ancient times and that they had long ago been lost, but that what he was telling us was what had been in those books."

"Yes, well distorted. It's the same story. In every world we go to, the records of Earth have, in one way or another, disappeared. -Well, how did he say the radioactivity began on Earth?"

"He didn't, in any detail. The closest he came to saying so was that the Spacers were responsible, but then I gathered that the Spacers were the demons on whom the people of Earth blamed all misfortune. The radioactivity-"

A clear voice overrode him here. "Bliss, am I a Spacer?"

Fallom was standing in the narrow doorway between the two rooms, hair tousled and the nightgown she was wearing (designed to fit Bliss's more ample proportions) having slid off one shoulder to reveal an undeveloped breast.

Bliss said, "We worry about eavesdroppers outside and we forget the one inside. - Now, Fallom, why do you say that?" She rose and walked toward the youngster.

Fallom said, "I don't have what they have," she pointed at the two men, "or what you have, Bliss. I'm different. Is that because I'm a Spacer?"

"You are, Fallom," said Bliss soothingly, "but little differences don't matter. Come back to bed."

Fallom became submissive as she always did when Bliss willed her to be so. She turned and said, "Am I a demon? What is a demon?"

Bliss said over her shoulder, "Wait one moment for me. I'll be right back."

She was, within five minutes. She was shaking her head. "She'll be sleeping now till I wake her. I should have done that before, I suppose, but any modification of the mind must be the result of necessity." She added defensively, "I can't have her brood on the differences between her genital equipment and ours."

Pelorat said, "Someday she'll have to know she's hermaphroditic."

"Someday," said Bliss, "but not now. Go on with the story, Pel."

"Yes," said Trevize, "before something else interrupts us."

"Well, Earth became radioactive, or at least its crust did. At that time, Earth had had an enormous population that was centered in huge cities that existed for the most part underground-

"Now, that," put in Trevize, "is surely not so. It must be local patriotism glorifying the golden age of a planet, and the details were simply a distortion of Trantor in its golden age, when it was the Imperial capital of a Galaxy-wide system of worlds."

Pelorat paused, then said, "Really, Golan, you mustn't teach me my business. We mythologists know very well that myths and legends contain borrowings, moral lessons, nature cycles, and a hundred other distorting influences, and we labor to cut them away and get to what might be a kernel of truth. In fact, these same techniques must be applied to the most sober histories, for no one writes the clear and apparent truth-if such a thing can even be said to exist. For now, I'm telling you more or less what Monolee told me, though I suppose I am adding distortions of my own, try as I might not to do so."

"Well, well," said Trevize. "Go on, Janov. I meant no offense."

"And I've taken none. The huge cities, assuming they existed, crumbled and shrank as the radioactivity slowly grew more intense until the population was but a remnant of what it had been, clinging precariously to regions that were relatively radiation-free. The population was kept down by rigid birth control and by the euthanasia of people over sixty."

"Horrible," said Bliss indignantly.

"Undoubtedly," said Pelorat, "but that is what they did, according to Monolee, and that might be true, for it is certainly not complimentary to the Earthpeople and it is not likely that an uncomplimentary lie would be made up. The Earthpeople, having been despised and oppressed by the Spacers, were now despised and oppressed by the Empire, though here we may have exaggeration there out of self-pity, which is a very seductive emotion. There is the case-"

"Yes, yes, Pelorat, another time. Please go on with Earth."

"I beg your pardon. The Empire, in a fit of benevolence, agreed to substitute imported radiation-free soil and to cart away the contaminated soil. Needless to say, that was an enormous task which the Empire soon tired of, especially as this period (if my guess is right) coincided with the fall of Kandar V, after which the Empire had many more things to worry about than Earth.

"The radioactivity continued to grow more intense, the population continued to fall, and finally the Empire, in another fit of benevolence, offered to transplant the remnant of the population to a new world of their own-to this world, in short.

"At an earlier period, it seems an expedition had stocked the ocean so that by the time 'the plans for the transplantation of Earthpeople were being developed, there was a full oxygen atmosphere and an ample supply of food on Alpha. Nor did any of the worlds of the Galactic Empire covet this world because there is a certain natural antipathy to planets that circle stars of a binary system. There are so few suitable planets in such a system, I suppose, that even suitable ones are rejected because of the assumption that there must be something wrong with them. This is a common thought-fashion. There is the well-known case, for instance, of-

"Later with the well-known case, Janov," said Trevize. "On with the transplantation."

"What remained," said Pelorat, hurrying his words a little, "was to prepare a land-base. The shallowest part of the ocean was found and sediment was raised from deeper parts to add to the shallow sea-bottom and, finally, to produce the island of New Earth. Boulders and coral were dredged up and added to the island. Land plants were seeded so that root systems might help make the new land firm. Again, the Empire had set itself an enormous task. Perhaps continents were planned at first, but by the time this one island was produced, the Empire's moment of benevolence had passed.

"What was left of Earth's population was brought here. The Empire's fleets carried off its men and machinery, and they never returned. The Earthpeople, living on New Earth, found themselves in complete isolation."

Trevize said, "Complete? Did Monolee say that no one from elsewhere in the Galaxy has ever come here till we did?"

"Almost complete," said Pelorat. "There is nothing to come here for, I suppose, even if we set aside the superstitious distaste for binary systems. Occasionally, at long intervals, a ship would come, as ours did, but it would eventually leave and there has never been a follow-up. And that's it."

Trevize said, "Did you ask Monolee where Earth was located?"

"Of course I asked that. He didn't know."

"How can he know so much about Earth's history without knowing where it is located?"

"I asked him specifically, Golan, if the star that was only a parsec or so distant from Alpha might be the sun about which Earth revolved. He didn't know what a parsec was, and I said it was a short distance, astronomically speaking. He said, short or long, he did not know where Earth was located and he didn't know anyone who knew, and, in his

opinion, it was wrong to try to find it. It should be allowed, he said, to move endlessly through space in peace."

Trevize said, "Do you agree with him?"

Pelorat shook his head sorrowfully. "Not really. But he said that at the rate the radioactivity continued to increase, the planet must have become totally uninhabitable not long after the transplantation took place and that by now it must be burning intensely so that no one can approach."

"Nonsense," said Trevize firmly. "A planet cannot become radioactive and, having done so, continuously increase in radioactivity. Radioactivity can only decrease."

"But Monolee is so sure of it. So many people we've talked to on various worlds unite in this-that Earth is radioactive. Surely, it is useless to go on."

80.

TREVIZE drew a deep breath, then said, in a carefully controlled voice, "Nonsense, Janov. That's not true."

Pelorat said, "Well, now, old chap, you mustn't believe something just because you want to believe it."

"My wants have nothing to do with it. In world after world we find all records of Earth wiped out. Why should they be. wiped out if there is nothing to hide; if Earth is a dead, radioactive world that cannot be approached?"

"I don't know, Golan."

"Yes, you do. When we were approaching Melpomenia, you said that the radioactivity might be the other side of the coin. Destroy records to remove accurate information; supply the tale of radioactivity to insert inaccurate information. Both would discourage any attempt to find Earth, and we mustn't be deluded into discouragement."

Bliss said, "Actually, you seem to think the nearby star is Earth's sun. Why, then, continue to argue the question of radioactivity? What does it matter? Why not simply go to the nearby star and see if it is Earth, and, if so, what it is like?"

Trevize said, "Because those on Earth must be, in their way, extraordinarily powerful, and I would prefer to approach with some knowledge of the world and its inhabitants. As it is, since I continue to remain ignorant of Earth, approaching it is dangerous. It is my notion that I leave the rest of you here on Alpha and that I proceed to Earth by myself. One life is quite enough to risk."

"No, Golan," said Pelorat earnestly. "Bliss and the child might wait here, but I must go with you. I have been searching for Earth since before you were born and I cannot stay behind when the goal is so close, whatever dangers might threaten."

"Bliss and the child will not wait here," said Bliss. "I am Gaia, and Gaia can protect us even against Earth."

"I hope you're right," said Trevize gloomily, "but Gaia could not prevent the elimination of all early memories of Earth's role in its founding."

"That was done in Gaia's early history when it was not yet well organized, not yet advanced. Matters are different now."

"I hope that is so. -Or is it that you have gained information about Earth this morning that we don't have? I did ask that you speak to some of the older women that might be available here."

"And so I did."

Trevize said, "And what did you find out?"

"Nothing about Earth. There is a total blank there."

"Ah."

"But they are advanced biotechnologists."

"Oh?"

"On this small island, they have grown and tested innumerable strains of plants and animals and designed a suitable ecological balance, stable and self-supporting, despite the few species with which they began. They have improved on the ocean life that they found when they arrived here a few thousand years ago, increasing their nutritive value and improving their taste. It is their biotechnology that has made this world such a cornucopia of plenty. They have plans for themselves, too."

"What kind of plans?"

Bliss said, "They know perfectly well they cannot reasonably expect to expand their range under present circumstances, confined as they are to the one small patch of land that exists on their world, but they dream of becoming amphibious."

"Of becoming what?"

"Amphibious. They plan to develop gills in addition to lungs. They dream of being able to spend substantial periods of time underwater; of finding shallow regions and building structures on the ocean bottom. My informant was quite glowing about it but she admitted that this had been a goal of the Alphans for some centuries now and that little, if any, progress has been made."

Trevize said, "That's two fields in which they might be more advanced than we are; weather control and biotechnology. I wonder what their techniques are."

"We'd have to find specialists," said Bliss, "and they might not be willing to talk about it."

Trevize said, "It's not our primary concern here, but it would clearly pay the Foundation to attempt to learn from this miniature world."

Pelorat said, "We manage to control the weather fairly well on Terminus, as it is."

"Control is good on many worlds," said Trevize, "but always it's a matter of the world as a whole. Here the Alphans control the weather of a small portion of the world and they must have techniques we don't have. -Anything else, Bliss?"

"Social invitations. These appear to be a holiday-making people, in whatever time they can take from farming and fishing. After dinner, tonight there'll be a music festival. I told you about that already. Tomorrow, during the day, there will be a beach festival. Apparently, all around the rim of the island there will be a congregation of everyone who can get away from the fields in order that they might enjoy the water and celebrate the

sun, since it will be raining the next day. In the morning, the fishing fleet will come back, beating the rain, and by evening there will be a food festival, sampling the catch."

Pelorat groaned. "The meals are ample enough as it is. What would a food festival be like?"

"I gather that it will feature not quantity, but variety. In any case, all four of us are invited to participate in all the festivals, especially the music festival tonight."

"On the antique instruments?" asked Trevize.

"That's right."

"What makes them antique, by the way? Primitive computers?"

"No, no. That's the point. It isn't electronic music at all, but mechanical. They described it to me. They scrape strings, blow in tubes, and bang on surfaces."

"I hope you're making that up," said Trevize, appalled.

"No, I'm not. And I understand that your Hiroko will be blowing on one of the tubes-I forget its name-and you ought to be able to endure that."

"As for myself," said Pelorat, "I would love to go. I know very little about primitive music and I would like to hear it."

"She is not 'my Hiroko,' " said Trevize coldly. "But are the instruments of the type once used on Earth, do you suppose?"

"So I gathered," said Bliss. "At least the Alphan women said they were designed long before their ancestors came here."

"In that case," said Trevize, "it may be worth listening to all that scraping, tootling, and banging, for whatever information it might conceivably yield concerning Earth."

81.

ODDLY enough, it was Fallom who was most excited at the prospect of a musical evening. She and Bliss had bathed in the small outhouse behind their quarters. It had a bath with running water, hot and cold (or, rather, warm and cool), a washbowl, and a commode. It was totally clean and usable and, in the late afternoon sun, it was even well lit and cheerful.

As always, Fallom was fascinated with Bliss's breasts and Bliss was reduced to saying (now that Fallom understood Galactic) that on her world that was the way people were. To which Fallom said, inevitably, "Why?" and Bliss, after some thought, deciding there was no sensible way of answering, returned the universal reply, "Because!"

When they were done, Bliss helped Fallom put on the undergarment supplied them by the Alphans and worked out the system whereby the skirt went on over it. Leaving Fallom unclothed from the waist up seemed reasonable enough. She herself, while making use of Alphan garments below the waist (rather tight about the hips), put on her own blouse. It seemed silly to be too inhibited to expose breasts in a society where all women did, especially since her own were not large and were as shapely as any she had seen but-there it was.

The two men took their turn at the outhouse next, Trevize muttering the usual male complaint concerning the time the women had taken.

Bliss turned Fallom about to make sure the skirt would hold in place over her boyish hips and buttocks. She said, "It's a very pretty skirt, Fallom. Do you like it?"

Fallom stared at it in a mirror and said, "Yes, I do. Won't I be cold with nothing on, though?" and she ran her hands down her bare chest.

"I don't think so, Fallom. It's quite warm on this world."

"You have something on."

"Yes, I do. That's how it is on my world. Now, Fallom, we're going to be with a great many Alphans during dinner and afterward. Do you think you can bear that?"

Fallom looked distressed, and Bliss went on, "I will sit on your right side and I will hold you. Pel will sit on the other side, and Trevize will sit across the table from you. We won't let anyone talk to you, and you won't have to talk to anyone."

"I'll try, Bliss," Fallom piped in her highest tones.

"Then afterward," said Bliss, "some Alphans will make music for us in their own special way. Do you know what music is?" She hummed in the best imitation of electronic harmony that she could.

Fallom's face lit up. "You mean" The last word was in her own language, and she burst into song.

Bliss's eyes widened. It was a beautiful tune, even though it was wild, and rich in trills. "That's right. Music," she said.

Fallom said excitedly, "Jemby made"-she hesitated, then decided to use the Galactic word-"music all the time. It made music on a " Again a word in her own language.

Bliss repeated the word doubtfully, "On a feeful?"

Fallom laughed. "Not feeful, "

With both words juxtaposed like that, Bliss could hear the difference, but she despaired of reproducing the second. She said, "What does it look like?"

Fallom's as yet limited vocabulary in Galactic did not suffice for an accurate description, and her gestures did not produce any shape clearly in Bliss's mind.

"He showed me how to use the" Fallom said proudly. "I used my fingers just the way Jemby did, but it said that soon I wouldn't have to."

"That's wonderful, dear," said Bliss. "After dinner, we'll see if the Alphans are as good as your Jemby was."

Fallom's eyes sparkled and pleasant thoughts of what was to follow carried her through a lavish dinner despite the crowds and laughter and noise all about her. Only once, when a dish was accidentally upset, setting off shrieks of excitement fairly close to them, did Fallom look frightened, and Bliss promptly held her close in a warm and protective hug.

"I wonder if we can arrange to eat by ourselves," she muttered to Pelorat.

"Otherwise, we'll have to get off this world. It's bad enough eating all this Isolate animal protein, but I must be able to do it in peace."

"It's only high spirits," said Pelorat, who would have endured anything within reason that he felt came under the heading of primitive behavior and beliefs.

-And then the dinner was over, and the announcement came that the music festival would soon begin.

82.

THE HALL in which the music festival was to be held was about as large as the dining room, and there were folding seats (rather uncomfortable, Trevize found out) for about a hundred fifty people. As honored guests, the visitors were led to the front row, and various Alphans commented politely and favorably on their clothes.

Both men were bare above the waist and Trevize tightened his abdominal muscles whenever he thought of it and stared down, on occasion, with complacent self-admiration at his dark-haired chest. Pelorat, in his ardent observation of everything about him, was indifferent to his own appearance. Bliss's blouse drew covert stares of puzzlement but nothing was said concerning it.

Trevize noted that the hall was only about half-full and that the large majority of the audience were women, since, presumably, so many men were out to sea.

Pelorat nudged Trevize and whispered, "They have electricity."

Trevize looked at the vertical tubes on the walls, and at others on the ceiling. They were softly luminous.

"Fluorescence," he said. "Quite primitive."

"Yes, but they do the job, and we've got those things in our rooms and in the outhouse. I thought they were just decorative. If we can find out how to work them, we won't have to stay in the dark."

Bliss said irritably, "They might have told us."

Pelorat said, "They thought we'd know; that anyone would know."

Four women now emerged from behind screens and seated themselves in a group in the space at the front. Each held an instrument of varnished wood of a similar shape, but one that was not easily describable. The instruments were chiefly different in size. One was quite small, two somewhat larger, and the fourth considerably larger. Each woman also held a long rod in the other hand.

The audience whistled softly as they came in, in response to which the four women bowed. Each had a strip of gauze bound fairly tightly across the breasts as though to keep them from interfering with the instrument.

Trevize, interpreting the whistles as signs of approval, or of pleased anticipation, felt it only polite to add his own. At that, Fallom added a trill that was far more than a whistle and that was beginning to attract attention when pressure from Bliss's hand stopped her.

Three of the women, without preparation, put their instruments under their chins, while the largest of the instruments remained between the legs of the fourth woman and

rested on the floor. The long rod in the right hand of each was sawed across the strings stretching nearly the length of the instrument, while the fingers of the left hand shifted rapidly along the upper ends of those strings.

This, thought Trevize, was the "scraping" he had expected, but it didn't sound like scraping at all. There was a soft and melodious succession of notes; each instrument doing something of its own and the whole fusing pleasantly.

It lacked the infinite complexity of electronic music ("real music," as Trevize could not help but think of it) and there was a distinct sameness to it. Still, as time passed, and his ear grew accustomed to this odd system of sound, he began to pick out subtleties. It was wearisome to have to do so, and he thought, longingly, of the clamor and mathematical precision and purity of the real thing, but it occurred to him that if he listened to the music of these simple wooden devices long enough he might well grow to like it.

It was not till the concert was some forty-five minutes old that Hiroko stepped out. She noticed Trevize in the front row at once and smiled at him. He joined the audience in the soft whistle of approval with a whole heart. She looked beautiful in a long and most elaborate skirt, a large flower in her hair, and nothing at all over her breasts since (apparently) there was no danger of their interference with the instrument.

Her instrument proved to be a dark wooden tube about two thirds of a meter long and nearly two centimeters thick. She lifted the instrument to her lips and blew across an opening near one end, producing a thin, sweet note that wavered in pitch as her fingers manipulated metal objects along the length of the tube.

At the first sound, Fallom clutched at Bliss's arm and said, "Bliss, that's a " and the word sounded like "feeful" to Bliss.

Bliss shook her head firmly at Fallom, who said, in a lower voice, "But it is!"

Others were looking in Fallom's direction. Bliss put her hand firmly over Fallom's mouth, and leaned down to mutter an almost subliminally forceful "Quiet!" into her ear.

Fallom listened to Hiroko's playing quietly thereafter, but her fingers moved spasmodically, as though they were operating the objects along the length of the instrument.

The final player in the concert was an elderly man who had an instrument with fluted sides suspended over his shoulders. He pulled it in and out while one hand flashed across a succession of white and dark objects at one end, pressing them down in groups.

Trevize found this sound particularly wearing, rather barbaric, and unpleasantly like the memory of the barking of the dogs on Aurora-not that the sound was like barking, but the emotions it gave rise to were similar. Bliss looked as though she would like to place her hands over her ears, and Pelorat had a frown on his face. Only Fallom seemed to enjoy it, for she was tapping her foot lightly, and Trevize, when he noticed that, realized, to his own surprise, that there was a beat to the music that matched Fallom's footfall.

It came to an end at last and there was a perfect storm of whistling, with Fallom's trill clearly heard above it all.

Then the audience broke up into small conversational groups and became as loud and raucous as Alphans seemed to be on all public occasions. The various individuals who had played in the concert stood about in front of the room and spoke to those people who came up to congratulate them.

Fallom evaded Bliss's grasp and ran up to Hiroko.

"Hiroko," she cried out, gaspingly. "Let me see the"

"The what, dear one?" said Hiroko.

"The thing you made the music with."

"Oh." Hiroko laughed. "That's a flute, little one."

"May I see it?"

"Well." Hiroko opened a case and took out the instrument. It was in three parts, but she put it together quickly, held it toward Fallom with the mouthpiece near her lips, and said, "There, blow thou thy breath across this."

"I know. I know," said Fallom eagerly, and reached for the flute.

Automatically, Hiroko snatched it away and held it high. "Blow, child, but touch not."

Fallom seemed disappointed. "May I just look at it, then? I won't touch it."

"Certainly, dear one."

She held out the flute again and Fallom stared at it earnestly.

And then, the fluorescent lighting in the room dimmed very slightly, and the sound of a flute's note, a little uncertain and wavering, made itself heard.

Hiroko, in surprise, nearly dropped the flute, and Fallom cried out, "I did it. I did it. Jemby said someday I could do it."

Hiroko said, "Was it thou that made the sound?"

"Yes, I did. I did."

"But how didst thou do so, child?"

Bliss said, red with embarrassment, "I'm sorry, Hiroko. I'll take her away."

"No," said Hiroko. "I wish her to do it again." -

A few of the nearest Alphans had gathered to watch. Fallom furrowed her brow as though trying hard. The fluorescents dimmed rather more than before, and again there was the note of the flute, this time pure and steady. Then it became erratic as the metal objects along the length of the flute moved of their own accord.

"It's a little different from the" Fallom said, a little breathlessly, as though the breath that had been activating the flute had been her own instead of power-driven air.

Pelorat said to Trevize, "She must be getting the energy from the electric current that feeds the fluorescents."

"Try again," said Hiroko in a choked voice.

Fallom closed her eyes. The note was softer now and under firmer control. The flute played by itself, maneuvered by no fingers, but moved by distant energy, transduced through the still immature lobes of Fallom's brain. The notes which began as almost random settled into a musical succession and now everyone in the hall had gathered around Hiroko and Fallom, as Hiroko held the flute gently with thumb and

forefinger at either end, and Fallom, eyes closed, directed the current of air and the movement of the keys.

"It's the piece I played," whispered Hiroko.

"I remember it," said Fallom, nodding her head slightly, trying not to break her concentration.

"Thou didst not miss a note," said Hiroko, when it was done.

"But it's not right, Hiroko. You didn't do it right."

Bliss said, "Fallow! That's not polite. You mustn't-"

"Please," said Hiroko peremptorily, "do not interfere. Why is it not right, child?"

"Because I would play it differently."

"Show me, then."

Again the flute played, but in more complicated fashion, for the forces that pushed the keys did so more quickly, in more rapid succession and in more elaborate combinations than before. The music was more complex, and infinitely more emotional and moving. Hiroko stood rigid and there was not a sound to be heard anywhere in the room.

Even after Fallom had finished playing, there was not a sound until Hiroko drew a deep breath and said, "Little one, hast thou ever played that before?"

"No," said Fallom, "before this I could only use my fingers, and I can't do my fingers like that." Then, simply and with no trace of vaunting, "No one can."

"Canst thou play anything else?"

"I can make something up."

"Dost thou mean-improvise?"

Fallow frowned at the word and looked toward Bliss. Bliss nodded and Fallom said, "Yes."

"Please do so, then," said Hiroko.

Fallow paused and thought for a minute or two, then began slowly, in a very simple succession of notes, the whole being rather dreamy. The fluorescent lights dimmed and brightened as the amount of power exerted intensified and faded. No one seemed to notice, for it seemed to be the effect of the music rather than the cause, as though a ghostly electrical spirit were obeying the dictates of the sound waves.

The combination of notes then repeated itself a bit more loudly, then a bit more complexly, then in variations that, without ever losing the clearly heard basic combination, became more stirring and more exciting until it was almost impossible to breathe. And finally, it descended much more rapidly than it had ascended and did so with the effect of a swooping dive that brought the listeners to ground level even while they still retained the feeling that they were high in the air.

There followed sheer pandemonium that split the air, and even Trevize, who was used to a totally different kind of music, thought sadly, "And now 17'11 never hear that again."

When a most reluctant quiet had returned, Hiroko held out her flute. "Here, Fallow, this is thine!"

Fallom reached for it eagerly, but Bliss caught hold of the child's outstretched arm and said, "We can't take it, Hiroko. It's a valuable instrument."

"I have another, Bliss. Not quite as good, but that is how it should be. This instrument belongeth to the person who playeth it best. Never have I heard such music and it would be wrong for me to own an instrument I cannot use to full potential. Would that I knew how the instrument could be made to play without being touched."

Fallom took the flute and, with an expression of deep content, held it tightly to her chest.

83.

EACH OF the two rooms of their quarters were lit by one fluorescent light. The outhouse had a third. The lights were dim, and were uncomfortable to read by, but at least the rooms were no longer dark.

Yet they now lingered outside. The sky was full of stars, something that was always fascinating to a native of Terminus, where the night sky was all but starless and in which only the faint foreshortened cloud of the Galaxy was prominent.

Hiroko had accompanied them back to their chambers for fear they would get lost in the dark, or that they would stumble. All the way back, she held Fallom's hand, and then, after lighting the fluorescents for them, remained outside with them, still clutching at the youngster.

Bliss tried again, for it was clear to her that Hiroko was in a state of a difficult conflict of emotions. "Really, Hiroko, we cannot take your flute."

"No, Fallom must have it." But she seemed on edge just the same.

Trevize continued to look at the sky. The night was truly dark, a darkness that was scarcely affected by the trickle of light from their own chambers; and much less so by the tiny sparks of other houses farther off.

He said, "Hiroko, do you see that star that is so bright? What is it called?" Hiroko looked up casually and said, with no great appearance of interest, "That's the Companion."

"Why is it called that?"

"It circleth our sun every eighty Standard Years. It is an evening star at this time of year. Thou canst see it in daytime, too, when it lieth above the horizon."

Good, thought Trevize. She's not totally ignorant of astronomy. He said, "Do you know that Alpha has another companion, a very small, dim one that's much much farther away than that bright star. You can't see it without a telescope." (He hadn't seen it himself, hadn't bothered to search for it, but the ship's computer had the information in its memory banks.)

She said indifferently, "We were told that in school."

"But now what about that one? You see those six stars in a zigzag line?"

Hiroko said, "That is Cassiopeia."

"Really?" said Trevize, startled. "Which star?"

"All of them. The whole zigzag. It is Cassiopeia." .

"Why is it called that?"

"I lack the knowledge. I know nothing of astronomy, respected Trevize."

"Do you see the lowermost star in the zigzag, the one that's brighter than the other stars? What is that?"

"It is a star. I know not its name."

"But except for the two companion stars, it's the closest of all the stars to Alpha. It is only a parsec away."

Hiroko said, "Sayest thou so? I know that not."

"Might it not be the star about which Earth revolves?"

Hiroko looked at the star with a faint flash of interest. "I know not. I have never heard any person say so."

"Don't you think it might be?"

"How can I say? None knoweth where Earth might be. I-I must leave thee, now. I will be taking my shift in the fields tomorrow morning before the beach festival. I'll see you all there, right after lunch. Yes? Yes?"

"Certainly, Hiroko."

She left suddenly, half-running in the dark. Trevize looked after her, then followed the others into the dimly lit cottage.

He said, "Can you tell whether she was lying about Earth, Bliss?"

Bliss shook her head. "I don't think she was. She is under enormous tension, something I was not aware of until after the concert. It existed before you asked her about the stars."

"Because she gave away her flute, then?"

"Perhaps. I can't tell." She turned to Fallom. "Now, Fallom, I want you to go into your room. When you're ready for bed, go to the outhouse, use the potty, then wash your hands, your face, and your teeth."

"I would like to play the flute, Bliss."

"Just for a little while, and very quietly. Do you understand, Fallom? And you must stop when I tell you to."

"Yes, Bliss."

The three were now alone; Bliss in the one chair and the men sitting each on his cot.

Bliss said, "Is there any point in staying on this planet any longer?"

Trevize shrugged. "We never did get to discuss Earth in connection with the ancient instruments, and we might find something there. It might also pay to wait for the fishing fleet to return. The men might know something the stay-at-homes don't."

"Very unlikely, I think," said Bliss. "Are you sure it's not Hiroko's dark eyes that hold you?"

Trevize said impatiently, "I don't understand, Bliss. What have you to do with what I choose to do? Why do you seem to arrogate to yourself the right of sitting in moral judgment on me?"

"I'm not concerned with your morals. The matter affects our expedition. You want to find Earth so that you can finally decide whether you are right in choosing Galaxia over Isolate worlds. I want you to so decide. You say you need to visit Earth to make the decision and you seem to be convinced that Earth revolves about that bright star in the sky. Let us go there, then. I admit it would be useful to have some information about it before we go, but it is clear to me that the information is not forthcoming here. I do not wish to remain simply because you enjoy Hiroko."

"Perhaps we'll leave," said Trevize. "Let me think about it, and Hiroko will play no part in my decision, I assure you."

Pelorat said, "I feel we ought to move on to Earth, if only to see whether it is radioactive or not. I see no point in waiting longer."

"Are you sure it's not Bliss's dark eyes that drive you?" said Trevize, a bit spitefully. Then, almost at once, "No, I take that back, Janov. I was just being childish. Still-this is a charming world, quite apart from Hiroko, and I must say that under other circumstances, I would be tempted to remain indefinitely. -Don't you think, Bliss, that Alpha destroys your theory about Isolates?"

"In what way?" asked Bliss.

"You've been maintaining that every truly isolated world turns dangerous and hostile."

"Even Comporellon," said Bliss evenly, "which is rather out of the main current of Galactic activity for all that it is, in theory, an Associated Power of the Foundation Federation."

"But not Alpha. This world is totally isolated, but can you complain of their friendliness and hospitality? They feed us, clothe us, shelter us, put on festivals in our honor, urge us to stay on. What fault is there to find with them?"

"None, apparently. Hiroko even gives you her body."

Trevize said angrily, "Bliss, what bothers you about that? She didn't give me her body. We gave each other our bodies. It was entirely mutual, entirely pleasurable. Nor can you say that you hesitate to give your body as it suits you."

"Please, Bliss," said Pelorat. "Golan is entirely right. There is no reason to object to his private pleasures."

"As long as they don't affect us," said Bliss obdurately.

"They do not affect us," said Trevize. "We will leave, I assure you. A delay to search further for information will not be long."

"Yet I don't trust Isolates," said Bliss, "even when they come bearing gifts."

Trevize flung up his arms. "Reach a conclusion, then twist the evidence to fit. How like a-

"Don't say it," said Bliss dangerously. "I am not a woman. I am Gaia. It is Gaia, not I, who is uneasy."

"There is no reason to-" And at that point there was a scratching at the door. Trevize froze. "What's that?" he said, in a low voice.

Bliss shrugged lightly. "Open the door and see. You tell us this is a kindly world that offers no danger."

Nevertheless, Trevize hesitated, until a soft voice from the other side of the door called out softly, "Please. It is P"

It was Hiroko's voice. Trevize threw the door open.

Hiroko entered quickly. Her cheeks were wet.

"Close the door," she gasped.

"What is it?" asked Bliss.

Hiroko clutched at Trevize. "I could not stay away. I tried, but I endured it not. Go thou, and all of you. Take the youngster with you quickly. Take the ship away-away from Alpha-while it is yet dark."

"But why?" asked Trevize.

"Because else wilt thou die; and all of you."

84.

THE THREE Outworlders stared frozenly at Hiroko for a long moment. Then Trevize said, "Are you saying your people will kill us?"

Hiroko said, as the tears rolled down her cheeks, "Thou art already on the road to death, respected Trevize. And the others with you. -Long ago, those of learning devised a virus, harmless to us, but deadly to Outworlders. We have been made immune." She shook Trevize's arm in distraction. "Thou art infected."

"How?"

"When we had our pleasure. It is one way."

Trevize said, "But I feel entirely well."

"The virus is as yet inactive. It will be made active when the fishing fleet returns. By our laws, all must decide on such a thing-even the men. All will surely decide it must be done, and we keep you here till that time, two mornings hence. Leave now while it is yet dark and none suspects."

Bliss said sharply, "Why do your people do this?"

"For our safety. We are few and have much. We do not wish Outworlders to intrude. If one cometh and then reporteth our lot, others will come, and so when, once in a long while, a ship arriveth, we must make certain it leaveth not."

"But then," said Trevize, "why do you warn us away?"

"Ask not the reason. -Nay, but I will tell you, since I hear it again. Listen-"

From the next room, they could hear Fallom playing softly-and infinitely sweetly.

Hiroko said, "I cannot bear the destruction of that music, for the young one will also die."

Trevize said sternly, "Is that why you gave the flute to Fallom? Because you knew you would have it once again when she was dead?"

Hiroko looked horrified. "Nay, that was not in my mind. And when it came to mind at length, I knew it must not be done. Leave with the child, and with her, take the flute that I may never see it more. Thou wilt be safe back in space and, left inactive, the virus now in thy body will die after a time. In return, I ask that none of you ever speak of this world, that none else may know of it."

"We will not speak of it," said Trevize.

Hiroko looked up. In a lower voice, she said, "May I not kiss thee once ere thou leavest?"

Trevize said, "No. I have been infected once and surely that is enough." And then, a little less roughly, he added, "Don't cry. People will ask why you are crying and you'll be unable to reply. -I'll forgive what you did to me in view of your present effort to save us."

Hiroko straightened, carefully wiped her cheeks with the back of her hands, took a deep breath, and said, "I thank thee for that," and left quickly.

Trevize said, "We will put out the light, and we will wait awhile, and then we will leave. -Bliss, tell Fallom to stop playing her instrument. Remember to take the flute, of course. -Then we will make our way to the ship, if we can find it in the dark."

"I will find it," said Bliss. "Clothing of mine is on board and, however dimly, that, too, is Gaia. Gaia will have no trouble finding Gaia." And she vanished into her room to collect Fallom.

Pelorat said, "Do you suppose that they've managed to damage our ship in order to keep us on the planet?"

"They lack the technology to do it," said Trevize grimly. When Bliss emerged, holding Fallom by the hand, Trevize put out the lights.

They sat quietly in the dark for what seemed half the night, and might have been half an hour. Then Trevize slowly and silently opened the door. The sky seemed a bit more cloudy, but stars shone. High in the sky now was Cassiopeia, with what might be Earth's sun burning brightly at its lower tip. The air was still and there was no sound.

Carefully, Trevize stepped out, motioning the others to follow. One of his hands dropped, almost automatically, to the butt of his neuronc whip. He was sure he would not have to use it, but-

Bliss took the lead, holding Pelorat's hand, who held Trevize's. Bliss's other hand held Fallom, and Fallom's other hand held the flute. Feeling gently with her feet in the nearly total darkness, Bliss guided the others toward where she felt, very weakly, the Gaia-ness of her clothing on board the Far Star.

PART SEVEN - EARTH

19. RADIOACTIVE?

85.

THE Far Star took off quietly, rising slowly through the atmosphere, leaving the dark island below. The few faint dots of light beneath them dimmed and vanished, and as the atmosphere grew thinner with height, the ship's speed grew greater, and the dots of light in the sky above them grew more numerous and brighter.

Eventually, they looked down upon the planet, Alpha, with only a crescent illuminated and that crescent largely wreathed in clouds.

Pelorat said, "I suppose they don't have an active space technology. They can't follow us."

"I'm not sure that that cheers me up much," said Trevize, his face dour, his voice disheartened. "I'm infected."

"But with an inactive strain," said Bliss.

"Still, it can be made active. They had a method. What is the method?"

Bliss shrugged. "Hiroko said the virus, left inactive, would eventually die in a body unadapted to it-as yours is."

"Yes?" said Trevize angrily. "How does she know that? For that matter, how do I know that Hiroko's statement wasn't a self-consoling lie? And isn't it possible that the method of activation, whatever it is, might not be duplicated naturally? A particular chemical, a type of radiation, a-a-who knows what? I may sicken suddenly, and then the three of you would die, too. Or if it happens after we have reached a populated world, there may be a vicious pandemic which fleeing refugees would carry to other worlds."

He looked at Bliss. "Is there something you can do about it?"

Slowly, Bliss shook her head. "Not easily. There are parasites making up Gaia-microorganisms, worms. They are a benign part of the ecological balance. They live and contribute to the world consciousness, but never overgrow. They live without doing noticeable harm. The trouble is, Trevize, the virus that affects you is not part of Gaia."

"You say 'not easily,'" said Trevize, frowning. "Under the circumstances, can you take the trouble to do it even though it might be difficult? Can you locate the virus in me and destroy it? Can you, failing that, at least strengthen my defenses?"

"Do you realize what you ask, Trevize? I am not acquainted with the microscopic flora of your body. I might not easily tell a virus in the cells of your body from the normal genes inhabiting them. It would be even more difficult to distinguish between viruses your body is accustomed to and those with which Hiroko infected you. I will try to do it, Trevize, but it will take time and I may not succeed."

"Take time," said Trevize. "Try."

"Certainly," said Bliss.

Pelorat said, "If Hiroko told the truth, Bliss, you might be able to find viruses that seem to be already diminishing in vitality, and you could accelerate their decline."

"I could do that," said Bliss. "It is a good thought."

"You won't weaken?" said Trevize. "You will have to destroy precious bits of life when you kill those viruses, you know."

"You are being sardonic, Trevize," said Bliss coolly, "but, sardonic or not, you are pointing out a true difficulty. Still, I can scarcely fail to put you ahead of the virus. I will kill them if I have the chance, never fear. After all, even if I fail to consider you"-and her mouth twitched as though she were repressing a smile-"then certainly Pelorat and Fallom are also at risk, and you might feel more confidence in my feeling for them than in my feeling for you. You might even remember that I myself am at risk."

"I have no faith in your self-love," muttered Trevize. "You're perfectly ready to give up your life for some high motive. I'll accept your concern for Pelorat, however." Then, he said, "I don't hear Fallom's flute. Is anything wrong with her?"

"No," said Bliss. "She's asleep. A perfectly natural sleep that I had nothing to do with. And I would suggest that, after you work out the Jump to the star we think is Earth's sun, we all do likewise. I need it badly and I suspect you do, too, Trevize."

"Yes, if I can manage. -You were right, you know, Bliss."

"About what, Trevize?"

"About Isolates. New Earth was not a paradise, however much it might have seemed like one. That hospitality-all that outgoing friendliness at first -was to put us off our guard, so that one of us might be easily infected. And all the hospitality afterward, the festivals of this and that, were designed to keep us there till the fishing fleet returned and the activation could be carried through. And it would have worked but for Fallom and her music. It might be you were right there, too."

"About Fallom?"

"Yes. I didn't want to take her along, and I've never been happy with her being on the ship. It was your doing, Bliss, that we have her here and it was she who, unwittingly, saved us. And yet-"

"And yet what?"

"Despite that, I'm still uneasy at Fallom's presence. I don't know why."

"If it will make you feel better, Trevize, I don't know that we can lay all the credit at Fallom's feet. Hiroko advanced Fallom's music as her excuse for committing what the other Alphans would surely consider to be an act of treason. She may even have believed this, but there was something in her mind in addition, something that I vaguely detected but could not surely identify, something that perhaps she was ashamed to let emerge into her conscious mind. I am under the impression that she felt a warmth for you, and would not willingly see you die, regardless of Fallom and her music."

"Do you really think so?" said Trevize, smiling slightly for the first time since they had left Alpha.

"I think so. You must have a certain proficiency at dealing with women. You persuaded Minister Lizalor to allow us to take our ship and leave Comporellon, and you helped influence Hiroko to save our lives. Credit where it's due."

Trevize smiled more broadly. "Well, if you say so. -On to Earth, then." He disappeared into the pilot-room with a step that was almost jaunty.

Pelorat, lingering behind, said, "You soothed him after all, didn't you, Bliss?"

"No, Pelorat, I never touched his mind."

"You certainly did when you pampered his male vanity so outrageously."

"Entirely indirect," said Bliss, smiling.

"Even so, thank you, Bliss."

86.

AFTER THE Jump, the star that might well be Earth's sun was still a tenth of a parsec away. It was the brightest object in the sky by far, but it was still no more than a star.

Trevize kept its light filtered for ease of viewing, and studied it somberly.

He said, "There seems no doubt that it is the virtual twin of Alpha, the star that New Earth circles. Yet Alpha is in the computer map and this star is not. We don't have a name for this star, we aren't given its statistics, we lack any information concerning its planetary system, if it has one."

Pelorat said, "Isn't that what we would expect if Earth circles this sun?"

Such a blackout of information would fit with the fact that all information about Earth seems to have been eliminated."

"Yes, but it could also mean that it's a Spacer world that just happened not to be on the list on the wall of the Melpomenian building. We can't be altogether sure that that list was complete. Or this star could be without planets and therefore perhaps not worth listing on a computer map which is primarily used for military and commercial purposes. - Janov, is there any legend that tells of Earth's sun being a mere parsec or so from a twin of itself."

Pelorat shook his head. "I'm sorry, Golan, but no such legend occurs to me. There may be one, though. My memory isn't perfect. I'll search for it."

"It's not important. Is there any name given to Earth's sun?"

"Some different names are given. I imagine there must be a name in each of the different languages."

"I keep forgetting that Earth had many languages."

"It must have had. It's the only way of making sense out of many of the legends."

Trevize said peevishly, "Well, then, what do we do? We can't tell anything about the planetary system from this distance, and we have to move closer. I would like to be cautious, but there's such a thing as excessive and unreasoning caution, and I see no evidence of possible danger. Presumably anything powerful enough to wipe the Galaxy

clean of information about Earth may be powerful enough to wipe us out even at this distance if they seriously did not wish to be located, but nothing's happened. It isn't rational to stay here forever on the mere possibility that something might happen if we move closer, is it?"

Bliss said, "I take it the computer detects nothing that might be interpreted as dangerous."

"When I say I see no evidence of possible danger, it's the computer I'm relying on. I certainly can't see anything with the unaided eye. I wouldn't expect to."

"Then I take it you're just looking for support in making what you consider a risky decision. All right, then. I'm with you. We haven't come this far in order to turn back for no reason, have we?"

"No," said Trevize. "What do you say, Pelorat?"

Pelorat said, "I'm willing to move on, if only out of curiosity. It would be unbearable to go back without knowing if we have found Earth."

"Well, then," said Trevize, "we're all agreed."

"Not all," said Pelorat. "There's Fallom."

Trevize looked astonished. "Are you suggesting we consult the child? Of what value would her opinion be even if she had one? Besides, all she would want would be to get back to her own world."

"Can you blame her for that?" asked Bliss warmly.

And because the matter of Fallom had arisen, Trevize became aware of her flute, which was sounding in a rather stirring march rhythm.

"Listen to her," he said. "Where has she ever heard anything in march rhythm?"

"Perhaps Jemby played marches on the flute for her."

Trevize shook his head. "I doubt it. Dance rhythms, I should think, lullabies. -Listen, Fallom makes me uneasy. She learns too quickly."

"I help her," said Bliss. "Remember that. And she's very intelligent and she has been extraordinarily stimulated in the time she's been with us. New sensations have flooded her mind. She's seen space, different worlds, many people, all for the first time."

Fallom's march music grew wilder and more richly barbaric.

Trevize sighed and said, "Well, she's here, and she's producing music that seems to breathe optimism, and delight in adventure. I'll take that as her vote in favor of moving in more closely. Let us do so cautiously, then, and check this sun's planetary system."

"If any," said Bliss.

Trevize smiled thinly. "There's a planetary system. It's a bet. Choose your sum."

87.

"You LOSE," said Trevize abstractedly. "How much money did you decide to bet?"

"None. I never accepted the wager," said Bliss.

"Just as well. I wouldn't like to accept the money, anyway."

They were some 10 billion kilometers from the sun. It was still star-like, but it was nearly 1/4,000 as bright as the average sun would have been when viewed from the surface of a habitable planet.

"We can see two planets under magnification, right now," said Trevize. "From their measured diameters and from the spectrum of the reflected light, they are clearly gas giants."

The ship was well outside the planetary plane, and Bliss and Pelorat, staring over Trevize's shoulder at the viewscreen, found themselves looking at two tiny crescents of greenish light. The smaller was in the somewhat thicker phase of the two.

Trevize said, "Janov! It is correct, isn't it, that Earth's sun is suppose to have four gas giants."

"According to the legends. Yes," said Pelorat.

"The nearest of the four to the sun is the largest, and the second nearest has rings. Right?"

"Large prominent rings, Golan. Yes. Just the same, old chap, you have to allow for exaggeration in the telling and retelling of a legend. If we should not find a planet with an extraordinary ring system, I don't think we ought to let that count seriously against this being Earth's star."

"Nevertheless, the two we see may be the farthest, and the two nearer ones may well be on the other side of the sun and too far .to be easily located against the background of stars. We'll have to move still closer-and beyond the sun to the other side."

"Can that be done in the presence of the star's nearby mass?"

"With reasonable caution, the computer can do it, I'm sure. If it judges the danger to be too great, however, it will refuse to budge us, and we can then move in cautious, smaller steps."

His mind directed the computer-and the starfield on the viewscreen changed. The star brightened sharply and then moved off the viewscreen as the computer, following directions, scanned the sky for another gas giant. It did so successfully.

All three onlookers stiffened and stared, while Trevize's mind, almost helpless with astonishment, fumbled at the computer to direct further magnification.

"Incredible," gasped Bliss.

88.

A GAS giant was in view, seen at an angle that allowed most of it to be sunlit. About it, there curved a broad and brilliant ring of material, tipped so as to catch the sunlight on the side being viewed. It was brighter than the planet itself and along it, one third of the way in toward the planet, was a narrow, dividing line.

Trevize threw in a request for maximum enhancement and the ring became ringlets, narrow and concentric, glittering in the sunlight. Only a portion of the ring

system was visible on the viewscreen and the planet itself had moved off: A further direction from Trevize and one corner of the screen marked itself off and showed, within itself, a miniature of the planet and rings under lesser magnification.

"Is that sort of thing common?" asked Bliss, awed.

"No," said Trevize. "Almost every gas giant has rings of debris, but they tend to be faint and narrow. I once saw one in which the rings were narrow, but quite bright. But I never saw anything like this; or heard of it, either."

Pelorat said, "That's clearly the ringed giant the legends speak of. If this is really unique—"

"Really unique, as far as I know, or as far as the computer knows," said Trevize.

"Then this must be the planetary system containing Earth. Surely, no one could invent such a planet. It would have had to have been seen to be described."

Trevize said, "I'm prepared to believe just about anything your legends say now. This is the sixth planet and Earth would be the third?"

"Right, Golan."

"Then I would say we were less than 1.5 billion kilometers from Earth, and we haven't been stopped. Gaia stopped us when we approached."

Bliss said, "You were closer to Gaia when you were stopped."

"Ah," said Trevize, "but it's my opinion Earth is more powerful than Gaia, and I take this to be a good sign. If we are not stopped, it may be that Earth does not object to our approach."

"Or that there is no Earth," said Bliss.

"Do you care to bet this time?" asked Trevize grimly.

"What I think Bliss means," put in Pelorat, "is that Earth may be radioactive as everyone seems to think, and that no one stops us because there is no life on the Earth."

"No," said Trevize violently. "I'll believe everything that's said about Earth, but that. We'll just close in on Earth and see for ourselves. And I have the feeling we won't be stopped."

89.

THE GAS giants were well behind. An asteroid belt lay just inside the gas giant nearest the sun. (That gas giant was the largest and most massive, just as the legends said.)

Inside the asteroid belt were four planets.

Trevize studied them carefully. "The third is the largest. The size is appropriate and the distance from the sun is appropriate. It could be habitable."

Pelorat caught what seemed to be a note of uncertainty in Trevize's words.

He said, "Does it have an atmosphere?"

"Oh yes," said Trevize. "The second, third, and fourth planets all have atmospheres. And, as in the old children's tale, the second's is too dense, the fourth's is not dense enough, but the third's is just right."

"Do you think it might be Earth, then?"

"Think?" said Trevize almost explosively. "I don't have to think. It is Earth. It has the giant satellite you told me of."

"It has?" And Pelorat's face broke into a wider smile than any that Trevize had ever seen upon it.

"Absolutely! Here, look at it under maximum magnification."

Pelorat saw two crescents, one distinctly larger and brighter than the other.

"Is that smaller one the satellite?" he asked.

"Yes. It's rather farther from the planet than one might expect but it's definitely revolving about it. It's only the size of a small planet; in fact, it's smaller than any of the four inner planets circling the sun. Still, it's large for a satellite. It's at least two thousand kilometers in diameter, which makes it in the size range of the large satellites that revolve about gas giants."

"No larger?" Pelorat seemed disappointed. "Then it's not a giant satellite?"

"Yes, it is. A satellite with a diameter of two to three thousand kilometers that is circling an enormous gas giant is one thing. That same satellite circling a small, rocky habitable planet is quite another. That satellite has a diameter over a quarter that of Earth. Where have you heard of such near-parity involving a habitable planet?"

Pelorat said timidly, "I know very little of such things."

Trevize said, "Then take my word for it, Janov. It's unique. We're looking at something that is practically a double planet, and there are few habitable planets that have anything more than pebbles orbiting them. Janov, if you consider that gas giant with its enormous ring system in sixth place, and this planet with its enormous satellite in third-both of which your legends told you about, against all credibility, before you ever saw them-then that world you're looking at must be Earth. It cannot conceivably be anything else. We've found it, Janov; we've found it."

90.

THEY WERE on the second day of their coasting progress toward Earth, and Bliss yawned over the dinner meal. She said, "It seems to me we've spent more time coasting toward and away from planets than anything else. We've spent weeks at it, literally."

"Partly," said Trevize, "that's because Jumps are dangerous too close to a star. And in this case, we're moving very slowly because I do not wish to advance into possible danger too quickly."

"I thought you said you had the feeling we would not be stopped."

"So I do, but I don't want to stake everything on a feeling." Trevize looked at the contents of the spoon before putting it into his mouth and said, "You know, I miss the fish we had on Alpha. We only had three meals there."

"A pity," agreed Pelorat.

"Well," said Bliss, "we visited five worlds and had to leave each one of them so hurriedly that we never had time to add to our food supplies and introduce variety. Even when the world had food to offer, as did Comporellon and Alpha, and, presumably-

She did not complete the sentence, for Fallom, looking up quickly, finished it for her. "Solaria? Could you get no food there? There is plenty of food there. As much as on Alpha. And better, too."

"I know that, Fallom," said Bliss. "There was just no time."

Fallom stared at her solemnly. "Will I ever see Jemby again, Bliss? Tell me the truth."

Bliss said, "You may, if we return to Solaria."

"Will we ever return to Solaria?"

Bliss hesitated. "I cannot say."

"Now we go to Earth, is that right? Isn't that the planet where you say we all originate?"

"Where our forebears originated," said Bliss.

"I can say 'ancestors,'" said Fallom.

"Yes, we are going to Earth."

Bliss said lightly, "Wouldn't anyone wish to see the world of their ancestors?"

"I think there's more to it. You all seem so concerned."

"But we've never been there before. We don't know what to expect."

"I think it is more than that."

Bliss smiled. "You've finished eating, Fallom dear, so why not go to the room and let us have a little serenade on your flute. You're playing it more beautifully all the time. Come, come." She gave Fallom an accelerating pat on the rear end, and off Fallom went, turning only once to give Trevize a thoughtful look.

Trevize looked after her with clear distaste. "Does that thing read minds?"

"Don't call her a 'thing,' Trevize," said Bliss sharply.

"Does she read minds? You ought to be able to tell."

"No, she doesn't. Nor can Gaia. Nor can the Second Foundationers. Reading minds in the sense of overhearing a conversation, or making out precise ideas is not something that can be done now, or in the foreseeable future. We can detect, interpret, and, to some extent, manipulate emotions, but that is not the same thing at all."

"How do you know she can't do this thing that supposedly can't be done?"

"Because as you have just said, I ought to be able to tell."

"Perhaps she is manipulating you so that you remain ignorant of the fact that she can."

Bliss rolled her eyes upward. "Be reasonable, Trevize. Even if she had unusual abilities, she could do nothing with me for I am not Bliss, I am Gaia. You keep forgetting.

Do you know the mental inertia represented by an entire planet? Do you think one isolate, however talented, can overcome that?"

"You don't know everything, Bliss, so don't be overconfident," said Trevize sullenly. "That th- She has been with us not very long. I couldn't learn anything but the rudiments of a language in that time, yet she already speaks Galactic perfectly and with virtually a full vocabulary. Yes, I know you've been helping her, but I wish you would stop."

"I told you I was helping her, but I also told you she's fearfully intelligent. Intelligent enough so that I would like to have her part of Gaia. If we can gather her in; if she's still young enough; we might learn enough about the Solarians to absorb that entire world eventually. It might well be useful to us."

"Does it occur to you that the Solarians are pathological isolates even by my standards?"

"They wouldn't stay so as part of Gaia."

"I think you're wrong, Bliss. I think that Solarian child is dangerous and that we should get rid of her."

"How? Dump her through the airlock? Kill her, chop her up, and add her to our food supply?"

Pelorat said, "Oh, Bliss."

And Trevize said, "That's disgusting, and completely uncalled for." He listened for a moment. The flute was sounding without flaw or waver, and they had been talking in half-whispers. "When this is all over, we've got to return her to Solaria, and make sure that Solaria is forever cut off from the Galaxy. My own feeling is that it should be destroyed. I distrust and fear it."

Bliss thought awhile and said, "Trevize, I know that you have the knack of coming to a right decision, but I also know you have been antipathetic to Fallom from the start. I suspect that may just be because you were humiliated on Solaria and have taken a violent hatred to the planet and its inhabitants as a result. Since I must not tamper with your mind, I can't tell that for sure. Please remember that if we had not taken Fallom with us, we would be on Alpha right now-dead and, I presume, buried."

"I know that, Bliss, but even so-"

"And her intelligence is to be admired, not envied."

"I do not envy her. I fear her."

"Her intelligence?"

Trevize licked his lips thoughtfully. "No, not quite."

"What, then?"

"I don't know. Bliss, if I knew what I feared, I might not have to fear it. It's something I don't quite understand." His voice lowered, as though he were speaking to himself. "The Galaxy seems to be crowded with things I don't understand. Why did I choose Gaia? Why must I find Earth? Is there a missing assumption in psychohistory? If there is, what is it? And on top of all that, why does Fallom make me uneasy?"

Bliss said, "Unfortunately, I can't answer those questions." She rose, and left the room.

Pelorat looked after her, then said, "Surely things aren't totally black, Golan. We're getting closer and closer to Earth and once we reach it all mysteries may be solved. And so far nothing seems to be making any effort to stop us from reaching it."

Trevize's eyes flickered toward Pelorat and he said in a low voice, "I wish something would."

Pelorat said, "You do? Why should you want that?"

"Frankly, I'd welcome a sign of life."

Pelorat's eyes opened wide. "Have you found that Earth is radioactive after all?"

"Not quite. But it is warm. A bit warmer than I would have expected."

"Is that bad?"

"Not necessarily. It may be rather warm but that wouldn't make it necessarily uninhabitable. The cloud cover is thick and it is definitely water vapor, so that those clouds, together with a copious water ocean, could tend to keep things livable despite the temperature we calculated from microwave emission. I can't be sure, yet. It's just that-

"Yes, Golan?"

"Well, if Earth were radioactive, that might well account for its being warmer than expected."

"But that doesn't argue the reverse, does it? If it's warmer than expected, that doesn't mean it must be radioactive."

"No. No, it doesn't." Trevize managed to force a smile. "No use brooding, Janov. In a day or two, I'll be able to tell more about it and we'll know for sure."

91.

FALLOM was sitting on the cot in deep thought when Bliss came into the room. Fallom looked up briefly, then down again.

Bliss said quietly, "What's the matter, Fallom?"

Fallom said, "Why does Trevize dislike me so much, Bliss?"

"What makes you think he dislikes you."

"He looks at me impatiently- Is that the word?"

"It might be the word."

"He looks at me impatiently when I am near him. His face always twists a little."

"Trevize is having a hard time, Fallom."

"Because he's looking for Earth?"

"Yes."

Fallom thought awhile, then said, "He is particularly impatient when I think something into moving."

Bliss's lips tightened. "Now, Fallom, didn't I tell you you must not do that, especially when Trevize is present?"

"Well, it was yesterday, right here in this room, and he was in the doorway and I didn't notice. I didn't know he was watching. It was just one of Pel's book-films, anyway, and I was trying to make it stand on one tip. I wasn't doing any harm."

"It makes him nervous, Fallom, and I want you not to do it, whether he's watching or not."

"Does it make him nervous because he can't do it?"

"Perhaps."

"Can you do it?"

Bliss shook her head slowly. "No, I can't."

"It doesn't make you nervous when I do it. It doesn't make Pel nervous, either."

"People are different."

"I know," said Fallom, with a sudden hardness that surprised Bliss and caused her to frown.

"What do you know, Fallow?"

"I'm different."

"Of course, I just said so. People are different."

"My shape is different. I can move things."

"That's true."

Fallow said, with a shade of rebelliousness, "I must move things. Trevize should not be angry with me for that, and you should not stop me."

"But why must you move things?"

"It is practice. Exerceez. -Is that the right word?"

"Not quite. Exercise."

"Yes. Jemby always said I must train my-my-"

"Transducer-lobes?"

"Yes. And make them strong. Then, when I was grown up, I could power all the robots. Even Jemby."

"Fallow, who did power all the robots if you did not?"

"Bander." Fallom said it very matter-of-factly.

"Did you know Bander?"

"Of course. I viewed him many times. I was to be the next estate-head. The Bander estate would become the Fallom estate. Jemby told me so."

"You mean Bander came to your-"

Fallow's mouth made a perfect O of shock. She said in a choked voice, "Bander would never come to-" The youngster ran out of breath and panted a bit, then said, "I viewed Bander's image."

Bliss asked hesitantly, "How did Bander treat you?"

Fallow looked at Bliss with a faintly puzzled eye. "Bander would ask me if I needed anything; if I was comfortable. But Jemby was always near me so I never needed anything and I was always comfortable."

Her head bent and she stared at the floor. Then she placed her hands over her eyes and said, "But Jemby stopped. I think it was because Bander stopped, too."

Bliss said, "Why do you say that?"

"I've been thinking about it. Bander powered all the robots, and if Jemby stopped, and all the other robots, too, it must be that Bander stopped. Isn't that so?"

Bliss was silent.

Fallow said, "But when you take me back to Solaria I will power Jemby and all the rest of the robots, and I will be happy again."

She was sobbing.

Bliss said, "Aren't you happy with us, Fallow? Just a little? Sometimes?"

Fallow lifted her tear-stained face to Bliss and her voice trembled as she shook her head and said, "I want Jemby."

In an agony of sympathy, Bliss threw her arms about the youngster. "Oh, Fallow, how I wish I could bring you and Jemby together again," and was suddenly aware that she was weeping, too.

92.

PELORAT entered and found them so. He halted in mid-step and said, "What's the matter?"

Bliss detached herself and fumbled for a small tissue so that she might wipe her eyes. She shook her head, and Pelorat at once said, with heightened concern, "But what's the matter?"

Bliss said, "Fallow, just rest a little. I'll think of something to make things a little better for you. Remember-I love you just the same way that Jemby did."

She seized Pelorat's elbow and rushed him out into the living room, saying, "It's nothing, Pel. -Nothing."

"It's Fallow, though, isn't it? She still misses Jemby."

"Terribly. And there's nothing we can do about it. I can tell her that I love her-and, truthfully, I do. How can you help loving a child so intelligent and gentle? -Fearfully intelligent. Trevize thinks too intelligent. She's seen Bander in her time, you know-or viewed it, rather, as a holographic image. She's not moved by that memory, however; she's very cold and matter-of-fact about it, and I can understand why. There was only the fact that Bander was owner of the estate and that Fallow would be the next owner that bound them. No other relationship at all."

"Does Fallow understand that Bander is her father?"

"Her mother. If we agree that Fallow is to be regarded as feminine, so is Bander."

"Either way, Bliss dear. Is Fallow aware of the parental relationship?"

"I don't know that she would understand what that is. She may, of course, but she gave no hint. However, Pel, she has reasoned out that Bander is dead, for it's dawned on

her that Jemby's inactivation must be the result of power loss and since Bander supplied the power- That frightens me."

Pelorat said thoughtfully, "Why should it, Bliss? It's only a logical inference, after all."

"Another logical inference can be drawn from that death. Deaths must be few and far distant on Solaria with its long-lived and isolated Spacers. Experience of natural death must be a limited one for any of them, and probably absent altogether for a Solarian child of Fallom's age. If Fallom continues to think of Bander's death, she's going to begin to wonder why Bander died, and the fact that it happened when we strangers were on the planet will surely lead her to the obvious cause and effect."

"That we killed Bander?"

"It wasn't we who killed Bander, Pel. It was I. "

"She couldn't guess that."

"But I would have to tell her that. She is annoyed with Trevize as it is, and he is clearly the leader of the expedition. She would take it for granted that it would be he who would have brought about the death of Bander, and how could I allow Trevize to bear the blame unjustly?"

"What would it matter, Bliss? The child feels nothing for her fathmother. Only for her robot, Jemby."

"But the death of the mother meant the death of her robot, too. I almost did own up to my responsibility. I was strongly tempted."

"Why?"

"So I could explain it my way. So I could soothe her, forestall her own discovery of the fact in a reasoning process that would work it out in a way that would offer no justification for it."

"But there was justification. It was self-defense. In a moment, we all would have been dead, if you had not acted."

"It's what I would have said, but I could not bring myself to explain. I was afraid she wouldn't believe me."

Pelorat shook his head. He said, sighing, "Do you suppose it might have been better if we had not brought her? The situation makes you so unhappy."

"No," said Bliss angrily, "don't say that. It would have made me infinitely more unhappy to have to sit here right now and remember that we had left an innocent child behind to be slaughtered mercilessly because of what we had done."

"It's the way of Fallom's world."

"Now, Pel, don't fall into Trevize's way of thinking. Isolates find it possible to accept such things and think no more about it. The way of Gaia is to save life, however, not destroy it-or to sit idly by while it is destroyed. Life of all kinds must, we all know, constantly be coming to an end in order that other life might endure, but never uselessly, never to no end. Bander's death, though unavoidable, is hard enough to bear; Fallom's would have been past all bounds."

"Ah well," said Pelorat, "I suppose you're right. -And in any case, it is not the problem of Fallom concerning which I've come to see you. It's Trevize."

"What about Trevize?"

"Bliss, I'm worried about him. He's waiting to determine the facts about Earth, and I'm not sure he can withstand the strain."

"I don't fear for him. I suspect he has a sturdy and stable mind."

"We all have our limits. Listen, the planet Earth is warmer than he expected it to be; he told me so. I suspect that he thinks it may be too warm for life, though he's clearly trying to talk himself into believing that's not so."

"Maybe he's right. Maybe it's not too warm for life."

"Also, he admits it's possible that the warmth might possibly arise from a radioactive crust, but he is refusing to believe that also. -In a day or two, we'll be close enough so that the truth of the matter will be unmistakable. What if Earth is radioactive?"

"Then he'll have to accept the fact."

"But-I don't know how to say this, or how to put it in mental terms. What if his mind-"

Bliss waited, then said wryly, "Blows a fuse?"

"Yes. Blows a fuse. Shouldn't you do something now to strengthen him? Keep him level and under control, so to speak?"

"No, Pel. I can't believe he's that fragile, and there is a firm Gaian decision that his mind must not be tampered with."

"But that's the very point. He has this unusual 'rightness,' or whatever you want to call it. The shock of his entire project falling to nothingness at the moment when it seems successfully concluded may not destroy his brain, but it may destroy his 'rightness.' It's a very unusual property he has. Might it not be unusually fragile, too?"

Bliss remained for a moment in thought. Then she shrugged. "Well, perhaps I'll keep an eye on him."

93.

FOR THE next thirty-six hours, Trevize was vaguely aware that Bliss and, to a lesser degree, Pelorat, tended to dog his footsteps. Still, that was not utterly unusual in a ship as compact as theirs, and he had other things on his mind.

Now, as he sat at the computer, he was aware of them standing just inside the doorway. He looked up at them, his face blank.

"Well?" he said, in a very quiet voice.

Pelorat said, rather awkwardly, "How are you, Golan?"

Trevize said, "Ask Bliss. She's been staring at me intently for hours. She must be poking through my mind. -Aren't you, Bliss?"

"No, I am not," said Bliss evenly, "but if you feel the need for my help, I can try. - Do you want my help?"

"No, why should I? Leave me alone. Both of you."

Pelorat said, "Please tell us what's going on."

"Guess!"

"Is Earth-"

"Yes, it is. What everyone insisted on telling us is perfectly true." Trevize gestured at the viewscreen, where Earth presented its nightside and was eclipsing the sun. It was a solid circle of black against the starry sky, its circumference outlined by a broken orange curve.

Pelorat said, "Is that orange the radioactivity?"

"No. Just refracted sunlight through the atmosphere. It would be a solid orange circle if the atmosphere weren't so cloudy. We can't see the radioactivity. The various radiations, even the gamma rays, are absorbed by the atmosphere. However, they do set up secondary radiations, comparatively feeble ones, but the computer can detect them. They're still invisible to the eye, but the computer can produce a photon of visible light for each particle or wave of radiation it receives and put Earth into false color. Look."

And the black circle glowed with a faint, blotchy blue.

"How much radioactivity is there?" asked Bliss, in a low voice. "Enough to signify that no human life can exist there?"

"No life of any kind," said Trevize. "The planet is uninhabitable. The last bacterium, the last virus, is long gone."

"Can we explore it?" said Pelorat. "I mean, in space suits."

"For a few hours-before we come down with irreversible radiation sickness."

"Then what do we do, Golan?"

"Do?" Trevize looked at Pelorat with that same expressionless face. "Do you know what I would like to do? I would like to take you and Bliss-and the child-back to Gaia and leave you all there forever. Then I would like to go back to Terminus and hand back the ship. Then I would like to resign from the Council, which ought to make Mayor Branno very happy. Then I would like to live on my pension and let the Galaxy go as it will. I won't care about the Seldon Plan, or about the Foundation, or about the Second Foundation, or about Gaia. The Galaxy can choose its own path. It will last my time and why should I care a snap as to what happens afterward?"

"Surely, you don't mean it, Golan," said Pelorat urgently.

Trevize stared at him for a while, and then he drew a long breath. "No, I don't, but, oh, how I wish I could do exactly what I have just outlined to you."

"Never mind that. What will you do?"

"Keep the ship in orbit about the Earth, rest, get over the shock of all this, and think of what to do next. Except that-"

"Yes?"

And Trevize blurted out, "What can I do next? What is there further to look for? What is there further to find?"

20. THE NEARBY WORLD

94.

FOR Four successive meals, Pelorat and Bliss had seen Trevize only at meals. During the rest of the time, he was either in the pilot-room or in his bedroom. At mealtimes, he was silent. His lips remained pressed together and he ate little.

At the fourth meal, however, it seemed to Pelorat that some of the unusual gravity had lifted from Trevize's countenance. Pelorat cleared his throat twice, as though preparing to say something and then retreating.

Finally, Trevize looked up at him and said, "Well?"

"Have you-have you thought it out, Golan?"

"Why do you ask?"

"You seem less gloomy."

"I'm not less gloomy, but I have been thinking. Heavily."

"May we know what?" asked Pelorat.

Trevize glanced briefly in Bliss's direction. She was looking firmly at her plate, maintaining a careful silence, as though certain that Pelorat would get further than she at this sensitive moment.

Trevize said, "Are you also curious, Bliss?"

She raised her eyes for a moment. "Yes. Certainly."

Fallom kicked a leg of the table moodily, and said, "Have we found Earth?"

Bliss squeezed the youngster's shoulder. Trevize paid no attention.

He said, "What we must start with is a basic fact. All information concerning Earth has been removed on various worlds. That is bound to bring us to an inescapable conclusion. Something on Earth is being hidden. And yet, by observation, we see that Earth is radioactively deadly, so that anything on it is automatically hidden. No one can land on it, and from this distance, when we are quite near the outer edge of the magnetosphere and would not care to approach Earth any more closely, there is nothing for us to find."

"Can you be sure of that?" asked Bliss softly.

"I have spent my time at the computer, analyzing Earth in every way it and I can. There is nothing. What's more, I feel there is nothing. Why, then, has data concerning the Earth been wiped out? Surely, whatever must be hidden is more effectively hidden now than anyone can easily imagine, and there need be no human gilding of this particular piece of gold."

"It may be," said Pelorat, "that there was indeed something hidden on Earth at a time when it had not yet grown so severely radioactive as to preclude visitors. People on Earth may then have feared that someone might land and find this whatever-it-is. It was

then that Earth tried to remove information concerning itself. What we have now is a vestigial remnant of that insecure time."

"No, I don't think so," said Trevize. "The removal of information from the Imperial Library at Trantor seems to have taken place very recently." He turned suddenly to Bliss, "Am I right?"

Bliss said evenly, "I/we/Gaia gathered that much from the troubled mind of the Second Founder Gendibal, when he, you, and I had the meeting with the Mayor of Terminus."

Trevize said, "So whatever must have had to be hidden because there existed the chance of finding it must still be in hiding now, and there must be danger of finding it now despite the fact that Earth is radioactive."

"How is that possible?" asked Pelorat anxiously.

"Consider," said Trevize. "What if what was on Earth is no longer on Earth, but was removed when the radioactive danger grew greater? Yet though the secret is no longer on Earth, it may be that if we can find Earth, we would be able to reason out the place where the secret has been taken. If that were so, Earth's whereabouts would still have to be hidden."

Fallom's voice piped up again. "Because if we can't find Earth, Bliss says you'll take me back to Jemby."

Trevize turned toward Fallom and glared-and Bliss said, in a low voice, "I told you we might, Fallom. We'll talk about it later. Right now, go to your room and read, or play the flute, or anything else you want to do. Go-go."

Fallom, frowning sulkily, left the table.

Pelorat said, "But how can you say that, Golan? Here we are. We've located Earth. Can we now deduce where whatever it is might be if it isn't on Earth?"

It took a moment for Trevize to get over the moment of ill humor Fallom had induced. Then, he said, "Why not? Imagine the radioactivity of Earth's crust growing steadily worse. The population would be decreasing steadily through death and emigration, and the secret, whatever it is, would be in increasing danger. Who would remain to protect it? Eventually, it would have to be shifted to another world, or the use of-whatever it was-would be lost to Earth. I suspect there would be reluctance to move it and it is likely that it would be done more or less at the last minute. Now, then, Janov, remember the old man on New Earth who filled your ears with his version of Earth's history?"

"Monolee?"

"Yes. He. Did he not say in reference to the establishment of New Earth that what was left of Earth's population was brought to the planet?"

Pelorat said, "Do you mean, old chap, that what we're searching for is now on New Earth? Brought there by the last of Earth's population to leave?"

Trevize said, "Might that not be so? New Earth is scarcely better known to the Galaxy in general than Earth is, and the inhabitants are suspiciously eager to keep all Outworlders away."

"We were there," put in Bliss. "We didn't find anything."

"We weren't looking for anything but the whereabouts of Earth."

Pelorat said, in a puzzled way, "But we're looking for something with a high technology; something that can remove information from under the nose of the Second Foundation itself, and even from under the nose—excuse me, Bliss—of Gaia. Those people on New Earth may be able to control their patch of weather and may have some techniques of biotechnology at their disposal, but I think you'll admit that their level of technology is, on the whole, quite low."

Bliss nodded. "I agree with Pel."

Trevize said, "We're judging from very little. We never did see the men of the fishing fleet. We never saw any part of the island but the small patch we landed on. What might we have found if we had explored more thoroughly? After all, we didn't recognize the fluorescent lights till we saw them in action, and if it appeared that the technology was low, appeared, I say—"

"Yes?" said Bliss, clearly unconvinced.

"That could be part of the veil intended to obscure the truth."

"Impossible," said Bliss.

"Impossible? It was you who told me, back on Gaia, that at Trantor, the larger civilization was deliberately held at a level of low technology in order to hide the small kernel of Second Foundationers. Why might not the same strategy be used on New Earth?"

"Do you suggest, then, that we return to New Earth and face infection again—this time to have it activated? Sexual intercourse is undoubtedly a particularly pleasant mode of infection, but it may not be the only one."

Trevize shrugged. "I am not eager to return to New Earth, but we may have to."

"May! After all, there is another possibility."

"What is that?"

"New Earth circles the star the people call Alpha. But Alpha is part of a binary system. Might there not be a habitable planet circling Alpha's companion as well?"

"Too dim, I should think," said Bliss, shaking her head. "The companion is only a quarter as bright as Alpha is."

"Dim, but not too dim. If there is a planet fairly close to the star, it might do."

Pelorat said, "Does the computer say anything about any planets for the companion?"

Trevize smiled grimly. "I checked that. There are five planets of moderate size. No gas giants."

"And are any of the five planets habitable?"

"The computer gives no information at all about the planets, other than their number, and the fact that they aren't large."

"Oh," said Pelorat deflated.

Trevize said, "That's nothing to be disappointed about. None of the Spacer worlds are to be found in the computer at all. The information on Alpha itself is minimal. These

things are hidden deliberately and if almost nothing is known about Alpha's companion, that might almost be regarded as a good sign."

"Then," said Bliss, in a business-like manner, "what you are planning to do is this-visit the companion and, if that draws a blank, return to Alpha itself."

"Yes. And this time when we reach the island of New Earth, we will be prepared. We will examine the entire island meticulously before landing and, Bliss, I expect you to use your mental abilities to shield-

And at that moment, the Far Star lurched slightly, as though it had undergone a ship-sized hiccup, and Trevize cried out, halfway between anger and perplexity, "Who's at the controls?"

And even as he asked, he knew very well who was.

95.

FALLOM, at the computer console, was completely absorbed. Her small, longfingere hands were stretched wide in order to fit the faintly gleaming handmarks on the desk. Fallom's hands seemed to sink into the material of the desk, even though it was clearly felt to be hard and slippery.

She had seen Trevize hold his hands so on a number of occasions, and she hadn't seen him do more than that, though it was quite plain to her that in so doing he controlled the ship.

On occasion, Fallom had seen Trevize close his eyes, and she closed hers now. After a moment or two, it was almost as though she heard a faint, far-off voice-far off, but sounding in her own head, through (she dimly realized) her transducer-lobes. They were even more important than her hands. She strained to make out the words.

Instructions, it said, almost pleadingly. What are your instructions?

Fallom didn't say anything. She had never witnessed Trevize saying anything to the computer-but she knew what it was that she wanted with all her heart. She wanted to go back to Solaria, to the comforting endlessness of the mansion, to Jemby-Jemby-Jemby-

She wanted to go there and, as she thought of the world she loved, she imagined it visible on the viewscreen as she had seen other worlds she didn't want. She opened her eyes and stared at the viewscreen willing some other world there than this hateful Earth, then staring at what she saw, imagining it to be Solaria. She hated the empty Galaxy to which she had been introduced against her will. Tears came to her eyes, and the ship trembled.

She could feel that tremble, and she swayed a little in response.

And then she heard loud steps in the corridor outside and, when she opened her eyes, Trevize's face, distorted, filled her vision, blocking out the viewscreen, which held all she wanted. He was shouting something, but she paid no attention. It was he who had taken her from Solaria by killing Bander, and it was he who was preventing her from returning by thinking only of Earth, and she was not going to listen to him.

She was going to take the ship to Solaria, and, with the intensity of her resolve, it trembled again.

96.

BLISS clutched wildly at Trevize's arm. "Don't! Don't!"

She clung strongly, holding him back, while Pelorat stood, confused and frozen, in the background.

Trevize was shouting, "Take your hands off the computer! -Bliss, don't get in my way. I don't want to hurt you."

Bliss said, in a tone that seemed almost exhausted, "Don't offer violence to the child. I'd have to hurt you-against all instructions."

Trevize's eyes darted wildly from Fallom to Bliss. He said, "Then you get her off, Bliss. Now!"

Bliss pushed him away with surprising strength (drawing it, Trevize thought afterward, from Gaia, perhaps).

"Fallom," she said, "lift your hands."

"No," shrieked Fallom. "I want the ship to go to Solaria. I want it to go there. There." She nodded toward the viewscreen with her head, unwilling to let even one hand release its pressure on the desk for the purpose.

But Bliss reached for the child's shoulders and, as her hands touched Fallom, the youngster began to tremble.

Bliss's voice grew soft. "Now, Fallom, tell the computer to be as it was and come with me. Come with me." Her hands stroked the child, who collapsed in an agony of weeping.

Fallom's hands left the desk, and Bliss, catching her under the armpits, lifted her into a standing position. She turned her, held her firmly against her breast, and allowed the child to smother her wrenching sobs there.

Bliss said to Trevize, who was now standing dumbly in the doorway, "Step out of the way, Trevize, and don't touch either of us as we pass."

Trevize stepped quickly to one side.

Bliss paused a moment, saying in a low voice to Trevize, "I had to get into her mind for a moment. If I've caused any damage, I won't forgive you easily."

It was Trevize's impulse to tell her he didn't care a cubic millimeter of vacuum for Fallom's mind; that it was the computer for which he feared. Against the concentrated glare of Gaia, however (surely it wasn't only Bliss whose sole expression could inspire the moment of cold terror he felt), he kept silent.

He remained silent for a perceptible period, and motionless as well, after Bliss and Fallom had disappeared into their room. He remained so, in fact, until Pelorat said softly, "Golan, are you all right? She didn't hurt you, did she?"

Trevize shook his head vigorously, as though to shake off the touch of paralysis that had afflicted him. "I'm all right. The real question is whether that's all right." He sat down at the computer console, his hands resting on the two handmarks which Fallom's hands had so recently covered.

"Well?" said Pelorat anxiously.

Trevize shrugged. "It seems to respond normally. I might conceivably find something wrong later on, but there's nothing that seems off now." Then, more angrily, "The computer should not combine effectively with any hands other than mine, but in that hermaphrodite's case, it wasn't the hands alone. It was the transducer-lobes, I'm sure-"

"But what made the ship shake? It shouldn't do that, should it?"

"No. It's a gravitic ship and we shouldn't have these inertial effects. But that she-monster-" He paused, looking angry again.

"Yes?"

"I suspect she faced the computer with two self-contradictory demands, and each with such force that the computer had no choice but to attempt to do both things at once. In the attempt to do the impossible, the computer must have released the inertia-free condition of the ship momentarily. At least that's what I think happened."

And then, somehow, his face smoothed out. "And that might be a good thing, too, for it occurs to me now that all my talk about Alpha Centauri and its companion was flapdoodle. I know now where Earth must have transferred its secret."

97.

PELORAT stared, then ignored the final remark and went back to an earlier puzzle. "In what way did Fallom ask for two self-contradictory things?"

"Well, she said she wanted the ship to go to Solaria."

"Yes. Of course, she would."

"But what did she mean by Solaria? She can't recognize Solaria from space. She's never really seen it from space. She was asleep when we left that world in a hurry. And despite her readings in your library, together with whatever Bliss has told her, I imagine she can't really grasp the truth of a Galaxy of hundreds of billions of stars and millions of populated planets. Brought up, as she was, underground and alone, it is all she can do to grasp the bare concept that there are different worlds-but how many? Two? Three? Four? To her any world she sees is likely to be Solaria, and given the strength of her wishful thinking, is Solaria. And since I presume Bliss has tried to quiet her by hinting that if we don't find Earth, we'll take her back to Solaria, she may even have worked up the notion that Solaria is close to Earth."

"But how can you tell this, Golan? What makes you think it's so?"

"She as much as told us so, Janov, when we burst in upon her. She cried out that she wanted to go to Solaria and then added 'there-there,' nodding her head at the

viewscreen. And what is on the viewscreen? Earth's satellite. It wasn't there when I left the machine before dinner; Earth was. But Fallom must have pictured the satellite in her mind when she asked for Solaria, and the computer, in response, must therefore have focused on the satellite. Believe me, Janov, I know how this computer works. Who would know better?"

Pelorat looked at the thick crescent of light on the viewscreen and said thoughtfully, "It was called 'moon' in at least one of Earth's languages; 'Luna,' in another language. Probably many other names, too. -Imagine the confusion, old chap, on a world with numerous languages-the misunderstandings, the complications, the-

"Moon?" said Trevize. "Well, that's simple enough. -Then, too, come to think of it, it may be that the child tried, instinctively, to move the ship by means of its transducer-lobes, using the ship's own energy-source, and that may have helped produce the momentary inertial confusion. -But none of that matters, Janov. What does matter is that all this has brought this moon -yes, I like the name-to the screen and magnified it, and there it still is. I'm looking at it now, and wondering."

"Wondering what, Golan?"

"At the size of it. We tend to ignore satellites, Janov. They're such little things, when they exist at all. This one is different, though. It's a world. It has a diameter of about thirty-five hundred kilometers."

"A world? Surely you wouldn't call it a world. It can't be habitable. Even a thirty-five-hundred-kilometer diameter is too small. It has no atmosphere. I can tell that just looking at it. No clouds. The circular curve against space is sharp, so is the inner curve that bounds the light and dark hemisphere."

Trevize nodded, "You're getting to be a seasoned space traveler, Janov. You're right. No air. No water. But that only means the moon's not habitable on its unprotected surface. What about underground?"

"Underground?" said Pelorat doubtfully.

"Yes. Underground. Why not? Earth's cities were underground, you tell me. We know that Trantor was underground. Comporellon has much of its capital city underground. The Solarian mansions were almost entirely underground. It's a very common state of affairs."

"But, Golan, in every one of these cases, people were living on a habitable planet. The surface was habitable, too, with an atmosphere and with an ocean. Is it possible to live underground when the surface is uninhabitable? "

"Come, Janov, think! Where are we living right now? The Far Star is a tiny world that has an uninhabitable surface. There's no air or water on the outside. Yet we live inside in perfect comfort. The Galaxy is full of space stations and space settlements of infinite variety, to say nothing of spaceships, and they're all uninhabitable except for the interior. Consider the moon a gigantic spaceship."

"With a crew inside?"

"Yes. Millions of people, for all we know; and plants and animals; and an advanced technology. -Look, Janov, doesn't it make sense? If Earth, in its last days, could

send out a party of Settlers to a planet orbiting Alpha Centauri; and if, possibly with Imperial help, they could attempt to terraform it, seed its oceans, build dry land where there was none; could Earth not also send a party to its satellite and terraform its interior?"

Pelorat said reluctantly, "I suppose so."

"It would be done. If Earth has something to hide, why send it over a parsec away, when it could be hidden on a world less than a hundred millionth the distance to Alpha. And the moon would be a more efficient hiding place from the psychological standpoint. No one would think of satellites in connection with life. For that matter I didn't. With the moon an inch before my nose, my thoughts went haring off to Alpha. If it hadn't been for Fallom-" His lips tightened, and he shook his head. "I suppose I'll have to credit her for that. Bliss surely will if I don't."

Pelorat said, "But see here, old man, if there's something hiding under the surface of the moon, how do we find it? There must be millions of square kilometers of surface-"

"Roughly forty million."

"And we would have to inspect all of that, looking for what? An opening? Some sort of airlock?"

Trevize said, "Put that way, it would seem rather a task, but we're not just looking for objects, we're looking for life; and for intelligent life at that. And we've got Bliss, and detecting intelligence is her talent, isn't it?"

98.

BLISS looked at Trevize accusingly. "I've finally got her to sleep. I had the hardest time. She was wild. Fortunately, I don't think I've damaged her."

Trevize said coldly, "You might try removing her fixation on Jemby, you know, since I certainly have no intention of ever going back to Solaria."

"Just remove her fixation, is that it? What do you know about such things, Trevize? You've never sensed a mind. You haven't the faintest idea of its complexity. If you knew anything at all about it, you wouldn't talk about removing a fixation as though it were just a matter of scooping jam out of a jar."

"Well, weaken it at least."

"I might weaken it a bit, after a month of careful dethreading."

"What do you mean, dethreading?"

"To someone who doesn't know, it can't be explained."

"What are you going to do with the child, then?"

"I don't know yet; it will take a lot of consideration."

"In that case," said Trevize, "let me tell you what we're going to do with the ship."

"I know what you're going to do. It's back to New Earth and another try at the lovely Hiroko, if she'll promise not to infect you this time."

Trevize kept his face expressionless. He said, "No, as a matter of fact. I've changed my mind. We're going to the moon-which is the name of the satellite, according to Janov."

"The satellite? Because it's the nearest world at hand? I hadn't thought of that."

"Nor I. Nor would anyone have thought of it. Nowhere in the Galaxy is there a satellite worth thinking about-but this satellite, in being large, is unique. What's more, Earth's anonymity covers it as well. Anyone who can't find the Earth can't find the moon, either."

"Is it habitable?"

"Not on the surface, but it is not radioactive, not at all, so it isn't absolutely uninhabitable. It may have life-it may be teeming with life, in fact-under the surface. And, of course, you'll be able to tell if that's so, once we get close enough."

Bliss shrugged. "I'll try. -But, then, what made you suddenly think of trying the satellite?"

Trevize said quietly, "Something Fallom did when she was at the controls."

Bliss waited, as though expecting more, then shrugged again. "Whatever it was, I suspect you wouldn't have gotten the inspiration if you had followed your own impulse and killed her."

"I had no intention of killing her, Bliss."

Bliss waved her hand. "All right. Let it be. Are we moving toward the moon now?"

"Yes. As a matter of caution, I'm not going too fast, but if all goes well, we'll be in its vicinity in thirty hours."

99.

THE MOON was a wasteland. Trevize watched the bright daylight portion drifting past them below. It was a monotonous panorama of crater rings and mountainous areas, and of shadows black against the sunlight. There were subtle color changes in the soil and occasional sizable stretches of flatness, broken by small craters.

As they approached the nightside, the shadows grew longer and finally fused together. For a while, behind them, peaks glittered in the sun, like fat stars, far outshining their brethren in the sky. Then they disappeared and below was only the fainter light of the Earth in the sky, a large bluish-white sphere, a little more than half full. The ship finally outran the Earth, too, which sank beneath the horizon so that under them was unrelieved blackness, and above only the faint powdering of stars, which, to Trevize, who had been brought up on the starless world of Terminus, was always miracle enough.

Then, new bright stars appeared ahead, first just one or two, then others, expanding and thickening and finally coalescing. And at once they passed the terminator into the daylight side. The sun rose with infernal splendor, while the viewscreen shifted away from it at once and polarized the glare of the ground beneath.

Trevize could see quite well that it was useless to hope to find any way into the inhabited interior (if that existed) by mere eye inspection of this perfectly enormous world.

He turned to look at Bliss, who sat beside him. She did not look at the viewscreen; indeed, she kept her eyes closed. She seemed to have collapsed into the chair rather than to be sitting in it.

Trevize, wondering if she were asleep, said softly, "Do -you detect anything else?"

Bliss shook her head very slightly. "No," she whispered. "There was just that faint whiff. You'd better take me back there. Do you know where that region was?"

"The computer knows."

It was like zeroing in on a target, shifting this way and that and then finding it. The area in question was still deep in the night side and, except that the Earth shone fairly low in the sky and gave the surface a ghostly ashen glow between the shadows, there was nothing to make out, even though the light in the pilot-room had been blacked out for better viewing.

Pelorat had approached and was standing anxiously in the doorway. "Have we found anything?". he asked, in a husky whisper.

Trevize held up his hand for silence. He was watching Bliss. He knew it would be days before sunlight would return to this spot on the moon, but he also knew that for what Bliss was trying to sense, light of any kind was irrelevant.

She said, "It's there."

"Are you sure?"

"Yes."

"And it's the only spot?"

"It's the only spot I've detected. Have you been over every part of the moon's surface?"

"We've been over a respectable fraction of it."

"Well, then, in that respectable fraction, this is all I have detected. It's stronger now, as though it has detected us and it doesn't seem dangerous. The feeling I get is a welcoming one."

"Are you sure?"

"It's the feeling I get."

Pelorat said, "Could it be faking the feeling?"

Bliss said, with a trace of hauteur, "I would detect a fake, I assure you."

Trevize muttered something about overconfidence, then said, "What you detect is intelligence, I hope."

"I detect strong intelligence. Except-" And an odd note entered her voice.

"Except what?"

"Ssh. Don't disturb me. Let me concentrate." The last word was a mere motion of her lips.

Then she said, in faint elated surprise, "It's not human."

"Not human," said Trevize, in much stronger surprise. "Are we dealing with robots again? As on Solaria?"

"No." Bliss was smiling. "It's not quite robotic, either."

"It has to be one or the other."

"Neither." She actually chuckled. "It's not human, and yet it's not like any robot I've detected before."

Pelorat said, "I would like to see that." He nodded his head vigorously, his eyes wide with pleasure. "It would be exciting. Something new."

"Something new," muttered Trevize with a sudden lift of his own spirits-and a flash of unexpected insight seemed to illuminate the interior of his skull.

100.

DOWN THEY sank to the moon's surface, in what was almost jubilation. Even Fallom had joined them now and, with the abandonment of a youngster, was hugging herself with unbearable joy as though she were truly returning to Solaria.

As for Trevize, he felt within himself a touch of sanity telling him that it was strange that Earth-or whatever of Earth was on the moon-which had taken such measures to keep off all others, should now be taking measures to draw them in. Could the purpose be the same in either way? Was it a case of "If you can't make them avoid you, draw them in and destroy them?" Either way, would not Earth's secret remain untouched?

But that thought faded and drowned in the flood of joy that deepened steadily as they came closer to the moon's surface. Yet over and beyond that, he managed to cling to the moment of illumination that had reached him just before they had begun their gliding dive to the surface of the Earth's satellite.

He seemed to have no doubt as to where the ship was going. They were just above the tops of the rolling hills now, and Trevize, at the computer, felt no need to do anything. It was as though he and the computer, both, were being guided, and he felt only an enormous euphoria at having the weight of responsibility taken away from him.

They were sliding parallel to the ground, toward a cliff that raised its menacing height as a barrier against them; a barrier glistening faintly in Earth-shine and in the light-beam of the Far Star. The approach of certain collision seemed to mean nothing to Trevize, and it was with no surprise whatever that he became aware that the section of cliff directly ahead had fallen away and that a corridor, gleaming in artificial light, had opened before them.

The ship slowed to a crawl, apparently of its own accord, and fitted neatly into the opening--entering-sliding along- The opening closed behind it, and another then opened before it. Through the second opening went the ship, into a gigantic hall that seemed the hollowed interior of a mountain.

The ship halted and all aboard rushed to the airlock eagerly. It occurred to none of them, not even to Trevize, to check. whether there might be a breathable atmosphere outside-or any atmosphere at all.

There was air, however. It was breathable and it was comfortable. They looked about themselves with the pleased air of people who had somehow come home and it was only after a while that they became aware of a man who was waiting politely for them to approach.

He was tall, and his expression was grave. His hair was bronze in color, and cut short. His cheekbones were broad, his eyes were bright, and his clothing was rather after the fashion one saw in ancient history books. Although he seemed sturdy and vigorous there was, just the same, an air of weariness about him-not in anything that one could see, but rather in something appealing to no recognizable sense.

It was Fallom who reacted first. With a loud, whistling scream, she ran toward the man, waving her arms and crying, "Jemby! Jemby!" in a breathless fashion.

She never slackened her pace, and when she was close enough, the man stooped and lifted her high in the air. She threw her arms about his neck, sobbing, and still gasping, "Jemby!"

The others approached more soberly and Trevize said, slowly and distinctly (could this man understand Galactic?), "We ask pardon, sir. This child has lost her protector and is searching for it desperately. How it came to fasten on you is a puzzle to us, since it is seeking a robot; a mechanical-"

The man spoke for the first time. His voice was utilitarian rather than musical, and there was a faint air of archaism clinging to it, but he spoke Galactic with perfect ease.

"I greet you all in friendship," he said-and he seemed unmistakably friendly, even though his face continued to remain fixed in its expression of gravity. "As for this child," he went on, "she shows perhaps a greater perceptivity than you think, for I am a robot. My name is Daneel Olivaw."

21. THE SEARCH ENDS

101.

TREVIZE found himself in a complete state of disbelief. He had recovered from the odd euphoria he had felt just before and after the landing on the moon—a euphoria, he now suspected, that had been imposed on him by this self-styled robot who now stood before him.

Trevize was still staring, and in his now perfectly sane and untouched mind, he remained lost in astonishment. He had talked in astonishment, made conversation in astonishment, scarcely understood what he said or heard as he searched for something in the appearance of this apparent man, in his behavior, in his manner of speaking, that bespoke the robot.

No wonder, thought Trevize, that Bliss had detected something that was neither human nor robot, but, that was, in Pelorat's words, "something new." Just as well, of course, for it had turned Trevize's thoughts into another and more enlightening channel—but even that was now crowded into the back of his mind.

Bliss and Fallom had wandered off to explore the grounds. It had been Bliss's suggestion, but it seemed to Trevize that it came after a lightning-quick glance had been exchanged between herself and Daneel. When Fallom refused and asked to stay with the being she persisted in calling Jemby, a grave word from Daneel and a lift of the finger was enough to cause her to trot off at once. Trevize and Pelorat remained.

"They are not Foundationers, sirs," said the robot, as though that explained it all. "One is Gaia and one is a Spacer."

Trevize remained silent while they were led to simply designed chairs under a tree. They seated themselves, at a gesture from the robot, and when he sat down, too, in a perfectly human movement, Trevize said, "Are you truly a robot?"

"Truly, sir," said Daneel.

Pelorat's face seemed to shine with joy. He said, "There are references to a robot named Daneel in the old legends. Are you named in his honor?"

"I am that robot," said Daneel. "It is not a legend."

"Oh no," said Pelorat. "If you are that robot, you would have to be thousands of years old."

"Twenty thousand," said Daneel quietly.

Pelorat seemed abashed at that, and glanced at Trevize, who said, with a touch of anger, "If you are a robot, I order you to speak truthfully."

"I do not need to be told to speak truthfully, sir. I must do so. You are faced then, sir, with three alternatives. Either I am a man who is lying to you; or I am a robot who has been programmed to believe that it is twenty thousand years old but, in fact, is not; or I

am a robot who is twenty thousand years old. You must decide which alternative to accept."

"The matter may decide itself with continued conversation," said Trevize dryly. "For that matter, it is hard to believe that this is the interior of the moon. Neither the light"-he looked up as he said that, for the light was precisely that of soft, diffuse sunlight, though no sun was in the sky, and, for that matter, no sky was clearly visible-"nor the gravity seems credible. This world should have a surface gravity of less than 0.2g."

"The normal surface gravity would be 0.16g actually, sir. It is built up, however, by the same forces that give you, on your ship, the sensation of normal gravity, even when you are in free fall, or under acceleration. Other energy needs, including the light, are also met gravitically, though we use solar energy where that is convenient. Our material needs are all supplied by the moon's soil, except for the light elements-hydrogen, carbon, and nitrogen-which the moon does not possess. We obtain those by capturing an occasional comet. One such capture a century is more than enough to supply our needs."

"I take it Earth is useless as a source of supply."

"Unfortunately, that is so, sir. Our positronic brains are as sensitive to radioactivity as human proteins are."

"You use the plural, and this mansion before us seems, large, beautiful, and elaborate-at least as seen from the outside. There are then other beings on the moon. Humans? Robots?"

"Yes, sir. We have a complete ecology on the moon and a vast and complex hollow within which that ecology exists. The intelligent beings are all robots, however, more or less like myself. You will see none of them, however. As for this mansion, it is used by myself only and it is an establishment that is modeled exactly on one I used to live in twenty thousand years ago."

"Which you remember in detail, do you?" .

"Perfectly, sir. I was manufactured, and existed for a time-how brief a time it seems to me, now-on the Spacer world of Aurora."

"The one with the-" Trevize paused.

"Yes, sir. The one with the dogs."

"You know about that?"

"Yes, sir."

"How do you come to be here, then, if you lived at first on Aurora?"

"Sir, it was to prevent the creation of a radioactive Earth that I came here in the very beginnings of the settlement of the Galaxy. There was another robot with me, named Giskard, who could sense and adjust minds."

"As Bliss can?"

"Yes, sir. We failed, in a way, and Giskard ceased to operate. Before the cessation, however, he made it possible for me to have his talent and left it to me to care for the Galaxy; for Earth, particularly."

"Why Earth, particularly?"

"In part because of a man named Elijah Baley, an Earthman."

Pelorat put in excitedly, "He is the culture-hero I mentioned some time ago, Golan."

"A culture-hero, sir?"

"What Dr. Pelorat means," said Trevize, "is that he is a person to whom much was attributed, and who may have been an amalgamation of many men in actual history, or who may be an invented person altogether."

Daneel considered for a moment, and then said, quite calmly, "That is not so, sirs. Elijah Baley was a real man and he was one man. I do not know what your legends say of him, but in actual history, the Galaxy might never have been settled without him. In his honor, I did my best to salvage what I could of Earth after it began to turn radioactive. My fellow-robots were distributed over the Galaxy in an effort to influence a person here-a person there. At one time I maneuvered a beginning to the recycling of Earth's soil. At another much later time, I maneuvered a beginning to the terraforming of a world circling the nearby star, now called Alpha. In neither case was I truly successful. I could never adjust human minds entirely as I wished, for there was always the chance that I might do harm to the various humans who were adjusted. I was bound, you see-and am bound to this day-by the Laws of Robotics."

"Yes?"

It did not necessarily take a being with Daneel's mental power to detect uncertainty in that monosyllable.

"The First Law," he said, "is this, sir: 'A robot may not injure a human being or, through inaction, allow a human being to come to harm.' The Second Law: 'A robot must obey the orders given it by human beings except where such orders would conflict with the First Law.' The Third Law: 'A robot must protect its own existence, as long as such protection does not conflict with the First or Second Law.'-Naturally, I give you these laws in the approximation of language. In actual fact they represent complicated mathematical configurations of our positronic brain-paths."

"Do you find it difficult to deal with those Laws?"

"I must, sir. The First Law is an absolute that almost forbids the use of my mental talents altogether. When dealing with the Galaxy it is not likely that any course of action will prevent harm altogether. Always, some people, perhaps many people, will suffer so that a robot must choose minimum harm. Yet, the complexity of possibilities is such that it takes time to make that choice and one is, even then, never certain."

"I see that," said Trevize.

"All through Galactic history," said Daneel, "I tried to ameliorate the worst aspects of the strife and disaster that perpetually made itself felt in the Galaxy. I may have succeeded, on occasion, and to some extent, but if you know your Galactic history, you will know that I did not succeed often, or by much."

"That much I know," said Trevize, with a wry smile.

"Just before Giskard's end, he conceived of a robotic law that superseded even the first. We called it the 'Zeroth Law' out of an inability to think of any other name that made sense. The Zeroth Law is: 'A robot may not injure humanity or, through inaction,

allow humanity to come to harm.' This automatically means that the First Law must be modified to be: 'A robot may not injure a human being, or, through inaction, allow a human being to come to harm, except where that would conflict with the Zeroth Law.' And similar modifications must be made in the Second and Third Laws."

Trevize frowned. "How do you decide what is injurious, or not injurious, to humanity as a whole?"

"Precisely, sir," said Daneel. "In theory, the Zeroth Law was the answer to our problems. In practice, we could never decide. A human being is a concrete object. Injury to a person can be estimated and judged. Humanity is an abstraction. How do we deal with it?"

"I don't know," said Trevize.

"Wait," said Pelorat. "You could convert humanity into a single organism. Gaia."

"That is what I tried to do, sir. I engineered the founding of Gaia. If humanity could be made a single organism, it would become a concrete object, and it could be dealt with. It was, however, not as easy to create a superorganism as I had hoped. In the first place, it could not be done unless human beings valued the superorganism more than their individuality, and I had to find a mind-cast that would allow that. It was a long time before I thought of the Laws of Robotics."

"Ah, then, the Gaians are robots. I had suspected that from the start."

"In that case, you suspected incorrectly, sir. They are human beings, but they have brains firmly inculcated with the equivalent of the Laws of Robotics. They have to value life, really value it. -And even after that was done, there remained a serious flaw. A superorganism consisting of human beings only is unstable. It cannot be set up. Other animals must be added-then plants-then the inorganic world. The smallest superorganism that is truly stable is an entire world, and a world large enough and complex enough to have a stable ecology. It took a long time to understand this, and it is only in this last century that Gaia was fully established and that it became ready to move on toward Galaxia-and, even so, that will take a long time, too. Perhaps not as long as the road already traveled, however, since we now know the rules."

"But you needed me to make the decision for you. Is that it, Daneel?"

"Yes, sir. The Laws of Robotics would not allow me, nor Gaia, to make the decision and chance harm to humanity. And meanwhile, five centuries ago, when it seemed that I would never work out methods for getting round all the difficulties that stood in the way of establishing Gaia, I turned to the second-best and helped bring about the development of the science of psychohistory."

"I might have guessed that," mumbled Trevize. "You know, Daneel, I'm beginning to believe you are twenty thousand years old."

"Thank you, sir."

Pelorat said, "Wait a while. I think I see something. Are you part of Gaia yourself, Daneel? Would that be how you knew about the dogs on Aurora? Through Bliss?"

Daneel said, "In a way, sir, you are correct. I am associated with Gaia, though I am not part of it."

Trevize's eyebrows went up. "That sounds like Comporellon, the world we visited immediately after leaving Gaia. It insists it is not part of the Foundation Confederation, but is only associated with it."

Slowly, Daneel nodded. "I suppose that analogy is apt, sir. I can, as an associate of Gaia, make myself aware of what Gaia is aware of-in the person of the woman, Bliss, for instance. Gaia, however, cannot make itself aware of what I am aware of, so that I maintain my freedom of action. That freedom of action is necessary until Galaxia is well established."

Trevize looked steadily at the robot for a moment, then said, "And did you use your awareness through Bliss in order to interfere with events on our journey to mold them to your better liking?"

Daneel sighed in a curiously human fashion. "I could not do much, sir. The Laws of Robotics always hold me back. -And yet, I lightened the load on Bliss's mind, taking a small amount of added responsibility on myself, so that she might deal with the wolves of Aurora and the Spacer on Solaria with greater dispatch and with less harm to herself. In addition, I influenced the woman on Comporellon and the one on New Earth, through Bliss, in order to have them look with favor on you, so that you might continue on your journey."

Trevize smiled, half-sadly. "I ought to have known it wasn't L"

Daneel accepted the statement without its rueful self-deprecation. "On the contrary, sir," he said, "it was you in considerable part. Each of the two women looked with favor upon you from the start. I merely strengthened the impulse already present-about all one can safely do under the strictures of the Laws of Robotics. Because of those strictures-and for other reasons as well-it was only with great difficulty that I brought you here, and only indirectly. I was in great danger at several points of losing you."

"And now I am here," said Trevize. "What is it you want of me? To confirm my decision in favor of Galaxia?"

Daneel's face, always expressionless, somehow managed to seem despairing. "No, sir. The mere decision is no longer enough. I brought you here, as best I could in my present condition, for something far more desperate. I am dying."

102.

PERHAPS it was because of the matter-of-fact way in which Daneel said it; or perhaps because a lifetime of twenty thousand years made death seem no tragedy to one doomed to live less than half a percent of that period; but, in any case, Trevize felt no stir of sympathy.

"Die? Can a machine die?"

"I can cease to exist, sir. Call it by whatever word you wish. I am old. Not one sentient being in the Galaxy that was alive when I was first given consciousness is still alive today; nothing organic; nothing robotic. Even I myself lack continuity."

"In what way?"

"There is no physical part of my body, sir, that has escaped replacement, not only once but many times. Even my positronic brain has been replaced on five different occasions. Each time the contents of my earlier brain were etched into the newer one to the last positron. Each time, the new brain had a greater capacity and complexity than the old, so that there was room for more memories, and for faster decision and action. But-

"But?"

"The more advanced and complex the brain, the more unstable it is, and the more quickly it deteriorates. My present brain is a hundred thousand times as sensitive as my first, and has ten million times the capacity; but whereas my first brain endured for over ten thousand years, the present one is but six hundred years old and is unmistakably senescent. With every memory of twenty thousand years perfectly recorded and with a perfect recall mechanism in place, the brain is filled. There is a rapidly declining ability to reach decisions; an even more rapidly declining ability to test and influence minds at hyperspatial distances. Nor can I design a sixth brain. Further miniaturization will run against the blank wall of the uncertainty principle, and further complexity will but assure decay almost at once."

Pelorat seemed desperately troubled. "But surely, Daneel, Gaia can carry on without you. Now that Trevize has judged and selected Galaxia-

"The process simply took too long, sir," said Daneel, as always betraying no emotion. "I had to wait for Gaia to be fully established, despite the unanticipated difficulties that arose. By the time a human being-Mr. Trevize-was located who was capable of making the key decision, it was too late. Do not think, however, that I took no measure to lengthen my life span. Little by little I have reduced my activities, in order to conserve what I could for emergencies. When I could no longer rely on active measures to preserve the isolation of the Earth/moon system, I adopted passive ones. Over a period of years, the humaniform robots that have been working with me have been, one by one, called home. Their last tasks have been to remove all references to Earth in the planetary archives. And without myself and my fellow-robots in full play, Gaia will lack the essential tools to carry through the development of Galaxia in less than an inordinate period of time."

"And you knew all this," said Trevize, "when I made my decision?"

"A substantial time before, sir," said Daneel. "Gaia, of course, did not know."

"But then," said Trevize angrily, "what was the use of carrying through the charade? What good has it been? Ever since my decision, I have scoured the Galaxy, searching for Earth and what I thought of as its 'secret'-not knowing the secret was you-in order that I might confirm the decision. Well, I have confirmed it. I know now that Galaxia is absolutely essential-and it appears to be all for nothing. Why could you not have left the Galaxy to itself -and me to myself?"

Daneel said, "Because, sir, I have been searching for a way out, and I have been carrying on in the hope that I might find one. I think I have. Instead of replacing my brain with yet another positronic one, which is impractical, I might merge it with a human brain

instead; a human brain that is not affected by the Three Laws, and will not only add capacity to my brain, but add a whole new level of abilities as well. That is why I have brought you here."

Trevize looked appalled. "You mean you plan to merge a human brain into yours? Have the human brain lose its individuality so that you can achieve a two-brain Gaia?"

"Yes, sir. It would not make me immortal, but it might enable me to live long enough to establish Galaxia."

"And you brought me here for that? You want my independence of the Three Laws and my sense of judgment made part of you at the price of my individuality? -No!"

Daneel said, "Yet you said a moment ago that Galaxia is essential for the welfare of the human-"

"Even if it is, it would take a long time to establish, and I would remain an individual in my lifetime. On the other hand, if it were established rapidly, there would be a Galactic loss of individuality and my own loss would be part of an unimaginably greater whole. I would, however, certainly never consent to lose my individuality while the rest of the Galaxy retains theirs."

Daneel said, "It is, then, as I thought. Your brain would not merge well and, in any case, it would serve a better purpose if you retained an independent judgmental ability."

"When did you change your mind? You said that it was for merging that you brought me here."

"Yes, and only by using the fullest extent of my greatly diminished powers. Still, when I said, 'That is why I have brought you here,' please remember that in Galactic Standard, the word 'you' represents the plural as well as the singular. I was referring to all of you."

Pelorat stiffened in his seat. "Indeed? Tell me then, Daneel, would a human brain that was merged with your brain share in all your memories-all twenty thousand years of it, back to legendary times?"

"Certainly, sir."

Pelorat drew a long breath. "That would fulfill a lifetime search, and it is something I would gladly give up my individuality for. Please let me have the privilege of sharing your brain."

Trevize asked softly, "And Bliss? What about her?"

Pelorat hesitated for no more than a moment. "Bliss will understand," he said. "She will, in any case, be better off without me-after a while."

Daneel shook his head. "Your offer, Dr. Pelorat, is a generous one, but I cannot accept it. Your brain is an old one and it cannot survive for more than two or three decades at best, even in a merger with my own. I need something else. -See!" He pointed and said, "I've called her back."

Bliss was returning, walking happily, with a bounce to her steps.

Pelorat rose convulsively to his feet. "Bliss! Oh no!"

"Do not be alarmed, Dr. Pelorat," said Daneel. "I cannot use Bliss. That would merge me with Gaia, and I must remain independent of Gaia, as I have already explained."

"But in that case," said Pelorat, "who-"

And Trevize, looking at the slim figure running after Bliss, said, "The robot has wanted Fallom all along, Janov."

103.

Brass returned, smiling, clearly in a state of great pleasure.

"We couldn't pass beyond the bounds of the estate," she said, "but it all reminded me very much of Solaria. Fallom, of course, is convinced it is Solaria. I asked her if she didn't think that Daneel had an appearance different from that of Jemby-after all, Jemby was metallic-and Fallom said, 'No, not really.' I don't know what she meant by 'not really.'"

She looked across to the middle distance where Fallom was now playing her flute for a grave Daneel, whose head nodded in time. The sound reached them, thin, clear, and lovely.

"Did you know she took the flute with her when we left the ship?" asked Bliss. "I suspect we won't be able to get her away from Daneel for quite a while."

The remark was met with a heavy silence, and Bliss looked at the two men in quick alarm. "What's the matter?"

Trevize gestured gently in Pelorat's direction. It was up to him, the gesture seemed to say.

Pelorat cleared his throat and said, "Actually, Bliss, I think that Fallom will be staying with Daneel permanently."

"Indeed?" Bliss, frowning, made as though to walk in Daneel's direction, but Pelorat caught her arm. "Bliss dear, you can't. He's more powerful than Gaia even now, and Fallom must stay with him if Galaxia is to come into existence. Let me explain-and, Golan, please correct me if I get anything wrong."

Bliss listened to the account, her expression sinking into something close to despair.

Trevize said, in an attempt at cool reason, "You see how it is, Bliss. The child is a Spacer and Daneel was designed and put together by Spacers. The child was brought up by a robot and knew nothing else on an estate as empty as this one. The child has transductive powers which Daneel will need, and she will live for three or four centuries, which may be what is required for the construction of Galaxia."

Bliss said, her cheeks flushed and her eyes moist, "I suppose that the robot maneuvered our trip to Earth in such a way as to make us pass through Solaria in order to pick up a child for his use."

Trevize shrugged. "He may simply have taken advantage of the opportunity. I don't think his powers are strong enough at the moment to make complete puppets of us at hyperspatial distances."

"No. It was purposeful. He made certain that I would feel strongly attracted to the child so that I would take her with me, rather than leave her to be killed; that I would protect her even against you when you showed nothing but resentment and annoyance at her being with us."

Trevize said, "That might just as easily have been your Gaian ethics, which Daneel could have strengthened a bit, I suppose. Come, Bliss, there's nothing to be gained. Suppose you could take Fallom away. Where could you then take her that would make her as happy as she is here? Would you take her back to Solaria where she would be killed quite pitilessly; to some crowded world where she would sicken and die; to Gaia, where she would wear her heart out longing for Jemby; on an endless voyage through the Galaxy, where she would think that every world we came across was her Solaria? And would you find a substitute for Daneel's use so that Galaxia could be constructed?"

Bliss was sadly silent.

Pelorat held out his hand to her, a bit timidly. "Bliss," he said, "I volunteered to have my brain fused with Daneel's. He wouldn't take it because he said I was too old. I wish he had, if that would have saved Fallom for you."

Bliss took his hand and kissed it. "Thank you, Pel, but the price would be too high, even for Fallom." She took a deep breath, and tried to smile. "Perhaps, when we get back to Gaia, room will be found in the global organism for a child for me-and I will place Fallom in the syllables of its name."

And now Daneel, as though aware that the matter was settled, was walking toward them, with Fallom skipping along at his side.

The youngster broke into a run and reached them first. She said to Bliss, "Thank you, Bliss, for taking me home to Jemby again and for taking care of me while we were on the ship. I shall always remember you." Then she flung herself at Bliss and the two held each other tightly.

"I hope you will always be happy," said Bliss. "I will remember you, too, Fallom dear," and released her with reluctance.

Fallom turned to Pelorat, and said, "Thank you, too, Pel, for letting me read your book-films." Then, without an additional word, and after a trace of hesitation, the thin, girlish hand was extended to Trevize. He took it for a moment, then let it go.

"Good luck, Fallom," he muttered.

Daneel said, "I thank you all, sirs and madam, for what you have done, each in your own way. You are free to go now, for your search is ended. As for my own work, it will be ended, too, soon enough, and successfully now."

But Bliss said, "Wait, we are not quite through. We don't know yet whether Trevize is still of the mind that the proper future for humanity is Galaxia, as opposed to a vast conglomeration of Isolates."

Daneel said, "He has already made that clear a while ago, madam. He has decided in favor of Galaxia."

Bliss's lips tightened. "I'd rather hear that from him. -Which is it to be, Trevize?"

Trevize said calmly, "Which do you want it to be, Bliss? If I decide against Galaxia, you may get Fallom back."

Bliss said, "I am Gaia. I must know your decision, and its reason, for the sake of the truth and nothing else."

Daneel said, "Tell her, sir. Your mind, as Gaia is aware, is untouched."

And Trevize said, "The decision is for Galaxia. There is no further doubt in my mind on that point."

104.

Bliss remained motionless for the time one might take to count to fifty at a moderate rate, as though she were allowing the information to reach all parts of Gaia, and then she said, "Why?"

Trevize said, "Listen to me. I knew from the start that there were two possible futures for humanity-Galaxia, or else the Second Empire of Seldon's Plan. And it seemed to me that those two possible futures were mutually exclusive. We couldn't have Galaxia unless, for some reason, Seldon's Plan had some fundamental flaw in it.

"Unfortunately, I knew nothing about Seldon's Plan except for the two axioms on which it is based: one, that there be involved a large enough number of human beings to allow humanity to be treated statistically as a group of individuals interacting randomly; and second, that humanity not know the results of psychohistorical conclusions before the results are achieved.

"Since I had already decided in favor of Galaxia, I felt I must be subliminally aware of flaws in Seldon's Plan, and those flaws could only be in the axioms, which were all I knew of the plan. Yet I could see nothing wrong with the axioms. I strove, then, to find Earth, feeling that Earth could not be so thoroughly hidden for no purpose. I had to find out what that purpose was.

"I had no real reason to expect to find a solution once I found Earth, but I was desperate and could think of nothing else to do. -And perhaps Daneel's desire for a Solarian child helped drive me.

"In any case, we finally reached Earth, and then the moon, and Bliss detected Daneel's mind, which he, of course, was deliberately reaching out to her. She described that mind as neither quite human nor quite robotic. In hindsight, that proved to make sense, for Daneel's brain is far advanced beyond any robot that ever existed, and would not be sensed as simply robotic. Neither would it be sensed as human, however. Pelorat referred to it as 'something new' and that served as a trigger for 'something new' of my own; a new thought.

"Just as, long ago, Daneel and his colleague worked out a fourth law of robotics that was more fundamental than the other three, so I could suddenly see a third basic axiom of psychohistory that was more fundamental than the other two; a third axiom so fundamental that no one ever bothered to mention it.

"Here it is. The two known axioms deal with human beings, and they are based on the unspoken axiom that human beings are the only intelligent species in the Galaxy, and therefore the only organisms whose actions are significant in the development of society and history. That is the unstated axiom: that there is only one species of intelligence in the Galaxy and that it is Homo Sapiens. If there were 'something, new:' if there were other species of intelligence widely different in nature, then their behavior would not be described accurately by the mathematics of psychohistory and Seldon's Plan would have no meaning. Do you see?"

Trevize was almost shaking with the earnest desire to make himself understood. "Do you see?" he repeated.

Pelorat said, "Yes, I see, but as devil's advocate, old chap-

"Yes? Go on."

"Human beings are the only intelligences in the Galaxy."

"Robots?" said Bliss. "Gain?"

Pelorat thought awhile, then said hesitantly-, "Robots have played no significant role in human history since the disappearance of the Spacers. Gaia has played no significant role until very recently. Robots are the creation of human beings, and Gaia is the creation of robots-and both robots and Gaia, insofar as they must be bound by the Three Laws, have no choice but to yield to human will. Despite the twenty thousand years Daneel has labored, and the long development of Gaia, a single word from Golan Trevize, a human being, would put an end to both those labors and that development. It follows, then, that humanity is the only significant species of intelligence in the Galaxy, and psychohistory- remains valid."

"The only form of intelligence in the Galaxy, " repeated Trevize slowly. "I agree. Yet we speak so much and so often of the Galaxy that it is all but impossible for us to see that this is not enough. The Galaxy is not the universe. There are other galaxies."

Pelorat and Bliss stirred uneasily. Daneel listened with benign gravity, his hand slowly stroking Fallom's hair.

Trevize said, "Listen to me again. Just outside the Galaxy are the Magellanic Clouds, where no human ship has ever penetrated. Beyond that are other small galaxies, and not very far away is the giant Andromeda Galaxy, larger than our own. Beyond that are galaxies by the billions.

"Our own Galaxy has developed only one species of an intelligence great enough to develop a technological society, but what do we know of the other galaxies? Ours may be atypical. In some of the others-perhaps even in allthere may be many competing intelligent species, struggling with each other, and each incomprehensible to us. Perhaps it is their mutual struggle that preoccupies them, but what if, in some galaxy, one species

gains domination over the rest and then has time to consider the possibility of penetrating other galaxies.

"Hyperspatially, the Galaxy is a point-and so is all the Universe. We have not visited any other galaxy, and, as far as we know, no intelligent species from another galaxy has ever visited us-but that state of affairs may end someday. And if the invaders come, they are bound to find ways of turning some human beings against other human beings. We have so long had only ourselves to fight that we are used to such internecine quarrels. An invader that finds us divided against ourselves will dominate us all, or destroy us all. The only true defense is to produce Galaxia, which cannot be turned against itself and which can meet invaders with maximum power."

Bliss said, "The picture you paint is a frightening one. Will we have time to form Galaxia?"

Trevize looked up, as though to penetrate the thick layer of moonrock that separated him from the surface and from space; as though to force himself to see those far distant galaxies, moving slowly through unimaginable vistas of space.

He said, "In all human history, no other intelligence has impinged on us, to our knowledge. This need only continue a few more centuries, perhaps little more than one ten thousandth of the time civilization has already existed, and we will be safe. After all," and here Trevize felt a sudden twinge of trouble, which he forced himself to disregard, "it is not as though we had the enemy already here and among us."

And he did not look down to meet the brooding eyes of Fallom-hermaphroditic, transductive, different-as they rested, unfathomably, on him.

FANTASTIC VOYAGE II - DESTINATION BRAIN

1. NEEDED

He who is needed must learn to endure flattery.

Dezhnev Senior

1.

"Pardon me. Do you speak Russian?" said the low voice, definitely contralto, in his ear.

Albert Jonas Morrison stiffened in his seat. The room was darkened and the computer screen on the platform was displaying its graphics with an insistence that had been lost on him.

He must have been more than half-asleep. There had definitely been a man on his right when he sat down. When had that man changed into a woman? Or risen and been replaced?

Morrison cleared his throat and said, "Did you say something, ma'am?" He couldn't make her out clearly in the dim room and the flashing light from the computer screen obscured rather than revealed. He made out dark hair, straight, hugging the skull, covering the ears -- no artifice.

She said, "I asked if you spoke Russian."

"Yes, I do. Why do you want to know?"

"Because that would make it easier. My English sometimes fails me. Are you Dr. Morrison? A. J. Morrison? I'm not certain in this darkness. Forgive me if I have made a mistake."

"I am A. J. Morrison. Do I know you?"

"No, but I know you." Her hand reached out, touching the sleeve of his jacket lightly. "I need you badly. Are you listening to this talk? You did not seem to be."

They were both whispering, of course.

Morrison looked about involuntarily. The room was sparsely filled and no one was sitting very close. His whisper grew lower just the same. "And if I'm not? What then?" (He was curious -- if only out of boredom. The talk had put him to sleep.)

She said, "Will you come with me now? I am Natalya Boranova."

"Come with you where, Ms. Boranova?"

"To the coffee shop -- so that we may talk. It is terribly important."

That was the way it began. It didn't matter, Morrison decided afterward, that he had been in that particular room -- that he had not been alert -- that he had been intrigued enough, flattered enough to be willing to go with a woman who said she needed him.

She would, after all, have found him wherever he had been and would have seized upon him and would have made him listen. It might not have been quite so easy under other circumstances, but it would all have gone as it did. He was certain.

There would have been no escape.

2.

He was looking at her in normal light now, and she was less young than he had thought. Thirty-six? Forty, perhaps?

Dark hair. No gray. Pronounced features. Heavy eyebrows. Strong jaws. Pleasant nose. Sturdy body, but not fat. Almost as tall as he was, even though she was wearing flat heels. On the whole, a woman who was attractive without being beautiful. The kind of woman, he decided, one could get used to.

He sighed, for he was facing the mirror and he saw himself there. Sandy hair, thinning. Blue eyes, faded. Thin face, thin body, stringy. Beaky nose, nice smile. He hoped it was a nice smile. But no, not a face you would want to get used to. Brenda had gotten entirely unused to it in a little over ten years, and his fortieth birthday would be five days past the fifth anniversary of the day his divorce had been made final and official.

The waitress brought the coffee. They had been sitting there, not talking but appraising each other. Morrison finally felt he had to say something.

"No vodka?" he said in an attempt at lightness.

She smiled and looked somehow even more Russian when she did so. "No Coca-Cola?"

"If that's an American habit, Coca-Cola is at least cheaper."

"For good reason."

Morrison laughed. "Are you this quick in Russian?"

"Let us see if I am. Let's talk Russian."

"We'll sound like a couple of spies."

Her last sentence had been in Russian. So had Morrison's reply. The change of language made no difference to him. He could speak and understand it as easily as English. That had to be so. If an American wished to be a scientist and keep up with the literature, he had to be able to handle Russian, almost as much as a Russian scientist had to be able to handle English.

This woman, Natalya Boranova, for instance, despite her pretence that she was not at home in English, spoke it readily and with only a faint accent, Morrison noticed.

She said, "Why will we sound like spies? There are hundreds of thousands of Americans speaking English in the Soviet Union and hundreds of thousands of Soviet citizens speaking Russian in the United States. These are not the bad old days."

"That's true. I was joking. But in that case, why do you want to speak Russian?"

"This is your country and that gives you a psychological advantage, does it not, Dr. Morrison? If we speak my language, it will balance the scales a bit."

Morrison sipped at his coffee. "As you wish."

"Tell me, Dr. Morrison. Do you know me?"

"No. I have never met you before."

"And my name? Natalya Boranova? Have you heard of me?"

"Forgive me. If you were in my field, I would have heard of you. Since I have not, I assume you are not in my field. Should I know you?"

"It might have helped, but we'll let it go. I know you, however. In fact, I know a great deal about you. When and where you were born. Your schooling. The fact that you are divorced and that you have two daughters that live with your ex-wife. I know about your university position and the research you do."

Morrison shrugged. "None of that would be hard to find out in our computer-ridden society. Should I be flattered or annoyed?"

"Why either?"

"It depends on whether you tell me that I am famous in the Soviet Union, which would be flattering, or that I have been the target of an investigation, which might be annoying."

"I have no intention of being anything but honest with you. I have investigated you -- for reasons that are important to me."

Morrison said coldly, "What reasons?"

"To begin with, you are a neurophysicist."

Morrison had finished his coffee and had absently signaled for a refill. Boranova's cup was half-empty, but she had apparently lost interest in it.

"There are other neurophysicists," Morrison said.

"None like you."

"Clearly you are trying to flatter me. That can only be because you don't know anything about me after all. Not the crucial things."

"That you are not successful? That your methods of brain wave analysis are not generally accepted in the field?"

"But if you know that, then why are you after me?"

"Because we have a neurophysicist in our country who knows your work, and he thinks it is brilliant. You have rather jumped into the unknown, he says, and you may be wrong -- but if you are, you are brilliantly wrong."

"Brilliantly wrong? How is that different from wrong?"

"It is his view that it is impossible to be brilliantly wrong without being not altogether wrong. Even if you are in some ways wrong, much of what you maintain will prove useful -- and you may be entirely right."

"What is the name of this paragon who has this view of me? I'll mention him with favor in my next paper."

"He is Pyotor Leonovich Shapiro. Do you know him?"

Morrison sat back in his chair. He had not expected this. "Know him?" he said. "I've met him. Pete Shapiro I called him. Our people here in the United States think he's as crazy as I am. If it turns out that he's backing me, that's just one more nail in my coffin."

-- Listen, tell Pete I appreciate his faith in me, but if he really wants to help me, please ask him not to tell anyone he's on my side."

Boranova looked at him disapprovingly. "You are not a very serious man. Is everything a joke to you?"

"No. Just me. I'm the joke. I've got something really great and I can't convince anyone of it. Except Pete -- I've now found out -- and he doesn't count. I can't even get my papers published these days."

"Then come to the Soviet Union. We can use you -- and your ideas."

"No, no. I'm not emigrating."

"Who said emigrate? If you wish to be an American, be an American. But you have visited the Soviet Union in the past and you can visit it once again and stay a while. Then return to your own country."

"Why?"

"You have crazy ideas and we have crazy ideas. Perhaps yours can help ours."

"What crazy ideas? I mean, yours. I know what mine are."

"It's not something to discuss until I know if you are perhaps willing to help us."

Morrison, still sitting back in his chair, was vaguely aware of the buzz about him, of people drinking, eating, talking -- most of them from the conference, he was sure. He stared at this intense Russian woman who admitted to crazy ideas and wondered what kind of--

He stiffened and cried out, "Boranova! I have heard of you. Of course. Pete Shapiro mentioned you. You're --"

In his excitement he was speaking English and her hand came down on his, her nails pressing hard against his skin.

He choked it off and she removed her hand, saying, "Sorry. I did not mean to hurt you."

He stared at the marks on his hand, one of which, he decided, was going to be slightly bruised. He said quietly in Russian, "You're the Miniaturizer."

3.

Boranova looked at him with an easy calm. "Perhaps a little walk and a bench by the river. The weather is beautiful."

Morrison held his lightly damaged hand in the other. There had been a few, he thought, who had looked in his direction when he had cried out in English, but none seemed to show any interest now. He shook his head. "I think not. I should be attending the conference."

Boranova smiled as though he had agreed that the weather was beautiful. "I don't think so. I think you'll find a seat by the river more interesting."

For one flashing moment, Morrison thought her smile might be intended to be seductive. Surely she wasn't implying --

He abandoned the thought almost before he had put it clearly to himself. That sort of thing was pass, even on holovision: "Beautiful Russian Spy Uses Sinuous Body to Dazzle Naive American."

To begin with, she wasn't beautiful and her body wasn't sinuous. Nor did she look as though anything of that nature could possibly be on her mind and he himself, after all, wasn't that naive -- or even interested.

Yet he found himself accompanying her across the campus and toward the river.

They walked slowly -- sauntered -- and she talked cheerfully about her husband Nikolai and her son Aleksandr, who was going to school and was, for some strange reason, interested in biology, even though his mother was a thermodynamicist. What's more, Aleksandr was a dreadful chess player, much to his father's disappointment, but he showed signs of promise on the violin.

Morrison did not listen. He occupied himself, instead, in trying to recall what he had heard about the Soviet interest in miniaturization and what possible connection there might be between that and his own work.

She pointed to a bench. "This one looks reasonably clean."

They sat down. Morrison stared over the river, watching, with eyes that did not really absorb it, the line of cars filing along the highway on their side and the parallel line on the highway on the other side -- while sculls, looking like centipedes, plied the river itself.

He remained silent and Boranova, staring at him thoughtfully, finally said, "You do not find this interesting?"

"Find what interesting?"

"My suggestion that you come to the Soviet Union."

"No!" He said it curtly.

"But why not? Since your American colleagues do not accept your ideas, and since you are depressed over this and are seeking a way out of the dead end at which you have arrived, why not come to us?"

"Given your investigations into my life, I am sure you know that my ideas are not accepted, but how can you possibly be sure that I am all that depressed over it?"

"Any sane man would be depressed. And one has only to talk to you to be certain."

"Do you accept my ideas?"

"I? I am not in your field. I know nothing -- or very little -- about the nervous system."

"I suppose you simply accept Shapirov's estimate of my ideas."

"Yes. And even if I did not -- desperate problems may require desperate remedies. What harm, then, if we try your ideas as a remedy? It will certainly leave us no worse off."

"So you have my ideas. They have been published."

She gazed at him steadily. "Somehow we don't think all your ideas have been published. That is why we want you."

Morrison laughed without humor. "What good can I possibly do you in connection with miniaturization? I know less about miniaturization than you do about the brain. Far less."

"Do you know anything at all about miniaturization?"

"Only two things. That the Soviets are known to be investigating it -- and that it is impossible."

Boranova stared thoughtfully at the river. "Impossible? What if I told you we had accomplished the task?"

"I would as soon believe you if you told me polar bears fly."

"Why should I lie to you?"

"I point out the fact. I'm not concerned about the motivation."

"Why are you so certain miniaturization is impossible?"

"If you reduce a man to the dimensions of a fly, then all the mass of a man would be crowded into the volume of a fly. You'd end up with a density of something like --" he paused to think -- "a hundred and fifty thousand times that of platinum."

"But what if the mass were reduced in proportion?"

"Then you end up with one atom in the miniaturized man for every three million in the original. The miniaturized man would not only have the size of a fly but the brainpower of a fly as well."

"And if the atoms are reduced, too?"

"If it is miniaturized atoms you are speaking of, then Planck's constant, which is an absolutely fundamental quantity in our Universe, forbids it. Miniaturized atoms would be too small to fit into the graininess of the Universe."

"And if I told you that Planck's constant was reduced as well, so that a miniaturized man would be encased in a field in which the graininess of the Universe was incredibly finer than it is under normal conditions?"

"Then I wouldn't believe you."

"Without examining the matter? You would refuse to believe it as a result of preconceived convictions, as your colleagues refuse to believe you?"

And at this, Morrison was, for a moment, silent.

"Not the same," he mumbled at last.

"Not the same?" Again she stared thoughtfully out over the river. "In what way not the same?"

"My colleagues think I'm wrong. My ideas are not theoretically impossible in their opinion -- only wrong."

"While miniaturization is impossible?"

"Yes."

"Then come and see. If it turns out that miniaturization is impossible, just as you say, then you'll at least have a month in the Soviet Union as a guest of the Soviet Government. All expenses will be paid. If there's a friend you would like to bring with you, bring her, too. Or him."

Morrison shook his head. "No thanks. I'd rather not. Even if miniaturization were possible, it is not my field. It would not help me or be of interest to me."

"How do you know? What if miniaturization gave you the opportunity to study neurophysics as you have never studied it before -- as no one has ever studied it before? And what if, in doing so, you might be able to help us? That would be our stake in it."

"How can you offer me a new way of studying neurophysics?"

"But, Dr. Morrison, I thought that was what we were talking about. You cannot really prove your theories because you cannot study single nerve cells in sufficient detail without damaging them. But what if we make a neuron as large as the Kremlin for you -- or even larger -- so that you can study it a molecule at a time?"

"You mean you can reverse miniaturization and make a neuron as large as you wish."

"No, we can't do that, as yet, but we can make you as small as we wish and that would amount to the same thing, wouldn't it?"

Morrison rose, staring at her.

"No," he said in half a whisper. "Are you insane? Do you think I am insane? Good-bye! Good-bye!"

He turned and strode away rapidly.

She called after him. "Dr. Morrison. Listen to me."

He made a sweeping gesture of rejection with his right arm and broke into a run across the drive, narrowly dodging the cars.

Then he was back into the hotel, puffing, almost dancing with impatience as he waited for the elevator.

Madwoman! he thought. She wanted to miniaturize him, attempt this impossibility on him. -- Or attempt the possibility of it on him, which would be infinitely worse.

4.

Morrison was still shaking when he stood at the door of his hotel room, holding the plastic rectangle of his key, breathing hard, and wondering if she knew his room number. She could find out, of course, if she were sufficiently determined. He looked down the length of the corridor each way, half-afraid he might see her running toward him, face contorted, hair flying, hands outstretched.

He shook his head. This was madness. What could she do to him? She could not carry him off bodily. She could not force him to do anything he didn't want to do. What childish terror was overcoming him?

Morrison took a deep breath and thrust his key into the door slit. He felt the small click as the key seated itself, then he withdrew it and the door swung open.

The man sitting in the wicker armchair at the window smiled at him and said, "Come in."

Morrison stared at him in astonishment, then twisted his head to look at the room number.

"No, no. It's your room, all right. Do come in and close the door behind you."

Morrison followed orders, staring at the man in silent astonishment.

He was a comfortably plump man, not quite fat, filling the chair from arm to arm. He wore a thin seersucker jacket and under it was a shirt so white that it seemed to glisten. He was not yet what one might call bald, but he was clearly on the way and what remained of his brown hair was crisply curly. He did not wear glasses, but his eyes were small and had a nearsighted look about them, which might be misleading -- or which perhaps meant he wore contacts.

He said, "You came back running, didn't you? I watched you --" he pointed out the window -- "sitting on the bench, then get up and come toward the hotel at the double. I was hoping you would come up to your hotel room. I didn't want to sit up here all day waiting for you."

"You were here in order to watch me from the window?"

"No, not at all. That was just an accident. You just happened to walk out with the lady to that bench. Convenient, but not really foreseen. It's all right, though. If I hadn't had the view from the window, there were others watching."

By that time Morrison had caught his breath and his mind had steadied itself to the point where he asked the question that should have had pride of place in the conversation. "Who are you, anyway?"

In response the man, smiling, took a small wallet from his inner jacket pocket and let it flip open. He said, "Signature, hologram, fingerprint, voiceprint."

Morrison looked from the hologram to the smiling face. The hologram was smiling, too. He said, "All right, so you're security. It still doesn't give you the right to break into my private quarters. I'm available. You could have called me from the lobby or knocked at my door."

"Strictly speaking, you're right, of course. But I thought it best to meet you as discreetly as possible. Besides, I presumed on old acquaintance."

"What old acquaintance?"

"Two years ago. Don't you remember? An international conference in Miami? You were presenting a paper and had a hard time of it --"

"I remember the occasion. I remember the paper. It's you I don't remember."

"That's not surprising, perhaps. I met you afterward. I asked you questions, and we actually had a few drinks together."

"I don't consider that old acquaintance. -- Francis Rodano?"

"That's my name, yes. You even pronounced it correctly. Accent on the second syllable. Broad a. Subliminal memory, obviously."

"No, I don't remember you. The name was on your identification. -- I'd rather you left."

"I would like to talk to you in my official capacity."

"Apparently everyone wants to talk to me. What about?"

"Your work."

"Are you a neurophysicist?"

"You must know I'm not. Slavic languages was my major. I minored in economics."

"Then what can we talk about? I'm good at Russian, but you're probably better.

And I know nothing about economics."

"We can talk about your work. As we did two years ago. -- Look, why don't you sit down? It's your room and I won't really take long. If you want the chair I'm sitting on, I'll be glad to give it to you."

Morrison sat down at the side of the bed. "Let's get this over with. What do you want to know about my work?"

"The same thing I wanted to know two years ago. Is there anything to your notion that there's a specific structure in your brain that's specifically responsible for creative thought?"

"Not quite a structure. It's not something you can cut out in the ordinary way. It's a neuron network. Yes, I think there's something to that. Obviously. The catch is that no one else thinks so because they can't locate it and have no evidence for it."

"Have you located it?"

"No. I reason backward from results and from my analysis of brain waves and I don't seem to be convincing. My analyses are not -- orthodox." He added bitterly, "Orthodoxy in this field has gotten them nowhere, but they won't let me be unorthodox."

"I am told that you use mathematical techniques in your electroencephalographic analyses that are not only unorthodox, but are flat wrong. To be unorthodox is one thing; to be wrong is quite another."

"The only reason they say I am wrong is that I cannot prove that I am right. The only reason I cannot prove that I am right is that I can't study an isolated brain neuron in sufficient detail."

"Have you tried to study them? If you work with a living human brain, don't you leave yourself open to severe lawsuits or to criminal trial?"

"Of course. I'm not mad. I've worked with animals. I have to."

"You told me all this two years ago. I take it, then, you have made no startling discoveries in the last two years."

"None. But I'm convinced I'm right just the same."

"Your being convinced doesn't matter if you can't convince anyone else. But now I have to ask you another question. Have you done something in the last two years that has managed to convince the Soviets?"

"The Soviets?"

"Yes. What is this attitude of surprise, Dr. Morrison? Haven't you spent an hour or two in conversation with Dr. Boranova? Isn't she the one whom you just left in a great hurry?"

"Dr. Boranova?" Morrison, in his confusion, could think of nothing better to do than play the parrot.

Rodano's face lost none of its pleasantness. "Exactly. We know her well. We keep half an eye on her whenever she is in the United States."

"You make it sound like the bad old days," mumbled Morrison.

Rodano shrugged. "No, not at all. There is no danger of nuclear war now. We are polite to each other, the Soviet Union and we. We cooperate in space. We have a cooperative mining station on the moon and freedom of entry into each other's space settlements. That makes these the good new days. But, Doctor, some things don't change entirely. We keep an eye on our polite companions, the Soviets, just to make sure they stay virtuous. Why not? They keep an eye on us."

Morrison said, "You keep an eye on me, too, it would seem."

"But you were with Dr. Boranova. We couldn't help seeing you."

"That won't happen again, I assure you. I have no intention of ever being in her vicinity again if I can help it. She's a madwoman."

"Do you mean that literally?"

"Take my word for it. -- Look, nothing of what she and I talked about is secret as far as I'm concerned. What she said I feel free to repeat. She's involved in some miniaturization project."

"We've heard of it," said Rodano easily. "They have a special town in the Urals devoted to miniaturization experiments."

"Are they getting anywhere as far as you know?"

"We wonder."

"She's tried to tell me they are, that they've succeeded in producing actual miniaturization."

Rodano said nothing.

Morrison, who had waited a moment to let him speak, then said, "But that's impossible, I tell you. Scientifically impossible. You must realize that, Or, since your field of expertise is Slavic languages and economics, take my word for it. "

"I don't have to, my friend. There are many others who say it is impossible and yet, nevertheless, we wonder. The Soviets are free to play with miniaturization if they please, but we don't actually want them to have it unless we do also. After all, we don't know to what uses it might be put."

"To none! To none!" said Morrison fiercely. "There's no point in worrying about it. If our government really doesn't want the Soviet Union to get too far ahead in technology, it should encourage this miniaturization madness. Let the Soviets spend money on it -- and time and material -- and concentrate every atom of their scientific expertise on it. Everything will be wasted."

"And yet," said Rodano. "I don't think Dr. Boranova is mad or a fool, any more than I think that you are mad or a fool. -- Do you know what I was thinking as I watched the two of you in so intent a conversation on the park bench? It seemed to me that she wanted your help. Perhaps she thought that with your theories on neurophysics you could somehow help the Soviet push for miniaturization. Their peculiar theories and your peculiar theories might add up to something that is not at all peculiar. Or so I think."

Morrison's lips tightened. "I told you I have no secrets to keep, so I'm telling you that you're right. Just as you say, she wants me to go to the Soviet Union and help out in their miniaturization project. I won't ask how you know that, but I don't think it's just an idle guess and don't try to persuade me it is."

Rodano smiled and Morrison went on. "In any case, I said no. I refused absolutely. I stood up and left at once -- and in a hurry. You saw me hurry. That's the truth. I would have reported it if you had given me time to do so. And I'm reporting it now, as a matter of fact, to you. Nor is there any reason for you not to believe me because why, under any circumstances, would I take any part in a project that has absolutely no sense to it. Even if I wanted to work against my country, which I don't, I'm enough of a physicist not to try to do so by involving myself in anything as insane as working on a project without hope. They might as well be working on a perpetual motion machine, or antigravity, or faster-than-light travel, or --" He was perspiring freely.

And Rodano said gently, "Please, Dr. Morrison, no one doubts your loyalty. Certainly I don't. I'm not here because I am perturbed at your having had a discussion with the Russian woman. I am here because we had reason to think she might approach you and we feared you would not listen to her."

"What?"

"Now understand me, Dr. Morrison. Please understand. We would suggest -- in fact, we would very much want -- to have you go with Dr. Boranova to the Soviet Union."

5.

Morrison stared at Rodano, face pale, lower lip quivering slightly. He brushed at his hair with his right hand and said, "Why do you want me to go to the Soviet Union?"

"Not I, personally. The United States Government wants it."

"Why?"

"For the obvious reason. If the Soviet Union is engaged in miniaturization experiments, we would like to know as much about them as possible."

"You've got Madame Boranova. She must know a great deal. Grab her and beat it out of her."

Rodano sighed and said, "I know you're joking. We can't do that these days. You know that. The Soviet Union would retaliate at once in the most unpleasant ways and world opinion would be with them. So let's not waste time with jokes like that."

"All right. Granted, we can't do anything crude. I presume we have agents attempting to dig out the details."

"The operative word, Doctor, is attempting. We have our agents in the Soviet Union, to say nothing of sophisticated espionage equipment both Earthside and in space, just as they have agents here. But if they and we are very good at poking around quietly, we're also very good at keeping things secret. If anything, the Soviet Union is better at it than we are. Even though these are not what you call the bad old days, the Soviet Union

is still not quite an open society in our sense and they've had more than a century of practice in keeping things under the rug."

"Then what do you expect me to do?"

"You're different. The usual agent is sent into the Soviet Union or into some region in which the Soviet Union is operating under some cover which might possibly be penetrated. He -- or she -- must insinuate himself into a place where he is not really welcome and manage to elicit information that is secret. This isn't easy. He -- or she -- usually does not succeed and he -- or she -- is sometimes caught, which is always unpleasant all around. In your case, though, they're asking for you; they behave as though they need you. They will place you in the very midst of their secret installations. What an opportunity you will have."

"But they've just asked me to go in these last two hours. How do you know so much about it?"

"They've been interested in you for quite a while now. One of the reasons I made it my business to talk to you two years ago was because they seemed interested in you even at that time and we were wondering why that should be. So when they made their move, we were ready."

Morrison's fingers drummed on the arm of the chair, his nails making a rhythmic clicking noise. "Let me get this straight. I'm to agree to go with Natalya Boranova to the Soviet Union, presumably to the region where they are supposedly working on miniaturization. I am to pretend to help them --"

"You needn't pretend," said Rodano comfortably. "Help them if you can, especially if that means you get to know the process better."

"All right, help them. And then give you what information I have when I return."

"Exactly."

"What if there is no information? What if the whole thing is one gigantic bluff or if they're only kidding themselves? What if they're following some Lysenko type down into an empty hole?"

"Then tell us that. We would love to know that -- if it's a matter of knowing and not just thinking. After all, the Soviets, we are pretty certain, are under the impression that we are making progress on the matter of antigravity. Maybe we are and maybe we're not. They don't know for certain and we're not about to let them find out. Since we're not asking any Soviet scientist to come and help us, we're not giving them an easy entry. For that matter, there's some talk the Chinese are working on faster-than-light travel. Oddly enough, those are two items you mentioned as being theoretically impossible. I haven't heard that anyone's working on perpetual motion, however."

"These are ridiculous games the nations are playing," said Morrison. "Why don't they cooperate in these matters? We might as well be in the bad old days."

"Not quite. But being in the good new days does not mean we're in heaven. There is still residual suspicion and there are still attempts to take a giant step forward before someone else does. Maybe it's even a good thing. If we're driven by selfish motives of aggrandizement, as long as that doesn't lead to war, we may make more rapid progress."

To stop trying to steal a march on neighbors and friends might reduce us to indolence and decay."

"So if I go and am eventually in a position to assure you, authoritatively, that the Soviets are drilling a dry hole or that they are indeed making progress of such and such a nature, then I will be helping not only the United States, but the whole world, to remain vigorous and progressive even including the Soviet Union."

Rodano nodded. "That's a good way to look at it."

Morrison said, "I have to give you people credit. You're clever con artists. However, I don't fall for it. I favor cooperation among nations and I'm not going to play these dangerous twentieth-century games in the rational twenty-first. I told Dr. Boranova I wasn't going and I'm telling you I'm not going."

"Do you understand that it is your government that is asking this of you."

"I understand that you are asking me and I'm refusing you. But if it happens that you actually represent the government's views in this, then I am prepared to refuse the government as well."

6.

Morrison sat there, flushed, chin up. His heart was beating rapidly and he felt heroic.

Nothing can make me change my mind, he thought. What can they do? Throw me in jail? What for? They have to have a charge.

He waited for anger from the other. For a threat.

Rodano merely looked at him with an expression of quiet bemusement.

"Why do you refuse, Dr. Morrison?" he asked. "Have you no feelings of patriotism?"

"Patriotism, yes. Insanity, no."

"Why insanity?"

"Do you know what they plan to do with me?"

"Tell me."

"They intend to miniaturize me and place me in a human body to investigate the neurophysical state of a brain cell from the inside."

"Why should they want you to do that?"

"They imply it's to help me with my research, which they claim will also help them, but I certainly don't intend to submit to such an experiment."

Rodano scratched lightly at his fluffy hair, put it into a mild disarray, and quickly flattened it again as though anxious not to show too much pink skin.

He said, "You can't possibly be concerned over this. You tell me that miniaturization is flatly impossible -- in which case, they can't miniaturize you whatever their intentions or desires."

"They'll perform some sort of experiment on me. They say they have miniaturization, which means they are either liars or mad, and in either case I won't have them playing games with me -- either to do them pleasure, or to do you pleasure, or to do the whole American government pleasure."

"They're not mad," said Rodano, "and whatever their intentions, they know very well we'd hold them responsible for the well-being of an American citizen invited by them to their country."

"Thank you! Thank you! How would you hold them responsible? Send them a stiff note? Hold one of their citizens in reprisal? Besides, who says they'll execute me publicly in Red Square? What if they decide they don't want me to return and talk about their work on miniaturization? They'll have what they want of me -- whatever that may be -- and they'll decide that the American government need not benefit in their turn from any knowledge I may have gained from them. So they arrange a small accident. So sorry! So sorry! And they, of course, will pay reparations to my sorrowing family and send back a flag-draped coffin. No, thank you. I'm not the type for a suicide mission."

Rodano said, "You dramatize. You'll be a guest. You will help them if you can and you needn't be ostentatious about learning things. We're not asking you to be a spy; we will be grateful for anything you may pick up more or less unavoidably. What's more, we will have people there who will keep an eye on you if they can. We intend to see to it that you get back safely --"

"If you can," interposed Morrison.

"If we can," agreed Rodano. "We can't promise you miracles. Would you believe us if we did?"

"Do what you will, this is not a job for me. I'm not that courageous. I'm not planning to become a pawn in some crazy chess game, with my life very possibly at stake, just because you -- or the government -- ask me to."

"You frighten yourself unnecessarily."

"Not so. Fright has its proper role; it keeps one cautious and alive. There's a trick to staying alive when you're someone like me; it's called cowardice. It may not be admirable to be a coward if someone has the muscles and mind of an ox, but it's no crime for a weakling to be one. I am not so great a coward, however, that I can be forced to take on a suicide role, simply because I fear revealing my weakness. I reveal it gladly. I am not brave enough for the role. Now, please leave."

Rodano sighed, half-shrugged, half-smiled, and rose slowly to his feet. "That's it, then. We can't force you to serve your country if you don't wish to."

He moved toward the door, his feet dragging a little, and then, even with his hand reaching for the doorknob, he turned and said, "Still, it upsets me a little. I'm afraid I was wrong and I hate to be wrong."

"Wrong? What did you do? Bet someone five bucks I'd jump at the chance to give my life for my country?"

"No, I thought you would jump at the chance to advance your career. After all, you're not getting anywhere as things are. Your ideas are not listened to; your papers are

no longer published. Your appointment at your university is not likely to be renewed. Tenure? Forget it. Government grants? Never. Not after you have refused our request. After this year, you will have no income and no status. And yet you will not go to the Soviet Union, as I was sure you would as the one way of salvaging your career. Failing that, what will you do?"

"My problem."

"No. Our problem. The name of the game in this good new world of ours is technological advance: the prestige, the influence, the abilities that come with being able to do what other powers cannot. The game is between the two chief contestants and their respective allies; we and they, the U.S. and the S.U. For all our circumspect friendship, we still compete. The counters in the game are scientists and engineers and any disgruntled counter might conceivably be used by the other side. You are a disgruntled counter, Dr. Morrison. Do you understand what I'm saying?"

"I understand that you're about to be offensive."

"We have your statement that Dr. Boranova invited you to visit the Soviet Union. Did she, really? May she not have invited you to stay in the United States and work for the Soviet Union in return for support for your ideas?"

"I was right. You are offensive."

"It's my job to be so -- if I must. What if I'm right after all and you would jump at the chance of advancing your career. Only this is the way you intend to do it -- stay here and accept Soviet money or backing in return for giving them whatever information you can."

"That is wrong. You have no evidence suggesting that and you cannot prove it."

"But I can suspect it and so can others. We will then make it our business to keep you under constant surveillance. You will not be able to do science. Your professional life will be over -- entirely. -- And you can avoid all that, simply by doing as we ask and going to the Soviet Union."

Morrison's lips tightened and he said, out of a dry throat, "You're threatening me in a crude attempt at blackmail and I won't capitulate. I'll take my chances. My theories on the brain's thinking center are correct and that will someday be recognized -- whatever you or anyone does."

"You can't live on 'someday.'"

"Then I'll die. I may be a physical coward, but I'm not a moral one. Good-bye."

Rodano, with one last look, half-commiserating, left.

And Morrison, shaking in a spasm of fear and hopelessness, felt the spirit of defiance leak away, leaving nothing behind but despair.

2. TAKEN

If asking politely is useless, take.

Dezhnev Senior

7.

Then I'll die, thought Morrison.

He hadn't even bothered double-locking the door after Rodano left. He sat in the chair, lost in thought, face vacant. The westering sun slanted in through the window and he didn't bother to push the contact that would opacify the glass. He simply let it slant in. In fact, he found a distant hypnotic fascination in watching the dust motes dance.

He had fled from the Russian woman in fright, but he had stood up to the American agent, stood up with the courage of -- of despair.

And desperation -- minus the courage -- was all he felt now. What Rodano had said was, after all, true. His appointment would not be renewed for the coming year and none of the feelers he had sent out had twitched. He was poison at the academic box office and he lacked the kind of experience (or, more important, the kind of contacts) that would get him a job in the private sector, even if the quiet countervailing effort of an offended government were not taken into account.

What would he do? Go to Canada?

There was Janvier at McGill University. He had once expressed an interest in Morrison's ideas. Once! Morrison had not tried McGill, since he hadn't planned to leave the country. Now his plans were of no account. He might have to.

There was Latin America, where a dozen universities might welcome a Northerner who could speak Spanish or Portuguese -- at least after a fashion. Morrison's Spanish was poor; his Portuguese was nil.

What had he to lose? There were no family ties. Even his daughters were distant now, fading at the edges, somehow, like old photographs. He had no friends to speak of -- at least none that had survived the disasters of his research.

There was his program, of course, specially designed by himself. It had been built, in the first place, by a small firm according to his specifications. Since then he had modified it endlessly on his own. Perhaps he should patent it, except that no one but he was ever likely to use it. He would take it with him, of course, wherever he went. He had it with him now, in his left inner jacket pocket, within which it bulged like an oversize wallet.

Morrison could hear the roughness of his own breathing and he realized that he was escaping from the purposeless merry-go-round of his thoughts by falling asleep over

them. How could he interest others in anything, he thought bitterly, when he bored even himself?

He was aware that the sun no longer struck his window and that a gathering twilight encompassed his room. So much the better.

He became conscious of a polite buzz. It was the room telephone, he realized, but he didn't budge. Morrison let his eyes remain closed. It was probably this man, this Rodano, calling to make a final try. Let him ring.

Sleep closed in and Morrison's head lolled to one side in so uncomfortable a position that he didn't stay asleep long.

It was perhaps fifteen minutes later that he started awake. The sky was still blue, but the twilight in his room had darkened and he thought, with some guilt, that he had missed all the papers given in the afternoon. And then, rebelliously, he thought: Good! Why should I want to hear them?

Rebellion grew. What was he doing at the convention anyway? In three days he had not heard one paper that had interested him, nor had he met anyone who could do his sinking career one bit of good. What would he do the remaining three days except try to avoid the two people he had met whom he desperately did not want to meet again -- Boranova and Rodano.

He was hungry. He hadn't had a proper lunch and it was almost dinnertime. The trouble was that he was in no mood to eat alone in the hotel's plush restaurant and in less of a mood to pay its inflated prices. The thought of waiting in line for a stool at the coffee shop was even less appetizing.

That decided everything. He'd had enough. He might as well check out and walk to the train station. (It was not a long walk and the cool evening air would, perhaps, help clear the miseries out of his mind.) It would take him little more than five minutes to pack; he'd be on his way in ten.

He went about the task grimly. At least he would save half the hotel bill and he would get away from a place that, he was convinced, would bring him only misery if he stayed.

He was quite right, of course, but no prescient bell in his mind rang to inform him that he had already stayed too long.

8.

After quickly checking out at the desk downstairs, Morrison stepped out of the large glass doors of the hotel, glad to be free, but still ill at ease. He had carefully investigated the lobby to make sure that neither Boranova nor Rodano was in sight and now he looked up and down the line of taxis and studied the knots of people moving in and out of the hotel.

All clear -- it seemed.

All clear, except for an angry government, nothing accomplished, and endless trouble ahead. McGill University seemed more attractive every moment -- if he could get in.

He swung down the sidewalk in the darkening evening toward the train station, which was just too far away to be in sight. He would get home, he calculated, well past midnight and he would have no chance at all of sleeping on the train. He had a book of crossword puzzles that might occupy him -- if the light were good enough. Or --

Morrison wheeled around at the sound of his name. He did this automatically, though by rights, under the conditions that prevailed, he should have hurried onward. There was no one here he wanted to speak to.

"Al! Al Morrison! Good heavens!" The voice was high-pitched and Morrison didn't recognize it.

Nor did he recognize the face. It was round, middle-aged, smooth-shaven, and decorated with steel-framed glasses. The person it belonged to was well dressed.

Morrison at once felt the usual agony of trying to remember a person who clearly remembered him and who behaved as though they were good friends. His mouth fell open with the effort of riffling through his mind's card catalog.

The other man seemed to be aware of what was troubling Morrison and it didn't seem to bother him. He said, "You don't remember me, I see. No reason you should. I'm Charlie Norbert. We met at a Gordon Research Conference -- oh, years ago. You were questioning one of the speakers on brain function and did a good job. Very incisive. So it's no wonder I remember you, you see."

"Ah yes," mumbled Morrison, trying to remember when he had last been at a Gordon Research Conference. About seven years ago, wasn't it? "That's very flattering of you."

"We had a long talk about it that evening, Dr. Morrison. I remember because I was so impressed by you. No reason for you to remember, though. There's nothing impressive about me. Listen, I came across your name on the list of attendees. Your middle name, Jonas, brought you right back. I wanted to talk to you. I called your room about half an hour ago, but there was no answer."

Norbert seemed to be aware of Morrison's suitcase for the first time and said in obvious dismay, "Are you leaving?"

"Actually, I'm trying to catch a train. Sorry."

"Please give me a few minutes. I've been reading about your -- notions."

Morrison stepped back a little. Even expressed interest in his ideas was not enough at the moment. Besides, the other's after shave lotion was strong and invaded his personal space, as did the man himself. Nothing the other said brought back any memory of him.

Morrison said, "I'm sorry, but if you've been reading about my notions, you're probably the only one. I hope you don't mind, but --"

"But I do mind." Norbert's face grew serious. "It strikes me the field isn't properly appreciative of you."

"That fact struck me a long time ago, Mr. Norbert."

"Call me Charlie. We were on a first-name basis long ago. -- You don't have to go unappreciated, you know?"

"There's no compulsion about it. I just am and that's it. Well --" Morrison turned as if to leave.

"Wait, Al. What if I told you I could get you a new job with people who are sympathetic to your way of thinking?"

Morrison paused again. "I would say you were dreaming."

"I'm not. Al, listen to me -- boy, am I glad I bumped into you -- I want to introduce you to someone. Look, we're starting a new company, Genetic Mentalics. We've got lots of money behind us and big plans. The trick is to improve the human mind by means of genetic engineering. We've been improving computers every year, so why not our personal computer as well?" He tapped his forehead earnestly. "Where is he? I left him in the car when I saw you walk out of the hotel. You know, you haven't changed much in the years since I last saw you."

Morrison was untouched by that. "Does this new company want me?"

"Of course it wants you. We want to change the mind, make it more intelligent, more creative. But what is it we change in order to accomplish that? You can tell us."

"I'm afraid I haven't gotten that far."

"We don't expect offhand answers. We simply want you to work toward it. -- Listen, whatever your salary is now, we'll double it. You just tell us your present figure and we'll go to the small trouble of multiplying it by two. Fair enough? And you'll be your own boss."

Morrison frowned. "This is the first time I've ever met Santa Claus in a business suit. Smooth-shaven, too. What's the gag?"

"No gag. -- Where is he? -- Ah, he moved the car to get it out of the line of traffic. -- Look, he's my boss, Craig Levinson. We're not doing you a favor, Al. You'll be doing us a favor. Come with me."

Morrison hesitated only momentarily. It's always darkest before the dawn. When you're down, there's no direction but up. Lightning does strike sometimes. -- He was suddenly full of old saws.

He let himself be led by the other, hanging back only slightly.

Norbert waved and called out, "I found him! This is the fellow I told you about. Al Morrison. He's the one we need."

A grave middle-aged face looked out from behind the steering wheel of a late-model automobile, whose color was something uncertain in the gathering darkness. The face smiled, teeth gleaming whitely, and the voice that belonged to it said, "Great!"

The trunk door lifted upward as they approached and Charlie Norbert took Morrison's suitcase. "Here, let me unload you." He swung it into the trunk and closed the door.

"Wait," said Morrison, rather surprised.

"Don't worry, Al. If you miss this train, there's another. If you want, we'll hire a limousine to take you home -- eventually. Get in."

"Into the car?"

"Certainly." The back door had swung open invitingly.

"Where will we be going?"

"Look," said Norbert, his voice dropping half an octave and getting much softer.

"Let's not waste time. Get in."

Morrison felt something hard against his side and twisted in order to see what it was.

He felt it -- whatever it was -- push against him. Norbert's voice was a whisper now.

"Let's be very quiet, Al. Let's not make a fuss."

Morrison got into the car and was suddenly very frightened. He knew that Norbert was holding a gun.

9.

Morrison pushed himself across the back seat, wondering if he could reach the other door and get out again. Even if Norbert had a gun, would he want to use it in a hotel parking lot with a hundred people within thirty meters? After all, even if the gun were silenced, his sudden collapse would surely draw attention.

The possibility vanished quickly, however, when a third man got into the other door, a large one who grunted as he bent himself into the car and who looked at Morrison, if not malevolently, then certainly with an expression that was free of any trace of friendship.

Morrison found himself squeezed between a man on either side and was incapable of stirring. The car moved forward smoothly and picked up speed once it moved onto the highway.

Morrison said in a choked voice, "What is this all about? Where are we going? What are you going to do?"

Norbert's voice, without the falsetto and without the synthetic bonhomie, was grim. "No need to worry, Dr. Morrison. We have no intention of harming you. We just want you with us."

"I was with you back there." (He tried to point "back there," but the man on his right leaned against him and he could not free his right hand to do so.)

"But we want you to be with us -- somewhere else."

Morrison tried to sound threatening. "See here, you're kidnapping me. That's a serious offense."

"No, Dr. Morrison, let's not call it kidnapping. Let's call it being friendly in a rather forcible way."

"Whatever you call it, this is illegal. Or are you the police? If so, identify yourself and tell me what I've done and what this is all about."

"We are not charging you with anything. I told you. We just want you with us. I'd advise you to keep quiet, Doctor, and remain calm. It will be better for you."

"I can't remain calm if I don't know what's going on."

"Force yourself," said Norbert unsympathetically.

Morrison couldn't think of anything further to say that would help matters and, without actually becoming calm, fell silent.

The stars were out now. The night was as clear as the day had been. The automobile moved through traffic consisting of a thousand cars, each of which had someone behind the wheel who was going quietly about his or her ordinary business without any awareness that in a nearby car a crime was being committed.

Morrison's heart continued working overtime and his lips trembled. He couldn't help but be nervous. They said they meant him no harm, but how far could he trust them? So far, everything that this man on his left had told him had been a lie.

He tried to be calm, but to what organ of his body did he speak in order to achieve calmness? He closed his eyes and forced himself to breathe deeply and slowly -- and to think rationally. He was a scientist. He had to think rationally.

These must be Rodano's colleagues. They were taking him to headquarters, where the pressure to force him to undertake the mission would be increased. However, they couldn't succeed. He was an American and that meant he could be treated only according to certain established rules, certain legal procedures, and certain customary modes of action. There could be nothing arbitrary, nothing improvised.

He drew another deep breath. He merely had to keep saying no and they would be helpless.

There was a small lurch and his eyes flew open.

The car had turned off the highway onto a narrow dirt road.

Automatically, he said, "Where are we going?"

There was no answer.

The automobile bumped along for a considerable distance and then turned into a field, obscure and dark. In the glow of the car's headlights, Morrison made out a helicopter, its rotors turning slowly and its motor making only the slightest purr.

It was one of the new kind, its sound waves suppressed, its smooth surface absorbing, rather than reflecting, radar beams. Its popular name was the "hushicopter."

Morrison's heart sank. If they were using a hushicopter, which were extremely expensive and quite rare, then he was being treated as no ordinary prey. He was being treated as a big fish.

But I'm not a big fish, he thought desperately.

The automobile stopped and the headlights went out. There was still the faint purr and a few dim violet lights, hardly visible, marked the spot where the hushicopter sat.

The large man at Morrison's right threw open the car door and, again with a grunt, lowered his head and forced his way out. His large hand reached in for Morrison.

Morrison tried to shrink away. "Where are you taking me?"

The large man seized his upper arm. "Come out. Enough talking."

Morrison felt himself half-lifted, half-pulled out of the car. His shoulder hurt as it might be expected to do, considering that it had been nearly yanked out of its socket.

But he disregarded the pain. It was the first time he had heard the large man speak. The words were in English, but the accent was thickly Russian.

Morrison felt cold. These were not Americans who had him.

10.

Morrison had entered the hushicopter -- though that is not an accurate description of what took place. To enter implies a voluntary action and he had been much more nearly pushed into the vehicle.

It had pulsed its way through the darkness as he sat between the same two men between whom he had sat in the car. It was almost as though nothing had changed, although the whisper of the rotors was distinctly more hypnotic than the purr of the automobile engine had been.

After an hour -- or possibly less -- they came out of the darkness of the air and drifted downward toward the darkness of the ocean. Morrison could tell it was the ocean because he could smell it, was vaguely aware of the fog of droplets in the air, and because he could make out, very dimly, the dark bulk of a ship -- dark on dark.

How could the hushicopter make its way out to the ocean and pinpoint a ship? -- the right ship, he was sure. Even in his half-stupor of despair, Morrison's mind could not help searching for solutions. Undoubtedly, the hushicopter pilot had followed a shielded and pseudorandomized radio beam. The beam seemed random but, given the key, it could be found to have order and its source could be identified. Properly done, the pseudorandomness could not be penetrated even by quite an advanced computer.

Nor was the ship more than a temporary stopping place. He was allowed to use the head, given time for a hurried meal of bread and thick soup (which he found most welcome), and was then ushered -- with the unceremonious hustle he had begun to accept as a fact of life -- into a medium-sized airplane. It was a ten-seater (he counted automatically), but except for the two pilots and, sitting in the rear, the two men who had been on either side of him in the car and in the hushicopter, he was alone in the plane.

Morrison looked back at his guards, whom he just made out in the very dim light that filled the plane's interior. There was enough room in the plane so that they were not forced to hem him in. Nor did they need to do so out of fear that he might break and run for it. Here, he could break out only onto the deck of the ship. Once the plane took off, he could break out only into the open air with nothing beneath him but water of indefinite depth.

He wondered numbly why they were not taking off and then the door opened to admit another passenger. Despite the dimness, he recognized her at once.

He had met her for the first time only twelve hours before, but how could he have progressed from that first moment of meeting to the present moment in only twelve hours?

Boranova sat down in the seat next to his and said in a low voice, "I am sorry, Dr. Morrison." She was speaking in Russian.

And, as though that were the signal, the sound of the airplane's engines deepened and he felt himself pressed against his seat as the plane moved steeply upward.

Morrison stared at Natalya Boranova, trying to collect his thoughts. Dimly, he felt a desire to say something to her in a suave, imperturbable way, but there was no chance of that.

His voice was a creak and even after he cleared his throat, all he could say was "I've been kidnapped."

"That could not be helped, Dr. Morrison. I regret this. I really do. I have my duty, you understand. I had to bring you back by persuasion if I could. Otherwise --" She let the last word hang.

"But you can't behave in this fashion. This is not the twentieth century." He choked a little in his earnest attempt to stifle his sense of indignation to the point where he could speak sensibly. "I am not a recluse. I am not a derelict. I will be missed and American intelligence is perfectly aware that we spoke and they know that you wanted me to come to the Soviet Union. They will know I have been kidnapped -- they may know it already -- and your government will find itself in the middle of a kind of international incident it will want no part of."

"Not so," said Boranova earnestly, her dark eyes gazing levelly into his. "Not so. Of course your people know what has happened, but they have no objections. Dr. Morrison, the Soviet Union's intelligence operations are marked both by advanced technology and by over a century of close study of American psychology. I have no doubt that American intelligence is just as advanced. It is this equality of expertise, which is shared by several of the other geographical units of the planet, that helps to keep us in cooperation. Each of us is firmly convinced that no one else is far ahead on a road of its own."

"I don't know what you're driving at," said Morrison. The planet was arrowing through the night, speeding toward the eastern dawn.

"What concerns American intelligence most right now is our attempt at miniaturization."

"Attempt!" Morrison said with a note of sardonic amusement.

"Successful attempt. -- The Americans don't know that it is successful. They don't know if the miniaturization project may not be a mask behind which something altogether different is going on. They know we're doing something. I'm sure they have a detailed map of the area in the Soviet Union where the experiments are proceeding -- every building, every truck convoy. They undoubtedly have agents who are doing their best to penetrate the project.

"Naturally, we're doing our best to counter all this. We are not indignant. We know a great deal about the American experiments in antigravity and it would be naive to take the attitude that we can probe and that the Americans can't; that we can have our successes, but the American mustn't."

Morrison rubbed his eyes. Boranova's quiet, even voice was making him realize that his ordinary bedtime was past and that he was sleepy. He said, "What has this to do with the fact that my country will bitterly resent my kidnapping?"

"Listen to me, Dr. Morrison. Understand me. Why should they? We need you, but they can't be certain why. They have no reason to suppose there is anything of value in your neurophysical notions. They must think we are following a false trail and will get nothing out of you, but they can have no objection to getting an American into the miniaturization project. If this American finds out what it is all about, the information will prove valuable to them. -- Don't you think they might reason in this fashion, Dr. Morrison?"

"I don't know how they would reason," said Morrison carefully. "It is not a matter of interest to me."

"But you spoke to a Francis Rodano after you left me so suddenly. -- You see, we know even that. Would you care to tell me that he did not suggest that you play along with us and go to the Soviet Union in order to find out what you might find out?"

"You mean he wants me to play the spy?"

"Doesn't he? Didn't he make that suggestion?"

Again Morrison ignored the question. He said, "And since you are convinced I am to be a spy, you will have me executed after I do whatever it is you want me to do. Isn't that what happens to spies?"

"You've been viewing too many old-fashioned movies, Dr. Morrison. In the first place, we will see to it that you don't find out anything important -- anything at all. In the second place, spies are too valuable a commodity to destroy. They are useful as trading units for any agents of ours that may be in American hands -- or in foreign hands generally. I believe that the United States takes much the same attitude."

Morrison said, "To begin with, then, I am not a spy, madame. I am not going to be a spy. I know nothing about American intelligence operations. Also, I'm not going to do anything for you."

"I'm not at all sure about that, Dr. Morrison. I think you'll decide to work with us."

"What do you have in mind? Will you starve me till I agree? Beat me? Keep me in solitary confinement? Put me in a work camp?"

Boranova frowned and shook her head slowly in what seemed to be genuine shock. "Really, Doctor, what are these things you suggest? Are we back in the days when you were loudly proclaiming us to be an evil empire and inventing horror stories about us? I don't say that we might not be tempted to use strong measures if you intransigently refuse. Necessity drives sometimes, you know. -- But we won't have to. I'm convinced of that."

"What convinces you?" Morrison asked wearily.

"You're a scientist. You're a brave man."

"I? Brave? Lady, lady, what do you know about me?"

"That you have a peculiar viewpoint. That you have upheld it all this time. That you have watched your career go downhill. That you have convinced nobody. And that, despite all this, you cling to your view and do not budge from what you are certain is right. Is not this the act of a brave man?"

Morrison nodded. "Yes. Yes. It is a kind of bravery. Still, there are a thousand crackpots in the history of science who clung all their lives to some ridiculous view against logic, against evidence, against their own self-interest. I may be just another one of them."

"In that case, you might be wrong, but you would still be brave. Do you think bravery is entirely a matter of physical daring?"

"I know it is not. There are all kinds of bravery and perhaps," he said bitterly, "every one of those kinds of bravery is a mark of insanity or, at any rate, folly."

"Surely you do not consider yourself a coward?"

"Why not? In some ways, I flatter myself by saying that I am sane."

"But mad in your stubborn views concerning neurophysics?"

"I would not be surprised."

"But surely you think your views are correct."

"Certainly, Dr. Boranova. That would be part of my madness, would it not?"

Boranova shook her head. "You are not a serious man. I've said that before. My countryman Shapirov thinks you're right -- or, if not right, at least a genius."

"Next best thing, certainly. Part of his madness, too."

"Shapirov's opinion is very special."

"To you, I'm sure. -- Look, lady, I am tired. I am so groggy, I don't know what I'm saying. I'm not sure all this is real. I hope it isn't. Let me just -- just rest a little."

Boranova sighed and a look of concern entered her eyes. "Yes, of course, my poor friend. We wish you no harm. Please believe that."

Morrison let his head bow down on his chest. His eyes closed. Dimly, he felt himself pushed gently to one side and a pillow placed under his head.

Time passed. A dreamless time.

When he opened his eyes, he was still on the plane. There were no lights, but he knew without any doubt whatever that he was still on the plane.

He said, "Dr. Boranova?"

She replied instantly, "Yes, Dr. Morrison?"

"We're not being pursued?"

"Not at all. There are several of our own planes flying distant interference, but they have had nothing to do. Come, my friend, we want you and your government wants us to have you."

"And you still insist that you have miniaturization? That it is not madness? Or a hoax?"

"You will see for yourself. And you will see what a wonder it is, so that you will want to be part of it. You will demand to be part of it."

"And what will you be doing with it," asked Morrison thoughtfully, "assuming this is not an elaborate joke you are playing on me? Do you plan to make a weapon of it? Transport an army in a plane like this? Infiltrate each land with an invisible host? That sort of thing?"

"How revolting!" She cleared her throat as though she were tempted to spit with disgust. "Have we not enough land? Enough people? Enough resources? Have we not our large share of space? Are there not more important things to do with miniaturization? Can it be that you are so twisted and distorted that you do not see what it will mean as a research tool? Imagine the study of living systems that it will make possible; the study of crystal chemistry and solid-state systems; the construction of ultra-miniaturized computers and devices of all sorts. Think further of what we might learn of physics if we can alter Planck's constant to suit ourselves. What might we not learn of cosmology?"

Morrison struggled to sit upright. He was still woozy, but there was an incipient dawn outside the plane windows and he could see Boranova very dimly.

He said, "Is that what you wish to do with it, then? Noble scientific endeavors?"

"What would your government do with it if you had it? Try to achieve a sudden military superiority and restore the bad old days?"

"No. Of course not."

"So that only you are noble and only we are terribly evil? Do you honestly believe that? -- It may be, of course, that if miniaturization becomes sufficiently successful, the Soviet Union may achieve a lead in the development of a space-centered society. Think of transporting miniaturized material from one world to another, of sending a million colonists in a spaceship that would house only two or three human beings of normal size. Space will acquire a Soviet coloring, a Soviet tinge -- not because the Soviet people will dominate and be masters, but because Soviet thought will have won in the battle of ideas. And what is wrong with that?"

Morrison shook his head in the dimness. "Then I certainly won't help you. Why should you expect me to? I won't fasten Soviet thought on the Universe. I prefer American thought and tradition."

"You think you do and I don't blame you for it. But we will persuade you. You will see."

"You won't."

Boranova said, "My dear friend Albert -- if I may call you that. I have said that we will be admired for our progress. Do you think you will be immune? -- But let us leave such discussions for another time."

She pointed out the plane window at the gray sea beneath, which was just becoming visible.

"We are now over the Mediterranean," she said, "and soon we will be over the Black Sea and then across the Volga to Malenkigrad -- Smalltown, in English, eh? -- and the sun will have risen when we land. That will be symbolic. A new day. New light. I

predict you will be eager to help us establish this new day and I would not be surprised if you never wish to leave the Soviet Union again."

"Without your forcing me to stay?"

"We will fly you home freely if you ask us to -- once you have helped us."

"I won't help you."

"You will."

"And I demand now that I be returned."

"Now doesn't count," said Boranova cheerfully.

And they flew the last several hundred kilometers to Malenkigrad.

3. MALENKIGRAD

A pawn is the most important piece on the chessboard -- to a pawn.

Dezhnev Senior

11.

Francis Rodano was at his office early the next morning, which was Monday and the beginning of the week. That he had worked on Sunday was common enough not to surprise him. That he had slept at all during the night just completed did.

When he arrived, half an hour before the official start of the day, Jonathan Winthrop was already there. That did not surprise Rodano, either.

Winthrop walked into Rodano's office within two minutes of the latter's arrival. He leaned against the wall, the palms of his large hands hugging his elbows, his left leg crossing his right, so that the toe of his left shoe was digging into the carpet.

"You look worn-out, Frank," he said, his eyebrows hunching low over his dark eyes.

Rodano looked up at the other's shock of coarse gray hair, which routinely deprived him of any claim of his own to splendor of appearance, and said, "I feel worn-out, but I was hoping it didn't show." Rodano was very aware of having gone through the morning's rituals thoroughly and carefully and of having dressed with considerable judgment.

"It shows, though. Your face is the mirror of your soul. Some agent in the field you'd have made."

Rodano said, "We're not all made for the field."

"I know. And we're not all made for desk work, either." Winthrop rubbed his bulbous nose as though he were anxious to file it down to normal size. "I take it you're worried about your scientist, what's his name?"

"His name is Albert Jonas Morrison," said Rodano wearily. There was this pretense at the Department of not knowing Morrison's name, as though everyone was anxious to emphasize that the project wasn't theirs.

"Okay. I have no objection to your mentioning his name. I take it you're worried about him."

"Yes, I'm worried about him, along with a lot of other things. I wish I could see things more clearly."

"Who doesn't?" Winthrop sat down. "Look, there's no use worrying. You've handled this from the start, and I've been willing to let you do so because you're a good man. I'm perfectly satisfied you've done all you could to make this work because one thing about you is that you understand the Russkies."

Rodano winced. "Don't call them that. You've been watching too many twentieth-century movies. They're not all Russians, any more than we're all Anglo-Saxons. They're Soviets. If you want to understand them, try to understand how they think of themselves."

"Sure. Anything you say. Have you figured out what's so important about your scientist?"

"Nothing, as far as I know. No one takes him seriously except the Soviets."

"Do you think the Soviets know something we don't?"

"A few things, I'm sure, but I haven't any notion of what they see in Morrison. It's not the Soviets, either. It's one Soviet scientist -- a theoretical physicist named Shapiro. It's possible that he's the guy who worked out the method of miniaturization -- if the method has really been worked out at all. Scientists outside the Soviet Union are ambivalent about Shapiro. He's erratic and, to put it kindly, eccentric. The Soviets are all gung-ho on him, however, and he's all gung-ho on Morrison, though that may just be another sign of his eccentricity. Then the interest in Morrison recently graduated from curiosity to desperation."

"Ah? And how do you know that, Frank?"

"Partly from contacts inside the Soviet Union."

"Ashby?"

"Partly."

"Good agent."

"At it too long. Needs to be replaced."

"I don't know. Let's not retire a winner."

"In any case," said Rodano, unwilling to fight the point, "there was a sudden multiplication of interest in Morrison, on whom I'd been keeping tabs for a couple of years."

"This Shapiro, I suppose, had another brainstorm about Morrison and persuaded the Russ-- Soviets they needed him."

"Perhaps, but the funny thing is that Shapiro seems to have dropped out of the news recently."

"Out of favor?"

"No sign of that."

"Could be, Frank. If he's been feeding the Soviets a line of garbage about miniaturization and they've caught on to it, I wouldn't want to be in his shoes. These may be the good new days, but the Soviets have never learned to have a sense of humor about being made to look or feel foolish."

"It could be that he's gone underground because the miniaturization project is heating up. And that could also explain the sudden desperation about Morrison."

"What does he know about miniaturization?"

"Only that he's sure it's impossible."

"It makes no sense, does it?"

Rodano said carefully, "That's why we let him be taken. There's always the hope it will shake up the pieces and that they may then come together in a new way that will begin to make sense."

Winthrop looked at his watch. "He should be there by now. Malenkigrad. What a name! No news of any plane crash last night anywhere in the world, so I guess he's there."

"Yes -- and just the wrong person to send, too, except he was the one that the Soviets wanted."

"Why is he wrong? Is he shaky ideologically?"

"I doubt that he has an ideology. He's a zero. All last night I've been thinking that it's all a mistake. He lacks guts and he's not very bright, except in an academic sense. I don't think he can possibly think on his feet -- if he ever has to. He's not going to be smart enough to find out anything. I suspect he'll be in one long panic from beginning to end and I've been thinking for hours now that we'll never see him again. They'll imprison him -- or kill him -- and I've sent him there."

"That's just middle-of-the-night blues, Frank. No matter how dumb he is, he'll be able to tell us whether he watched a demonstration of miniaturization, for instance, or what it was they did to him. He doesn't have to be a shrewd observer. He need only tell us what happened and we will do the necessary thinking."

"But, Jon, we may never see him again."

Winthrop placed his hand on Rodano's shoulder. "Don't begin by assuming disaster. I'll see that Ashby gets the word. If something can be done, it will be done and I'm sure the Russ-- Soviets will hit a sane moment and let him go if we put on enough quiet pressure when the time comes. Don't make yourself sick over it. It's a move in a complex game and if it doesn't work, it doesn't work. There are a thousand other moves on the board."

12.

Morrison felt haggard. He had slept through much of Monday, hoping it would rid him of the worst of his jet lag. He had eaten gratefully of the food that had been brought in toward evening, had partaken even more gratefully of a shower. Fresh clothing was given him that fit rather indifferently -- but what of that? And he had spent Monday night alternately sleeping and reading.

And brooding.

The more he thought of it, the more convinced he was that Natalya Boranova was correct in her estimate that he was here only because the United States was satisfied to have him here. Rodano had urged him to go, had vaguely threatened him with further career troubles (how much deeper in trouble could he possibly get?) if he did not go. Why, then, should they object to his having been taken? They might object on principle

or feel there was the danger of setting an undesirable precedent, but apparently their own eagerness to have him go had overruled that.

What, then, would be the point in demanding to be taken to the nearest American consul or in making wild threats of American retaliation?

As a matter of fact, now that the deed had been done with American connivance -- surely with American connivance -- it would be impossible for the United States to take open action on his behalf or express any indignation whatever. Questions would inevitably arise as to how the Soviets had managed to spirit him off and there would be no answer other than American stupidity or American connivance. And surely the United States would not want to have the world come to either conclusion.

Of course, he could see why this had been done. It was as Rodano had explained. The American government wanted information and he was in an ideal position to get it for them.

Ideal? In what way? The Soviets would not be fools enough to let him get any information they didn't want him to have and if they thought that the information he managed to get (or couldn't avoid getting) was too much, they would not be fools enough to let him go.

The more he thought of that, the more he felt that, dead or alive, he would never see the United States again and that the American intelligence community would shrug its collective shoulders and write it all off as an unavoidable miss -- nothing gained but, then again, nothing much lost.

Morrison assessed himself -- Albert Jonas Morrison, Ph.D., assistant professor of neurophysics, originator of a theory of thought that remained unaccepted and all but ignored; failed husband, failed father, failed scientist, and now failed pawn. Nothing much lost.

In the depth of the night, in a hotel room in a town he didn't even know the location of, in a nation that for over a century had seemed the natural enemy of his own, however much a spirit of reluctant and suspicious cooperation might rule in the last few decades, Morrison found himself weeping out of self-pity and out of sheer childish helplessness -- out of a feeling of utter humiliation that no one should think him worth struggling for or even wasting regret over.

And yet -- and here a small spark of pride managed to surface -- the Soviets had wanted him. They had gone to considerable trouble to get him. When persuasion had failed, they had not hesitated to use force. They couldn't possibly have been certain that the United States would studiously look the other way. They had risked an international incident, however slightly, to get him.

And they were going to considerable trouble to keep him safe now that they had him. He was here alone, but the windows, he noted, had bars on them. The door was not locked, but when, earlier, he had opened it, two uniformed and armed men looked up from where they had been lounging against the opposite wall and asked him if he were in need of anything. He didn't like being in prison, but it was a measure, of sorts, of his value -- at least here.

How long would this last? Even though they might be under the impression that his theory of thought was correct, Morrison himself had to admit that it remained a fact that all the evidence he had gathered was circumstantial and terribly indirect -- and that no one had been able to confirm his most useful findings. What would happen if the Soviets found that they, too, could not confirm them or if, on closer consideration, they found it all too gaseous, too vaporous, too atmospheric to trouble with.

Boranova had said Shapiro had thought highly of Morrison's suggestions, but Shapiro was a notorious wild man who changed his mind daily.

And if Shapiro shrugged and turned away, what would the Soviets do? If their American trophy were of no use to them, would they return him contemptuously to the United States (one more humiliation, in a way) or hide their own folly in taking him, by imprisoning him indefinitely -- or worse.

In fact, it had been some Soviet functionary, some specific person, who must have decided to kidnap him and risk an incident and if the whole thing turned sour, what would that functionary do to save his own neck -- undoubtedly at the expense of Morrison's?

By dawn on Tuesday, when Morrison had been in the Soviet Union for a full day, he had convinced himself that every path into the future, every alternative route that could possibly be taken, would end in disaster for him. He watched the day break, but his spirits remained in deepest night.

13.

There was a brusque knock at his door at 8 a.m. He opened it a crack and the soldier on the other side pushed it open farther, as though to indicate who it was who controlled the door.

The soldier said, more loudly than necessary, "Madame Boranova will be here in half an hour to take you to breakfast. Be ready."

While he dressed hurriedly and made use of an electric razor of rather ancient design by American standards, he wondered why on Earth he had been faintly astonished at hearing the soldier speak of Madame Boranova. The archaic "comrade" had long passed out of use.

It made him feel irritable and foolish, too, since of what value was it to brood over tiny things in the midst of the vast morass in which he found himself? -- Except that that was what people did, he knew.

Boranova was ten minutes late. She knocked more gently than the soldier had and when she entered said, "How do you feel, Dr. Morrison?"

"I feel kidnapped," he said stiffly.

"Aside from that. Have you had enough sleep?"

"I may have. I can't tell. Frankly, madame, I'm in no mood to tell. What do you want of me?"

"At the moment, nothing but to take you to breakfast. And please, Dr. Morrison, do believe that I am as much under compulsion as you are. I assure you that I would rather, at this moment, be with my little Aleksandr. I have neglected him sadly in recent months and Nikolai is not pleased at my absence, either. But when he married me, he knew I had a career, as I keep telling him."

"As far as I'm concerned, you are free to send me back to my own country and spend all your time with Aleksandr and Nikolai."

"Ah, if that could be so -- but it cannot. So come, let us go to breakfast. We could eat here, but you would feel imprisoned. Let us eat in the dining room and you will feel better."

"Will I? Those two soldiers outside will follow us, won't they?"

"Regulations, Dr. Morrison. This is a high-security zone. They must guard you until someone in charge is convinced that it is safe not to guard you -- and it would be difficult to convince them of that. It is their job not to be convinced."

"I'll bet," said Morrison, shrugging himself into the jacket they had given him, which was rather tight under the armpits.

"They will in no way interfere with us, however."

"But if I suddenly break away or even just move in an unauthorized direction, I assume they will shoot me dead."

"No, that would be bad for them. You are valuable alive, not dead. They would pursue you and, eventually, seize you. -- But then, I'm sure you understand that you must do nothing that would be uselessly troublesome."

Morrison frowned, making little effort to hide his anger. "When do I get my own baggage back? My own clothes?"

"In time. The first order of business is to eat."

The dining room, which they reached by an elevator and a rather long walk along a deserted corridor, was not very large. It contained a dozen tables, each one seating six, and it was not crowded.

Boranova and Morrison were alone at their table and no one offered to join them. The two soldiers were at a table near the door and though they each ate enough for two, they faced Morrison and their eyes never left him for more than a second or two.

There was no menu. Food was simply brought to them and Morrison found he had no quarrel over the quantity. There were hard-boiled eggs, boiled potatoes, cabbage soup, and caviar, along with thick slices of dark bread. They were not given out in individual portions, but were placed in the center of the table where each person could help himself.

Perhaps, thought Morrison, they bring enough food to feed six and, since we two are the only ones here, we should only consume a third. And after a while, he had to admit that with a full stomach he felt a little mollified. He said, "Madame Boranova --"

"Why not call me Natalya, Dr. Morrison? We are very informal here and we will be colleagues for perhaps an extended period of time. The repeated 'madames' will give me a headache. My friends even call me Natasha. It could come to that."

She smiled, but Morrison felt stubbornly indisposed to be ingratiated. He said, "Madame, when I feel friendly, I will certainly act friendly, but as a victim and an involuntary presence here, I prefer a certain formality."

Boranova sighed. She bit off a sizable chunk of bread and chewed moodily. Then, swallowing, she said, "Let it be as you wish, but please spare me the 'madames.' Let me have my professional title -- and I don't mean 'academician.' Too many syllables. -- But I interrupted you."

"Dr. Boranova," said Morrison, more coldly than before. "You haven't told me what it is you want of me. You mentioned miniaturization, but you know and I know that that is impossible. I think that you spoke of it merely to mislead -- to mislead me and to mislead anyone overhearing us. Let us drop that, then. Surely here we have no need to play games. Tell me why I am really here. After all, eventually you must, since you apparently expect me to be of some use to you and I can't be that if I am left completely ignorant of what it is that you wish."

Boranova shook her head. "You are a hard man to convince, Dr. Morrison. I have been truthful with you from the start. The project is one of miniaturization."

"I cannot believe that."

"Why, then, are you in the city of Malenkigrad?"

"Small city? Little town? Tinyburg?" said Morrison, feeling a pleasure in hearing his own voice sound the phrases in English. "Perhaps because it is a small city."

"As I have had periodic occasion to say, Dr. Morrison, you are not a serious man. Still, you will not be in doubt long. There are a few people you should meet. One of them should, in fact, be here by now." She looked around with an annoyed frown. "So where is he?"

Morrison said, "I notice that no one approaches us. Every once in a while, the people at the other tables look at me, but then they look away if they catch my eye."

"They have been warned," said Boranova absently. "We will not waste your time with irrelevancies and almost everyone here is an irrelevancy as far as you are concerned. But some are not. Where is he?" She rose. "Dr. Morrison, excuse me. I must find him. I will not be gone long."

"Is it safe to leave me?" said Morrison sardonically.

"The soldiers will remain, Dr. Morrison. Please do not give them cause to react. Intellect is not their forte and they are trained to follow orders without the painful necessity of thinking, so they might easily hurt you."

"Don't worry. I'll be careful."

She left, moving hurriedly out the door after exchanging a few words with the soldiers as she passed.

Morrison watched her go, then glanced over the dining room morosely. Having found nothing of interest, he bent his eyes upon his clasped hands on the table and then stared at the still-sizable portions of unconsumed food before him.

"Are you all through, comrade?"

Morrison looked up sharply. He had decided "comrade" was an archaism, hadn't he?

-- A woman was standing, looking at him, with one balled fist on her hip in a negligent manner. She was a reasonably plump woman in a white uniform, slightly stained. Her hair was reddish-brown, as were her eyebrows, which arched disdainfully.

"Who are you?" asked Morrison, frowning.

"My name? Valeri Paleron. My function? Hardworking serving woman, but Soviet citizen and member of the party. I brought you this food. Didn't you notice me? Am I beneath your notice, perhaps?"

Morrison cleared his throat. "I'm sorry, miss. I have other things on my mind. -- But you had better leave the food. Someone else is supposed to be coming here, I think."

"Ah! And the Tsarina? She will be back, too, I suppose?"

"The Tsarina?"

"You don't think we have Tsarinas any longer in the Soviet Union? Think again, comrade. This Boranova, the granddaughter of peasants and a long line of peasants, considers herself quite a lady, I'm sure." She made a sound with her lips like a long "psh-sh-sh," redolent with contempt and a touch of herring.

Morrison shrugged. "I do not know her very well."

"You are an American, aren't you?"

Morrison said sharply, "Why do you say that?"

"Because of the way you speak Russian. With that accent, what would you be? The son of Tsar Nicholas the Tyrant?"

"What's wrong with the way I speak Russian?"

"It clashes as though you learned it in school. You can hear an American a kilometer away as soon as he says, 'A glass of vodka, please.' He is not as bad as an Englishman, of course. Him you can hear two kilometers away."

"Well, then, I'm an American."

"And you'll be going home someday?"

"I certainly hope so."

The serving woman nodded her head quietly, pulled out a rag, and wiped the table thoughtfully. "I would like to visit the United States someday."

Morrison nodded. "Why not?"

"I need a passport."

"Of course."

"And how does a simple, loyal serving woman get one?"

"I suppose you must apply for one."

"Apply? If I go to a functionary and I say, 'I, Valeri Paleron, wish to visit the United States,' he will say, 'Why?'"

"And why do you want to go?"

"To see the country. The people. The wealth. I am curious how they live. -- That would not be reason enough."

"Say something else," said Morrison. "Say you want to write a book about the United States as a lesson to Soviet youth."

"Do you know how many books --"

She stiffened and began to wipe the table again, suddenly absorbed in her work.

Morrison looked up. Boranova was standing there, her eyes hard and angry. She uttered a harsh monosyllable that Morrison didn't recognize but that he could have sworn was an epithet and not a very polite one, either.

The serving woman flushed dully. Boranova made a small gesture with her hand and the woman turned and left.

Morrison noticed that a man stood behind Boranova -- short, thick-necked, with narrowed eyes, large ears, and a broad-shouldered, muscular body. His hair was black, longer than usual for a Russian, and it was in wild disarray, as though he clutched at it a great deal.

Boranova made no move to introduce him. She said, "Was that woman talking to you?"

"Yes," said Morrison.

"She recognized you to be an American?"

"She said my accent made it obvious."

"And she said she wants to visit the United States?"

"Yes, she did."

"What did you say? Did you offer to help her go there?"

"I advised her to apply for a passport if she wanted to go."

"Nothing more?"

"Nothing more."

Boranova said with discontent, "You must pay no attention to her. She is an ignorant and uncultured woman. -- Let me introduce to you my friend, Arkady Vissarionovich Dezhnev. This is Dr. Albert Jonas Morrison, Arkady."

Dezhnev managed a clumsy bow and said, "I have heard of you, Dr. Morrison. Academician Shapirov has spoken of you often."

Morrison said coldly, "I am flattered. -- But tell me, Dr. Boranova, if that serving woman annoys you so much, it should be an easy task to have her replaced or transferred."

Dezhnev laughed harshly. "Not a chance, Comrade American -- which I expect is what she called you --"

"Not actually."

"Then she would have sooner or later, had we not interrupted you. That woman, I suspect, may be an intelligence operator and is one of those who keeps a close eye on us."

"But why --?"

"Because with an operation like this, no one can be trusted entirely. When you Americans are engaged in breakthrough science, are you not kept under close observation?"

"I don't know," said Morrison stiffly. "I have never been engaged in any breakthrough science that my government has been in the least interested in. -- But what I was going to ask is, why does that woman act as she does if she is an intelligence agent?"

"To be a provocateur, obviously. To say outrageous things and to see what she can trip someone else into saying."

Morrison nodded. "Well, it's your worry, not mine."

"As you say," said Dezhnev. He turned to Boranova. "Natasha, have you told him yet?"

"Please, Arkady--"

"Now come, Natasha. As my father used to say, 'If you must pull a tooth, it is mistaken kindness to pull it slowly.' Let's tell him."

"I have told him we're involved in miniaturization."

"Is that all?" said Dezhnev. He sat down, pulled his chair next to that of Morrison, and leaned toward him. Morrison, with his personal space invaded, automatically withdrew. Dezhnev came closer still and said, "Comrade American, my friend Natasha is a romantic and she is convinced that you will want to help us for love of science. She feels that we can persuade you to do gladly what must be done. She is wrong. You will not be persuaded any more than you were persuaded to come here voluntarily."

"Arkady, you are being boorish," snapped Boranova.

"No, Natasha, I am being honest -- which is sometimes the same thing. Dr. Morrison -- or Albert, to avoid formality, which I hate" -- he shuddered dramatically -- "since you won't be persuaded and since we have no time, you will do what we want by force, as you were brought here by force."

Boranova said, "Arkady, you promised you wouldn't --"

"I do not care. I have thought since I promised and I have decided that the American must know what he faces. It will be easier for us -- and it will be easier for him, too."

Morrison looked from one to another and his throat tightened so that it grew difficult to breathe. Whatever it was they planned for him, he knew he would be given no choice.

14.

Morrison continued to be silent while Dezhnev, unconcerned, proceeded to eat his own breakfast with relish.

The dining room had more or less emptied out and the serving woman, Valeri Paleron, was carrying off the remains and was wiping down the chairs and tables.

Dezhnev caught her eye, beckoned to her, and indicated that the table was to be cleared.

Morrison said, "So I have no choice. No choice in what?"

"Hah! Has Natasha not even told you that?" replied Dezhnev.

"She told me on several occasions that I was to be involved in miniaturization problems. But I know -- and you know -- that there is no miniaturization problem except that of trying to turn an impossibility into fact -- and I certainly can't help you in that. What I want to know is what you really have for me to do."

Dezhnev looked amused. "Why do you think miniaturization is impossible?"

"Because it is."

"And if I tell you that we have it?"

"Then I say show me!"

Dezhnev turned to Boranova, who drew a deep breath and nodded.

Dezhnev rose. He said, "Come. We will take you to the Grotto."

Morrison bit his lip in vexation. Small frustrations loomed large. "I do not know that Russian word you've used."

Boranova said, "We have an underground laboratory here. We call it the Grotto. It is one of our poetic words, not used in ordinary conversation. The Grotto is the site of our miniaturization project."

15.

Outside an air-jet awaited them. Morrison blinked, adjusting his eyes to the sunlight. He regarded the jet curiously. It lacked the elaboration of American models and seemed little more than a sled with small seats and with a complex engine in front. It would be absolutely useless in cold or wet weather and he wondered whether the Soviets had an enclosed version for those times. Perhaps this was just a summer runabout.

Dezhnev took the controls and Boranova directed Morrison into the seat behind Dezhnev, while she took the one to his right side. She turned to the guards and said, "Go back to the hotel and wait for us there. We will take full responsibility from this point." She handed them a printed slip of paper on which she scrawled her signature, the date, and, after consulting her wristwatch, the time.

When they arrived at Malenkigrad, Morrison discovered that it was a small town in fact, as well as in name. There were rows of houses -- each two stories high -- with a deadly sameness about them. The town had clearly been built for those who worked on the project -- whatever it was that they masked with the fairy tale of miniaturization -- and it had been built without undue expense. Each house had its own vegetable garden and the streets, although paved, had an unfinished look about them.

The little craft, riding on the jets of air pushing against the ground, blew up a small cloud of dust, which was, for the most part, left behind as they progressed smoothly

forward. Morrison could see that it was not comfortable for the pedestrians they passed who, one and all, took evasive action as it approached.

Morrison felt the discomfort in full when they passed an air-jet moving in the other direction and was inundated in the dust.

Boranova looked amused. She coughed and said, "Do not be concerned. We will be vacuumed soon."

"Vacuumed?" asked Morrison, coughing also.

"Yes. Not so much for us, for we can live with a little dust, but the Grotto must be reasonably dust-free."

"So must my lungs. Wouldn't it be better to have these air-jets enclosed?"

"They promise us shipments of more elaborate models and perhaps someday they will arrive. Meanwhile, this is a new town and it is built in the steppes, where the climate is arid. That has its advantages -- and its disadvantages, too. The settlers grow vegetables, as you saw, and they have some animals, too, but large-scale agriculture must wait until the community is larger and there are irrigation facilities. For now, it doesn't matter. It is miniaturization that concerns us."

Morrison shook his head. "You speak of miniaturization so often and with such a straight face, you might almost trick me into believing it."

"Believe it. You will have the demonstration Dezhnev arranged."

Dezhnev said from his seat at the controls, "And I had trouble doing so. Once again I had to speak to the Central Coordinating Committee -- may what is left of their gray hairs fall out. As my father used to say, 'Apes were invented because politicians were needed.' How it is possible to sit two thousand kilometers away and make policy --"

The air-jet glided smoothly forward to the rather sharp ending of the town and to the broad, low rocky massif that suddenly loomed before them.

"The Grotto," said Boranova, "is located inside that. It gives us all the room we want, frees us from the vagaries of weather, and is impenetrable from aerial surveillance, even from spy satellites."

"Spy satellites are illegal," said Morrison indignantly.

"It is merely illegal to call them spy satellites," shot back Dezhnev.

The air-jet banked as it made a turn, then landed in the shadow of a rocky cleft in the body of the massif.

"All out," said Dezhnev.

He moved forward, the other two following, and a door opened in the hillside. Morrison didn't see how it was done. It didn't look like a door; rather it seemed an integral part of the rocky wall. It opened just as the cavern of the Forty Thieves had with the utterance of the words "Open Sesame."

Dezhnev stepped to one side and gestured for Morrison and Boranova to move inside. Morrison went out of the brilliant morning sunshine into a rather dimly lit chamber to which his eyes took half a minute to adapt. It was no thieves' cave but an elaborately detailed structure.

Morrison felt as though he had stepped from the Earth onto the moon. He had never been on the moon, of course, but he was familiar, as was virtually everyone on Earth, with the appearance of the underground lunar settlements. This had precisely that other-worldly air about it somehow, except, of course, that gravity was Earth-normal.

4. GROTTO

Small can be beautiful: An eagle may at times go hungry; a pet canary, never.

Dezhnev Senior

16.

In a large and well-lit washroom, Boranova and Dezhnev began to remove their outer clothing. Morrison, alarmed at the prospect, hesitated.

Boranova smiled. "You may keep your underclothing on, Dr. Morrison. Just toss everything else, except your shoes, into that bin. I presume there is nothing in your pockets. Place your shoes at the base of the bin. By the time we leave, it will all be cleaned and ready for use."

Morrison did as he was told, trying not to observe that Boranova had a most opulent figure, concerning which she seemed totally unaware. Amazing, he thought, what clothes will obscure when not designed to reveal.

They were washing now, with lavish application of soap -- faces to the ears and arms to the elbows -- then brushing savagely at their hair. Again Morrison hesitated and Boranova, reading his mind, said, "The brushes are cleaned after each use, Dr. Morrison. I don't know what you may have read of us, but some of us understand hygiene."

Morrison said, "All this just to go into the Grotto? Do you go through this every time?"

"Every time. That's why no one goes in just briefly. And even when staying within, there are frequent ablations. -- You may find the next step unpleasant, Dr. Morrison. Close your eyes, take a deep breath, and hold it if you can. It will take about a minute."

Morrison followed orders and found himself strongly buffeted by a swirling wind. He staggered drunkenly and collided with one of the bins. He held on tightly. Then, as suddenly as it started, it was over.

He opened his eyes. Dezhnev and Boranova looked as though they had put on fright wigs. He felt his own hair and knew he must look the same. He reached for his brush.

"Don't bother," said Boranova, "There's more we'll have to go through."

"What was that all about?" said Morrison. He found he had to clear his throat twice before he could speak.

"I mentioned that we'd have the dust vacuumed away from us, but that's only the first stage of the cleaning process. -- Through this door, please." She held it open for him.

Morrison emerged into a narrow but well-lit corridor, the walls glowing photoluminescently. He lifted his eyebrows. "Very nice."

"Saves energy," Dezhnev said, "and that's very important. -- Or are you referring to the technological advancement? Americans seem to come to the Soviet Union expecting everything to be kerosene lamps." He chuckled and added, "I admit we haven't caught up with you in every respect. Our brothels are very primitive compared with yours."

"You strike back without waiting to be struck," said Morrison. "That is a sure sign of an unclear conscience. If you were anxious to demonstrate advanced technology, I could point out that it would be very simple to pave the avenue going from Malenkigrad to the Grotto and to use closed air-jets. We would need less of this."

Dezhnev's face darkened, but Boranova put in sharply, "Dr. Morrison is quite right, Arkady. I don't like your feeling that it is not possible to be honest without being rude. If you cannot be both honest and polite, keep your tongue on your own side of your teeth."

Dezhnev grinned uneasily. "What have I said? Of course the American doctor is right, but is there anything we can do when decisions are made in Moscow by idiots who save small bits of money without counting the consequences? As my old father used to say, 'The trouble with economizing is that it can be very expensive.'"

"That's true enough," said Boranova. "We could save a great deal of money, Dr. Morrison, by spending on a better road and better air-jets, but it is not always easy to persuade those who hold the purse strings. Surely you have the same trouble in America."

She was motioning even as she talked and Morrison followed her into a small chamber. As the door closed behind them, Dezhnev held out a bracelet to Morrison. "Let me tie this around your right wrist. When we hold up our arms, you hold up yours."

Morrison felt his weight lighten momentarily as the chamber floor dropped.

"An elevator," he said.

"Clever guess," said Dezhnev. Then he clapped a hand to his mouth and said in a muffled tone, "But I mustn't be rude."

They stopped smoothly and the elevator door opened.

"Identification!" came a peremptory voice.

Dezhnev and Boranova raised their bands, at which Morrison did as well. Under the purplish light that suddenly suffused the elevator, the three bracelets glittered in patterns which were not, Morrison noted, exactly alike.

They were ushered down another corridor and into a room which was both warm and damp.

"We will have to have a final scrubdown, Dr. Morrison," said Boranova. "We are accustomed to this and stripping is routine for us. It is easier -- and timesaving -- to do it as a group."

"If you can stand it," said Morrison grimly, "I can."

"It is unimportant," said Dezhnev. "None of us are strangers to the sight."

Dezhnev scrambled out of his underclothes, stepped over to a portion of the wall where a small red knob was glowing, and placed his right thumb immediately above it. A

narrow panel in the wall slid open and revealed white garments hanging flaccidly to one side. He placed his underclothes at the bottom.

He seemed utterly unabashed about being nude. His chest and shoulders were dark with hair and there was a long-healed scar on his right buttock. Morrison wondered idly how that might have come about.

Boranova did the same as Dezhnev had done and said, "Pick a light that is on, Dr. Morrison. It will open to your thumbprint and then, when you touch it again, it will close. After that it will open only to your thumbprint, so please remember your locker number and you won't have to press every locker in order to find your own."

Morrison did as he was told.

Boranova said, "If you need to use the bathroom first, you can go there."

"I'm all right," said Morrison.

With that, the room was aswirl with a damp mist of water droplets.

"Close your eyes," called out Boranova, but it was unnecessary for her to say so. The initial sting of the water forced his eyes closed at once.

There was soap in the water or, at any rate, something that stung his eyes, tasted bitter in his mouth, and irritated his nostrils.

"Lift your arms," called out Dezhnev. "You needn't circle. It comes from all directions."

Morrison lifted his arms. He knew it came from all directions. It came from the floor, too, as he could tell by the slightly uncomfortable pressure on his scrotum.

"How long does this last?" he gasped.

"Too long," said Dezhnev, "but it is necessary."

Morrison counted to himself. At the count of 58, it seemed to him that the bitterness on his lips ceased. He squinted his eyes. Yes, the other two were still there. He continued to count and when he reached 126, the water stopped and he was bathed in uncomfortably hot and dry air.

He was panting by the time that stopped too and he realized he had been holding his breath.

"What was all that for?" he said, looking away uncomfortably at the sight of Boranova's large but firm breasts and finding little comfort in Dezhnev's hairy chest.

"We are dry," said Boranova. "Let's get dressed."

Morrison was eager but was almost immediately disappointed by the nature of the white clothes in the locker. They consisted of a blouse and pants of light cotton, the pants held by a cord. There was also a light cap to cover the hair and light sandals. Though the cotton was opaque, it seemed to Morrison that little or nothing was truly left to the imagination.

He said, "Is this all we wear?"

"Yes," said Boranova. "We work in a clean, quiet environment at even temperature and, with throwaway clothes, we can't expect much in the way of fashion or expense. Indeed, barring a certain understandable reluctance, we could easily work in the nude. But enough -- come."

And now at last they stepped into what Morrison recognized at once as the main body of the Grotto. It stretched away before him -- between and beyond ornate pillars to a distance he couldn't make out.

He could recognize none of the equipment. How could he? He was entirely a theoretician and when he worked in his own field, he used computerized devices that he had designed and modified himself. For a moment, he felt a stab of nostalgia for his laboratory at the university, for his books, for the smell of the animal cages, even for the stupid obstinacy of his colleagues.

There were people everywhere in the Grotto. There were a dozen nearby and others farther off and the impression was of the interior of a human ant hill crawling with machinery, with humanity, with purpose.

No one paid any attention to the newcomers or to each other. They went about their work in silence, their steps muffled by their sandals.

Again Boranova seemed to read Morrison's mind and when she spoke it was in a whisper. "We keep our council here. None of us knows more than it is good for him -- or her -- to know. There must be no leaks of significance."

"But surely they must communicate."

"When they must, they will -- minimally. It reduces the pleasure of camaraderie, but it is necessary."

"This kind of compartmentalization slows progress," said Morrison.

"It's the price we pay for security," said Boranova, "so if no one talks to you, it is not a personal matter. They will have no reason to talk to you."

"They'll be curious about a stranger."

"I have seen to it that they know you are an outside expert. That is all they need to know."

Morrison frowned. "How can they expect an American to be an outside expert?"

"They don't know you're an American."

"My accent will give me away at once as it did to the serving woman."

"But you will not talk to anyone, except for those to whom I will introduce you."

"As you wish," said Morrison indifferently.

He was still looking around. Since he was here, he might as well learn what he could, even if it should turn out to be trivial. When -- if -- he returned to the United States, he would surely be asked for every detail he had observed and he might as well have something to give them.

He said in Boranova's ear, "This must be an expensive place. What fraction of the national budget is expended here?"

"It's expensive," said Boranova, admitting nothing further, "and the government labors to limit the expense."

Dezhnev said sourly, "I had to work for an hour this morning to persuade them to allow a small additional experiment for your benefit -- may the Committee catch the cholera."

Morrison said, "The cholera no longer exists, even in India."

"May it be reinstated for the Committee."

Boranova said, "Arkady, if these supposedly humorous expressions of yours get back to the Committee, it will do you no good."

"I'm not afraid of those pigs, Natasha."

"I am. What will happen to next year's budget if you infuriate them?"

Morrison said, with sudden impatience, but speaking even more softly, "What concerns me is neither the Committee nor the budget, but the simple question of what it is I am doing here."

Dezhnev said, "You are here to witness a miniaturization and to be given an explanation of why we need your help. Will that satisfy you, Comrade Am-- Comrade Outside Expert?"

17.

Morrison followed the other two to something that looked like a small old-fashioned train carriage on very narrow-gauge tracks.

Boranova placed her thumb on a smooth patch and a door slid open smoothly and without noise. "Please get in, Dr. Morrison."

Morrison held back. "Where are we going?"

"To the miniaturization chamber, of course."

"By railroad? How big is this place?"

"It is large, Doctor, but not so large. This is a matter of security. Only certain individuals can use this device and only by using it can one penetrate into the core of the Grotto."

"Are your own people so untrustworthy?"

"We live in a complex world, Dr. Morrison. Our people are trustworthy, but we do not wish to subject large numbers to temptations they need not face. And if someone persuades one of us to go -- elsewhere, as we have persuaded you, it is safer if their knowledge is limited, you see. -- Please get in."

Morrison entered the compact vehicle with some difficulty. Dezhnev followed him with equal trouble, saying, "Another example of senseless cheese paring. Why so small? Because the bureaucrats spend billions of rubles on a project and they feel virtuous if they save a few hundred in odd places at the cost of making hardworking people miserable."

Boranova got into the front seat. Morrison could not see how she manipulated the controls or, for that matter, if there were controls to manipulate. It was probably controlled by a computer. The carriage began to move suddenly and Morrison felt the slight backward jar that resulted.

There was a small window at eye level on either side, but not of clear glass. Morrison could see a small section of the cavern outside in a streaky, wavy, poorly focused manner. Apparently, the windows were not meant for vision, but were merely

intended to reduce what might otherwise be an unacceptably tight enclosure to those with claustrophobic tendencies.

It seemed to Morrison that the individuals he could make out through the glass paid no attention to the moving carriage. Everyone here, he thought, is well-trained. To show any interest in any procedure with which you have nothing directly to do must apparently be a sign of discourtesy -- or worse.

It seemed to Morrison that they were approaching the wall of the cavern and the carriage, with another small jerk, slowed. A section of the wall slid aside and the carriage, with yet another jerk, picked up speed and moved through the opening.

It grew dark almost at once and the dim light in the carriage's ceiling did little more than change night to dusk.

They were in a narrow tunnel into which the carriage fit with apparently little room to spare, except on the left side where Morrison, peering past Dezhnev, thought he could make out another pair of rails. There must be at least two such carriages, he thought, with room to pass one another in the tunnel if both were in operation.

The tunnel was as dimly lit as the carriage and it was not straight. Either it had been carved through the hill in such a way as to follow lines of least resistance in order to save money or it was curved deliberately in some dim, atavistic search for making things more secure by making them more complicated. The darkness inside and outside the carriage might serve the same purpose.

"How long will this take -- uh --" asked Morrison.

Dezhnev looked at him with (in the dimness) an unreadable expression. "You don't know how to address me, I see. I do not have an academic title, so why not call me Arkady? Everyone does here and why not? My father always said, 'What counts is the person, not the name.'"

Morrison nodded. "Very well. How long will this take, Arkady?"

"Not long, Albert," said Dezhnev cheerfully -- and Morrison, having been lured into first-name informality, could not object to the return.

He surprised himself a little by finding he did not wish to object. Dezhnev, even with his father's aphorisms included, seemed to be uncomplicated, at least, and, under the circumstances, Morrison welcomed a chance of refraining from the perpetual fencing match to which Boranova seemed to subject him.

The carriage could not be moving at a speed faster than a leisurely walk, but there was a small lurch each time it took a curve on the track. Apparently, petty economies included leaving the curves unbanked.

Then, with absolutely no warning, light flooded in and the carriage ground to a stop.

Morrison blinked as he stepped out. The room they were now in was not as large as the one they had left and there was virtually nothing in it. There were only the tracks under the carriage that made a wide arc and then led back toward the section of the wall from which they had emerged. He could see another small carriage disappearing into the

opening and the wall closing behind it. The carriage in which they had arrived made a slow circuit of the arc and came to rest near the wall.

Morrison looked around. There were many doors and the ceiling was comparatively low. Without definite evidence of the fact, he felt that he was in a three-dimensional checkerboard, with numerous small rooms on several levels.

Boranova was waiting for him, seeming to observe his curiosity with a touch of disapproval. "Are you ready, Dr. Morrison?"

"No, Dr. Boranova," said Morrison. "Since I don't know where I'm going or what I'm doing, I'm not ready. However, if you will lead the way, I will follow."

"That is sufficiently ready. -- This way, then. There is someone else you must meet."

They passed through one of the doors and into another small room. This one was very well-lit and had its walls lined with thick cables.

In the room was a young woman who looked up when they came in, pushing aside something, that seemed, from its appearance, to be some kind of technical report. She was quite pretty in a pale and vulnerable way. Her flaxen hair was cut short but with enough of a wave in it to keep her from looking too severe. The scanty cotton uniform she wore, which Morrison already knew to be universal within the Grotto, showed her to be attractively slim and shapely enough, though without Boranova's opulence. Her face was marred or perhaps enhanced (according to taste) by a tiny mole just under the left corner of her mouth. Her cheekbones were high, her hands thin-fingered and graceful, and her expression did not appear as though she were much given to smiling.

Morrison smiled, however. For the first time since his kidnapping, it seemed to him that there might be a lighter side to this dismal situation in which he had been unwillingly plunged.

"Good day," he said. "It's a pleasure meeting you." He tried to give his Russian an educated sound and to get rid of what the serving woman had so easily detected as his American accent.

The young woman made no direct answer but, turning to Boranova, said in a voice that was slightly husky, "Is this the American?"

"It is," said Boranova. "He is Dr. Albert Jonas Morrison, professor of neurophysics."

"Assistant professor," said Morrison deprecatorily.

Boranova ignored the correction. "And this, Dr. Morrison, is Dr. Sophia Kahinin, who is our electromagnetics expert."

"She scarcely looks old enough," said Morrison gallantly.

The young lady did not seem amused. She said, "I look, perhaps, younger than I am. I am thirty-one years old."

Morrison looked abashed and Boranova cut in quickly, "Come, we are ready to begin. Please check the circuits and set matters in motion. -- And quickly."

Kahinin hurried out.

Dezhnev looked after her with a grin. "I'm glad she doesn't seem to like Americans. It cuts out a hundred million potential competitors at least. Now if she also didn't like Russians and would come to realize that I am as Karelo-Finnish as she is."

"You Karelo-Finnish?" said Boranova, forced into a smile. "Who would believe that, you madman?"

"She would -- if she were in the proper mood."

"This would require an impossible mood." Boranova turned to Morrison. "Please do not take Sophia's behavior personally, Dr. Morrison. Many of our citizens pass through an ultrapatriotic phase and feel it to be very Soviet to dislike Americans. It is more pose than reality. I'm sure, once we begin to work together as a team, that Sophia will let down her barriers."

"I understand completely. Things are similar in my country. As a matter of fact, at the moment, I'm not very fond of Soviets -- and understandably, I think. But" -- and he smiled -- "I could make an exception for Dr. Kahinin very easily."

Boranova shook her head. "American like you or Russian like Arkady, there is a peculiar masculine way of thought that transcends national boundaries and cultural differences."

Morrison was unmoved. "Not that I will be working with her -- or with anyone. I have grown tired of telling you, Dr. Boranova, that I don't accept the existence of miniaturization and that I cannot and will not be of assistance to you in any way."

Dezhnev laughed. "You know, one could almost believe Albert. He speaks so seriously."

Boranova said, "Observe, Dr. Morrison. This is Katinka."

She tapped a cage which Morrison, startled, now observed for the first time. Dr. Kahinin had rather absorbed his attention till now and even after she had left he had been idly keeping his eye on the door through which she had gone, waiting for her reappearance.

He focused on the cage of wire mesh. Katinka was, apparently, a white rabbit of moderate size and placid appearance, who was munching away at greenery with the rapt concentration of her kind.

Morrison was aware of the slight scabbling noise she made and of the rabbit odor, which he must have noted, unconsciously, earlier and ignored.

He said, "Yes, I see her. A rabbit."

"Not just a rabbit, Doctor. She is a most unusual creature. Unique. She has made history to a far greater extent than has the catalog of war and disaster that usually is thought of by that name. If we exclude such purely incidental creatures as worms, fleas, and submicroscopic parasites, Katinka is the first living creature that has been miniaturized. In fact, she has been miniaturized on three separate occasions and would have been miniaturized dozens of times more if we had been able to afford it. She has contributed enormously to our knowledge of the miniaturization of life forms and, as you can see, her experiences have in no way adversely affected her."

Morrison said, "I do not wish to be insulting, but your bare statement that the rabbit has been miniaturized three times is not really evidence that this has indeed happened. I do not mean to cast doubt upon your integrity, but, in a case like this, I think you understand that nothing less than witnessing the fact is sufficiently convincing."

"Certainly. And it is for that reason that -- at considerable expense -- Katinka will now be miniaturized a fourth time."

18.

Sophia Kahinin swirled back in and turned to Morrison. "Are you wearing a watch or do you have anything metallic on you?" she asked crisply.

"I have no possessions on me at all, Dr. Kahinin. Nothing but the clothes I wear, the single pocket of which is empty. Even this identification bracelet that has been put on me seems to be of plastic."

"It is merely that there is a strong electromagnetic field and metal would interfere."

Morrison said, "Any physiological effects?"

"None. Or at least none have yet been detected."

Morrison, who was waiting for them to give up their pretense of miniaturization and wondering how long they could carry on the fraud (he was growing more censorious over the matter by the minute), said, with just a touch of malice, "Might not overexposure lead to birth defects should you ever get pregnant, Dr. Kahinin?"

Kahinin flushed. "I have a baby. She is perfectly normal."

"Were you exposed during pregnancy?"

"Once."

Boranova said, "Is the inquisition over, Dr. Morrison? May we begin?"

"You still maintain that you will miniaturize the rabbit?"

"Certainly."

"Then go ahead. I'm all eyes."

(How foolish of them, he thought sardonically. They would soon be claiming, of course, that something had gone wrong, but where would they go from there? What was it all about?)

Boranova said, "To begin with, Dr. Morrison, would you lift the cage?"

Morrison made no move to do so. He looked from one to the other of the three Soviets in suspicion and uncertainty.

Dezhnev said, "Go ahead. It won't hurt, Albert. You won't even get your hands dirty and, after all, hands were meant to become dirty at work."

Morrison put his hands on either side of the cage and lifted. It weighed about ten kilograms, he judged. He grunted and said, "May I put it down now?"

"Of course," said Boranova.

"Gently," said Kahinin. "Do not disturb Katinka."

Morrison lowered it carefully. The rabbit, which had momentarily stopped feeding when the cage was lifted, sniffed the air curiously and returned tentatively to its unhurried chewing.

Boranova nodded and Sophia moved to one side of the room where a bank of controls were all but hidden by the cables. She looked over her shoulder at the cage as though estimating its position, then walked over to move it slightly. She returned to the controls and closed a switch.

A whining sound made itself heard and the cage began to glitter and shimmer as though something, all but invisible, had interposed itself between it and themselves. The shimmer extended beneath the cage, separating it from the stone-top table on which it had been resting.

Boranova said, "The cage is now enclosed in the miniaturization field. Only the objects within the field will be miniaturized."

Morrison stared and a little worm of uncertainty began to stir within him. Were they going to try some clever illusion on him and make him think he had witnessed miniaturization? He said, "And how exactly did you produce that so-called miniaturization field?"

"That," said Boranova, "we do not intend to tell you. I think you understand what classified information is. Go ahead, Sophia."

The whine heightened in pitch and intensified somewhat. Morrison found it unpleasant, but the others seemed to endure it stolidly. In looking at them, he had taken his eyes off the cage. Now when he looked at it again, it seemed to have grown smaller.

He frowned and bent his head so as to line up one side of the cage with the vertical line of a cable on the opposite wall. He held his head steady, but the side of the cage shrank away from the reference line. There was no mistake, the cage was distinctly smaller. He blinked his eyes in frustration.

Boranova smiled narrowly. "It is indeed shrinking, Dr. Morrison. Surely your eyes tell you so."

The whine continued -- the shrinking continued. The cage was perhaps half its original linear measurement.

Morrison said, with obvious lack of conviction, "There are such things as optical illusions."

Boranova called out. "Sophia, stop the process for a moment."

The whine lowered into silence and the glitter of the miniaturization field dimmed and died. The cage sat on the table as before, a considerably smaller version than it had been. Inside was the rabbit still -- a smaller rabbit, but one that was proportioned in every way as the original had been, munching on smaller leaves, with smaller pieces of carrot distributed across the floor of the cage.

Boranova said, "Do you honestly think that this is an optical illusion?"

Morrison was silent and Dezhnev said, "Come, Albert, accept the evidence of your senses. This experiment consumed considerable energy and if you remain unconvinced,

our clever administrators will be annoyed with all of us for wasting money. What do you say, then?"

And Morrison, shaking his head in rueful confusion, said, "I don't know what to say."

Boranova said, "Would you lift the cage again, Dr. Morrison?"

Again Morrison hesitated and Boranova said, "The miniaturization field has not left it radioactive or anything like that. The touch of your unminiaturized hand will not affect it, nor will its state of miniaturization affect you. You see?" And she placed her hand, flatly and gently, on top of the cage.

Morrison's hesitation was not proof against that. Gingerly, he placed his hand on either side of the cage and lifted. He exclaimed in surprise, for it could not be much over a kilogram in mass. The cage trembled in his grip and the miniaturized rabbit, alarmed, hopped to one corner of the cage and huddled there in agitation.

Morrison put the cage down and, as nearly as he could estimate, did so in its original position, but Kahinin walked over and made a small adjustment.

Boranova said, "What do you think, Dr. Morrison?"

"It weighs considerably less. Is there some way you pulled a switch?"

"Pulled a switch? You mean replaced the larger object with a smaller while you were watching, the smaller exactly like the larger in everything but size. Dr. Morrison, please."

Morrison cleared his throat and didn't press the point. It lacked plausibility even to himself.

Boranova said, "Please notice, Dr. Morrison, that not only has the size been decreased, but the mass in proportion. The very atoms and molecules of which the cage and its contents are composed have shrunk in size and mass. Fundamentally, Planck's constant has decreased, so that nothing inside has changed relative to its own parts. To the rabbit, itself, its food, and everything within the cage seems perfectly normal. The outside world has increased in size relative to the rabbit, but, of course, it remains unaware of that."

"But the miniaturization field is gone. Why don't the cage and its contents revert to ordinary size?"

"For two reasons, Dr. Morrison. In the first place, the miniaturized state is metastable. That is one of the great fundamental discoveries that make miniaturization possible. At whatever point we stop in the process, it takes very little energy to maintain it in that state. And secondly, the miniaturization field is not entirely gone. It is merely minimized and drawn inward so that it still keeps the atmosphere within the cage from diffusing outward and normal molecules outside from diffusing inward. It also leaves the walls of the cage touchable by unminiaturized hands. -- But we are not finished, Dr. Morrison. Shall we continue?"

Morrison, troubled and unable to deny the direct experience, wondered for a moment if he had somehow been drugged into a kind of super-suggestibility that would

make him experience whatever he was told he was experiencing. In a choked way, he said, "You are telling me a great deal."

"Yes, we are, but only superficially. If you repeat this in America, you will probably not be believed and nothing you say will give the slightest hint as to the core of the miniaturization technique." Boranova lifted her hand and Kahinin again threw the switch.

The whine returned and the cage began once again to shrink. It seemed to be going faster now and Boranova, as though reading Morrison's mind, said, "The further it shrinks, the less mass there is to remove and the more rapidly it shrinks further."

Morrison found himself staring, in a state of near-shock, at a cage that was a centimeter across and still shrinking.

But Boranova raised her hand again and the whine died.

"Be careful, Dr. Morrison. It weighs only a few hundred milligrams now and it is a fragile object indeed to anyone on our scale. Here. Try this."

She handed him a large magnifying glass. Morrison, without saying a word, took it and held it over the tiny cage. He might not have managed to make out what the moving object within it was if he had come upon it without prior knowledge, for his mind would not have accepted such an incredibly tiny rabbit.

He had seen it shrink, however, and he stared at it now with a mixture of confusion and fascination.

He looked up at Boranova and said, "Is this really happening?"

"Do you still suspect an optical illusion or hypnotism or -- what else?"

"Drugs?"

"If it were drugs, Dr. Morrison, it would be a greater achievement than miniaturization. Look around you. Doesn't everything else look normal? It would be an unusual drug indeed that would alter your sense perception of a single object in a large room of unchanged miscellany. Come, Doctor, what you've witnessed is real."

"Make it larger," said Morrison breathlessly.

Dezhnev laughed and suppressed in a quick choke. "If I laugh, the wind may well blow away Katinka, whereupon Natasha and Sophia will both strike me with everything else in this room. If you wish it enlarged, you will have to wait."

Boranova said, "Dezhnev is right. You see, Dr. Morrison, you have witnessed a scientific demonstration, not magic. If it were magic, I could snap my finger and the rabbit would be its normal self again in a normal cage -- and then you would know you were witnessing an optical illusion. However, it takes considerable energy to decrease Planck's constant to a tiny fraction of its normal value, even over a relatively small volume of the Universe, which is why miniaturization is so expensive a technique. To enlarge Planck's constant once again must result in the production of energy equal to that which had been consumed originally, for the law of conservation of energy holds even in the process of miniaturization. We cannot deminiaturize then any faster than we can dispose of the heat produced, so that it takes considerable time to do it -- much more than it took to miniaturize."

For a while, Morrison was silent. He found the explanation involving conservation of energy more convincing than the demonstration itself. Charlatans would not have been so meticulous about obeying the constraints of physics.

He said, "It seems to me, then, that your miniaturization process can scarcely be a practical device. At most it would only serve as a tool, perhaps, to broaden and expand quantum theory."

Boranova said, "Even that would be enough, but don't judge a technique by its initial phase. We can hope that we will learn how to circumvent these large energy changes, how to find methods of miniaturization and deminiaturization that will be more efficient. Does all the energy-change have to pass from electromagnetic fields into miniaturization and then into heat on deminiaturization? Might not deminiaturization be somehow inveigled into releasing energy as electromagnetic fields again. That would be easier to handle, perhaps."

"Have you repealed the second law of thermodynamics?" asked Morrison with exaggerated politeness.

"Not at all. We don't expect an impossible 100 percent conversion. If we can convert 75 percent of the deminiaturization energy into an electromagnetic field -- or even only 25 percent -- that would be an improvement over the present situation. However, there is hope of a technique even more subtle and far more efficient and that is where you come in."

Morrison's eyes widened. "I? I know nothing about this. Why pick me out for your salvation? You would have done as well with a child out of kindergarten."

"Not so. We know what we are doing. Come, Dr. Morrison, you and I shall go to my office while Sophia and Arkady begin the tedious process of restoring Katinka. I will there show you that you know quite enough to help us make miniaturization efficient and therefore a commercially practical venture. In fact, you will see quite clearly that you are the only person who can help us."

5. COMA

Life is pleasant Death is peaceful. It is the transition that is troublesome.

Dezhnev Senior

19.

"This," said Natalya Boranova, "is my own portion of the Grotto."

She sat down in a rather battered armchair that (Morrison imagined) she found perfectly comfortable, having molded it to her body over the years.

He sat down in another chair, smaller and more austere, with a satin-covered seat that was less comfortable than it looked. He glanced over the surroundings with a sharp sensation of homesickness. There were ways in which it reminded him of his own office. There was the computer outlet and the large screen. (Boranova's was far more ornate than his own -- the Soviet style tended toward the curlicue and Morrison felt a momentary curiosity as to the reason and then put that aside as a trivial matter.)

There was also the same trend toward disorder in the piles of printouts, the same distinct odor they gave rise to, the same occasional old-fashioned book in among the film cassettes. Morrison tried to read the title of one that was too far off and too worn to be made out. (Books always had an ancient appearance, even when they were new.) He had the impression it was an English-language book, which would not have surprised him. He himself had several Russian classics in his laboratory for an occasional brush-up of the language.

Boranova said, "We are quite private here. We will not be overheard and we will not be disturbed. Later we can have lunch brought in."

"You are kind," said Morrison, trying not to sound sardonic.

Boranova seemed to take it at face value. "Not at all. And now, Dr. Morrison, I can't help having noticed that Arkady is on a first-name basis with you. He is, of course, to a certain extent an uncultured individual and is apt to presume. Still, may I ask again if, despite the conditions that brought you here, we might be pleasant and informal with each other?"

Morrison hesitated. "Well, call me Albert, then. But it will be merely a convenience and no sign of friendship. I am not likely to dismiss my kidnapping."

Boranova cleared her throat. "I did try to persuade you to come of your own free will. If necessity had not driven us so hard, we would have gone no farther than that."

"If you are embarrassed by what you have done, then return me to the United States. Send me back now and I will be willing to forget this episode and will make no complaint to my government."

Slowly Boranova shook her head. "You know that cannot be done. Necessity still drives. You will see what I mean, shortly. But meanwhile, Albert, let us talk together, without nonsense, as part of the global family of science that rises superior to questions of nationality and other artificial distinctions among human beings. -- Surely by now you have accepted the reality of miniaturization."

"I must accept it." Morrison shook his head, almost regretfully.

"And you see our problem?"

"Yes. It is far too expensive in energy."

"Imagine, however, if we lower the energy cost drastically. Imagine if we can bring about miniaturization by plugging a wire into a wall socket and consuming no more energy than we would if we were heating a toaster oven."

"Of course -- but apparently it can't be done. Or, at any rate, your people cannot do it. Why all the secrecy, then? Why not publish the findings you have already made and welcome the contributions of the rest of the family of science? Secrecy seems to imply the possibility that the Soviet Union is planning to use miniaturization as a weapon of some kind, one powerful enough to make it possible for your country to find it feasible to break the mutual understanding that has led to peace and cooperation throughout the world for the last two generations."

"That is not so. The Soviet Union is not trying to establish a world hegemony."

"I hope not. Still, if the Soviet Union seeks secrecy, it is understandable that other units of the global alliance would begin to wonder if it seeks conquest."

"The United States has its secrets, has it not?"

"I don't know. The American government does not confide in me. If it does have secrets -- and actually I suppose it does -- I disapprove of that, too. But tell me why there is any necessity for secrets? What does it matter if you develop miniaturization, or we, or both of us in combination -- or the Africans, for that matter? We Americans invented the airplane and the telephone, but you have both. We were the first to reach the moon, but you enjoy your full share of the lunar settlements. You, on the other hand, were the first to crack the problem of fusion power and the first to build a solar power station in space and we participate fully in both."

Boranova said, "All that you say is true. Nevertheless, for over a century, the world has taken it for granted that American technology is superior to Soviet technology. That is a constant irritant to us, and if, in something as basic and as thoroughly revolutionary as miniaturization, it is clearly established that the Soviet Union led the way, then that would be most desirable for us."

"And the global family of science that you appeal to? Are you a member of that or are you merely a Soviet scientist?"

"I am both," said Boranova with a touch of anger. "If it were my decision, then perhaps I would open our discoveries to the world. However, I do not make the decision. My government does and I owe them loyalty. Nor do you Americans make it easy for us to do otherwise. Your constant loud American assumption of superiority drives us into a defensive posture."

"But won't it spoil Soviet pride in their accomplishment to have to call upon an American such as myself to help out?"

"Well, yes, it does sour the milk a bit, but it will at least give the United States a share in the achievement, which we shall acknowledge, Albert. You will be showing yourself a true American patriot and will improve your own reputation if you help us."

Morrison smiled bitterly. "A bribe?"

Boranova shrugged. "If that is how you interpret it, I cannot stop you. But let us talk in a friendly manner and see what will come of it."

"In that case, start by giving me some information. Now that I am forced to believe that miniaturization is possible, can you tell me the basic physics behind it? I am curious."

"You know better than that, Albert. It would be dangerous for you to learn too much. How would we, then, be able to let you go back to your country? -- Besides, although I can operate the miniaturization system, even I don't know the basics. If I did, our government could scarcely risk having me visit the United States."

"You mean we might kidnap you as you kidnapped me. Do you think the United States engages in kidnapping?"

"I am absolutely certain it would when necessity drove sufficiently."

"And who are the people who do know the basics of miniaturization?"

"That also is not something that, in general, it is safe for you to know. However, I can lift the curtain just a bit in this matter. Pyotor Shapirov is one of them."

"Crazy Peter," said Morrison, smiling. "Somehow I'm not surprised."

"You shouldn't be. I am sure you say 'crazy' only as one of your jokes, but it was he who first worked out the basic rationale behind miniaturization. Of course," she added thoughtfully, "it may very well be that that required a certain insanity -- or, at any rate, a certain idiosyncrasy of thought. It is also Shapirov who first suggested a method of achieving miniaturization with a minimum expenditure of energy."

"How? The conversion of deminiaturization into an electromagnetic field?"

Boranova made a face. "I was merely giving you an example. Shapirov's method is far more subtle."

"Can it be explained?"

"Only roughly. Shapirov points out that the two great aspects of the unified theory of the Universe -- the quantum aspect and the relativistic aspect -- each depends on a constant that sets a limit. In quantum theory it is Planck's constant, which is very tiny but not zero. In relativity, it is the speed of light, which is very great but not infinite. Planck's constant sets a lower limit to the size of energy transfer and the speed of light sets an upper limit to the speed of information transmission. Shapirov maintains, furthermore, that the two are related. In other words, if Planck's constant is decreased, the speed of light would increase. If Planck's constant were reduced to zero, then the speed of light would be infinite."

Morrison said at once, "In which case, the Universe would be Newtonian in its properties."

Boranova nodded. "Yes. According to Shapiro, then, the reason for the enormous energy consumption of miniaturization is that the two limits are uncoupled, that Planck's constant is decreased without the speed of light being increased. If the two were coupled, then energy would flow from the speed-of-light limit into the Planck's constant limit during miniaturization and in the other direction during deminiaturization, so that the speed of light would go up as miniaturization proceeded and down again during deminiaturization. The efficiency should be nearly a hundred percent. Very little energy would then be required to miniaturize and re-expansion could take place very quickly."

Morrison said, "Does Shapiro know how miniaturization and deminiaturization can be carried through with the two limits coupled?"

"He said he did."

"Said? Past tense? Does that mean he has changed his mind?"

"Not exactly."

"Then what has he done?"

Boranova hesitated. "Albert," she said almost pleadingly, "do not go too fast. I want you to think. You know that miniaturization works. You know that it is possible, but not practical. You know that it would be a boon for humanity and I have assured you that it is not meant for destructive or warlike use. Once we know that our national precedence is recognized, which we want for psychological reasons I have presented to you quite frankly, I am sure we will share miniaturization with all divisions of the globe."

"Really, Natalya? Would you and your nation trust the United States if the situation were reversed?"

"Trust!" said Boranova and sighed heavily. "It doesn't come naturally to anyone. It is the weakness of humanity that we constantly read the worst into others. Yet trust must begin somewhere or the fragile mood of cooperation we have enjoyed for so long will shatter and we will be back to the twentieth century with all its horrors. Since the United States feels so strongly that it is the stronger and more advanced nation, should it not be the first to risk the act of trusting?"

Morrison spread out his arms. "I can't answer that. I am a private citizen and do not represent my nation."

"As a private citizen you can help us, knowing that you will not be harming your own country."

"I can't possibly know such a thing, since I only have your word for it and I don't believe you represent your nation any more than I represent mine. But all this is irrelevant, Natalya. Even if I wanted to, how on Earth can I help you make miniaturization practical, when I know nothing about the subject?"

"Be patient. In a while we will have lunch. Dezhnev and Kahinin will be through with the deminiaturization of Katinka by then and will join us, together with one other whom you must meet. Then, after lunch, I will take you to see Shapiro."

"I'm not sure about that, Natalya. You told me just a while ago that it would be dangerous for me to meet anyone who really understood miniaturization. I might learn

too much and this might raise problems with my return to the United States. Why, then, should I risk seeing Shapiro?"

Boranova said sadly, "Shapiro is an exception. I promise you that you will understand this when you see him -- and you will also understand why we must turn to you."

"That," said Morrison with all the conviction with which he had lately proclaimed the impossibility of miniaturization, "I will never understand."

20.

Lunch was in a well-lit room, for strips of the walls, together with the entire ceiling, were electroluminescent. Boranova had pointed it out with obvious pride and Morrison had refrained from making invidious comparisons with the United States, where electroluminescence was widespread.

Nor did he express his amusement over the fact that despite the electroluminescence there was a small but ornate chandelier centered in the ceiling. Its bulbs contributed nothing to the light, but it undoubtedly made the room seem less antiseptic.

As Boranova had predicted, a fifth person had joined them and Morrison was introduced to someone named Yuri Konev. "A neurophysicist like yourself, Albert," said Boranova.

Konev, who was darkly handsome and who seemed to be in his middle thirties, had an air of almost gawky youth about himself. He shook hands with wary curiosity and said, "I am most pleased to meet you," in creditable English, spoken with a distinct American accent.

"You have been in the United States, I imagine," said Morrison, also in English.

"I spent two years doing graduate work at Harvard University. It gave me a splendid opportunity to practice my English."

"Nevertheless," said Boranova in Russian, "Dr. Albert Morrison does very well in our language, Yuri, and we must give him a chance to practice it here in our country."

"Of course," said Konev in Russian.

Morrison had, indeed, almost forgotten that he was underground. There were no windows in the room, but that was common enough in large office buildings even aboveground.

The meal was not an ebullient one. Arkady Dezhnev ate with silent concentration and Sophia Kahinin seemed abstracted. She glanced occasionally at Morrison, but ignored Konev completely. Boranova watched everyone, but said very little. She seemed content to leave the floor to Konev.

Konev said, "Dr. Morrison, I must tell you that I have followed your work carefully."

Morrison, who had been eating the thick cabbage soup appreciatively, looked up with a quick smile. This was the first reference to his work, rather than to their work, since he had arrived in the Soviet Union.

"Thank you for your interest, but Natalya and Arkady call me Albert and I will have difficulty in responding to different names. Let us all be on a first-name basis for the brief time that remains before I am returned to my own land."

"Help us," said Boranova in a low voice, "and it will indeed be a brief time."

"No conditions," said Morrison in an equally low tone. "I wish to leave."

Konev raised his voice, as though to force the conversation back into the track he had chosen. "But I must admit, Albert, that I have been unable to duplicate your observations."

Morrison's lips tightened. "I have had this complaint from neurophysicists in the United States."

"Now, why should this be? Academician Shapirov is greatly intrigued by your theories and maintains that you are probably correct, at least in part."

"Ah, but Shapirov isn't a neurophysicist, is he?"

"No, he's not, but he has an extraordinary feel for what is correct. I have never known him to say, 'It seems to me that this must be right,' in which whatever he is discussing hasn't proved to be right -- at least in part. He says you are probably on the road to establishing an interesting relay station."

"A relay station? I don't know what he means by that."

"It's what he said once in my hearing. Some private thought of his own, no doubt." He cast a penetrating glance at Morrison, as though waiting for an explanation of the remark.

Morrison simply shrugged it away. "What I have done," he said, "is to establish a new kind of analysis of the cephalic waves originating in the brain and to have narrowed the search for a specific network within the brain devoted to creative thought."

"There you may be a little overoptimistic, Albert. I have not satisfied myself that this network of yours really exists."

"My results mark it out quite clearly."

"In dogs and monkeys. It is uncertain how far we can extrapolate such information to the much more complex structure of the human brain."

"I admit I haven't worked with the human brain anatomically, but I have analyzed human brain waves carefully and those results are at least consistent with my creative structure hypothesis."

"This is what I haven't been able to duplicate and what American researchers may not have been able to duplicate, either."

Again Morrison shrugged. "Adequate brain wave analysis is, at best, a monumentally difficult thing at the quinary level and no one else has given the years to the problem that I have."

"Or possesses the particular computerized equipment. You have designed your own program for the purpose of brain wave analysis, haven't you?"

"Yes, I have."

"And described it in the literature?"

"Certainly. If I achieved results with an undescribed program, they would be worth nothing. Who could confirm my results, lacking an equivalent computer program?"

"Yet I have heard, at the International Neurophysical Conference in Brussels last year, that you are continually modifying your program and complaining that the lack of confirmation stems from the use of insufficiently complex programming incapable of Fourier analysis to the proper degree of sensitivity."

"No, Yuri, that is false. Entirely false. I have modified my program from time to time, but I have carefully described each modification in *Computer Technology*. I have tried to publish the data in *The American Journal of Neurophysics*, but they haven't accepted my papers these last few years. If others confine their reading to the *AJN* and don't keep up with relevant literature elsewhere, that is not my fault."

"And yet --" Konev paused and frowned in what seemed to be uncertain thought. "I don't know if I ought to say this because it may be something else that will antagonize you."

"Go ahead. I have, in these last few years, learned to accept all kinds of remarks-- hostile, sarcastic, and -- worst of all -- pitying. I am quite hardened to it. -- This is good chicken Kiev, by the way."

"This is a guest meal," murmured Kahinin, almost under her breath. "Too buttery -- bad for the figure."

"Hah," said Dezhnev loudly. "Bad for the figure. That is an American remark that makes no sense in Russian. My father always said, 'The body knows what it needs. That's why some things taste good.'"

Kahinin closed her eyes in quite obvious distaste. "A recipe for suicide," she said.

Morrison noticed that Konev did not look at the young woman during this bit of byplay. Not at all.

He said, "You were saying, Yuri? About something that might antagonize me, you thought?"

Konev said, "Well, then, is it true, Albert, or not true that you actually gave your program to a colleague and that, using it in your computer, he was still unable to duplicate your results?"

"That's true," said Morrison. "At least my colleague, an able enough man, said he could not duplicate my results."

"Do you suspect he was lying?"

"No. Not really. It's just that the observations are so delicate that to attempt them while certain of failure may well lead, it seems to me, to failure."

"Might one not argue the other way around, Albert, and say that your certainty of success leads you to imagine success?"

"Possibly," said Morrison. "That has been pointed out to me several times in the past. But I don't think so."

"One more rumor," said Konev. "This I truly hate to repeat, but it seems so important. Is it true that you have claimed that in your analysis of brain waves you have occasionally sensed actual thoughts?"

Morrison shook his head vigorously. "I have never made such a claim in print. I have said to a colleague, once or twice, that in concentrating on the brain wave analysis there are occasionally times when I seem to find thoughts invading my mind. I have no way of telling whether the thoughts are entirely mine or whether my own brain waves resonate to those of the subject."

"Is such a resonance conceivable?"

"I suppose so. The brain waves produce tiny fluctuating electromagnetic fields."

"Ah! It is this, I suppose, that made Academician Shapirov make that remark about a relay station. Brain waves are always producing fluctuating electromagnetic fields -- with or without analysis. You don't resonate -- if resonance is what it is -- to the thoughts of someone in your presence, no matter how intensely he may be thinking. The resonance takes place only when you are busily studying the brain waves with your programmed computer. It presumably acts as a relay station, magnifying or intensifying the brain waves of the subject and projecting them into your mind."

"I have no evidence for that except for an occasional fugitive impression. That's not enough."

"It might be. The human brain is far more complex than any other equivalent piece of matter we know of."

"What about dolphins?" said Dezhnev, his mouth full.

"An exploded view," said Konev at once. "They're intelligent, but their brains are devoted too entirely to the minutiae of swimming to allow enough room for abstract thought on the human scale."

"I have never studied dolphins," said Morrison indifferently.

"Ignore the dolphins," said Konev impatiently. "Just concentrate on the fact that your computer, properly programmed, may act as a relay station, passing thoughts from the mind of the subject you are studying to your own mind. If that is so, Albert, we need you and no other person in the world."

Morrison said, frowning and pushing his chair away from the table, "Even if I can pick up thoughts by way of my computer -- a claim I have never made and which, in fact, I deny -- what can that possibly have to do with miniaturization?"

Boranova rose and looked at her watch. "It is time," she said. "Let us go and see Shapirov now."

Morrison said, "What he says will make no difference to me."

"You will find," said Boranova with a hint of steel in her voice, "that he will say nothing -- but will be utterly convincing just the same."

21.

Morrison had kept his temper well so far. The Soviets were, after all, treating him as a guest and if he could overlook the small matter of his being carried off by force, he had little of which to complain.

But what were they getting at? One by one, Boranova had introduced him to others -- first Dezhnev, then Kahinin, then Konev -- for reasons he had not penetrated. Over and over, Boranova had hinted of his usefulness without actually saying what it might be. Now Konev talked of it and was equally uncommunicative.

And now they were to see Shapirov. Clearly this had to be a climax of sorts. From the first mention of him by Boranova at the convention two days ago, Shapirov had seemed to hover over the whole matter like a thickening fog. It was he who had worked out the miniaturization process, he who seemed to detect a connection between Planck's constant and the speed of light, he who seemed to value Morrison's neurophysical theories, and he who made the remark about the computer as relay station that had apparently set off Konev's conviction that Morrison -- and only Morrison -- could help them.

It remained for Morrison, now, to resist any blandishments or arguments that Shapirov could present. If Morrison insisted that he would not help them, what would they do when all the blandishments and arguments had failed?

Crude threat of force -- or torture?

Brainwashing?

Morrison quailed. He dared not put his refusal on the basis that he would not. He would have to persuade them that he could not. Surely that was a reasonable position on which to take his stand. What could neurophysics -- and a dubious, unaccepted bit of neurophysical work at that -- have to do with miniaturization?

But why didn't they see that for themselves? Why did they all act as though it were conceivable that a person like himself, who had never as much as thought of miniaturization until some forty-eight hours before, could do something for them -- them, the only experts in the field -- that they could not do for themselves?

It was a rather lengthy walk along corridors and, lost in his own uncomfortable thoughts, Morrison did not notice that they were fewer in number than he had thought.

He said to Boranova suddenly, "Where are the others?"

She said, "They have work to do. We do not have forever to do what we must, you know."

Morrison shook his head. Chatty, they were not. None of them seemed to scatter information. Always close-lipped. A long-standing Soviet habit, perhaps -- or something that was ground into them through their work on a secret project in which even the scientists dared not step outside the narrow limits of their immediate work.

Were they coming to him as a storybook American generalist? Nothing he had ever done, surely, would give anyone that impression. As a matter of fact, he was himself

a narrow specialist, knowing virtually nothing outside of neurophysics. -- This was a worsening disease of modern science, he thought.

They had entered another elevator, something he had scarcely bothered to notice, and they were now on another level. He looked around him and recognized characteristics that seemed to transcend national differences.

"Are we in a medical wing?" he asked.

"A hospital," said Boranova. "The Grotto is a self-contained scientific complex."

"And why are we here? Am I --" He stopped suddenly, as the horror of the thought smote him. Was he to be drugged or, by some other medical means, made more compliant?

Boranova had walked on for a moment, then stopped, looked back, and came toward him, saying snappishly, "Now what is frightening you?"

Morrison felt ashamed. Were his facial expressions that transparent? "Nothing is frightening me," he grumbled. "I am simply tired of walking aimlessly."

"What makes you think we are walking aimlessly? I said we were going to see Pyotor Shapirov. We are walking toward him now. -- Come, we have only a few steps left."

They turned a corner and Boranova beckoned him to a window.

He stepped to her side and looked in. It was a room and there were a number of people present. There were four beds, but only one was occupied and it was surrounded by equipment that he did not recognize. There were tubes and glassware extending toward the bed and Morrison counted a dozen functionaries, who might be doctors, nurses, or medical technicians.

Boranova said, "There is Academician Shapirov."

"Which one?" said Morrison, his eyes traveling from one of the figures to the other and finding no one who seemed similar in appearance to the scientist he recalled having met once.

"In the bed."

"In the bed? He's ill, then?"

"Worse than ill. He is in a coma. He has been in a coma for over a month and we strongly suspect it is an irreversible state."

"I'm terribly sorry to hear that. I presume that is why you referred to him in the past tense before lunch."

"Yes, the Shapirov we know is in the past tense, unless --"

"Unless he recovers? But you just said the coma is probably irreversible."

"That's true. But neither is he brain-dead. The brain is damaged certainly or he wouldn't be in a coma, but it is not dead and Konev, who has followed your work closely, thinks that some of his thinking network is still intact."

"Ah," said Morrison, the light breaking. "I begin to understand. Why didn't you explain this to begin with? If you had wanted to consult me on such a matter and had explained, I might have been willing to come here with you voluntarily. Yet, on the other

hand, if I were to study his cerebral functioning and tell you, 'Yes, Yuri Konev is right,' then what good will that do you?"

"That will do us no good at all. You don't yet begin to understand, you see, and I can't explain exactly what it is I want until you understand the problem. Do you quite realize what is buried there in the still-living portions of Shapirov's brain?"

"His thoughts, I suppose."

"Specifically, his thoughts of the interconnection of Planck's constant and the speed of light. His thoughts of a method for making miniaturization and deminiaturization rapid, low-energy, and practical. With those thoughts, we give humanity a technique that will revolutionize science and technology -- and society -- more than anything since the invention of the transistor. Perhaps more than anything since the discovery of fire. Who can tell?"

"Are you sure you're not being overdramatic?"

"No, Albert. Does it occur to you that if miniaturization can be tied in with a vast acceleration of the speed of light, a spaceship, if sufficiently miniaturized, can be sent to anywhere in the Universe at many times the ordinary speed of light. We won't need faster-than-light travel. Light will travel fast enough for us. And we won't need antigravity, for a miniaturized ship will have close to zero mass."

"I can't believe all that."

"You couldn't believe miniaturization."

"I don't mean I can't believe the results of miniaturization. I mean I can't believe that the solution of the problem is permanently locked in the brain of one man. Others will eventually think of it. If not now, then next year or next decade."

"It's easy to wait when you are not concerned, Albert. The trouble is we're not going to have a next decade or even a next year. This Grotto which you see all about you has cost the Soviet Union as much as a minor war. Each time we miniaturize anything -- even if it's just Katinka -- we consume enough energy to last a sizable town for a whole day. Already, our government leaders look askance at this expense and many scientists, who do not understand the importance of miniaturization or who are simply selfish, complain that all of Soviet science is being starved for the sake of the Grotto. If we do not come up with a device to save on energy -- an extreme saving, too -- this place will be shut down."

"Nevertheless, Natalya, if you publish what is now known of miniaturization and make it available to the Global Association for the Advancement of Science, then innumerable scientists will put their minds to it and quickly enough someone will devise a method for coupling Planck's constant and the speed of light."

"Yes," said Boranova, "and perhaps the scientist who will obtain the key of low-energy miniaturization will be an American or a Frenchman or a Nigerian or a Uruguayan. It is a Soviet scientist who has it now and we don't want to lose the credit."

Morrison said, "You forget the global fellowship of science. Don't cut it up into segments."

"You would speak differently if it were an American who was on the edge of the discovery and you were asked to do something that might possibly give the credit to one of us. Do you remember the history of the American reaction when the Soviet Union was the first to put an artificial satellite into orbit?"

"Surely we have advanced since then."

"Yes, we have advanced a kilometer, but we have not advanced ten kilometers. The world is not yet entirely global in its thinking. There remains national pride to a considerable extent."

"So much the worse for the world. Still, if we are not global and if national pride is something we are expected to retain, then I should have mine. As an American, why should I be disturbed over a Soviet scientist losing credit for the discovery?"

"I ask you only to understand the importance of this to us. I ask you to put yourself in our place for a moment and see if you can grasp our desperation to do what we can to find out what it is that Shapirov knows."

Morrison said, "All right, Natalya. I understand. I don't approve, but I understand. Now -- listen carefully, please -- now that I understand, what is it you want of me?"

"We want you," said Boranova intensely, "to help us find out what Shapirov's thoughts -- his still-living and existing thoughts -- are."

"How? There's nothing in my theory that makes that possible. Even granting that thinking networks do exist, and that brain waves can be minutely analyzed, and even granting that I occasionally get a mental image, possibly imaginary, possibly an artifact -- there remains no way in which the brain waves can be studied to the extent of interpreting them in terms of actual thoughts."

"Not even if you could analyze, in detail, the brain waves of a single nerve cell that was part of a thinking network?"

"I couldn't deal with a single nerve cell in anything approaching the necessary kind of detail."

"You forget. You can be miniaturized and be inside that single nerve cell."

And Morrison stared at her in sick horror. She had mentioned something like this at their first meeting, but he had put it aside as nonsense -- horrifying, but nonsense, since miniaturization, he was certain, was impossible. But miniaturization was not impossible and now the horror was undiluted and paralyzing.

22.

Morrison did not then, nor could he at any time afterward, clearly recall the events that immediately followed. It was not a case of everything going black as much as everything having blurred.

His next clear memory was that of lying on a couch in a small office with Boranova looking down at him and with the other three -- Dezhnev, Kahinin, and Konev -- behind her. Those three came into focus more slowly.

He tried to struggle into a sitting position, but Konev moved toward him and placed his hand on Morrison's shoulder. "Please, Albert, rest awhile. Gather your strength."

Morrison looked from one to another in confusion. He had been upset, but he did not clearly remember what he had been upset about.

"What happened? How -- how did I get here?" He looked around the room again. No, he hadn't been here. He had been looking through a window at a man in a hospital bed.

He said, puzzled, "Did I faint?"

"Not really," said Boranova, "but you weren't quite yourself for a while. You seemed to undergo a shock."

Now Morrison remembered. Again he tried to lift himself into a sitting position, more strenuously this time. He struck Konev's restraining hand out of the way. He was sitting up now, with his hands on the couch on either side of him.

"I remember now. You wanted me to be miniaturized. What happened to me when you said that?"

"You simply swayed and -- crumpled. I had you placed on a stretcher and brought here. It didn't seem to anyone that you needed medication, merely a chance to rest and recover."

"No medication?" Morrison looked vaguely at his arms, as though he expected to see needle marks through the sleeve of his cotton blouse.

"None. I assure you."

"I didn't say anything before I collapsed?"

"Not a word."

"Then let me answer you now. I'm not going to be miniaturized. Is that clear?"

"It is clear that you say so."

Dezhnev sat down on the couch next to Morrison. He had a full bottle in one hand and an empty glass in the other.

"You need this," he said and half-filled the glass.

"What is it?" asked Morrison, lifting his arm to ward it off.

"Vodka," said Dezhnev. "It's not medicinal, it's nourishing."

"I don't drink."

"There is a time for everything, my dear Albert. This is a time for a warming bit of vodka, even for those who do not drink."

"I don't drink out of disapproval. I can't drink. I have no head for alcohol, that's all. If I take two swallows of that, I will be drunk within five minutes. Completely drunk."

Dezhnev's eyebrows went up. "So? What other purpose is there in drinking? Come, if you are lucky enough to win your goal in a few inexpensive sips, thank whatever you find thankable. A very small amount will warm you, stimulate your peripheral circulation, clear your head, concentrate your thoughts. It will even give you courage."

Kahinin's voice sounded in half a whisper, but was distinctly audible. "Do not expect miracles of a little alcohol."

Morrison's head twisted sharply and he looked at her. She did not seem as pretty as he had thought her on their first meeting. There was a hard and unforgiving look about her.

Morrison said, "I have never represented myself as a courageous man. I have never presented myself as anything that would be of help to you. I have maintained from the beginning that I could not do anything for you. That I am here at all is the result of compulsion, as you all know. What do I owe you? What do I owe any of you?"

Boranova said, "Albert, you are shivering. Take a sip of the vodka. You will not be drunk on a sip and we won't force more on you."

Almost as though to show bravery in a small way, Morrison, after a moment's hesitation, took the glass from Dezhnev's hand and swallowed a bit of the liquor recklessly. He felt a burning sensation in his throat, which passed. The taste was rather sweetish than otherwise. He took a larger sip and handed the glass back. Dezhnev took it and placed it and the bottle on a small table on his side of the couch.

Morrison tried to speak, but he coughed instead. He waited, cleared his throat, and said breathily, "Actually, that's not so bad. If you don't mind, Arkady --"

Dezhnev reached for the glass, but Boranova said, "No. That's enough, Albert." Her imperious gesture stopped Dezhnev. "We do not want you drunk, Albert. Just a little warm so you will listen to us."

Morrison could feel the warmth rising within him, as it always had when, on rare occasions of social bonhomie, he had had some sherry or (once) a dry martini. He decided he could handle any argument she could produce.

"All right," he said, "say on," and set his lips into a firm and unyielding line.

"I don't say, Albert, you owe us anything and I'm sorry that all this came as such a shock to you. We are aware that you are not a reckless man of action and we tried to break it to you as gently as possible. I had hoped, in fact, that you would see what was essential on your own, without any necessity of explanation."

"You were wrong," said Morrison. "At no time would such a mad thing have occurred to me."

"You see our necessity, don't you?"

"I see your necessity. I don't see it as mine."

"You might feel you owe it to the cause of global science."

"Global science is an abstraction that I admire, but I am not likely to want to sacrifice my highly concrete body for an abstraction that doesn't seem to exist. The whole point of your necessity is that it is Soviet science that is at stake, not global science."

"Then consider American science," said Boranova, "If you help us, that will become an eternal part of the victory. It will become a joint Soviet-American victory."

"Will my part be publicized?" demanded Morrison. "Or will the thing be announced as purely Soviet?"

Boranova said, "You have my word."

"You cannot commit the Soviet Government."

"Horrible," said Kahinin. "He judges our government by his own."

Konev said, "Wait, Natalya. Let me talk to our American friend, man to man." He sat down by Morrison and said, "Albert, I appeal to your interest in your work. So far, you have achieved little in the way of results. You have convinced no one in your country and you don't have any chance of doing so as long as you are left with only the tools you have. We offer you a better tool, one whose worth you couldn't dream of three days ago and one which you'll never have again if you turn away from it now. Albert, you have the chance to graduate from romantic speculations to convincing evidence. Do this for us and you will become, at a bound, the most famous neurophysicist in the world."

Morrison said, "You're asking me to risk my life on an untried technique."

"That is not unprecedented. All through history, scientists have risked death to continue their investigations. They have gone up in balloons and have dipped under the seas in primitive armored spheres to make their measurements and observations. Chemists have risked dealing with poisons and explosives, biologists with pathogens of all types. Physicians have injected themselves with experimental sera and physicists, in attempting to establish a self-supporting nuclear reaction, knew well that the explosion that resulted might destroy them or, conceivably, the entire planet."

Morrison said, "You spin dreams. You would never let it be known that an American played a role. Not when you confess your desperation at the possibility that Soviet science would lose the credit."

Konev said, "Let's be honest with each other, Albert. We couldn't hide your share in this, even if we wished to. The American government knows we brought you here. We know they do. You know they do. They made no move to stop us because they want you here. Well, they will know -- or at least guess -- what we wanted you here for and what you did for us, once we announce our success. And they will see to it that American science, in your person, will get full credit."

Morrison sat silently, head bent, for a while. There was a flushed spot, high on each cheek, as a result of the vodka he had drunk. Without looking, he knew that four pairs of eyes were firmly fixed upon him and he suspected that four breaths were being held.

He looked up and said, "Let me ask you one question. How did Shapirov come to be in a coma?"

There was again a silence and three of the pairs of staring eyes shifted to Natalya Boranova.

Morrison, seeing that, also stared at her. "Well?" he said.

Boranova said, "Albert, I will tell you the truth, even if that would tend to defeat our aims. If we try to lie to you, you will be right not to believe anything we say. If you see we are truthful, then you can believe us in the future. Albert, Academician Shapirov is in a coma because he was miniaturized, as we hope you will be. There was a small accident during deminiaturizing that destroyed part of his brain, apparently permanently. That can happen, you see, and we are not hiding it from you. Now give us the credit for utter frankness and say you will help us."

6. DECISION

We are always certain that the decision we have just made is wrong.

Dezhnev Senior

23.

Now, finally, Morrison rose, feeling a trifle unsteady on his feet -- whether from the vodka, from the general tension of the day, or from this last revelation he did not know or care. He stamped his feet a little, as though to firm them, then deliberately walked the length of the small room and back.

He faced Boranova and said in a harsh voice, "You can miniaturize a rabbit and nothing seems to happen to it. Did it occur to you that the human brain is the most complex bit of matter we know and that, whatever else might survive, the human brain might not?"

"It did," said Boranova stolidly, "but all our investigations have shown us that miniaturization does not in the least affect the interrelationships within the object being miniaturized. In theory, even the human brain would not be affected by miniaturization."

"In theory!" said Morrison with contempt. "How is it possible that, based on theory alone, you would experiment with Shapiro, whose brain you seem to value so highly? And having failed with him, to your enormous loss, how can you be so mad as to propose experimenting with me to recover that loss? You'll simply fail with me, too, and I cannot accept that."

Dezhnev said, "Don't speak nonsense. We are not mad. Nothing we did was lightly undertaken. The fault was Shapiro's."

Boranova said, "In a way, it was. Shapiro had his eccentric ways. 'Crazy Peter' I believe you call him in English and that is perhaps not so far off. He was intent on having the miniaturization experience. He was getting old, he said, and he would not, like Moses, reach the Promised Land without entering it."

"He might have been forbidden to do so."

"By me? I would forbid Shapiro? You can't be serious."

"Not you. Your government. If the miniaturization process is so precious to the Soviet Union --"

"Shapiro threatened to abandon the project altogether if he did not have his way and that could not be risked. Nor is our government quite so high-handed as it once was in its pressures on troublesome scientists. It must take world opinion into greater account now, as your government must. It is the price of global cooperation. Whether that is for

the better or for the worse, I cannot say. In any case, Shapirov was eventually miniaturized."

Morrison muttered, "Absolutely mad."

"No," said Boranova, "for we did not move without precautions. Despite the fact that every exercise in miniaturization is costly and sends shivers through the Central Coordinating Committee, we insisted on a careful approach. Twice we miniaturized chimpanzees and twice we brought them back and could detect no changes in them -- either as a result of minute studies of their behavior or by magnetic resonance imaging of the brain."

"A chimpanzee is not a human being," said Morrison.

"Something we were aware of," said Boranova gravely. "Therefore, we miniaturized a human being next. A volunteer. Yuri Konev, to be precise."

Konev said, "It had to be me. It was I who felt most strongly that the human brain would not be affected. I am the neurophysicist of the project and it was I who made the necessary calculations. I would not ask another human being to risk his sanity on my calculations and my certainty. Life is one thing -- we all lose it sooner or later. Sanity is quite another."

"So brave," whispered Kahinin, looking at her fingertips, "the deed of a true Soviet hero." Her lip trembled, as though on the brink of a sneer.

Looking firmly at Morrison, Konev said, "I am a loyal Soviet citizen, but I did not do it for nationalist motives. They would be, in this case, irrelevant. I did it as a matter of decency and of scientific ethics. I had confidence in my analysis and of what worth was my confidence if I would not risk myself on it? And it is a matter of something else, too. When the history of miniaturization is recorded, I will be listed as the first human being ever to have been subjected to the process. That will eclipse the deeds of a great-grand-uncle of mine who was a general fighting the German Nazis in the Great Patriotic War. And I would be pleased with that, not out of vainglory but out of a belief that the conquests of peace should always be held superior to victories in war."

Boranova said, "Well, putting ideals to one side and passing on to the facts. Yuri was miniaturized twice. First, he was taken down to about half his height and was restored in perfect order. Then he was miniaturized to the size of a mouse and again was restored in perfect order."

Morrison said, "And then Shapirov?"

"And then Shapirov. He was by no means easy to control even this far. He argued vociferously for the chance to be the first person miniaturized. After Konev's first venture into the small, it was all we could do to persuade him to wait for a second and more drastic attempt. After that we could control him no more. Not only were we forced to miniaturize him, but he swore that he would abandon the project and somehow make his way out of the country to begin a miniaturization project elsewhere if we did not miniaturize him to a greater extent than we had Konev. We had no choice. If 'Crazy Peter,' as you call him, were mad enough to speak of emigrating, that would go beyond what

the government would be willing to allow even in these days. We didn't want him in prison, so we miniaturized him to the size of a cell."

"And that passed the limits of safety, did it?"

"No. We have every reason to think he was in perfect order, even miniaturized so far. He was being brought back and then at one point in the deminiaturization there was a misadventure. Deminiaturization took place a trifle too quickly and the temperature rose slightly in Shapiro's body. It had the effect of a high fever -- not enough to kill him, but enough to damage his brain permanently. It might have been reversed if we could have attended to him at once, but deminiaturization had to be completed and that took time. It was an appalling catastrophe and all that we can hope for is the chance to salvage what we need from what is left of his brain."

"There may be another misadventure, as you call it, if I were to be miniaturized. Isn't that so?"

"Yes," said Boranova, "that is so. I don't deny it. There have been failures and misadventures throughout the history of science. Surely you need no reminder that there were deaths of cosmonauts in space both on the American and Soviet sides. That did not prevent our present settlement of the moon -- and of space itself -- as a new home for humanity."

"That may be so, but all advances in space were made by volunteers. No one was launched into space against his will. And I am not volunteering."

Boranova said, "You need not be so frightened of it. We have done our best to make it as safe as possible and, by the way, you will not go alone. Konev and Shapiro did go alone and as bare as the rabbit, for they, like the rabbit, were in a miniaturization field that was encased in air. You, on the other hand, will be in a ship, a kind of modified submarine. It, too, has been miniaturized and deminiaturized without harm. It is a little less expensive to carry through the process with an inanimate object because it can stand a rise in temperature more easily. In fact, such a rise serves to test for the ruggedness and stability of all its components."

"I am not going, Natalya, either alone or with the Red Army."

Boranova ignored the remark. "With you on the ship," she said, "will be we four. Myself, Sophia, Yuri, and Arkady. That is why I have introduced each of them to you. We are all partners in this greatest of all exploring trips. We will not be crossing an ocean or penetrating the vacuum of space. We will instead enter a microscopic ocean and penetrate the human brain. Can you be a scientist -- a neurophysicist -- and resist that?"

"Yes. I can resist that. And easily. I will not go."

Boranova said, "We have your software, your program. You always carry it with you and you had it with you when you were brought here. We will have a computer on board the ship for you, one that is the exact model of the one you use in your laboratory. It should not be a long trip. We will all be miniaturized, taking our chances along with you. You will take your computer readings and record the sensations you receive and then we will all be deminiaturized and your part will be done with. Say that you will join us. Say you will do it."

And Morrison, fists clenched, said stubbornly, "I will not join you. I will not do it."

Boranova said, "I am so sorry, Albert, but that is the wrong answer. We will not accept it."

24.

Morrison felt his heart racing again. If this was going to be a straightforward contest of wills, he was not sure he was up to coping with this woman who, despite all her apparent softness, seemed made of alloy steel. Moreover, she had behind her the full apparatus of the Soviet Union and he himself was alone.

He said desperately, "Surely you know this whole thing is a trumped-up romantic notion. How do you know there is any connection between Planck's constant and the speed of light? All you have is some statement by Shapirov. Isn't that correct? Did he give you any details? Any evidence? Any explanations? Any mathematical analysis? -- It was nothing more than a statement -- an imaginative speculation -- wasn't it?"

Morrison tried to sound confident. After all, if Shapirov had given them anything substantive, they would not now be trying the desperate trick of rifling his brain for something useful. He held his breath, waiting for the response.

Boranova looked at Konev then said, with a shade of reluctance, "We will continue our policy of telling the flat and unadorned truth. We have nothing but some remarks Shapirov made, as you've guessed. He enjoyed keeping things to himself until he could spring them on us fully dressed, so to speak. He was more than a little childish in this respect. Perhaps that was an aspect of his eccentricity -- or of his genius -- or of both."

"But how can you tell, under those circumstances, that such an unsupported speculation would have any validity whatever?"

"When Academician Pyotor Shapirov said, 'I feel it will be thus and so,' that is how it turned out to be."

"Come on. Always?"

"Almost always."

"Almost always. He could have been wrong this time."

"I admit that. He could have been."

"Or if he had some notion which would really prove of use, it might have been localized in the part of the brain which has been destroyed."

"That is conceivable."

"Or if the notion is useful and is still in the intact portion of the brain, I might not be able to interpret the brain waves properly."

"That may well be."

"Putting it all together: Shapirov's suggestion may be wrong and, even if it isn't, it might be out of reach or, even if it isn't, I might not be able to interpret it. Considering that, what are the chances of success? And can't you see that we will be putting our lives into danger for something we will almost certainly fail to get?"

"Considering the matter objectively," said Boranova, "it would seem the chances are very small. However, if we do not hazard our lives, the chances of obtaining anything at all are zero -- flat zero. If we do risk our lives, the chances of success are very small, admittedly, but they are not zero. Under the circumstances, we must take the risk, even though the best we can say for our chances of success are that they are not zero."

"For me," said Morrison, "the risk is too great and the chances of success are too small."

Boranova placed one hand on Morrison's shoulder and said, "Surely that is not your final decision."

"Surely it is."

"Think about it. Think about the value to the Soviet Union. Think about the benefits to your own country that will result from your acknowledged participation, to the needs of global science, to your own fame and reputation. All this is in favor of doing it. Against it are your personal fears. These are understandable, but all achievement in life requires the overcoming of fear."

"Thinking about it won't change my mind."

"Think about it until tomorrow morning, anyway. That's fifteen hours and it's all we can spare you. After all, balancing fears against hopes can keep one irresolute for a lifetime and we don't have a lifetime. Poor Shapiro might linger on in coma for a decade, but we don't know how long what is left of his brain will retain his ideas and we dare not wait very long at all."

"I can not and will not concern myself with your problems."

Boranova seemed to hear none of his denials and refusals. She said in her unfailingly gentle voice, "We will not attempt to persuade you further right now. You may have a leisurely dinner. You may watch our holovision programs if you wish, view our books, think, sleep. Arkady will accompany you back to the hotel and if you have any more questions, you need only ask him."

Morrison nodded.

"And, Albert, remember, tomorrow morning you must give us your decision."

"Take it now. It will not change."

"No. The decision must be that you will join us and help us. See to it that you come to that decision -- for come to it you must -- and it will be easier for all of us if you do so gladly and voluntarily."

25.

It proved to be a quiet and thoughtful dinner for Morrison and not a very filling one -- for he found he could only pick at his food. Dezhnev seemed quite unaffected by the other's lack of appetite and reaction. He ate vigorously and spoke incessantly, drawing on what was apparently a large stock of funny stories -- in all of which his father played a key role -- and was clearly delighted to try them out on a new audience.

Morrison smiled faintly at one or two, more because he recognized from the other's raised voice that a punch line had been advanced than because he heard them with any interest at all.

Valeri Paleron, the waitress who had served them at breakfast, was still there at dinner. A long day -- but either that was reflected in her wages or it was required by her extracurricular duties. Either way, she glowered at Dezhnev each time she approached the table, perhaps (Morrison thought distantly) because she disapproved of his stories, which tended to be disrespectful of the Soviet regime.

Morrison did not particularly enjoy his own thoughts. Now that he was considering the distant possibility of getting away from the Grotto -- from Malenkigrad -- from the Soviet Union -- he was beginning to feel a perverse disappointment at what he might be missing. He found himself daydreaming just a little on the matter of miniaturization, of using it to prove the worth of his theories, of triumphing over the smug fools who had dismissed him out of hand.

He recognized the fact that, of all the arguments presented by Boranova, only the personal one had shaken him. Any reference to the greater good of science, or of humanity, or of this nation or that was just idle rhetoric. His own place in science was something more. That seethed within him.

When the serving woman passed near the table, he stirred himself to say, "How long must you stay on, waitress?"

She looked at him without favor. "Until you two grand dukes can bring yourselves to stir out of here."

"There's no rush," said Dezhnev as he emptied his glass. His speech was already slurred and his face was flushed. "I am so fond of the comrade waitress, I could stay on for as long as the Volga flows, that I might gaze on her face."

"As long as I don't have to gaze at yours," muttered Paleron.

Morrison filled Dezhnev's glass and said, "What do you think of Madame Boranova?"

Dezhnev gazed at the glass owlshly and did not offer to lift it immediately. He said with an attempt at gravity, "Not a first-class scientist, I am told, but an excellent administrator. Keen, makes up her mind quickly, and absolutely incorruptible. A pain in the neck, I should think. If an administrator is incorruptible-- too infernally honest, it makes life hard in so many little ways. She is a worshipper of Shapirov, too, and she thinks him incorruptible-- no, incomprehensible-- no, incontrovertible. That's it."

Morrison was not sure of the Russian word. "You mean she thinks he's always right."

"Exactly. If he hints that he knows how to make miniaturization cheap, she's sure he can. Yuri Konev is sure of it, too. He's another of the worshippers. But it's Boranova who'll send you into Shapirov's brain. One way or another, she'll send you there. She has her ways. -- As for Yuri, that little shaver, he's the real scientist of the group. Very brilliant." Dezhnev nodded solemnly and sipped at his refilled drink gently.

"I'm interested in Yuri Konev," said Morrison, his eyes following the lifting of the glass, "and in the young woman, Sophia Kahinin."

Dezhnev leered. "A fine young piece." Then sadly, shaking his head, "But she has no sense of humor."

"She's married, I take it."

Dezhnev shook his head more violently than the occasion seemed to require.

"No."

"She said she had had a baby."

"Yes, a little girl, but it isn't the signing of the marriage book that makes one pregnant. It's the game of bed -- married or not."

"Does the puritanical Soviet Government approve of this?"

"No, but its approval was never asked, I think." He burst into laughter.

"Besides, as a scientist at Malenkigrad, she has her special dispen-pensations. The government looks the other way."

"It strikes me," said Morrison, "that Sophia is much interested in Yuri Konev."

"You see that, do you? It takes little shrewdness. She is so interested that she has made it quite clear that her child was the result of Yuri's collaboration in that little game I spoke of."

"Oh?"

"But he denies it. And very vigorously, too. I think it is rather humorous, in a bitter way, that he remains compelled to work with her. Neither one can be spared from the project and all he can do is pretend she doesn't exist."

"I noticed that he never looks at her, but they must have been friendly once."

"Very friendly -- if she is to be believed. If so, they were very discreet about it. But what's the difference? She doesn't need him to support the child. Her salary is a large one and the day-care center takes loving care of her daughter when she is at work. It is just a matter of emotion with her."

"What split them up, I wonder?"

"Who knows? Lovers take their disputes so seriously. I myself have never let myself fall in love -- not poetically. If I like a girl, I play with her. If I get tired, I move on. It is my good fortune that the women I engage are as prag-pragmatic -- isn't that a good word? -- as I am and make little fuss. As my father used to say, 'A woman who doesn't fuss has no faults.' Sometimes, to be truthful, they grow tired before I do, but even then, so what? A girl who is tired of me is not much good to me and, after all, there are others."

"I suppose Yuri is much like that, too, isn't he?"

Dezhnev had emptied his glass again and he held out his hand when Morrison made a move to refill it. "Enough! Enough!"

"Never enough," said Morrison calmly. "You were telling me about Yuri."

"What is there to tell? Yuri is not a man to fly from woman to woman, but I have heard --" He stared blearily at Morrison. "You know how one hears -- one tells another who tells another and who is to know whether what comes out of the funnel is anything like what went in. But I have heard that when Yuri was in the United States, being

educated Western-style, he met an American girl. In went La Belle Americaine, they say, and out went poor little Soviet Sophia. Perhaps that was it. Perhaps he came back different and perhaps he still dreams of his lost love across the sea."

"And is that why Sophia is so ill-disposed to Americans?"

Dezhnev stared at the glass of vodka and sipped a little of it. "Our Sophia," he said, "has never liked Americans. This is not surprising." He leaned toward Morrison, his breath heavy with food and drink. "Americans are not a lovable people -- if I may say so without offense."

"I'm not offended," said Morrison evenly, as he watched Dezhnev's head sink slowly and come to rest on his bent right arm. His breathing grew stertorous.

Morrison watched him for half a minute or so, then raised his hand to beckon the serving woman.

She came at once, her ample hips swinging. She stared at the unconscious Dezhnev with rather more than half a sneer. "Well, do you wish me to get a large pair of tongs and use them to carry our prince here to his bed?"

"Not just yet, Miss Paleron. As you know, I'm an American."

"As everyone knows. You have but to say three words and the tables and chairs in this room nod to each other and say, 'An American.'"

Morrison winced. He had always been proud of the purity of his Russian and this was the second time the woman had sneered at it.

"Nevertheless," he said, "I have been brought here by force, against my will. I believe it was done without the knowledge of the Soviet Government, which would have disapproved of and prevented the action if they had known. The people here -- Dr. Boranova, whom you have referred to as the Tsarina -- have acted on their own. The Soviet Government should be told of this and they will then act speedily to return me to the United States and prevent an international incident that nobody would want. Don't you agree?"

The waitress put her fists on her hips and said, "And of what matter is it to anyone either here or in the United States as to whether I agree or not? Am I a diplomat? Am I the reincarnated spirit of Tsar Peter the Great Drinker?"

"You can see to it," said Morrison, suddenly uncertain, "that the government learns of it. Quickly."

"What is it you think, American? That I have but to tell my lover, who is on the Presidium, and all will be well for you? What have I to do with the government? What's more -- and in all seriousness, Comrade Foreigner -- I do not wish you to talk to me in this fashion again. Many a fine, loyal citizen has been hopelessly compromised by foreign blabbermouths. I will, of course, report this to Comrade Boranova at once and she will see to it that you do not insult me in this fashion again."

She left in a flounce and with a scowl and Morrison stared after her in dismay. And then his head whirled in surprise and astonishment when he heard Dezhnev's voice saying, "Albert, Albert, are you satisfied, my child?"

Dezhnev's head was raised from his pillowing arm and, though his eyes were a little bloodshot, his voice seemed to have lost its fuzziness. He said, "I wondered why you were so anxious to fill my glass, so I gobbled a little and let myself collapse. It was all very interesting."

"You are not drunk?" said Morrison, goggling at the other in wonder.

"I have been more sober in my life, certainly," said Dezhnev, "but I am not unconscious, nor have I been. You non-drinkers have an exaggerated idea of the speed with which all accomplished Soviet citizen will fall unconscious with drink -- which shows the dangers of being a nondrinker."

Morrison still found himself in a state of disbelief over the failure of the waitress to cooperate. "You said she was an intelligence operator."

"Did I?" Dezhnev shrugged. "I think I said I suspected she was, but suspicions are often wrong. Besides, she knows me better than you do, my little Albert, and was probably under no illusion that I was drunk. I'll bet you ten rubles to a kopeck that she knew I was listening with both ears. What would you have her say in such circumstances?"

"In that case," said Morrison, taking heart, "she will have heard what I said and will nevertheless inform your government of the state of affairs. Your government, to avoid an international incident, will then order me set free, probably with an apology, and you people here will have some tall explaining to do. You had better free me and send me back to the United States of your own accord."

Dezhnev laughed. "You waste your time, my clever intriguer. You have too romantic a notion of our government. Conceivably, they may be willing to let you go someday but, regardless of possible embarrassment, not before you have been miniaturized and --"

"I don't believe anyone in authority knows you kidnapped me. They cannot approve once they find out."

"Maybe they don't know and maybe they will grind their teeth when they find out - - but what can they do? The government has invested too much money in the project to let you go before you have had your chance to make it practical, so that it will repay all that has been spent -- and more in addition. Well? Doesn't that seem logical to you?"

"No. Because I won't help you." Morrison felt his heart harden once again. "I will not allow myself to be miniaturized."

"That will be up to Natasha. She will be furious with you, you know, and will have no pity. You realize that you callously attempted to have everyone in the project thrown into the government's bad graces, have some of us retired -- or worse. And this, after we had treated you with perfect consideration and kindness."

"You kidnapped me."

"Even that was done with perfect consideration and kindness. Were you hurt in any way? Mistreated? Yet you have tried to harm us. Natasha will repay you for that."

"How? Force? Torture? Drugs?"

Dezhnev turned his eyes up to the ceiling. "How little you know our Natasha. She doesn't do such things. I might, but she wouldn't. She's as much a gentle chicken-heart as you are, my wicked Albert -- in her own way. But she will force you to go along with us."

"Well? How?"

"I don't know. I can never quite make out how she does it. But she manages. You will see." His smile developed a wolfish edge. And when Morrison saw that smile, he finally realized there was no escape.

26.

The next morning Morrison and Dezhnev returned to the Grotto. They entered a large windowless ceiling-lit office, which Morrison had not seen before. It was clearly not Boranova's and it was very impressive, as anything with an ostentatious waste of space is bound to be.

Boranova sat behind a bulky desk and on the wall behind her was a portrait of the Soviet Executive, looking grave. In the corner to her left was a water cooler and in the one on the right a microfilm cabinet. On the desk was a small word processor. That was all. The room was empty otherwise.

Dezhnev said, "I have brought him, you see. The mischievous fellow tried to use the charming Paleron to effect an escape by intriguing with the government behind our back."

"I have received the report," said Boranova quietly. "Please leave, Arkady. I wish to be alone with Professor Albert Morrison."

"Is that safe, Natasha?"

"I think so. Albert is not, in my opinion, a man of violence. -- Will I be safe, Albert?"

Morrison spoke for virtually the first time that day. "Let's not play games," he said. "What is it you want, Natalya?"

Boranova gestured with her hand peremptorily and Dezhnev left. When the door closed behind him, she said, "Why have you done this? Why have you tried to intrigue with someone you thought was an intelligence agent watching us? Have we treated you so badly?"

"Yes," said Morrison angrily, "you have. Why can't any of you get it through your head that hijacking me to the Soviet Union is not something I am likely to appreciate? Why do you expect gratitude of me? Because you didn't break my head in the process? You probably would have -- if my head, unbroken, hadn't been valuable to you."

"If your head, unbroken, hadn't been valuable to us, we would have left you in peace. You know that and you know the necessity that drove us. We have explained it carefully. If you were simply trying to get away, I would understand, but your method of attempted escape might have destroyed our project and perhaps us as well -- if you had succeeded. You hoped our government would disapprove of our actions and be appalled. If that were so, what do you think would have happened to us?"

Morrison's lips tightened and he looked sullen. "I could think of no other way of escaping. You speak of driving necessities. My needs drive me, too."

"Albert, we have tried every reasonable way to persuade you to help us. There has been no force, no threats of force, no unpleasantness of any kind after you had arrived there. Isn't that true?"

"I suppose so."

"You suppose so? It is true. But it has all failed. You still refuse to help us, I think."

"I still refuse and I shall continue to refuse."

"Then I am forced, very much against my will, to take the next step."

A bit of fear stirred within Morrison and he felt his heart skip a beat, but he tried desperately to sound defiant, "Which is?"

"You want to get home, to go back to America. Very well, if all our persuasiveness fails, you shall return."

"Are you serious?"

"Are you surprised?"

"Yes, I'm surprised, but I accept. I take you at your word. When will I leave?"

"The very moment we settle upon the story we're going to tell."

"Where's the problem? Tell the truth."

"That would be a little difficult, Albert. It would embarrass my government, which would have to deny having given permission for my action. I would be in serious trouble. It would be unreasonable for you to expect me to do that."

"What can you say instead?"

"That you came here at your own request, in order to help us with our projects."

Morrison shook his head vehemently. "That would be at least as difficult for me as admitting the kidnapping would be for you. These may be the good new days, but old habits die hard and the American public would be more than a little suspicious of an American scientist who went to the Soviet Union to help them with their projects. Old competitions remain and I have my reputation to think of."

"Yes, there is that difficulty," admitted Boranova, "but from my point of view, I would rather you had the difficulty than that I did."

"But I won't allow it. Do you suppose I will hesitate to tell the truth in full detail?"

"But, Albert," said Boranova quietly, "do you suppose anyone would believe you?"

"Of course. The American government knows that you asked me to come to the Soviet Union and that I refused. I would have had to be kidnapped to get here."

"I'm afraid your American government won't want to admit that, Albert. Would they want to say that Soviet agents had plucked an American out of his comfortable hotel room and carried him off by land, sea, and air without the forces of American law being aware of this? Considering modern American high-tech, of which your people are all so proud, that would argue either incompetence or a little inside treason on the part of your intelligence. I think your government would prefer to have the world believe you went to

the Soviet Union voluntarily. -- Besides, they wanted you to go to the Soviet Union voluntarily, didn't they?"

Morrison was silent.

Boranova said, "Of course they did. They wanted you to find out as much about miniaturization as possible. You're going to have to tell them you refused to be miniaturized. All you'll be able to report will be that you watched a rabbit undergo miniaturization, which they will consider to have been a bit of flim-flam on our part. They will consider that we carefully hoodwinked you and you will have failed them badly. They will not feel bound to support you."

Morrison revolved the matter in his mind. He said, "Do you really intend to leave me in the position of being considered a spy and a traitor by my people? Is that what you're going to try to do?"

"No, indeed, Albert. We will tell all the truth we can. In fact, we would like to protect you, even though you showed no signs of wanting to protect us. We would explain that our great scientist Pyotr Shapirov is in a coma, that he had spoken highly of your neurophysical theories shortly before this tragedy had befallen him. We therefore called on you and asked you to use your theories and your expertise to see if you could bring him out of his coma. You can't object to that. It would hold you up to the world as a great humanitarian. Your government might well support this view. It would certainly protect them against possible embarrassment -- and our government as well. And it is all almost true."

"What about the miniaturization?"

"That is the one place where we must avoid the truth. We can't mention that."

"But what would keep me from mentioning it?"

"The fact that no one would believe you. Did you accept the existence of miniaturization until you saw it with your own eyes? Nor would your government want to spread the feeling that the Soviet Union has attained miniaturization. They would not want to frighten the American public until such time as they were certain the Soviet Union had the process and, better yet, that they had the process as well. -- But there you are, Albert. We will send you home with an innocuous story that doesn't mention miniaturization, doesn't embarrass either my country or yours, and relieves you of any suspicion of being a traitor. Are you satisfied?"

Morrison stared at Boranova uncertainly and rubbed his thin sandy hair till it stood up in vague tufts. "But why will you say you are sending me back? That has to be explained, too. You can't very well say that Shapirov recovered with my help unless he actually recovers so that you can produce him. Nor can you say that he died before I could get to him unless he actually does die soon, as otherwise you would have to explain why he is still in a coma or why, perhaps, he has come back to life. You can't hide the situation forever."

"That is a problem that worries us, Albert, and it is clever of you to see it. After all, we are sending you back within a few days of your arrival -- and why? The only logical reason, I'm afraid, is that we have found you to be a charlatan. We brought you here in

high hopes for our poor Shapiro, but in no time at all it turned out that your views were incoherent nonsense and, with bitter disappointment, we sent you back. That will do you no harm, Albert. Being a charlatan is not the same as being a spy."

"Don't play the innocent, Natalya. You can't do that." He had turned white with anger.

"But it makes sense, doesn't it? Your own peers don't take you seriously. They laugh at your views. They would agree with us that your neurophysical suggestions are incoherent nonsense. We'd be a little embarrassed for having been so credulous as to take you seriously, but it was really Shapiro who thought highly of you and he was, unbeknown to us, on the edge of a stroke and total mental breakdown, so that one could scarcely blame him for his mad admiration of you."

Morrison's lips trembled. "But you can't make a clown out of me. You can't ruin my reputation so."

"But what reputation are you talking about, Albert? Your wife has left you and some people think it was because having your career founder on your mad ideas was the last straw for her. We have heard that your appointment is not to be renewed and that you have not managed to find another place. You are finished as a scientist in any case and this story of ours would merely confirm what already exists. Perhaps you can find some other way of making a living -- outside of science. You would probably have had to do that anyway, even if we had never touched you. There's that consolation."

"But you're lying and you know you're lying, Natalya. Have you no code of ethics? Can a respectable scientist do this to an honorable brother scientist?"

"You were unmoved by abstractions yesterday, Albert, and I am unmoved by them today in consequence."

"Someday scientists will discover I was right. How will you look then?"

"We may all be dead by then. Besides, you know that that is not the way it works. Franz Anton Mesmer, though he discovered hypnotism, was considered a fraud and a charlatan. When James Braid rediscovered hypnotism, he got the credit and Mesmer was still considered a fraud and charlatan. Besides-are we truly lying when we call you a charlatan?"

"Of course you are!"

"Let's reason it out. Why do you refuse to venture into an experiment of miniaturization which may enable you to establish your theories and which is likely to increase your knowledge of the brain by whole orders of magnitude? Such refusal can only arise through your own certain knowledge that your theories are wrong, that you are either a fool or a fraud or both, and that you don't want this established beyond a doubt, as it would be if you subjected yourself to miniaturization."

"That is not so."

"Do you expect us to believe that you refuse miniaturization simply because you are frightened? That you turn down a chance at knowledge, glory, fame, victory, vindication after years of scorn -- all because you are scared? Come, we can't think so

little of you, Albert. It makes much more sense to believe you are a fraud and so we will have no hesitation in saying you are."

"Americans won't believe a Soviet libel against an American scientist."

"Oh, Albert, of course they will. When we release you, with our explanation, it will be in all your American newspapers at once. They will be full of it. They are the most enterprising in the world and the freest, as you are all so fond of saying, meaning they are a law unto themselves. They pride themselves on it and never tire of flaunting that in the eyes of our own more sedate press. This will be such a lovely story for them: 'American Faker Fools Stupid Soviets.' I can see the headlines now. In fact, Albert, you may make a great deal of money on your American lecture circuit. You know: 'How I Made Jerks of the Soviets.' Then you can tell them all the ridiculous things you persuaded us to believe before we caught on to you and the audiences will laugh themselves into hysterics."

Morrison said in a whisper, "Natalya, why do you do this to me?"

"I? I am doing nothing. You are doing it. You want to go home and since we've failed to get you to accept miniaturization, we have no choice but to agree. Once, though, we agree to send you home, then, step by step, everything else must logically follow."

"But in that case, I can't go home. I can't have my life destroyed beyond repair."

"But who would care, Albert? Your estranged wife? Your children, who no longer know you and can always change their names anyway? Your university, which is firing you? Your colleagues, who laugh at you? Your government, which has abandoned you? Take heart. No one would care. An initial raucous laugh across the whole country and then you would be forgotten forever. You'll die without an obituary notice eventually, except for those papers who might not object to the tastelessness of bringing back that old joke for one more spurt of laughter to follow you to your grave."

Morrison shook his head in despair. "I can't go home."

"But you must. Unless you are willing to help us, which you're not, you can't stay here."

"But I can't go home on your terms."

"But what is the alternative?"

Morrison stared at the woman, who was looking at him with such mild concern. He whispered, "I accept the alternative."

Boranova looked at him for a long minute. "I do not wish to be mistaken, Albert. Put your agreement into clear language."

"It's either consent to be miniaturized or consent to be destroyed. Isn't that it?"

Boranova thrust out her lips. "That's a harsh way of putting it. I prefer that you look at it this way. Either you agree to help us by noon or you will be on a plane to the United States by 2 p.m. What do you say? It is now nearly 11 a.m. You have over an hour to decide."

"What's the use? An hour won't change anything. I'll be miniaturized."

"We will be miniaturized. You will not be alone." Boranova reached out and touched a contact on her desk.

Dezhnev entered. "Well, Albert. You stand there looking so sad, so crumpled, that it strikes me you have decided to help us."

Boranova said, "You need make no sardonic remarks. Albert will help us and we will be grateful for his help. His decision was a voluntary one."

"I'm sure it was," said Dezhnev. "How you squeezed it out this time, Natasha, I can't say, but I knew you would. -- And I must congratulate you, too, Albert. It took her quite a bit longer than I thought it would."

Morrison could only stare at the two vacantly. He felt as though he had swallowed an icicle whole -- one that didn't melt but that, instead, reduced the temperature of his abdomen to the freezing point.

Certainly, he was shivering.

7. SHIP

No voyage is dangerous to the one who waves good-bye from the shore.

Dezhnev Senior

27.

Morrison felt numb all through lunch and yet in a way the pressure was off. There were no determined voices pressing on him, no intensity of explanations and persuasions, no smiles of intent, no heads closing in.

Of course, they made it quite clear, in a cool businesslike way, that he would no longer leave the Grotto till the deed was done and that from the Grotto there was, of course, no escape.

And then every once in a while a thought swirled into his mind. He had actually agreed to be miniaturized!

They took him to a room of his own in the Grotto where he could view book-films through a viewer provided for his personal use -- even English-language book-films if he wanted the inner familiarity of home to pass the next few hours. So he sat there with a book-film unreeling through the viewer strapped on his eyes and somehow it left his mind totally untouched.

He had actually agreed to be miniaturized!

He had been told that he could do as he pleased until someone came for him. He could do as he pleased, that is, provided he did not please to leave. There were guards everywhere.

The feeling of terror had, Morrison was aware, much diminished. That was the use of numbness and, of course, the more one repeats a sentence in one's mind, the more it loses meaning. He had actually agreed to be miniaturized, The more it rang in his mind like the tolling of a bell, over and over, the more the horror of it faded. And left a mere vacuum of non-sensation in its place.

He was distantly aware that the door of his room had opened. Someone, he presumed dully, had come for him. He removed his viewer, lifted his eyes languidly, and, for just a moment, felt a mild spark of interest.

It was Sophia Kahinin, looking beautiful even to his bleared senses. She said in English, "A good afternoon to you, gentleman."

He grimaced slightly. He would rather hear Russian than English delivered with quite so distorted an accent.

He said sullenly in Russian, "Please speak in Russian, Sophia."

His Russian might be as distressing to her, for all he knew, as her English was to him, but he didn't care. He was here by their doing and if his shortcomings troubled them, that was their doing, too.

She shrugged slightly and said in Russian, "Certainly -- if that is what pleases you."

Then she stared at him for a thoughtful while. He met that stare easily enough for, at the moment, he did not much care what he did and looking at her was not much different to him than looking at something else would have been -- or looking at nothing would have been. The momentary impression of beauty that had come with her entrance had faded.

She said finally, "I understand that you have now agreed to accompany us on our venture."

"Yes, I have."

"That is good of you. We are all grateful. In all honesty, I did not think you would do so, since you are an American. I apologize."

Morrison said with a far-off touch of regret and anger, "The decision to help you was not voluntary. I was persuaded -- by an expert."

"By Natalya Boranova?"

Morrison nodded.

"She is very good at persuading," said Kahinin. "Not very kind, usually, but very good. I, too, required persuasion."

"Why you?" said Morrison.

"I had other reasons -- ones that were important to me."

"Indeed? What were they?"

"But unimportant to you."

There was a short uncomfortable pause.

"Come, the task I have been given is to show you the ship," said Kahinin.

"The ship? How long have you been planning this? Have you had time to build a ship?"

"For the specific purpose of testing Shapiro's brain from within? Of course not. It was meant for other, simpler purposes, but it is the only thing we have that we can use. -- Come, Albert, Natalya thinks it will be wise for you to become acquainted with it, see it, feel it. It is possible that the down-to-earthness of the technology will reconcile you to the task."

Morrison held back. "Why must I see it now? Can't I have time to grow accustomed to the whole subject of personal miniaturization?"

"That is foolish, Albert. If you had more time to sit in your room and brood, you would have more time to feed your uncertainty. Besides, we have no time. How long do you suppose we can allow Shapiro to lie there deteriorating, with his thoughts diminishing with each moment? The ship embarks on its journey tomorrow morning."

"Tomorrow morning," muttered Morrison, his throat dry. Foolishly, he looked at his watch.

"You have few enough hours, but we'll keep track of the time for you so you need not consult your watch. Tomorrow morning the ship enters a human body. And you will be on the ship."

Then, without warning, she slapped his cheek hard. She said, "Your eyes were beginning to turn upward. Were you planning to faint?"

Morrison rubbed his cheek, grimacing with pain. "I wasn't planning anything," he mumbled, "but I might have fainted without planning it. Have you no gentler way of breaking the news?"

"Have I really caught you by surprise, when you already know that you have agreed to be miniaturized and it is self-evident that we have no time?"

She gestured peremptorily, "Now come with me."

And Morrison, still rubbing his cheek and seething with rage and humiliation, followed.

28.

It was back to the miniaturization area -- back to the busy people, each concerned with their own affairs and paying no attention to one another. Through them all, Kahinin walked with an erect carriage and maintained the aristocratic air that arises automatically when all defer to you.

She was one of the leading lights, Morrison could see (his hand still resting lightly on his cheek, which felt inflamed and which he hesitated to expose), and all who crossed or even neared her path nodded their heads in a kind of rudimentary bow and stepped a little backward, as though to make sure not to impede her path. No one acknowledged Morrison's presence at all.

On, on, through one room after another -- and everywhere the feel of pent-up energy held in bare check.

Kahinin must have sensed it too, familiar as she must be with it, for she muttered to Morrison with a certain pride, "There's a solar power station in space, a major part of whose output is reserved for Malenkigrad."

And then they were upon it before Morrison had a true chance to realize what he was looking at. It was not a very large room and the object within it was not of impressive bulk. Indeed, Morrison's first impression was that it was a piece of artwork.

It was a streamlined object not much larger than an automobile, certainly shorter than a stretch limousine, though taller. And it was transparent!

Automatically, Morrison reached out to feel it.

It was not cold to the touch. It felt smooth and almost moist, but when he removed his hand, his fingertips were perfectly dry. He tried it again and as he ran his fingertips across the surface, they seemed to stick slightly, but they left no sweaty mark. On impulse, he breathed upon it. There was the shadow of condensing moisture on the transparent material, but it disappeared quickly.

"It is a plastic material," said Kahinin, "but I don't know its composition. If I knew, it would probably come under the head of classified information anyway, but whatever it is, it is stronger than steel -- tougher and more resistant to shock -- kilogram for kilogram."

"Weight for weight, perhaps," said Morrison, for the moment his scientific curiosity drowning his uneasiness, "but such a thickness of plastic material could not possibly be as strong as the same thickness of steel. It could not be as strong, volume for volume."

"Yes, but where are we going?" said Kahinin. "There will be no pressure differential inside and outside the ship; there will be no meteoroids or even cosmic dust against which we must protect ourselves. There will be about us nothing but soft cell structure. This plastic will be ample protection and it is light. The two of us could perhaps lift it if we tried. That is what is important. As you can well understand, we must be sparing of mass. Every additional kilogram consumes considerable electromagnetic energy in miniaturization and delivers considerable heat in deminiaturization."

"Will it hold a large enough crew?" said Morrison, peering inside.

"It will. It is very compact, but it can hold six and we will only be five. And it contains a surprising amount of unusual gadgetry. Not as much as we would like, of course. The original plans -- But what can we do? There are always pressures for economy, even unwarranted ones, in this unjust world."

Morrison said with a twinge of strong uneasiness, "How much pressure for how much economy? Does everything work?"

"I assure you it does." Her face had lit up. Now that the settled melancholy had left (temporarily only, Morrison felt sure), Kahinin was unmistakably good-looking.

"Everything in it has been tested exhaustively, both singly and all together. Zero risk is impossible of attainment, but we have a reasonably close to zero risk here. And all with virtually no metal. What with microchips, fiber optics, and Manuilsky junctions, we have all we want in a total of less than five kilograms of devices all together. That is why the ship can be so small. After all, voyages into the microcosm are not expected to last for more than some hours, so we don't need sleeping arrangements, cycling equipment, elaborate food and air supplies, anything other than quite simple devices for excretory functions, and so on."

"Who'll be at the controls?"

"Arkady."

"Arkady Dezhnev?"

"You seem surprised."

"I don't know why I should. I presume he's qualified."

"Completely. He's in engineering design and he's a genius at it. You can't go by the way he sounds -- No, you can go by the way he sounds. Do you suppose any of us could endure his crude humor and affectations if he weren't a genius at something? He designed the ship -- every part of it -- and all its equipment. He invented a dozen completely new ways of lowering mass and introducing compactness. You have nothing like it in the United States."

Morrison said stiffly, "I have no way of knowing what the United States may have or may not have in unusual devices."

"I am sure they don't. Dezhnev is an unusual person, for all his love of presenting himself as a boor. He is a descendant of Semyon Ivanov Dezhnev. You have heard of him, I suppose."

Morrison shook his head.

"Really?" Kahinin's voice turned icy. "He is only the famous explorer who, in the time of Peter the Great, explored Siberia to its easternmost centimeter and said there was a stretch of sea separating Siberia and North America decades before Vitus Bering, a Dane in Russian employ, discovered the Bering Strait. -- And you don't know Dezhnev. That's so American. Unless a Westerner did it, you never heard of it."

"Don't see insults everywhere, Sophia. I haven't studied exploration. There are many American explorers that I don't know -- and that you don't, either." He shook his finger at her, again remembering her slap and rubbing his cheek once more, "This is what I mean. You find things to feed hate on -- inconsequential things you should feel ashamed to grub up."

"Semyon Dezhnev was a great explorer -- and not inconsequential."

"I'm willing to admit that. I am glad to learn of him and I marvel at his achievement. But my not having heard of him is not a fit occasion for Soviet-American rivalry. Be ashamed of yourself!"

Kahinin's eyes fell, then lifted to his cheek. (Had she left a bruise there? Morrison wondered.) She said, "I'm sorry I struck you, Albert. It need not have been that hard, but I didn't want you to faint. At that moment, I felt I would have no patience to deal with an unconscious American. I did let unjustified anger guide me."

"I'll grant you meant well, but I, too, wish you had not struck so hard. Still, I will accept your apology."

"Then let us get into the ship,"

Morrison managed a smile. Somehow he felt a little better dealing with Kahinin than he would have with Dezhnev or Konev -- or even Boranova. A pretty woman, still quite young, does somehow distract a man's mind from his troubles more effectively than most things would. He said, "Aren't you afraid I might try to sabotage it?"

Kahinin paused. "Actually, I'm not. I suspect you have enough respect for a vessel of scientific exploration to avoid doing it any damage whatever. Besides -- and I say this seriously, Albert -- the laws against sabotage are excessively severe in the Soviet Union and the slightest mistake in handling anything in the ship will set off an alarm that will have guards here in a matter of seconds. We have strict laws against guards beating up saboteurs, but sometimes they tend to forget themselves in their indignation. Please don't even think of touching anything."

She put a hand on the hull as she spoke and presumably closed a contact, though Morrison didn't see how it was done. A door -- a rectangle curved at the edge -- opened. (The door's own edge seemed to be double. Would it also act as an air lock?)

The opening was compact. Kahinin, entering first, had to stoop. She held out a hand to Morrison. "Careful, Albert."

Morrison not only stooped, but turned sideways. Once inside the ship, he found that he could not quite stand upright. When he bumped his head gently, he looked up at the ceiling, startled.

Kahinin said, "We'll be doing our work sitting down for the most part, so don't be concerned about the ceiling."

"I don't think claustrophobes would like this."

"Are you claustrophobic?"

"No."

Kahinin nodded her relief. "That's good. We have to save space, you know. What can I tell you?"

Morrison looked around. There were six seats, in pairs. He sat down in the one nearest the door and said, "These are not exactly roomy, either."

"No," admitted Kahinin. "Weight lifters could not be accommodated."

Morrison said, "Obviously, this ship was built long before Shapirov went into his coma."

"Of course. We've been planning to have miniaturized personnel invade living tissue for a long time. That would be necessary if we wished to make truly important biological discoveries. Naturally, we expected that we would work with animals at the start and study the circulatory system in fine detail. It is for that project that this ship was built. No one could possibly have guessed that when the time came to carry out the first such microvoyage, the subject would not only be a human body but Shapirov himself."

Morrison was still studying the interior of the ship. It seemed bare. Detail was surprisingly difficult to make out in the situation of transparency-on-transparency and miniaturization of the old-type -- ordinary, but microscopic -- components.

He said, "There will be five on the ship: you and I, Boranova, Konev, and Dezhnev."

"That's right."

"And what will each of us be doing?"

"Arkady will control the ship. Obviously, he knows how to do that. It's the child of his hands and mind. He'll be in the left front seat. To his right will be the other male, who has a complete map of the neurocirculatory pattern of Shapirov's brain. He will be the pilot. I will sit behind Arkady and I will control the electromagnetic pattern of the ship's surface."

"An electromagnetic pattern? What's that for?"

"My dear Albert. You recognize objects by reflected light, a dog recognizes objects by emitted odor, a molecule recognizes objects by surface electromagnetic pattern. If we're going to make our way as a miniaturized object among molecules, we must have the proper patterns in order to be treated as friends rather than foes."

"That sounds complicated."

"It is -- but it happens to be my life study. Natalya will sit behind me. She will be the captain of the expedition. She will make the decisions."

"What kind of decisions?"

"Whatever kind are necessary. Obviously, those can't be predicted in advance. As for you, you will sit to my right."

Morrison rose and managed to shift his position along the narrow aisle on the door side of the seats and move one seat back. He had been in Konev's seat and now he was in what would be his own. He could feel his heart pounding as he imagined himself in that same seat on the following day, with the miniaturization process in progress.

He said in a muffled voice, "There is only one man, then -- Yuri Konev -- who was miniaturized and deminiaturized and was unharmed by the process."

"Yes."

"And he mentioned no discomfort in the process, no sickness, no mental disturbance?"

"Nothing of the sort was reported."

"Would that be because he is a stoic? Would he feel it would be beneath the dignity of a hero of Soviet science to complain?"

"Don't be foolish. We are not heroes of Soviet science and the one you speak of certainly isn't. We are human beings and scientists and, in fact, if there were any discomfort that we felt, we would be compelled to describe it in full detail, since it might be that with modifications of the process we could remove that discomfort and make future miniaturizations less difficult. Hiding any part of the truth would be unscientific, unethical, and dangerous. Don't you see that -- since you are a scientist yourself?"

"Yet there may be individual differences. Yuri Konev survived untouched. Pyotr Shapirov did not -- quite."

"That had nothing to do with individual differences," said Kahinin impatiently.

"We can't really tell, can we?"

"Then judge for yourself, Albert. Do you think we would take the ship into miniaturization without a final testing -- with and without human beings aboard? This ship was miniaturized, empty, during the course of this past night -- not to a very great extent, but enough to know that all is well."

At once Morrison struggled upward to get out of his seat. "In that case, if you don't mind, Sophia, I want to get out before it is tested with human beings aboard."

"But, Albert, it's too late."

"What!"

"Look out the ship at the room. You haven't once looked outside since you got in, which, I suppose, was a good thing. But look out now. Go ahead. The walls are transparent and the process is complete for now. Please! Look!"

Morrison, startled, did so and then, very slowly, his knees bent and he seated himself again. He asked (and even as he did so, he knew how foolish he must sound), "Do the ship's walls have a magnifying effect?"

"No, of course not. Everything outside is as it always is. The ship and I and you have been miniaturized to about half our linear dimensions."

29.

Morrison felt dizziness overcome him and he bent his head between his knees and breathed slowly and deeply. When he lifted his head again, he saw Kahinin watching him thoughtfully. She was standing in the narrow aisle, leaning slightly against a seat's armrest to allow the ceiling to clear her head.

"You might have fainted this time," she said. "It would not have disturbed me. We are being deminiaturized now and that will be more time-consuming than the miniaturization, which took no more than three or four minutes. It will take an hour or so for us to get back, so you will have ample time to recover."

"It was not a decent act to do this without telling me, Sophia."

"On the contrary," said Kahinin. "It was an act of kindness. Would you have entered the ship as freely and as easily as you did if you had suspected that we would be miniaturized? Would you have inspected the ship as coolly if you had known? And if you had been anticipating miniaturization, would you not have developed psychogenic symptoms of all sorts?"

Morrison was silent.

Kahinin said, "Did you feel anything? Were you even aware that you were being miniaturized?"

Morrison shook his head. "No."

Then, driven by a certain shame, he said, "You've never been miniaturized before any more than I have, have you?"

"No. Before this day, Konev and Shapirov have been the only human beings to have undergone miniaturization."

"And you weren't at all apprehensive?"

She said, "I wouldn't say that. I was uneasy. We know from our experience with space travel that, as you said earlier, there are individual differences in reaction to unusual environments. Some astronauts suffer episodes of nausea under zero gravity and some do not, for instance. I couldn't be sure how I would react. -- Did you feel nausea?"

"I didn't until I found out we had been miniaturized, but I suppose feeling queasy now doesn't count. -- Who planned this?"

"Natalya."

"Of course. I needn't have asked," he said drily.

"There were reasons. She felt we couldn't have you break down once the voyage began. We couldn't be expected to deal with hysteria on your part once we began miniaturizing."

"I suppose I deserve that lack of confidence," said Morrison, his eyes looking away in embarrassment from those of Kahinin. "And I imagine she assigned you to come with me for the precise purpose of distracting my attention while all this was going on."

"No. That was my idea. She wanted to come with you herself, but with her, by now, I thought you might be anticipating trickery."

"Whereas with you, I might be at my ease."

"At least, as you say, distracted. I am still young enough to distract men." Then, with a touch of bitterness, "Most men."

Morrison looked up, eyes narrowing. "You said I might be anticipating trickery."

"I mean, with Natalya."

"Why not with you? All I see now is that everything outside seems enlarged. How can I be sure that that is not an illusion, something designed to make me think I have been miniaturized and that it is harmless -- merely so that I step quietly into the ship tomorrow?"

"That's ridiculous, Albert, but let's consider something. You and I have lost half our linear dimension in every direction. The strength of our muscles varies inversely with their cross-sections. They are now half their normal width and half their normal thickness, so that they have half times half or one fourth the cross-section and, therefore, the strength they would normally have. Do you see what I mean? Do you understand?"

"Yes, of course," said Morrison, annoyed. "That is elementary."

"But our bodies as a whole are half as tall, half as wide, and half as thick, so that the total volume -- and mass and weight as well -- is half times half times half or one eighth what it was originally. -- If we are miniaturized, that is."

"Yes. This is the square-cube law. It's been understood since Galileo's time."

"I know, but you haven't been thinking about it. If I were to try to lift you now, I would be lifting one eighth your normal weight and I would be doing so with my muscles at one quarter their normal strength. My muscles compared to your weight would be twice as strong as they would appear to be if we were not miniaturized."

And with that, Kahinin thrust her hands under his armpits and, with a grunt, lifted. Up he moved from his seat.

She held him so while she gasped twice and then she lowered him. "It's not easy," she said, panting a bit, "but I could do it. And since you may be telling yourself, 'Ah yes, but this is Sophia, probably a Soviet weight lifter,' then do it to me."

Kahinin seated herself in the seat before him and held out her arms to either side and said, "Come, stand up and lift me."

Morrison rose to his feet and into the aisle. He moved forward, turned, and faced her. The slight bending enforced on him by the low ceiling made it an uncomfortable position. For a moment, he hesitated.

Kahinin said, "Come, seize me under the arms. I use deodorant. And you needn't be concerned about possibly touching my breasts. They have been touched before this. Come -- I'm lighter than you are and you're stronger than I am. Since I have lifted you, you should have no trouble at all lifting me."

Nor did he. He couldn't lift with his full strength because of his slight, uncomfortable stoop, but he automatically applied the force he judged, through years of experience, would be suitable for an object her size. She floated upward, however, almost as though she were weightless. Despite the fact that he had been somewhat prepared for the possibility, he almost dropped her.

"Do you consider that an illusion?" Kahinin asked. "Or are we miniaturized?"

"We are miniaturized," said Morrison. "But how did you do it? I never saw you make a move that looked as though you might be using miniaturization controls."

"I didn't. It's all done from outside. The ship is equipped with miniaturization devices of its own, but I wouldn't dare use them. That would be part of Natalya's job."

"And now the deminiaturization is being controlled from outside, too, isn't it?"

"That's right."

"And if the deminiaturization gets slightly out of hand, our brains will be damaged as Shapirov's was -- or worse."

"That's not really likely," said Kahinin, stretching her legs out into the aisle, "and it doesn't help to think about it. Why not just relax and close your eyes?"

Morrison persisted. "But damage is possible."

"Of course it's possible. Almost anything is possible. A three-meter-wide meteorite may strike two minutes from now, penetrate the mountain shell above us, flash into this room, and destroy the ship and us and perhaps the entire project in a few flaming seconds. -- But it's not likely."

Morrison cradled his head in his arms and wondered whether -- if the ship started warming -- he could feel the heat before his brain proteins denatured.

30.

Well over half an hour had passed before Morrison felt convinced that the objects he could see outside the ship were shrinking and were receding perceptibly toward their normal size.

Morrison said, "I am thinking of a paradox."

"What's that?" said Kahinin, yawning. She had obviously taken her own advice about the advisability of relaxing.

"The objects outside the ship seemed to grow larger as we shrink. Ought not the wavelengths of light outside the ship also grow larger, becoming longer in wavelength, as we shrink? Should we not see everything outside turn reddish, since there can scarcely be enough ultraviolet outside to expand and replace the shorter-wave visible light?"

Kahinin said, "If you could see the light waves outside, that would indeed be how they would appear to you. But you don't. You see the light waves only after they've entered the ship and impinged upon your retina. And as they enter the ship, they come under the influence of the miniaturization field and automatically shrink in wavelength, so that you see those wavelengths inside the ship exactly as you would see them outside."

"If they shrink in wavelength, they must gain energy."

"Yes, if Planck's constant were the same size inside the miniaturization field as it is outside. But Planck's constant decreases inside the miniaturization field -- that is the essence of miniaturization. The wavelengths, in shrinking, maintain their relationship to the shrunken Planck's constant and do not gain energy. An analogous case is that of the atoms. They also shrink and yet the interrelationships among atoms and among the subatomic particles that make them up remain the same to us inside the ship as they would seem to us outside the ship."

"But gravity changes. It becomes weaker in here."

"The strong interaction and the electroweak interaction come under the umbrella of the quantum theory. They depend on Planck's constant. As for gravitation?" Kahinin shrugged. "Despite two centuries of effort, gravitation has never been quantized. Frankly, I think the gravitational change with miniaturization is evidence enough that gravitation cannot be quantized, that it is fundamentally nonquantum in nature."

"I can't believe that," said Morrison. "Two centuries of failure can merely mean we haven't managed to get deep enough into the problem yet. Superstring theory nearly gave us our unified field at last." (It relieved him to discuss the matter. Surely he couldn't do so if his brain were heating in the least.)

"Nearly doesn't count," said Kahinin. "Still, Shapirov agreed with you, I think. It was his notion that once we tied Planck's constant to the speed of light, we would not only have the practical effect of miniaturizing and deminiaturizing in an essentially energy-free manner, but that we would have the theoretical effect of being able to work out the connection between quantum theory and relativity and finally have a good unified field theory. And probably a simpler one than we could have imagined possible, he would say."

"Maybe," said Morrison. He didn't know enough to comment beyond that.

"Shapirov would say," said Kahinin, warming to the task, "that at ultraminiaturization, the gravitational effect would be close enough to zero to be utterly ignored and that the speed of light would be so great that it might be considered infinite. With mass virtually zero, inertia would be virtually zero and any object, like this ship, for instance, could be accelerated with virtually zero energy input to any speed. We would have, practically speaking, antigravity and faster-than-light travel. Chemical drive, he said, gave us the Solar System, ion drive would give us the nearer stars, but relativistic miniaturization would give us the whole Universe at a bound."

"It's a beautiful vision," said Morrison, ravished.

"Then you know what we're looking for now, don't you?"

Morrison nodded. "All that -- if we can read Shapirov's mind. And if he really had something there and wasn't merely dreaming."

"Isn't the chance worth the risk?"

"I am on the point of believing so," said Morrison in a low voice. "You are terribly convincing. Why couldn't Natalya have used arguments of that sort, rather than those she did use?"

"Natalya is -- Natalya. She is a highly practical person, not a dreamer. She gets things done."

Morrison studied Kahinin as she sat, now in the seat to his left, looking straight ahead with an abstracted look that gave her profile the appearance of an impractical dreamer, at that -- but perhaps not one who, like Shapirov, dreamed of conquering the Universe. With her, it was something closer to home perhaps.

He said, "Your unhappiness is not my business, Sophia, as you've said -- but I have been told about Yuri."

Her eyes flashed. "Arkady! I know it was he. He is a -- a --" She shook her head. "With all his education and all his genius, he remains a peasant. I always think of him as a bearded serf with a vodka bottle."

"I think he's concerned about you in his own way, even if he doesn't express himself poetically. Everyone must be concerned."

Kahinin stared at Morrison fiercely, as if holding her words back.

He prodded her gently, saying, "Why don't you tell me about it? I think it will help and I am a logical choice, being the outsider of the party -- I assure you I am trustworthy."

Kahinin looked at him again, this time almost gratefully.

"Yuri!" she spat. "Everyone may be concerned, except Yuri. He has no feelings."

"He must have been in love with you at one time."

"Must he? I don't believe it. He has a -- a --" -- she looked up and spread her hands, which were shaking, as though groping for a word and having to settle for something inferior -- "vision."

"We're not always masters of our own emotions and affections, Sophia. If he has found another woman and dreams of her --"

"There's no other woman," said Kahinin, frowning. "None! He uses that as an excuse to hide behind! He loved me, if at all, only absently, because I was convenient at hand, because I satisfied a vague physical need, and because I was also involved in the project, so that he didn't have to lose much time dallying with me. As long as he had this project firmly in hand, he didn't mind having me -- quietly, unobtrusively -- at odd moments."

"A man's work --"

"Need not fill every moment of time. I told you he has a vision. He plans to be the new Newton, the new Einstein. He wants to make discoveries so fundamental, so great, that he will leave nothing for the future. He will take Shapirov's speculations and turn them into hard science. Yuri Konev will become the whole of the natural law and everyone else will be commentary!"

"Might that not be considered an admirable ambition?"

"Not when it makes him sacrifice everything and everyone else, when it makes him deny his own child. I? What do I matter? I can be neglected, denied. I am an adult. I can take care of myself. But a baby? A child? To deny her a father? To refuse her? To reject her? She would distract him from his work, she would make demands on him, she would consume a few moments of time here and there -- so he insists he is not the father."

"A genetic analysis --"

"No. Would I drag him to court and force a legal decision upon him? Consider what his denial implies? The child is not a virgin birth. Someone must be the father. He implies -- no, he states -- that I am promiscuous. He has not hesitated to give it as his opinion that I do not know the father of my child since I am lost among the numerous possibilities. Shall I labor to make a man as low as he is the legally proved father of my child against his will? No, let him come to me and admit he is the father and apologize for what he has done -- and I may allow him a glance, now and then, at the child."

"Yet I have a feeling you still love him."

"If I do, that is my curse," said Kahinin bitterly. "It shall not be my child's."

"Is that why you have had to be persuaded to undertake this miniaturization?"

"And work with him? Yes, that is why. But they tell me I cannot be replaced, that what we may do for science lies far above and beyond any conceivable personal feeling -- any anger, any hate. Besides --"

"Besides?"

"Besides, if I abandon the project, I lose my status as a Soviet scientist. I lose many privileges and perquisites, which do not matter, and so does my daughter -- which matters a great deal."

"Did Yuri have to be persuaded, too, to work with you?"

"He? Of course not. The project is all he knows and sees. He does not look at me. He does not see me. And if he dies in the course of this attempt --" She held out her hand in appeal to him. "Please understand that I do not for a moment believe that this will happen. It is just a stupidly romantic notion that I torture myself with for the love of pain, I suppose. If he should die, he would not even be aware that I would die with him."

Morrison felt himself tremble. "Don't talk like that," he said. "And what would happen to your daughter in that case? Did Natalya tell you that?"

"She did not have to. I know that without her. My daughter would be reared by the state, as the child of a Soviet martyr to science. She might be better off so." Sophia paused and looked around. "But it's beginning to look quite normal out there. We should be out of the ship soon."

Morrison shrugged.

"You will have to spend much of the rest of the day being medically and psychologically examined, Albert. So will I. It will be very boring, but it has to be done. How do you feel?"

"I'd feel better," said Morrison in a burst of honesty, "if you hadn't talked about dying. -- Listen! Tomorrow, when we make the trip into Shapiro's body, how far will we be miniaturized?"

"That will be Natalya's decision. To cellular dimensions at the very least, obviously. Perhaps to molecular dimensions."

"Has anyone ever done that?"

"Not to my knowledge."

"Rabbits? Inanimate objects?"

Kahinin shook her head and said again, "Not to my knowledge."

"How, then, does anyone know that miniaturization to such an extent is possible? Or that, if it is, any of us can survive?"

"The theory says it is and that we can. So far, every bit of experimentation has fit in with the theory."

"Yes, but there are always boundaries. Wouldn't it be better if ultraminiaturization were tested on a simple bar of plastic, then on a rabbit, then on a --"

"Yes, of course. But persuading the Central Coordinating Committee to allow the energy expenditure would be an enormous task and such experiments would have to be dribbled out over months and years. We have no time! We must get into Shapirov immediately."

"But we're going to be doing something unprecedented, crossing into an untested region, with only the maybes of theory to --"

"Exactly, exactly. Come, the light is flashing and we must emerge and accompany the waiting physicians."

But for Morrison the marginal euphoria of a safe deminiaturization was seeping away. What he had experienced today was in no way indicative of what he must face the next day.

The terror was returning.

8. PRELIMINAIRES

The greatest difficulty comes at the start. It's called "getting ready."

Dezhnev Senior

31.

Later that evening, after a long -- and tedious -- medical exam, he joined the four Soviet researchers for dinner. The Last Supper, Morrison thought grimly.

Sitting down, he burst out, "No one told me the results of my examination!" He turned to Kahinin. "Did they examine you, Sophia?"

"Yes, indeed, Albert."

"Did they tell you the results?"

"I'm afraid not. Since it is not we who pay them, I suppose they don't feel they owe us anything."

"It doesn't matter," said Dezhnev jovially. "My old father used to say, 'Bad news has the wings of an eagle, good news the legs of a sloth.' If they said nothing, it was because they had nothing bad to report."

"Even the bad news," said Boranova, "would have been reported to me -- and only to me. I am the one who must decide who will accompany us."

"What did they tell you about me?" asked Morrison.

"That there is nothing important wrong with you. You will be coming with us and in twelve hours the adventure will begin."

"Is there anything unimportant wrong with me, then, Natalya?"

"Nothing worth mentioning, except that you display, according to one doctor, a 'typical American bad temper.'"

"Huh!" said Morrison. "One of our American freedoms is that of being bad-tempered when doctors show a typical Soviet lack of concern for their patients."

Nevertheless, his apprehension over the state of his mind ebbed and, as it did so, inevitably the apprehension over his impending miniaturization rose higher.

He lapsed into silence, eating slowly and without much of an appetite.

32.

Yuri Konev was the first to rise from the dinner table. For a moment he remained standing, leaning forward over the table, a slight frown on his intense, youthful face.

"Natalya," he said, "I must take Albert to my office. It is necessary that we discuss tomorrow's task and prepare for it."

Boranova said, "You will remember, please, that we must all have a good night's sleep. I don't wish you to forget the passage of time. Do you want Arkady to go with you?"

"I don't need him," said Konev haughtily.

"Nevertheless," said Boranova, "there will be two guards at your office door and you will call out if you need them."

Konev turned from her impatiently and said, "I won't need them, Natalya, I'm sure. Come with me, Albert."

Morrison, who had been watching them both from under lowered eyebrows, rose and said, "Is this going to be a long trip? I'm tired of being shuttled from point to point in the Grotto."

Morrison knew well he was being ungracious, but it didn't seem to bother Konev, who responded just as ungraciously, "I should think a professor would be used to plunging back and forth across a university campus."

Morrison followed Konev out the door and together they tramped along the corridor in silence. Morrison was aware that at a certain point two guards fell in behind them. He heard additional footsteps keeping time with his own. He looked back, but Konev did not.

Morrison said impatiently, "Much longer, Yuri?"

"That is a foolish question, Albert. I have no intention of walking you past our destination. When we get there, we will be there. If we are still walking, it is because we are not there yet."

"I should think, with all this walking, you might arrange golf carts or something of the sort for the corridors."

"Anything to allow the muscles to atrophy, Albert? Come, you are not so old that you cannot walk or so young that you must be carried."

Morrison thought, If I were that poor woman with his child, I would shoot off fireworks to celebrate his denial of fatherhood.

They reached Konev's office at last. At least Morrison assumed it was his office when Konev barked the word "Open" and the door slid smoothly open in response to his voiceprint. Konev strode through first.

"What if someone imitates your voice?" asked Morrison curiously. "You don't have a very distinctive voice, you know."

Konev said, "It also scans my face. It will not respond to either separately."

"And if you have a cold?"

"One time when I had a bad one, I could not get into my office for three days and I finally had to have the door opened mechanically. If my face were bruised or scarred by accident, I might also have trouble. Still, that is the price of security."

"But are the people here so -- inquisitive -- that they would invade your privacy?"

"People are people and it is not wise to overtempt even the best of them. I have things here unique to myself and they may be viewed only when I decide to allow it. This, for instance." His slim hand (very well cared-for and manicured, Morrison noticed -- he might neglect other things for his work, but not himself) rested on an extraordinarily large and thick volume, which, in turn, rested on a stand that had been clearly designed for it.

"What is that?" asked Morrison.

"That," said Konev, "is Academician Shapirov -- or at least the essence of him." He opened the book and flipped the pages. Page after page (all of them, perhaps) were filled with symbols arranged in diagrammatic fashion.

Konev said, "I have it on microfilm, of course, but there are certain conveniences to having it in a printed volume." He patted the pages almost lovingly.

"I still don't understand," said Morrison.

"This is the basic structure of Shapirov's brain, translated into a symbolism of my own devising. Fed into the appropriate software, it can reconstitute a three-dimensional map of the brain in intimate detail on a computer screen."

"Astonishing," said Morrison, "if you are serious."

"I am serious," said Konev. "I have spent my entire career on this task: translating brain structure into symbols and symbols into brain structure. I have invented and advanced this science of cerebrography."

"And you used Shapirov as your subject."

"By incredible good fortune, I did. Or perhaps it was not good fortune, but merely inevitable. We all have our small vanities and it seemed to Shapirov that his brain was worth preserving in detail. Once I began working on this field under his direction -- for there was the feeling that we might someday want to explore animal brains at least -- he insisted on having his own brain analyzed cerebrographically."

Morrison said with a sudden excitement, "Can you get his theories out of the recorded cerebral structure of his brain?"

"Of course not. These symbols record a cerebral scanning that was carried through three years ago. That was before he had evolved his recent notions and, in any case, what I have preserved here is, unfortunately, only the physical structure and not the thoughts. Still, the cerebrograph will be invaluable to us in tomorrow's voyage."

"I should think so -- but I have never heard of this."

"I'm not surprised. I have published papers on this, but only in the Grotto's own publication -- and these remain highly classified. No one outside the Grotto, not even here in the Soviet Union, knows of them."

"That is bad policy. You will be overtaken by someone else who will publish and who will be granted priority."

Konev shook his head. "At the first sign that significant advances in this direction are being made elsewhere, enough of my early work will be published to establish priority. I have cerebrographs of canine brains that I can publish, for instance. But never mind that. The point is that we have a map of Shapirov's brain to guide us, which is a

matter of incredible good fortune. It was made without the knowledge that we might need it someday to guide us through that very cerebral jungle."

Konev turned to a computer and, with practiced flips of his wrist, inserted five large discs.

"Each one of these," he said, "can hold all the information in the Central Moscow Library without crowding. It is all devoted to Shapiro's brain."

"Are you trying to tell me," said Morrison indignantly, "that you could transfer all that information, all of Shapiro's brain, into that book you have here?"

"Well, no," said Konev, glancing at the book. "In comparison with the total code, that book is only a small pamphlet. However, it does hold the basic skeleton, so to speak, of Shapiro's neuron structure and I was able to use it as a guide by which to direct a computer program that mapped it out in greater detail. It took months for the best and most advanced computer we have to do the job.

"And even so, Albert, all we have reaches merely to the cellular level. If we were to map the brain down to the molecular level and try to record all the permutations and combinations -- all the conceivable thoughts that might arise from a particular human brain like Shapiro's; all the creativity, actual and potential -- I suppose it would take a computer the size of the Universe working for a much longer time than the Universe has existed. What I have, however, may be enough for our task."

Morrison, entranced, asked, "Can you show me how it works, Yuri?"

Konev studied the computer -- which was turned on, as one could tell by the soft whisper of its cooling mechanism -- then pushed the necessary keys. On the screen there appeared the side view of a human brain.

Konev said, "This can be viewed at any cross-section." He pressed a key and the brain began to peel as though it were being continually sliced by an ultrathin microtome some thousands of slices per second. "At this rate," he said, "it would take an hour and fifteen minutes to complete the task, but I could stop it at any chosen point. I could also cut off thicker slices or cut off one thick calculated slice to bring me at once to any wanted cross-section."

As he spoke, he demonstrated. "Or I could orient it in another direction or rotate it along any axis. Or I can magnify it to any extent down to the cellular level, either slowly or, as you see, quickly." As he said this, the material of the brain spread outward in all directions from a central point -- dizzily -- so that Morrison was forced to blink his eyes and then look away.

Konev said, "This is now at the cellular level. Those small objects are individual neurons and if I expanded the image still further, you would see the axons and dendrites. If one wishes, we could follow a single axon through the cell into a dendrite and across a synapse to another neuron and so on, traveling, by computer, through a brain three-dimensionally. Nor is the matter of three dimensions just a manner of speaking. The computer is outfitted for holographic imaging and it can present a three-dimensional appearance quite literally."

Morrison said challengingly, "Then why do you need miniaturization? Why do you need to send ships into the brain?"

Konev briefly allowed a look of contempt to cross his face. "That is a foolish question, Albert, and I suppose it is inspired only by your fear of miniaturization. You are groping for any excuse to eliminate it. What you see here on the screen is a three-dimensional mapping of the brain, but only three-dimensional. It has caught it at what is, essentially, an instant of time. In effect, we see unchanging material -- dead material. What we want to be able to detect is the living activity of the neurons, the changing activity with time. We want a four-dimensional view of the electric potentials that rise and fall, the microcurrents that travel along the cells and cell fibers, and we want to interpret them into thoughts. That's your task, Albert. Arkady Dezhnev will manipulate the ship along the routes I have chosen and you will give us the thoughts."

"On what basis have you chosen the routes?"

"On the basis of your own papers, Albert. I have chosen the regions you had decided must represent the neuron network for creative thought and, using this book, with its coded representation of Shapiro's brain as my initial guide, I calculated centers where more or less direct pathways could be found to several portions of the network. I then located them more accurately on the computer and it is to one or more of those centers that we will penetrate tomorrow."

Morrison shook his head. "I'm afraid I can't guarantee that we will be able to determine actual thoughts, even if we find the centers in which thinking takes place. It's as though we might reach a place where we can hear people's voices, but if we don't know the language, we are still left in ignorance of what they are saying."

"We can't know that in advance. The varying electric potentials in Shapiro's mind must resemble those in ours and we may simply be aware of his thoughts without knowing how we are aware. In any case, we can't tell unless we go in and try."

"In that case, you will have to be ready for possible disappointment."

"Never," said Konev with the utmost seriousness. "I intend to be the person to whom the human brain will finally yield its secrets. I will solve, completely, the ultimate physiological mystery of humanity, perhaps of the Universe -- if we are the most advanced thinking devices that exist anywhere. So we will work together, you and I, tomorrow. I want you to be ready for it, to help guide me by studying carefully the brain waves we encounter. I want you to interpret Shapiro's thoughts and, most particularly, his thoughts on combining quantum theory and relativity so that trips such as ours tomorrow can become routine and we can begin the study of the brain in all earnestness."

He stopped and stared at Morrison intently, then said, "Well?"

"Well, what?"

"Does none of this impress you?"

"Of course it impresses me, but . . . I have a question. Today when I watched the rabbit being miniaturized, there was a pronounced whine during the process -- and a rumble when it was deminiaturized. There was nothing of the sort when I was subjected to it -- or I would have known what was happening."

Konev raised a finger, "Ah. The noise is apparent when you are in real space, but not when you are in miniaturized space. I was the first to realize that was so when I was miniaturized and I reported it. We still don't know why the miniaturization field seems to stop sound waves when it doesn't stop light waves, but then we expect to learn new aspects of the process as we go on."

"As long as we don't discover fatal aspects," muttered Morrison. "Are you afraid of nothing, Yuri?"

"I'm afraid of not being able to complete my work. That would be true if I died tomorrow or if I refused to undergo miniaturization. Being stopped by death, however, is only a small possibility, but if I refuse to undergo miniaturization, then I am stopped certainly. That is why I much prefer to risk the former than take the latter way out."

"Does it bother you that Sophia will be undergoing miniaturization with you?"

Konev frowned. "What?"

"If you don't remember her first name, it may help if I refer to her as Kahinin."

"She is part of the group and will be on the ship. Yes."

"And you don't mind?"

"Why should I?"

"After all, she feels you have betrayed her."

Konev frowned darkly and a dull flush rose to his face. "Has her madness gone so far as to force her to confide her incoherencies to strangers? If she weren't needed on this project --"

"I'm sorry. She didn't sound incoherent to me."

Morrison didn't know why he was pushing the matter. Perhaps he felt diminished at fearing a task the other so ardently welcomed and he therefore wished to diminish in turn. "Were you never her -- friend?"

"Friend?" Konev's face mirrored his contempt. "What is friendship? When I joined the project, I found her here; she had joined a month earlier. We worked together, we were new and untried together. Of course, there was what one might call friendship, a physical need for intimacy. What of it? We were young and unsure of ourselves. It was a passing phase."

"But it left something behind. A child."

"That was not my doing." And his mouth closed with a snap.

"She says --"

"I have no doubt she would like to saddle me with the responsibility, but it won't work."

"Have you considered genetic analysis?"

"No! The child is adequately cared for, I imagine, and even if genetic analysis seemed to indicate I might be the parent, I would refuse all efforts to tie me to the child emotionally, so what would the woman have to gain?"

"Are you so coldhearted?"

"Coldhearted! What do you imagine I have done -- corrupted a young, innocent virgin? She took the initiative in everything. In the sad story that I suppose she told you,

did she happen to mention that she'd been pregnant before, that she had had an abortion some years before I met her? I don't know who the father was then or who it is now. Perhaps neither does she -- either time."

"You are being unkind to her."

"I am not. She is being unkind to herself. I have a mistress. I have a love. It is this project. It is the human brain in the abstract, its study, its analysis, and all that that might lead to. The woman was, at best, a distraction -- at worst, a destruction. This little talk we are having -- that I did not ask for -- that she goaded you into undertaking, no doubt --"

"She did not," interdicted Morrison.

"Goads are not necessarily noticed. This discussion may cost me a night's sleep and make me that much less sharp tomorrow when I will need all my sharpness. Is that your intention?"

"No, of course not," Morrison said quietly.

"Then it is surely hers. You have no idea in how many different ways she has attempted interference and how often she has succeeded. I don't look at her, I don't speak to her, yet she will not leave me alone. Her imaginary wrongs seem as fresh in her mind as they were when I first broke away. Yes, I do mind her being on the ship with me and I have said so to Boranova, but she says that both of us are needed. Are you satisfied?"

"I'm sorry. I didn't mean to upset you so."

"What did you mean? Simply to have a quiet conversation? 'Say, what about all those betrayals and dirty tricks you have committed?' Just a friendly talk?"

Morrison remained silent, bowing his head slightly against the other's rage. Three out of five on the ship -- himself and the two ex-lovers -- would be laboring under a sense of unbearable wrong. He wondered if, on careful questioning, Dezhnev and Boranova would prove similarly disabled.

Konev said harshly, "You had better go. I brought you here to bury your fear of the project by providing you with a blaze of enthusiasm. Obviously, I have failed. You are more interested in prurient gossip. Go, the guards outside this door will take you to the quarters assigned you. You will need to sleep."

Morrison sighed. Sleep?

33.

Yet on this, his third night in the Soviet Union, Morrison slept.

Dezhnev had been waiting outside Konev's room with the guards, his broad face grinning and his large ears all but flapping with merriment. After the shadowed intensity of Konev's personality, Morrison found himself welcoming Dezhnev's chatter on all subjects but the morrow's miniaturization.

Dezhnev urged a drink on him. "It is not vodka, not alcohol," he had said, "It is milk and a little sugar and flavoring. I stole it from the commissary where it is used, I think,

for animals, because all those officials find human beings more easily replaceable than the animals. It is the curse of overpopulation. As my father used to say, 'To get a human being takes a moment of pleasure, but to get a horse costs money.' But drink. It will settle the stomach. I promise you."

The drink was in a can which Morrison punctured. He poured it into a cup that Dezhnev proffered and it tasted fairly good. He thanked Dezhnev almost cheerily.

When they got to Morrison's room, Dezhnev said, "Now the important thing for you to do is to sleep. Sleep well. Let me show you where everything is." And as he did so, he rather resembled a large and slightly unkempt mother hen. With a hearty "Good night. Be sure to get plenty of sleep," Dezhnev left the room.

And Morrison slept. Almost as soon as he worked himself into his favorite position - - stomach down, left leg bent, knee outward -- he began to feel sleepy. Of course, he had little sleep the last two nights, but he suddenly guessed that there had been a mild sedative in the cup into which he had poured the drink. Then came the thought that perhaps Konev should take such a sedative. Then -- nothing.

When he woke, he could not even remember having had any dreams.

Nor did he wake of his own accord. Dezhnev was shaking him, as cheerful as he had been the evening before, as wide awake, and even as spruced up as it was possible for that animated haystack to be.

He said, "Awake, Comrade American, for it is time. You must shave and wash. There are fresh towels, combs, deodorants, tissues, and soap in the bathroom. I know because I have delivered them myself. Also a new electric razor. And on top of that, new cotton clothes for you to wear with a reinforcement in the crotch so you will not feel so exposed. They actually have them, the rotten bureaucrats, if you know how to ask -- with a fist." And he raised his fist while twisting his face into a look of ferocity.

Morrison stirred and sat up on the bed. It took him a moment to place himself and to weather the shock of realization that it was Thursday morning and that miniaturization was just ahead.

Half an hour or so later, when Morrison stepped out of the bathroom again -- satisfactorily bathed, dried, deodorized, shaved, combed, and reaching for his two-piece cotton uniform and his slippers -- Dezhnev said, "Satisfactory elimination, my lad? No constipation?"

"Quite satisfactory," said Morrison.

"Good! I don't ask out of idle curiosity, of course. I am not fascinated by excrement. It is just that the ship is not ideally suited for such things. Better we all go in empty. I didn't trust to nature, myself. I took a bit of a laxative."

"How long will we stay miniaturized?" asked Morrison.

"Perhaps not long. An hour if we are very lucky, perhaps twelve if we're not."

"But, look," said Morrison. "I can count on a well-behaved colon, but I can't go for twelve hours without urinating."

"Who can?" asked Dezhnev jovially. "Each seat in the ship is equipped for the eventuality. There is a recess, a removable cover. A built-in toilet, so to speak. I designed it myself. But it will be a struggle and, if you're sensitive, embarrassing. Someday, though, when the energy-free miniaturization process is a fact, we can build ocean liners for miniaturization and live in them like tsars of old."

"Well, let's hope the expedition is not unnecessarily extended." (He found it odd that, for a moment, his apprehension shifted from fears of death or mental disability to the details of how to manipulate the toilet lid and how to proceed as unobtrusively as possible. -- It occurred to him that there must have been many grossnesses and indelicacies, involved in the great exploratory trips of the past, items that had gone undetailed and, therefore, unnoted.)

He was in his cotton clothes and had stepped into his slippers when Dezhnev, dressed in slightly larger versions of the same (also with refinement in the crotch), said, "Let us now go to breakfast. We will have good food, high calories, and low bulk, for there will be no eating on board the ship. There'll be water, of course, and fruit juices, but no real beverages of any kind. The sweet Natasha made a terrible face when I suggested we might need a drop of vodka now and then. There were a lot of uncalled-for comments about sots and drunkards. Albert, Albert, how I am persecuted -- and unjustly, too."

Breakfast was indeed plentiful, but not exactly filling. There was gelatin and custard, thick slabs of white bread with butter and marmalade, fruit juices, and several varieties of pills to be sluiced down.

The talk over the breakfast table was moderately animated and, for the most part, dealt with the local chess tournament. There was no mention of the ship or of miniaturization. (Was it bad luck to mention the project?)

Morrison did not object to the direction of comment. He even made a few comments about his own adventures as a chess player of marked lack of renown.

And then, all too soon, the table was being cleared and it was time.

They left for the ship.

34.

They walked in single file, with space between themselves. Dezhnev was first, then Kahinin, then Boranova, then Morrison, and finally Konev.

Almost at once, Morrison understood the purpose. They were on view and they were being individualized. Along the edges of the corridor were men and women -- employees of the project, obviously -- watching eagerly.

They, at least, must know what was going on, even if the rest of the Soviet Union (let alone the world) did not.

Drezhnev, in front, waved eagerly to the right and left, rather in the fashion of a kindly and popular monarch, and the crowds responded appropriately, shouting, waving, and calling out his name.

Each name was called at various times, for obviously each prospective crew member was known to all. The two women were restrained in their acknowledgement and Konev (as Morrison could see when he looked behind him) was, not unexpectedly, moving along, eyes forward and unresponsive.

And then Morrison was surprised when he distinctly heard the cry, in English, "Hurrah, the American!"

He looked in the direction of the outcry and automatically waved, at which, just as automatically, there was a loud and enthusiastic shout and the words were picked up until "Hurrah, the American!" drowned out all else.

Morrison found himself unable to maintain his earlier sullen resignation. He had never been the object of mob jubilation and he took to it immediately and without trouble, waving and grinning madly. He caught Boranova's gravely amused expression and saw Dezhnev pointing his finger at him in an ostentatious that's-the-American gesture, but allowed neither action to disturb him.

And then they passed out of the line of observers and into the large room in which Shapirov was resting in his mental cocoon of coma. The ship was also in the room.

Morrison looked around with astonishment. He said, "There's a camera crew out there."

Kahinin was now standing next to him. (How beautiful her breasts are, Morrison thought. They were veiled but not hidden by the thin cotton and he could see why Konev had referred to her as a distraction.) She said, "Oh yes, we'll be on television. Every significant experiment is carefully recorded and there are reporters at each occasion so that it might be described. There was even a camera present when you and I were miniaturized yesterday, but we kept it out of sight since you weren't to know you were to undergo the process."

"But if this is a secret project --"

"It will not always be secret. Someday, when we have reached full success, the details of our progress will be revealed to our people and to the world. -- Sooner, if it seems some other nation is making progress on its own in the same direction."

Morrison shook his head. "It isn't good, this primary concern with priority. Progress would be much faster if additional brains and resources were put on the job."

Kahinin said, "Would you willingly give up priority in your own field of research?"

Morrison was silent. It was the obvious retort.

Kahinin, noting this, said with a shake of her head, "I thought so. It is easy to be generous with someone else's money."

Boranova, meanwhile, was talking to someone whom Morrison judged to be a reporter, one who was listening eagerly. Morrison transferred his attention and found himself listening eagerly, too.

Boranova was saying, "This is the American scientist, Albert Jonas Morrison, who is a professor of neurophysics, which is, of course, Academician Konev's field. He is here serving as both an American observer and as an assistant to Academician Konev."

"And there will be five who will be on the ship?"

"Yes. And there will never be so remarkable a five again -- or so remarkable an event -- if miniaturization lasts a million years. Academician Konev is the very first human being ever to have undergone miniaturization. Dr. Sophia Kahinin is the first woman and Professor Albert Morrison is the first American ever to have undergone miniaturization. Kahinin and Morrison represent the first multiple miniaturization and were the first to be miniaturized in the ship. And as for today's voyage, this will represent the first miniaturization of five human beings at once and it will be the first occasion on which a miniaturized ship and its crew will be inserted into a living human being. The human being into whom we will be inserted is, of course, Academician Pyotr Shapirov, who was the second human being to be miniaturized and the first to be a casualty of the process."

Dezhnev, who was suddenly at Morrison's side, whispered hoarsely into his ear, "There you are, Albert. You are now an indelible footnote in history. You might have imagined until now that you were a failure, but not so. No one can take from you the fact that you were the first American ever to be miniaturized. Even if your countrymen work out the miniaturization process on their own and miniaturize an American, that American can be no better than second."

Morrison had not thought of that. He was tasting this newfound and permanent personal statistic (if the Soviets would someday release Natalya's statement, undistorted and unrewritten) and he found it savory.

Yet he was not satisfied. "It is not what I want to be remembered for."

"Do a good job on this journey we are to take and you will end up being known for much more," said Dezhnev. "Besides, as my old father used to say, 'It is good to be at the head of the table, even if only one other sits with you and there is but a bowl of cabbage soup to share.'"

Dezhnev stepped away and now Kahinin was again at Morrison's side. She tugged at his sleeve and said, "Albert."

"Yes, Sophia?"

"You were with him after dinner last night, weren't you?"

"He showed me a map of Shapirov's brain. Marvelous!"

"Did he say anything about me?"

Morrison hesitated. "Why should he have?"

"Because you are a curious man, trying to escape your own private devils. You would have asked."

Morrison winced at her characterization of him. He said, "He defended himself."

"How?"

"He mentioned an earlier pregnancy -- and -- and abortion. It was not something I would believe, Sophia, unless you admitted it."

Kahinin's eyes became bright with gathering tears. "Did he---did he describe the circumstances?"

"No, Sophia. Nor did I ask."

"He might have told you. I was forced when I was seventeen. It had undesirable consequences and my parents took legal measures."

"I understand. Perhaps Yuri chooses not to believe this."

"He may choose to think that I asked for it, but it is all on the record and the rapist is still in prison. Soviet law is hard on offenders of this type, but only if the situation can be thoroughly proven. I recognize the fact that women can falsely accuse men of rape, but this was not one of those situations and Yuri knows it. How cowardly of him to state the fact without the extenuation."

Morrison said, "Nevertheless, now is not the time to be concerned about this, although I understand how deeply it must affect you. We will have a complicated job to do inside the ship and it will need all our concentration and skill. I assure you, though, that I am on your side and not on his."

Kahinin nodded and said, "I thank you for your kindness and sympathy, but don't be afraid of me. I will do my job."

At this point, Boranova called out, "We are now to enter the ship in the order in which I call your names: Dezhnev -- Konev -- Kahinin -- Morrison -- and myself."

Boranova moved immediately into position behind him and murmured, "How do you feel, Albert?"

"Terrible," said Morrison. "Did you expect any other answer?"

"No," said Boranova. "But, nevertheless, I expect you to do your work as though you didn't feel lousy. Do you understand?"

"I will try," said Morrison through stiff lips and, following Kahinin, he entered the ship a second time.

35.

One by one, they had to adjust themselves into their seats in the arrangement that Kahinin had described the day before. Dezhnev was front left at the controls, Konev front right, Kahinin mid-left, Morrison mid-right, and Boranova rear left.

Morrison blinked his eyes and blew his nose into a tissue he found in one of his pockets. What if he needed more tissues than had been supplied him? (A silly thing to worry about, but it was a more comfortable worry than some he might have.) His forehead felt damp. Was that because of the closeness? Would five people breathing -- hyperventilating, perhaps -- into a skimpy volume raise the humidity to maximum? Or would there be sufficient ventilation?

He thought suddenly of the first astronauts of a century before -- even more constricted, more helpless -- but going into a space that was somewhat known and understood, not into a microcosm that was utterly virgin territory.

Yet, as Morrison sat down, he felt the edge of terror dulled. He had, after all, been in the ship before. He had even been miniaturized and deminiaturized and was none the worse for it. It didn't hurt.

He looked around to see how the others were taking it. Kahinin, to his left, looked coldly blank. A rather icy loveliness. It might have been impressive that she was showing

no fear, no anxiety, but (as she had said of him) she was probably sitting there fighting her private devils.

Dezhnev was looking back, perhaps trying to weigh reactions as Morrison was, and very likely for different reasons. Morrison was trying to bolster what little inner courage he could find by borrowing from that of others, whereas Dezhnev (Morrison thought) was weighing responses in order to measure the possible success of the mission.

Konev faced directly forward and Morrison could see only the back of his neck. Boranova was just seating herself and was straightening her flimsy cotton costume.

Dezhnev said, "Friends. Fellow-travelers. Before we can leave, we must each inspect our equipment. Once we start, telling me something doesn't work is not going to strike me as an uproarious joke. As my father used to say, 'The truly wise trapeze artist does not inspect his nails in mid-jump.' It will be my job to make sure that the ship's controls are in order, as I am particularly certain they are, since I designed them myself and supervised the construction.

"As for you, Yuri, my friend, your cereb-whatever-you-call-it -- Or your brain map, as anyone with sense would call it -- has been transferred point for point into the software of your computer behind the plate before you. Please make sure that you know how to operate the plate and then see if the brain map is functional in all respects.

"Sophia, my little dove, I don't know what it is you do except that you make electricity, therefore make sure you can make it in the style you will find suitable. Natalya," his voice lifted slightly, "are you all right back there?"

Boranova said, "I am perfectly all right. Please check Albert. He needs your help most."

"Of course," said Dezhnev. "I have left him for last, so that he can get my full attention. Albert, do you know how to operate the panel before you?"

"Of course not," Morrison snapped. "How should I know?"

"In two seconds, you will know. This contact is to open and that contact is to close. Albert, open! -- Ah, you see, it slides open noiselessly. Now close! Perfect. Now you know. -- And have you seen what is inside the recess?"

"A computer," said Morrison.

"Perfect again, but do me a favor and see if it is a computer equivalent to yours. Your programmed software is in the recess to the side. Please check it out, make sure it fits the computer, and make sure it works as it is supposed to work. I will rely on you to tell me if it is working properly. Please! If you have any doubts, any suspicion, the tiniest hint that something is not just so, we will delay until it is fixed to your entire satisfaction."

Boranova said, "Please, Arkady, no dramatics. There is no time."

Dezhnev ignored her. "But if you tell me that something is wrong that really isn't wrong, my good Albert, Yuri will find out, I assure you, and neither he, nor I, nor anyone will be pleased. So if it occurs to you that inventing a trouble may delay the trip or even cancel it, let it unoccur to you at once."

Morrison could feel his face flushing and he hoped that it would be interpreted as the result of a generous anger over the thought that he might be dishonest in this fashion and not as guilt over a foiled plot.

Actually, as he hovered over his computer, he thought again of what his design and repeated redesign of his program had done. Now and then, these most recent designs of his had brought him -- feelings. It was not something he could identify, but it felt as though his own thought centers were being directly stimulated by the brain waves he was analyzing. He had not reported these, but he had occasionally talked about it and the word had gotten out. Shapirov had called his program a relay station because of that -- if Yuri was to be believed. Well, then, how could he now check if that were working well, when at best he had had the sensation only a few times and at unpredictable occasions?

Or might it all be simply the will-to-believe, the same will that had led Percival Lowell to see canals on Mars?

He realized that it hadn't actually even occurred to him to try to stymie the voyage by saying his program wasn't working. Dearly as he longed to avoid the risk, he could not do so at the cost of vilifying his program.

And then there was suddenly cause for a bit of fresh panic within Morrison's heart. What if the program had been damaged somehow in transit? How could he persuade them that there was truly something wrong and that he was not simply pretending?

But it all worked beautifully, at least as far as he could tell without it being in actual contact with a skull behind which an active brain existed.

Dezhnev said, as he watched Morrison's hands working, "We have placed new batteries in it. American batteries."

"Everything is working properly," said Morrison, "as far as I can see."

"Good. Is everyone satisfied with the equipment? Then lift your pretty rears from your seats and check the sliding panels there. Do they work? Believe me, you would all be very unhappy if they didn't."

Morrison watched Kahinin open and close the panel (covered with a thin layer of upholstery) that she was sitting on. His own worked similarly when he imitated her motions.

Dezhnev said, "It will take solid wastes, too, within reason, but let us hope we will have no occasion to check that out. In case the worst comes to the worst, there is a small roll of tissue just under the edge of your seat, where you can reach it easily. As we miniaturize, everything loses mass, so excretions would float. There will, however, be a downward current of air to prevent that. Don't let the draft startle you. There is a liter of water in a tiny refrigerator under the side of your seat. It is only for drinking. If you get dirty or sweaty or smelly, just make up your mind to stay that way. No washing until we get out. And no eating. If we lose a few ounces, so much the better."

Boranova said dryly, "If you lost seven kilograms, Arkady, so much the better. And we would consume less energy in the miniaturization."

"The thought has occurred to me at times, Natasha," replied Dezhnev coolly. "I will now test the controls of the ship and if all responds properly, as I'm sure it will, we will be ready to begin."

There was what seemed to Morrison to be a tense wait in utter silence, except for a soft whistle between the teeth on the part of Dezhnev, as he bent over his controls.

Then Dezhnev sat up, wiped his forehead with his sleeve, and said, "All is well. Comrade ladies, Comrade gentleman, and Comrade American, the fantastic voyage we face is about to begin." He fixed an auditor in his left ear, raised a tiny microphone before his mouth, and said, "All is operational within. Is all operational outside? -- Very well, then, wish us good fortune, comrades all."

Nothing seemed to happen and Morrison cast a quick look at Kahinin. She was still immobile, but she seemed to be aware of Morrison's head turning toward her, for she said, "Yes, we are miniaturizing."

The blood roared in Morrison's ears. This was the first time he was consciously miniaturizing.

9. ARTERY

If the current flow is taking you where you want to go, don't argue.

Dezhnev Senior

36.

Morrison's eyes remained, for the most part, focused on the recess before him, on the computer, and on the software he had inserted. The software -- the one material object of the long ago.

Long ago? It was less than a hundred hours ago that he was half-dozing his way through a dull talk on his last day at the conference and wondering whether there was any way to save his position at the university. And now a hundred subjective years had passed in those hundred objective hours and he could no longer clearly visualize the university at all or the life of sad frustration he had been leading there toward the end.

He would have given a great deal to have broken out of the dull cycle of useless striving a hundred hours ago. He would give a great deal more -- a great deal more -- to break back into it now, to wake up and to find the last hundred hours (or years) had never taken place.

He glanced through the transparent wall of the ship, there at his right elbow, his eyes half-closed as though he were really reluctant to see anything. He was reluctant. He did not want to see anything larger than it should be. It would interfere with his wild hope that the miniaturization process had broken down or that the whole thing had -- somehow -- been an illusion.

But a man walked into his view -- tall, over two meters tall. But then, perhaps he was actually that tall.

Others appeared. They couldn't all be that tall.

He shrank down into his seat and looked no more. It was enough. He knew that the miniaturization process was going its inexorable way.

The silence inside the ship was oppressive, unbearable. Morrison felt he had to hear a voice, even if only his own.

Kahinin, at his left side, was the one to whom he could speak most easily and she might be the best of a difficult choice, perhaps. Since Morrison did not want Dezhnev's misplaced jocularly, or Boranova's one-dimensional concentration, or Konev's dark intensity, he turned to Kahinin's frozen sorrow.

He said, "How will we get into Shapiro's body, Sophia?"

It took a while, it seemed, for Kahinin to hear him. When she did, her lips moved pallidly and she said in a whisper, "Injection."

Then, as though with a supreme effort, she apparently decided that she must be companionable, so she turned to him and said, "When we are small enough, we will be placed into a hypodermic needle and injected into Academician Shapiro's left carotid artery."

"We'll be shaken up like dice," said Morrison, appalled.

"Not at all. It will be complex, but the problems have been thought through."

"How do you know? This has never been done before. Never in a ship. Never in a hypodermic needle, Never into a human body."

"True," said Kahinin, "but problems like this -- much simpler ones, of course -- have been planned for a long time and we have had extended seminars over the last few days on this mission. You don't think that Arkady's announcements before miniaturization began -- the ones about toilet tissue and so on -- were new to us, do you? We have heard it all before, over and over. It was for your benefit, actually, since you have attended no seminars, and for Arkady's, too, since he loves his moment in the sun."

"Tell me, then, what will happen?"

"I will explain events as they occur. For now we do nothing until we are in the centimeter range. It will take another twenty minutes, but not everything will be so slow. The smaller we get, the faster we can miniaturize, in proportion. -- Have you felt any bad effects yet?"

Morrison mentally subtracted the rapid beating of his heart and the panting of his lungs and said, "None." Then, feeling that to be an unduly optimistic remark, he added, "At least so far."

"Well, then?" said Kahinin and closed her eyes as though to indicate that she was tired of talking.

Morrison thought that might not be such a bad idea and closed his as well.

He might have actually fallen asleep or he might simply have gone into a protective state of semi unconsciousness, withdrawing from reality, for it seemed that no time had passed when he was brought to by a slight jar.

He opened his eyes wide and found himself a centimeter or so above the seat. He had the odd sensation of drifting with each vagrant puff of wind.

Boranova had moved over to the seat behind him and placed her hands on his shoulders. She pushed down gently and said, "Albert, put on your seat belt. Sophia, show him how. I'm sorry, Albert -- we should have gone over all of this -- everything -- before we started, but we had little time and you were nervous enough as it was. We did not wish to reduce you to utter helplessness by flooding you with information."

To his own surprise, Morrison had not been feeling helpless. He had rather enjoyed the sensation of sitting on air.

Kahinin touched a spot on her seat edge between her knees and a belt around her waist flipped away. It had not been there, Morrison was sure, when he had closed his eyes and now it was again no longer there, for it disappeared, with a snap, into a recess in the seat to her left. She twisted toward Morrison and said, "This, here to your left, is your belt

ejector." Morrison couldn't help noticing that, now unbound, she lifted up from her seat slightly as she moved toward him.

She pressed the ejector -- a somewhat darker circle in a light background -- and a flexible network of clear plastic shot out with a faint hiss, wrapped itself about him, and buried its triple tip into the seat at his other side. He found himself held, elastically, in a kind of lacework.

"If you want to free yourself, there is the belt release there, just between your knees." Kahinin leaned farther toward him to indicate the place and Morrison found the pressure of her body against his to be pleasurable.

She did not seem to be aware of it and, having completed her task, she pulled herself back into her chair and re-belted herself.

Morrison glanced quickly around, squeezing upward and forward as far as the belt would let him, and peered, with difficulty, over Konev's shoulder. All five were belted.

He said, "We've miniaturized to the point where we have very little weight, is that it?"

"You only weigh about twenty-five milligrams now," said Boranova, "so that you might as well consider yourself weightless. Then, too, the ship is being lifted."

Morrison looked at Kahinin accusingly and Kahinin shrugged slightly and said, "I told you I'd describe things as they happened, but you seemed to be asleep and I thought it wiser to let you stay that way. The jar of the clamp woke you and lifted you out of the seat."

"The clamp?" He looked to one side. He had been conscious of a shadow on both sides, but walls were supposed to be opaque and he had dismissed the sensation. Now he suddenly remembered that the ship's walls were transparent and realized that the light on either side was blocked.

Kahinin nodded. "A clamp is gripping us and helping to keep us steady so that we are not shaken up unnecessarily. It looks enormous, but it is a very small and delicately padded clamp. And we are being put into a small tank of saline solution. We are also being held steady by an airstream being sucked upward into a blunt nozzle. That pushes us against the nozzle so that, with the clamps, we are held three ways."

Morrison looked out again. Objects outside the ship that might have been visible through portions of the wall not blocked by the clamp or by the overhead nozzle were, nevertheless, not visible. Morrison could see occasional shifting of light and shadow and realized that whatever existed out there was too large to make out clearly with his tiny eyes. If the photons that approached the ship were not themselves miniaturized as they entered the field, they would behave as though they were long radio waves and he would have seen nothing at all.

He felt the ship suddenly jar again as the clamps withdrew, although he couldn't actually see them withdraw. One moment they were there and the next they weren't. The movement -- on his scale -- was too rapid to see.

Then he felt himself rising slightly against the belt that bound him in and he interpreted that as a downward movement of the ship. There followed a slow bobbing sensation.

Dezhnev pointed to a dark horizontal line that moved slowly up and down against the wall of the ship and said with satisfaction, "That's the surface of the water. I thought the motions would be worse. Apparently, there are engineers in this place who are almost as good as I am."

Boranova said, "Actually, engineering has little to do with it. We're being held in place by surface tension. That will only work while we're at the surface of a fluid. It will not affect us once we're in Shapiro's body."

"But this ripple effect, Natasha? This up-and-down movement. Is that affecting it at all?"

Boranova was studying her instruments and, in particular, a small screen on which a horizontal line seemed to be playing out forever, without budging from the center.

Morrison, twisting and lifting until his back ached, could just make it out.

Boranova said, "It's as steady as your hand when you are sober, Arkady."

"No better than that, eh?" Dezhnev's laugh boomed out.

(He sounds relieved, thought Morrison uneasily and wondered what the "it" was that Dezhnev had felt might be affected.)

"What happens now?" asked Morrison.

Konev spoke for the first time, as far as Morrison could remember, since miniaturization had begun. "Must everything be explained to you?"

Morrison answered with spirit. "Yes! You have had everything explained to you. Why should I not have it explained as well?"

Boranova said quietly, "Albert is perfectly correct, Yuri. Please hold your temper and be reasonable. You will need his help soon enough and I hope he will not be so discourteous as to snap at you."

Konev's shoulders twitched, but he said nothing in reply.

Boranova said, "The cylinder of a hypodermic syringe will pick us up, Albert. It will be under remote control."

And, as though that cylinder were waiting to hear her say so, a shadow encased them from behind, swallowing them almost at once. Only in front was there a circle of light visible for a moment and then that disappeared, too.

Boranova said calmly, "The needle has been clamped on. Now we will have to wait a while."

The interior of the ship, which had become quite dark, was suddenly suffused with a white light, rather softer and more restful than before, and Boranova said, "From now on there will be no more light from the outside until our journey is over. We will have to rely on our own internal illumination, Albert."

Puzzled, Morrison looked around for the source of the light. It seemed to be in the transparent walls themselves.

Kahinin, interpreting his glance, said, "Electroluminescence."

"But what is the source of power?"

"We have three microfusion engines." She looked at him proudly. "Of a type that's the best in the world." Then she repeated, "In the world."

Morrison let it go. He had the impulse to talk of the American microfusion engines on the latest space vessels, but what would be the point? Someday the world would be freed of its nationalist fervors, but that day had not yet arrived. Still, as long as those fervors did not express themselves in violence or threat of violence, matters were bearable.

Dezhnev, leaning back in his seat with his arms behind his neck and apparently addressing the gently illuminated wall before him, said, "Someday what we will do is expand a hypodermic syringe, place that around a full-sized ship, and miniaturize the whole thing. Then we won't have this small-scale maneuvering."

Morrison said, "Oh, can you do the other thing, too? What do you call it? Maximization? Gigantization?"

"We don't call it anything," said Konev crisply, "because it can't be done."

"Maybe someday, though."

"No," said Konev. "Never. It is physically impossible. It takes a lot of energy to miniaturize, but more than an infinite amount to maximize."

"Even if you hooked it up to relativity?"

"Even so."

Dezhnev made an inelegant sound with his lips. "That for your physically impossible. Someday you will see."

Konev relapsed into indignant silence.

Morrison said, "What is it we are waiting for?"

Boranova said, "The last-minute preparation of Shapirov and then the moving up of the needle and its insertion into the carotid."

As she spoke, the ship was jarred forward.

"Is that it?" asked Morrison.

"Not yet. They were merely removing the air bubbles. Don't worry, Albert. We'll know."

"How?"

"Why, they'll tell us. Arkady is in contact with them. It's not difficult. Radio wave photons miniaturize as they cross the boundary from there to here and deminiaturize as they cross in the other direction. There's very little energy involved -- even less than in the case of light."

Dezhnev said, "It's time to move up to the base of the needle."

"Then go ahead," said Boranova. "We might as well test the motive power under miniaturization."

There was a gathering rumble that reached a low peak and then settled down into a buzzing murmur. Morrison twisted his head in order to look as nearly backward as he could against his restraining belt.

Water was churning behind them as though paddle wheels were turning. In the absence of any real reference point outside, it was impossible to judge how quickly they were moving, but progress seemed slow to Morrison.

"Are we moving much?" he asked.

"No, but we don't need to," said Boranova. "There's no use wasting energy trying to move faster. After all, we're pushing against normal-sized molecules, which means high viscosity on our scale."

"But with microfusion motors --"

"We have many energy needs for matters other than propulsion."

"I'm just wondering how long it will take us to get to key points in the brain."

"Believe me," said Boranova grimly, "I'm wondering, too, but we will have an arterial current taking us as close as possible."

Dezhnev cried out, "We're there! See?"

Right ahead, in the forward light beam of the ship, a round circle could be seen. Morrison had no trouble translating that into the base of the needle.

On the other end of that needle, they would find Pyotr Shapirov's bloodstream and then they would actually be within a human body.

37.

Morrison said, "We're too large to go through the needle, Natalya."

He felt a peculiar amalgam of emotions at the thought. Uppermost was a feeling of hope that perhaps the whole experiment had failed. This might be as small as they could get and it wasn't small enough. They would have to deminiaturize and it would all be over.

Under that thought, well-hidden, was a little sigh of disappointment. Having come so far, might it not be as well to get into the body and experience the interior of a nerve cell? Ordinarily, being no darer of dangers, no scaler of heights, Morrison would have turned away in horror at the thought -- he did turn away in horror -- but having miniaturized, having reached this point, having survived the fright so far, was it possible that he might want to go farther?

But above these contradictory urges came a bit of realism. Surely these people were not such fools as to deal with a ship that could not be reduced to a size that would pass through the needle it was supposed to pass through. No conceivable stupidity in these very intelligent people could reach that pitch.

And Boranova, as though she were resonating with that thought, said, almost indifferently, "Yes, we are too large now, but we will not stay too large. That is my job here."

"Yours?" said Morrison blankly.

"Of course. We have been reduced to this point by our central miniaturization device. Now the fine adjustments will be made by me."

Kahinin murmured, "That is one of the things we must save our microfusion motors for as much as possible."

Morrison looked from one to another. "Do we have enough energy on board ship for further miniaturization? Surely the impression I got was that a vast quantity of energy was needed for --"

"Albert," said Boranova, "if gravitation were quantized, then it would take the same enormous amount of energy to reduce a mass by half, regardless of the original value of that mass. To reduce the mass of a mouse by half would take the same energy as was required to reduce the mass of an elephant by half. But the gravitational interaction is not quantized and, therefore, neither is mass loss. That means that the energy required for mass loss decreases with that loss -- not entirely in proportion, but to an extent. We have so little mass now that it takes much less energy to miniaturize further."

Morrison said, "But since you've never miniaturized anything as large as this ship through so many orders of magnitude, you are depending on the extrapolation of data obtained for a much different size range."

(They're not speaking to an infant, he thought indignantly. I am their equal.)

"Yes," said Boranova. "We are taking the chance that the extrapolation will hold, that something new and unexpected will not surprise us. Still, we live in a Universe that faces us with uncertainties now and then. That can't be helped."

"But we all face death if something goes wrong."

"Didn't you know that?" said Boranova calmly. "Have you been uneasy about this fantastic voyage of ours simply for the pleasure of being uneasy? But we are not alone in this. If things go wrong and the stored energy of miniaturization is released, it will not only destroy us, but it may damage the Grotto to some extent. I'm sure that many an unminiaturized person out there is holding his or her breath and wondering if he or she will survive an explosion. You see, Albert, even those who are not undergoing the risks of miniaturization are not altogether safe."

Dezhnev turned and grinned widely. Morrison noted that one of his upper molars was capped and did not match the rather yellowish tint of his other teeth.

Dezhnev said, "Concentrate on the thought, my friend, that if something goes wrong, you will never know. My father used to say, 'Since we all must die, what better can we ask for than a quick and sudden death?'"

Morrison said, "Julius Caesar said the same thing."

Dezhnev said, "Yes, but we won't even have time to say, 'Et tu, Brute.'"

"There will be no death," said Konev sharply, "and it is foolish to speak of it. The equations are correct."

"Ah," said Dezhnev. "There was a time of superstition when people relied on the protection of God. Thank Equations we now have Equations to rely on."

"Not funny," said Konev.

"I didn't mean to be funny, Yuri. -- Natasha, they're ready out there for us to proceed."

Boranova said, "Then there will be no further need to speculate. Here we go."

Morrison gripped his seat tightly, preparing himself, but he felt nothing happen. Up front, though, the round circle he had made out expanded and grew dimmer and dimmer as it moved very slowly backward until it could no longer be made out.

"Are we moving?" he asked automatically. It was the kind of question one was unable to refrain from asking, even though the answer was obvious.

"Yes," said Kahinin, "and we are expending no energy in doing so. We are not battling the water molecules. We are being carried along by the water flow in the needle as the cylinder presses in slowly."

Morrison was counting to himself. It kept his mind more efficiently occupied than studying the second hand of his watch would have done.

When he reached a hundred, he said, "How long will it take?"

"How long will what take?" asked Kahinin.

"When do we reach the bloodstream?"

Dezhnev said, "A few minutes. They are going very slowly, just in case there is some kind of microturbulence. As my father once said, 'It is slower, but better, to creep along the downward path than to leap over the cliff.'"

Morrison grunted, then said, "Are we still miniaturizing?"

Boranova answered from behind him. "No. We are down in the cellular range and that is far enough for our needs now."

Morrison was surprised to find that he was trembling. After all, so much was happening and so many new things existed to think about that he had somehow lacked the room to remain in terror. He was not terrified, at least not to an acute stage -- yet for some reason he continued to tremble.

He attempted to will himself to relax. He tried to let himself droop, but that required more than an effort of will. It needed gravitational pull and there was none to speak of. He closed his eyes and slowed his breathing. He even tried humming, under his breath, the choral singing from Beethoven's Ninth Symphony.

Finally he felt himself forced into comment on the matter. "I'm sorry," he said. "I seem to be shaking."

Dezhnev snickered. "Aha! I wondered who would be the first to mention it."

Boranova said, "It's not you, Albert. We are all shaking slightly. It's the ship."

Morrison was at once elevated into fright. "Is something wrong with it?"

"No. It's just a matter of size. It's small enough to feel the effect of Brownian motion. You know what that is, don't you?"

It was a purely rhetorical question. Boranova would surely expect a high school student of physics to know what Brownian motion was, let alone Morrison, and yet Morrison found himself explaining it in his own mind -- not in words, but as a flash of concept.

Every object suspended in a liquid is bombarded on all sides by the atoms or molecules of the liquid. These particles strike randomly and therefore unevenly, but the unevenness is so small compared to the total that it is unnoticeable and has no measurable effect. As an object grows smaller, however, the unevenness becomes

greater among the smaller and smaller number of particles striking the object in a given time. The ship was small enough now to respond to the slight excesses of collisions -- first in one direction, then in another -- randomly. It moved slightly in consequence, a random trembling.

Morrison said, "Yes, I should have thought of that. It will get worse if we continue to become smaller."

"Actually, it won't," said Boranova. "There will be other counteracting effects."

"I don't know of any," said Morrison, frowning.

"Nevertheless, there will be such effects."

"Leave it to the Equations," said Dezhnev in an affectedly pious tone. "The Equations know."

Morrison said, "I think this could make us seasick."

"It certainly would," said Boranova, "but there is a chemical treatment for that. We have been dosed with the same chemical that cosmonauts use against space sickness."

"Not I," said Morrison indignantly. "Not only haven't I been treated, I haven't even been forewarned."

"We told you as little as possible of the discomforts and dangers out of concern for your comfort, Albert. As for treatment, you consumed your dose with your breakfast. -- How do you feel?"

Morrison, who had begun to feel a bit squeamish with all this talk about sickness, decided that he felt fine. Astonishing, he thought, the tyranny exerted over the body by the mind.

He said in a low voice, "Tolerable."

"Good," said Boranova, "because we are now in Academician Shapiro's bloodstream."

38.

Morrison stared through the transparent wall of the ship.

Blood?

His first impulse was to expect redness. What else?

He peered out, squinting his eyes slightly, but could see nothing, even in the gleaming light of the ship. He might as well have been in a rowboat, drifting down the calm surface of a pond on a dark and cloudy night.

Morrison's thoughts suddenly veered. In the absolute sense, the light within the ship had the wavelength of gamma rays -- and very hard gamma rays at that. Yet the wavelengths were the result of miniaturizing ordinary visible light and to the equally miniaturized retinas and optic lobes of the people within the ship they were still light rays and had the property of light rays.

Outside, just beyond the hull of the ship, where the miniaturization field ended, the miniaturized photons enlarged to ordinary light-wave photons and those that were

reflected back to the ship were miniaturized again when the field boundary was crossed. The others might be accustomed to this paradox-ridden situation, but to Morrison the attempt to grasp the effect of a miniaturized bubble within a sea of normality was dizzying. Was the boundary visible, marking off the miniaturized from the normal? Was there a discontinuity somewhere?

Following his line of thought, he whispered to Kahinin, who was bent over her instrument, "Sophia, when our light leaves the miniaturization field and expands, it must give off heat energy, and when it's reflected back into the ship it must absorb energy in order to be miniaturized and the energy must come from us. Am I right?"

"Perfectly, Albert," said Kahinin without looking up. "Our use of light results in a small but steady loss of energy, but our motors can supply that. It is not a significant drain."

"And are we really in the bloodstream?"

"Never fear. We are. Natalya will probably dim the internal lights in a while and you'll see the outside more clearly then."

Almost as though that were a signal, Boranova said, "There! Now we can relax for a few moments." The lights dimmed.

At once, objects outside the ship came dimly into view. He could not make them out clearly yet, but they were immersed in something heterogeneous, something with objects floating in it, as would be true of blood.

Morrison stirred uneasily, straining at the constraint of his seat belt. He said, "But if we are in the bloodstream, which is at a temperature of thirty-seven degrees Celsius, we'll --"

"Our temperature is conditioned. We'll be quite comfortable," said Kahinin. "Really, Albert, we've thought of these things."

"Perhaps you have," said Morrison, slightly offended, "but I haven't been privy to those thoughts, have I? How can you condition the temperature when you don't have a cold sink?"

"We don't have one here, but there's outer space, isn't there? The microfusion motors give off a thin drizzle of subatomic particles which, under miniaturized conditions, have a mass of very nearly zero. They therefore travel at virtually the speed of light, penetrating matter as easily as neutrinos do and carrying off energy with them. In less than a second they are in outer space, so that the effect is of transferring heat from within the ship into outer space and we keep cool. Do you see?"

"I see," muttered Morrison. It was ingenious -- but perhaps obvious, after all, to those used to thinking in terms of miniaturization.

Morrison noticed that the controls of the ship, immediately under Dezhnev's hands, were luminous, as were the instruments before Kahinin. He struggled to raise himself in his seat and managed to see a corner of the computer screen in front of Konev. It contained what Morrison thought might be a map of the circulatory system of the neck. For a moment, before his body ceased its fight against the webbing of the belt and he

sank down into his seat again, he saw a small red dot on the screen, which, he deduced, was a device to mark the position of the ship in the left internal carotid artery.

He was panting a little from his effort and had to wait a few moments to regain control of his breath. The recess in which his own computer rested was illuminated and he shielded that bit of light from his face by raising his left hand. Then he looked out.

Far in the distance, Morrison could see something that looked like a wall, a barrier of some sort. It receded, then approached, then receded again, over and over, rhythmically. Automatically, he looked at his watch for a few seconds. It was clearly the pulsation of the arterial wall.

He said to Kahinin in a low voice, "Obviously the passage of time is not affected by miniaturization. At least the pulsation of the heart is -- just what it ought to be, even though I view it with miniaturized eyes and time it with a miniaturized watch."

It was Konev who answered. "Time isn't quantized apparently, or at least it isn't affected by the miniaturization field, which may be the same thing. That's convenient. If we had to take a shifting time flow into account, things might become unbearably complicated."

Morrison silently agreed and turned his thoughts in other directions.

If they were inside an artery, and if the ship were merely being swept forward by the current, the forward movement would have to be in spurts, one spurt for each contraction of the distant heart (the very distant heart -- on the scale of their present size). And if that were so, he ought to feel those spurts of motion.

He closed his eyes and tried to hold as still as possible, to move not at all except for the trembling of the Brownian motion -- which, after all, he could in no way control.

Ah, he could feel it. A slight but distinct push backward as the spurt started, a slight push forward as it came to an end.

But why was the spurt not more energetic? Why was he not yanked backward and forward in a sickening fashion?

And then he thought of the mass he no longer possessed. With his remaining mass so tiny, his inertia was similarly tiny. The viscosity of the normal fluid of the bloodstream exerted an enormous cushioning effect, so that the spurts were all but lost in the Brownian motion.

And, ever so slightly, Morrison felt himself relax. He felt something inside himself untighten a bit. The miniaturized environment was unexpectedly benign.

He looked through the ship's transparent hull again, his eyes focusing on the volume between himself and the arterial wall. He could see bubbles, faintly outlined. No, not bubbles, but things of substance -- many of them. Some turned slowly and changed apparent shape as they did so, so they were not spheres. They were disks, he now realized.

The truth burst in on him and shamed him. Why was he so slow in identifying them, since he knew he was in a bloodstream? -- But then he knew the answer to that, too. He could not really conceive of himself as being in a bloodstream; it was too easy to suppose he was in a submarine making its way through an ocean. He would naturally expect to see

the familiar sights of an ocean and would be foolishly puzzled at anything he saw that did not fit his assumption.

He would see the red corpuscles of the blood -- the erythrocytes -- and fail to recognize them.

Of course, they weren't red but faintly yellowish. Each one absorbed some shortwave light to produce that color. Get them in bulk, though, millions and billions of them, and they would absorb enough such light to appear red -- in arterial blood, anyway, and they were in an artery now. Once the cells withdrew the oxygen carried by the red corpuscles, the individual corpuscle would seem faintly bluish, and, in bulk, blue-purple.

He watched the erythrocytes with interest and saw them quite clearly now that he had recognized them for what they were.

They were biconcave discs, the centers depressed on each side. To Morrison, they were enormous, considering that, under normal conditions, they were microscopic, perhaps seven and a half micrometers in diameter and a little over two micrometers thick. Now here they were, swollen objects the size of his hand.

There were many of them in sight and they had a tendency to pile together in roulettes. These weren't static, however. Some corpuscles would peel off the roulettes and others would add on and there were always some single corpuscles in view. Those that were in sight tended to stay in sight; they weren't moving relative to the ship.

"I take it," said Morrison, "that we're simply going with the flow."

"That's right," said Kahinin. "It saves energy."

But, at that, the red corpuscles weren't entirely stationary relative to the ship. Morrison noticed one corpuscle drifting slowly toward the ship, carried perhaps by a bit of microturbulence or by a random push of Brownian motion. The corpuscle flattened slightly and momentarily against the plastic of the ship and then rebounded.

Morrison turned to Kahinin. "Did you see that, Sophia?"

"The red corpuscle nudging us? Yes."

"Why didn't it miniaturize? Surely it entered the field."

"Not quite, Albert. It bounced off the field, which extends a small distance beyond any miniaturized object, such as our ship, in every direction. There's a certain repulsion between normal matter and miniaturized matter, and the greater the extent of miniaturization, the stronger the repulsion. That's why very tiny objects such as miniaturized atoms or subatomic particles go through matter without interacting with it. It's also that which keeps the miniaturized state metastable."

"How do you mean?"

"Any miniaturized object is always surrounded by normal matter, unless it is in deep space. If nothing served to keep normal matter out of the field, such matter would forever be miniaturizing and, in the process, absorbing energy from the miniaturized object. The drain would be significant and the miniaturized object would quickly deminiaturize. In fact, it would be impossible to induce miniaturization in the first place, since the energy crammed into the miniaturizing object would leak away at once. What

we would then be trying to do, in effect, would be to miniaturize the entire Universe. -- Of course, the repulsion isn't extremely strong at our size. If a red corpuscle collided with sufficient force, the colliding surface might undergo some miniaturization."

Morrison turned back to the view and, almost at once, something that was obviously a shredded red corpuscle drifted into view.

"Ah," said Morrison, "is that an example of one that approached us too forcefully?"

Kahinin bent toward Morrison to get a better view in the direction he was pointing. She shook her head. "I don't think so, Albert. Red corpuscles have a limited life of about a hundred and twenty days. The poor things wear out and break down. In the volume of blood we can see, several dozen would break down every minute, so that torn and damaged red corpuscles would be a common sight. -- And that is a good thing, too, for it means that if we were to use our power and rush through the bloodstream, breaking up a few red corpuscles, or even a few million, it would make no difference to Shapirov. We couldn't possibly break down red corpuscles at a rate even approaching that of natural breakdown."

Morrison said, "What about platelets?"

"Why do you ask?"

"That must be a platelet I see there." He pointed. "It's lentil-shaped and only half the size of the red corpuscles."

A pause and then Kahinin nodded. "Ah yes, I see it now. That's a platelet. There should be one of them to every twenty red corpuscles."

That was about right, Morrison thought. If he were on a carousel, reaching out for rings as he passed, and each red corpuscle were an ordinary iron ring, the occasional platelet would represent the coveted brass ring.

Morrison said, "My point, Sophia, is that platelets are more fragile than red corpuscles and when they break they start the clotting process. If we break a few, we'll start a clot forming in the artery. Shapirov will then have another stroke and surely die."

Boranova, who had been listening to the exchange between Morrison and Kahinin, interposed at this point. "In the first place," she said, "platelets are not as fragile as all that. They can strike us lightly and rebound without harm. The danger of another stroke lies at the arterial wall. The platelets are moving much faster relative to the inner wall of the carotid artery than they are relative to us. And the inner wall of the artery may be layered with cholesterol and lipid plaques of all kinds. That surface is therefore much rougher and uneven than the smooth plastic hull of our ship. It's at the arterial wall that the clots might form -- not here. And even that isn't too enormous a danger. A single platelet -- or even a few hundred of them -- might be broken and still be insufficient to start the clotting process in a way that doesn't damp out. Massive quantities of platelets must break to turn the trick."

Morrison watched a platelet that vanished, now and then, behind the numerous red corpuscles. He wanted to see if it would make contact with the ship and, if it did, what would happen. The platelet, however, did not oblige but remained at a distance.

It then occurred to Morrison that the platelet appeared to be as large as his hand. How could that be if they were half the diameter of the red corpuscles and the red corpuscles were themselves as large as his hand? His eyes sought out a red cell and, sure enough, it seemed considerably larger than his hand.

He said, troubled, "The objects out there are getting larger."

"We're still miniaturizing, obviously," called out Konev, apparently annoyed at Morrison's seeming inability to draw the proper conclusion from an observed fact.

Boranova said, "That's right, Albert. The coronary is narrowing as we progress and we want to keep pace with it."

"We don't want to get stuck in the pipe," said Dezhnev genially, "by being too fat." Then, as another thought struck him, he added, "You know, Natasha, I've never been this thin in my life."

Boranova said, unmoved, "You are as fat as ever, Arkady, on the scale of Planck's constant."

Morrison was in no mood for airy banter. "But how far do we miniaturize, Natalya?"

"Down to molecular size, Albert."

And all of Morrison's apprehensions surged up again.

39.

Morrison felt foolish at his failure to realize at once that they were still miniaturizing and, at the same time, bitterly resentful at Konev for making it plain he recognized that folly. The trouble was that all these others had been living and thinking miniaturization for years and he himself, a newcomer to the concept, was still trying to cram it into his reluctant brain. Couldn't they sympathize with his difficulties?

He studied the red corpuscles moodily. They were distinctly larger. They were wider across than his chest and their boundaries were becoming less sharp. Their surfaces quivered, as though they were canvas bags full of syrup.

He said in a low voice to Kahinin, "Molecular size?"

Kahinin looked quickly at him, then turned away and said, "Yes."

Morrison said, "I don't know why that should bother me, considering the small size to which we have already miniaturized, but there's something rather frightening about being as small as a molecule. How small a molecule, do you suppose?"

Kahinin shrugged. "I don't know. That's up to Natalya. A virus molecule, perhaps."

"But this sort of thing has never been tried."

Kahinin shook her head. "We're charting unknown territory."

There was a pause and then Morrison said uneasily, "Aren't you afraid?"

She looked at him furiously, but continued to whisper. "Of course I'm afraid. What do you think I am? It isn't sensible not to be afraid when you have rational reason for it. I was afraid when I was violated. I was afraid when I was pregnant and deserted. I've spent half my life being afraid. Everyone does. That's why people drink as much as they do, to

wipe out the fear that grips them." She was virtually hissing through clenched teeth. "Do you want me to be sorry for you because you're afraid?"

"No," muttered Morrison, taken aback.

"There's nothing remarkable about being afraid," she went on, "as long as you don't act afraid -- as long as you don't let yourself be twisted into doing nothing because of fear, into having hysterics because of fear, into failing --" She interrupted herself in a bitter, whispered self-accusation. "I've had hysterics in my time." Her glance flickered in the direction of Konev, whose back was straight, stiff, and motionless.

"But now," she went on, "I intend to do my part, even if I am half-dead with fear. No one will tell from my actions that I'm afraid. And that had better be your case, too, Mr. American."

Morrison swallowed hard and he said, "Yes, of course," but it sounded very unconvincing, even to him.

His eyes flicked backward, then forward. There was no use whispering in those close quarters. There was no whisper so low it would not be overheard.

Boranova, behind Kahinin, was obviously busy with her miniaturization mechanism, but there was a tiny smile on her face. Approval? Contempt? Morrison couldn't tell.

As for Dezhnev, he turned his head and called out, "Natasha, it is continuing to narrow. Should you hasten the miniaturization?"

"I'll do what is needed, Arkady."

Dezhnev's eye caught Morrison's and he winked, with a grin. "Don't believe little Sophia," he said, pretending to whisper. "She is not afraid. Never afraid. She just doesn't want you to be alone with your uneasiness. She has a very soft heart, our Sophia, as soft as her --"

"Keep quiet, Arkady," said Sophia. "Surely your father must have told you that it is not wise to beat the empty teapot you call your head with the rusty spoon you call your tongue."

"Ah," said Dezhnev, rolling his eyes, "that was harsh. What my father did say was that no knife could be honed as sharp as a woman's tongue. -- But, Albert, seriously, reaching molecular size is nothing. Wait until we have learned to attach relativity to quantum theory and then, with a tiny puff of energy, we will reduce ourselves to subatomic size. Then you will see."

"What will I see?" said Morrison.

"You would see instant acceleration. We would simply take off --" He removed his hands from the controls momentarily in order to make a whizzing gesture with them, accompanied by a shrill whistle.

Boranova said calmly, "Hands on the controls, Arkady."

"Of course, my dear Natasha," said Dezhnev, "A moment of excusable drama, no more." Then to Morrison, "Instantly we would go at nearly the speed of light, the much faster speed of light under such conditions. In ten minutes we could be across the Galaxy, in three hours at the Andromeda, in two years at the nearest quasar. And if that's not fast

enough, we can get smaller still. We have faster-than-light travel, we have antigravity, we have everything. The Soviet Union will lead the way to it all."

Morrison said, "And how would you guide the flight, Arkady?"

"What?"

"How would you guide it?" said Morrison seriously. "As soon as the ship swoops down to the proper sizelessness and masslessness, it will, in effect, radiate outward at hundreds of light-years per second. That means that if there were trillions of ships, they would shoot out in every direction with spherical symmetry -- like sunlight. But since there would only be one ship, it would move outward in one particular direction, but in an absolutely unpredictable one."

"That's a problem for the clever theoreticians -- like Yuri."

Konev had not indicated any interest in the conversation up to that point, but now he snorted loudly.

Morrison said, "I'm not sure that it's wise to develop the traveling and carelessly assume the steering. Wouldn't your father say: 'A wise man does not build the roof of a house first.'"

"He might," said Arkady, "but what he once did say was this: 'If you find a gold key without a lock, don't throw it away. The gold is also sufficient.'"

Boranova stirred in her seat behind Morrison and said, "Enough with the saws and sayings, my friends. -- Where are we, Yuri? Are we making progress?"

Konev said, "In my opinion we are, but I would like the American to support my judgment, or correct it."

"How can I do either?" snapped Morrison. "I'm strapped in."

"Then unstrap," said Konev. "if you float a bit, at least you can't float very far."

For a moment, Morrison fumbled at his seat belt, having forgotten the location of the appropriate contact. Kahinin's hand moved quickly and he was free.

"Thank you, Sophia," he said.

"You will learn," she replied indifferently.

"Lift yourself so that you can see over my shoulder," said Konev.

Morrison did so and, inevitably, pushed too hard against the back of the seat ahead. As a result of his insignificant inertia, he moved upward explosively and struck his head against the roof of the ship. Had this happened at the same speed under unminiaturized conditions, he might well have suffered the blinding pain of a concussion, but the very lack of mass and inertia that had sent him shooting upward had bounced him back almost once with no sensation of pain and virtually none of pressure. He was as easy to stop as he had been to start.

Konev clicked his tongue. "Gently. Just lift your hand upward edgewise, turn it slowly, then push it down flatwise, slowly. Do you get it?"

Morrison said, "I understand."

He followed Konev's suggestion and moved up slowly. He caught at Konev's shoulder and stopped himself.

Konev said, "Now, look here at the cerebrograph. Do you see where we are at this moment?"

Morrison found himself looking at an enormously complex network, with a distinct three-dimensional effect. It consisted of sinuous rills branching outward in such a way as to form an exceedingly intricate tree. In one of the larger branches there was a small red dot, moving slowly and progressively.

Morrison said, "Can you give me a broader view so that I can place this section?"

Konev, with another click of his tongue, one that might have signified impatience, expanded the view. "Does this help?"

"Yes, we're on the edge of the brain." He could recognize the individual convolutions and fissures. "Where do you plan to go?"

The picture magnified somewhat. Konev said, "We'll curve off here into the interior of the neuron layer -- the gray matter. And where I'd like to head for, by this route" -- he named the areas in Russian rapidly and Morrison struggled to translate them in his mind into English -- "is this area here which, if I have read your papers correctly, is a crucial node of the neuron network."

"No two brains are exactly alike," said Morrison. "I can pin down nothing with certainty, all the more so if the particular brain in question is one I have never studied. Still, I would say the area you're heading for looks hopeful."

"Good, as far as that goes. And if we get to my destination, will you be able to tell more accurately whether we are at a crossroads where several branches of the network meet or, if not, in what direction and how far such a crossroads might be?"

"I can try," said Morrison cautiously, "but please remember that I have made no guarantees as to my abilities in this connection. I have not offered you any promises. I have not volunteered --"

"We know that, Albert," said Boranova. "We ask only that you do what you can."

"In any case," said Konev, "that's where we're going as a first approximation and we'll get there before long, even though the current is slowing. We are, after all, almost down to capillary size. -- Strap yourself in, Albert. I'll let you know if I need you."

Morrison managed to operate the seat belt without any help, proving that even small triumphs can be sweet.

Almost to capillary size, he thought, and looked out through the walls of the ship.

The vessel wall was still at a comfortable distance, but it had changed in appearance. Earlier, the steadily pulsating walls had been rather featureless. Now, however, Morrison could make out no pulsing and the walls were beginning to look faintly tiled. The tiling, Morrison realized, consisted of the cells that made up the thinning walls.

He could not actually get a clear look at the tiling, either, for the red corpuscles were in the way. They were now soft bags nearly the size of the ship. Occasionally, one ballooned past the ship at close quarters and was pushed elastically inward at the point of contact, without undergoing any visible harm.

One time a small smear was left behind. Perhaps the contact had been just a little too forceful and a line of miniaturized molecules had been formed against the hull, Morrison thought. The smear lifted off quickly, however, and dissolved in the surrounding fluid.

The platelets were another story, since by their very nature they were much more fragile than the red corpuscles.

One made a head-on collision with the ship. Or perhaps it had been slowed by a collision with a red corpuscle so that the ship had overtaken it. The prow of the ship penetrated deeply and the skin of the platelet punctured. Its contents oozed out slowly, mixing with the plasma and then forming into two or three long strings that tangled with each other. They clung to a portion of the ship's hull for quite a time, trailing behind.

Morrison waited to see any evidence of a clot forming. None did.

Minutes later Morrison saw, up ahead, a milky fog that seemed to fill the blood vessel from wall to wall, pulsating and undulating. Inside it were dark granules that moved steadily from one side to the other. To Morrison, it looked like a malignant monster and he couldn't help but cry aloud in a moment of terror.

10. CAPILLARY

If you want to know whether water is boiling, don't test it by hand.

Dezhnev Senior

40.

Dezhnev turned his head, startled, and said, "It's a white cell, Albert, a leucocyte. It is nothing to be bothered about."

Morrison swallowed and felt distinctly annoyed. "I know it's a white cell. It just caught me by surprise. It's bigger than I thought it would be."

"It's nothing," said Dezhnev. "A piece of pumpernickel, really, and no bigger than it should be. We're just smaller. And even if it were as big as Moscow, so what? It's just floating along in the bloodstream as we are."

"As a matter of fact," said Kahinin gently, "it doesn't even know we're here -- I mean, that we're anything special. It thinks we're a red corpuscle."

Konev seemed to be addressing the air in front of him in an abstracted sort of way, saying, "White cells do not think."

A flash of resentment crossed Kahinin's face, flushing it slightly, but her voice remained even. "By saying 'think,' Albert, I am merely using a figure of speech. What I mean is that the white cell's behavior toward us is that which it would display toward a red corpuscle."

Morrison cast another look toward the large billowing cell up ahead and decided that, harmless or not, he found its appearance distasteful. He looked with much appreciation at the contrast made by Kahinin's pretty high-cheekboned face, and wondered why she had never had that little mole under the left corner of her lip removed. Then he wondered if it didn't add just the right trifle of piquancy to a face that might otherwise be considered too pretty to possess character.

That moment of beside-the-point speculation effectively removed the uneasiness that the white cell's appearance had introduced and Morrison returned, in his mind, to Kahinin's statement.

"Does it act as though we're a red corpuscle because we're the right size for it?"

"That may help," said Kahinin, "but it's not the real reason. You judge a red corpuscle to be a red corpuscle because you see it. The white cell judges a red corpuscle to be one because it senses the characteristic pattern of the electromagnetic pattern on its surface. White cells are trained -- that is just another figure of speech -- let us say, adapted -- to ignore that."

"But this ship doesn't have the electromagnetic pattern of a red corpuscle . . . Ah, but I guess you've taken care of that."

Kahinin smiled in gentle self-satisfaction. "Yes, I have. It is my speciality."

Dezhnev said, "That is it, Albert. Our little Sophia knows, completely in her head" - he tapped his right temple -- "the exact electromagnetic pattern of every cell, every bacterium, every virus, every protein molecule, every --"

"Not quite," said Kahinin, "but those I forget, my computer can supply. And I have a device here that can use the energy of the microfusion motors to place positive and negative electric charges on the ship in whatever pattern I choose. The ship has the charge pattern of a red corpuscle on itself as best as I can duplicate it, and that is close enough to cause the white cell to react -- or, rather, not to react -- accordingly."

"When did you do that, Sophia?" asked Morrison with interest.

"When we were reduced to the size that would make us a potential object of interest for a white cell or for the immune apparatus generally. We don't want antibodies swarming over us, either."

A thought occurred to Morrison. "Since we're talking about being reduced in size, why hasn't the Brownian motion gotten worse? I should think it would batter us more as we got smaller."

Boranova put in from behind, "So it would if we were unminiaturized objects of this size. Since we are miniaturized, there are theoretical reasons that prevent Brownian motion from getting very bad. It's nothing to worry about."

Morrison thought about it, then shrugged. They weren't going to tell him anything they thought might make him too knowledgeable in the matter of miniaturization and what did that matter? The Brownian motion had not grown worse. In fact, it had grown less troublesome (or was he just getting used to it?) and he had no objection to that. That made it, as Boranova said, nothing to worry about.

His attention shifted back toward Kahinin. "How long have you been training in this field, Sophia?"

"Since my graduate days. Even without Shapirov's coma, we all knew the time would come when a trip through a bloodstream would become necessary. We've been planning something like this for a long time and we knew that this skill of mine would be needed."

"You might have planned an automated crewless ship."

"Someday, perhaps," said Boranova, "we will, but not yet. We cannot, even now, make the automation equivalent to the versatility and ingenuity of a human brain."

"That's true," said Kahinin. "An automated pattern maker would place us in the red corpuscle pattern as a way of following the path of least resistance, and it would do little more than that. After all, it would be a useless expense and perhaps an impractical exercise altogether to try to instill in an automated pattern maker the ability to change appropriately in response to all sorts of improbable conditions. When I am present, however, I have the capacity to do almost anything. I can change the pattern to meet an unlikely emergency, to test the value of something earlier unthought of, or simply to suit a

whim. -- For instance, I could change the ship's pattern to that of an E coli bacterium and the white cell would attack at once."

"I'm sure of that," said Morrison, "but don't do it, please."

"No fear," said Kahinin. "I won't."

But Boranova's voice sounded in sudden -- and uncharacteristic -- excitement. "On the contrary, Sophia, do that!"

"But, Natalya --"

"I mean it, Sophia. Do it. We haven't tested your instrument under field conditions, you know. Let's try it."

Konev muttered, "That's a waste of time, Natalya. Let us first get to where we're going."

Boranova said, "It won't do us any good to get there -- if we can't enter a cell. Here is an immediate opportunity at hand to see if Sophia can control the behavior of a cell."

"I agree," said Dezhnev boisterously. "This has been a remarkably uneventful trip so far."

"That's the best kind, I should think," said Morrison.

But Dezhnev held up a disapproving hand. "My old father used to say: 'To want peace and quiet above all else is to hope for death.'"

"Go ahead, Sophia," Boranova said firmly. "We waste time."

Kahinin hesitated a bare moment -- the time required, perhaps, to remember that Boranova was captain of the ship -- then her hand flickered over the controls of her device and the configurations upon the television screen altered markedly. (Morrison admired, in an apprehensive sort of way, the speed with which she did it.)

Morrison lifted his eyes to the white cell ahead, and for a moment he saw no change. And then it seemed as though a fit of trembling overtook the monster and Dezhnev whispered, "Aha, it recognizes the presence of its prey."

At the extreme forward end of the white cell, its substance seemed to bulge toward and all around them in an uneven circle. At the same time, the substance in the center retreated as though it were being sucked in. Morrison envisioned a monster's jaws preparing for a meal.

Konev said, "It works, Natalya. That creature ahead is preparing to envelop and engulf us."

Boranova said, "So it is. Very well, Sophia, restore us to the red cell mode."

Again Kahinin's fingers flickered and the configurations on the screen returned (as nearly as Morrison's memory could judge) to what they had earlier been.

This time, however, the white cell remained unaffected. Its outer rim was shooting past the ship, which was now heading into the deep central concavity.

41.

Morrison was appalled. The entire ship was encased by something that looked precisely like fog -- a gritty granular fog, within which a multi-lobed object, faintly denser than the rest, writhed its way around them. Morrison knew that this must be the nucleus of the white cell.

Konev snapped out angrily, "Apparently, once the white cell gears itself for engulfment, the rest is automatic and nothing will stop it. -- What now, Natalya?"

Boranova replied quietly, "I admit I hadn't expected this. The fault is mine."

"What's the difference?" said Dezhnev, frowning. "It's no matter. What can this blob do to us? It cannot crush us. It is not a boa constrictor."

Konev said, "It can try to digest us. We're in a food vacuole right now and digestive enzymes are pouring in around us."

"Let them pour," said Dezhnev. "I wish them the joy of the attempt. The ship's wall is not digestible to anything a white cell has. After a while, it will reject us as indigestible residue."

"How will it know?" asked Kahinin.

"How will it know what?" snapped Dezhnev.

"How will it know we are indigestible residue? It was spurred into activity by our bacterial charge pattern."

"Which you removed."

"Yes, but as someone remarked, the white cell, once stimulated, apparently has to go through its whole cycle of activity. It is not a thinking device; it is entirely automatic." Kahinin was frowning now and looking around at the others. "It seems to me that the white cell will continue trying to digest us until it is given the appropriate stimulus that will put its engulfment mechanism into reverse and allow it to eject us."

Boranova said, "But we now have the charge pattern of a red corpuscle again. Don't you think that would stimulate rejection? It doesn't eat red cells."

"I think it's too late for that," said Kahinin a little diffidently, as though nervous about standing up to Boranova. "The red corpuscle pattern keeps it unengulfed, but once it is engulfed by some means, it would seem that the pattern alone is insufficient to spark ejection. After all, here we are; we are not being ejected."

Her eyes -- all five pairs of eyes, in fact -- uneasily surveyed the wall of the ship. They were trapped in the cloudy cell.

"I think," Kahinin went on, "that there's a charge pattern to the kind of indigestible residue left by the bacteria the white cell is designed to engulf and that that alone would be a trigger for ejection."

"In that case," said Dezhnev, "give it the pattern it wants, Sophia, my little chicken."

"Gladly," said Kahinin, "if you will tell me what it is because I don't know. I can't just try patterns at random. The number of possible patterns is astronomical."

"As a matter of fact," said Konev, "can we be sure the white cell ejects anything at all? Perhaps indigestible residue becomes part of its granular material and remains within it until it is removed and dismantled in the spleen."

Boranova said sharply (perhaps weighed down with the knowledge that she was responsible for their present situation, thought Morrison), "There is no point in babbling. Is there a constructive suggestion?"

Dezhnev said, "I can turn on the microfusion motors and bore a way out of the white cell."

"No," said Boranova sharply. "Do you know the direction which we are heading at this moment? Inside this food vacuole we may be slowly turning or the vacuole itself may be drifting through the cell's substance. If you smash your way outward, you may damage the wall of the blood vessel and the brain itself."

Konev said, "For that matter, white cells can wiggle out of a capillary, working their way between the cells that make up the capillary wall. Since the path we have taken has led us into an arteriole branch that has narrowed to just about capillary size, we can't even be sure that we're still in the bloodstream."

"Yes, we can," said Morrison suddenly. "The white cell can pinch itself small, but it can't pinch us small. If it squeezes out of the vessel, it would be forced to leave us behind. -- And that would be a good thing, except that it hasn't done it."

"There you are," said Dezhnev. "I should have thought of it sooner. Natasha, make us bigger and crack the white cell open. Give it indigestion like it has never had."

Again a sharp negative from Boranova. "And crack the blood vessel open, too? The blood vessel is fairly small now, not much wider than the white cell."

Kahinin said, "If Arkady will get in touch with the Grotto, someone there might have an idea."

There was silence for a moment and then Boranova said in a half-strangled way, "Not just yet. We have done something foolish -- well, I have -- and you know as well as I do that it would be better for all of us if we didn't need help."

"We can't wait forever," said Konev restlessly. "The fact is that I don't know where we are by now. I can't rely on the white cell drifting with the bloodstream or with maintaining any given speed, for that matter. Once we are lost, it may take considerable time to locate ourselves and we may need help from the Grotto to do it, too. In that case, how do we explain being lost?"

Morrison said, "How about the air-conditioning?"

There was a pause and Boranova said, "What do you mean, Albert?"

"Well, we're sending miniaturized subatomic particles out of the ship and into interplanetary space. They carry heat away from the ship, I was told, so that we remain cool even in the all-pervasive warmth of the body we're in. That coolness must be something the white cell is not designed to tolerate. If we turn up the air-conditioning and become colder still, there may come a time when the white cell will be uncomfortable enough to eject us."

Boranova mulled this over and said evenly, "I think -- possibly -- that might work."

Dezhnev said, "Don't bother thinking. I've turned up the air-conditioning to maximum. Let's see if anything happens besides all of us getting frostbite."

Morrison watched the fog outside. He was well aware that he was as tense as the others. He was not in agony over an unfortunate decision -- an ill-advised experiment. Nor was he biting his nails over the fate of Shapirov and yet -- Tapping his own emotions, it occurred to him that having come thus far, having been miniaturized and finding himself in a small cerebral arteriole, he suddenly had an urge to check out his theories. Had he come this far in order to turn back and spend the rest of his life, holding up an imaginary thumb and forefinger nearly in contact and saying in the depth of his mind, "Missed it by that much"?

Very well, then. He had passed from desperately not wanting to attempt the project to a definite reluctance to abort it.

Dezhnev's voice broke in on his thoughts. "I don't think this little animal likes what's happening."

Morrison was conscious of a biting chill, and shivered as he became aware that the thin cotton uniform he wore was a totally inadequate shield against this sudden onset of winter.

And perhaps the white cell "thought" this, too, for the fog thinned and a rift appeared in it. Then, in another moment or two, the surroundings were clear and the white cell was a ball of fog to their rear, drifting away -- or perhaps crawling away -- amoeba-like, from an unpleasant experience.

Boranova said (sounding a little dumbfounded), "Well, it's gone."

Dezhnev waved both hands high in the air. "A toast -- if we had a small swallow of vodka with us -- to our American hero. It was an excellent suggestion."

Kahinin nodded at Morrison and smiled. "It was a good idea."

"As good as mine was bad," said Boranova, "but at least we know that your technique can do what it should, Sophia -- as long as we know enough. And as for you, Arkady, ease the air-conditioning intensity before we all catch pneumonia. -- So you see, Albert, we have already done well to take you with us."

"Perhaps," said Konev tightly, "but in the meanwhile, I think the white cell took us on an excursion. We are not where we were and I do not know exactly where we are."

42.

Boranova's lips tightened and she asked with some difficulty, "How can you not know where we are? We were inside the white cell only a few minutes. It couldn't have moved us into the liver, could it?"

Konev seemed at least equally upset. "No, we're not in the liver, Madame." (He came down heavily on the honorific, giving it the French pronunciation.) "But I suspect the white cell, dragging us with it, has turned into a branching capillary so that we are

now out of the mainstream of the arteriole -- which was not yet quite a capillary -- that we were carefully following."

"Which capillary did it turn into?" asked Boranova.

"That is what I don't know. There are a dozen capillaries it might have turned into and I don't know which one it was."

"Doesn't your red marker --" began Morrison.

"My red marker," said Konev at once, "works by dead reckoning. If I know where we are and the speed at which we're progressing, it will move along with us, turning when I tell it to turn."

"You mean," said Morrison incredulously, "it only marks your position insofar as you know your position -- no more than that?"

"It is not a magical marker, no," said Konev freezingly. "It acts to mark our place and keep track of it, lest we lose it in the confusion of the three-dimensional complexity of the bloodstream and the neuron networks, but we have to guide it. At this stage, it's not complex enough to guide itself. In an emergency, we can be located from outside, but that's a time-consuming process."

It seemed to be time for someone to ask a classically foolish question and that someone turned out to be Dezhnev. He said, "Why should the white cell have turned off into a capillary?"

Konev turned red. Speaking so rapidly that Morrison could hardly make out the Russian, he said, "And how should I know that? Am I privy to the thought processes of a white cell?"

"That's enough," said Morrison sharply. "We're not here to fight with each other." (He noted the quick look that Boranova had shot toward him and he chose to interpret it as representing gratitude.)

"Actually," he went on, "the solution is simple. We're in a capillary. Very well. The current is at a creeping pace in capillaries, so where is the difficulty in making use of the famous microfusion engines? If you put them into reverse, we will just back out of this capillary and eventually -- not a very long eventually, either -- we will be back at the junction point and in the arteriole again. Then we continue onward until we get to the proper turnoff and into the proper capillary. We'll have lost a little time and spent a little power, that's all."

Morrison's statement was greeted with solemn stares. Even Konev, who generally spoke -- when he did -- with his face steadfastly forward, turned now, his angry frown concentrated on Morrison.

Morrison said uneasily, "Why are you all looking at me like that? It's a perfectly natural course of procedure. If you had been driving a car and accidentally turned into a narrow alley and found it the wrong one, wouldn't you back out?"

Boranova was shaking her head. "Albert, I'm sorry. We have no reverse."

"What?" Morrison stared at her blankly.

"We have no reverse. We have only a forward drive. Nothing more."

Morrison said, "How is it possible to -- No reverse gear at all?"

"None."

Morrison looked around at the other four faces and then burst out, "Of all the stupid, incompetent, maddening situations. It's only in the Sov--"

He stopped.

Boranova said, "Finish the thought. You were going to say that it's only in the Soviet Union that such a situation would be allowed to arise."

Morrison swallowed, then said grumpily, "I was going to say that, yes. It might be an ill-tempered statement, but I'm angry -- and the statement may be true, at that."

"And do you think we're not angry, Albert?" said Boranova with her glance level upon him. "Do you know how long we've been working on a ship like this? Years! Many years! Since miniaturization first seemed to become a practical possibility, we have been thinking of entering a bloodstream someday and exploring the working mammalian body -- if not the human body -- from within."

"But the more we planned and the more we designed, the more expensive the project grew, and the more stubborn the budgeteers in Moscow became in response. I can't blame them; they had to balance the expense of this project against other expenses in areas that were far less problematical than miniaturization was. So, as a result, the ship grew simpler and simpler in concept, as we cut out first this, then that, then the other thing. Do you remember when you Americans were building your first shuttles? What you planned and what you got?"

"In any case, we ended up with an unpowered craft, fit for observation only. We planned to enter the bloodstream and let the current carry us where it would. When we had all the information we could get, we would slowly deminiaturize. This would kill the animal which we had been studying -- it would only be an animal, of course, but even so some of us agonized over that. That was all this ship was planned for. Nothing more. We had no way of knowing that we would suddenly be faced with a situation in which we had to invade a human body, in which we had to get to a specific spot in the brain, in which we would have to emerge without killing the body. In which we had to -- and all we had was this ship, which was not meant for the job at all."

The anger and contempt on Morrison's face had vanished into a frown of concern. "What did you do?"

"We worked as fast as we could. We improved the microfusion motors and a few other things, frightened that at any moment Shapirov would die, and equally frightened -- or more so -- that our hurry would cause us to make some fatal mistake. Well, I don't think we made any fatal mistakes, but still the microfusion motors we ended up with were to be used for acceleration only when absolutely necessary -- they had originally been designed only for lighting, air-conditioning, and other low-energy uses. Of course, we lacked the time to do a complete job, so -- no reverse gear."

"Didn't anyone point out that there might just be a chance you would want to go into reverse?"

"That would mean more money and there was none to be had. After all, we had to compete with space, which was a going concern, with the realistic needs of agriculture,

commerce, industry, crime control, and half a hundred other departments of government all clutching at the national purse. Of course we never had enough."

Dezhnev sighed and said, "And so here we are. As my good father used to say: 'Only simpletons go to fortune-tellers. Who else would be in such a hurry to hear bad news?'"

"Your father is telling me nothing I don't know, Arkady. At least with that remark. I'm afraid to ask, but can we simply turn the ship?" Morrison asked.

Dezhnev said, "You are wise to be afraid. In the first place, the capillary is too narrow. The ship has no room to turn."

Morrison shook his head impatiently. "You don't have to do it in the ship's present size. Shrink it a bit. Miniaturize it. You're going to have to miniaturize anyway before getting inside a cell. Do it now and turn it."

Dezhnev said mildly, "And in the second place, we can't turn it any more than we can go backward. We have a forward gear and that is all."

"Unbelievable," whispered Morrison to himself. Then aloud, "How could you consent to begin this project with so inadequate a ship?"

Konev said, "We had no choice and we were not counting on playing games with white cells."

Boranova, her face expressionless, her voice toneless, said, "If the project fails, I will take full responsibility."

Kahinin looked up and said, "Natalya, assigning blame will not help us. Right now, we have no choice. We must go ahead. Let us move on, miniaturize if we have to, and find some likely cell to enter."

"Any cell?" said Konev in a stifled fury, and addressing no one. "Any cell? What good will that do?"

"We might find something useful anywhere we go, Natalya," said Kahinin.

When Konev made no response, Boranova said, "Is there any objection to that, Yuri?"

"Objection? Of course there's objection." He did not turn, but his very back seemed stiff with anger. "We have ten billion neurons in the brain and someone is suggesting that we wander among them blindly and choose one at random. It would be an easier task to drive along Earth's roads in an automobile and randomly choose some human being on the wayside in the hope that he might be a long-lost relative. Much easier. The number of human beings on Earth is a little more than half the number of neurons in the brain."

"That is a false analogy," said Kahinin, carefully turning her face toward Boranova. "We are not engaged in a blind search. We are looking for Pyotr Shapiro's thoughts. Once we detect them, we need only move in the direction in which the thoughts strengthen."

"If you can," said Morrison, shaking his head. "If your single forward gear happens to be carrying you in the direction in which the thoughts weaken, what do you do then?"

"Exactly," said Konev. "I had plotted out a course that would have taken us directly to an important junction in the particular neuron network that is related to abstract thought -- according to Albert's researches. The bloodstream would have carried us there and whatever tortuous path it took, the ship would have followed. And now --" He lifted both his arms and shook them at the unresponsive Universe.

"Nevertheless," said Boranova, her voice strained, "I don't see that we have any choice but to do what Sophia suggests. If that fails, we must find a way out of the body and perhaps try again another day."

"Wait, Natalya," said Morrison. "There just may be another way to remedy the situation. Is it at all possible for one of us to get outside the ship and into the bloodstream?"

43.

Morrison did not expect an affirmative answer. The ship, which had seemed to him earlier to be a marvelous example of high technology, had now shrunk in his imagination to a stripped-down scow of which nothing at all could be expected.

It seemed to him best, from any practical standpoint, to do as Kahinin had suggested -- to try any brain cell they could reach. But if that failed, it would mean getting out of the body and trying again, as Boranova had just said, and Morrison did not feel he would be physically capable of going through this again. He would try any wild scheme to prevent that.

"Is it possible to get out of this ship, Natalya?" he asked again as she looked at him, dazed. (The others were no more responsive.) "-- Look, don't you understand? Suppose you want to collect samples? Do you have a dredge, a scoop, a net? Or can someone get outside and go scuba diving?"

Boranova finally seemed to overcome her surprise at the question. Her heavy eyebrows lifted into an attitude of wonder. "You know, we do. One diving suit for reconnoitering, the plans say. It should be under the back row seats. Under here, in fact."

She unclasped herself and went into a slow float, then managed to pull herself into a horizontal position, her light cotton clothing billowing.

"It's here, Albert," she said. "I presume it has been checked -- I mean, against gross errors. There would be no leaks, no obvious flaws. I don't know that it's been field-tested."

"How could it be?" said Morrison. "I take it this is the first time the ship -- or anything -- has been in a bloodstream."

"I imagine it must have been checked in warm water adjusted to the proper viscosity. I blame myself for not checking on this, but of course there was no thought at any time of anyone leaving the ship. I had even forgotten the suit existed."

"Do you at least know if the suit has an air supply?"

"Indeed it does," said Boranova with some asperity. "And it has a power supply that makes it possible for it to have a light of its own. You mustn't think of us as utter incompetents, Albert. --Though," she said with a rueful shrug, "I suppose we -- or, at least, I -- have given you some reason to think so."

"Does the suit have flippers?"

"Yes, on both hands and feet. It is meant for maneuvering in fluid."

"In that case," said Morrison, "there is perhaps a way out."

"What are you thinking of, Albert?" asked Kahinin.

Morrison said, "Suppose we miniaturize a bit further so that the ship can turn easily without scraping the capillary walls. Someone then gets into the suit, moves outside the ship -- assuming you have an air lock of some sort -- and, propelling himself by means of the flippers, turns the ship. Once the ship is turned, the person gets back into the ship, which is now facing in the correct direction. The motor is started and we push our way back against the feeble capillary current to the joining with the arteriole and thus back to our original path."

Boranova said thoughtfully, "A desperate remedy, but our condition, too, is desperate. Have you ever done any scuba diving, Albert?"

"Some," said Morrison. "That's why I thought of this."

"And none of us have -- which is why we didn't think of it. In that case, Albert, unclasp yourself and let us get this suit on you."

"On me?" Morrison sputtered.

"Of course. It is your idea and you're the one with experience."

"Not in the bloodstream."

"No one has experience in the bloodstream, but the rest of us don't even have it in water."

"No," said Morrison savagely. "This thing is your baby -- you four. I've done the thinking that got you out of the white cell and I've just done the thinking that could get you out of your present fix. That's my share. You do the doing. One of you."

"Albert," said Boranova. "We're all in this together. In here, we are neither Soviets nor Americans; we are human beings trying to survive and to accomplish a great task. Who does what depends on who can do what best, and nothing more."

Morrison caught Kahinin's eye. She was smiling very slightly and Morrison thought he could read admiration in that smile.

Groaning softly at the folly of being influenced in so childish a manner by a hunger for admiration, Morrison knew he would agree to this madness of his own suggestion.

44.

Boranova had the suit out. Like the ship itself, it was transparent, and, except in the head portion, it lay wrinkled and flat. To Morrison, it looked unpleasantly like a life-sized caricature of a human being drawn in outline by a child.

He reached out to touch it and said, "What is it made of? Plastic wrap?"

Boranova said, "No, Albert. It is thin, but it is not weak and it is exceedingly tough and inert. No foreign material will cling to it and it should be perfectly leakproof."

"Should be?" echoed Morrison sardonically.

Dezhnev interrupted. "It is leakproof. I seem to recall it was tested some time ago."

"You seem to recall it."

"I blame myself for not having checked it personally in going over the ship, but I, too, forgot its existence. There was no thought --"

Morrison bitterly exclaimed, "I'm sure your father must have told you once that self-blame is a cheap penalty for incompetence, Arkady."

Dezhnev replied, graspingly, "I am not incompetent, Albert."

Boranova cut in, "We will have our fights when this is all over. Albert, there is nothing to worry about. Even if there were a microscopic leak, the water molecules in the plasma outside are far larger in comparison to the suit than they would be under normal conditions. A leak in a normal suit might let in normal water molecules, but that same leak in a miniaturized suit would not allow those same water molecules, now giants in comparison, to enter."

"That makes sense," muttered Morrison, looking for solace.

"Of course," said Boranova. "We can insert a standard oxygen cylinder right here - - small size, but you won't be out there for long -- an absorption canister for carbon dioxide here, and a battery for the light. So, you see, you will be equipped."

"Just the same," said Konev, turning to look at Morrison dispassionately, "you had better do it as quickly as possible. It's warm out there -- thirty-seven degrees Celsius -- and I don't think the suit has a cooling mechanism."

"No cooling mechanism?" Morrison looked at Boranova questioningly.

Boranova shrugged. "It is not easy to cool an object in an isothermal medium. This entire body, which is as large as a mountain to us, is all at a constant temperature of thirty-seven. The ship itself can be cooled by means of the microfusion engines. We can't build an equivalent device into the suit, but then, as we keep saying, you won't be out for very long. -- Still, you had better take off the suit you're wearing now, Albert."

Morrison demurred. "It's not heavy, just a thin layer of cotton."

"If you perspire with it on," said Boranova, "you will be sitting in wet clothes when you return to the ship. We have no spare clothing we can offer you."

"Well, if you insist," Morrison said. Then he removed his sandals and tried to strip his one-piecer off his legs, something which proved surprisingly difficult in his nearly weightless state.

Boranova, noting his discomfort, said, "Arkady, please help Albert into the suit."

Dezhnev worked his way, with difficulty, over the back of his seat to where Morrison floated, in a cramped posture, against the hull of the ship.

Dezhnev helped Morrison into the legs of the suit one at a time, though the two, working together, were scarcely less clumsy than Morrison alone had been. (Everything about us, Morrison thought, is designed to work in the presence of gravity.)

Dezhnev maintained a running commentary as they struggled. "The material of this suit," he said, "is precisely that of the ship itself. Entirely secret, of course, though, for all I know, you have a similar material in the United States -- also secret, I am sure." He paused on a small note of inquiry.

"I wouldn't know," muttered Morrison. His bare leg worked its way into a sheath of thin plastic. It didn't stick to his leg, but moved smoothly along, yet it somehow gave the impression of being cold and wet without, in reality, being either. He had never encountered a surface quite like that of the plastic suit and he didn't know how to interpret the sensation.

Dezhnev said, "When the seams close, they become virtually a single piece of material."

"How do they open again?"

"The electrostatics can be neutralized once you're back in the ship. For now, most of the exterior of the suit has a mild negative charge, balanced by a positive one on the inner surface. Any portion of the suit will cling to any positively charged area on the ship's surface, but not so strongly that you can't pull loose."

Morrison said, "What about the rear end of the ship where the engines are?"

"You need not be concerned about them. They are working at minimum power for our cooling and illumination and any particles emerging from them will pass through you without noticing your presence at all. The oxygen cylinders and waste absorption work automatically. You will produce no bubbles. You need only breathe normally."

"One must be grateful for some technological blessings."

Dezhnev frowned and said darkly, "It is well-known that Soviet spacesuits are the best in the world and the Japanese are second."

"But this is not a spacesuit."

"It is modeled on one in many ways." Dezhnev made as though to pull the headpiece down.

"Wait," said Morrison. "What about a radio?"

Dezhnev paused. "Why would you need a radio?"

"To communicate."

"You will be able to see us, and we will be able to see you. Everything is transparent. You can signal to us."

Morrison drew a deep breath. "In other words, no radio."

Boranova said, "I am sorry, Albert. It is really only a very simple suit for small tasks."

Morrison said sourly, "Still, if you do a thing, it's worth doing well."

"Not to bureaucrats," said Dezhnev. "To them, if you do a thing, it's worth doing cheaply."

There was one advantage of irritation and annoyance, thought Morrison; it did tend to wipe out fear. He said, "How do you plan to get me out of the ship?"

Dezhnev said, "Right where you're standing, the hull is double."

Morrison turned sharply to look and, of course, went floundering. He could not seem to remember for three seconds running that he was essentially weightless. Dezhnev helped him control his body at some cost to himself (We must look like a pair of clowns, Morrison thought.)

Morrison found himself staring, at last, at the indicated portion of the hull. Now that his attention was drawn to it, it did seem faintly less transparent than the other portions, but that might well have been his imagination.

Dezhnev said, "Hold still, Albert. My father used to say: 'It is only when a child has learned to hold still that it can be considered a creature of sense.'"

"Your father was not considering zero-gravity conditions."

"The air lock," said Dezhnev, ignoring Morrison's comment, "is modeled on the type we have in our lunar surface enclosures. The inner layer of the lock will peel back, then move around you and seal. Most of the air between the layers will be sucked out -- we can't afford to waste air -- which will give you a strange feeling, no doubt. Then the outer layer will peel open and you will be outside. Simple! -- Now, let me close your helmet."

"Wait! How do I get back?"

"The same way. In reverse."

Now Morrison was closed in completely and a definite claustrophobic sensation helped unsettle him, as the coldness of fear began to wipe out the saving sensation of anger.

Dezhnev was pushing him against the hull and Konev, having managed to turn about in his seat, was helping. The two women remained calmly in their seats and were staring intently.

Morrison did not for a moment feel that they were staring at his body; he wished they were, in fact. That would be relatively benign. He was absolutely certain they were watching to see if the air lock would work, if his suit would work, if he himself would remain alive for more than a few minutes once he was outside the ship.

He wanted to cry out and call off everything, but the impulse to do so remained only an impulse.

He felt a slippery motion behind him and then the whipping of a transparent sheet before him. It was like the seat belt clasp around his waist and chest, but here the sheet enclosed him entirely, head to toe, side to side.

It clung to him more and more tightly, as the air between was pumped out. The material of his suit seemed to strain outward as the air inside it pushed against the developing vacuum outside.

And then the outer layer of the hull behind him whipped away and he felt a soft thrust that sent him tumbling outward and into the blood plasma within the capillary.

He was out of the ship and on his own.

11. DESTINATION

Going there may be most of the fun -- but only if you get there in the end.

Dezhnev Senior

45.

Immediately, Morrison felt the enveloping warmth and gasped. As Konev had said -- the temperature was 37 degrees Celsius. It was the heat of a sweltering summer day and there was no escape. No shade, no breeze.

He looked around, getting his bearings. Clearly, Boranova had miniaturized the ship further while he had clumsily clambered into the suit. The tiled wall of the capillary was farther away. He could see only a bit of it, for between himself and the wall was a huge cloudy object. A red corpuscle, of course. Then a platelet went slipping between the red corpuscle and the wall, but very slowly.

All of them -- red corpuscle, platelet, himself, the ship -- were moving along with the small creeping current within the capillary, if one judged by the slow drifting motion of the tilings in the wall.

Morrison wondered why he felt the Brownian motion as little as he did. There was indeed the sensation of movement and the other objects in sight appeared to tremble. Even the tile marks of the capillary walls seemed to shift somehow, in a rather peculiar manner.

But there was no time to be keenly analytical. He had to get things done and get back within the ship.

He was a meter or so from the ship. (A meter? Purely subjective. How many micrometers -- how many millionths of a meter was he separated from the ship in real measurements? He didn't pause to try to work out an answer to the question.) He twiddled his flippers to get back to the ship. The plasma was distinctly more viscous than seawater -- unpleasantly so.

The heat continued, of course. It would never stop while the body he was in remained alive. Morrison's forehead was getting moist. -- Come, he had to get started.

His hand reached out to the place where he had left the ship, but it touched nothing. It was almost as though it were pushing into a soft rubbery cushion of air, although his eyes told him there was nothing between that portion of the hull of the ship and his suited hand except, at best, a film of fluid.

A moment of thought and he saw what was happening. The outer skin of his suit carried a negative electric charge. So did that portion of the hull he was touching. It was repelling him.

There were other portions of the hull, however. Morrison slid his hands along until he was aware of touching the plastic. That was not in itself enough, however, for his hands moved along the area as though it were infinitely slippery.

And then, almost with a click, his left hand froze. It had passed a region of positive charge and remained in place. He tried to pull free first by a gentle backward push and then more frantically. He might as well have been riveted to the spot. He felt farther along with his right hand. Anchor that and he might be able to pull his left hand free.

Click. Anchored now by his right hand, he pulled at his left. Nothing happened. He clung to the hull, crucified there.

Drops of perspiration rolled down his forehead and collected in his armpits.

He shouted uselessly, wiggling his legs in an ecstasy of effort.

They were looking at him, but how could he gesture to his trapped hands? The red corpuscle that had been companion to the ship since he had emerged from it drifted closer and nudged him against the hull. His chest, however, did not cling. Luckily, it was not up against a positively charged region.

Kahinin was looking toward him. Her lips were moving, but he could not lip-read -- not Russian, at any rate. She did something with her computer and his left arm pulled free. Presumably, she had weakened the intensity of the charge.

He nodded his head in what he hoped would be interpreted as a gesture of thanks. Now it would only be necessary to work his way back, positively charged area by positively charged area, until he reached the rear of the ship.

He began the motion and found himself more or less pinned, but not so much this time by the harsh pull of the electromagnetic interaction as by the soft, pillowy push of the red corpuscle.

"Get back!" shouted Morrison, but the red corpuscle knew nothing of shouts. Its role was purely passive.

Morrison thrust at it with his hands and used his leg flippers to push harder. The elastic surface film of the red cell gave and bellied inward, but resisted more strongly, the more it gave until, finally, Morrison was pushing uselessly and, as he tired, was forced back against the ship.

He paused to catch his breath, which was difficult, hot and sweat-drenched as he was. He wondered whether he would be disabled first by dehydration or by the fever which would surely come over him if he could not get rid of the heat his own body was producing -- and all the more so because of the effort he was making to free himself of the red corpuscle.

He lifted his arm again and brought it down, the plastic flipper held edgewise. It sliced through the pellicle of the corpuscle, puncturing it like a balloon. The surface tension of the film pulled the opening wider and wider. Matter exuded -- a thin cloud of granules -- and the red corpuscle began to shrink.

Morrison felt as though he had killed an inoffensive living creature and experienced a pang of guilt -- then decided that there were trillions of others in the circulatory system and that a red corpuscle only had 120 days of functioning anyhow.

Now he could pull back toward the rear.

No fog collected on the inner surface of his suit. Why should it? The surface was as warm as he was and nothing would cling to the plastic anyway. What would have been fog was probably collecting as little pools of sweat in this corner and that of the suit, rolling around as he did.

He was back at the rear now, back where the ship's streamlining failed because the jets of each of the three microfusion engines broke the smooth lines. Here he was as far from the center of gravity of the ship as possible. (With luck, the other four would move as close to the front of the ship as they could. -- He wished he had thought to make that explicit before getting into the suit.) What he had to do was to find positively charged areas that would hold his hands back and then -- push!

He was feeling a little dizzy. Physical? Psychological? The effect was the same, either way.

He took another deep breath and blinked his eyes as perspiration leaked into them (there was no way he could brush it away and again he felt a spasm of fury against the fools who had designed a suit only microscopically better than none at all).

He found the handholds against the hull and paddled his feet. Would this work? The mass he was trying to turn was only micrograms in quantity, but he had at his disposal -- what? Microergs? He knew that the square-cube law gave him a tremendous advantage, but how much efficiency could he put into his push?

But the ship moved. He could tell that by the motions of the tiling on the capillary wall. He could now reach that wall with his feet, so the ship must be lying across the capillary. He had turned it 90 degrees.

When his feet touched the capillary wall, he pushed with perhaps injudicious savagery. If he were to punch a hole in the wall, the results might be incalculably bad, but he was aware he had little time left and he could not think beyond that. Fortunately, his feet rebounded as though they had sunk into spongy rubber and the ship turned a bit faster.

Then stuck.

Morrison looked up blearily, squinting and willing himself to see. (He was almost past the ability to breathe in the squalid damp heat of the suit's interior.) It was another red corpuscle. Surely it was another red corpuscle. They were as closely spaced in capillaries as -- as cars on a busy city street.

This time he did not wait. The flipper on his right hand came down at once, carving open a vast swath, and this time he did not spend a microsecond of worry over the murder of an innocent object. His legs worked again and the ship moved.

He hoped it was shifting in the same direction as before. What if he had managed to twist himself upside down in his mad attack on the red corpuscle and he was simply pushing the ship back into the wrong direction? He was almost beyond caring.

The ship was now parallel to the long axis of the capillary. Gasping, he tried to study the tiles. If they were moving forward toward the prow of the ship, then the ship was moving backward with the current and it was facing the junction of the arteriole.

He decided it was. No, he didn't care. Right way, wrong way, he had to get back into the ship.

He was not ready to sell his life for success.

Where? Where?

His hands were sliding along the walls of the ship. Sticking here. Sticking there.

Vaguely he saw the dim figures on the other side of the wall. Motioning. He tried to follow the gestures.

They were fading out.

Up? Signaling up? How could he clamber up? He had no strength.

His last truly sane thought, for a while, was that he needed no strength. Up meant no more than down for a weightless, massless body.

He wriggled upward, forgetting why, and a fog of darkness came down upon him.

46.

The first thing Morrison sensed was cold.

A wave of cold. Then a touch of cold.

Then light.

He was staring at a face. For an interval of time, he did not grasp the fact that it was a face. It was just a pattern of light and shade at first. Then a face. Then the face of Sophia Kahinin.

She said softly, "Do you know me?"

Slowly, creakily, Morrison nodded.

"Say my name."

"Sophia," he croaked.

"And to your left?"

His eyes turned, and difficulty focusing, then he turned his head. "Natalya," he said.

"How do you feel?"

"Headache." His voice sounded small and far away.

"It will go away."

Morrison closed his eyes and surrendered to the peace of nonstruggle. Just to do nothing was the highest good. To feel nothing.

Then he felt a cool stroke over his groin and his eyes opened again. He discovered that the suit had been removed and he was naked.

He felt arms holding him down and heard a voice say, "Don't worry. We can't give you a shower. There's no water for that. But we can use a damp towel. You need to be cooled -- and cleaned."

". . . undignified," he managed, struggling over the syllables.

"Foolish. We'll dry you now. A little deodorant. Then back into your one-piece." Morrison tried to relax. It was only when he felt cotton against his body that he spoke again. He asked, "Did I turn the ship properly?"

"Yes," said Kahinin, nodding her head vigorously, "and fought off two red corpuscles most savagely. You were heroic."

Morrison said hoarsely, "Help me up." He pushed down with his elbows against his seat and, of course, drifted into the air.

He was brought down.

"I forgot," he muttered. "Well, strap me in. Let me sit and recover."

He fought down the dizzy feeling, then said, "That plastic suit is worthless. A suit for use in the bloodstream of a warm-blooded animal must be cooled."

"We know," said Dezhnev from his seat at the controls. "The next one will be."

"The next one," spat Morrison bitterly.

"At least," said Dezhnev, "you did what was necessary and the suit made that possible."

"At a cost," said Morrison, who then slipped into English in order to express his feelings more accurately.

"I understood that," said Konev. "I lived in the United States, you know. If it will make you feel better, I'll teach you how to say every one of those words in Russian."

"Thanks," said Morrison, "but they taste better in English." He licked his dry lips with a dry tongue and said, "Water would taste still better. I'm thirsty."

"Of course," said Kahinin. She held a bottle to his lips. "Suck at it gently. It won't pour when it has no mass to speak of. -- Slowly, slowly. Don't waterlog yourself."

Morrison drew his head away from the bottle. "Do we have enough water?"

"You must replace what you lost. We'll have enough."

Morrison drank more, then sighed. "That's much better. -- There was something I thought of when I was out in the capillary. Just a flash. I wasn't sufficiently myself to understand my own thought." He bent his head and, covered his eyes with his hands. "I'm not sufficiently myself to remember it now. Let me think."

There was silence in the ship.

And then Morrison said with a sigh and a rather massive clearing of his throat.

"Yes, I remember it."

Boranova sighed also. "Good, then you have your memory."

"Of course I have," said Morrison pettishly. "What did you think?"

Konev said coldly, "That a loss of memory might be an early sign of brain damage."

Morrison's teeth clicked as his mouth snapped shut. Then he said, feeling a chill in the pit of his stomach. "Is that what you thought?"

"It was possible," said Konev. "As in Shapirov's case."

"Never mind," said Kahinin insinuatingly. "It didn't happen. What was your thought, Albert? You still remember." It was half-confident statement, half-hopeful question.

"Yes, I do remember. We're pushing upstream now, aren't we? So to speak?"

"Yes," said Dezhnev. "I'm using the motors -- expending energy."

"When you reach the arteriole, you'll still be heading upstream and you can't turn. You'll be heading back the way you came. The ship will have to be turned again from outside. It can't be me. Do you understand? It can't be me!"

Kahinin put her arm around his shoulder. "Shh! It's all right. It won't be you."

"It won't be anyone, Albert, my friend," said Dezhnev jovially. "Look ahead. We're coming to the arteriole now."

Morrison looked up and felt a twinge of pain. He must have grimaced, for Kahinin put a cool hand on his forehead and said, "How is your headache?"

"Getting better," said Morrison, shaking her hand off rather querulously. He was peering forward and relieved to find that his vision seemed normal. The cylindrical tunnel up ahead was widening somewhat and beyond an elliptical lip he could see a distant wall in which the tiling was much less pronounced.

Morrison said, "The capillary comes off the arteriole like the branch of a tree at an oblique angle. We go through that opening up ahead and we'll be pointed three quarters of the way upstream -- and once we nudge the far wall, we'll bounce off and be moving fully upstream."

Dezhnev chuckled. "My old father used to say: 'Half an imagination is worse than none at all.' Watch, little Albert. See, I will wait until we are almost at the opening and I will throttle down the motor so that we make our way up the current very slowly. Now our ship sticks its snout out of the capillary -- a little more -- a little more -- and now the main stream of arteriole blood catches us and pushes against the nose and turns us -- and I push out a little more -- and it turns us a bit more -- and I come out the whole way -- and behold I've been turned, I am heading downstream once more, and I cut the motors."

He grinned triumphantly. "Wasn't that well-done?"

"Well-done," said Boranova, "but impossible without what Albert had done first."

"True enough," said Dezhnev, waving his hand. "I give him full credit and the Order of Lenin -- if he will take it."

Morrison felt infinite relief. He would not have to go out again. He said, "Thank you, Arkady." Then, rather bashfully, he added, "You know, Sophia, I'm still thirsty."

At once she handed him the bottle, but he hesitated. "Are you sure I'm not drinking more than my share, Sophia?"

"Of course you are, Albert," said Kahinin, "but more than your share is your share. Come, water is easily recycled. Besides, we have a small additional supply. You did not fit into the air lock neatly. An elbow stuck well out and we had to crack the inner layer and pull it in -- which meant the entry of some plasma. Not much, thanks to its viscosity. It's been miniaturized of course and is being recycled now."

"Once miniaturized, it can't amount to more than a droplet."

"That's all it does amount to," said Kahinin, smiling, "but even a droplet is an extra supply and since you brought it in, you deserve an extra supply. Logic is logic."

Morrison laughed and sucked up additional water greedily, squeezing it out of the flexible container astronaut-style. He was beginning to feel comparatively normal -- more than that. He was feeling the kind of dreamy contentment that comes from being freed from the intolerable.

He tried to concentrate, to gain some sense of reality, He was still in the ship. He was still the size of a bacterium, more or less. He was still in the bloodstream of a man in a coma. His chance of living another few hours was still problematical. -- And yet, even as he told himself all this, he nevertheless couldn't flog himself out of the feeling that the mere absence of unbearable heat, the mere being with others, the mere existence of a woman's care was, in itself, a touch of heaven.

He said, "I thank not only Arkady but all of you for pulling me in and caring for me."

"Don't bother," said Konev indifferently. "We need you and your computer program. If we had left you out there, the project would be a failure, even if we found the right cell."

"That may be so, Yuri," said Boranova, clearly indignant, "but at the time we were bringing Albert in, I did not think of that, but only of saving his life. I cannot believe that even you were cold-blooded enough to feel no anxiety for a human being who was risking his life to help us, except insofar as we needed him."

"Obviously," muttered Konev, "plain reason is not wanted."

Plain reason was certainly what Morrison wanted. Since the mention of brain damage, he had been testing himself, thinking, trying to come to conclusions. He said, "Arkady, when the microfusion engines are working, you are converting miniaturized hydrogen into miniaturized helium, and some of the helium escapes along with miniaturized water vapor or other materials designed to produce thrust."

"Yes," said Arkady warily. "And if that is so, what follows?"

"And the miniaturized particles -- atoms and less -- simply escape through Shapirov and through the Grotto and through the Earth and end in outer space, as you told me."

"Again -- what follows?"

"Surely," said Morrison, "they do not stay miniaturized. We are not initiating a process, are we, in which the Universe will gradually be filled with miniaturized particles as humanity proceeds to make use of miniaturization more and more?"

"If we did, what harm? All human activity for billions of years could not add a significant quantity of miniaturized particles to the Universe. But it is not so. Miniaturization is a metastable condition, which means that there is always a chance that a miniaturized particle will snap out, spontaneously, to true stability, that is, to the unminiaturized state." (Out of the corner of his eye, Morrison saw Boranova raise a warning hand, but Dezhnev was always hard to stop when in oral flood.)

"Naturally," he went on, "there is no predicting when a particular miniaturized particle will snap out of it, but it is a good wager that almost all will be beyond the moon

when it happens. As for the few -- there are always a few -- who snap out of miniaturization almost at once, Shapiro's body can absorb them --"

He then seemed to see Boranova's gesture, which had grown peremptory, and he said, "But I'm boring you. As my old father said on his deathbed: 'My proverbs may have bored you, but now you can look forward to hearing them no more, so that you will mourn me less and, therefore, suffer less.' The old man would have been surprised -- and disappointed, perhaps -- to know how much we children mourned him, even so -- but I think I won't risk it with my companions in this ship --"

"Exactly," snapped Konev, "so please stop, especially since we are now approaching the capillary that we should be entering. Albert, lean over and study the cerebrograph. Do you agree?"

Kahinin, carefully addressing Boranova, said, "Albert is in no condition to be badgered with cerebrographs."

"Let me try," said Morrison, struggling with his seat belt.

"No," said Boranova with authority. "Yuri can make this decision his own responsibility."

"Then I so make it," said Konev, looking sullen. "Arkady, can you get near the wall on our right and catch the current that turns into the capillary?"

Arkady said, "I've been racing the red corpuscles and I have caught one that is drifting toward the right wall. It will push us -- or the small eddy that is pushing it will also push us. -- Ah, you see, it is taking place, just as it did in the previous cases where we had to branch off. Each time I managed to use the natural current correctly." A broad grin creased his happy face as he said, "Applause, everybody. Say, 'Well-done, Arkady.'"

Morrison obligingly said, "Well-done, Arkady," and into the capillary the ship went.

47.

Morrison had recovered sufficiently to be tired of invalidism. Outside the transparent hull of the ship, the wall of the capillary was strongly tiled and seemed fairly close on all sides. It looked very much like the other capillary, the one in which he had turned the ship around.

He said, "I want to see the cerebrograph."

He flung open his seat belt, the first really decisive movement he had made since returning to the ship, and stared rebelliously at the perturbed Kahinin as he did so.

He pushed himself gently upward into a float, holding himself in position to look over Konev's shoulders by repeated corrections -- first up, then down. He said, "How do you know you are in the right one, Yuri?"

Konev looked up and said, "Counting and dead reckoning. See here. If we cut down the scale of the cerebrograph, this is the arteriole we've been following off the carotid. We took this branch and that one, and then it's a matter of counting the capillaries as they branch off on the right."

"We had our run-in with the white cell right here and in the time the white cell had at its disposal, this capillary was the only one it could reasonably have reached. Once we were turned around and got back to the arteriole, we followed its narrowing structure and matched what we saw against the cerebrograph. The pattern of branch points outside matched almost exactly the pattern described by the cerebrograph and that alone assures me we were following the right path. Now we have gone into this capillary."

Morrison's left hand slipped off the smooth texture of the back of Konev's seat and his attempt to make up for that twisted him into a comic handstand on the outspread fingers of his right hand. He labored to right himself even as he thought, savagely, that another improvement that must be introduced in later versions of the ship would be handholds on the seats and in other strategic areas.

He said, panting, "And where will this capillary take us?"

Konev said, "Directly to one of the centers which you believe to be a crossroad for the processes of abstract thought. -- Let's cut down the scale of the cerebrograph again. Right here."

Morrison nodded. "Please remember that I've located them in human beings only indirectly, judging from my findings in animal brains. Still, if I'm correct, that should be the superior external skeptic node."

Konev said, "According to you, there should be eight such nodes, four on each side. This one, however, is the largest and most intricate on the left side and therefore stands the best chance of giving us the data we need. Am I right?"

"I think so," said Morrison cautiously, "but please remember that my reasoning has not been accepted by the scientific community."

"And do you begin to doubt it now, too, Albert?"

"Caution is a reasonable scientific attitude, Yuri. My concept of the skeptic node makes sense in the light of my observations, but I have never been able to test the matter directly -- that's all -- and I do not wish it said later that I misled you."

Dezhnev snickered. "Skeptic node! No wonder your countrymen are skeptical of the whole notion, Albert. My father used to say: 'People are ready enough to laugh at you. Don't make funny faces in order to encourage them.' -- Why didn't you call it 'thought node' in simple Russian? It would have sounded much better."

"Or 'thought node' in simple English," said Morrison patiently. "But science is international and one uses Greek or Latin when possible. The Greek word for 'thought' is 'skeptis.' It has given us 'skeptical' both in English and in Russian to indicate a habitual doubting attitude. That's because the very act of doubt implies thought. Surely you all know that the most efficient way of accepting the foolish dogmas foisted on us by social orthodoxy is to refrain from thinking."

There was an uncomfortable silence at that, whereupon Morrison (having left it there for just long enough, out of a faint malice -- he owed them that much) said, "As human beings in all nations know."

The atmosphere lightened perceptibly at once and Dezhnev said, "In that case, we will see how skeptical we need be of the skeptic node, when we reach it."

"I hope," said Konev with a scowl, "that you don't think this is something to joke about, you clown. That node is where we can hope to detect Pyotr Shapirov's thoughts. Without that, this venture will come to nothing."

Dezhnev said, "To each his own job. I will take you there, with my expert handling of the ship. Once there, you will get the thoughts -- or Albert will, if you cannot. And if you do as well with the thoughts as I do with the ship, you will have nothing to be unhappy about. My father used to say --"

"Your father is better off where he is," said Konev. "Don't dig him up again."

"Yuri," said Boranova sharply, "that was an unbearably rude remark to make. You must apologize."

"That's all right," said Dezhnev. "My father used to say: 'The time for offense is when a man, once he has cooled down, repeats an insult he has offered in his rage.' I am not sure that I can always follow that advice, but in honor of my father, I will pass over Yuri's stupid remark this time." He bent over his controls, his face grim.

Morrison had listened to the altercation (just Konev being nasty -- obviously because he was under a great strain) with only half an ear. His mind slipped back to something else, to Dezhnev's carefree chatter and Boranova's warning hand.

He lowered himself into his seat, clasp ing himself in for stability, and turned his head toward Boranova. "Natalya! A question!"

"Yes, Albert?"

"Those miniaturized particles released into the normal, unminiaturized Universe --"

"Yes, Albert?"

"Eventually, they deminiaturize."

Boranova hesitated. "As Arkady told you, they do."

"When?"

She shrugged. "Unpredictably. Like the radioactive breakdown of a single atom."

"How do you know?"

"Because it's so."

"I mean, what experiments have been conducted? Nothing has ever been miniaturized to the extent that we are now miniaturized, so surely you can't know what happens to such miniaturized particles by direct observation."

Boranova said, "We've observed events at miniaturizations we have reached and in that way determined what seem to be the laws of behavior of miniaturized objects. We extrapolate --"

"Extrapolations aren't always trustworthy when they go well outside the realm of direct study."

"Granted."

"You compared spontaneous deminiaturization to radioactive breakdown. Is there a half-life of deminiaturization? Even if you can't tell when a particular miniaturized particle will deminiaturize, can you tell when half of a particular large quantity of them will?"

"We have half-life figures and we think they are expressions of first-order kinetics, as radioactive half-lives are."

Morrison said, "Can you generalize from one type of particle to another?"

Boranova pursed her lips and, for a moment, seemed lost in thought. Then she said, "It would seem that the half-life of a miniaturized object varies inversely with the intensity of miniaturization and also with the normal mass of the object."

"So that as we are miniaturized to smaller and smaller sizes, the less time we are likely to remain miniaturized, and the smaller we are to begin with, the less time we are likely to remain miniaturized."

"That's right," replied Boranova stiffly.

Morrison looked at her gravely. "I admire your integrity, Natalya. You're not anxious to tell me things. You don't volunteer information. Still, you draw the line at misinforming me."

Boranova said, "I am a human being and I tell lies on occasion out of necessity or out of defects in my emotions or personality. But I am also a scientist and I would not twist scientific fact for any but the most compelling reasons."

"Then what it amounts to is this. Even this ship, although it is much more massive than a helium nucleus, has a half-life."

"A very long one," put in Boranova quickly.

"But the fact that we are so intensely miniaturized has curtailed this very long half-life."

"Still leaving it long."

"And what about the individual components of the ship? The molecules of water that we drink, the molecules of air we breathe, the individual atoms that make up our body? They could have -- must have -- very short --"

"No!" said Boranova forcefully, seeming to find relief in being able to deny something. "The miniaturization field overlaps where it deals with particles sufficiently close together, and that are at rest, or nearly at rest, relative to each other. An extended body -- such as the ship and everything it contains -- is treated as a large but single particle and has a half-life of deminiaturization to match. There miniaturization differs from radioactivity."

"Ah," said Morrison, "but when I was out of the ship and out of contact with it, could it be that I was then a separate particle with a much smaller mass than the ship and its contents and that I had a miniaturization half-life much smaller than we have now?"

"I'm not sure," said Boranova, "whether the distance between yourself and the ship was great enough to make you a separate body. Possibly it did, for the time you were not in contact."

"And I then had a shorter half-life -- much shorter."

"Possibly -- but then you were out of contact only a matter of minutes."

"Well, then, what is the half-life of this ship at the present level of miniaturization?"

"We can't really speak of the half-life of a single object."

"Yes, because half-lives are statistical. For any particle, deminiaturization can come, spontaneously, at any time, even after a very short time and even though the half-life of a large number of similar particles would be quite long."

"For spontaneous deminiaturization to come after a very short time when the statistical half-life is long is extremely improbable."

"But not impossible, is it?"

"No," said Boranova. "It is not impossible."

"So we can suddenly deminiaturize in five minutes, or even in one minute, or even as I take my next breath."

"In theory."

"Did you all know?" His eyes darted around the ship. "Of course you all knew. Why was I not told?"

Boranova said, "We are volunteers, Albert, working for science and for our nation. We know all the dangers and accept them. You have been forced into this and you don't have the motives that drive us. It seemed possible that if you knew all the dangers, you would have refused to enter the ship voluntarily under any persuasion or that, being brought on board ship by force, you would be altogether useless to us out of sheer --" She paused.

"Out of sheer fright, you were going to say," said Morrison. "Surely I have a right to be afraid. There is reason for fear."

Kahinin interrupted, her voice a little shrill. "It is time to stop harping on Albert's fear, Natalya. It is he who left the ship in an inadequate suit. It is he who turned the ship around at the risk of his life. Where was his fear then? If he felt it, he bottled it inside and didn't let it prevent him from doing what had to be done."

Dezhnev said, "And yet it was you who did not hesitate to say, in the past, that Americans were all cowardly."

"Then I was wrong. I was speaking unfairly and I ask Albert's pardon."

It was at this point that Morrison caught Konev's eye. The man was twisting around in his seat and glowering at him. Morrison did not pretend to be a master at reading facial expressions, but felt that he could, at a glance, tell what was ailing Konev. The man was jealous -- furiously and quite impressively jealous.

48.

The ship continued its slow way along the capillary toward the destination Konev had marked out: the skeptic node. It was not depending on the current now, which was slow indeed. The engines were going, as Morrison could tell, in two different ways. First, it steadied the ship to have it move along actively, rather than drift passively, and it further deadened the already surprisingly small effect of Brownian motion. Second, the ship was overtaking one red corpuscle after another.

In most cases these were nudged to one side and the red corpuscles then rolled backward between the ship and the wall. Occasionally, a red corpuscle would be met too near dead-center and it would then be pushed forward for a while until it burst. The debris would flow backward, leaving the ship's hull unmarked. With at least five million corpuscles in every cubic millimeter of blood, it didn't matter how many were disrupted and Morrison had become hardened to the carnage.

Morrison deliberately thought of the red cells, rather than of the chance of spontaneous deminiaturization. He knew there was no appreciable chance of exploding outward in the next few moments and, even if it happened, it would simply mean blackout. Death by fried brain would take place so quickly that there would be no conceivable way of sensing it.

Not long before, he had been heating much more slowly in the bloodstream itself. He had felt himself dying. After that, instantaneous death had no terrors.

But he preferred to think of other things just the same.

Konev's look! What was seething within him and tearing him apart? He had abandoned Sophia with the utmost cruelty. Did he really think the child was not his? People needed no reason to come to an emotional conclusion and the suspicion of being wrong just bolted the conclusion defensively and immovably in place. Pathological. Think of Leontes in *The Winter's Tale*. Shakespeare always got these things right. Konev would push her away and hate her for the wrong he had done her. He would push her into another man's arms and hate her for being pushed -- and be jealous in addition.

And she? Did she know of the jealousy and play upon it? Would she deliberately turn to Morrison, an American, to tear Konev into strips? Tenderly patting the American with the wet towel. Defending him at every step. With Konev, of course, a witness to everything.

Morrison's lips tightened. He didn't like to be a tennis ball, batted from one to another in order to produce maximum pain.

It was none of his business, after all, and he shouldn't take sides. But how was he going to not take sides? Sophia Kahinin was an attractive woman who reacted with silent sorrow. Yuri Konev was a frowning nasty man who reacted with a compressed boiling of anger. He could neither help liking Sophia nor help disliking Yuri.

He then noted Boranova staring at him gravely and wondered if she were misinterpreting his thoughtfulness and silence. Did she feel he was brooding about the possibility of death by miniaturization -- which he was manfully trying not to do?

It seemed so, when Boranova suddenly said, "Albert, none of us are reckless. I have a husband. I have a son. I want to go back to them alive and I intend to get us all back alive. I want you to understand that."

"I'm sure your intentions are good," said Morrison, "but what can you do against a possibility of deminiaturization that is spontaneous, unpredictable, unstoppable?"

"Spontaneous and unpredictable, I agree, but who said unstoppable?"

"Can you stop it, then?"

"I can try. We each have our jobs here. Arkady maneuvers the ship. Yuri directs it to the destination. Sophia gives the ship its electric pattern. You will study the brain waves. As for me, I sit back here and make decisions -- my major decision up to now was a mistake, I admit that -- and I watch the heat flow."

"The heat flow?"

"Yes. Before the deminiaturization takes place, there is a small evolution of heat, characteristic in pattern. It is that emission that is destabilizing; it is what tips the delicate balance and, after a small delay, starts the process of deminiaturization. When that happens, if I am fast enough, I can intensify the miniaturization field in such a way as to reabsorb the heat and reestablish the metastability."

Morrison said dubiously, "And has that ever been done -- actually been done under field conditions -- or is it simply theory?"

"It has been done -- under much smaller intensities of miniaturization, of course. Still, I have trained at this and my reflexes are sharpened. I hope not to be caught short."

"Was it spontaneous deminiaturization that put Shapirov into a coma, Natalya?"

Boranova hesitated. "We don't really know whether it was an unfortunate encounter with the laws of nature or human error -- or both. It may have been a slightly greater wobble from the metastable point of equilibrium than usual and nothing more than that. It is not something I can analyze in detail with you, for you don't have the needed background in the physics and mathematics of miniaturization, nor would I be permitted to give you that background."

"I understand. Classified material."

"Of course."

Dezhnev broke in, "Natasha, we have reached the skeptic node -- or so Yuri says."

"Then come to a halt," ordered Boranova.

49.

Coming to a halt took a while.

Morrison noted, with some mild surprise, that Dezhnev did not seem concerned in the process. He was checking his instruments but was making no effort to control the motion of the ship.

It was Kahinin who was deeply involved now. Morrison looked to his left, studying her as she bent over her instrument, her hair falling forward but not long enough to get in her way, her eyes intent, her slim fingers caressing the keys of her computer. The graphic patterns on the screen she was watching made no sense to Morrison, of course.

"Arkady," she said, "move forward just a little."

The feeble current in the capillaries barely stirred the ship. Dezhnev supplied a small burst of power. (Morrison felt his almost massless body move slightly backward, since there wasn't sufficient inertia to give it a real jerk.) The nearest red corpuscles between the ship and the farther wall of the capillary drifted backward.

"Stop, stop," said Kahinin. "Enough."

"I can't stop," said Dezhnev. "I can only cut the motors and that I've done."

"It's all right," said Kahinin. "I have it now," then added the all-but-inevitable saving afterthought of "I think." Then: "Yes, I do have it."

Morrison felt himself sway forward very slightly. Then he noted the nearby red corpuscles, together with an occasional platelet, drift forward and pass by lazily.

In addition, he became aware of a total cessation of the Brownian motion, that faint tremble he had grown so used to that he was able to ignore it -- until it stopped. Now its absence was noticeable and it produced the same sensation within Morrison as the sudden cessation of a continuous low hum would have. He stirred uneasily. It was as though his heart had stopped, even though intellectually he knew it had not.

He asked, "What's happened to the Brownian motion, Sophia?"

She replied, "We're affixed to the wall of the capillary, Albert."

Morrison nodded. If the ship was one piece with the capillary wall, so to speak, the bombarding water molecules that produced the Brownian motion would lose their effect. Their impacts would work toward moving an entire section of comparatively inert wall, instead of a tiny ship the size of a blood platelet. Naturally, the trembling would cease.

"How did you manage to affix the ship, Sophia?" he asked.

"The usual electrical forces. The capillary wall is partly protein, partly phospholipid in character. There are positively and negatively charged groups here and there. I had to detect a pattern sufficiently compact, and then produce a complementary pattern on the ship; negative where the wall is positive and vice versa. The trouble is that the ship is moving with the current, so that I have to detect it a little ahead and produce the complementary pattern before we pass it. I missed three such occasions and then we hit a region where there were no suitable patterns at all, so I had to get Arkady to move us ahead a bit into a better region. -- But I made it."

"If the ship had a reverse gear," said Morrison, "there would have been no problem, would there?"

"True," said Kahinin, "and the next ship will have one. But for now, we have only what we have."

"Quite so," put in Dezhnev. "As my father used to say: 'On tomorrow's feast, we can starve today.'"

"On the other hand," said Kahinin, "if we had a motor that could do all we would want it to do, we would have a strong impulse to use it lavishly and that might not be so good for poor Shapirov. And it would be expensive besides. As it is, we used an electric field which is more sparing of energy than a motor would be and the price is only a little more work for me -- and what of that?"

Morrison was quite certain she wasn't talking for his benefit. He said, "Are you always so philosophical?"

For a moment, her eyes widened and her nostrils tightened, but only for a moment. Then she relaxed and said with a small smile, "No, who could be? But I try."

Boranova interjected, impatiently, "Enough chat, Sophia. -- Arkady, you are clearly in touch with the Grotto. What's the delay?"

Arkady held up a large hand, half-twisting in his seat to present its palm toward Boranova. "Patience, my captain. They want us to stay exactly where we are for two reasons. First, I'm sending out a carrier wave in three directions. They are locating each and using them to locate us in order to see if the location they determine jibes with what Yuri says it is by dead reckoning."

"How long will that take?"

"Who can say? A few minutes, at any rate. But then my carrier waves are not very intense and the location must be precise, so they may have to repeat the measurement several times and take a mean and calculate limits of error. After all, they have to be correct, for as my father used to say: 'Almost right is no better than wrong.'"

"Yes yes, Arkady, but that depends on the nature of the problem. What is the second reason we are waiting?"

"They're going through some observations on Pyotr Shapirov. His heartbeat has become slightly irregular."

Konev looked up, his mouth failing open slightly and his thin cheeks looking gaunt under his high cheekbones. "What! Do they say it's anything we're doing?"

"No," said Dezhnev. "Do not become a tragedian. They say nothing of the sort. And what can we be doing to Shapirov that is of any importance? We are merely a red corpuscle among red corpuscles in his bloodstream, one among trillions."

"Well, then, what's wrong?"

"Do I know?" said Dezhnev, clearly irritated. "Do they tell me? Am I a physician? I just maneuver this vessel and they pay me no mind except as a pair of hands on the controls."

Kahinin said with a touch of sadness, "Academician Shapirov clings but weakly to life in any case. It is a wonder that he has remained in stable condition so long."

Boranova nodded. "You are right, Sophia."

Konev said savagely, "But he must continue to remain so. He can't let go now. Not now. We haven't made our measurements yet."

"We will make them," said Boranova. "An irregular heartbeat is not the end of the world, even for a man in a coma."

Konev pounded the arm of his seat with a clenched fist. "I will not lose a moment. Albert, let's begin."

Morrison was startled. He said, "What can be done here in the bloodstream?"

"A neural effect may be felt immediately outside the nerve cell."

"Surely not. Why would the neurons have axons and dendrites to channel the impulse if it was going to spread and weaken into space beyond? Locomotives move along rails, telephone messages along wires, neural impulses --"

"Don't argue the case, Albert. Let's not accept failure by some fine process of reasoning. Let's test the matter. See if you can detect brain waves and if you can analyze them in the proper fashion."

Morrison said, "I'll try, but don't order me around in that bullying tone."

"I'm sorry," said Konev, not sounding sorry at all. "I want to watch what you do." He unclasped himself, turned in his seat, holding on tightly, muttering, "We must have more room the next time."

"An ocean liner, certainly," said Dezhnev. "Next time."

"What we have to do first," said Morrison, "is to discover whether we can detect anything at all. The trouble is, we are surrounded by electromagnetic fields. The muscles are rich in them and each molecule, almost, is the origin point of a --"

"Take all that as known," said Konev.

"I am only filling in the time while I carry my device through some necessary steps. The neural field is characteristic in several ways and by adjusting the computer to eliminate fields without those characteristics, I leave only what the neurons produce. We blank out all microfields like so and we deflect the muscle fields in this manner --"

"In what manner?" demanded Konev.

"I describe it in my papers."

"But I didn't see what you did."

Wordlessly, Morrison repeated the maneuver slowly.

"Oh," said Konev.

"And by now we should be detecting only neural waves if any are present here to detect -- and there aren't."

Konev's right fist clenched. "Are you sure?"

"The screen shows a horizontal line. Nothing else."

"It's quivering."

"Noise. Possibly from the ship's own electric field, which is complex and not entirely like any of the natural fields of the body. I've never had to adjust a computer to filter out an artificial field."

"Well, then, we have to move on. -- Arkady, tell them we can wait no longer."

"I can't do that, Yuri, unless Natasha tells me to. She's the captain. Or had you forgotten?"

"Thank you, Arkady," said Boranova coldly. "You, at least, have not. We'll forgive Konev his lapse and put it down to overzealousness in pursuit of his work. My orders are not to move until the Grotto gives us the word. If this mission fails because of anything that goes wrong with Shapirov, there must be no opportunity for anyone to say it was because we did not follow orders."

"What if some disaster happens because we did follow orders? That can happen, too, you know." Konev's voice rose to near-hysteria.

Boranova replied, "The fault will then lie with those who gave the orders."

"I can find no satisfaction in apportioning blame, whether to myself or to anyone else. It is results that count," said Konev.

"I agree," said Boranova, "if we are dealing with fine-spun theory. But if you expect to continue working on this project past the time of a possible catastrophe, you will find that the manner of allotting blame is all-important."

"Well, then," said Konev, stuttering slightly in his passion. "Urge them to let us move as soon as possible and then we'll -- we'll --"

"Yes?" said Boranova.

"And then we'll enter the cell. We must."

12. INTERCELLULAR

In life, unlike chess, the game continues after checkmate.

Dezhnev Senior

50.

A heavy silence fell upon the five shipmates. Konev's silence was the least quiet. He was quivering with unrest and his hands would not keep still.

Morrison felt a dim sympathy. To have reached the destination, to have done just as planned, through difficulties, to imagine one's self at the point of snatching success, and to have to fear that it will be moved away from the eagerly grasping fingers even now -- he knew the feeling. No longer quite as sharply perhaps, as once, now that he was ground down and dulled by frustration, but he remembered the early occasions. Experiments that raised hope, but were somehow never quite conclusive. Colleagues who smiled and nodded, but were never convinced.

He leaned forward and said, "Look, Yuri, just watch the red corpuscles. They're creeping ahead, one after the other, steadily -- and that means the heart is beating and is doing so fairly normally. As long as the red corpuscles move steadily ahead, we're safe."

Dezhnev said, "There's the blood temperature, too. I've got it monitored at all times and it will have to start dropping slowly, but with determination, if Shapiro lets go. Actually, the temperature is at the upper edge of normal."

Konev grunted, as though scorning consolation and pushing it to one side, but it seemed to Morrison that he was noticeably quieter after that.

Morrison sank back in his seat and let his eyes close. He wondered if he was experiencing hunger and decided that he was not. He also wondered if there was a distinct sensation of bladder pressure. There wasn't but that did not relieve him much. One could always postpone eating for a considerable length of time, but the necessity of urination did not lend itself to quite the same flexibility of choice.

He was suddenly aware that Kahinin had addressed him but he had not been listening. "Pardon me. What did you say?" he asked, turning toward her.

Kahinin looked surprised. She said softly, "I ask your pardon. I interrupted your thoughts."

"They were worth interrupting, Sophia. I ask your pardon for being inattentive."

"In that case, I asked what it is you do in your analysis of brain waves. I mean, what is it you do that is different from what others do? Why was it necessary for us --" She paused, clearly uncertain as to how to proceed.

Morrison finished her thought without difficulty. "Why was it necessary for me to be abstracted forcibly from my country?"

"Have I made you angry?"

"No. I presume you did not advise the action."

"Of course not. I knew nothing of it. In fact, that is why I am asking you my question. I know nothing about your field except that there are electroneural waves; that electroencephalography has become an intricate study, and an important one."

"Then if you ask me what is special about my own views, I'm afraid I can't tell you."

"Is it secret, then? I thought it might be."

"No, it is not secret," said Morrison, frowning. "There are no secrets in science, or there should be none -- except that there are struggles for priority so that scientists are sometimes cautious about what they say, and I am guilty of that, too, sometimes. In this case, though, I mean it literally. I can't tell you because you lack the basis for understanding."

Kahinin considered, her lips compressed as though in aid to thought. "Could you explain a bit of it?"

"I can try, if you're willing to hear simple assertions. I can't very well describe the entire field. -- What we call brain waves are a conglomeration of all sorts of neuron activity -- sense perceptions of various kinds, stimuli of various muscles and glands, arousal mechanisms, coordinations, and so on. Lost among all these are those waves that control, or result from, constructive and creative thought. Isolating those skeptic waves, as I call them, from all the rest is an enormous problem. The body does it without any difficulty, but we poor scientists are, for the most part, at a total loss."

"I'm having no difficulty understanding this," said Kahinin, smiling and looking pleased. (She is remarkably pretty, thought Morrison, when she manages to get rid of her air of melancholy.)

"I haven't gotten to the hard part yet," he said.

"Please do, then."

"About twenty years ago, it was demonstrated that there was what seemed a random component in the waves that no one had ever picked up because the instruments that had been used until then did not pick up what we now call 'the twinkle.' It's a very rapid oscillation of irregular amplitude and intensity. That's not a discovery I made, you understand."

Kahinin smiled again. "I imagine that twenty years ago you would have been too young to make the discovery."

"I was an undergraduate then, making the discovery that young women were not entirely unapproachable, which is by no means an unimportant thing to find out. In fact, each person may have to rediscover it now and then, I think. -- But never mind that."

"A number of people speculated that the twinkle might represent thought processes in the mind, but no one managed to isolate it properly. It would come and go, be detectable at times and not at others, and the general feeling was that it was

artificial, a matter of working with instruments that were too delicate for the thing they were measuring so that one picked up what was, essentially, noise.

"I thought not. In time I developed a computer program that made it possible for me to isolate the twinkle and to demonstrate it was always present in the human brain. For that I got some credit, though few people were able to duplicate my work. I used animals for types of experimentation that were too dangerous to perform on human beings and used the results to further sharpen my program of analysis. But the sharper I made the analysis and the more significant I thought the results, the less others were able to duplicate them and the more they insisted that I was misled by my animal experimentation.

"But even isolating the twinkle was a long way from demonstrating that it was a representation of abstract thought. I have amplified it, intensified it, modified my program over and over, and have convinced myself that I am studying thought, the skeptic waves themselves. Still, no one can duplicate the crucial points of my work. I have, on several occasions, allowed someone to use my program and my computer -- the sort of thing I'm using now -- and they invariably fail."

Kahinin was listening gravely. She said, "Can you imagine why no one can duplicate your work?"

"The easiest explanation is that there is something wrong with me, that I am a crank -- if not a madman. I believe that some of my colleagues suspect that to be the answer."

"Do you think you're a madman?"

"No, I don't, Sophia, but even I waver sometimes. You see, after you isolate the skeptic waves and amplify them, it is conceivable that the human brain itself might become a receiving instrument. The waves may transfer the thoughts from the thinker you are studying directly to you. The brain would certainly be an extraordinarily delicate receiver, but it would also be an extraordinarily individual one. If I improved my program so that I could sense the thoughts better, that would mean I improved it to suit my own individual brain. Other brains might not be affected and, in fact, might be less affected, the closer I adjusted it to mine. It would be like a painting. The closer a painting is made to look like me, the less it looks like anyone else. The more I can make my program produce sensible self-consistent results, the less anyone else can."

"Have you actually sensed thought?"

"I'm not sure. There are times I have thought I did, but I'm never quite convinced it's not my imagination. Certainly no one else -- with my program or any other -- has sensed anything. I have used the twinkle to track down the skeptic nodes in the brains of chimpanzees and from that reasoned out where they would be in human brains, but that is not accepted either. It is considered the overenthusiasm of a scientist oversold on his own unlikely theory. And even using leads into the skeptic nodes -- on animals, of course -- I couldn't be sure."

"With animals it would be difficult. Have you published these -- sensations of yours?"

"I haven't dared," said Morrison, shaking his head. "No one would accept such subjective findings. I've mentioned it in passing to several people -- foolish of me -- and the news spread and merely convinced my colleagues all the more firmly that I am, shall we say, unstable. It was only last Sunday that Natalya told me that Shapirov took me seriously, but he is considered, at least in my country, to be unstable, too."

"He is not," said Kahinin firmly, "or was not."

"It would be nice to think he wasn't, obviously."

Konev, from in front of Morrison, said suddenly, without turning around, "It was your sensations of thought that impressed Shapirov. I know! He discussed it with me. He said on a number of occasions that your program was a relay station and he would like to try it himself. If you were inside a neuron, a key neuron of the skeptic node, things would be different. You would sense thoughts unmistakably. Shapirov thought so and I think so. Shapirov thought it possible you might even have sensed thoughts unmistakably as it was, but were not ready to let the world know. Is that so?"

How they harped on secrecy, all of them, thought Morrison. Then he caught the look on Kahinin's face. Her mouth was partly open, her eyebrows drawn together, her finger hovering near her lips. It was as though she wanted to ask him to be quiet with a kind of agonizing intensity, without quite daring to do so openly.

But then he was distracted by Dezhnev's voice, joyfully loud. "Enough babble, my children. The Grotto has located us and we are, to their enormous astonishment, exactly where we say we are."

Konev threw up both hands and his voice sounded almost boyish. "Exactly where I say we are."

Dezhnev said, "Let us have communal responsibility. Where we say we are."

"No," said Boranova. "I ordered Konev to make the decision on his own responsibility. The credit is therefore his."

Konev was not mollified. He said, "You would not have so quickly demanded communal responsibility, Arkady Vissarionovich" -- he used the patronymic in a style long out of fashion in the Soviet Union, as though to emphasize the fact that Dezhnev was the son of a peasant, among whom, only, the style remained in fashion -- "had we proved to be in the wrong capillary."

Dezhnev's smile became an uncomfortable one and his somewhat yellow upper incisors caught at his lower lip.

Boranova said in her masterful contralto, cutting off any retort Dezhnev might have made, "And Shapirov. What of him?"

"That," said Dezhnev, "has passed. An injection of some sort steadied the heartbeat."

Konev said, "Well, then, are we ready to go?"

"Yes," said Boranova.

"In that case -- out of the bloodstream at last."

51.

Boranova and Kahinin were bent over their instruments. Morrison watched them for a few moments, but, of course, knew nothing of what was going on. He turned to Dezhnev, who sat in a relaxed position (unlike Konev, whose body was tense, almost ridged with muscle), and said, "What will be done, Arkady? We can't very well just blast our way out of a blood vessel in the brain."

"We'll sneak out once we're small enough. We're miniaturizing again. Look around you."

Startled, Morrison did. He realized that every time the outside world seemed to stabilize, he quickly learned to take it for granted and to pay no attention to it.

The current had picked up speed. Or, rather, it hadn't, but the ship had shrunk in size once more and objects moving by took correspondingly less time to pass, so that the mind, insisting on considering the ship's size unchanged, interpreted what was seen as a faster current.

A red cell passed by, moving as it had (or seeming to move as it had) in the carotid artery, but despite its speed, it billowed past for a long time, like a quivering whale passing a rowboat. It had grown faint indeed. It was almost transparent now and its edge was fuzzy with Brownian motion. There was a grayish dimness about it, so that it looked like an angry thundercloud spreading its way over the heavens. It had lost most of its oxygen by this time, of course, giving it up to the avid brain cells which, without motion or visible signs of life, consumed one quarter of all the oxygen carried by the blood to the various organs of the body. For all that the brain seemed to simply sit there, sense perception, response, and thought, all of it coordinated with a complexity that no human computer could come within an astronomical distance of duplication -- might never duplicate -- did not come cheap.

To make up for the spreading of the red cells, the platelets, and the comparatively rare white cells that had grown into monsters that were now too large to grasp, the blood plasma was becoming far less featurelessly liquid.

It had started to turn grainy and now the grains were slowly expanding as they shot past with gradually increasing speed. Morrison knew he was looking at protein molecules and, after a while, it seemed to him that through their whirling and flexing he could make out the helical arrangements of their atoms in fuzzy manner. Some had a miniature forest of lipid molecules partially encasing them.

He was becoming aware also of movement, not the tremble of Brownian motion but a lurching that was becoming more pronounced.

He turned his head to look out the other side at the capillary wall to which they were attached.

The tiling was gone -- or at least one tile (or cell, as he might as well think of it now) had expanded to the point where it was the only one to be seen. Slipping off behind was the bulge of the nucleus of the cell, large and thick and growing larger and thicker.

The ship lurched as part of it slid away from the wall and then lurched again as it slid back.

"What's happening?" said Morrison, looking at Kahinin, who shook her head impatiently. She was totally absorbed in her work.

Dezhnev said, "Sophia is trying to neutralize the ship's electric charge here and there so that it lets go before the tension damages the wall. And she has to find new areas of attachment to keep from losing the wall altogether. It's not easy, having to miniaturize and, at the same time, staying attached to the wall."

Morrison said, alarmed, "How far will we miniaturize?"

His words were overborne by Kahinin's shrill command. "Arkady, move it forward. Gently! Just put forward pressure on the ship."

"Yes, Sophia -- but tell me when to stop." To Morrison, he added, "My father used to say: 'Between not enough and too much is a hair's breadth.'"

"More, more," said Kahinin. "All right. Now we'll try." The ship seemed to stick and strain and then it suddenly slid forward and Morrison felt himself thrust gently back against his seat.

"Good," said Kahinin. "Just a little less now."

The cell came to an end. Beyond it was another cell. Thin cells, as cells went, a mere film of cells, fitted together to make a tiny tube, with the ship and its crew of five clinging to the inner surface by minute attractions of electric charge.

The space between the adjoining cells seemed ropy, with cables stretching from inside one cell to the other. They were not all intact and there were stumps visible like the remains of a felled forest. It seemed to Morrison that there were narrow gaps in that felled forest, but he couldn't see clearly from the angle at which he viewed them.

He said again, "How far will we miniaturize, Arkady?"

"Eventually to the size of a small organic molecule."

"But what would the chances be of spontaneous deminiaturization at that size?"

"Appreciable," said Dezhnev. "Much more than it was when we were the size of a red corpuscle or even of a blood platelet."

"Still not enough to worry about," said Boranova. "I assure you."

"Exactly," said Dezhnev and raised his hand slightly with the first two fingers crossed so that Morrison could just see it and Boranova, farther back, could not. That American gesture had become universal and Morrison, knowing exactly what it meant, felt himself growing cold inside.

Dezhnev was looking straight ahead, but he might have sensed Morrison's grimace or heard his soft grunt. He said, "Don't worry about it, young Albert. It is always wise to have but one worry at a time and right now let us worry about squeezing out of the blood vessel. -- Sophia, my loved one."

"Yes, Arkady," she said.

"Weaken the field in the rear of the ship and when I move grope for one ahead."

"I will do so, Arkady. Didn't your father once say: 'There is no point in trying to teach a thief to steal?'"

"Yes, he did. Steal, then, little thief, steal."

Morrison wondered whether Dezhnev and Kahinin were deliberately being lighthearted in the face of the possibility of sudden death as a way of cheering him up? Or were they showing contempt for his cowardice? He chose the former. Surely when an action might equally well be interpreted as friendly or hostile, one might as well choose the friendly. Perhaps Dezhnev's father would have agreed. With that thought, he felt cheered.

The ship's rear seemed to be hanging loosely and to remain several centimeters (several picometers in real measure?) from the wall of the capillary. Morrison studied it closely and could see the serried ranks of protein and lipid molecules that made up that wall.

He thought, What are we doing ignoring this? Here is our opportunity to study tissues with greater precision than the best scanning electron microscope can -- and to study them while alive; to see not only position but living change and motion. We have passed through the bloodstream and narrowed in on a capillary wall without looking at anything in any real scientific sense. We are only passing through, with no more interest than we would show if we were in a subway, barreling through an underground tunnel. -- All to study oscillations that might be produced by thought . . . and might not.

The ship was inching along (an old word, thought Morrison suddenly, antedating the metric system, but he'd never heard anyone say "centimetering along") as though it were somehow feeling its way. Perhaps, between Dezhnev's motors and Kahinin's flickering electric fields, that was precisely what it was doing.

"We're approaching the junction, little Sophia," said Dezhnev in a curiously tight voice. "Make sure your hold is firm in front, while I move forward another meter or so."

"I suspect from the appearance and electrical behavior," said Kahinin, "that we have a clump of arginines toward the junction. That represents a strong region of positive charge and I can handle that as smoothly as sour cream."

But Boranova said sternly, "No overconfidence, Sophia. Keep a firm watch. If you miss and the ship tears loose, there will be much to do over."

"Yes, Natalya," said Sophia, "but with all respect, the warning is not really needed."

Dezhnev said, "Sophia, do exactly what I say. Keep only the prow of the ship attached to the wall, but strongly. Release everything else."

"Done," said Sophia faintly.

Morrison found himself holding his breath. The rear of the ship had spun away from the wall, but it held in front. The bloodstream caught the detached rear end and pushed the ship into a position at right angles to the current, while the capillary wall, where the ship still held, moved outward like a pimple.

Morrison said tightly, "Watch out. We'll pull a section out of the wall."

"Quiet, all!" thundered Dezhnev. Then, in an ordinary voice, "Sophia, I shall increase the engine push slowly. Get yourself in position to break all remaining attraction. The ship is to be entirely neutral -- but not until I say so."

Sophia cast a quick look toward Boranova, who said in her quiet way, "Do exactly as you're told, Sophia. For this, Arkady's word is absolute."

Morrison imagined he felt the ship straining forward. The section of the capillary wall to which it was attached stretched farther and farther.

Sophia said urgently, "Arkady, either the field will snap or the wall will."

"Another moment, dear one, another moment. -- Now."

The wall snapped back and the ship bounded forward in a great leap that rocked Morrison gently backward. The forward end of the ship buried itself in the cement stuff between the two cells of the capillary wall.

52.

For the first time, Morrison was aware of the laboring of the microfusion engines. There was a subliminal throbbing as the ship worked its way through the joint with what seemed increasing difficulty. There was nothing to see up ahead. The thickness of the capillary wall, very thin though it was in normal terms, was far thicker than the length of the ship.

The ship was now totally immersed in the joint and Dezhnev, beads of sweat on his forehead, turned his head and spoke to Boranova. "We're using up energy faster than we should."

Boranova said, "Then stop the ship and let's consider."

Dezhnev said, "If I do that, there is a chance that the natural elasticity of this material will pop us out of the joint and back into the bloodstream."

"Slow the engines down, then. Choose a level that will be enough to keep us in place."

The throbbing came to an end.

Dezhnev said, "The joint is exerting considerable pressure on the ship."

"Enough to crush us, Arkady?"

"Not now. But who can say for the future if the pressure continues."

Morrison burst out. "This is ridiculous. Didn't someone say we're the size of a small organic molecule?"

"We're the size of a glucose molecule," said Boranova, "which is made up of twenty-four atoms altogether."

"Thank you," said Morrison freezingly, "but I know how many atoms there are in a glucose molecule. As it happens, small molecules drift through the capillary walls constantly by diffusion. Diffusion! That's the way the body works. Why aren't we diffusing through?"

Boranova said, "Diffusion is a statistical proposition. There are twenty-four billion trillion glucose molecules in the bloodstream at any given time. They move around randomly and some manage to hit in such places and in such ways as to move through a joint, or to move into the membrane of a capillary wall cell, into the cell, and out the other

side. A very small percentage succeed at any given second, but that is enough to ensure proper tissue functioning. However, by chance, a particular glucose molecule may remain in the bloodstream for a month without diffusing. Can we wait a month for a chance to do its work?"

"That's no argument, Natalya," said Morrison impatiently. "Why don't we simply do deliberately what a real glucose molecule would do by chance? Especially now, when we're part way through the joint. Why are we stuck in position?"

Konev said, "I'm on Albert's side. Diffusion probably isn't a passive leakage. There's some sort of interaction between the diffusing object and the barrier through which the diffusion takes place -- except that no one knows what the interaction might be exactly. Especially here, where we face the blood-brain barrier."

"We're here at the barrier," said Dezhnev. "You're the brain expert. Can you look around and tell us how this diffusion works?"

"No, I can't. But glucose is one molecule that gets through the blood-brain barrier easily. It must be because it is the brain's sole fuel for energy. The trouble is that while the ship is as small as a glucose molecule, it isn't a glucose molecule."

"Are you getting at something, Yuri," said Boranova, "or is this a lecture?"

"I'm getting at something. We had the ship become uncharged in order to lunge into the joint, but why leave it uncharged now? Can it be given the charge pattern of a glucose molecule? If so, it will be a glucose molecule as far as Shapiro's body is concerned. I suggest you order it done, Natalya."

Kahinin did not wait for the order. She said, "It is done, Natalya."

(They each addressed Boranova, Morrison noted. Each still maintained the fiction of the other's nonexistence.)

Dezhnev said, "And the joint's pressure decreases at once. It recognizes a friend, so it bows politely and steps aside. My father's mother, long may I keep her memory, would have cried out, 'Black magic,' and at once would have hidden beneath the bed."

"Arkady," said Boranova, "increase the power of the engines and pass through before the joint notices that underneath the glucose pattern is something that is not glucose."

"Yes, Natalya," said Dezhnev.

Morrison said, "This one is yours, Yuri. Your suggestion was just right. In hindsight I see that I should have thought of that, too, but the fact is, I didn't."

Konev said gruffly, as though finding praise something he couldn't handle, "It was nothing. Since the brain lives on glucose, we got down to glucose size. Eventually, we would have had to have a glucose pattern, and as soon as you asked the question why we weren't diffusing when we should have been, I realized we needed the pattern already."

Dezhnev said, "Members of the expedition, we are through the joint. We are out of the bloodstream. We are in the brain."

53.

In the brain, thought Morrison, but not in a brain cell. So far they had only passed from the intercellular space between the cells of the capillary wall, into the intercellular spaces of the brain where the support structures existed that maintained the form and interrelationships of the nerve cells, or neurons. Remove them and the cells would squash into amorphous masses, pulled together by gravity and unable to maintain any sensible function.

It was a jungle, made up of thick viny threads of collagen. (This was the nearly universal animal connective protein that fulfilled the function of cellulose in plants, less cheaply, since it was protein rather than carbohydrate, but far more flexibly.) Through the eye of ultraminiaturization, those collagen threads, totally invisible without an electron microscope, looked like tree trunks, leaning this way and that in a world in which gravity was of little importance.

There were finer and still finer threads. Morrison knew that some of them might be elastin and that the collagen itself might come in subtly different varieties. If he could see the whole in a wider view, from a less-miniaturized standpoint, he would have been able to detect order and structure. At this level, however, it was chaotic. One couldn't even see far in any direction; the overlapping fibers blocked vision.

Morrison became aware that the ship was moving very slowly. The four others were each staring around in wonder. Either they had not expected this (Morrison hadn't, for he had been too interested in the electrical properties of the brain to think much concerning its microanatomy) or, if they had, they had nevertheless failed to visualize it.

Morrison said, "How do you expect to find your way to a neuron? Does anybody know?"

Dezhnev was the first to answer, "The ship can only move straight ahead, so we move straight ahead until we get to a cell."

"How do we move straight ahead through this jungle? If we can't steer the ship, how do we move around obstacles?"

Dezhnev rubbed his chin thoughtfully. "We don't move around, we push around. The ship will move past one of those objects and there will be more friction on the contact side than on the other, so our path bends, like a comet rounding the sun." He smiled. "Cosmonauts do that when they use gravity to skim around a satellite or planet. We'll do it to skim around those things."

Konev said morosely, "Those things are collagen fibers."

Morrison said, "Some of them are pretty thick. You won't always pass by. You'll hit one head-on and stay there and if you can only move forward, what will you do? This ship was designed only for the bloodstream. We're helpless out of it with nothing to carry us along."

Boranova interposed. "Arkady, you have three microfusion engines and the jets, I know, are arranged at the rear at the apices of an equilateral triangle. Can you fire only one of them?"

"No. One contact controls all three."

"Yes, Arkady, that is how it is now. But you designed the ship and you know the details of its controls. Is there anything you can do to modify them so that you can fire them one at a time?"

Dezhnev took a deep breath. "Everyone told me over and over again that I must cut corners, that I must save the budget, that I must do nothing to irritate the bureaucrats."

"Aside from that, Arkady, is there anything you can do?"

"Let me think. It means jury-rigging. It means finding something to make switches out of, and extra wire, and who knows if it will work or how long it will work if it does, and if we won't end up worse than we are. I see what you mean, though. If I can fire only one of the engines, it will set up an unbalanced thrust."

"You'll be able to steer then, depending on which you fire."

"I'll try, Natalya."

Morrison said angrily, "Why didn't you think of this when we were in the wrong capillary? It might have saved me the small trouble of nearly dying trying to turn the ship by hand."

Dezhnev said, "If you hadn't so promptly suggested turning the ship by hand, we might have thought of it -- but it wouldn't have been a good idea."

"Why not?"

"We were in the current of the bloodstream. The ship is carefully streamlined to take advantage of it and its surface is designed to allow water to flow past it without turbulence, which makes it all the harder to turn out of the current. It would have taken much longer than turning by hand -- and very much more energy. The narrow confines of the capillary must be remembered, too. Here, there is no current and because we've been so miniaturized there is a great deal of room."

"Enough," said Boranova. "Get to work, Arkady."

Dezhnev did so, rummaging through a tool chest, removing a cover plate and studying the control details within, maintaining through it all a kind of incoherent muttering.

Konev, his hands clasped behind his neck, said, without turning, "Albert, tell us about those sensations you receive."

"Sensations?"

"You were telling us about them just before we got the news from the Grotto that we were located in the correct capillary. I'm talking about the sensations you experienced when you were trying to analyze the thought waves."

"Ah," said Morrison and caught Kahinin's eye.

Very slightly, she shook her head. Very tentatively, a warning finger crossed her lips.

Morrison said, "Nothing to tell. I had vague sensations I couldn't describe in any objective way. It could well have been my imagination. Certainly those whom I tried to tell about it were convinced it was."

"And you never published anything about them?"

"Never. I merely mentioned it in passing at conventions and that was bad enough. If Shapiro and you heard of it, it was through word of mouth only. If I had published, that would have come as near to scientific suicide as I would ever want to be."

"Too bad."

Morrison looked briefly toward Kahinin. She had nodded very slightly, but said nothing. Clearly, she couldn't say anything without being overheard by the entire ship.

Morrison looked around carelessly. Dezhnev was lost in his work, clucking to himself. Konev stared straight ahead, lost in whatever tortuous thoughts he happened to have. Boranova, behind Kahinin, was studying the screen of her computer carefully and was making notes. Morrison did not try to read them -- he could read English upside down, but he hadn't come to that pitch of ease with Russian.

Only Kahinin, to his left, was looking at him.

Morrison pressed his lips together and then shifted his computer into a word-processing mode. It did not have a Cyrillic adjunct, but he spelled out the Russian words in phonetic Roman lettering. WHAT IS WRONG?

She hesitated, probably not very much at home in Roman.

Then her own fingers flashed and the neat Cyrillic on her screen read: DON'T TRUST HIM. SAY NOTHING. It was erased at once.

Morrison wrote: WHY?

Kahinin said: NOT EVIL, BUT PRIORITY, CREDIT. WILL DO ANYTHING, ANYTHING, ANYTHING.

The words were gone and she looked away firmly.

Morrison considered her thoughtfully. Was it only the vengefulness of a woman betrayed?

It didn't matter, in any case, for he had no intention of talking about anything that he hadn't already given away, either in a paper or by word of mouth. He himself was not evil, but where priority and credit were concerned, he might not do anything, anything, anything, but he would do a great deal.

Still, there was nothing to be done at that moment. Or one thing, perhaps, which was completely aside from the point, but which was beginning, just beginning, to occupy his mind to the exclusion of other things.

He turned to Boranova, who was still staring at her instrument and tapping her fingers softly against the arm of her seat in thoughtful concentration.

"Natalya?"

"Yes, Albert?" She did not look up.

"I hate to introduce a note of ugly realism, but" -- his voice lowered to near-soundlessness -- "I'm thinking of urinating."

She looked up at him, a corner of her lips twitching very slightly, but avoiding the smile. She did not lower her voice. "Why think of it, Albert? Do it."

Morrison felt like a little boy raising his hand for permission to leave the room -- unreasonably so, he knew. "I don't like to be the first."

Boranova frowned, almost as though she were the teacher in the case. "That is quite silly and, in any case, you are not. I have already taken care of such a need in myself." Then, with a faint shrug, "Tension tends to increase urgency, I have frequently found."

Morrison had frequently found that, too. He whispered, "It's all very well for you. You're there in the back seat alone." And he nodded slightly in the direction of Sophia.

"So?" Boranova shook her head. "Surely you don't wish me to improvise a curtain for you? Shall I place my hand over her eyes." (Kahinin looked in their direction in surprise.) "She will ignore you, I'm sure, out of decency and out of a feeling that in short order she will wish you to ignore her."

Morrison was keenly embarrassed, for Kahinin was now looking at him with obvious understanding. She said, "Come, Albert, I held you naked in my lap. What room need one make for modesty now?"

Morrison smiled weakly and made a little thank-you gesture.

He tried to remember how to manage the waste lid on his seat, but once he remembered, he found that it slid open with a small but definite click. (Those irritating Soviets! Backward always in small ways. It might easily have been designed to open noiselessly.)

He also managed to loosen the electrostatic seam along his crotch and then found himself worrying whether he would manage to close it unobtrusively afterward.

Morrison felt the current of air at the moment the waste lid opened and it felt uncomfortably cold against his bare skin. He sighed with a tremendous relief when he was done, then he managed to close the seal along the crotch and sat there, panting. He realized that he must have been holding his breath.

"Here," said Boranova brusquely. He stared, for a moment, at what she was holding, then recognized it as a small sealed towel. He tore open the seal, found the towel within moistened and scented and rubbed his hands with it. (The Soviets were learning small elegances, obviously -- or decadences, depending on whether finickiness or impatience won the battle for domination within you.)

And then Dezhnev's throaty voice sounded loudly, very loudly, in Morrison's ear after all the whispering he had been engaged in. "That's done now."

"What's done?" asked Morrison angrily, automatically assuming the reference was to his bodily functions.

"The individual firing of the motors," said Dezhnev, making a there-you-are gesture with both hands in the directions of the ship's controls. "I can fire any one, or two, or all three, if I wish. Absolutely certain -- I think."

"Which is it, Arkady?" said Boranova waspishly. "Is it quite certain or is it a matter of opinion?"

"Both," said Dezhnev. "It is my opinion that I am absolutely certain. The trouble is that my opinion isn't always right. My father used to say --"

"I think we ought to try it out," said Konev, cutting off Dezhnev's father, perhaps in the full realization he was doing so.

"Of course," said Dezhnev. "That goes without saying, but as my father used to say" -- he raised his voice as though determined not to be again subverted -- "the sure thing about anything that goes without saying is that someone is bound to say it. -- And you might as well know --"

He paused momentarily and Boranova said, "What might we as well know?"

"Several things, Natasha," said Dezhnev. "In the first place, steering will take a lot of energy. I've done my best, but the ship is not designed for this. For another -- well, I can't communicate with the Grotto now."

"Can't communicate?" said Kahinin, her voice rising to a near squeak in what was either surprise or indignation.

Boranova's voice marked her as definitely indignant. "What do you mean, we can't communicate?"

"Come, Natasha, I can't wire up the motors separately without wires, can I? The best engineer in the world can't make wires out of nothing and can't manufacture silicon chips out of nothing, either. Something had to be dismantled and the one thing I could dismantle without disabling the ship was communications. I told them that out in the Grotto and there was a lot of shrieking and complaining, but how could they stop me? So now we can steer, I think -- and we can't communicate, I know."

54.

There was silence as the ship began to move. The surroundings were utterly different now. In the bloodstream, there had been a heaving medley of objects -- some crawling ahead of the ship, some slowly drifting behind, depending on eddies and streamlining, Morrison supposed. There was the feeling of movement, if only because the markings on the walls -- fatty plaques in the arteries, tiling in the capillaries, slipped steadily backward.

Here, in intercellular space, however, there was stasis. No motion. No feeling of life. The tangle of collagen fibers seemed a forest primeval, built up of trunks only, without leaves, without color, without sound, without motion.

Once the ship pushed forward through the viscous intercellular fluid, however, everything began to move backward. The ship slipped toward and through a V-shaped meeting of fibers and, as they passed through, Morrison had the plain impression of a loose spiral making its way upward along each collagen fiber, the spiral being more marked on the thinner of the two.

Up ahead was a thicker fiber still, a monarch of the collagen jungle.

"You'll have to turn, Arkady," said Konev. "Now's the time to test it."

"All right, but I'll have to lean over. I don't have the controls neatly at my fingertips. There's a limit to improvisation." He leaned forward, groping at a level about that of his calves. "I do not relish the thought of having to do this constantly. It is hard on a man of portly habit."

"You mean a man who is fat," said Konev ill-naturedly. "You have let yourself go flabby, Arkady. You should lose weight."

Dezhnev straightened up. "Very well. I will stop right now, go home, and begin to lose weight. Is this a time, Yuri, to lecture me?"

"It is not a time for you to get emotional either, Arkady," said Boranova. "Steer!"

Dezhnev bent over, suppressing a grunt. Slowly, the ship turned rightward in a gentle arc; or, to judge more literally by appearance, the thick collagen fiber drifted leftward as it approached -- as did everything else.

"You will hit it," said Konev. "Turn more sharply."

"It won't turn more sharply," said Dezhnev. "Each motor is only so far off-center and I can't change that."

"Well, then, we will hit it," said Konev, an edge of anxiety in his voice.

"Then let us hit," said Boranova angrily. "Yuri, do not go into panic over inconsequential. The ship is tough plastic; that fiber is undoubtedly rubbery."

And as she spoke, the prow of the ship began to pass the collagen fiber, with little room to spare. Watching through the port side of the ship, it was clear that the broadening beam of the ship would make contact. When the fiber was nearly level with Kahinin's seat, it happened. There was no scraping sound, only a very soft hiss could be detected. Not only was the fiber rubbery, as Boranova had said, so that it compressed slightly under the force of the collision, then rebounded, pushing the ship a trifle away -- but the slimy intercellular fluid served as a cushion and a friction reducer.

The ship continued to move and turned leftward in the direction of the fiber.

Dezhnev said, "I shut off the motor as soon as I saw we were about to make contact. This leftward turn we're going through now is a friction turn."

"Yes," said Konev, "but what if you had wanted to turn in the other direction?"

"Then I would have used the motor. Or, considerably earlier in our progress, I would have made a turn toward a graze with the fiber to the right. That fiber would have turned us rightward. The main thing, in any case, is to use the motors as little as possible and the fibers as much as possible. In the first place, we don't want to consume our supply of energy too rapidly. In the second place, the rapid output of energy increases the chances of spontaneous deminiaturization."

"What!" cried Morrison. He turned to Boranova. "Is that true?"

"It's not an important effect," said Boranova, "but it's true. The chances go up a bit. I should say that conservation is the more important of the two reasons for saving energy."

But Morrison could not repress his anger. "Don't you see how ridiculous -- no, criminal -- this whole situation is? We're in a ship that simply isn't up to the task and everything we do makes it worse."

Boranova shook her head. "Albert, please. You know we have no choice."

"Besides," said Dezhnev, grinning, "if we manage to do the job in this unsuitable ship, think how much more remarkable that will make us. We will be heroes. Authentic heroes. We will surely get the Order of Lenin -- each one of us. It will be a foregone

conclusion. And if we fail, it is comforting to think that we will be able to explain it as the ship's fault."

"Yes. Soviet heroes, win or lose, all of you," said Morrison. "And what will I be?"

Boranova said, "Remember, Albert, you will not be neglected if we succeed. The Order of Lenin has been given to foreigners on a number of occasions, including many Americans. Even if you should not want the honor for some reason, the success of your theories will be established and you may receive a Nobel Prize before any of us do."

"We're in no position to count our chickens," said Morrison. "I shall refrain from composing my Nobel acceptance speech for just a while, thank you."

"Actually," said Kahinin, "I wonder if we're in a position to reach a neuron."

"What's the difficulty?" asked Dezhnev. "We can move and steer and we're outside the capillary and in the brain. Just out there is a neuron, any number of them, billions of them."

"Just out where?" Kahinin asked. "I don't see any neurons. Just collagen fibers."

Dezhnev said, "How much of this intercellular fluid do you think there is?"

"A microscopic thickness," said Kahinin, "if we were normal in size. However, we're the size of a glucose molecule and, relative to ourselves, there may be a kilometer's distance or more to the nearest neuron."

"Well, then," said Dezhnev, "we'll move our ship a kilometer. It may take a little time but it can be done."

"Yes, if we could move in a straight line, but we're in the middle of a dense jungle. We have to turn and twist around this fiber and that and, in the end, we may travel fifty kilometers by our own measurement and find ourselves back at our starting point. We're just going to be blundering through a maze and we won't reach a neuron except by sheerest accident."

"Yuri has a map," said Dezhnev, sounding a little nonplussed. "Yuri's cerebro-whatever--"

Konev, frowning, shook his head. "My cerebrograph shows me the circulatory network of the brain and the cell pattern, but I can't expand it to the point where it will indicate our position in the intercellular fluid between cells, We don't know that sort of fine detail and we can't get out of cerebrography any more than we can put into it."

Morrison looked through the wall of the ship. In all directions, the collagen fibers could be made out, overlapping and blocking them in. In no direction could the eye see through them very far and in no direction was there any sign of anything but fiber upon fiber.

No nerve cells! No neurons!

13. CELL

The wall that says "Welcome, stranger" has never been built.

Dezhnev Senior

55.

Boranova's nostrils flared slightly and her dark eyebrows hunched together, but her voice remained calm.

"Arkady," she said, "You will travel forward in as straight a line as possible. Curve to a minimum extent and, if you can, curve left and right alternately. And, since we're in a three-dimensional situation, up and down alternately."

"It would get confusing, Natasha," said Dezhnev.

"Of course it will, but perhaps it won't get completely confusing. We may not be able to travel ruler-straight, but maybe we won't go in circles, spirals, or helixes either. And sooner or later we should reach a cell."

"Perhaps," said Dezhnev, "if you deminiaturize the ship a little bit --"

"No," said Boranova.

"Wait, Natasha. Think about it. If we deminiaturize a bit, then there will be less space to travel. We grow larger, the space between blood vessel and neuron grows smaller." He made eloquent gestures with his hands. "You understand?"

"I understand. But the larger we get, Arkady, the more difficult it will be to pass between the fibers. The neurons of the brain are well-protected. The brain is the only organ to be completely encased in bone and the neurons themselves, which are the most irregular in the body, are well-packed with intercellular material. Look for yourself. It's only if we're down to the size of a glucose molecule that we can make our way through and around the collagen without, perhaps, doing drastic damage to the brain."

At this point, Konev committed the unusual act of turning in his seat, looking upward as he turned to his left so that his glance passed over Kahinin before meeting Boranova's eyes. He said, "I don't think we have to travel onward completely blind -- completely at random."

"How otherwise, Yuri?" asked Boranova.

"Surely the neurons give themselves away. Each has nerve impulses running its length periodically and at very short intervals. That might be detected."

Morrison frowned. "The neurons are insulated."

"The axons are -- not the cell bodies."

"But it is the axons where the nerve impulse is strongest."

"No, it is the synapses where the nerve impulse may be strongest and they are not insulated, either. The synapses ought to be sparking all the time and you ought to be able to detect it."

Morrison said, "We couldn't in the capillary."

"We were on the wrong side of the capillary wall at the time. -- Look, Albert, why are you arguing the matter? I'm asking you to try to detect brain waves. That's why you're here, isn't it?"

"I was kidnapped," said Morrison violently. "That's why I'm here."

Boranova leaned forward. "Albert, whatever the reason, you're here and Yuri's suggestion is a reasonable one. -- And, Yuri, must you always be confrontational?"

Morrison found himself shaking with anger and for a moment he wasn't sure why. Konev's suggestion was indeed reasonable.

Then it occurred to him that he was being asked to put his theories to the test under conditions which would allow him no escape. He was on the very border of a brain cell that was magnified with respect to himself to mountainous proportions. He might be asked next to make his test inside, actually inside, such a cell. And if he did -- and if he failed -- under what blanket of argument and excuse could he hide from the fact that his work was wrong and had always been wrong?

He was angry, surely, at being thrust into this uncomfortable corner by circumstance and not at Konev particularly.

He was aware of Boranova waiting for him to say something and of Konev maintaining his incandescent stare.

Morrison said, "If I detect signals, I will detect them from all sides. Except for the capillary we have just left, we're surrounded by uncounted numbers of neurons."

"But some are closer than others," said Konev, "and one or two would be closest of all. Can't you detect the direction from which the signals will be the strongest? We can home in on that signal."

"My receiving device isn't equipped to determine directional signals."

"Ah! Then Americans, too, make use of devices that are equipped for specific purposes and do not prepare for emergency needs. It is not merely the ignorant Soviets who --"

"Yuri!" said Boranova sternly.

Konev swallowed. "I suppose you'll tell me I'm confrontational again. In that case, Natalya, you tell him to think of a way of devising something that will tell him the direction from which the strongest signals are coming."

"Please, Albert, make the attempt," said Boranova. "If you fail, we shall just have to blunder our way through this collagen jungle and hope we come upon something before too long."

"We're blundering onward even as we speak," put in Dezhnev almost cheerfully, "but I still see nothing."

Still angry, Morrison activated his computer and put it into the brain wave reception mode. The screen flickered, but it was only noise -- though the noise was more prominent than it had been within the capillary.

Until now, he had always used leads that involved micropositioning inside a nerve. Where was he to put the leads now? He had no nerve to put them into -- or, rather, he was already inside the brain, which made the whole matter of positioning anomalous. Perhaps, though, if he let the leads (made as stiff as possible) rise in the air and spread apart like a pair of antennae, they might play the part. At their present size, the spread would be tiny and could scarcely be useful but --

He doubled and redoubled the leads and they stood up in long loops, looking very much like the insect antennae that had first given them their names. He then focused and sharpened reception as well as he could and the flickering on the screen suddenly broke into deep narrow waves -- but only for a moment. Involuntarily, he let out a cry.

"What happened?" said Boranova, startled.

"I received something. Just a flash. But it's gone."

"Try again."

Morrison looked up. "Listen. All of you. Quiet. Working this thing is difficult and I manage best when I can concentrate entirely. Understood? No noise. Nothing."

"What was it you received?" said Konev softly.

"What?"

"Like a flash. You received something like a flash. May we know what it was?"

"No. I don't know what I received. I want to listen again." He looked behind him to the left. "Natalya, I'm in no position to give orders, but you are. I am not to be disturbed by anyone, particularly by Yuri."

"We will all be quiet," said Boranova. "Proceed, Albert. -- Yuri, not one word."

Morrison looked sharply to his left, for there had been a soft touch on his hand. Kahinin was looking at him keenly and there was a small smile on her face. She mouthed words in an exaggerated fashion and he managed to catch the Russian: "Pay no attention to him. Show him! Show him!"

Her eyes seemed to glitter. Morrison could not help but smile warmly in response. She might be motivated entirely by a desire for vengeance against the man who had abandoned her, but he enjoyed the look of assurance and faith that was present in her eyes.

(How long ago had it been since a woman had looked at him with pride and with trust in his abilities? How many years ago had it been since Brenda had lost hers?)

A spasm of self-pity shook him and he had to wait for a moment.

Back to the device. He tried to shut out the world, shut out his condition, think only of his computer, only of the tiny fluctuations in the electromagnetic field produced by the interchange of sodium and potassium ions across the neuron membrane.

The screen flashed again, steadied, and resolved into a pattern of low peaks and valleys. Carefully, barely daring to touch the keys, Morrison threw in an expansion

directive. The peaks and valleys spread out, the edges sliding off the screen. On the single peak and valley left remaining, there was a fuzzy smaller wiggle.

It's recording the waves, he thought, afraid to say so, afraid even to think it with any intensity, lest the slightest physical or mental effect suffice to blank it out.

The minor wiggle -- the skeptic waves, as he called them -- went out of focus and back in, never quite sharpening.

Morrison wasn't surprised. He might be detecting the fields of a number of cells that didn't quite duplicate each other. There was also the insulating effect of the plastic wall of the ship. There was the eternal shaking of Brownian motion. There might even be the interfering charge of atom groupings outside the miniaturization field.

The wonder was that he had gotten waves at all.

Slowly he made hand contact with the antennae -- slid his fingers up and down, first one hand, then the other, then both in unison, then both in opposite directions. Then he bent the antennae gently, this way and that. There were sharpening and fuzzing of the skeptic waves, but he didn't know, for certain, exactly what he was doing that resulted in the sharpening.

And then, at a certain point, the tiny waves sharpened acutely. A little to one direction and another they fuzzed, but in one particular direction they were sharp. He tried to keep his hands from trembling.

"Arkady," he said.

"Yes, my American magician," said Dezhnev.

"Curve left and a little upward. I don't want to talk too much."

"I'll have to curve around the fibers."

"Curve slowly. Too fast and I'll lose the focus."

Morrison fought to keep his eyes from flickering leftward toward Kahinin. Just one look at her face and one inevitable thought of her prettiness would be distraction enough to fuzz out the screen. Even the thought of distraction was itself distracting enough for the thought wave to flicker.

Dezhnev was curving the ship in the gentle arc that was all that the offset motors would manage and slowly Morrison shifted the antennae to suit. Occasionally he muttered a brief whispered direction: "Up and right," "Down," "A little left."

Finally he gasped, "Straight ahead."

It should get easier, he thought, as they got closer, but he couldn't relax until a neuron was actually in sight. And, through the obscuring collagen thicket, that was not likely to be until they were nearly on top of it.

Concentrating on only one subject was as tiring as clenching a muscle and leaving it clenched. He had to introduce just a bit of quick variation. He had to think of something else, but something neutral, something that would, for a while, leave his mind unclenched. So he thought of his broken family because he had thought of them so often that the image had faded and lost effect somehow. It was a photograph that was growing bent and gray and he could snap out of it quickly and return to the single-minded contemplation of the skeptic waves.

Then -- without warning and overwhelmingly -- another thought invaded his mind. It was a sharp mental picture of Sophia Kahinin, looking younger, prettier, and happier than she had ever seemed to him in the short time he had known her. And with that picture came a tumbling of love and frustration and jealousy that left him weak.

He had not been consciously aware of any of these feelings, but who knew what unconscious thoughts and emotions might be hidden there in his own brain cells? Kahinin? Did he feel that way about her? So quickly? Or was it the abnormal tensions of this fantastic voyage into the brain that had brought about fantastic responses?

It was only then that he noticed that the screen had fuzzed out completely. He was about to shout a warning to Dezhnev to stop the motors while he concentrated and tried to recapture the waves when Dezhnev's voice boomed out.

"There it is, Albert. You guided us to the cell like a bloodhound. Congratulations!"

"Also," said Boranova, gazing at Konev's lowering countenance, "congratulations to Yuri for coming up with the idea and persuading Albert to make the effort."

Konev's face relaxed and Dezhnev said, "But now, how do we get inside?"

56.

Morrison stared at the vista ahead with interest. What he saw was a vast ridged wall stretching up and down, right and left, as far as the ship's light made it possible to see. The ridges were themselves broken up into domes so that, on closer inspection, the wall seemed to be a checkerboard with each square bulging outward. There were ragged extensions jutting outward between the bulges, like thick, short, and branching ropes that gave the wall an appearance of being tattered.

Morrison, with some effort, allowed for his own miniaturization and grasped the fact that the bulges were the ends of molecules (of phospholipids, he assumed) that made up the cell membrane. He realized with some dismay just what it meant for the ship to be the size of a glucose molecule. The cell was an enormous object; by present ship measure, it must be many kilometers across.

Konev had been staring at the cell membrane also, but emerged from his thoughtful contemplation sooner than Morrison did.

"I'm not sure," said Konev, "that this is a brain cell -- or, at least, a neuron."

"What else can it be?" said Dezhnev. "We're in the brain and that's a cell."

Konev made no visible attempt to smother the disgust in his expression as he said, "There is more than one kind of brain cell. The neuron is the important cell, the chief agent of the mind. There are ten billion of them in the human brain. There are also some ten times as many glial cells of several kinds, which serve supporting and subsidiary functions. They are considerably smaller than the neurons. On the basis of chance, then, it is ten to one that this is a glia. The thought waves are in the neurons."

Boranova said, "We can't be guided simply by chance, Yuri. Can you tell in some definitive way whether this is glia or a neuron without involving statistics?"

"Not just by looking at it, no. From this size, all I see is a small section of a cell membrane and in such a case one cell looks like another. We'll have to become larger and get a more panoramic view. I presume we can become larger now, Natalya. After all, we're through what you called the collagen jungle."

"We can deminiaturize, if necessary," said Boranova, "but increasing size is more tedious and risky than decreasing it. An increase means the generation of heat and must be done slowly. Is there any alternative?"

Konev said tartly, "We might try Albert's instrument again. Albert, can you tell us if the skeptical waves you can detect are coming from straight ahead or from a slightly different direction?"

Morrison hesitated. Before his instrument had fuzzed out at a time just before the cell had been sighted, there had been the Kahinin vision and he didn't want it back. It was too embarrassing, too upsetting. Surely, if his mind hid and suppressed emotions, it was because they were better hidden and suppressed.

He said uncertainly, "I'm not sure --"

"Try it," said Konev and all four Soviets were now looking at Morrison earnestly.

With an inward shrug, Morrison put his computer into action. After some consideration, he said, "I get the waves, Yuri, but not as strongly as I did on the way here."

"Do they get stronger in another direction?"

"Slightly, from a more upward direction, but I must warn you again that the directional abilities of my device are very primitive."

"Yes, like this ship you complain about. -- Here is what it seems to me has happened, Natalya. Coming here, we were able to detect a neuron directly above the top of a glia that lay before it. When he saw the glia, Arkady naturally steered for it and its bulk now masks the neuron and we get the thought waves more dimly."

"In that case," said Boranova, "we must go over the glia to the neuron."

"And in that case," said Konev, "I say again that we must deminiaturize. At our present glucose size, the distance we must pass in moving over the glia may well prove to be a hundred or a hundred and fifty kilometers. If we increase in length ten times, say to the size and mass of a small protein molecule, we would reduce the apparent distance to merely ten or fifteen kilometers."

Kahinin said in an abstracted voice, as though what she had to say bore no relationship to what had just been said, "We will have to be our present size to get into the neuron, Natalya."

And, after a short pause, as though disengaging himself from the possibility of directly answering the remark, Konev said, "Of course. Once we reach the neuron, we readjust our size to whatever seems best."

Boranova sighed and seemed lost in her own thought.

Konev said with unaccustomed gentleness, "Natalya, we'll have to change size eventually. We can't stay glucose size forever."

"I hate to deminiaturize oftener than I must," said Boranova.

"But we must in this case, Natalya. We cannot spend hours cruising along a cell membrane. And deminiaturizing tenfold at this stage involved a very low absolute energy change."

Morrison said, "Is it that starting the deminiaturizing process might initiate an uncontrolled and explosive continuation?"

Boranova said, "There's nothing wrong with your intuition, Albert. Without knowing anything about miniaturization theory, you manage to grasp the point. Once started, it is safest to allow the deminiaturization to continue. Stopping it involves a certain risk."

"So does remaining at glucose size for hours longer than we need," said Konev.

"True," said Boranova, nodding her head.

Dezhnev said, "Shall we put it to a vote and come to a people's democratic decision?"

At this, Boranova's head snapped up and her dark eyes seemed to flash. Her heavy jaws set firmly and she said, "No, Arkady. It is my responsibility to make the decision and I will increase the size of the ship." Then, abandoning the air of majesty, she said, "Of course you can wish me well."

Dezhnev said, "And why not? It would be the same as wishing all of ourselves well."

Boranova bent over her controls and Morrison grew quickly tired of trying to watch. He couldn't actually see what she was doing, wouldn't understand that she was doing if he did see it, and there was the mundane fact that his neck was beginning to ache with the effort to keep it turned. He looked forward and found Konev peering at him over his shoulder.

"About the skeptic wave detection," said Konev.

"What about the skeptic wave detection?" said Morrison.

"When we were making our way to this cell through the collagen jungle --"

"Yes yes, what about it?"

"Did you get any -- images?"

Morrison remembered that tearing vision of Sophia Kahinin. Nothing like it existed in his mind now. Even when he thought of it as it had then been, it now roused no response. Whatever it was in his mind, it seemed to have been reached only under the intense stimulation of concentrated skeptic waves; and whatever it was, he was not going to describe it to Konev -- or to anyone else, for that matter.

He temporized, "Why should I have sensed any images?"

"Because you did on occasion when you analyzed skeptic waves at normal-size intensities."

"You're assuming that analysis during miniaturization would produce greater intensities or possess greater image-producing powers."

"It's a reasonable assumption. But did you or didn't you? The question doesn't involve theorizing. I'm asking about an observation. Did you get any images?"

And Morrison sighed inwardly and said, "No."

Konev continued his sidewise peering (under which Morrison felt himself grow a little restless and rather more than a little irate), then said softly, "I did."

"You did?" Morrison's eyes widened in honest surprise. Then, more cautiously, "What did you sense?"

"Not much, but I thought you might have gotten it more clearly. You were actually holding and manipulating your detector and it is probably more adapted to your brain than mine."

"Just what was it you got? Can you describe it at all?"

"A kind of flicker that moved into and out of awareness. It seemed to me that I saw three human figures, one larger than the others."

"And what did you make of that?"

"Well, Shapirov had a daughter whom he adored and she had two children whom he also adored. I imagine that in his coma he may have been thinking of them, or remembering them, or being under the delusion that he was seeing them. Who knows what goes on in a coma?"

"Do you know his daughter and his grandchildren? Did you recognize them?"

"I was seeing them, as it were, through translucent glass in the twilight. It was all I could do to sense three figures." He sounded disappointed. "I had hoped you would see it more clearly."

Morrison, thinking hard, said, "I neither saw, nor sensed, anything like that."

Konev said, "Of course, things should be sharper once we are inside a neuron. It is not images we must sense, in any case. We want to hear words."

"I've never heard words," said Morrison, shaking his head.

"Of course not," said Konev, "since you worked with animals who don't use words."

"True," said Morrison. "Just the same, I once managed to run some tests on a human being, though I never reported it. I sensed no words then or images either."

Konev shrugged it off.

Morrison said, "You know, under the circumstances, it might be natural for Shapirov's mind to be full of family -- if we accept your interpretation of what you thought you sensed. What would the chances be that he would be thinking of some esoteric extension of miniaturization mathematics?"

"He was a physicist. Even his family came second to that. If we can sense words out of those skeptic waves, they'll be words dealing with physics."

"You think that, do you?"

"I am positive."

The two fell quiet and for a few minutes there was no sound in the ship. Then Boranova said, "I've deminiaturized the ship to protein size and I have brought the process to a halt."

A moment passed and then Dezhnev, with an unaccustomed tightness to his throaty voice, said, "Are things all right, Natasha?"

Boranova said, "The mere fact that you can ask the question, Arkady, is an answer in the positive. Deminiaturization has stopped without incident."

She smiled, but there was a definite trace of perspiration glistening at her hairline.

57.

The surface of the glial cell still stretched out as far as the eye could see into the dimness beyond the reach of the ship's light, but it had changed in character. The domes and ridges had faded out into a fine texture. The ropes that had extended from between the domes had become threads nearly impossible to see as the ship sped along the surface.

Morrison's attention was, for the most part, on his computer, as he watched to see that the skeptic waves did not decline in intensity, but, periodically, he could not help but drift away from that and gaze at the panorama outside.

Occasionally, there would emerge from the surface of the cell the typical dendritic processes of a nerve cell -- even one that was merely a subsidiary glial cell. They branched and sub-branched like a tree in winter, growing out of the cell membrane.

Even at the new and larger size of the ship, the dendrites were large when they emerged from the cell. They were like tree trunks, which, however, narrowed rapidly and were clearly flexible. Lacking the rigidity of the cartilage fibers, they swayed in the eddies set up by the ship's progress through the extracellular fluid. They swayed, indeed, at the ship's approach and Dezhnev rarely had to do anything to avoid them. They would bend out of line and the ship would pass them safely.

Collagen fibers were fewer in the immediate neighborhood of the cell and, thanks to the larger size of the ship, were much thinner and more fragile. On one occasion, Dezhnev either did not see one looming directly ahead of the ship or did not care that it was. The ship brushed past it in a way that brought it just outside Morrison's seat. He flinched at the grating collision, but the ship was in no way damaged. It was the collagen fiber that bent, then snapped and dangled free. Morrison's head turned and his eyes followed the broken fiber for the second or so that it remained in view before floating away.

Boranova must have seen it, too, and watched Morrison's reaction, for she said, "There's no reason for concern. There are trillions of those fibers scattered through the brain, so that one more or less doesn't matter. Besides, they heal -- even in a brain as badly damaged as poor Shapiro's."

"I suppose so," said Morrison, "yet I can't help but think we are crashing without any right through an infinitely delicate mechanism not meant for technological invasion."

"I appreciate your feeling," said Boranova, "but hardly anything in the world seems to have been brought into being by geological and biological processes with any apparent pre-vision of human interference. Humanity does a great deal of wrong to Earth and to life, some of it wittingly. -- Incidentally, I'm thirsty. Are you?"

"Definitely," said Morrison.

"You'll find a cup in the little recess under your right armrest. Pass it back."

She distributed water to all five, saying matter-of-factly, "There's no shortage of water, so if you want seconds, say so."

Dezhnev looked at his cup distastefully, while keeping one hand on the controls. He sniffed at it and said, "My father used to say: 'There is no drink like pure water, provided one realizes that it is alcohol that is the purifying agent.'"

"Yes, Arkady," said Boranova. "I am quite sure your father purified his water frequently, but here on the ship, with your hands on the controls, you will have your water unpurified."

"We must all go through privations now and then," said Dezhnev, who then downed his water and made a face.

It might have been the taste of the water that caused Kahinin to fumble between her legs. It took a moment for Morrison to realize that it was her turn to urinate and he turned his head toward the window and waited to see if another collagen fiber might go flying.

Boranova said, "I suppose, strictly speaking, it's lunchtime, but we can do without. Still --"

"Still what?" asked Dezhnev. "A good plate of piping hot borscht with sour cream?"

Boranova said, "What I have smuggled in against regulations are bits of chocolate -- high-calorie, zero-fiber."

Kahinin, who had disposed of her small damp paper towel and was shaking her hands to dry them, said, "It will rot our teeth."

"Not immediately," said Boranova, "and you can rinse your mouth with a little water to reduce the sugar residue. Who wants one?"

Four hands went up, Kahinin's not the last. Morrison welcomed his gladly. He was fond of chocolate in any case and sucked at it to make it last longer. The taste reminded him poignantly of his boyhood in the outskirts of Muncie.

The chocolate was gone when Konev said to Morrison in a low voice, "Have you sensed anything while we've been skimming past the glial cell?"

"No," said Morrison. (He hadn't.) "Have you?"

"I thought I did. The phrase 'green fields' crossed my mind."

Morrison could not prevent himself from saying "Hmm" and for a while remained lost in thought.

"Well?" said Konev.

Morrison shrugged. "Phrases go through one's mind all the time. You hear something out of the corner of your ear, so to speak, and sometime later it penetrates your consciousness; or some stream-of-consciousness thoughts invade your mind and one phrase surfaces; or you can have an auditory hallucination of some sort."

"It crossed my mind when I was looking at your instrument and concentrating."

"You wanted to be aware of something, I suppose, and something promptly obliged by flitting through your mind in response. You get the same effect in dreams."

"No. This was real."

"How can you tell, Yuri? -- I didn't sense any such thing. Did anyone else sense it, do you suppose?"

"They wouldn't. No one else was concentrating on your machine. Perhaps no one else in the ship had a brain sufficiently like yours to sense on your wavelength, so to speak."

"You're just guessing. Besides, what does the phrase mean?"

"Green fields? Shapirov had a house out in the country. He would remember the green fields."

"He might have merely supplied the image. You would supply the words."

Konev frowned, paused a moment, then said in a clearly hostile manner, "Why are you so opposed to the possibility of getting a message?"

Morrison allowed himself to be equally hostile. "Because I've been burned by reporting such sense perceptions. I've been ridiculed long enough and I have become cautious. An image of a woman and two children doesn't tell us anything. Neither does a phrase like 'green fields.' If you report it, how can you possibly tell it from a self-generated image or phrase? Now listen, Yuri, a hint, to be useful, must, however vaguely and indirectly, tie in with the quantum-relativity relationship. That we can report. Anything less than that is not compelling; it won't force belief. It will only succeed in hurting us. I speak from experience."

Konev said, "What, then, if you succeed in hearing something vital, something that bears on our project? Will you perhaps keep it to yourself?"

"Why should I? If I sense something in physics relating to miniaturization, I would lack the background to understand it and keeping it to myself would get me nowhere. If some useful result is shared between us, this computer remains my machine and it is activated by my theory. I am the one who will get the major share of the credit. I won't keep it to myself, Yuri. Both my self-interest and my honor as a scientist will keep me from doing that. -- And what about you?"

"Of course I'll share whatever I sense. I have been doing so just now."

"I don't mean 'green fields.' That is nonsense. Suppose you sense something very significant and I don't. Might it not occur to you that the knowledge would be a state secret, as miniaturization itself is? Would you then tell me that knowledge and risk the wrath of your Central Coordinating Committee?"

They had been speaking in whispers, heads together, but Boranova's ears picked up the key word. "Politics, gentlemen?" she asked frostily.

Konev said, "We're discussing the possible uses of Albert's instrument, Natalya. If I learn something of importance from Shapirov's skeptic waves and Albert does not, he thinks I will keep it from him under the excuse that it is a state secret."

Boranova said, "It well may be."

Konev said mildly, "We need Albert's cooperation. It is his machine and his program and I am sure he knows how to work it at less than perfect efficiency. If he is not completely assured of our honesty and goodwill, he may arrange to have us sense nothing. I am willing to share anything that I sense if he will do the same."

"The Committee may disapprove, as Albert himself pointed out," said Boranova.

"Let it. I don't concern myself with it," said Konev.

"I'll prove I love you, Yuri," interposed Dezhnev with a chuckle. "I won't quote you."

Kahinin said, "Natalya, I agree that we should be honest with Albert, since we must ask him to be honest with us. Using his own device with which he has experience, he is far more likely to come up with something useful than we are. A policy of quid pro quo is likely to be far more to our advantage than to his. -- Isn't that so, Albert?"

Morrison nodded. "I've been thinking precisely that and would have mentioned it if it looked as though you were going to tell me that it was against government policy to be honest with me."

Boranova said, "Well, let us await events." The tension died down.

Morrison remained busy with his own thoughts, watching his machine only in abstraction.

And then Dezhnev said, "There's another cell just ahead -- a kilometer or two. It looks as though it might be larger than the one we've been passing. Is that a neuron, Yuri?"

Konev, who seemed to have been in a brown study of his own, snapped to attention. "Albert, what does your machine say? Is that a neuron?"

Morrison was already handling his device. "It must be," he said. "I've never seen the skeptic waves this sharp."

"Good!" said Dezhnev. "Now what?"

58.

Kahinin looked thoughtfully at the cell surface below. She said, "Natalya, we'll have to miniaturize to glucose size again. Arkady, get us in among the dendrites so that we can get down to the surface of the cell body."

Morrison watched the surface also. The dendrites were much more elaborate than those on the glia. The nearest one branched and branched again until it looked like a fuzzy frond vanishing beyond the reach of ship's light. Others, farther away, were fuzzier and smaller.

Morrison suspected that the fuzziness was at least partly the result of Brownian motion. Surely there couldn't be much of that, however. Probably each final strand of the branchings -- each twig -- met a similar twig or some neighboring neuron to form that intimate near-touch called a synapse. The wavering of the twig would not be strong enough to break the contact or the brain couldn't do its work.

Dezhnev had the ship approach the surface of the cell body, slowly slithering past the nearest dendrite (he was learning to handle the unbalance of the individual engines with a certain finesse, Morrison thought) -- and, as he did so, it seemed to Morrison that the surface of the neuron was changing character.

Of course, it had to, for the ship was miniaturizing again. The ridges in the cell surface were becoming more prominent and were dividing into domes. Between the phospholipid domes the hairs were becoming ropier. Receptors, thought Morrison. Each one of them was designed to link on to a particular molecule that would be useful to the neuron and certainly glucose would be the most useful of those.

The downward change was considerably more rapid than the upward change. Absorbing energy was simple, while the energy release of deminiaturization was dangerous. Morrison understood that well by now.

Kahinin said, frowning in concern, "I don't know which receptors are for glucose, but a great many of them must be. Skim across them slowly, Arkady -- very slowly. If we're caught, I don't want to tear loose -- or to tear them loose, either."

"No problem, little Sophie," said Dezhnev. "If I shut off the motors, the ship stops at once. It can't push through the giant atoms that surround us at all easily. Too viscous. So I just give it a touch of energy, enough to shoulder our way past the molecules of water, and we'll tiptoe across the receptors."

"Through the tulips," said Morrison, looking at Konev.

"What?" said Konev, looking both annoyed and puzzled.

"It's a phrase that went through my head. There's an old show tune called 'Tip Toe Through the Tulips With Me,' In English, the words are --"

"What nonsense are you speaking?" snapped Konev.

"I'm trying to point out that whenever someone says 'tiptoe' to me, I automatically hear the phrase 'through the tulips' in my mind. If I happen to be concentrating on my computer when someone says 'tiptoe,' I will still hear the phrase in my mind and it will not mean that I am getting it from the skeptic waves on the computer. Do you take my meaning?"

"You're talking emptily," said Konev. "Leave me alone."

But he looked shaken, Morrison thought. He had taken the meaning.

They were now moving parallel to the surface of the neuron. The receptors were moving gently and Morrison realized that he couldn't tell which were empty and which had attached themselves to some of the molecules moving through the extracellular fluid with them.

He tried to concentrate on those molecules. There seemed to be glitterings in the fluid which might have been the light of the ship's beacon reflected from molecules, but none of it showed up well. Even the surface of the cell membrane wasn't actually clear if you looked at it directly. It was more the surrealistic impression of a surface than an actual one -- too few photons were being reflected and too few were reaching them on their small scale.

Still, by the glitter, he could make out a kind of grittiness in the fluid they were passing through (water molecules, surely) and among them, now and then, something wormy-twisting, turning, closing up, then opening again. The immediate neighborhood of the ship was, of course, within the miniaturization field, so that atoms and molecules of the standard-size world were constantly shrinking as they entered -- and expanding again as they left. The number of atoms doing so must be enormous but the energy change that resulted, even totaled over that number, were small enough so that it did not drain the ship perceptibly, or bring about spontaneous deminiaturization, or do any damage. -- Or, at least, it seemed to do no damage.

Morrison tried not to think about it.

Boranova said, "I don't mean to question your ability, Sophia, but please check and make sure the ship has the electrical pattern of glucose."

"I assure you it does," said Kahinin.

And as though to give notice that that was indeed so, the ship seemed to twist in mid-fluid, judging by the sudden shift in view through the walls.

Under ordinary conditions, such a twist would have thrown every person on the ship hard against the wall or the seat arm. Mass and inertia, however, were at virtually zero and there was only a faint swaying, hardly distinguishable from that which they associated with Brownian motion.

Kahinin said, "We've attached ourselves to a glucose receptor."

"Good," said Dezhnev. "I've turned off the motor. Now what do we do?"

"Nothing," said Kahinin. "We let the cell do its work and we wait."

The receptor did not actually make contact with the ship. This was good, for had it come any closer it would have entered the miniaturization field and its tip would have collapsed. As it was, there was a close meeting of electrical fields only, negative to positive and positive to negative. The attractions were not the full attractions but the lesser ones that resembled hydrogen bonds. It was enough to hold, but weak enough to allow the ship to pull away somewhat, as though it were connected to the receptor by rubber bands rather than by grappling hooks.

The receptor stretched the length of the ship and was irregular in outline, as though it were embracing a pattern of bulges along the plastic hull. The hull was smooth and featureless to the eye, of course, but Morrison was quite certain that there was an electric field that bulged in just the locations where the hydroxyl groups would be in the glucopyranose structure, the bulges taking on just the shapes they would in the natural molecule.

Morrison looked out again. The receptor virtually blanked out vision on the side of the ship along which it lay. If he looked beyond the receptor, however, he could see a farther stretch of the neuron's surface, seemingly without end, for it vanished beyond the reach of the ship's light.

The neuron surface seemed to be heaving slightly and he could see greater detail. Among the regular domes of the rank and file of phospholipid molecules, he caught occasional glimpses of an irregular mass, which he guessed to be a protein

molecule that ran through the thickness of the cell membrane. It was to these molecules that the receptors were attached, which did not surprise Morrison. He knew that the receptors must be peptides -- chains of amino acids. They were part of the thread of a protein backbone, sticking outward, each different receptor made up of different amino acids in a specific order so designed as to possess an electric field pattern matching (in opposing attractions and physical shape) that of the molecule it was designed to pick up.

Then, even as he watched, it seemed to him that the receptors were moving toward him. He could see them now in greater numbers and could also see that those numbers were still increasing. The receptors and the protein molecules to which they were attached seemed to be swimming through the phospholipid molecules (with a film of cholesterol molecules underneath, Morrison knew), which opened before and closed behind.

"Something's happening," said Morrison as he felt the ship's own motion through the tiny drag of inertia that remained to them at their thoroughly negligible mass.

59.

Kone said, "The surface is gathering us in."

Dezhnev nodded. "It looks like its doing this." He held up his thick and callused hand, cupping it.

"Exactly," said Konev. "It will invaginate, make a deeper and deeper cup, narrowing the neck and finally closing it, and we will be inside the cell." He seemed quite calm about it.

So was Morrison. They wanted to be inside the cell and this was the way it was done.

The receptors continued coming together, alongside each one of them some molecule -- some real molecule -- and in among them the feigning molecule of the ship. The cell's surface, like Dezhnev's cupped hand, closed upon them entirely and drew them in.

"Now what?" said Dezhnev.

"We're in a vesicle inside the cell," said Kahinin. "It will grow more acid and the receptor will then detach itself from us. It and all the receptors will then return to the cell membrane."

"And we?" persisted Dezhnev.

"Since we are recognized by our electric field as a glucose molecule," said Kahinin, "the cell will try to metabolize us -- break us up into smaller fragments and extract energy from us."

Even as she spoke, the peptide receptor fell away, uncoiling.

"Is that a good idea, having it metabolize us?" asked Dezhnev.

"It won't," said Morrison. "We'll be attached to an appropriate enzyme molecule which will find that we don't react as expected. We won't take on a phosphate group, so it will be helpless and will probably release us. We're not really a glucose molecule."

"But if the enzyme molecule releases us, won't another enzyme molecule of the same type attach itself to us and try again -- and so on indefinitely."

"Now that you mention it," said Morrison, rubbing his chin and absently noticing the bristles grown since his morning shave, "it may be that the first molecules won't let us go, I suppose, if we won't do the expected."

"A fine situation," said Dezhnev indignantly, slipping into his local dialect of Russian, as he always seemed to do when excited, and which Morrison always had a bit of difficulty in following. "The best we can expect is that an enzyme molecule either holds us forever all by himself or holds us forever in a relay race as we pass from one enzyme to another indefinitely. -- My father used to say: 'To be saved from the jaws of a wolf by a hungry bear is no great cause for gratitude.'"

"Please notice," said Kahinin, "that no enzyme molecule has attached itself to us."

"Why is that?" asked Morrison, who had, indeed, noticed that.

"Because of a slight change in electric charge pattern. We had to mimic a glucose molecule to get into the cell, but once in, we don't have to be one anymore. In fact, we must mimic something else."

Boranova leaned forward. "Won't any molecule we mimic be liable to metabolic change, Sophia?"

"Actually, no, Natalya," said Kahinin. "Glucose -- or any other simple sugar in the body -- belongs to a certain molecular configuration, so that we call it D-glucose. I've simply altered the pattern to its mirror image. We have become L-glucose and there isn't an enzyme that will touch us now, any more than any of us are likely to put a right shoe on a left foot. -- Now we can move about freely."

The vesicle which had formed on their introduction to the cellular interior had broken up and Morrison gave up as hopeless any attempt to follow what was going on. Fragments around him were enveloped by much larger enzyme molecules that seemed to embrace them and then relax. Presumably, an altered victim of the enzymatic squeeze was set free to be embraced again by another enzyme.

It was all happening at once and, Morrison knew, this was only the anaerobic portion of the process (in which no molecular oxygen was used.) It would end by breaking up the glucose molecule, with its six carbon atoms, into two three-carbon fragments.

A little energy would be produced in this fashion and the fragments would be shunted to the mitochondria for the completion of the process with the use of oxygen; a process in which the universal energy-transfer molecule, adenosine triphosphate (or ATP, for short) would be invested in order to get things started and, in the end, be produced once more in quantities substantially greater than the investment.

Morrison felt the urge to drop everything and to find a way into a mitochondrion, the small energy factory of the cell. After all, the fine details of mitochondrial processes had still not been worked out -- but then he pulled away almost angrily at the thought.

The skeptic waves came first. He shouted that to himself, as though trying to force a realization of priorities onto an overly curious brain that was threatening to diffuse its interests.

Apparently, the same thought occurred to Konev, for he said, "We're finally inside the neuron, Albert. Let's not be tourists. What do you find in the way of skeptic waves now?"

14. AXON

Those who say "A penny for your thoughts" are usually being overgenerous.

Dezhnev Senior

60.

Morrison bristled at Konev's order. (It had definitely been that.)

He indicated his resentment by refusing to respond at all for a while. He continued to stare out into the interior of the neuron and could distinguish nothing he recognized. He could see fibers, convoluted plates, hulks of uncertain size and of no clear shape. What's more, he had a strong feeling that there was a skeletal presence in the cell that held the larger objects -- the organelles -- in place, but that the ship was slipping past it all too quickly, as though it were in a river racing downstream. The feeling of motion was far stronger here than in the bloodstream, for though there were small objects (debris?) that moved along with them, there were larger objects that apparently remained in place and that they passed rapidly.

Finally Morrison said, "Look, Yuri, we're moving so quickly that the motion is likely to distort the skeptic waves badly."

Konev snarled, "Are you mad? We're not moving quickly at all. We're just drifting with the intracellular stream that serves to make certain that the small molecules are all made available to the organelle structure of the cell. The movement is very slow on the normal scale; it seems fast only on our miniaturized scale. Do I have to teach you cellular physiology?"

Morrison bit his lips. Of course. He had again forgotten how miniaturization distorted his perception. And again Konev was completely right.

"It might be better, though," said Morrison, fighting for self-respect, "if we changed back to D-glucose and allowed an enzyme to snatch us up. The combined size would slow us down and make it easier to pick up the waves."

"We don't have to slow down. The nerve impulse travels at a minimum of two meters per second in real velocity and in apparent velocity at our size that's about seventy times the real speed of light. As compared with that, our speed, however great it seems, is trivial. Even if we are moving at the apparent speed of a rocket ship, to the nerve impulse we seem virtually motionless."

Morrison lifted his arm in surrender and felt furious with Konev. There was such a thing as being too right. He cast a quick sidewise glance at Kahinin, with the uncomfortable feeling that she would be showing her contempt. She met his glance

soberly and with no trace of a sneer. In fact, her shoulders lifted slightly as though to say (Morrison imagined), "What do you expect of a savage?"

Boranova (Morrison glanced over his left shoulder) seemed oblivious to the exchange. She was busy with her instrument and Morrison wondered what she could be so intent on, considering that the ship's engines were off and they were merely drifting with the current.

As for Dezhnev -- with the engines off -- he was the one crew member who, in truth, had nothing to do at the moment (except to keep half an eye at the material up ahead in case of an unexpected emergency).

He said, "Come, Albert, study the skeptic waves and give us some answers. Then we can leave this place. It's extremely exciting being inside a cell for those who like it, but already I am quite certain I have seen enough. My father used to say: 'The most exciting part of any trip is reaching home again.'"

Boranova said, "Arkady --"

"Yes, Natasha."

"Save a few words for tomorrow." Morrison noticed the trace of a smile on her lips.

"Certainly, Natasha. I suspect an attempt at sarcasm, but I shall do as you say." And though he snapped his mouth shut with an exaggerated click of his teeth, he began to hum very quietly to himself, a tune in the minor mode.

Morrison felt a little astonished. They had been in the ship now for a little less than five hours -- but it felt the equivalent number of days, perhaps years. Yet, unlike Arkady and despite his earlier feelings of terror, he was not ready to leave Shapiro's body. He felt a strong urge to explore the cell and his thoughts rested on the possibility.

Kahinin must have been thinking along similar lines, for she said in a soft, introspective tone, "What a shame to be the first people inside the most complex of all living cells and to do nothing at all about investigating it properly."

"That is exactly --" began Morrison, then thought better of it and let the words dangle.

Konev swung his arm as though he were driving off hordes of insects. "I can't understand this. We are in the cell and we came here for a specific purpose. Albert, focus on the skeptic waves."

"I am doing so," said Morrison sharply. "In fact, I have done so. -- Look!"

Konev twisted his head, then unclasped himself, so that he could turn around and peer over the back of his seat. He stared at Morrison's small screen and said, "The waves seem sharper."

"They are sharper. They're more intense and they show finer oscillations than I've ever seen. Come to think of it, I wonder how fine they can get. Sooner or later, an oscillation, if fine enough, will represent the wobbling of a single electron -- and then we have to take into account the uncertainty principle."

"You forget. We're miniaturized and Planck's constant is nine orders of magnitude smaller for us than it is under standard conditions."

"You forget," protested Morrison, eager to catch the other in a misstep this time, "that the waves are reduced by that much before they reach us. Those waves are exactly where they should be relative to the uncertainty principle, therefore."

Konev hesitated a bare moment. "It doesn't matter. We're looking at something now and there's no perceptible uncertainty blurring. What does it mean?"

"It supports my theory," said Morrison. "This is exactly what I ought to see inside a cell if my interpretation of skeptic wave activity is correct --"

"That's not what I mean. We began with the assumption that your theory was correct. Now it's no longer an assumption, it's a demonstrated fact, and I congratulate you. But what does it mean? What do those skeptic waves show Shapirov to be thinking?"

Morrison shook his head. "I have no data -- zero data -- on the correlation of such waves and specific thoughts. It would take years to gather such a correlation, if it could be done at all."

"But perhaps the skeptic waves, when this clear and intense, produce an inductive effect on your brain. Are you getting any of your famous images?"

Morrison thought for a moment, then shook his head, "None!"

From behind him came a quiet voice, "I'm getting something, Albert."

Morrison turned. "You, Natalya?"

"Yes, it's odd -- but I am."

Konev demanded, "What are you getting, Natalya?"

Boranova hesitated, concentrating. "Curiosity. Well, it's not exactly an image of anything. Just an impression. I feel curiosity."

"And so you might," said Morrison. "It needs no impression from outside to produce such a feeling under these circumstances."

"No, no. I know what my own thoughts and impressions are like. This is imposed from outside."

Morrison said, "Do you feel it right now?"

"Yes. It comes and goes a little, but I feel it right now."

"All right. What about now?"

Boranova looked surprised. "It stopped suddenly. -- Did you turn off your machine?"

"I turned it down. Now, you tell me when you feel the sensation and when you don't." He turned to look at Kahinin, intending to tell her to say or do nothing that would indicate when he turned the machine down or up, but she was staring out at the cell, obviously lost in the marvel of watching the interior of a neuron. He wondered if, at the moment, she heard -- or cared -- what was going on.

He turned away and said, "Natalya, close your eyes and concentrate. Just say 'on' when you get the sensation and 'off' when you don't."

For several minutes, she complied with his suggestion.

Morrison said to Konev, "Does the machine make a noise when it is turned down or up? Is there anything you can hear or sense?"

Konev shook his head. "I'm not aware of anything."

"Then there's no mistake. She's getting the sensation only when the machine is on."

Dezhnev, who, unlike Kahinin, had followed everything, said. "But why?" His eyes narrowed. "The brain waves are there whether your machine detects them or not. She should get the feeling of curiosity all the time."

"No no," said Morrison. "My device filters out all the components but the actual skeptic waves. Without the machine, she just gets a confused mass of sensations, responses, correlations, and miscellany of all kinds. With the machine, she gets only the skeptic waves, which further demonstrates the usefulness of my theory."

"I don't get anything at all," said Dezhnev, frowning. "Doesn't that destroy your theory?"

Morrison shrugged. "Brains are complicated mechanisms. Natalya gets it. You don't. For that matter, neither do I. Maybe this particular skeptic wave component fits something in Natalya's brain, not in ours. I'm not going to be able to explain everything at once. -- Do you get anything, Konev?"

"No," he answered, as discontented as Dezhnev had been. "Yet I obtained impressions when we were outside the neuron."

Morrison shook his head and said nothing.

Konev burst out, "Can't you get anything but just a vague feeling of curiosity, Natalya?"

Boranova, "No, Yuri, I can't. Not at this moment. But you remember Pyotr Shapirov. He was curious about everything."

"I remember, but that doesn't help. Albert, in what direction are we moving?"

Albert said, "Downstream. It's the only direction in which we can move."

"No, no." Then, in sudden anger, "Is that a joke? Are you trying to be funny?"

Morrison said, "Not at all. You asked in what direction we were going. What other answer could I have given you? Surely the compass directions have no meaning here."

Konev said, "All right. Sorry. The stream goes this way here. On the other side of the cell, it goes the other way. It's a circulation. But the nerve impulse goes one way only, from the dendrites to the axon. Are we on the side of the cell that's taking us in the same direction as the nerve impulse or in the other direction?"

"Does it matter?" said Morrison.

"I think it does. Can your device tell you in which direction the impulse is traveling?"

"Yes, certainly. There should be a slight shift in the shape of the waves, depending on whether they are meeting the device head-on or from the rear."

"And?"

"And we're moving in the direction of the impulse."

"Good! A stroke of luck. We're heading for the axon, then."

"So it would seem."

Boranova said, "And if we are heading for the axon?"

Konev said, "Natalya, think! The skeptic waves travel along the surface of the cell. The cell here is wide and relatively large. The skeptic waves spread out over a large surface and are weakened in intensity. As the cell approaches the axon, it narrows. The axon itself is long, a very long tube compared to the cell -- and very narrow. The waves must concentrate enormously as they race along that tube and they must grow more intense. What's more, the axon is insulated by a thick myelin sheath, so that the wave energy will not be lost to the outside, but will be kept tightly within the axon."

Boranova said, "You think, then, that we can receive more effectively in the axon?"

"Much more effectively. If you can detect curiosity now, it should be overwhelming in the axon. And you might be able to detect what Shapirov is curious about."

"It may turn out to be totally unimportant," said Morrison thoughtfully. "What if he's curious about why he should be lying there and not moving?"

"No," said Konev sharply, "that would not interest him. I knew Shapirov well. You didn't."

Morrison nodded. "That's true enough."

"All his waking time was consumed with the miniaturization process," said Konev. "All his dreams, too, I suspect. And toward the end, in the last few weeks before the -- the accident took place, he was working, thinking, dreaming of the connection between quantum and relativity, thinking of how to make miniaturization and deminiaturization energy-free and stable."

"Surely," said Morrison, "if that were the case, he must have given some hints as to some of the details of his thinking."

"No, he was a child in some ways. We knew what he was thinking of, but not whether he was making progress or in what direction. What he loved to do was to present it to us whole, complete. -- Remember, Natalya, how he loved to do that? He did that with miniaturization itself. When he finally wrote his paper -- it was a young book --"

Morrison said casually, "Where was it published?"

Konev sneered. "You know it wasn't published. It had a limited circulation to those who had to know. It's nowhere where you're likely ever to see it."

Boranova said, "Yuri, don't be needlessly insulting. Albert is a fellow crew member and a guest. He is not to be treated as a spy."

Konev said, "If you say so, Natalya. Nevertheless, if Shapirov is curious, so intensely curious that Natalya gets that message, it can be only about the quantum-relativity connection. If we can get some details about that, any details at all, we'll have a starting point and can continue."

"And you think we'll get those details in the axon?"

"Yes, I'm sure of it." Konev clenched both fists as though preparing to get a stranglehold on the facts.

Morrison looked away. He was not sure of it. Increasingly, it was beginning to look to him as though matters were moving in another direction altogether and that that was just as well--

He tried not to show it, but he was as excited as Konev was.

61.

Dim objects to either side loomed up ahead, drifted to one side, left or right, and fell behind. Ribosomes? Golgi apparatus? Fibrils of one sort or another? Morrison could not tell. From the vantage point of small molecule size, nothing, not even the sharpest, most familiar intracellular object, would look familiar, let alone recognizable.

They were racing through a strange land of indefiniteness and Morrison could not, no matter how he tried, picture his surroundings as those with which he was familiar from electron micrography.

He wondered if, somewhere beyond where the light of the ship's beam extended, there would be the endless volume of the cell's nucleus. Imagine being within submicroscopic distance of it and yet never seeing it.

He concentrated on the immediate surroundings. It seemed to him, once again, that he ought to make out the water molecules that made up 98 percent of all the molecules in the cell, that huge percentage being the direct consequence of the fact that they were just about the smallest molecules there.

He could not be sure. Focus his eyes though he did and as tightly as he could, what he saw was only a faint glitter -- a photon, perhaps, bouncing off such a molecule and flashing back toward his eye. At best, he would only see one or two from any given water molecule.

He was suddenly aware of Kahinin's head, bending toward his. Her hair brushed his face and he noticed, as he had once or twice before, the fresh scent of her shampoo.

She said, "This is terrible, Albert."

Her breath was a little strong and Morrison flinched before he could stop himself.

She noticed, for her fingers came up sharply, covering her mouth, and she mumbled, "I'm sorry."

Morrison shook his head slightly, "My own breath isn't exactly a bed of roses. -- Tension, nothing much to eat. A drink of water might help, Natalya."

One drink set off everybody, of course, in a chain reaction.

Kahinin fingered a small white pellet. "Peppermint drop?"

Morrison held out his hand and smiled. "Is it permitted?"

Kahinin's eye flickered back toward Boranova and she gave a Who-cares shrug. Having passed the drop to Morrison, Sophia popped another in her mouth.

Then she said again, "This is terrible, Albert."

"What is, Sophia?"

"How can we pass through this cell without examining it in detail?"

"We have a specific mission."

"Yes, but no one may be back within a brain cell for many years. Perhaps, never. When, in the future, someone will read that this ship and this crew merely raced through, looking neither to right or left, what barbarians they will think we must have been."

She was whispering very softly and their heads were bent close together. Morrison found himself rather enjoying it.

Had he grown so calloused to the threat of the situation -- the constant skirting along the edge of the abyss of spontaneous deminiaturization, the possibility of split-second death at any moment -- that he could take joy from the trivial fact that his lips were so close to the pretty face of a woman?

Well, why quarrel with that? Let the nearness anesthetize him, so that he might for a moment forget.

Morrison remembered the sharp image he had had so brief a time before of a happy, smiling, beautiful girl. He had not recognized the thought as his own, so unexpectedly had it come out of nowhere, and it didn't return, even now, but he remembered it distinctly and the memory squeezed at his heart with a warm feeling.

He had the momentary impulse to kiss her lightly, just a touch upon the cheekbone with his lips -- and fought it down. If she decided to take it amiss, he would feel like an incredible fool.

Morrison said gently, "The people of the future will know we have a mission. They will understand."

"I wonder," Sophia said, then paused and sent a quick and almost fearful look in the direction of Konev, who as always sat stiff and detached at any sign of speech or even motion from Kahinin.

She turned to her computer, switched it to the word-processor mode, and tapped out in rapid Russian: YURI IS A FANATIC WHO SACRIFICES EVERYTHING TO HIS MANIA. THERE IS NO CHANCE OF READING THOUGHTS, BUT HE PERSUADES EVERYONE. She blanked it, then tapped out: WE ARE HIS VICTIMS and blanked it at once.

For "we," read "I," thought Morrison sadly. He looked at his own instrument hesitantly. It seemed to him that the thought waves, which he had dimmed to low, were growing more intense. Morrison looked out as though he might be able to tell just how near the axon they now were, but, of course, there was no way of knowing.

He blanked the radiation, switched to word-processing, and printed out in Roman-lettered Russian: HE, TOO, IS HIS VICTIM.

Kahinin at once printed savagely: NO. I DON'T BELIEVE PEOPLE ARE THEIR OWN VICTIMS.

Morrison thought sadly of his one-time wife, his two children, his own inability to present his theory persuasively, or, alternatively, to walk away from it, and tapped out: I BELIEVE WE ARE EACH OF US MORE A VICTIM OF OURSELVES THAN OF ANYONE ELSE and returned it quickly to the thoughtwave mode.

He sucked in his breath sharply. The waves on his screen had risen high in intensity despite the fact that the device was still at low.

Morrison opened his mouth to comment on the fact, but Dezhnev made that unnecessary. "Yuri," he said, "the cell membrane is curving in and we're curving in with it."

That would account for it, thought Morrison. The cell was narrowing in toward the axon and the skeptic waves were being enormously concentrated. His device, having

filtered out everything else, would radiate the wave function of the skeptic waves throughout the interior of the ship. And with what results?

Konev said with delight, "We'll see what happens now. Albert, keep your machine working at top intensity."

Boranova said, "I hope that whatever happens gives us our answer or at least a start to our answer. I have grown tired waiting."

"I don't blame you," said Dezhnev. "As my father used to say: 'The longer it takes to get to a point, the blunter it turns out to be.'"

It seemed to Morrison that every line of Konev's stiff body now betokened excitement and expectant triumph -- but Morrison did not join in that expectation.

62.

Morrison stared outward. They were well into the axon now and being carried along it by the fluid stream within the cell.

In the real world, the axon was an excessively thin fiber, but in the microminiaturized world of the ship, it might be the equivalent of a hundred kilometers across. As for its length, it was much, much longer than the cell itself. Going from one end to the other of the axon might very well be the equivalent of a trip from the Earth to the moon and back a couple of dozen times over. On the other hand, their apparent speed on the microminiaturized scale must seem, to themselves, to be a respectable fraction of the speed of light.

There was no indication of that incredibly rapid speed, however. The ship was moving with the current and there was far less in the way of macromolecules or organelles in the axon than there had been in the cell body. If there were structural fibers withstanding the current and remaining motionless with respect to the cell membrane, the current swept them past those too rapidly for them to be visible, even if a sizable number of photons were reflected from them -- which, of course, they were not.

So he gave up. There was nothing to look at outside.

He ought, in any case, to be looking at his screen. The skeptic waves were becoming even more intense, he could see. It had grown difficult to wipe out the nonskeptical material. It was so strong that it flooded the computer's receiving capacity.

What's more, the tight, elaborate vibration of the skeptic waves had become a series of irregular spikes. Even at full expansion, it was clear he wasn't getting all the detail that existed. Morrison had a clear vision of the necessity of a laser printout clear enough to be placed under a microscope.

Konev had unclasped himself and had half-lifted himself over the back of his seat so that he might stare at the screen.

He said, "I haven't seen it like that before."

Morrison replied, "Nor have I and I have been studying skeptic waves for nearly twenty years. Nothing like this."

"I was right, then, about the axon?"

"Absolutely, Yuri. The waves have concentrated themselves beautifully."

"And the meaning, then?"

Morrison spread out his hands helplessly. "There you have me. Since I have never seen anything like this, I obviously can't interpret it."

"No no," said Konev impatiently. "You keep concentrating on the screen and I keep thinking about induction. Our own minds are the true receptors -- by way of your machine. What do you receive? Images? Words?"

"Nothing," said Morrison.

"That's impossible."

"Are you getting anything?"

"It's your machine. Adjusted to you."

"You've had images before, Yuri."

Dezhnev's voice broke in dryly, "My father used to say: 'If you want to hear, you must begin by listening.'"

Boranova said, "Dezhnev Senior is correct. We can receive nothing if we fill our minds with contention and shouts."

Konev drew a deep breath and said with a softness that was most uncharacteristic of him, "Very well, then, let us concentrate."

An unnatural quiet fell over the ship's crew.

Then Kahinin said, breaking the silence rather timidly, "There is no time."

"No time for what, Sophia," said Boranova.

"I mean that's the phrase I sensed: 'There is no time.'"

Morrison said, "Are you saying that you received it from Shapirov's skeptic waves?"

"I don't know. Is that possible?"

Boranova said, "A moment before I had the same thought. It occurred to me that a better way of tackling the problem might be to study the recorded skeptic waves on the screen and to wait for sudden changes. It might be the change of pattern rather than the pattern itself that would produce an image. But then I thought that the waiting might be an enormously long drawn-out affair and for that we lacked the time."

"In other words," said Morrison, "you thought, 'There is no time.'"

"Yes," said Boranova, "but it was my own thought."

"How can you know, Natalya?" said Morrison.

"I know my own thoughts."

"You also know your own dreams, but sometimes dreams arise out of external stimuli. Suppose you receive the thought 'There is no time.' Because you are not accustomed to receiving thoughts, you quickly build up a line of free association that makes it reasonable for you to feel that you have had the thought yourself."

"That may be so, but how does one tell, Albert?"

"I'm not sure, but Sophia apparently sensed the same phrase and we might ask if she were thinking something independently that would give rise to the phrase as a matter of course."

"No, I was not," said Kahinin. "I was trying to keep my mind empty. It just came in."

"I didn't sense anything," said Morrison. "How about you, Yuri?"

Konev shook his head, frowning ferociously at his failure. "No, I didn't."

"In any case," said Morrison thoughtfully, "it needn't mean anything. Natalya felt it might be an idle thought that arose out of a series of previous thoughts in a natural way and with none but the most superficial meaning. Even if the thought had arisen in Shapiro's mind, it might be equally superficial there."

"Perhaps," said Konev, "but perhaps not. His whole life and mind were bound up in the problems of miniaturization. He would be thinking of nothing else."

"You keep saying that," said Morrison, "but, actually, that is romantic nonsense. No one thinks of nothing else. The most lovesick Romeo in history could not concentrate on his Juliet forever. A twinge of colic, a distant sound, and he would be distracted at once."

"Nevertheless, we must take anything Shapiro says as possibly significant."

"Possibly," said Morrison. "But what if he were trying to work out the extension of the miniaturization theory and decided to moan he had no time, that there was insufficient time to complete his work?"

Konev shook his head, more, it seemed, to brush off distraction than in a clear negative. He said, "How about this? What if it seemed to Shapiro that any miniaturization that involved an increase in the speed of light proportional to the decrease in Planck's constant would involve a change that was instantaneous, that took no time. And, of course, as the speed of light increased vastly, so would the inevitable speed of a massless -- or nearly massless -- object. He would, in effect, abolish time and could say to himself proudly, 'There is no time.'"

Boranova said, "Very farfetched."

"Of course," said Konev, "but worth thinking about. We must record every impression we get, however dim, however apparently meaningless."

"I plan to do precisely that, Yuri," said Boranova.

Konev said, "Then quiet again. Let's see if we can get anything more."

Morrison concentrated fiercely, his eyes half-buried under jutting eyebrows, but those same eyes were fixed on Konev, who sighed and said in a whisper, "I get something over and over -- 'nu times c equals m sub s.'"

Morrison said, "I got that, too, but I thought it was 'm times c square.'"

"No," said Konev tightly. "Try again."

Morrison concentrated, then, quite abashed, said, "You're right. I get it, too: 'nu times c equals m sub s.' What does it mean?"

"Who can say at first glance? However, if this is in Shapiro's mind, it means something. We can assume that nu is radiational frequency, c the speed of light, and m

sub s is the standard mass -- that is, the mass at rest under ordinary conditions. In the light of --"

Boranova's arms lifted with an admonitory forefinger upraised. Konev stopped short and said uncomfortably, "But that is neither here nor there."

Morrison grinned, "Classified material, eh, Yuri?"

And then Dezhnev's voice sounded with an unaccustomed petulance to it. "How is it," he said, "that you are hearing all these things about time and standard mass and whatnot and I sense nothing? Is it that I am not a scientist?"

Morrison said, "I doubt that that has anything to do with it. Brains are different. Maybe they come in different types the way blood does. Blood is blood but you can't always transfuse one person's blood into another. Your brain may be sufficiently different from Shapirov's so that there is no sensory crossover."

"Only mine?"

"Not only yours. There may be billions of minds that can pick up nothing from Shapirov. You'll notice that Sophia and Natalya can pick up the same things, which Yuri and I cannot -- and vice versa."

"Two men and two women," grumped Dezhnev, "and I am what?"

Konev said impatiently, "You are wasting our time, Arkady. Let's not endlessly discuss every tiny thing we pick up. We have more to hear and little time to do it in. If you concentrate a little harder, Arkady, you, too, may sense something."

Silence!

It was broken occasionally by a soft murrur from one or another who reported sensing an image or a scrap of words. Dezhnev contributed only one thing: "I sense a feeling of hunger, but it may be my own."

"Undoubtedly," said Boranova dryly. "Console yourself with the thought, Arkady, that when we get out of here, you will be allowed seconds and thirds of every dish and unlimited vodka."

Dezhnev grinned almost lasciviously at the thought.

Morrison said, "We don't seem to come across anything mathematical or even out of the ordinary. I insist that even Shapirov must have the great majority of his thoughts concerned with trivia."

"Nevertheless," grunted Konev under his breath, "we listen."

"For how long, Yuri?"

"Till the end of the axon. Right down to the end."

Morrison said, "Do you then intend to run into the synapses or will you double back?"

"We will go as close to the synapses as possible. That will bring us into the immediate neighborhood of the adjoining nerve cell and the skeptic waves may be even more easily sensed at that crucial point of transfer than anywhere else."

Dezhnev said, "Yes, Yuri, but you are not the captain. -- Natasha, little flower, is that what you wish, too?"

Boranova said, "Why not? Yuri is right. The synapse is a unique spot and we know nothing about it."

"I ask only because half our power supply has now been consumed. How long dare we continue to remain within the body?"

"Long enough," said Boranova, "to reach the synapse, certainly."
And silence fell once more.

63.

The ship continued to move along the enormous length of the axon and Konev dictated the actions of the others more and more.

"Whatever you get, report. It doesn't matter whether it makes sense or not, whether it's one word or a paragraph. If it's an image, describe it. Even if you think it's your own thought, report it if there's the slightest doubt."

"You'll have meaningless chatter," said Dezhnev, apparently still annoyed at his non-receiving brain.

"Of course, but two or three meaningful hints will pay all. And we won't know what's meaningful until we examine everything."

Dezhnev said, "If I sense something I think isn't mine, do I throw it in, too?"

"You, especially," said Konev. "If you're as insensitive as you seem to think, anything you do get may be particularly important. Now, please, no more talk. Every second of conversation may mean we miss something."

And there began a period of disjointed phrases out of which, in Morrison's opinion, it was impossible to make sense.

One surprise came when Kahinin said suddenly, "'Nobel Prize!'"

Konev looked up sharply and almost responded -- then, as though realizing who had said it, he subsided.

Morrison said, trying not to sound mocking, "Did you get that, too, Yuri?"

Konev nodded. "At almost the same time."

"That's the first crossover between a man and woman," said Morrison. "I suppose Shapirov had his mind on it in connection with his extension of miniaturization theory."

"Undoubtedly. But his Nobel Prize was sure for what he had already done in miniaturization."

"Which is classified and therefore unknown."

"Yes. But once we perfect the process, it will no longer be unknown."

"Let's hope so," said Morrison sardonically.

Konev snapped, "We are no more secretive than you Americans."

"All right. I'm not arguing," but Morrison grinned broadly at Konev, who was peering over his shoulder at him, and that seemed to irritate the younger man even further.

At one point, Dezhnev said, "'Hawking.'"

Morrison's eyebrows lifted in surprise. He had not expected this.

Boranova said, looking displeased, "What is this, Arkady?"

"I said, 'Hawking,'" said Dezhnev defensively. "Out of nowhere it popped into my mind. You told me to tell you anything that did."

"It is an English word," said Boranova, "that means 'spitting.'"

"Or 'selling,'" said Morrison cheerfully.

Dezhnev said, "I don't know enough English to know that word. I thought it was someone's name."

"So it was," said Konev uncomfortably. "Stephen Hawking. He was a great English theoretical physicist of over a century ago. I was thinking of him, too, but I thought it was my own thought."

Morrison said, "Good, Arkady. That might be useful."

Dezhnev's face split with a grin. "I'm not altogether useless, then. As my father used to say: 'If the words of a wise man are few, they are nevertheless worth listening to.'"

An interminable half hour later, Morrison said gently, "Are we getting anywhere at all? It seems to me that most of the phrases and images tell us nothing. 'Nobel Prize' tells us, reasonably enough, that Shapiro thought of winning one, but we know that. 'Hawking' tells us that that physicist's work was significant, perhaps, in connection with the extension of miniaturization, but it doesn't tell us why."

It was not Konev who rose to the defense, as Morrison would have expected, but Boranova. Konev, who might have been readying himself for a response, seemed willing, on this occasion, to let the captain bear the weight.

Boranova said, "We are dealing with an enormous cryptogram, Albert. Shapiro is a man in a coma and his brain is not thinking in a disciplined or orderly fashion. It is sparking wildly, those parts of it that remain whole, perhaps randomly. We collect everything without distinction and it will all be studied by those of us with a deep understanding of miniaturization theory. They may see meaning where you see none. And a bit of meaning, in one corner of the field, may be the start of an illumination that will spread to all parts of it. What we are doing makes sense and it is the proper thing to do."

Konev then said, "Besides, Albert, there is something else we can try. We are approaching a synapse. This axon will end eventually and split up into many fibers, each of which will approach but not join with the dendrite of a neighboring neuron."

"I know that," said Morrison impatiently.

"The nerve impulse, including the skeptic waves, will have to jump the tiny gap of the synapse and, in doing so, the dominant thoughts will be less attenuated than the others. In short, if we jump the synapse, too, we will reach a region where we may, for a while at least, detect what we want to hear with less interference from trivial noise."

"Really?" asked Morrison archly. "This notion of differential attenuation is new to me."

"It's the result of painstaking Soviet work in the area."

"Ah!"

Konev fired up at once, "What do you mean, 'Ah!'? Is that a dismissal of the value of the work?"

"No, no."

"Of course it is. If it's Soviet work, it means nothing."

"I just mean that I haven't read or heard anything about it," Morrison said in defense."

"The work was done by Madame Nastiaspenskaya. I presume you've heard of her."

"Yes, I have."

"But you don't read her papers, is that it?"

"Yuri, I can't keep up with the English-language literature, let alone with --"

"Well, when this is over, I'll see that you get a collection of her papers and you may educate yourself."

"Thank you, but may I say that on the face of it I think the finding is an unlikely one. If some types of mental activity survive a synapse better than others, then, considering that there are many hundreds of billions of synapses in the brain, all constantly in use, the final result would be that only a tiny proportion of thoughts would survive at all."

"It's not as simple as that," said Konev. "The trivial thoughts are not wiped out. They continue at a lower level of intensity and don't decline indefinitely. It's just that, in the immediate neighborhood of a synapse, the important thoughts are, for a time, relatively strengthened."

"Is there evidence for this? Or is it only a suggestion?"

"There's evidence of a subtle nature. Eventually, with miniaturization experiments, that evidence will be hardened, I'm sure. There are some people among whom this synapse effect is much stronger than average. Why else can creative individuals concentrate so hard and so long, if they are not less distracted by trivia? And why, on the contrary, are brilliant scholars traditionally absentminded?"

"Very well. If we find something, I won't quarrel with the rationale."

Dezhnev said, "But what happens when we come to the end of the axon? The stream of fluid we're riding will just make a U-turn at that point and carry us back again against the opposite wall of the axon. Do I force my way through the membrane?"

"No," said Konev. "Of course not. We'd damage the cell. We'll have to take on the electric charge pattern of acetylcholine. That carries the nerve impulse pattern across the synapse."

Boranova said, "Sophia, you can give the ship an acetylcholine pattern, can't you?"

"I can," said Kahinin, "but aren't the acetylcholine molecules active on the outside of the cell?"

"Nevertheless, the cell may have a mechanism for ejecting them. We'll try."

And the trip along the seemingly endless axon continued.

Suddenly the end of the axon was in sight. There was no hint, no warning. Konev noticed it first. He was watching and he knew what he was watching for, but Morrison gave him full credit. He himself was watching, too, and knew what he was watching for, and yet did not see it when it came.

To be sure, Konev was in the front seat, while Morrison had to stare past Konev's head. That was not much of an excuse either.

In the curiously ineffective light of the ship's beacon, it was clear that there was a hollow ahead and yet the current was beginning to veer away from it.

The axon was beginning to break off into branches, into dendrites like those at the other end of the neuron, at the end where the nucleated cell body was. The axonian dendrites at the far end of the cell were fewer and thinner, but they were there. Undoubtedly, a portion of the cellular stream flowed into it, but the ship was in the main stream that curved away and they could take no chances.

They would have to push into the first dendrite encountered -- if it could be done.

"There, Arkady, there," cried Konev, pointing, and it was only then that all the rest realized they were reaching the end of the axon. "Use your motors, Arkady, and push over."

Morrison could make out the soft throbbing of the motors as they edged the ship toward the side of the stream. The dendrite toward which they aimed was a tube that was slipping sideways, a huge tube at their size scale, so huge they could only see a small arc of its circumference.

They continued to edge closer to it and Morrison found himself leaning toward the dendrite, as though adding body English could improve matters.

But it was not a matter of reaching the tube itself, merely moving over an eddying section of fluid, a rushing of water molecules that quieted into gentle circles and then slipped beyond into another stream that was curving off in another direction.

The ship made the transition and was suddenly plunging forward into the tube opening.

"Turn off the motors," said Konev excitedly.

"Not yet," grumbled Dezhnev. "We may be too near the countercurrent emerging from this thing. Let me slip over a bit closer to the wall."

He did so, but that did not take long. They were now essentially moving with the current, not against it. And when Dezhnev did finally shut off the engine and pushed back his damp, graying hair, he heaved a great breath and said, "Everything we do consumes a ton of energy. There's a limit, Yuri, there's a limit."

"We'll worry about that later," said Konev impatiently.

"Will we?" said Dezhnev. "My father always said: 'Later is usually too late.' -- Natalya, don't leave all this to Yuri. I don't trust his attitude toward our energy supply."

"Calm yourself, Arkady. I will take care to override Yuri if it becomes necessary. -- Yuri, the dendrite is not very long, is it?"

"We will come to the ending in short order, Natalya."

"In that case, Sophia, please see to it that we are ready to adopt the acetylcholine pattern at a moment's notice."

"You'll give me the signal, then?" said Kahinin.

"I will not have to, Sophia. I'm sure that Yuri will whoop like a Cossack when the end is in sight. Shift the pattern to acetylcholine at that moment."

They continued sliding along the final tubular remnant of the neuron they had entered a considerable time before. It seemed to Morrison that, as the dendrite continued to narrow, he could see the wall arc above him, but that was illusion. Common sense told him that even at its narrowest, the tube would appear to be a few kilometers across at their present molecular size.

And, as Boranova had foreseen, Konev lifted his voice in a great cry, probably quite unaware that he was doing so. "The end is ahead. Quick. Acetylcholine before we're swept around and back."

Kahinin's fingers flickered over the keyboard. There was no indication from inside the ship that anything about it had changed, but somewhere up ahead was an acetylcholine receptor -- or, more likely, hundreds of them -- and the patterns meshed, positive to negative and negative to positive, so that the attraction between ship and receptor was sharp and great.

They were pulled out of the stream and melted into and through the wall of the dendrite. For a few minutes they continued to be pulled through the intercellular medium between the dendrite of the neuron they had just left and the dendrite of the neighbor neuron.

Morrison saw almost nothing. The ship, he felt, was sliding along -- or through -- a complex protein molecule and then he noticed the formation of a concavity, as when the ship had first entered the first neuron.

Konev had unclasped himself so that he could stand up. (Quite obviously, he was too excited to feel this was something he could do sitting down.)

He said, almost stuttering, "Now, according to the Nastiaspenskaya hypothesis, the filtering out of the important thoughts is most evident immediately after the synapse. Once the cell body is approached, the difference fades. So once we are in the neighboring dendrite, open your minds. Be ready for anything. Say whatever you hear out loud. Describe any images. I'll record everything. You, too, Arkady. Albert, you, too. -- We're in now. Begin!"

15. ALONE!

Good company robs even death of some of its terrors.

Dezhnev Senior

65.

Morrison watched what followed with a certain detachment. He did not intend to participate actively. If something forced itself into his mind, he would respond and report it. It would be unscientific not to.

Kahinin, at his left, looked grim and her fingers were idle. He leaned toward her and whispered, "Have you got us back as L-glucose?"

She nodded.

He said, "Are you aware of this Nastiaspenskaya hypothesis?"

She said, "It's not in my field. I've never heard of it."

"Do you believe it?"

But Kahinin was not to be trapped. She said, "I'm not qualified either to believe or disbelieve, but he believes it. -- Because he wants to."

"Do you sense anything?"

"Nothing more than before."

Dezhnev was, of course, silent. Boranova occasionally produced a crisp word or two, which, however, seemed to Morrison's ears to lack conviction.

Only Konev seemed to maintain enthusiasm. At one point, he cried out, "Did anyone get that? Anyone? 'Circular rhythm.' 'Circular rhythm.'"

There was no direct answer and, after a while, Morrison said, "What does that mean, Yuri?"

Konev did not answer. -- And even he grew quiet after a while and was reduced to staring blankly ahead as the ship moved onward in the fluid stream.

Boranova asked, "Well, Yuri?"

Konev said rather hoarsely, "I do not understand it."

Dezhnev said, "Yuri, little son, it may be this is a bad neuron and isn't doing much thinking. We'll have to try another and maybe another. The first one may have been simply beginner's luck."

Konev looked at him angrily. "We don't work with single cells. We're in a group of cells -- a million of them or more -- that are a center of creative thought by Albert's theory. What one of them thinks, they all think -- with minor variations."

Morrison said, "That's what I believe I have shown."

Dezhnev said, "Then we don't go looking from cell to cell?"

"It would be no use," said Morrison.

"Good," said Dezhnev heavily, "because we don't have the time and we don't have the energy. So what do we do now?"

In the silence that followed, Konev said again, "I do not understand it. Nastiaspenskaya could not be wrong."

And now Kahinin, with great deliberation, unclasped herself and stood up.

She said, "I want to say something and I don't want to be interrupted. Natalya, listen to me. We have gone far enough. This is an experiment that perhaps had to be done, even though, in my opinion, it was sure to fail. Well, it has failed."

She pointed a slim finger briefly at Konev, without looking at him. "Some people want to alter the Universe to their liking. Whatever is not so, they would make so by sheer force of will -- except that the Universe is beyond any person's will, squeeze he ever so hard.

"I don't know if Nastiaspenskaya is correct or not. I don't know if Albert's theories are correct or not. But this I know--what they think, and what any neuroscientist thinks about the brain generally, must be about a reasonably normal brain. Academician Shapirov's brain is not reasonably normal. Twenty percent of it is nonfunctioning--dead. The rest must be distorted in consequence and the fact that he has been in a coma for weeks shows that.

"Any reasonable human being would realize that Shapirov cannot be thinking in normal fashion. His brain is an army in -- in disarray. It is a factory in which all the equipment has been jarred loose. It is sparking randomly, emitting broken thoughts, scattered pieces, splinters of memory. Some men" -- she pointed again -- "won't admit it because they believe that if they only insist loudly enough and strongly enough, the obvious will retreat and the impossible will somehow come into being."

Konev had now also unclasped and was also standing. He turned slowly and looked at Kahinin. (Morrison was astonished. Konev was actually looking at her. And on his face there was no visible sign of anger or hatred or contempt. It was a hangdog look, with a touch of self-contempt in it. Morrison felt sure of this.)

Yet Konev's voice was steady and hard as he looked away from Kahinin and turned to Boranova, addressing her.

"Natalya, was this point made before we embarked on this voyage?"

"If you mean, Yuri, did Sophia say all this to me before this moment? She did not."

"Is there any reason we should be plagued with crew members who have no faith in our work? Why should such a person have agreed to come on this voyage?"

"Because I am a scientist," shot back Kahinin and she, too, addressed Boranova.

"Because I wanted to test the effect of artificial electrical patterns on biochemical interaction. That has been done, so that for me the voyage was a success, and for Arkady, since the ship has handled as it should, and for Albert, since the evidence for his theories is stronger now, I gather, than it was before we came here, and for you, Natalya, since you brought us down here and, presumably, will bring us back safely again. But for one" -

- pointing at Konev -- "it has been a failure and the mental stability of he who has failed would be greatly helped by the frank admission of that failure."

(She's getting back at him with a vengeance, thought Morrison.)

But Konev did not crumple under Kahinin's forceful attack. He remained surprisingly calm and he said, still to Boranova, "That is not so. That is the reverse of what is true. It was clear from the start that we could not expect Shapirov to think as he did when he was in full health. It was entirely likely we would get bits and pieces of meaning intermingled with meaninglessness and trivialities. That we did. I was hoping to get a higher percentage of meaning in this new neuron immediately past the synapse. There we failed. That makes the task before us more difficult, but not impossible.

"We've got well over a hundred phrases and images we've salvaged from Shapirov's thinking. Don't forget 'nu times c equals m sub s,' which must be significant. There's no possible reason to think of that simply as a triviality."

Boranova said, "Have you thought, Yuri, that it is possible that that fragment of a mathematical expression represents something Shapirov tried and found wanting?"

"I have thought of it, but why should it stick in his mind, in that case? It is certainly worth investigating. And how much of what seems to be trivial or meaningless would not be so if even one phrase or image gave us a necessary hint. With each step forward, other things might more easily fall into place. We certainly have no reason as yet to declare this voyage a failure -- or any part in it."

Boranova nodded slightly. "Well, let's hope you're right, Yuri, but, as Arkady has already asked, what do we do now? What, in your opinion, ought we to do now?"

With great deliberation, Konev said, "There's one thing we haven't tried yet. We've tried detection outside the neuron, inside the neuron, inside the axon, inside the dendrites, past the synapse, but, in every single case, we have tried it inside the ship, inside its presumably insulating walls."

"In that case, then," said Boranova, "are you suggesting that we make the attempt outside the ship and within the cell fluid itself? Remember, such an observer would still be inside a plastic suit."

"A plastic suit is not as thick as a plastic ship and the insulating effect would presumably be less. Besides, the computer itself need not be inside the suit."

Morrison said with gathering alarm, "Who do you have in mind for this?"

Konev looked at him coolly. "There is only one possibility, Albert. The computer is your design and is made to match your brain. You are, of necessity, the most sensitive to Shapirov's thoughts. It would be foolish in the highest degree to send out anyone else. I have you in mind for this, Albert."

66.

Morrison's stomach clenched tightly. Not that! He couldn't be asked to do it again!

He tried to say so, but his mouth seemed to have dried completely and instantaneously and he could make no sound other than a throaty hiss. It flashed through his mind that he had been beginning to enjoy the feeling of not being a coward, of wandering, by ship, through the brain cell fearlessly -- but he was a coward, after all.

"Not that!" he cried out, but it wasn't his voice; it was higher by an octave. It was Kahinin.

She had turned around to face Boranova, holding herself down in her seat with knuckles standing out whitely.

"Not that, Natalya," she cried again passionately, her chest heaving in excitement. "It's a cowardly suggestion. Poor Albert has been out there once already. He nearly died and if it hadn't been for him we might still be lost in the wrong capillary and we might never have reached this cell block at all. Why should he have to do that again? It is surely someone else's turn and since he wants it done" -- no one questioned who "he" was -- "let him do it. He should not ask it of someone else."

Morrison, beneath his own fright, wondered faintly if Kahinin's emotion was due to a growing affection for him or a determination to oppose at every point any strong wish of Konev's. There was a corner of Morrison's mind that was pragmatic enough to be certain it was the latter.

Konev's face had grown slowly redder as Sophia spoke. He said, "There's no cowardice here." (He spat out the word, making it quite plain that that was what had most offended him.) "I am making the only possible suggestion. If I go out there, which I am perfectly willing to do, it can only be with Albert's device, which won't work as well for me as it would for him. We cannot choose this one or that one according to whim. It must be the one who can get the best results and there is no question, in that case, who it must be."

"True," said Morrison, finding his voice now, "but there is no reason to suppose that reception will be better outside the ship than inside."

Konev said, "There is no reason to think the reverse, either. And as Dezhnev will tell you, our energy supply -- and therefore our time -- is decreasing. There is no room for delay. You'll have to leave the ship as you did before -- and now."

Morrison said in a low voice, which he hoped would make the remark final, "I'm sorry. I will not leave the ship."

But Boranova had apparently made up her mind. "I'm afraid you'll have to, Albert," she said gently.

"No."

"Yuri is right. Only you and your device can give us the information we need."

"I am certain there'll be no information."

Boranova held out her two hands, palms upward. "Perhaps not, but we can't leave that a matter of conjecture. Let us find out."

"But --"

Boranova said, "Albert, I promise you that if you do this one thing for us, your part in all this will be reported honestly when the time comes for open publication. You will be

known as the man who worked out the correct theory of thought, the man who developed the device that could exploit that theory properly, the man who saved the ship in the capillary, and the man who detected Shapirov's thinking by bravely venturing into the neuron, as earlier he had ventured into the bloodstream."

"Are you implying that the truth will not be told if I refuse?"

Boranova sighed. "You force me to play the role of villainess openly. I would rather you had been satisfied with the implication. -- Yes, the truth need not be told. That, after all, is the only weapon I hold against you. We cannot very well turn you out of the ship by force, since there is no advantage in your merely being outside. You must also sense poor Shapirov's thought and for that we must have your willing cooperation. We will reward you for that, but only for that."

Morrison looked around at his crewmates' faces, searching for help. Boranova -- steadily studying him. Konev -- staring him down imperiously. Dezhnev -- looking awkward, not willing to commit himself either way. And Kahinin . . . his only hope.

Morrison gazed at her thoughtfully and said, "What do you think, Sophia?"

Kahinin hesitated, then said in a voice that did not tremble, "I think it is wrong to threaten you in this way. A task like this should be performed voluntarily and not under duress."

Dezhnev, who had been humming very softly to himself, now said, "My old father used to say: 'There is no duress like one's own conscience and it is that which makes life so needlessly bitter.'"

"My conscience doesn't trouble me in this matter," said Morrison. "Shall we put it to a vote?"

"It wouldn't matter," said Boranova. "I am the captain and in a case like this I alone have the vote."

"If I am out there and sense nothing, would you believe me?"

Boranova nodded. "I would. After all, you might so easily invent something that would sound useful if you wished us to be suitably grateful. If you come back with nothing or with trivia, I believe I would have a greater tendency to believe that than if you instantly claimed you had heard something of great importance."

Konev said, "I am not likely to be fooled. If he comes in with something that seems important, I will be able to tell if it truly is. And now, surely, we have had enough discussion. Let's go!"

And Morrison, his heart beating and his throat tightening, managed to say, "Very well, I will go -- but only for a brief time."

67.

Morrison, of his own accord, stripped himself of his cotton garment. The first time (was it really only a couple of hours before?) it had seemed to be a violation of modesty; this second time it was almost routine.

He was quite aware, as with Kahinin's help he struggled into the suit, how easily he could suck in his abdomen. Despite a good breakfast, ample water, and a piece of chocolate, his stomach was empty and he was glad it was. He felt a twinge of nausea as the suit enclosed more and more of his body and to throw up, once enclosed, would have been unbearable. Just before enclosure, he refused another piece of chocolate with what was almost a shudder.

They put his computer into his sheathed hands and Boranova said to him loudly, "Can you work it?"

Morrison heard her without too much difficulty. He knew he wouldn't hear her once he was outside the ship. He balanced the essentially weightless computer in one hand and struck the keys carefully and rather gracelessly with the other. He shouted back, "I think I can manage."

Then, rather clumsily, they tied the computer to both his wrists with firm knots of tough plastic twine (probably the same material of which the suit and the ship itself were made).

"So you don't lose it," Boranova called out.

Out into the air lock he went. He felt himself embraced by it, then pressured as the air in it was withdrawn, and then he was outside the ship.

Outside again. For only a brief time, he had warned the rest, but what good was that? How could he enforce that, if the others within the ship refused to let him back in? Already, he was sorry he had let himself be talked out of the ship by any threat, but dared not articulate the thought. It would do him no good.

Morrison tucked the computer under his left arm, partly because he did not entirely trust the plastic twine that secured it and partly because he wanted to protect it from the cellular contents as much as possible. He felt the surface of the ship for some spot where the electric charge on his suit would adhere to a charge of opposite nature on the ship's hull.

Morrison found one that allowed him to keep his back on the ship. The electric field did not hold him tightly and there was considerable give. Still, he was the size of an atom and it might be difficult to concentrate electric charge on a portion of him.

Or would it be? Wouldn't the electrons that were the source of the charge be microminiaturized as well? He felt -- and resented keenly -- his ignorance of miniaturization theory.

He was little aware of his motion along the intracellular stream, for everything was moving along with him. He found himself, however, the center of a shifting and ever-changing panorama. With the thinner plastic of the suit between himself and the scene, with the beacon of his own suit turning here and there as he moved his head and felt the headpiece twist (a little resistantly) with it, he could make out more.

There was the knobiness of the water molecules rubbing against each other, like dimly seen balloons. He could see them brush past him slowly, this way or that, and largely ignore him. Occasionally, one would cling for a moment, an electric charge meeting an opposite charge on his suit, so that they clutched at him and released their

hold only lingeringly. It was almost as though a molecule occasionally yearned for him but couldn't manage to turn the wish into deed.

Among these were larger molecules, some as large as the ship, some far larger still. He could see them only because light glinted off them here and there in changing, prismatic fashion. He did not see them; his mind built them up out of what he could glimpse. That he could do this at all was the result of his knowing a good deal about the contents of the cell to begin with, or thought he did. It might also, he thought, simply be his imagination.

It even seemed to Morrison that he could make out the skeleton of the cellular interior; the large structures that remained in place while the fluid stream passed them and that gave the cell its more or less fixed shape. These structures seemed to go by so quickly he could barely take note of them before they were gone. They alone gave him the impression of the rapid movement of the intercellular stream that carried the ship and him along with it as it weaved in gentle swoops around those fixed structures.

All this observation had not taken very long, but it was enough. It was time that he now turned his attention to his computer.

Why? It would detect nothing. Morrison was sure of it, but he couldn't act on that belief, however strongly he felt it. He might be wrong, perhaps, and he owed it to the others -- and to himself, too -- to make the effort.

He tried clumsily to adjust the computer to maximum sensitivity, barely able to handle the keys correctly and relieved that the self-contained power pack in the computer worked properly. He concentrated hard in order to sense and tap the currents of thought passing by.

The device did its work. The water molecules drifted by it as gently and untouchingly as they drifted by him and, disregarding them, his computer portrayed the skeptic waves more purely etched, more steep and clear, more finely detailed, than he had ever before seen them. But for all that, he sensed nothing but a faint hissing whisper that produced neither words nor images but only sadness.

Wait! How did he know the whisper was sad? Surely that was merely a subjective judgment on his part. Or was he detecting an emotion? Was the partially brain-dead, totally comatose Shapirov sad? Would it be surprising if he were?

Morrison looked over his shoulder, back at the ship. Surely what he was detecting was enough. He was registering sad nothingness and nothing more. Should he signal now to be pulled in? Would they be willing to do so? And if they brought him in and if he told Boranova that he had sensed nothing, would not Konev tell him angrily that he had been out there only two minutes, that he hadn't given it a chance? Would Konev not demand he go out again?

And if he waited longer?

Actually, he could wait longer. At this stage of miniaturization (or for whatever cause), he did not feel any particular heat.

But if he waited longer -- another two minutes, or five minutes, or an hour, for that matter -- Konev would still say, "Not enough."

He could make out Konev looking out toward him, his expression dark and glowering. Kahinin was directly behind him, since she had unclasped herself and moved over into what had been Morrison's seat. She was staring outward anxiously.

He caught her eyes and she seemed about to signal to him, but Boranova leaned forward and pushed her shoulder firmly. Kahinin moved back to her own seat at once. (She had to, Morrison told himself, for her job was to keep an eye on the charge patterns of the ship and of himself right now and she could not -- must not -- abandon that job, no matter what her anxiety over him.)

For the sake of completeness, Morrison tried to catch Dezhnev's eye, but the angle required was too great for the twisting ability of his headpiece. He caught, instead, Konev motioning in what seemed, clearly, an interrogative gesture.

Morrison looked away petulantly, making no attempt to give information, and became aware of something in the distance looming toward him at a great speed. He could make out no details, but he automatically winced as he waited for the current to carry the ship and himself around it.

It came straight on like a juggernaut and Morrison cowered toward the hull of the ship.

The ship did evade the object, but not by much and as the looming monster passed him Morrison felt himself drawn outward and toward it.

It flashed through his mind that Kahinin had put some random electric charge on his suit and that whatever it was he was passing, by the most miserable of coincidences, had a charge that exactly complemented his own.

Under normal circumstance, that would not have mattered. The ship and the structure passed each other at such a speed that no attraction could have sufficed to rip him loose, but he was a tiny object with neither mass nor inertia and, for a moment, he felt -- stretched -- as though the structure and the ship disputed ownership. The ship, it seemed to his appalled eyes, briefly faltered and then was pushed loose by the current.

Morrison had been peeled off by the object and the ship, still continuing with the current, moved off so rapidly that it was lost to sight at once. One second it was with him, the next second it was totally gone.

Before he had time to realize what had happened, he was alone and helpless -- an atom-sized object in a brain cell. His only faint attachment to life and reality -- the ship -- was forever gone.

68.

Some minutes must have been lost to Morrison. During that time, he had no conception of where he was or of what had happened. He was conscious only of absolute panic, of the conviction that he was on the point of death.

When life continued, Morrison was almost sorry. If that moment had been death, it would have been all over. Now he still had to wait for it.

How long would his air last? Would heat and humidity crawl on, even if more slowly than before, inexorably, just the same, perhaps. Would his light give out before he did and would he have to die in utter darkness as well as utterly alone? He thought, quite madly, How will I know when I'm dead if it's absolutely dark before and absolutely dark thereafter? (He thought of Ajax's prayer to Zeus that if he had to meet death, let it be in the light of day. And, with this, Morrison thought hopelessly, And with one person, at least, to hold one's hand.)

What to do, then?

Just wait?

What had gone wrong, anyway?

Ah, he was not yet dead. The fear had receded enough to allow room for a little curiosity -- and a will to fight and live.

Could he somehow get loose from this thing? It seemed disgraceful, somehow, to die like a fly stuck in amber. -- And every moment the ship was getting farther away. Almost at once he thought, It's already too far away for me to be caught, no matter what I do.

The thought drove him to frenzy and Morrison writhed with all his might, trying to break loose. It did no good and it occurred to him that he was wasting energy and increasing the heat within the suit.

He slid his hands upward along the misty structure that held him, but his hands bounced away. Like charges repel each other.

He reached along it -- right, left, up, down. Somewhere there was the opposite charge. He might be able to seize hold then and try to tear the structure apart. (Why were his teeth chattering? Fright? Desperation? Both?)

His right hand clicked shut as it was attracted to a portion of the structure. He clenched hard, trying to push past the mere charge and tear at the atomic arrangement itself -- if there was any atomic arrangement that had meaning aside from the charge itself.

For a moment, Morrison felt the structure resist a too-tight grip with a kind of rubbery rebound. And then, without warning, it crumbled in his hand. He stared in amazement at his hand, trying to make out what had happened. There was no tearing, ripping, or wrenching sensation. It seemed to him that a portion of the structure had simply disappeared.

Morrison tried again, groping here and there, until another portion vanished. What was happening?

Wait awhile! The miniaturization field extended beyond the ship slightly, Boranova had said. It would extend beyond the suit, too. When he squeezed as hard as he might, some of the atom he was touching would miniaturize and, in so doing, it would lose its normal architecture and break loose from the atoms to which it had formerly been bonded. Anything he touched -- if he could touch it hard enough -- would miniaturize.

Any atom or portion thereof that he miniaturized in this way would become a point-sized particle with far less mass than an electron. It would take off at nearly the speed of light, pass through matter as though that matter weren't there, and be gone.

Could this be so? It had to be so. Nothing else he could imagine would make sense.

And even as he thought this, Morrison began to push his hands and feet violently against the imprisoning material -- and broke loose.

He was no longer glued to the structure. He was an independent body coursing along the intercellular stream.

It didn't stop the ship from being forever out of reach, but he was at least on its trail. (Foolish! Foolish! What good was it to be on its trail? On his own scale, he was dozens of kilometers from the ship -- if not scores.)

Another thought struck him and staggered him. He had been miniaturizing atoms to get free, but such miniaturization required an input of energy. Not much at this stage, since there was so little mass to remove, but where would the energy come from?

It had to come from the suit's own miniaturization field. Every atom that miniaturized weakened the field, therefore. How much had he weakened it, then, by getting loose?

And was that why he wasn't feeling the heat? Had the miniaturization of his surroundings soaked up some of the heat as well as of the energy of the miniaturization field? No, that couldn't be so, for he hadn't felt much in the way of heat even before he began breaking loose.

Yet another thought struck him, making his position more desperate still. If he had broken loose from the structure at the expense of the energy of his field -- if his field had been weakened -- then he would have deminiaturized slightly. Was that the reason for spontaneous deminiaturization?

Boranova had talked of the possibility of such spontaneous deminiaturization. The possibility of that increased, the smaller the miniaturized object was. -- And he was now small.

As long as he had been on the ship, he had been part of the overall miniaturization field of the ship. He was part of a molecule-sized object. While he was part of the cytoskeleton of the cell, he was part of an even larger object. But now he was alone, separate, part of nothing beyond himself. He was an atom-sized object.

He was much more likely, now, to deminiaturize spontaneously, except that it wouldn't be spontaneous -- it would be the weakening of the field by the miniaturization of surrounding normal objects.

How could he tell if he were deminiaturizing? If he were, the process would proceed at an exponential rate. He would be deminiaturizing slowly at first, but as he grew larger he would affect a larger volume of surrounding material and he would grow larger at a faster rate, then still faster, and finally it would be an explosion and he would die.

But what did it matter if he were deminiaturizing? If he were, then, in a brief time -- seconds merely, at most -- he would be dead and it would happen too quickly to make any impression upon him. One moment he would be alive and the next moment there would be nothingness.

How could he ask for a better death? Why should he want to know a second earlier that it was going to happen?

Because he was alive and he was human -- and wanting to know was what made an object alive and human.

How could he tell?

Morrison stared at the dim glinting around him, at the moving swell of the water molecules, turning and shifting around him in a kind of slow motion as both he and they moved along the intercellular stream.

If he were increasing in size, they should seem to be decreasing, and vice versa.

Morrison stared. They were decreasing in size, getting smaller. Was this death? Or his imagination?

Wait, were the water molecules increasing in size? Swelling? Getting larger? Ballooning? If so, it must follow that he was getting smaller.

Would he shrink to the size of a subsubatomic particle? A subelectron? Would he go streaking off at the speed of light and explode when he was halfway to the moon, dying in a vacuum before he had time to know he was in a vacuum?

No, the molecules were shrinking, not expanding -- Morrison closed his eyes and took a deep breath. He was going mad. Or was he beginning to experience brain damage?

Better to die, then. Better death altogether than a dead brain and living body.

Or were the water molecules pulsating? Why should they pulsate?

Think, Morrison, think. You're a scientist. Find an explanation. Why should they pulsate?

He knew why the field might weaken -- its tendency to miniaturize the surroundings. Why should it strengthen?

It would have to gain energy to strengthen. From where?

What about the surrounding molecules? They had more random heat energy per volume than he had because they were at a higher temperature. Ordinarily, heat should flow from the surroundings into his suit until his suit and he himself would be at blood temperature and he would die of his own inability to rid himself of the heat he had accumulated, as he almost had on his earlier venture outside the ship.

But there was not only the heat energy intensity of his body; there was also the energy of the miniaturization field. And, as he was struck randomly by the water molecules, energy need not flow into him in the form of heat, but in the form of miniaturization activation. The field would grow more intense and he would shrink.

This must be true at all times when a miniaturized object was surrounded by normal objects of higher temperature. The energy might flow from the surroundings to the miniaturized object either as heat or as field intensity. And it must be that the smaller

the object, the more intensely miniaturized, the more it was the field that gained the energy and not the object itself.

Probably the ship, too, was pulsating, growing larger and smaller constantly, but to an extent not great enough to notice. Still, that was why the Brownian motion hadn't increased as far as it might have and that was why the air-conditioning could perform its function with less strain. The miniaturization field formed a cushion in both cases.

But he -- Morrison, alone in the cell -- was much smaller, possessing less mass, and for him the energy inflow went far more into miniaturization than heat.

Morrison's fists clenched helplessly. He let go of the computer and didn't care. Undoubtedly, the others, Boranova and Konev certainly, knew of this and might have explained it to him. Once again they let him go into danger without warning him.

And now that he had worked it out for himself -- what good did it do him?

He opened his eyes suddenly. Yes, there were pulsations. Now that he knew what to expect, he saw them. The water molecules were expanding and contracting in an irregular rhythm as they gave up energy to the field and then extracted energy from it.

Morrison watched it with a stupefied swaying rhythm and he found himself muttering soundlessly: "Larger, smaller, larger, smaller, larger, smaller."

It could only get so large, he thought. The expansion mirrored his own contraction and there was only so much energy to be pushed into him to power that contraction. The cellular contents had a temperature only so high. On the other hand, they could take large quantities of energy from him, and once they took enough, what was left would go more and more quickly, and he would explode.

Therefore, when the water molecules expanded in size (and he himself was growing smaller) he was safe. He would not grow very small. When the water molecules contracted in size, however (and he himself was growing larger), he was not safe. If the water molecules continued to contract until they were too small to see that meant he would be expanding toward instantaneous explosion.

"Larger, smaller -- smaller -- stop contracting!"

Morrison let his breath go, for the molecules were expanding again.

Over and over! Each time -- would the contraction stop?

It seemed to be playing with him and it didn't matter anyway. No matter if it brought him to the brink of destruction, then snatched him away, and if it did it a million times over, it wouldn't matter. Sooner or later, his air would be gone and he would die a slow, suffocating death.

Better a quick death, surely.

69.

Kahinin was screaming. She was the first to realize what had happened and she choked on her words.

"He's gone! He's gone!" she shrieked.

Boranova was unable to stop herself from asking the obvious question. "Who's gone?"

Kahinin turned wide eyes on her and said, "Who's gone? How can you ask who's gone? Albert is gone."

Boranova stared blankly out at the spot where Morrison had been and now wasn't. "What happened?"

Dezhnev muttered hoarsely, "I'm not sure. We cut a corner closely. Albert, attached to the outside of the ship, introduced an asymmetry, perhaps. I tried to steer the ship away from -- from whatever it was, but it didn't respond properly."

"A fixed macromolecular organelle," said Konev, who looked up now after having buried his face in his hands, "scraped him off. We've got to get back to him. He may have the information we need."

Boranova by now clearly understood the situation. She unclasped herself with a quick movement and stood up. "Information?" she said tightly. "Is that what you feel the loss of, Yuri? Information? Do you know what's going to happen now? Albert's miniaturization field is isolated and he's only atom-sized. The chance of his undergoing spontaneous deminiaturization is at least fifty times ours. Given enough time, the chance will become too good. Information or not, we must get him. If he deminiaturizes, he will kill Shapirov and he will kill us."

Konev said, "We're just arguing motivation. We both want him back. The reasons why are secondary."

"We should never have sent him out," said Kahinin. "I knew it was wrong to do so."

"It is done," said Boranova gruffly, "and we must proceed from that point. Arkady!"

"I'm trying," said Dezhnev. "Don't teach a drunkard to hiccup."

"I'm not trying to teach you anything, old fool. I'm ordering you. Turn around. Back! Back!"

"No," said Dezhnev. "Let this old fool tell you that's ridiculous. Do you want me to make a U-turn and buck the current? You want me to try to force my way upstream?"

Boranova said, "If you just stand still, the stream will bring him to us."

"He is adhering to something. He will not be brought to us," said Dezhnev. "What we must do is turn to the other side of the dendrite and let the return stream carry us back."

Boranova put both hands to her head and said, "I apologize for calling you an old fool, Arkady, but if we go back by the counterstream we'll miss him."

"We have no choice," said Dezhnev. "We lack the energy to try to make our way against the stream we're in."

Konev said, sounding a bit weary but reasonable, "Let Arkady do as he wishes, Natalya. We will not lose Albert."

"How can you know that, Yuri?"

"Because I can hear him. -- Or, rather, sense him. -- Or, rather, sense Shapiro's thoughts by way of his instrument, bare and uninsulated in the cell."

There was a momentary silence. Boranova, clearly astonished, said, "Are you getting something?"

"Of course. In that direction," said Konev, pointing.

"You can tell the direction?" said Boranova. "How?"

"I'm not sure how. I just feel. It's in that direction!"

Boranova said, "Arkady, do as you were planning."

"I am doing it regardless of what you say, Natasha. You may be captain, but I am navigator with death staring me in the face. What have I to lose? As my old father would say: 'If you are dangling from a rope over an abyss, don't bother snatching at a coin that falls out of your pocket.' -- It would be better if I had a real steering mechanism than this system of trying to maneuver three off-center engines."

Boranova had stopped listening. She peered into the darkness uselessly and said, "What is it you hear, Yuri? Shapiro's thoughts tell us -- what?"

"Nothing at the moment. It is just noise. Anguish."

Kahinin muttered, as though to herself, "Do you suppose part of Shapiro's mind knows he's in a coma? Do you suppose part of his mind feels trapped and is clamoring to get out? Like Albert -- trapped? Like we ourselves -- trapped?"

Boranova said sharply, "We are not trapped, Sophia. We can move. We will find Albert. We will get out of this body. Do you understand, Sophia?" She reached for the other woman's shoulders, her fingers digging deeply.

Kahinin winced. "Please. I understand."

Boranova turned to Konev. "Is that all you get? Anguish?"

"But strongly." Then, curiously, staring at Boranova, "Do you sense nothing?"

"Nothing at all."

"But it is so strong. Stronger than anything I felt when Albert was in the ship. It was right for him to move outside."

"But can't you make out any actual thoughts? Words?"

"Perhaps I am too far. Perhaps Albert hasn't got his machine properly focused. And you really sense nothing?"

Boranova shook her head decisively and glanced briefly at Kahinin, who said in a low voice (rubbing one shoulder), "I sense nothing, either."

And from Dezhnev came a discontented, "I never get any of these mysterious messages."

"You got 'Hawking.' Albert suggested there might be different brain types as there are different blood types and that he and I might be of the same type. He may be right," said Konev.

Boranova said, "From what direction does the sensation come now?"

"From there." This time Konev pointed much closer to the fore end of the ship. He said, "You are turning, aren't you, Arkady?"

"I am," said Dezhnev, "and I'm now fairly close to the doldrums between the two streams. I am planning to edge only slightly into the counterstream so that we head back, but not too quickly."

"Good," said Boranova. "We don't want to miss him. -- Yuri, can you judge the intensity? Is it getting stronger?"

"Yes, it is." Konev seemed a bit surprised, as though he had not noticed the rise in intensity until Boranova had mentioned it.

"Is it imagination, do you think?"

"It might be," said Konev. "We haven't really gotten any closer to him. We're just making a turn. It's almost as if he's approaching us."

"Perhaps he's washed off whatever he adhered to or forced himself loose. In that case, the current would carry him to us, if we're forcing a turn and staying essentially in the same place."

"Perhaps."

"Yuri," said Boranova vehemently, "you just concentrate on the sensation. Keep Arkady aware at all times of the direction from which it comes, which means you will have to be pointing toward Albert steadily. -- Arkady, as you get closer to Albert, you will have to turn toward the original stream again and get into it as close to his position as possible. Then once we're moving together, it will be easy to drift closer by use of our motors."

"Easy for one who's not controlling the motors," growled Dezhnev.

"Easy or difficult," said Boranova, her formidable eyebrows hunching low, "do it. If not -- No, there is no 'If not.' Do it."

Dezhnev's lips moved, but no sound came and silence fell upon the ship -- except for the unheard flood of sensation that entered Konev's mind but left the other minds empty.

Konev remained standing, facing in the direction from which it seemed to him the sensation was coming. He muttered once, "Definitely stronger." Then, after several moments, "It seems to me I can almost sense words. Maybe, if he comes close enough --"

His expression grew even more strained, as though it were trying to force the sensation, to cram it into his mind, while taking the noise apart and separating it into words. His finger kept pointing rigidly and he said finally, "Arkady, begin curving back into the doldrums and be ready to plunge into the original stream. -- Quickly. Don't let him pass us."

"As quickly as the motors will let me," said Dezhnev. Then, in a lower voice, "If I could maneuver this ship by the same magic with which the rest of you hear voices --"

"Head straight for the membrane," said Konev, ignoring the remark.

It was Kahinin who saw the spark of light first. "There he is!" she cried out. "That's the light of his suit."

"I don't have to see it," said Konev to Boranova. "The noise is like a volcanic eruption in Kamchatka."

"Still noise, Yuri? No words?"

"Fright," said Konev, "incoherent fright."

Boranova said, "If I were aware in any way of being trapped in a comatose body, it would be precisely how I would feel. -- But how has he come to realize it now? Earlier we did make out words and even quiet and peaceful images."

Dezhnev said, panting a little in the excitement of the chase, which had him unconsciously holding his breath, "It may be something we've done with this ship. We've stirred up his brain."

"We're too small," said Konev with contempt. "We can't even stir up this one cell noticeably."

"We're coming up to Albert," said Dezhnev.

"Sophia," said Boranova, "can you detect his electrical pattern?"

"Faintly, Natalya."

"Well, throw everything you've got into something complementary that will attract him tightly."

"He seems a little large. Natalva."

"He's oscillating, I'm sure," said Boranova grimly. "Once you attach him to the ship, he'll become part of our general miniaturization field and his size will adjust. Quickly, Sophia."

There was a slight bump as Morrison was electronically pulled against the side of the ship.

16. DEATH

Once the sun sets, it grows dark; don't let that catch you by surprise.

Dezhnev Senior

70.

Morrison could not later recall anything that took place -- either just before or just after his return to the ship. Try as he might, he did not remember seeing the ship coming for him at any time, nor did he recall the moment of transfer, nor the removal of his plastic suit.

Going far enough back, he remembered the despair and loneliness of waiting to explode and die. Going far enough forward, he remembered looking up at the concerned face of Sophia Kahinin bending over him. There was nothing in between.

Hadn't this happened already? The two incidents, joined by Kahinin's care for him, were separated by several hours in time, but melted into one.

He said in a hoarse and almost unintelligible voice, "Are we headed in the right direction?" He said it in English.

Kahinin hesitated, then answered slowly, also in English and with a moderately heavy accent, "Yes, Albert, but that was some time ago, when we were in the capillary. You came back and then went out a second time. We are in a neuron now. Remember?"

Morrison frowned. What was all this?

Slowly, in bits, his memory returned. He closed his eyes and tried to get it all straight. Then he said, "How did you find me?" He spoke in Russian now.

Konev said, "I sensed -- quite strongly -- the thought waves of Shapirov as it came through your instrument."

"My computer! Is it safe?"

Konev said, "It was still attached to you. Did you make out actual thoughts?"

"Actual thoughts?" Morrison stared at him fuzzily. "What actual thoughts? What are you talking about?"

Konev was clearly impatient, but he set his lips tightly together and then said, "I could make out Shapirov's thought waves reaching me across the cell by way of your device, but there were no actual words or images."

"What did you sense, then?"

"Anguish."

Boranova said, "The rest of us sensed nothing at all, but it seemed to us that what Yuri described was the anguish of a mind that knew it was in a comatose trap, that knew it was a prisoner. Did you sense anything more specific than that?"

"No." Morrison looked down upon himself and realized that he was sprawled across two seats, his head was in the crook of Kahinin's arms, and that he was in his one-piece cotton suit. He tried to struggle upright. "Water, please."

He drank thirstily, then said, "I don't recall hearing anything or sensing anything. In my position --"

Konev said sharply, "What has your position to do with it? Your computer was transmitting information. I sensed it at a considerable distance. How would it be possible for you not to sense anything?"

"I had other things to think about, Yuri. I was lost and I was sure of death. Under the circumstances, I paid no attention to anything else."

"I can't believe that, Albert. Don't lie to me."

"I am not lying to you. -- Madame Boranova." He managed to pronounce the name very formally. "I demand that I be treated in a courteous manner."

"Yuri," said Boranova sharply. "Don't make accusations. If you have questions to ask, ask them."

Konev said, "Then let me put it this way. I sensed a great deal of emotion, even though I was far from the instrument in terms of our miniaturized state. You, Albert, were right on top of your device and it was keyed to your brain, not mine. Our brains are of similar type, presumably, but they are not identical and you can sense on your instrument more sharply than I can. How is it possible, then, that I could sense so much and that you should nevertheless claim to have sensed nothing?"

Morrison said strenuously, "Do you think I had time or inclination for sensing? I was swept away from the ship. I was separated, alone, lost."

"I understand that, but you need make no special effort to sense. The sensations would invade your mind despite anything that might be taking place."

"I received no sensations just the same. What filled my mind was that I was alone and I was going to die. How is it possible you don't understand that? I thought I would heat up and die, as I almost did the first time." A sudden doubt assailed him and he looked across at Kahinin. "There were two times, weren't there?"

"Yes, Albert," she said softly.

"And then I realized I wasn't heating up. Instead, it seemed to me that I was growing larger and smaller -- oscillating. I was involved in some sort of miniaturization transfer in place of heat transfer. Is that possible, Natalya?"

Boranova hesitated, then said, "That effect follows naturally from the field equations of miniaturization. It has never been tested, but apparently you confirmed it while out there."

"It seemed to me that my surroundings were oscillating in size, that the water molecules all around me were expanding and contracting, and it seemed to me to be more logical that it was I who was oscillating, rather than that everything else was."

"You were correct and what you report is valuable. One might argue from this that the turmoil of the event to you was not without its compensation in a larger sense."

Konev said indignantly, "Albert, you tell us that you were perfectly capable of careful and rational thought out there -- and yet you expect us to believe that you sensed nothing?"

Morrison raised his voice, "Can't you understand, you monomaniac, that it was this very careful and rational thought, as you call it, that filled my mind to the exclusion of everything else? I was in absolute terror. I expected, with each contraction of the molecules around me, that contraction would continue indefinitely, which would mean, in actual fact, that I would expand indefinitely; that, in other words, I would undergo spontaneous deminiaturization and explode and die. I was not in the least concerned with sensing thought waves at that moment. If any had forced themselves on me, I would, in my condition then, have ignored them. That is the truth."

Konev twisted his face into an expression of scorn. "If I had an important job to do and if a firing squad had their weapons trained on me, then in the few moments before they fired, I would still concentrate on my job."

Dezhnev muttered, "As my father used to say: 'Anyone can hunt a bear fearlessly when the bear is absent.'"

Konev turned on him fiercely, "I've had enough of your father, you old drunkard."

Dezhnev said, "Repeat that to me when we are safely back in the Grotto and you will then find you are hunting the bear when the bear is present."

Boranova said, "Not another word, Yuri. Are you intent on quarreling with everyone?"

"Natalya, I'm intent on doing my job. Albert must go out again."

"No," said Morrison in terror. "Never."

Dezhnev, who glared at Konev less than lovingly, said, "A hero of the Soviet Union is heard from. He must do his job, so Albert must go out into the cell again."

Boranova said, "Dezhnev is right, Yuri. You boast that even a firing squad would not interrupt your duty. Go out once, then, as Albert has done twice."

Konev said, "It is his machine. It is keyed to his brain."

"So I understand," said Boranova, "but you, as you yourself say, have the same brain type. At least you could sense what he sensed. Certainly you sensed the skeptic waves when he was lost in the intercellular current. And you were at a distance. With the machine in your very hand and yourself outside, you would gather data of your own, which should be more valuable to us, in any case. Of what use would it be to have Albert's keener perception if you insist on disbelieving whatever he says?"

All were staring at Konev now. Even Kahinin managed to look at him at intervals through her long lashes.

Then Morrison coughed slightly and said, "I'm afraid I urinated into the suit. A little. Not much, I think. Terror has its price."

"I know," said Boranova. "I've drained it and cleaned it as well as I could. That shouldn't stop Yuri. A little bit of urine residue will surely not stop the dedication to duty of a man like him."

Konev said, "I resent this clumsy sarcasm on the part of all of you, but I'll go out into the cell. Do you really think I'm afraid of doing that? My only thought to the contrary has been that Albert is the best receiver. Still, I am second-best, certainly, and if he will not do it, then I will, provided --"

He paused and Dezhnev said, "Provided the bear is not there, eh, Yuri, my hero."

Konev said bitterly, "No, old sot, provided that I am held firmly to the ship. Albert was torn loose because he was attached feebly, a poor job on the part of the one in charge of that department. I want no poor jobs done on me."

Kahinin said to no one, her eyes on her fingertips, "Albert must have struck a structure in such a way as to exactly fit it, electrically speaking. The chance of that happening was very low. Even so, I shall try to make use of an odd pattern on the ship and the suit in order to reduce the odds as far as I can manage."

Konev nodded. "I'll accept that," he said to Boranova. Then, to Morrison, "You say there is no heat transfer?"

Morrison said, "None that I could detect. Just size oscillation."

"Then I won't bother removing my garment."

Boranova said, "You understand, Yuri, that you won't stay out long. We cannot stretch the risk of deminiaturization indefinitely."

"I understand," said Konev and with Morrison's help he clambered into the suit.

71.

Morrison looked through the hull of the ship and watched Konev.

Twice it had been the other way around. He had been outside looking in. (And for a while, that second time, he had been nowhere looking nowhere.)

Morrison felt a little chagrined that Konev seemed so composed. Konev did not turn to look into the ship. He held Morrison's computer in his hands, following Morrison's hasty instructions on the elementary aspects of expanding and focusing. He seemed entirely intent on his job. Was he really that icily brave? Would he continue to concentrate even if he were ripped loose as Morrison had been? Probably -- and Morrison felt ashamed of himself.

He looked at the others on the ship.

Dezhnev remained at his controls. He had to stay near the membrane of the cell. He had suggested moving into the doldrums between the two streams. Nearly motionless as they would then be (probably turning in a slow eddy, actually), they would not risk the kind of accident that had torn Morrison loose. Konev had vetoed that at once. It was along the membrane that the skeptic waves moved and he wanted to be near them.

Dezhnev had also suggested turning the ship upside down. Up and down made no difference here in the cell, any more than it did in outer space. By turning upside down, the air lock would be on the side of the ship away from the membrane and that might keep Konev away from cytoskeletal structures.

That merely angered Konev. He pointed out that such structures might be anywhere in the cell and that, in any case, he did not want the bulk of the ship between himself and the membrane.

So he was out there, in just the way he wanted, and Dezhnev, paying close attention to his controls, whistled very softly to himself.

Boranova watched her instrument, looking up only occasionally to gaze thoughtfully at Konev. Kahinin was fidgety. It was the only word. Her eyes shifted toward Konev a hundred times and they shifted away as many times.

Boranova said suddenly, "Albert, it's your instrument. Do you think Yuri can work it? Do you think he's getting anything?"

Morrison smiled briefly. "I preset it for him. There isn't much further for him to do and I explained the focusing. Just the same, I know he isn't getting anything, Natalya."

"How can you know that?"

"If he were to sense something, I would overhear it -- or oversense it, perhaps I should say -- as he oversensed me when I was out in the stream. I sense nothing; absolutely nothing."

Boranova looked surprised. "But could that be? If he sensed something when you held it, why shouldn't he sense something when he holds it?"

"Perhaps conditions have changed. Consider that all this agony that Konev says he detected when he followed my machine's broadcast of Shapiro's thoughts to me. That was not characteristic of what we heard before."

"I know. It had been almost idyllic before. Green fields. Mathematical equations."

"Can it be, then, that the living part of Shapiro's brain, if it is capable of consciousness, has just recently recognized its comatose position, that it has done so in the last hour, perhaps --"

"Why should that have happened in the last hour? That's too much of a coincidence that it should do so now, just as we are in the brain."

"Perhaps we have stimulated the brain by actually being in it, and brought the realization about in consequence. Or, perhaps it is a coincidence. The funny thing about coincidences is that they do happen. -- And perhaps the realization that struck him with anguish not long ago has now caused him to sink into silent apathy."

Boranova looked uncertain. "I still can't believe that. Do you really think Yuri's not getting anything?"

"Nothing of any significance. I am quite certain."

"Perhaps I should call him in."

"I would if I were you, Natalya. He's been out nearly ten minutes. If he isn't getting anything, that's time enough."

"But what if he's getting something?"

"Then he'll refuse to come in. You know Konev."

Boranova said, "Tap on the hull of the ship, Albert. You're nearest his face."

Morrison did so and Konev looked in their direction. His face was blurred through the plastic headpiece but he wore an unmistakable frown. Boranova gestured for him to come in.

Konev hesitated, then nodded, and Morrison said to Boranova, "There's your proof."

Konev was brought in and they could see his face was flushed. They unbuckled his helmet and he drew in a deep breath.

"Whew! That's good. It was getting a little warm out there. Since I was attached to the ship, the size oscillation was less than I expected and the heat transfer was perceptible. -- Help me get the rest of this plastic armor off."

Boranova said in a sudden small spasm of hope, "Is that why you were ready to come in? The heat?"

"That was certainly the chief reason."

"Did you sense anything, Yuri?"

And Konev scowled and said, "No. Not a thing. Nothing."

Morrison lifted his head. A muscle in his right cheek twitched briefly, but he did not smile.

72.

"Well, Natasha, little captain," said Dezhnev with an air of faded bonhomie. "What do we do next? Any ideas?"

He received no answer, In fact, no one seemed to notice that he had spoken.

Konev was still mopping away at his chest and at the back of his neck. His look at Morrison had no bonhomie in it at all. His dark eyes smoldered. "There was a great deal of transmission out there when you were outside the ship."

"If you say so," said Morrison coldly, "but I told you that I don't remember a thing about it."

"Maybe it does make a difference who holds the device."

"I don't believe that."

"Science is not a matter of belief, but of evidence. Why don't we see what happens when you go out holding your own device exactly as I did? We'll have you bound firmly so that you don't come loose again and you can stay out the same ten minutes I did. No more."

Morrison said, "I won't do it. That's already been tried."

"And I sensed Shapiro's thoughts -- even if you say you didn't."

"You did not sense his thoughts. You sensed only emotion. There were no words."

"Because you let go of the device. You admitted that yourself. Try it now, without letting go."

"No. It won't work."

"You were frightened because you were torn loose. This time you will not be torn loose, as I was not. You will not be frightened."

"You underestimate my capacity for terror, Yuri," said Morrison, shrugging.

Konev looked disgusted. "Is this a time to joke?"

"I'm not joking. I'm easily terrified. I lack your -- whatever.

"Courage?"

"All right. If you want an admission I lack courage, I'll admit it."

Konev turned to look at Boranova. "Natalya. You are the captain. Direct Albert to try once more."

"I don't think I can direct him under these conditions," said Boranova. "As he himself has said, what good will it do if we combine our strength, force him into the suit, and shove him out? If he is incapable of doing anything, we'll get nothing out of it. However, I can ask him. -- Albert."

"Save your breath," said Morrison wearily.

"Once more. Not more than three minutes by the clock unless you get a transmission."

"We won't. I'm convinced we won't."

"Then only three minutes to prove the point."

Morrison said, "To what end, Natalya? If I get nothing, Yuri will say I am deliberately misadjusting my computer. If there is no trust between us, we will accomplish nothing in any case. How would it be, for instance, if I displayed Konev's conviction that to disagree is to lie? I say I sensed nothing of either Shapirov's thoughts or emotions when I was alone in the intracellular stream. Konev said he sensed a great deal. Who else did? Did you, Natalya?"

"No. I sensed nothing."

"Sophia?"

Kahinin shook her head.

"Arkady?"

Dezhnev said in an aggrieved tone, "I do not seem to be able to sense very much."

Morrison said, "Well, then, Yuri stands alone. How are we to know he really sensed anything? I shall not be as unkind as he is. I shall not accuse him of lying -- but isn't it possible that his wild desire to sense something caused him to imagine he had?"

Konev's face was white with anger, but his voice, except for a slight tremor, was cool enough. "Forget all that. We have spent hours in this body and I'm asking for one last observation, one last experiment, that may justify all that has gone before."

"No," said Morrison. "Last pays all. I've heard that before."

Boranova said, "Albert, this time there will be no mistake. One last experiment."

Dezhnev said, "It would have to be a last experiment. Our power supply is lower than I would like it to be. Finding you was costly, Albert."

"Yet we did find you," said Konev, "and without counting the cost. I found you." He suddenly smiled tightly and fiercely. "And I wouldn't have found you if I did not detect

the transmissions emanating from your device. It would have been impossible. There's the proof that what I sensed was not imaginary. And since I found you, pay me back."

Morrison's nostrils flared. "You came after me because my explosion would have killed you all in a matter of minutes, perhaps. What payment do you expect for your anxiety to save your own li-"

The ship rocked violently without warning. It swayed heavily and Konev, who had been standing, tottered and caught at the back of his seat.

"What was it?" called out Boranova, clutching with one hand at her own control device.

Kahinin bent over her computer. "I caught a glimpse, but you can't tell in this light. It may have been a ribosome."

"A ribosome," repeated Morrison in astonishment.

"Why not? They're scattered all over the cell. They're the protein-manufacturing organelles."

"I know what they are," said Morrison indignantly.

"So it landed us a blow. Or rather, as we skimmed along, we landed it a blow. It doesn't matter which way you look at it; we just had a giant piece of Brownian motion."

"Worse than that," said Dezhnev, pointing outward in horror. "We're not getting heat transfer, we're getting field oscillation."

Morrison, staring in despair, recognized the phenomenon he had seen when alone in the cell. The water molecules were expanding and contracting -- visibly so.

"Stop it! Stop it!" shouted Konev.

"I'm trying to," said Boranova through tight lips. "Arkady, shut off the jets and make all the power available to me. -- Shut off the air-conditioning, lights, everything!"

Boranova bent over the tiny glow that marked her battery-powered computer.

Morrison could see nothing except for the light from Boranova's computer and, in the seat next to him, Kahinin's. He could not see, in the otherwise total darkness of a cell buried in the interior of a brain, the water molecules swelling and subsiding.

There was no uncertainty about it, however. He could feel the jarring in the pit of his stomach. It was not the water molecules that were oscillating, after all. It was the miniaturization field that was -- and the objects that were buried in it -- and he himself.

Each time the ship expanded (and the water molecules seemed to contract), the field converted some of its energy to heat and he could feel the flush that swept over him. Then, as Boranova forced energy into the field, squeezing it into contraction, the heat vanished. For a while, he could feel the oscillations slow and subside.

But then they began to grow wilder and he knew that Boranova was failing. She could not fend off the spontaneous deminiaturization that was on the way and, in ten seconds, he knew he would be dead. He -- and all of them, and the body in which they were buried -- would be an exploding puff of water vapor and carbon dioxide.

He felt dizzy. He was going to faint and, in his pusillanimous way, he would thus anticipate death by a second and his last recognizable emotion would be one of intense shame.

73.

The seconds passed and Morrison didn't faint. He stirred a little. He should be dead by now, shouldn't he? (It was inevitable that the next thought should come: Can there be an afterlife after all? -- He dismissed the possibility quickly.)

He was aware of someone sobbing. No! It was harsh breathing.

He opened his eyes (he hadn't realized they were closed) and found himself staring at Kahinin in the dim light. Since all the energy available was being pumped into the effort to keep the ship from deminiaturizing, he saw her only by the glow of her own computer. He could make out her head bent over it, her hair in disarray and her breath whistling sharply through her parted lips.

He looked around in a sudden renewal of hope and thought and life. The ship's oscillations seemed less extreme. They were settling downward into a kind of peace even as he watched.

And then cautiously, Kahinin stopped and looked up sidewise at him, her face twitching into a painful smile. "It is done," she said in a hoarse whisper.

The light within the ship brightened slowly, almost tentatively, and Dezhnev uttered a huge shuddering sigh. "If I am not dead now," he said, "I hope to live yet a little while. As my father once said: 'Life would be unbearable if death were not worse yet.' -- Thank you, Natasha. You may be my captain forever."

"Not I," said Boranova, her face looking very old -- to the point where Morrison would not have been surprised to see white streaks in her black hair. "I simply couldn't pump enough energy into the ship. Was it something you did, Sophia?"

Kahinin's eyes were closed now, but her breasts were still heaving. She stirred a little, as though reluctant to answer, reluctant to do anything but savor life for a time. Then she said, "I don't know. Maybe."

Boranova said, "What did you do?"

Kahinin said, "I couldn't just wait for death. I made the ship the electric duplicate of a D-glucose molecule and hoped the cell would do the normal thing and interact with a molecule of ATP -- adenosine triphosphate. In doing so, it gained a phosphate group and energy. The energy, I hoped, would go into reinforcing the miniaturization field. I then neutralized the ship and the phosphate group fell off. D-glucose again, another gain in energy, then neutral, and so on, over and over." She stopped to pant a bit. "Over and over. My fingers were working so fast, I didn't know if I were hitting the right keys or not -- but I must have. And the ship gained enough energy to stabilize the field."

Boranova said, "How did you come to do that? No one has ever suggested in my hearing that this might --"

"Nor in mine," said Kahinin. "Nor in mine. I was just wondering this morning before we got on the ship what I would do -- or what anyone could do -- if spontaneous deminiaturization began. We'd need energy, but if the ship couldn't pump up enough -- I thought, Could the cell itself supply the energy? If it did, it would only be through ATP, which every cell has. I didn't know if it would work. I had to spend energy, forcing the electrical pattern on and off the ship, and I knew I might spend more than I got from ATP. Or the energy of the ATP might simply not affect the ship in such a way as to counter the deminiaturization. It was all such a gamble."

Dezhnev said -- softly, almost as though to himself, "As my old father would say: 'If you have nothing to lose, gamble freely.'" Then, briskly, he said, "Thank you, little Sophia. My life is yours from now on. I will give it to you at your need. I will go farther. I will even marry you if that would strike you as convenient."

"A chivalrous offer," said Kahinin, smiling faintly, "but I wouldn't ask marriage of you. Your mere life -- at need -- would be quite enough."

Boranova was entirely herself now and she said, "This will be cited in detail in the final report. Your quick thinking and your quick action saved everything."

Morrison couldn't trust himself to make any speech at all. (Unaccountably, he felt near tears. -- In gratitude for life? In admiration for Kahinin?) All he could do was reach for Kahinin's hand, put it to his lips, and kiss it. Then, after clearing his throat vigorously, he said with extraordinary mildness, "Thank you, Sophia."

She looked embarrassed, but did not draw her hand away immediately. She said, "It might not have worked. I didn't think it would work."

"Had it not," said Dezhnev, "we would be no deader."

Through all this, only Yuri Konev had not said a word and Morrison turned to look at him. He sat as he usually sat, very upright and very much turned away from them.

Morrison, finding his voice suddenly -- and his anger -- said, "Well, Yuri, what have you to say?"

Konev looked over his shoulder briefly and said, "Nothing."

"Nothing? Sophia saved the expedition."

Konev shrugged, "She did her job."

"Her job? She did much more than her job." Morrison leaned forward and reached wildly for Konev, grabbing his shoulder. "She invented the technique that saved us. And in doing so, she saved your life, you idiot. She's the reason you're still alive. You can at least thank her."

"I'll do as I please," said Konev, twitching his shoulder and then writhing out of Morrison's grasp.

Morrison's hands found their way around Konev's throat. "You miserable, egotistical barbarian," he grunted out, squeezing desperately. "You love her in your own insane way and you won't give her a kind word. Not one kind word, you piece of dirt."

Again Konev pulled himself loose and then the two were pummeling each other clumsily. They were half-trapped by the seats from which they had partly risen and neither could maneuver properly under zero-gravity conditions.

Kahinin screamed, "Don't hurt him!"

He won't hurt me, thought Morrison, striving mightily. He had not been engaged in this kind of physical combat since he was sixteen and, he thought in embarrassment, he wasn't doing any better now.

Boranova's voice rang out sharply. "Stop it. Both of you."

And they did. Both of them.

Boranova said, "Albert, you are not here to teach anyone manners. And Yuri, you need not labor to be a boor, it comes natural to you. If you do not wish to acknowledge Sophia's --"

Sophia said with an obvious effort, "I'm not asking for thanks -- from anyone."

"Thanks?" said Konev angrily. "Let us all say thanks. Before the deminiaturization started, I was trying to get this American coward to thank us for rescuing him. I didn't want thanks in words. This isn't a dance floor. We needn't bow and curtsy. I wanted him to show his thanks by getting out there and trying to sense some of Shapirov's thoughts. He refused. Who is he to teach me how and when to say thanks?"

Morrison said, "I said before the deminiaturization that I wouldn't do it and I repeat that now."

Dezhnev interrupted and said, "We beat a dead horse here. We have consumed our energy supply as though it were vodka at a wedding. Between pursuits and deminiaturizations, we have very little to spare for the task of deminiaturizing under controlled conditions. We must get out now."

Konev said, "It would take very little energy to have this man go out for a couple of minutes and come in again. Then we can leave."

For a moment, Konev and Morrison stared at each other hostilely and then Dezhnev said in a voice that seemed drained of some of its life, "My poor old father used to say: 'The most frightening phrase in the Russian language is "That's odd."'"

Konev turned angrily and said, "Shut up, Arkady."

Dezhnev replied, "I mentioned that only because it is now time for me to say it: That's odd."

74.

Boranova pushed her dark hair back from her forehead (a bit wearily, Morrison thought, and noted the hair itself was clearly damp with perspiration). She said, "What is odd, Arkady? Let us not play games."

"The current flow of the cellular material is slowing."

There was a brief silence, then Boranova said, "How can you tell?"

Dezhnev said heavily, "Natasha, dear, if you sat in my seat you would know that there are fibers criss-crossing the cell --"

"The cytoskeleton," put in Morrison.

"Thank you, Albert, my child," said Dezhnev with a grand wave of his hand. "My father used to say: 'It is more important to know the thing than the name.' Still, never mind. The whatever - you - call - it doesn't stop the cell flow and it doesn't stop the ship, but I can see it glint past. Well, it's glinting past more slowly now. I assume the fibers don't move, so I take it we're slowing. And since I'm not doing anything to slow the ship, I assume that it is the intracellular flow that is really slowing. -- This is called logic, Albert, so you don't have to educate me on that point."

Kahinin said in a small voice, "I think we have damaged the cell." She sounded conscience-stricken.

Morrison took it so and said, "One brain cell gone, more or less, won't hurt Shapirov in any way, especially in the condition he's in. I wouldn't be surprised if the cell were gone, though. After all, the ship came after me in a furious race, I imagine -- and I thank you all again for that -- and it probably vibrated itself nearly to death and must have vibrated the entire cell as well."

Konev said, frowning darkly, "That's mad. We're molecule-sized -- and a small molecule at that. Do you suppose anything we can do, whether moving or jiggling, is going to damage an entire cell?"

Morrison said, "We don't have to reason it out, Yuri. It's an observed fact. The intracellular stream is stopping and that isn't normal."

"In the first place, that's just Arkady's impression," said Konev, "and he's no neurologist --"

"Do I have to be a neurologist to have eyes?" demanded Dezhnev hotly, one arm raised as though to strike at the younger man.

Konev cast a brief glance at Dezhnev, but made no other acknowledgment of his remark. He said, "And besides, we don't know what is normal in a living brain cell from this level of observation. There may be calms and eddies in the flow, so that even if something like this is observed, it might be only temporary."

"You're whistling past the graveyard, Yuri," said Morrison. "The fact is, we can't use this cell any more and we don't have sufficient remaining energy to wander around searching for another cell."

Konev ground his teeth. "There must be something we can do. We can't give up."

Morrison said, "Natalya, make the decision. Is there any point in investigating this cell any further? And are we in a position to seek out another cell?"

Boranova raised her hand and bowed her head in a moment of thought. The others turned to look at her and Konev seized the opportunity to grasp Morrison by the upper arm and pull him closer. His eyes were dark with hostility. He whispered, "How is it you think I am in love with --" he jerked his head in Kahinin's direction. "What gives you the right to think so? Tell me that."

Morrison looked at him blankly.

At this point, Boranova spoke, but it was not to answer Morrison's question. She said mildly, "Arkady, what is it you are doing?"

Dezhnev, who was bent over his controls, lifted his head. "I am rearranging the wiring back to what it was. I am hooking up communications again."

Boranova said, "Have I told you to do that?"

Dezhnev said, "Necessity has told me to do that."

Konev said, "Does it occur to you it will be impossible to steer?"

Dezhnev growled and said in sullen irony, "And does it occur to you that there may be no more steering to do?"

"What is the necessity that drives you, Arkady?" said Boranova patiently.

Dezhnev said, "I don't think it's this cell alone that is out of order. The temperature around us is going down. -- Slowly."

Konev sneered. "By your measurements?"

"No. By the ship's measurements. By the background infrared radiation we're getting."

"You can't tell anything by that," said Konev. "At our size, we get very few infrared photons. The level would vary all over the lot."

Dezhnev nodded at Konev and said, "Like this." His hand waved up and down frenetically. "Still, it can wave up and down like a rowboat in a typhoon and yet do so at a lower and lower average level." And his hand sank ever lower as it continued its trembling.

Boranova said, "Why should the temperature be dropping?"

Morrison smiled grimly. "Come on, Natalya. I think you know why. I know that Yuri knows why. Arkady must find out and for that reason necessity is forcing him to put back communications."

An uncomfortable silence fell, except for Dezhnev's occasional grunts and muttered expletives as he struggled with the ship's wiring.

Morrison gazed out at the surroundings, which he could once again see in the usual unsatisfactory fashion now that ship's lighting had been restored. There were the usual dim glitter of molecules, large and small, that traveled with them. Now that Dezhnev had mentioned it, he saw the occasional reflection of light from a line that stretched across the path before them and then moved over (or under) and behind at express speed.

These were, undoubtedly, very thin collagen fibers that preserved the shape of the irregular neuron and kept it from converting itself into a roughly spherical blob under the pull of its own surface tension. Had he been watching for it, he would have noticed it before. It occurred to him that Dezhnev, as navigator, had to watch for everything and, in the entirely unprecedented situation in which the ship found itself, Dezhnev had had no guide, no instruction, no experience to let him know what to watch for. There was no question but that Dezhnev's task had placed him under greater tension than the others had allowed for.

Certainly, to Morrison himself, Dezhnev had been taken for granted as the least of the five. Not fair, Morrison thought now.

Dezhnev had straightened up now. He had an earphone in one ear canal and said, "I should be able to establish communication." He said, "Are you there? Grotto. -- Grotto."

Then he smiled. "Yes. We are, to this point, safe. -- I'm sorry, but as I told you, it was either communicate or steer. -- How is it at your end? -- What? Repeat that, more slowly. -- Yes, I thought so."

He turned to the others. "Comrades," he said, "Academician Pyotr Leonovich Shapirov is dead. Thirteen minutes ago, all vital signs ceased and our task now is to leave the body."

17. EXIT

If trouble were as easy to get out of as into -- life would be one sweet song.

Dezhnev Senior

75.

A gray silence fell over the ship.

Kahinin buried her face in her hands and then, after a long moment, broke the silence by whispering, "Are you sure, Arkady?"

And Dezhnev, blinking hard to hold back tears, said, "Am I sure? The man has been on the brink of death for weeks. The cellular flow is slowing, the temperature is falling, and the Grotto, which has him wired with every instrument ever invented, says he is dead. What is there to be but sure?"

Boranova sighed. "Poor Shapiro. He deserved a better death."

Konev said, "He might have held out another hour."

Boranova said with a frown, "He did not pick and choose, Yuri."

Morrison felt chilled. Until now he had been conscious of some surrounding red corpuscles, of a specific speck of intercellular region, of the interior of a neuron. His environment had been circumscribed to the immediate.

Now he looked out of the ship, through its transparent plastic walls, at what appeared to him, for the first time, to be thickness upon thickness of matter. On their present scale, with the ship the size of a glucose molecule and himself not much more than the size of an atom, the body of Shapiro was larger than the planet Earth.

Here he was, then, buried in a planetary object of dead organic matter. He felt impatience over the pause for mourning. Time for that later, but meanwhile -- He said in a voice that was perhaps a little louder than it ought to have been, "How do we get out?"

Boranova looked at him in surprise, eyes widening. (Morrison was certain that in her grief for Shapiro the thought of leaving had been momentarily buried.)

She cleared her throat and made a visible effort to be her usual businesslike self. She said, "We must deminiaturize to some extent, to begin with."

Morrison said, "Why only to begin with? Why not deminiaturize all the way to normality right now?" Then, as though to forestall the inevitable objection, "We will inflict damage on Shapiro's body, but it is a dead body and we are still alive. Our needs come first."

Kahinin looked at Morrison reproachfully. "Even a dead body deserves respect, Albert, especially the dead body of a great scientist like Academician Pyotr Shapiro."

"Yes, but surely not to the intent of risking five lives." Morrison's impatience was growing. Shapirov was only someone he had known by distant reputation and peripherally -- to Morrison he was not the demigod he seemed to be to the others.

Dezhnev said, "Aside from the question of respect, we are enclosed by Shapirov's cranium. If we expand to fill that cranium and then try to crumble the cranium by the effect of our miniaturization field, we will lose too much energy and deminiaturize explosively. We must first find our way out of the cranium."

Boranova said, "Albert is right. Let's begin. I will deminiaturize to cell size. Arkady, have the people in the Grotto determine our exact position. Yuri, make sure you locate that position accurately on your cerebrograph."

Morrison stared out the hull at the distant cell membrane -- a brighter and more continuous sparkle, one that was visible through the occasional flicker of light from the intervening molecules.

The first indication of deminiaturization was the fact that the molecules -- subsided. (It was the only word Morrison could think of to describe what happened.)

It was as though the little curved swellings that filled the space around them -- and which Morrison's brain constructed out of twinklings rather than saw directly -- shrank. It was for all the world as though they were balloons with the air being let out of them until the surroundings seemed relatively smooth.

But even as the liquid around them grew smooth, the large macromolecules in the distance -- the proteins, the nucleic acids, the still larger cellular structures -- also shrank and, in doing so, grew more distinct. The sparks of light they reflected were more closely spaced.

The cell membrane itself seemed to be approaching and it, too, could be seen more clearly. It came closer still and yet closer. The ship was, after all, in a narrow dendrite that projected from the cell body itself and if the ship was going to enlarge to the size of a cell, it would have to grow much larger than this mere projection.

It was clear that the membrane was going to collide with the ship and Morrison automatically clenched his teeth and steeled himself for the shock of impact.

There was none. The membrane came closer and closer and then simply separated and was not there. It was too thin a structure and too lightly bound to withstand the consequences of being forced into a miniaturization field. Though the ship was deminiaturizing to an extent, it was still far, far smaller than the normal world around it and the molecules of the membrane, on entering the field and shrinking, lost contact with each other so that the integrity of the whole vanished.

Morrison watched everything after that with fascination. The surroundings seemed chaotic until, as objects continued to shrink, he began to recognize the intercellular jungle of collagen that they had encountered before entering the neuron. That jungle continued to shrink, in its turn, until the collagen trunks and cables became nothing more than twine.

Boranova said, "And that is all. We will want to be able to fit within a small vein."

Dezhnev grunted. "That is all under any circumstances. Our remaining energy supply is not great."

Boranova said, "It will last until we find our way out of the cranium, surely."

Dezhnev said, "We can hope so. However, you're only the captain of the ship, Natasha; you are not the captain of the laws of thermodynamics."

Boranova shook her head as though in reproof and said, "Arkady, have them determine our position -- and don't lecture me."

Konev said, "I'm certain, Natalya, that it is not terribly important to determine our position. It cannot be measurably different from what it was when we left the capillary. All our wanderings since have merely taken us to a nearby neuron and from that to a neighboring neuron. The difference in position on even an ordinary microscopic scale is scarcely measurable."

And then, after a wait of several minutes, the position came through and Konev said, "As I told you."

Morrison said, "What's the good of the position, Yuri? We don't know which way we're headed and we can only go in whatever direction that might be. Now that communications are restored, we can't steer."

Konev said, "Well, then, since there is only one way in which we can head, we will head in that direction. I'm sure that Arkady's father had a saying concerning that."

Dezhnev said at once, "He used to say: 'When only one course of action is possible, there is no difficulty in deciding what to do.'"

"You see?" said Konev. "And we will find that whatever direction we go in, we will find a way out. Move ahead, Arkady."

The ship moved forward, ploughing through the now fragile threads of collagen, splashing through a neuron, and cutting across a thin axon. (It was hard to believe they were recently inside one of those axons and that it had seemed like a highway a hundred kilometers across.)

Morrison said dryly, "Suppose that Shapirov was still alive when it became necessary for us to leave his body. What would we have done?"

"What do you mean?" said Boranova.

"I mean, what alternative is there to this? Would we not have had to determine our position? And to do that, would we not have had to establish communications? And once that was done, would we not have been able to move in only one direction -- forward? Would we not have had to deminiaturize in order not to have to travel the equivalent of tens of thousands of kilometers, but merely the equivalent of a few kilometers? In short, in order to get out, would we not have had to push our way through the living neurons of a living Shapirov, as we are now pushing our way through dying and dead ones?"

Boranova said, "Well -- yes."

"Where, then, is the respect for a living body? After all, we actually hesitated to violate the integrity of a dead one."

"You must understand, Albert, that this is an emergency operation with an inadequate ship. We have no choice. And, in any case, it is not like your suggestion that

we deminiaturize completely in the brain, smashing the cranium and leaving Shapirov headless. Our present course, even if Shapirov was alive, would destroy a dozen neurons - or possibly a hundred -- and that would not have been likely to make Shapirov's condition appreciably worse. Brain neurons are continually dying throughout life -- like red corpuscles."

"Not quite," said Morrison grimly. "Red corpuscles are continually replaced. Neurons never are."

Konev interrupted, his voice rather loud, as though he were impatiently overriding the idle talk of others. "Arkady, stop. We need another position determination."

There was at once a dead silence within the ship, one that continued -- as though any speech might interfere with the measurements being made in the Grotto or might hamper the concentration of those making the measurement.

Finally Dezhnev whispered the measurements to Konev, who said, "Confirm them, Arkady. Make sure you have them right."

Morrison unclasped himself. He was still virtually without mass, but there was distinctly more of it than there had been when they were maneuvering within the cell. He pulled himself cautiously upward, so that he could see the cerebrograph over Konev's shoulder.

There were two red spots on it, with a thin red line connecting them. The map displayed on the screen condensed a bit, the two dots shrinking toward each other, and then it expanded again in a different orientation.

Konev's fingers worked busily over the computer keys and the map grew double and uninterpretable. Morrison knew, however, that Konev could view it through a device that would render it stereoscopic, displaying a third dimension.

Konev laid down that device and said, "Natalya, this time chance is on our side. Wherever we are and in whatever direction we were traveling, we'd be bound to encounter a small vein sooner or later. In this case, it is sooner. We are not far away and we will strike it in such a way that we will be able to enter."

Morrison heaved an internal sigh of relief, but could not help saying, "And what would you have done if chance had dictated a vein very far away?"

Konev said coolly, "Then I would have had Dezhnev break communications again and steer to a closer one."

Dezhnev, however, turned to stare at Morrison, made a grimace of disagreement, and mouthed the words, "Not enough energy."

"Move forward, Arkady," said Boranova peremptorily, "and get to the vein."

After a few minutes, Dezhnev said, "Yuri's map is right, which I wouldn't have bet on with any enthusiasm. That's it ahead."

Morrison found himself staring at a curving wall reaching into the indefinite haze upward and downward and with just a faint suggestion of tiling to it. If it was a vein, it was as yet not very far removed from a capillary. Morrison wondered uneasily if the ship would be able to fit inside it.

76.

Boranova said, "Is there any way, Sophia, that you can give the ship an electric charge pattern that will slip us into the vein?"

Kahinin looked doubtful and Morrison, holding up his hand, said, "I don't think so, Natalya. The individual cells may not be entirely dead even now, but certainly the organization within them has been destroyed. I don't think any cell in the body can take us in by pinocytosis or by any other means.

"What do I do, then?" said Dezhnev unhappily, "Force my way in?"

"Of course," said Konev. "Lean against the vein wall. A small bit of it will then miniaturize and disintegrate and you can move in. You won't have to use your motors much."

"Ah," said Dezhnev, "the expert speaks. The vein will miniaturize and disintegrate at the expense of our field and that would take energy, too -- more energy than forcing our way in would."

"Arkady," said Boranova, "don't be angry. This is not the time for it. Use your motors moderately and take advantage of the first weakening of the vein wall through miniaturization to burst through. Using both techniques will consume less energy than either separately."

"We can hope so," said Dezhnev, "but saying so doesn't make it so. When I was little, my father said to me once: 'Vehemence, my little son, is no guarantee of truth.' He told me this when I swore with great earnestness that I had not broken his pipe. He asked me if I understood the statement. I said I didn't and he explained it to me very carefully. Then he walloped me."

"Yes, Arkady," said Boranova, "but move in now."

Konev said, "It's not as though you're going to flood the brain with blood. It wouldn't matter now that Shapiro is dead, but, as it happens, the blood isn't flowing now. Virtually nothing will leak."

"Ah," said Dezhnev, "this raises an interesting point. Ordinarily, once we enter a vein, the blood flow would carry us in a particular direction. Without blood flow, I must use my engines -- but in which direction must we go?"

"Once we penetrate at this point," said Konev calmly, "you will turn to the right. So my cerebrograph says."

"But if there is no current to turn me to the right and if I enter at an angle to the left?"

"Arkady, you will enter at an angle to the right. My cerebrograph tells me that, too. Just push in, will you?"

"Go ahead, Arkady," said Boranova. "We have no choice but to rely on Yuri's cerebrograph."

The ship moved forward and, as the prow touched the vein wall, Morrison could feel the slight vibration of the laboring motors. And then the wall simply gave and pulled away in all directions and the ship was inside.

Dezhnev stopped the motors at once. The ship moved in at a rapidly slowing pace, rebounded off the far wall (maintaining contact so briefly as to cause no damage that Morrison could see), and straightened out with the long axis of the ship along the enormous tunnel of the vein. The ship's width was better than half the width of the blood vessel.

"Well," said Dezhnev, "are we pointed in the right direction? If we're not, there's nothing to be done. I can't back up. We fit the vein too tightly for Albert to get out and turn us around and we have an insufficient remaining supply of energy to miniaturize further and make such a turn possible."

"You're pointed in the right direction," said Konev sternly. "Just get moving and you'll find out soon enough. The vessel will get larger as we move."

"Let's hope it does. -- And if it does, how far do we have to travel before we can move out of the body?"

"I can't say yet," said Konev. "I have to follow the vein on my cerebrograph, consult with the people in the Grotto, and arrange for the insertion of a hypodermic needle into the vein as close as possible to the position in which we'll be when we emerge from within the cranium."

Dezhnev said, "May I explain that we cannot move on forever. What with miniaturizing and deminiaturizing, with steering at very low efficiency, with wrong capillaries, and with chasing after Albert when he was lost, we have used up much more energy than we had counted on using. We had much more energy than we thought we'd need, but, even so, we've almost used it all."

Boranova said, "Do you mean we're out of energy?"

"Just about. Haven't I been telling you this for quite a while?" said Dezhnev. "Haven't I been warning you we were running low?"

"But how low are we? Are you saying we don't have enough to carry us out of the cranium?"

"Ordinarily, we would have plenty for that, even now. If we were in a living vein, we could count on a blood current sweeping us along. But there is no current. Shapiro is dead and his heart isn't beating. That means I'll have to force my way through the bloodstream with my motors going and the cooler the stream gets, the more viscous it will become, the harder the motors will have to work, and the more rapidly the energy supply will run out."

Konev said, "We have only a few centimeters to go."

Dezhnev said furiously, "Only a few? Less than the width of my palm? Really? At our present size, we've got kilometers to go."

Morrison said, "Should we deminiaturize further, then?"

"We can't." Dezhnev was now speaking very loudly. "We don't have the energy for it. Uncontrolled deminiaturization takes no energy; it releases energy. But controlled deminiaturization -- Look, Albert, if you jump out of a high window, you will reach the ground without effort. But if you want to survive the ordeal and if you want to be lowered slowly while you hang on to a rope, that takes a great deal of effort. Understand?"

Morrison muttered, "I understand."

Kahinin's hand stole to his and squeezed it gently. She said in a low voice, "Don't mind Dezhnev. He grumbles and howls, but he'll get us there."

Boranova said, "Arkady, if vehemence doesn't guarantee truth, as you told us just now, neither does it guarantee a cool head and a solution. Rather, the reverse. So why don't you just push your way along the vein and perhaps the energy will last until we reach the hypodermic."

Dezhnev scowled and said, "It's what I will do, but if you want me to keep a cool head, you must let me get rid of some heat."

The ship began to move and Morrison thought to himself: Every meter we go is a meter closer to the hypodermic needle.

It didn't make much sense as a comforting thought, since to fail to reach the needle by a small distance might be as fatal as to fail by a large distance. Yet it worked to slow the beat of his heart and it gave him a sense of accomplishment as he watched the wall slide rapidly backward.

The red corpuscles and platelets seemed far more numerous now than they had been in the arteries and capillaries on the way in. Then there had been a blood flow and there had been only the relatively few objects in their immediate neighborhood that had moved along the flow with them. Now the various formed bodies were largely motionless and the ship moved past what seemed countless numbers, squeezing them right and left and leaving them behind, bobbing, in their wake.

They even passed an occasional white cell, large and globular and quiescent. Now, though, they were totally unresponsive to the presence of a foreign object speeding by. In one case, the ship simply whipped through a white cell and left it sprawling behind.

Konev said, "We are going in the right direction. The vein is now distinctly wider than it was."

And so it was. Morrison had noticed that without managing to grasp the significance. He had been too intent on simply moving.

He felt a small surge of hope. To have been going in the wrong direction would have been total disaster. The vein would have narrowed and burst, leaving them adrift in gray matter with, perhaps, insufficient fuel to find and reach another vein.

Konev was taking down something that Dezhnev was repeating to him. He nodded and said, "Have them confirm those figures, Arkady. -- Good!"

He spent some time with his cerebrograph and then said, "Listen, they know the vein we're in and they will be inserting a hypodermic needle at a specific spot that I have marked off on the cerebrograph. We will reach it in half an hour or a little less. -- Can you keep going for half an hour, Arkady?"

"More likely a little less. If the heart was beating --"

"Yes, I know, but it isn't," said Konev. Then he said, "Natalya, may I have whatever records you have concerning what we have sensed of Shapirov's thought processes? I am going to send the raw data -- complete out to the Grotto."

Boranova said, "You mean in case we don't make it out."

"That's exactly what I mean. This material is what we went in for and there's no reason to have it perish with us if we can't get out."

"That's a proper attitude, Yuri," said Boranova.

"Provided," said Konev, his voice suddenly taking on a tinge of anger, "the data has any value at all." Briefly, he glared at Morrison.

Konev then bent toward Dezhnev and together the two began electronically transmitting the information they had collected, computer to computer, from tiny to large, from inside a vein to the outside world.

Kahinin was still holding Morrison's hand, perhaps as much for comfort to herself as to him, Morrison thought.

He said in a low voice, "What happens, Sophia, if we run out of energy before we reach the needle?"

She lifted her eyebrows briefly and said, "We'll just have to remain passively in place. The people in the Grotto will try to reach us wherever we are."

"We won't deminiaturize explosively as soon as the energy is gone, will we?"

"Oh no. Miniaturization is a metastable state. You remember we explained that. We'll stay as we are indefinitely. Eventually -- sometime -- this chance pseudo-Brownian motion of expanding and contracting will set up spontaneous deminiaturization, but that might not be for -- Who knows?"

"Years?"

"Possibly."

"That won't do us any good, of course," said Morrison. "We'll die of asphyxiation. Without energy, we won't be able to recycle our air supply."

"I said the people in the Grotto would try to reach us. Our computers will still be working and they can home in on us, cut to the vein and into it, and spot us electronically -- or even visually."

"How can they find one cell among fifty trillion?"

Kahinin patted his hand. "You are in a pessimistic mood, Albert. We're an easily recognizable cell -- and a broadcasting one."

"I think I would feel better if we find the hypodermic needle now and they don't have to look for us."

"So would I. I am merely pointing out that running out of energy and not finding the needle is not the ultimate end."

"And if we do find it?"

"Then we are drawn out and the Grotto's own energy sources will be applied to the task of deminiaturizing us."

"Can't they do it now?"

"We're too closely surrounded by masses of unminiaturized material and it would be too difficult to focus the deminiaturizing field with sufficient accuracy. Once we are out and visible to them, the conditions will be entirely different."

At this point, Dezhnev said, "Have we transmitted everything, Yuri?"

"Yes. Everything."

"Then it is my duty to tell you that I have only enough energy to continue moving this ship for five minutes. Perhaps less, but certainly not more."

77.

Morrison, Kahinin's hand still in his, squeezed convulsively and the young woman winced.

Morrison said, "I'm sorry, Sophia."

He released her hand and she rubbed it vigorously.

Boranova said, "Where are we, Yuri? Can we get to the needle?"

"I should say yes," said Konev. "Slow down, Arkady. Conserve what energy you have."

"No, believe me," said Dezhnev. "At the present speed, I am cutting through the blood with comparatively little turbulence, thanks to the streamlining and surface characteristics of the ship. If I slow down, there'll be more turbulence and energy waste."

Konev said, "But we don't want to overshoot the mark."

"We won't. Any time you want me to cut the motors, we begin to slow down at once because of the blood viscosity. As we slow down, the turbulence builds, we slow down faster, and in ten seconds we're motionless. If we had our normal mass and inertia, the rapid pace of slowing would plaster us all up against the front of the ship."

"Stop when I tell you, then."

Morrison had risen and was looking over Konev's shoulder again. The cerebrograph, he judged, must be at enormous expansion, perhaps at maximum. The thin red line that had marked the path of the ship by dead reckoning was now thick and was approaching a small green circle, which, Morrison surmised, must represent the position of the hypodermic needle.

But it was dead reckoning and it could be off a bit. Konev was alternating his gaze between the cerebrograph and the view up ahead of the ship.

"We should have aimed for an artery," Morrison said suddenly. "They're empty after death. We wouldn't have had to waste energy on viscosity and turbulence."

Konev said, "Useless idea. The ship cannot progress through air." He might have gone on, but at this point he stiffened and cried out, "Stop, Arkady! Stop!"

Dezhnev hit a knob hard with the heel of his hand. It moved inward and Morrison felt himself sway gently forward as the ship slowed and stopped almost at once.

Konev pointed. There was a large circle, glowing with an orange light. He said, "They're using fiber optic methods to make sure the tip glows. They said I wouldn't miss it."

"But we have missed it," said Morrison tightly, "We're looking at it, but we're not there. To get into it, we have to turn -- and that means that Dezhnev has to unhook communications again."

"No use," said Dezhnev. "I have enough power in my engines to have kept us going another forty-five seconds maybe, but I certainly do not have enough to start us moving from scratch. We are at this moment dead in the water and cannot move again."

"Well, then?" began Morrison with what was almost a wail.

"Well, then," said Konev, "there is another kind of motion that is possible. That hypodermic needle has intelligence at the other end. Arkady, tell them to push it in very slowly."

The orange circle expanded slowly, becoming slightly elliptical.

Morrison said, "It's going to miss us."

Konev made no reply to that, but leaned over toward Arkady to speak directly into the transmitter. The orange ellipse became, for a moment, more markedly elliptical, but this ceased after a bark from Konev. It became nearly circular after that. The needle was close now and was pointing at them.

And then there was sudden motion everywhere. The faint outlines of the red corpuscles and the occasional platelet, moved, and converged toward and through the circle. And the ship was moving, too.

Morrison looked up and around as the orange circle moved past them neatly on all sides, then slipped behind the ship, shrank rapidly, and disappeared.

Konev said with grim satisfaction, "They've sucked us in. From this point on, we sit quietly. They will handle everything."

78.

Now Morrison did his best to wash away thought, to close his mind. Either he would be brought back to the standard world, to normality, to reality, or he would die in a microblink and the rest of the Universe would go on without him -- as it would do, in any case, in twenty years, or thirty, or forty.

He shut his eyes firmly and tried to respond to nothing, not even to the beating of his heart. At one point he felt a light touch on his left hand. That would have to be Kahinin. He withdrew his hand -- not suddenly in rejection, but slowly, as though simply to say: "Not now."

At another point, he heard Boranova say, "Tell them, Arkady, to evacuate Section C, to put in strictly long-distance controls. If we go, there is no point in carrying anyone with us."

Morrison wondered if Section C were indeed evacuated. He would evacuate if he were ordered to or even if he were not ordered to, but there might be those lunatics who would be anxious to be on the spot when the first crew to explore a living body returned safely. -- So they could tell their grandchildren, he supposed.

What happened to such people, he wondered, if they ended up not having grandchildren -- if they died too young to see them -- if their children chose never to have children -- if the --

Dimly, he was aware that he was deliberately immersing himself in nonsense and trivia. One can't really think of nothing and especially not if one has spent a lifetime devoting one's self to thought, but one can think of something utterly unimportant. There are, after all, so many more possible thoughts that are unimportant rather than important, trivial rather than vital, nonsensical rather than sensible, that --

He might even have fallen asleep. Thinking about it afterward made him feel certain he had. He wouldn't have thought it would be possible to be so cold-blooded, but it wasn't cold blood; it was weanness, relief from tension, the feeling that someone else was making decisions, that he himself might be totally relaxed at last. And perhaps (although he didn't want to admit it), it had all been too much and he had simply passed out.

And again he felt a light touch on his left hand and this time it did not go away. He stirred and opened his eyes on something that looked like ordinary illumination. Too ordinary -- it hurt his eyes. He blinked rapidly and they watered.

Kahinin was looking down at him. "Wake up, Albert!"

He wiped at his eyes, began to make the natural interpretation of his surroundings, and said, "Are we back?"

"We are back. All is well. We are safe and we're waiting for you. You're nearest the door."

Morrison looked back at the open door and started to his feet, rising a few inches and sinking back. "I'm heavy. "

Kahinin said, "I know. I feel like an elephant myself. Just get up slowly. I'll help you."

"No no, that's all right." He fended her off. The room was crowded. His vision had cleared to the point where he could see the crowd, face upon face, looking toward him, smiling, watching. He did not want them -- Soviet citizens, all -- to see the sole American helped to his feet by a young Soviet woman.

Slowly, a little drunkenly but by himself, he rose to his feet, stepped sidewise to the door and very carefully let himself down to a small flight of stairs. Half a dozen pairs of arms reached out to help him, utterly disregarding his words: "It's all right. I don't need help."

Then he said sharply, "Wait!"

Before stepping to solid ground, he turned and looked past Kahinin, who was right behind him.

"What is it, Albert?" she asked.

He said, "I was just taking a last look at the ship because I don't intend ever to see it again -- not at a distance, not in films, not in any form of reproduction."

Then he was on normal ground again and the others followed. It was with relief that Morrison saw that every one of them was helped down.

There would then have been some sort of impromptu celebration, but it was Boranova who stepped forward, looking distinctly disheveled and much unlike her usual

calm, well-cared-for self -- all the more so since she was wearing the thin cotton coverall that did very little to hide the mature lines of her body.

"Fellow workers," she said, "I'm sure there will be appropriate ceremonies at some reasonable time to mark this fantastic voyage of ours, but please, we are in no condition to join you now. We must rest and recover from an arduous time and we beg your indulgence."

They were all led off to wild shouts and frantic waving and only Dezhnev had the presence of mind to take a glass offered to him that contained something that was either water or vodka and Morrison, for one, had no doubt as to which of the alternatives was, in fact, the case. The broad smile on Dezhnev's damp face as he sipped made it certain.

Morrison said to Kahinin, "How long were we on the ship?"

"I think it was over eleven hours," said Kahinin.

Morrison shook his head. "It seemed more like eleven years."

"I know," she said, smiling slightly, "but clocks lack imagination."

"One of Dezhnev Senior's aphorisms, Sophia?"

"No. One of my own."

"What I want," said Morrison, "is a chance at the bathroom, and a shower, and fresh clothes, and a good dinner, and a chance to shout and scream, and a good night's sleep. In that order, I think, especially with the bathroom coming first."

"You'll have it all," said Kahinin, "as will the rest of us."

And they did and the dinner seemed to Morrison to be particularly satisfactory. Throughout their stay on the ship, tension had managed to suppress his appetite, but such things are merely deferred and hunger was gnawing with a vengeance once Morrison felt truly safe, truly comfortable, truly clean, and truly clothed.

The main course at the dinner was a roast goose of enormous size which Dezhnev carved, saying, "Be abstemious, my friends, for as my father used to say: 'Eating too much kills more quickly than eating too little.'"

Having said this, he served himself a much larger helping than he served anyone else.

The one outsider present was a very blond tall man, who was introduced as the military commander of the Grotto, something which could be seen at once, since he was in full uniform with a spate of decorations. The others seemed extraordinarily polite to him and extraordinarily uncomfortable at the same time.

Throughout the meal, Morrison felt the tension returning. The commander looked at him often, with unsmiling gravity, but said nothing to him directly. Because of the commander's presence, he felt unable to ask the important question and then, finally, when he might have raised it after the commander's departure, he suddenly found himself too sleepy. He would not be able to argue it out properly if there were any complications.

And when he finally managed to tumble into bed, his last semiconscious thought was that there would be complications.

Breakfast was late and Morrison found that it was for two. Only Boranova joined him.

He was mildly disappointed, for he had looked forward to the presence of Sophia Kahinin, but when she failed to appear, he decided not to ask after her. There were other questions he would have to ask.

Boranova looked tired, as though she had not had enough sleep, but she looked happy, too. Or perhaps (Morrison thought) "happy" was too strong a word. Contented, rather.

She said, "I had a good talk with the commander last night and there was a two-way video call with Moscow. Carefully shielded. Comrade Rashchin himself spoke with me and was clearly pleased in the highest degree. He is not a demonstrative man but he told me that he had been in touch with events all yesterday and that, during the interval in which we were not in communication with the outside world, he had been unable to eat or to do anything but pace back and forth. That, perhaps, was an exaggeration. He even said he had wept with joy at hearing that we were all safe and that may be true. Undemonstrative men can be emotional when the dam breaks."

"It sounds good for you, Natalya."

"For the whole project. You understand that, according to the tentative schedule under which we had worked, we were not expected to launch a voyage into a living human body for at least five years. To have done so with a grossly inadequate ship and to have come out of it alive is viewed as a great triumph. Even the bureaucracy in Moscow understood the emergency under which we labored."

"I doubt that we really got what we were after."

"You mean Shapiro's thoughts? That was, of course, Yuri's dream. On the whole, it was fortunate that he talked us all into following that dream. We would never have attempted the voyage otherwise. Nor does the failure of the dream dim our feat. Had we failed to return alive, we can be sure that there would have been much criticism of our folly in attempting the matter. As it is, though, we are the first to have entered a living human body and to have returned alive -- a Soviet first that will stand forever in history. There will be no non-Soviet feat of the sort for years and our Soviet leadership is well-aware of that and very satisfied. We are assured of the money we will need for a considerable time, I imagine, provided we can come up with a spectacular feat now and then."

She smiled broadly at this and Morrison nodded and smiled politely with her. He cut away at the ham omelet he had requested and said, "Would it have been diplomatic to emphasize that an American was one of the crew? Was I mentioned at all?"

"Come, Albert, don't think so ill of us. Your feat in turning the ship by hand at the risk of your life was mentioned with emphasis."

"And Shapiro's death? That will not be blamed on us, I hope?"

"The death is understood to have been unavoidable. It is well-known that he was kept alive as long as he was by advanced medical methods only. I doubt that it will be mentioned to any great extent in the records."

"In any case," said Morrison, "the nightmare is over."

"The nightmare? Come, give yourself a month or two and it will seem an exciting episode that you'll be glad you experienced."

"I doubt it."

"You'll see. If you live to witness other such voyages, you'll be delighted to say, 'Ah, but I was on the very first,' and you'll never tire of telling the story to your grandchildren."

That's the opening, thought Morrison. Aloud, he said, "I see you assume that I will see my grandchildren someday. What happens to me once we're finished with breakfast, Natalya?"

"It will be out of the Grotto for you and back to the hotel."

"No no, Natalya. I want more than that. What follows that? I warn you that if the miniaturization project is going to go public and if there's a parade in Red Square, I don't intend to be part of it."

"Parades are out of the question, Albert. We're a long way from going public, although we're closer to it by far than we were the day before yesterday."

"Let me put it baldly then. I want to go back to the United States. Now."

"As soon as possible, certainly. I imagine there will be pressure from your government."

"I should hope so," said Morrison dryly.

"They would not have been willing to have you back before you had a chance to help us or" -- her eyes looked into his rather sternly -- "from their point of view, spied on us. But now that you have done your part -- and I'm sure they will be aware of that somehow -- they will demand you back."

"And you must send me back. You promised that over and over."

"We will keep our promise."

"Nor need you think I have spied on you, I have seen nothing you have not let me see."

"I know that. Yet, when you return to your own country, do you imagine that you will not be questioned exhaustively on what you have seen?"

Morrison shrugged. "That was the consequence you must have accepted when you brought me here."

"True and we won't let it keep us from returning you. It is quite certain you won't be able to tell your people anything they don't already know. They poke their noses into our affairs carefully and skillfully --"

"As your people poke their noses into ours --" said Morrison with some indignation.

"Undoubtedly," said Boranova with a negligent wave of her hand. "Of course, you will be able to tell them of our success, but we don't really object to their knowing. To this

day, Americans insist on believing that Soviet science and technology is second-class. It will do us good to teach them a lesson in this. One thing, though --"

"Ah," said Morrison.

"Not a large thing, but a lie. You must not say we brought you here by force. In any public mention of this matter, you must state -- if the question arises -- that you came here voluntarily, in order to test your theories under conditions not available to you elsewhere in the world. It is a totally likely thing. Who would disbelieve you?"

"My government knows otherwise."

"Yes, but they will themselves urge you to tell the lie. They are as little eager as we are to plunge the world into a crisis over this. Aside from the fact that crises between the United States and the Soviet Union would instantly antagonize the rest of the world against both of us in these so-called good new days, the United States will no more wish to admit they had let you be taken than we would to admit we had taken you. Come, Albert, it is a small thing."

Morrison sighed. "If you return me now, as you say you will do, I will keep quiet about this small matter of kidnapping."

"You use the conditional. You say 'if.'" Boranova was grim. "You clearly find it troublesome to believe me to be a person of honor. Why? Because I am a Soviet. Two generations of peace, two generations of getting along, and your old habits persist. Is there to be no hope for humanity?"

"Good new days or not, we still don't like your system of government."

"Who gives you the right to judge us? We don't like yours, either. -- But never mind. If we begin to quarrel, that will spoil what should be a happy day for you -- and what is a happy day for me."

"Very well. We will not quarrel."

"Then let us say good-bye now, Albert, and someday we will meet again under more normal circumstances I am sure." She held out her hand to him and he took it. She went on, "I have asked Sophia to escort you back to the hotel and to make the arrangements for your leaving. You will not object to that, I'm sure."

Morrison pressed her hand strongly. "No. I rather like Sophia."

Boranova smiled. "I had sensed that somehow."

80.

It was a happy day for Boranova and her exhaustion did not prevent her from enjoying it.

Exhaustion! How many days of rest, how many nights of sleep, how long a stretch at home with Nikolai and Aleksandr would it take to cure that?

But she was alone now and for a period of time there would be nothing to do. Seize the moment!

Boranova stretched out luxuriously on the couch in her office and gave herself over to a curious jumble of thought -- now a commendation from Moscow, with a promotion, all mixed up with days on the beach at Crimea with her husband and son. It became almost real as she slept and dreamed that she was pursuing little Aleksandr as he marched firmly into the cold waters of the Black Sea in heedless lack of concern over the possibility of drowning himself. She was carrying a drum that she was beating wildly in order to attract the attention he stubbornly refused to give her.

And the vision broke apart and faded and the drumbeat was a hammering at the door.

She rose with a confused effort, smoothed the blouse she was wearing, and strode to the door in hasty concern. This turned to fury when she threw it open and found Konev frowning darkly, his fist raised to renew his assault.

"What is this, Yuri?" she said indignantly. "Is this your way of announcing yourself? There are signals."

"Which no one answered, though I knew you to be within."

Boranova motioned him in with a quick gesture of her head. She was not anxious to see him and he was not a pleasant sight.

She said, "Haven't you slept at all? You look awful."

"I haven't had time. I've been working."

"At what?"

"At what do you suppose, Natalya? At the data we obtained yesterday in the brain."

Boranova felt her anger seep away. After all, it was Konev whose dream this had been. The success of survival was sweet for everyone but Konev. Only he felt the failure.

She said, "Sit down, Yuri. Try to face it. The thought analysis didn't work -- and it couldn't. Shapirov was too far gone. Even as we went in, he was on the point of death."

Konev looked at Boranova blankly, as though totally disregarding her words.

"Where is Albert Morrison?"

"There's no use in hounding him, Yuri. He did what he could, but Shapirov's was a dying brain. -- Listen to me. It was a dying brain."

Again that blank look. "What are you talking about, Natalya?"

"The data we got. The supposed data that you're struggling with. Let it go. The voyage has been a marvelous success even without it."

Konev shook his head. "A marvelous success without it? You don't know what you're saying. Where is Morrison?"

"He's gone, Yuri. It's finished. He's on his way back to the United States. As we promised."

Konev's eyes opened wide. "But that's impossible. He can't go. He mustn't go."

"Well, now," said Boranova calmly. "What are you talking about?"

Konev rose to his feet. "I went over the data, you stupid woman, and it's all plain. We must keep Morrison. At all costs, we must keep him."

Boranova's face reddened. "How dare you insult me, Yuri? Explain yourself at once or I will have you suspended from this project. What is this new mad fixation of yours on Albert?"

Konev lifted his hands halfway upward, as though impelled by an overwhelming desire to strike out at something, with nothing present to strike at.

He gasped, "I'm sorry, I'm sorry. I withdraw the adjective. But you must understand. All through our stay in the brain -- all the time we were trying to tap Shapiro's thoughts -- Albert Morrison was lying to us. He knew what was happening. He must have known and he carefully led us in the wrong direction. We must have him, Natalya, and we must have his device. We can never let him go."

18. RETURN

The trouble with triumph is that you may be on the other side.

Dezhnev Senior

81.

Morrison was doing his best to keep his feelings under control. There was a natural elation. He was going to go home. He was going to be free. He was going to be safe. Much more than that, he would --

But he dared not think of that climactic bit as yet. Yuri Konev was fearfully intelligent and already suspicious. Morrison's thoughts, if Konev concentrated on them, might give themselves away in his facial expressions somehow.

-- Or were they just playing with him? That was the other side of the coin.

Were they planning to break his spirit and turn him to their own uses? It was an old trick, to raise hopes and then dash them -- far worse than having no hope at all at any time.

Would Natalya Boranova do such a thing? She had not hesitated to take him forcibly when he would not come willingly. She had not hesitated to threaten to destroy his reputation forever to get him on the ship. How much farther would she go? Would she stop at nothing?

His heart bounded with a marked relief when Sophia Kahinin appeared. Surely she would not be party to such a deception.

He believed that even more firmly when she smiled at him, looking happier than he had ever seen her. She took his hand and tucked it under her arm.

"You'll be going home now. I'm so glad for you," she said and Morrison could not make himself believe that those words -- their intonation, her expression -- were all part of a careful lie.

Nevertheless, he said cautiously, "I hope I'm going home."

And she said, "You are. -- Have you ever been on a skimmer?"

For a moment, Morrison stumbled on the Russian word, then used a translated English phrase. "Do you mean an SPF -- a solar-powered flyer?"

"This is a Soviet design. Much better. It has light engines. You can't always trust the sun."

"But why a skimmer, then?" They were moving briskly toward the passageway that would lead them out of the Grotto.

"Why not? We'll be at Malenkigrad in fifteen minutes and since you've never been in a Soviet skimmer, you'll love it. It will be one more way of celebrating your return."

"I'm a little nervous of heights. Will it be safe?"

"Absolutely. Besides, I couldn't resist. We're in a wonderful situation now and I don't know how much longer it will last. Whatever we want we get for the moment. I said, 'A skimmer is what we will want,' and they smiled all over their faces and said, 'Why, certainly, Dr. Kahinin. It will be waiting for you.' Day before yesterday, I would have had to fill out a proof-of-need form for a plate of borscht. Today I am a hero of the Soviet Union -- unofficially, as yet. We all are. You, too, Albert."

"I hope I won't be expected to stay for the official ceremonies," said Morrison, still cautious.

"The official ceremonies will be confined to the Grotto, of course, and won't be elaborate at all. Your scroll will undoubtedly be forwarded to you. Perhaps our ambassador can give it to you in a quiet Washington ceremony."

"Not necessary," said Morrison. "I would appreciate the honor, but getting it in the mail is all I really want."

They had turned down a corridor that Morrison had not taken before and then walked long enough to make him wonder uneasily where they might be going. No need to have worried, Morrison thought as they emerged into a small airfield.

There was no mistaking the skimmer. It had long wings, glittering with a layer of photovoltaic cells along their entire upper surface, very much as American SPFs had. The American planes, however, relied on the solar panels entirely. The skimmer he saw had small rotors -- gasoline-powered, no doubt -- as assists. Kahinin might present that as a Soviet improvement but Morrison suspected that the Soviet photovoltaic cells were not as efficient as the American ones.

A mechanic was standing near the skimmer and Kahinin approached him with long, confident strides. "How does it test out?"

"Sweet as a dream," said the mechanic.

She smiled and nodded, but as he stepped away she muttered to Morrison, "I'll check it out anyway, of course. I've seen dreams that turned into nightmares."

Morrison studied the skimmer with a mixture of interest and apprehension. It looked like the skeleton of a plane, with everything somehow thinner and longer than it should be. The cockpit was tiny, like a soap bubble under the huge flap of wings and the long backward extension of a thin skeletal structure.

Kahinin had to bend herself nearly double to climb in. Morrison watched her as she fiddled with the controls. Then, after what seemed a considerable lapse of time, she taxied it down the field, turned it, and came back. She raised the rotors and let them turn slowly and eventually everything was shut down and she got out.

"It's working nicely," she said. "The fuel supply is adequate and the sun is shining brilliantly. One couldn't ask for more."

Morrison nodded and looked around. "One could ask for the pilot. Where is he?"

Kahinin froze at once. "Where is he? Is there some sexual requirement for the task? I pilot my own skimmer."

"You?" exclaimed Morrison quite automatically.

"Yes, !! Why not? I have my license and I qualify as a master pilot. Get in!"

"I'm sorry," stammered Morrison. "I -- I rarely fly and piloting anything through the air is almost a mystical thing to me. I just assumed that a pilot didn't do anything but piloting and that if someone did anything else, he couldn't be a pilot. Do you know what I mean?"

"I'm not even going to try to figure it out, Albert. Get in."

Morrison climbed in, following her directions and doing his best not to damage his head on any portion of the skimmer -- or, perhaps, damaging the skimmer.

He sat in his seat, staring in horror at the skimmer's open side to his right. "Isn't there a door to close?"

"Why do you want a closed door? It would spoil the wonderful feeling of flight. Strap yourself in and you'll be perfectly safe. -- Here, I'll show you how. -- Are you ready now?" She was in the seat beside him, looking quite confident and pleased with herself. They were crowded into contact and that much at least Morrison found rather soothing.

"I'm resigned," he said. "That's as close as I can get to ready."

"Don't be silly. You're going to love this. We'll use the motors to rise."

There was a high-pitched throb of the small engine and a rhythmic slap as the rotors began to spin. Slowly the skimmer rose and -- as slowly -- it turned. It canted to one side while turning and Morrison found himself leaning out over the open side and straining precariously against the strap that held him. He barely managed to fight off the strong impulse to throw his arms around Kahinin for nothing more than utterly non-erotic security.

The skimmer straightened and Kahinin said, "Now, listen," as she turned off the engine and threw in a switch labeled, in Cyrillic, SOLAR. The throb ceased and the rotors slackened as the forward propeller began to turn. The skimmer moved slowly and almost silently forward.

"Listen to the quiet," whispered Kahinin. "It's like drifting on nothing."

Morrison looked down uneasily.

Kahinin said, "We won't fall. Even if a cloud passed over the sun or if a circuit failure put the photovoltaic cells out of action, there is enough power in the storage components to bring us across kilometers, if necessary, to a safe landing. And if we ran out of power, the skimmer is more than half a glider and it would still settle down to a safe landing. I don't think I could force the craft into a crash even if I tried. The only real danger is a strong wind and there's none of that now."

Morrison swallowed and said, "It's a gentle motion."

"Of course. We're not going much faster than an automobile would go and the sensation is much pleasanter. I love it. Try to relax and look at the sky. There's nothing as peaceful as a skimmer."

He said, "How long have you been doing this?"

"When I was twenty-four, I got my master's license. So did Yu-- so did he. Many a peaceful summer afternoon we spent in the air in a skimmer like this. Once we each had a racing skimmer and marked out lover's knots in the air." Her face twisted slightly as she

said that and it occurred to Morrison that she had obtained a skimmer for the short hop to Malenkigrad only for the sake of a momentary reliving of memories and for no other reason.

"That must have been dangerous," he said.

"Not really -- if you know what you're doing. Once we skimmed along the foothills of the Caucasus and that might have been dangerous. A wind squall can easily smash you into a hillside and that wouldn't be fun at all, but we were young and carefree. -- Though I might have been better off if that had happened."

Her voice trailed away and for a moment her face darkened, but then an inner thought seemed to illuminate her into a smile.

Morrison felt his distrust mounting again. Why did the thought of Konev make her so happy, when she could not bear to look at him when they were together in the miniaturized ship?

Morrison said, "You don't seem to mind talking about him, Sophia." Then, deliberately, he used the forbidden word, "About Yuri, I mean. It even seems to make you happy. Why is that?"

And Kahinin said between her teeth, "It's not sentimental memories that makes me happy, I assure you, Albert. Anger and frustration and -- and heartbreak can make a person vicious. I want revenge and I am mean-spirited enough -- well, human enough -- to enjoy it when it comes."

"Revenge? I don't understand."

"It's simple enough, Albert. He deprived me of love and my daughter of a father when I had no way of striking back. That did not bother him as long as he had his dream of bringing miniaturization to practical low-energy fruition so that he might become, at a bound, the most famous scientist in the world -- or in history."

"But he failed at that. We didn't get the necessary information from Shapirov's brain. You know we didn't."

"Ah, but you don't know him. He never gives up; he's driven by the Furies. I've seen him, fleetingly, looking at you, after the voyage through Shapirov's body was done. I know his looks, Albert. I can tell his thoughts even from the droop of an eyelid. He thinks you have the answer."

"Of what was in Shapirov's brain? I don't. How could I?"

"It doesn't matter whether you do or not, Albert. He thinks you do and he wants you and your device with a greater yearning than he ever wanted anything in his life; certainly more than he wanted me or his child. And I'm taking you away from him, Albert. With my own hands I am taking you out of the Grotto and will watch you leave for your own country. And I will see him sicken to death of frustrated ambition."

Morrison stared at her in astonishment as the skimmer moved along in response to her rock-steady hand at the controls. He had not thought that Kahinin was capable of wearing an expression of such consuming and malignant joy.

Boranova had listened to Konev's emotional and breathless account and felt herself carried along by the wave of his utter conviction. That had happened before, when he had been convinced that Shapirov's dying mind could be tapped and that Morrison, the American neurophysicist, was the key to doing that. She had been swept along then and she tried to resist it now.

She said finally, "That sounds quite mad."

Konev said, "What's the difference what it sounds like if it's true?"

"Ah, but is it true?"

"I am certain."

Boranova muttered, "We need Arkady here to tell us that his father assured him that vehemence was no guarantee of truth."

"Neither is it a guarantee of the reverse. If you accept what I say, you must also see that we can't let him go. Certainly not now and possibly not ever."

Boranova shook her head violently. "It's too late. There's nothing to be done. The United States wants him back and the government has agreed to let him go. The government can't very well backtrack now without bringing about a world crisis."

"Considering what is at stake, Natalya, we must surely risk it. The world crisis will not explode. There will be loud talk and much posturing for a month or two and then if we have what we want, we might let him go if absolutely necessary -- or we might arrange an accident --"

Boranova rose to her feet angrily. "No! What you are suggesting is unthinkable. This is the twenty-first century, not the twentieth."

"Natalya, whatever century this is, we face the question of whether the Universe is to be ours -- or theirs."

"You know you're not going to convince Moscow that that is what is at stake. The government has what it wants, a safe voyage into and out of a body. At the moment it's all they want. They never understood that we wanted to read Shapirov's mind. We never explained that."

"That was a mistake."

"Come, Yuri. Do you know how long it would have taken to persuade them that Albert would have to be taken forcibly if he did not come voluntarily? They would not have wanted to risk a crisis -- even as much a crisis as they now face, which is a minor one indeed. You will now be asking them to face a much larger one. Not only will you fail but you will encourage them to look into the matter of the arrival of Albert here and I don't think we can afford that."

"The government is not all one piece. There are many high officials who are convinced that we are too eager to give in to the Americans, that we pay too high a price for the occasional pat on the head we receive. I have people to whom I have entry --"

"I have long known that you have. That's a dangerous game you play, Yuri. Better men than you have been caught up in that sort of intrigue and have come to deplorable ends."

"It's the chance I must take. In a case like this, I can turn the government around. But we must have Albert Morrison in our own hands if we're to do it. Once he's gone, it will be all over. -- When is he supposed to be leaving?"

"Nightfall. Sophia and I agreed that, for the sake of avoiding obtrusiveness and of needlessly provoking those who tend to be against accommodation with the Americans, night is better than day."

He stared at her, eyes opening widely enough so that they almost seemed protuberant. "Sophia?" he said harshly. "What's she got to do with it?"

"She's in charge of the details of returning Albert. She requested it."

"She requested it?"

"Yes. I imagine she wished to be with him for an additional while." With a touch of spite, she added, "Perhaps you didn't notice it, but she rather likes the American."

Konev sneered in disgust. "Not a bit of it. I know that devil. I know her if I know anything at all -- every thought in her head. She's getting him away from me. Sitting right next to him in the ship, watching his every move, she must have guessed his importance and she means to deprive me of him. She won't wait for nightfall. She'll hurry him off at once."

He rose and left the room at a run.

"Yuri," Boranova called after him. "Yuri, what do you intend to do?"

"Stop her," floated back the answer.

She gazed after him thoughtfully. She could stop him. She had the authority. She had the means. And yet -- What if he was right? What if what was at stake was indeed nothing less than the Universe? If she stopped him, everything -- everything -- might be handed over to the Americans. If she let him go, there might be a crisis of an intensity that hadn't been dreamed of in generations.

She had to come to a decision at once.

She began again.

If she stopped him, she would have done something. If he then turned out to have been right, the blame for having stopped him and having lost the Universe would rest squarely on her. If he turned out to be wrong after being stopped -- her action would be forgotten. There is nothing dramatic about a mistake that is not made.

If she did nothing to stop him, however, then all was on Konev's head. If he somehow prevented Morrison's return to the United States and if the government were then humiliatingly forced to release him, it would be Konev who would be blamed. Boranova would lose nothing, for he had dashed off without telling her what he was going to do and she could reasonably claim she had not dreamed he would try to subvert the known intention of the government. She would be in the clear. If, on the other hand, he prevented Morrison's return and proved to be right and the government won the

battle of wills that followed, she could claim the credit of having done nothing to stop him. She could say that it had been with her permission that he had worked.

Well, then, if she stopped him, the worst was blame, the best was neutral. If she did nothing, the best was credit, the worst was neutral.

So Boranova did nothing.

83.

Morrison decided that Kahinin was right. As the minutes passed, he grew less uncomfortable in the skimmer and even began to experience a feeble pleasure.

He could see the ground clearly through the open latticework that made up the chassis of the craft. It was about thirty meters below (he judged) and moving smoothly backward.

Kahinin sat at the controls, completely absorbed, though it didn't seem to Morrison that she had much to do. Presumably, it was skill and patient observation that made it possible for her to keep the skimmer on track without minute-by-minute adjustment.

He said, "What happens if you find yourself moving into a headwind, Sophia?"

She said without taking her eyes from the controls, "Then I would have to use the engine and waste fuel. If it were a fresh wind, it wouldn't pay to use a skimmer at all. Fortunately, today is ideal skimmer weather."

Morrison began to feel something that was almost well-being for the first time since having left the United States -- no, since a considerable length of time before that. He began to picture himself back in the United States; it was the first time he had dared to do so.

He asked, "What happens after we reach the hotel in Malenkigrad?"

"Car to an airport," said Kahinin crisply, "and then you'll board a plane to America."

"When?"

"Tonight, according to schedule. I'll try to get it done more quickly."

Morrison said with what was almost joviality, "Anxious to get rid of me?"

And to his surprise, the answer came back at once. "Yes. Exactly."

He studied her face in profile. The look of studied hatred had long since vanished, but there was a settled anxiety about her expression that caused Morrison to quiver. The picture of himself back in the United States began to fade around the edges.

He said, "Is anything wrong, Sophia?"

"No, nothing wrong now. It's just that I expect that -- he will come after us. The wolf is in pursuit, so I must get you away quickly if I can."

The city of Malenkigrad lay below them, although it was not exactly a city. Small in name, it was small in fact and it raveled off in all directions into the flat countryside.

It was the bedroom community for the people working on the miniaturization project and during the day -- now -- it seemed all but deserted. There was a moving vehicle here and there, occasionally a pedestrian, and, of course, children playing in the dusty streets.

It occurred to Morrison that he had no way of knowing where, in the mighty stretch of land that made up the Soviet Union, Malenkigrad and the Grotto might be. It wasn't in the birch forest or in the tundra. The early summer was warm and the ground looked semiarid. He might be in central Asia or in the steppes near the European side of the Caspian. He could not say.

The skimmer was dropping now, more gently than an elevator. Morrison would not have believed that so soothing a descent could be possible. Then the wheels touched the ground and they braked to a nearly instant halt. They were in the rear of the hotel, a hotel the small size of which he could appreciate when it was seen from the air.

Kahinin left the skimmer with a lively jump and motioned to Morrison, who emerged more sedately.

He said, "What happens to the skimmer now?"

She answered carelessly, "I'll pick it up on my return and take it back to the Grotto field if the weather holds. Come, let's go around to the front and I'll get you into your room, where you can rest a little and where we can plan the next step."

"The room with the soldiers watching me, you mean."

She said impatiently, "There'll be no soldiers watching you. We're not afraid of your trying to escape now." Then, with a quick glance around, she added, "Though I'd rather have the soldiers, actually."

Morrison looked about, too, a bit anxiously and decided he'd rather not have the soldiers. It occurred to him that if Konev came to reclaim him, as Kahinin clearly feared he might do, he might easily come with soldiers at his back.

And then Morrison thought: Or is this really something to fear? She has a thing about Yuri. She'll believe anything of him.

The thought did not quiet him, however.

Morrison had not seen the hotel in broad daylight from outside; he had not had the leisure to study it in any case. It occurred to him that it was probably used only by visiting officials and special guests -- such as he himself, if he could lay claim to the category. He wondered if, small as it was, it was ever full. Certainly, the two nights he had spent here had been quiet indeed. He recalled no noise in the corridors and the dining room, when he had eaten there, had been all but empty, too.

It was at the moment he thought of the dining room that they approached the front entrance and there, to one side, sitting in the sun and poring over a book, was a stoutish woman with reddish-brown hair. She was wearing half-spectacles, perched low on

her nose. (Morrison was surprised at that bit of archaism. It was rare to see glasses in these days when eye-molding was routine and normal vision had truly become normal.)

It was the glasses and the studious look on her face that changed her appearance so that Morrison might easily not have recognized her. He would not have, perhaps, if he had not just thought of the dining room. The woman was the waitress to whom he had appealed for help three evenings before and who had failed him -- Valeri Paleron.

He said austerely, "Good morning, Comrade Paleron." His voice was stiff and his expression unfriendly.

She did not seem discomfited by this. She looked up, removed her glasses, and said, "Ah, Comrade American. You are back safe and sound. Congratulations."

"For what?"

"It is the talk of the town. There has been an experiment that was a great success."

Kahinin, her face like thunder, said sharply, "That should not be the talk of the town. We need no wagging tongues."

"What wagging tongues?" said the waitress with spirit. "Who here does not work at the Grotto or have a relative there? Why should we not know of it and why should we not speak of it? And can I fail to hear? Must I stop my ears? I cannot carry a tray and put my fingers in my ears, too."

She turned to Morrison. "I hear that you did very well and are greatly praised for it."

Morrison shrugged.

"And this man," the waitress said, turning to the frowning and increasingly impatient Kahinin, "wished to leave before he had the chance to participate in the great deed. He turned to me for help in his scheme to leave -- to me, a waitress. I reported him at once, of course, and that made him unhappy. Even now, see how he glares at me." She wagged her finger at him. "But consider the favor I did you. Had I not prevented you from doing whatever it was they were trying to have you do, you would not now be the great success you are, the toast of Malenkigrad and perhaps even of Moscow. And the little Tsaritsa here surely loves you for it."

Kahinin said, "If you do not stop this impudence immediately, I shall report you to the authorities."

"Go ahead," said Paleron, her hands on her hips and her eyebrows lifting. "I do my work, I am a good citizen, and I have done nothing wrong. What can you report? -- And there is a fancy car here for you, too."

"I saw no fancy car," said Kahinin.

"It is not in the parking lot, but on the other side of the hotel."

"What makes you think it is for me?"

"You are the only important persons to approach the hotel. For whom, then, should it be? For the porter? For the desk clerk?"

"Come, Albert," said Kahinin. "We are wasting our time." She brushed past the waitress, doing this so closely that she stepped on her foot -- perhaps not by accident. Morrison followed meekly.

"I hate that woman," muttered Kahinin as they walked up the flight of stairs to Morrison's second-floor room.

"Do you think that she is an observer of this place on behalf of the Central Coordinating Committee?" asked Morrison.

"Who knows? But there is something wrong with her. She is possessed by a devil of impudence. She does not know her place."

"Her place? Are there class distinctions, then, in the Soviet Union?"

"Don't be sarcastic, Albert. There are supposedly none in the United States, either, but you have them surely. And so do we. I know what the theory is, but no person can live by theory alone. If Arkady's father didn't say that, he should have."

They walked up one flight of stairs to what had been Morrison's room earlier in the week and apparently still was. Morrison viewed it with mild distaste. It was a room without charm, though the sunlight made it seem less gloomy than he remembered it to be and, of course, the prospect of returning home was enough to add glitter to anything.

Kahinin sat in the better of the two armchairs in the room, her legs crossed, the upper leg swinging in short arcs. Morrison sat down on the side of the bed and watched her legs thoughtfully. He had never had good occasion to admire his own calmness under pressure and it seemed to him rather unusual to watch someone be more nervous than he himself was.

He said, "You seem greatly troubled, Sophia. What is wrong?"

She said, "I told you. That woman Paleron troubles me."

"She can't upset you that much. What's wrong?"

"I don't like waiting. The days are long now. It will be nine hours until sunset."

"It's amazing that it's only a matter of hours. The diplomatic maneuvering could have continued for months." He said so lightly enough, but the thought gave him a cold feeling in the pit of his stomach.

"Not in a case like this. I've seen it work before, Albert. The Swedes are involved. It's not an American plane that's coming. Having an American plane land deep in Soviet territory is still something our government shies away from. But the Swedes -- Well, they serve as an intermediary between the two nations by common consent and they tend to work hard to defuse any possibility of friction."

"In the United States, we consider Sweden lukewarm toward us at the best. I think we'd prefer to have Great Britain --"

"Oh come, you might as well say Texas. As it is, Sweden may be lukewarm toward you, but she is considerably less than that toward us. In any case, it's Sweden and their principle always is that if it is necessary to defuse a situation, it is best to defuse it swiftly."

"It seems quite swift to me. Certainly, I'm the one who should be in the greater hurry, since it is I who am most anxious to leave. Why should a few hours matter to you?"

"I've told you. He is after us." She ground out the pronoun.

"Yuri? What can he do? If your government is giving me up --"

"There are elements in the government who might easily not wish to give you up and our -- friend -- knows some of these well."

Morrison raised a finger to his lips and looked around.

Kahinin said, "Are you worried about being bugged? That's another American spy novel myth. Bugs are so easily detected these days and so easily scrambled -- I carry a small detector myself and I've never spotted one."

Morrison shrugged. "Then say what you wish."

"Our friend is not a political extremist himself, but he finds he can use those in high office who are. There are extremists in America, too, I suppose. "

"Those who think our policy toward the Soviet Union is too mild?" Morrison nodded. "I've met a few."

"Well, then, there you are. His ambition consumes him and if extremism will advance his plans, then he is prepared to be an extremist."

"Surely you don't think he can arrange some sort of coup in Moscow and put the diehards in control and do it all in time to stop me from leaving for home this evening?"

"You've got it the wrong way around, Albert. If he could somehow prevent you from leaving and precipitate a crisis, he may be able to persuade some in the government to stand firm and delay your leaving for a long time. He can be very persuasive, our friend, when he is in the full grip of his mania. He can sway even Natalya."

Kahinin fell into a silence and bit at her lower lip. Finally she looked up and said, "He hasn't given up on you and he won't. I'm sure of it. I've got to get you away."

She rose suddenly and paced up and down the room with short, quick steps, looking as though she were trying to force the Universe into turning her way. She stopped in front of the door, listened, then jerked it open suddenly.

Valeri Paleron, her bland expression shifting rapidly into surprise, had one fist raised, as though she were about to knock.

"What do you want?" said Kahinin tightly.

"I?" said the waitress. "I want nothing. It is a question of whether you do. I have come to ask if you would like some tea."

"We have not asked for any."

"I did not say you have. I come out of courtesy."

"Then go out of courtesy. And do not return."

Paleron, reddening, looked from Kahinin to Morrison and said between her teeth, "Perhaps I interrupt a tender moment."

"Leave!" said Kahinin. She closed the door, waited long enough to count to ten in a deliberate manner (her lips moving soundlessly), and then flung it open again. No one was there.

She closed the door and locked it, walked to the opposite end of the room, and said in a low voice, "She had been out there, probably, for quite some time. I heard feet shuffling."

Morrison said, "If high-tech bugging is pass,, then I suppose there is a premium on old-fashion eavesdropping."

"Ah, but for whom?"

"Do you suppose she does it for Yuri? It doesn't seem likely that he would have the money to hire spies -- or does he?"

"It might not take much money. A woman like that might do it for pleasure."

There was silence for a moment and then Morrison said, "If it's possible that you're beset by spies, Sophia, why not come to America with me?"

"What?" She seemed not to have heard him.

"You might be in trouble for getting me out, you know."

"Why? I have official papers that will place you on the plane. I am under orders."

"That might not save you if a scapegoat is needed. Why not just get on the plane with me, Sophia, and come to America?"

"Just like that? What would happen to my child?"

"We'll send for her afterward."

"We'll send for her? What are you suggesting?"

Morrison flushed slightly. "I'm not sure. We can be friends, certainly. You'll need friends in a new country."

"But it can't happen, Albert. I appreciate your kindness and concern -- or pity -- but it can't happen."

"Yes, it can. This is the twenty-first century, not the twentieth, Sophia. People may move about freely anywhere in the world."

"Dear Albert," said Kahinin, "you do tend to live in theory. Yes, people can move about, but every nation has its exceptions. The Soviet Union will not allow a highly trained scientist with experience in miniaturization-related fields to leave the country. Think about it and you'll see that that's reasonable. If I do accompany you, there will be an immediate Soviet protest, a sure claim that I have been kidnapped, and there will be a loud howl from all corners of the world that I be sent back in order to avoid a crisis. Sweden will act as quickly for me as she has for you."

"But in my case, I was kidnapped."

"There'll be many who will believe I was -- or who might prefer to believe it -- and I will be sent back by the United States, as you are being sent back by the Soviet Union. We've papered over, in this fashion, dozens of crises over the last six decades or so -- and isn't that better than war?"

"If you say, firmly and frequently, that you want to stay in the United States --"

"Then I never see my child again and my life may be at risk, too. Besides, I don't want to go to the United States."

Morrison looked surprised.

Kahinin said, "Do you find that hard to believe? Do you want to stay in the Soviet Union?"

"Of course not. My country --" He stopped.

She said, "Exactly. You talk endlessly about humanity, about the importance of a global view, but if we scrape you down to your emotions, it's your country. I have a country also, a language, a literature, a culture, a way of life. I don't want to give it up."

Morrison sighed. "As you say, Sophia."

Sophia said, "But I cannot endure it here in this room any longer, Albert. There's no use waiting. Let us get into the car and I'll drive you to where the Swedish plane is waiting."

"It probably won't be there."

"Then we'll wait at the airport, rather than here, and we'll at least be certain that as soon as it arrives you can board it. I want to see you safely gone, Albert, and I want to see his face afterward."

She was out the room and clattering down the stairs. He followed hastily. He was, in truth, not sorry to be going.

They strode along a carpeted corridor and through a door that led directly out to the side of the hotel.

There, pulled up close to the wall, was a highly polished black limousine.

Morrison, a little breathless, said, "They're certainly supplying us with deluxe transportation. Can you drive that thing?"

"Like a dream," said Kahinin, smiling -- and then came to a full and sudden halt, her smile forgotten.

Around the corner of the hotel stepped Konev. He, too, halted and for long moments they did not stir, either of them -- as though they were a pair of Gorgons, each of whom had frozen into stone at the glance of the other.

85.

Morrison was the first to speak. He said a little huskily, "Have you come to see me off, Yuri? If so, good-bye. I'm leaving."

The phrases sounded false in his own ears and his heart was pounding.

Yuri's eyes shifted just enough to glance quickly at Morrison and then moved back to their original position.

Morrison said, "Come, Sophia."

He might as well have said nothing. When she spoke -- finally -- it was to Konev. "What do you want?" she demanded harshly.

"The American," said Konev in a tone no softer than hers.

"I'm taking him away."

"Don't. We need him. He has deceived us." Konev's voice was becoming quieter.

"So you say," said Kahinin. "I have my orders. I am to take him to a plane and see that he gets in. You cannot have him."

"It's not I who must have him. It's the nation."

"Tell me. Go on and tell me. Say that Holy Mother Russia needs him and I'll laugh in your face."

"I'll say no such thing. The Soviet Union needs him."

"You care only for yourself. Step out of my way."

Konev moved between the two others and the limo. "No. You don't understand the importance of his staying here. Believe me. My report has already gone to Moscow."

"I'm sure and I can guess to whom it's going, too. But old gruff-and-grumble won't be able to do anything. He's a blowhard and we all know that. He won't dare say a word in the Presidium and if he does, Albert will be long gone."

"No. He's not going."

Morrison said, "I'll take care of him, Sophia. You open the limo door." He felt himself trembling slightly. Konev was not a large man, but he looked wiry and he was clearly determined. Morrison did not believe himself to be a successful gladiator under any conditions and he certainly didn't feel like one now.

Kahinin lifted her hand, palm turned toward Morrison. "Stay where you are, Albert." She then said to Konev, "How do you intend to stop me. Do you have a gun?"

Konev looked surprised. "No. Of course not. Carrying a hand weapon is illegal."

"Indeed? But I have one." She drew it from her jacket pocket, a small thing almost enclosed in her fist, its small muzzle gleaming as it edged through the space between her first and second fingers.

Konev backed away, eyes widening. "That's a stunner."

"Of course. Worse than a gun, isn't it? I thought you might interfere, so I'm prepared."

"That's also illegal."

"Then report me and I'll plead the need to fulfill my orders against your criminal interference. I will probably get a commendation."

"You won't. Sophia --" He took a step toward her.

She took a step back. "No closer. I'm ready to shoot and I might do so even if you stand where you are. Just keep in mind what a stunner does. It scrambles your brain. Isn't that what you once told me? You'll be unconscious and you'll wake up with partial amnesia and it may take you hours to recover or even days. I've even heard that some people never quite recover. Imagine if your magnificent brain should not quite regain its fine edge."

"Sophia," he said again.

She said, through almost closed lips, "Why do you use my name? The last time I heard you use it, you said, 'Sophia, we will never speak again, never look at each other again.' You are now speaking to me, looking at me. Go away and keep your promise, you miserable --" (She used a Russian word that Morrison didn't understand.)

Konev, white to his lips, said a third time, "Sophia -- Listen to me. Believe that every word I have ever said is a lie, but listen to me now. That American is a deadly threat to the Soviet Union. If you love your country --"

"I'm tired of loving. What has it gotten me?"

"And what has it gotten me?" whispered Konev.

"You love yourself," said Kahinin bitterly.

"No! You kept saying that, but it's not so. If I have some regard for myself now, it is because only I can save our country."

"You believe that?" said Kahinin, wondering. "You really believe that? -- You are mad to do so."

"Not at all. I know my own worth. I couldn't let anything deter me -- not even you. For the sake of our country and my work, I had to give you up. I had to give up my child. I had to tear myself in two and throw the better half of myself away."

"Your child?" Kahinin said. "Are you claiming responsibility?"

Konev's head bent. "How else could I drive you away? How else could I be sure I would work unimpeded? -- I love you. I have always loved you. I have known all along it was my child and that it could be no one else's."

"Do you want Albert so much?" Her stunner did not waver. "Are you willing to say that it is your child -- say you love me -- believe I will, for that, give you Albert -- and then deny it all again? How low an opinion you must have of my intelligence."

Konev shook his head. "How can I convince you? -- Well, if I deliberately threw it all away, I can't expect to get it back again, can I? Will you, in that case, give me the American for the sake of our nation and then throw me away? Would you let me explain the need for him?"

"I wouldn't believe the explanation." Kahinin threw a quick glance in Morrison's direction. "Do you hear this man, Albert?" she said. "You don't know with what cruelty he cast my daughter and me aside. Now he expects me to believe that he loved me all along."

And Morrison heard himself say, "That much is true, Sophia. He loves you and he has always loved you -- desperately."

Kahinin froze for a moment. Her free left hand gestured at Morrison while her eyes remained fixed on Konev. "How do you know that, Albert? Did he lie to you, too?"

But Konev shouted in excitement, "He knows. He admits it. Don't you see? He sensed it with his computer. If you now let me explain, you will believe everything."

Kahinin said, "Is this true, then, Albert? Do you confirm Yuri?"

And Morrison, too late, clamped his mouth shut, but his eyes gave him away.

Konev said, "My love has been unwavering, Sophia. As much as you have suffered, so much have I. But give me the American and there will be no more of it. I will no longer ask that I be spared any chance of hindrance. I will do my work and have you and the child, too, whatever the cost may be -- and may I be cursed if I don't manage both."

Kahinin stared at Konev, her eyes suddenly swimming in tears. "I want to believe you," she whispered.

"Then believe. The American has told you."

As though she were sleepwalking, she moved toward Konev, holding the stunner out to him.

Morrison shouted, "Your orders -- to the plane!" He rushed wildly at them.

But as he did so, he collided heavily with another body. Arms were around him, holding him closely, and a voice in his ear said, "Take it easy, Comrade American. Do not attack two good Soviet citizens."

It was Valeri Paleron, who held him in a strong and unbreakable grip.

Kahinin clung as closely to Konev, though with different effect, the stunner still gripped loosely in her right hand.

Paleron said, "Academician, Doctor, we could become conspicuous here. Let us go back to the American's room. Come, Comrade American, and come quietly or I will be compelled to hurt you."

Konev, catching Morrison's eye, smiled tightly in absolute triumph. He had it all -- his woman, his child, and his American -- and Morrison saw his dream of returning to America pop like a soap bubble and vanish.

19. TURNAROUND

In the true triumph, however, there are no losers.

Dezhnev Senior

86.

Morrison sat in the hotel room that he had, for some fifteen minutes, thought he would never see again. He was close to despair -- closer, it seemed to him, than he had been even when he was alone and lost in the cellular stream of the neuron.

What was the use? Over and over again, he thought this, as though the phrase were reverberating in an echo chamber. He was a loser. He had always been a loser.

For a day or so, he had thought that Sophia Kahinin had been attracted to him, but, of course, she hadn't. He had been nothing more than her weapon against Konev and when Konev had called to her -- beckoned to her -- she had returned to him and had then no further use for her weapons, either for Morrison or for her stunner.

He looked at them dully. They were standing together in the sunlight streaming through the window -- they in the sunlight, he in the shadow, as it must always be.

They were whispering together, so lost in each other that Kahinin seemed unaware that she was still holding the stunner. For a moment, her knees bent as though she was going to get rid of its weight by dropping it on the bed, but then Konev said something and she was all attention and again unaware of the stunner's existence.

Morrison called out hoarsely, "Your government will not endure this. You have orders to release me."

Konev looked up, his eyes brightening slightly, as though he were being persuaded, with difficulty, to pay attention to his captive. It was not, after all, as though he had to watch Morrison in any physical sense. The waitress, Valeri Paleron, was doing that most efficiently. She stood a meter from Morrison and her eyes (somehow amused -- as though she enjoyed the job) never left him.

Konev said, "My government need not concern you, Albert. It will change its mind soon enough."

Kahinin raised her left hand as though to object, but Konev enclosed it in his.

"Do not be concerned, Sophia," he said. "Information at my disposal has been forwarded to Moscow. It will make them think. They will get back to me on my personal wavelength before long and when I tell them we have safely secured Morrison, they will take action. I am sure they will have the persuasive power to make the Old Man see reason. I promise you that."

Kahinin said in a troubled voice, "Albert!"

Morrison said, "Are you getting ready to tell me that you are sorry, Sophia, that you crossed me out of existence at one word from the man you seemed to have hated?"

Kahinin reddened. "You are not crossed out of existence, Albert. You will be well-treated. You will work here as you would have worked in your own country, except that here you will be truly appreciated."

"Thank you," said Morrison, finding some small reservoir of the sardonic inside himself. "If you feel happy for me, of what importance is my feeling for myself?"

Paleron intervened impatiently, "Comrade American, you talk too much. Why do you not sit down? -- Sit down. " (She pushed him into a chair.) "You may as well wait quietly, since there is nothing else you can do."

She then turned to Kahinin, around whose shoulders Konev's right arm was protectively placed. "And you, little Tsaritsa," she said, "are you still planning to place this fine lover of yours out of action that you hold this stunner so menacingly in your hand? You will be able to embrace him the more tightly if both arms are free."

Paleron reached for the stunner Kahinin was holding and Kahinin gave it up without a word.

"Actually," said Paleron, looking curiously at the stunner, "I am relieved at having it. In the paroxysm of your newfound love, I feared you might shoot in all directions. It would not be safe in your hands, my little one."

She moved back to the vicinity of Morrison, still studying the stunner and turning it in various ways.

Morrison stirred uneasily. "Don't point it in my direction, woman. It may go off."

Paleron looked at him haughtily. "It will not go off if I don't want it to, Comrade American. I know how to use it."

She smiled in the direction of Konev and Kahinin. Relieved of the weapon, Kahinin now had both arms around Konev's neck and was kissing him with quick, gentle touches of her lips against his. Paleron said in their direction, but not really to them, for they weren't listening, "I know how to use it. Like this! And like this!"

And first Konev, then Kahinin crumpled.

Paleron turned toward Morrison. "Now help me, you idiot, we must work quickly." She said it in English.

87.

Morrison had difficulty understanding. He simply stared at her.

Paleron pushed his shoulder as though she were trying to awaken him from a deep sleep. "Come on. You grab the feet."

Morrison obeyed mechanically. First Konev and then Kahinin were lifted onto the bed, from which Paleron had stripped the thin blanket. She stretched both of them out along the narrow confines of the single mattress, then searched Kahinin in a quick, practiced way.

"Ah," she said, staring at a sheet of folded paper, whose close-set print marked it indelibly as something written in governmentese. She flipped it into the pocket of her white jacket and continued the search. Other items came to light -- a pair of small keys, for instance. Quickly she went over Konev, plucking a small metallic disc from the inner surface of his lapel.

"His personal wavelength," she said and placed that, too, into her pocket.

Finally she retrieved a black rectangular object and said, "This is yours, isn't it?"

Morrison grunted. It was his computer program. He had been so far gone he had not been aware that Konev had taken it from him. He clutched at it frantically now.

Paleron turned Kahinin and Konev toward each other, propping them so that they would not fall apart. She then placed Konev's arm around Kahinin and covered the two with the blanket, tucking it in under each to help keep them in place.

"Don't stare at me like that, Morrison," she said when she was done. "Come on." She seized his upper arm in a firm grip.

He resisted. "Where are we going? What's happening?"

"I'll tell you later. Not a word now. There is no time to lose. Not a minute. Not a second. Come." She ended with soft fierceness and Morrison followed her.

Out of the room they went, down the stairs as softly as she could manage (he following and imitating), along the carpeted corridor, and out to the limousine.

Paleron opened the front door on the passenger side with one of the keys she had obtained from Kahinin's pocket and said brusquely, "Get in."

"Where are we going?"

"Get in." She virtually hurled him into the limo.

She settled quickly behind the wheel and Morrison resisted the impulse to ask her if she knew how to drive. It had finally gotten through to his stunned mind that Paleron wasn't simply a waitress.

That she had played the part of one, however, was made plain by the faint odor of onions still clinging to her and mixing rather infelicitously with the richer and pleasanter odor of the limo's interior.

Paleron started the engine, looked around the parking area, which was deserted except for a cat going about some business of its own, and moved out over a sandy patch to the path that led to the nearby road.

Slowly the limo picked up speed and when it finally reached the ninety-five kilometer-per-hour mark, it was moving along a two-lane highway on which, occasionally, an automobile, moving in the other direction, passed them. Morrison found himself capable of thinking normally again.

He glanced back earnestly through the rear window. A car, far behind them, was turning off at an intersection they had passed some moments before. No one appeared to be following them.

Morrison then turned to watch Paleron's profile. She seemed competent but grim. It was clear to him now that she was not only no waitress by true profession but was very

likely no Soviet citizen. Her English had a strong urban accent that no European would learn in school or could pick up in a way that would be true enough to fool Morrison's ear.

He said, "You were waiting there outside the hotel, reading a book, so that you would see Sophia and myself when we came."

"You got it," said Paleron.

"You're an American agent, aren't you?"

"Shrewder and shrewder."

"Where are we going?"

"To the designated airport where the Swedish plane will pick you up. I had to get the details on that from Kahinin."

"And you know how to get there?"

"Yes, indeed. I've been in Malenkigrad for considerably longer a period than your Kahinin has been here. -- But tell me, why did you tell her this man, Konev, was in love with her? She was just waiting to hear that from a third person. She wanted it confirmed and you did that for her. In that way, you handed over the whole game to Konev. Why did you do it?"

"For one thing," said Morrison mildly, "it was the truth."

"The truth?" Paleron, looking bemused, shook her head. "You don't belong in the real world. You sure don't. I'm surprised no one knocked you on the head and buried you long ago -- just for your own good. Besides, how do you know it's the truth?"

Morrison said, "I know. -- But I was sorry for her. She saved my life yesterday. She saved all our lives yesterday. For that matter, Konev saved my life, too."

"You all saved each other's life, I suppose."

"Yes, as a matter of fact."

"But that was yesterday. Today you started fresh and you shouldn't have let yesterday influence you. She would never have taken up with him again if it weren't for your dumb remark. He could have sworn himself purple about loving her and all the rest of that rubbish and she wouldn't have believed him. She dared not. Be made a fool of again? Never! She would have stunned him to the ground in another minute and then you told her, 'Why, yes, kid, that there guy loves you,' and that's all she needed. I tell you, Morrison, you shouldn't be out without your keeper."

Morrison stirred uneasily, "How do you know all this?"

"I was on the floor in the back seat of this car, ready to go with you and Kahinin and to make sure she took you there. And then you pulled your dumb trick. What was there to do but grab you and keep you from being stunned down, then get you back to the room where we could have some privacy, and after that get hold of the stunner somehow?"

"Thank you."

"That's all right. -- And I made them look like a loving couple, too. Anyone coming in will be bound to say, 'Excuse me,' and leave quickly -- and that will give us more time."

"How long will it be before they're conscious again?"

"I don't know. It depends on how accurately I placed the radiation and what each state of mind was and who knows what else. But when they do come back, it will take them some time to remember what happened. I'm hoping that in their position, the first thing they'll remember is that they're in love. That would preoccupy them for a while. Then when they do get around to remembering you and what it was that was being done with Moscow, it will be too late."

"Are they going to be permanently damaged?"

Paleron cast a quick look at Morrison's concerned face. "You're worried about them, aren't you? Why? What are they to you?"

"Well . . . shipmates."

Paleron made an inelegant sound. "I guess they'll recover okay. They might be better off if some of that supersensitive edge is ground off. They can get together and make a nice family then."

"And what's going to happen to you? You'd better get on the plane with me."

"Don't be a jackass. The Swedes wouldn't take me. They've got orders to take one guy and they'll test you to make sure you're the right one. They'll have records of your fingerprints and your retina pattern, right out of the files of the Population Board. If they take the wrong person or an additional person, that'll be a new incident and the Swedes are too smart for that."

"But then what will happen to you?"

"Well, for starters, I'll say you got hold of the stunner and rayed them both, then held the stunner on me and made me take you to the airport because you didn't know its location. You ordered me to stop outside the gates, then stunned me down and tossed the stunner into the car. Early tomorrow, I'll make my way back to Malenkigrad, like I was coming out of a stunning."

"But Konev and Kahinin will deny your story."

"They weren't looking at me when they were stunned and almost no one remembers the actual moment of stunning, anyway. Besides, the Soviet Government knows that they ordered you returned and if you are returned, then anything Konev will tell them about you will do him no good. The government will accept the fait accompli. It's rubles to kopeks or, better, dollars to kopeks that they'll prefer to forget the whole thing -- and I'll just go back to waitressing."

"There's bound to be some suspicion clinging to you."

"Then we'll see," she said. "Nichevo! What will be, will be." She smiled faintly.

They continued to travel along the highway and Morrison finally said with a touch of diffidence, "Shouldn't we to speed it up a little?"

"Not even by a kilometer per hour," said Paleron firmly. "We're going at just under the speed limit and the Soviets have every centimeter of the highway radarized. They have no sense of humor about the speed limit and I don't intend to spend hours trying to get out of a police station because I wanted to save fifteen minutes reaching the plane."

It was past noon now and Morrison was beginning to feel the mild, premonitory pinches of hunger. He said, "What was it that Konev told Moscow about me, do you suppose?"

Paleron shook her head. "Don't know. Whatever it was, he got a response on his personal wavelength. It signaled about twenty minutes ago. You didn't hear?"

"No."

"You wouldn't last long in my business. -- Naturally, they got no answer, so whoever Konev was talking to in Moscow will try to find out why. Someone will find them and then they'll figure you're on the way to the airport and someone will chase out after us to see if you can be headed off. Like Pharaoh's chariots."

"We don't have Moses to part the Red Sea for us," muttered Morrison.

"If we get to the airport, we'll have the Swedes. They won't give you up to anybody."

"What can they do against the Soviet military?"

"It won't be the Soviet military. It will be some functionary, working for an extremist splinter group, who will try to bluff the Swedes. But we have official papers giving you up to them and they won't be bluffed. We just have to get there first."

"And you don't think we should go faster?"

Paleron shook her head firmly.

Half an hour later, Paleron pointed and said, "There we are and we have the breaks. The Swedish plane is in early and has landed."

She stopped the car, pressed a button, and the door flew open on his side. "You go on alone. I don't want to be seen, but listen --" She leaned toward him. "My name is Ashby. When you get to Washington, tell them that if they think it's time for me to get out -- I'm ready. Got it?"

"I've got it."

Morrison got out of the car, blinking in the sunlight. In the distance, a man in uniform -- not a Soviet uniform, as nearly as he could tell -- waved him forward.

Morrison broke into a run. There were no speed limits on running and though he could see no one in pursuit he would not have been surprised to see someone rise out of the ground to stop him.

He turned, waved a last time in the direction of the car, thought he saw an answering wave, and continued to run.

The man who had gestured to him advanced, first at a walk, then at a run, and caught him as he all but fell forward. Morrison could see now that he was wearing a European Federation uniform.

"May I please have your name?" said the man in English. His accent, to Morrison's infinite relief, was Swedish.

"Albert Jonas Morrison," he said and together they walked toward the plane and the small group waiting to check his identity.

88.

Morrison sat at the plane window, tense and exhausted, staring downward at the land fleeing east. A lunch, consisting largely of herring and boiled potatoes, had soothed the inner man but scarcely the inner mind.

Had the miniaturized trip through the bloodstream and brain yesterday (only yesterday?) twisted him forever into a mental attitude of apprehension of imminent disaster? Would he never again be able to accept the Universe as friendly? Would he never walk through it in serene consciousness that no one and no thing wished him harm?

Or had there merely been insufficient time for him to recover?

Of course, common sense told him that there was reason not to feel completely safe yet. That was still Soviet earth under the plane.

Was there still time for Konev's ally in Moscow, whoever he might be, to send out planes after the Swedes? Was he powerful enough to do so? Would Pharaoh's chariots take to the air and continue the pursuit?

For a moment, his heart failed him when he actually saw a plane in the distance -- then another.

He turned to the stewardess, who sat across the aisle from him. He did not have to ask the question. She apparently read his anxious expression accurately.

"Federation planes," she said, "as escort. We've left Soviet territory. The planes are Swedish-crewed."

Then, when they passed over the English Channel, American planes joined the escort. Morrison was safe from the chariots, at any rate.

His mind did not let him rest, however. Missiles? Would someone actually commit an act of war? He tried to calm himself. Surely no man in the Soviet Union, not even the Soviet Executive himself, could make such a move without consultation and no consultation would take less than hours or perhaps days.

It couldn't be.

Still, it wasn't until the plane had landed on the outskirts of Washington that Morrison could allow himself to feel that it was over and that he was safely in his own country.

89.

It was Saturday morning and Morrison was recovering. He had attended to his creature needs. He had had breakfast and had washed. He was even partly dressed.

Now he lay in bed on his back, arms behind his head. It was cloudy outside and he had only half-clarified the window because he wanted a sense of privacy. In the hours after he had disembarked from the plane and had been rushed to his present place of concealment, there had been enough official crowding around him to make him wonder a bit if he was any better off in the United States than he had been in the Soviet Union.

The doctors had finally finished their probing, the initial questions had been asked and answered, even during dinner, and they had finally left him to his sleep in a room that was, in turn, inside something that resembled a fortress for the depth of its security.

Well, at least he didn't have to face miniaturization. There was always that thought to comfort him.

The door signal flashed and Morrison reached over his head, feeling the bedboard for the button that would clarify the one-way patch on the door. He recognized the face that appeared and pushed another contact that allowed the door to be opened from the outside.

Two men entered. The one whose familiar face had been at the one-way patch said, "You remember me, I hope."

Morrison made no move to get out of bed. He was the center now around which all revolved, at least temporarily, and he would take advantage of that. He simply raised his arm in casual greeting and said, "You're the agent who wanted me to go to the Soviet Union. Rodano, isn't it?"

"Francis Rodano, yes. And this is Professor Robert G. Friar. I imagine you know him."

Morrison hesitated and then courtesy swung his feet off the bed and lifted him to his feet. "Hello, Professor. I know of you, of course, and have seen you on holovision often enough. I'm pleased to make your personal acquaintance."

Friar, one of the "visible scientists" whose photographs and HV appearances had made him familiar to most of the world, smiled tightly. He had a round face, pale blue eyes, an apparently permanent vertical crease between his eyebrows, ruddy cheeks, a sturdy body of average height, and a way of looking around him restlessly.

He said, "You, I take it, are Albert Jonas Morrison."

"That's right," said Morrison easily. "Mr. Rodano will vouch for me. Please sit down, both of you, and forgive me if I continue to relax on the bed. I have about a year's relaxation to catch up on."

The two visitors sat down on a large couch and leaned toward Morrison. Rodano smiled a bit tentatively. "I can't promise you much relaxation, Dr. Morrison. At least for a while. Incidentally, we have just received word from Ashby. Do you remember her?"

"The waitress who turned the tables? Yes, indeed. Without her --"

"We know the essentials of the story, Morrison. She wants you to know that your two friends have recovered and are apparently fond of each other still."

"And Ashby, herself? She told me she was ready to leave if Washington thought it best. I reported that last night."

"Yes, we'll get her out one way or another. -- And now I'm afraid we must bother you again."

Morrison frowned. "How long will this keep up?"

"I don't know. You must take it as it comes. -- Professor Friar, won't you take over?"

Friar nodded. "Dr. Morrison, do you mind if I take notes. -- No, let me rephrase that. I am going to take notes, Morrison."

He plucked a small computer keyboard of advanced design out of his briefcase.

Rodano said mildly, "Where will these notes go, Professor?"

"To my recording device, Mr. Rodano."

"Which is where, Professor?"

"In my office at Defense, Mr. Rodano," Then, with some irritation under the other's continuing stare, "Into my safe in my office at Defense and both the safe and the recording device are well-coded. Does that satisfy you?"

"Proceed, Professor."

Friar turned to Morrison and said, "Is it true that you were miniaturized, Morrison. You, personally?"

"I was. At my smallest, I was the size of an atom while part of a ship the size of a glucose molecule. I spent better than half a day inside a living human body, first in the bloodstream, then in the brain."

"And this is true? No chance of an illusion or trickery?"

"Please, Professor Friar. If I were tricked or hypnotized, my testimony now would be worthless. We can't proceed unless you recognize the fact that I am in my right mind and can be relied on to report events that correspond reasonably well with reality."

Friar's lips pressed together and then he said, "You are right. We must make assumptions to begin with and I will assume you are sane and reliable -- without prejudice to further reconsideration of such assumptions."

"Of course," said Morrison.

"In that case" -- and Friar turned to Rodano -- "we begin with one great and important observation. Miniaturization is possible and the Soviets do indeed have it and make use of it and can miniaturize even living human beings without apparent harm to them."

He turned back to Morrison. "Presumably, the Soviets claim to miniaturize by reducing the size of Planck's constant."

"Yes, they do."

"Of course they do. There's no other conceivable way of doing it. Did they explain the procedure by which that was done?"

"Certainly not. You might as well make the assumption that the Soviets scientists I dealt with are as sane as we are. They wouldn't carelessly give away anything they don't want us to know."

"Very well, then. Assumption made. Now tell us exactly what happened to you in the Soviet Union. Do not tell it as an adventure story, but only as the observations of a professional physicist."

Morrison began to talk. He was not entirely sorry to do so. He wanted to exorcise it and he didn't want the responsibility of being the only American to know what he knew. He told the story in detail and it took hours. He did not finish until they were sitting at a lunch delivered by room service.

Over dessert, Friar said, "Let me summarize, then, as best I can from memory. To begin with, miniaturization does not affect time flow, nor the quantum interactions -- that is, the electromagnetic, weak and strong interactions. The gravitational interaction is affected, however, and decreases in proportion to mass, as it naturally would. Is that so?"

Morrison nodded.

Friar went on. "Light -- and electromagnetic radiation, generally -- can cross into and out of the miniaturization field, but sound cannot. Normal matter is weakly repelled by the miniaturization field but, under pressure, normal matter can be made to enter it and be itself miniaturized, at the expense of the energy of the field."

Morrison nodded again.

Friar said, "The more miniaturized an object becomes, the less energy is required to miniaturize it further. Do you know if the energy requirement decreases in proportion to the mass remaining at any particular stage of miniaturization?"

"That would certainly seem logical," said Morrison, "but I don't recall anyone mentioning the quantitative nature of that phenomenon."

"To go on, then. The more miniaturized an object, the greater the chance of its spontaneous deminiaturization -- and that refers to the entire mass within the field, rather than to any component part. You, as a separated individual, were more likely to deminiaturize spontaneously than you would as part of the ship. Is that right?"

"That was my understanding."

"And your Soviet companions admitted that it was impossible to maximize and to make things more massive than they are in nature."

"Again, that was my understanding. You must realize, Professor Friar, that I can only repeat what I was told. They might have deliberately misled me or they may have been wrong because they had insufficient knowledge themselves."

"Yes yes, I understand. Do you have any reason to believe they were deliberately misleading you?"

"No. It seemed to me they were being honest."

"Well, perhaps. Now, the most interesting thing to me is that Brownian motion was in balance with miniaturization oscillation and that the greater the degree of miniaturization, the greater the shift in balance toward oscillation and away from ordinary Brownian motion."

"That is an actual observation of my own, Professor, and doesn't rest merely on what I was told."

"And that shift of balance has something to do with the rate of spontaneous deminiaturization."

"That is my own thought. I cannot state it as fact."

"Hmm." Friar sipped thoughtfully at his coffee and said, "The trouble is that all this is superficial. It tells us about the behavior of the miniaturization field, but nothing about how the field is produced. -- And in decreasing the value of Planck's constant, they leave the speed of light untouched, you say?"

"Yes, but that, as I emphasized, means that maintaining the miniaturization field costs enormously in energy. If they can couple Planck's constant with the speed of light, increasing the latter as they decrease the former -- But they don't have that yet."

"So they say. It was in Shapiro's mind, supposedly, but you were unable to get it out."

"That's right."

Friar remained lost in thought for a few minutes, then shook his head. "We'll go over everything you've said and deduce what we can from it, but I fear it won't help."

"Why not?" asked Rodano.

"Because none of it goes to the heart. If someone who had never seen a robot or heard anything about any of its component parts were to report a robot in operation, he could describe how the head and limbs moved, how the voice sounded, how it obeyed orders, and so on. Nothing he could observe would tell him how a positronic brain-path works or what a molecular valve is. He would not even have an inkling that either exists, nor would those scientists who would work from his observations have any."

"The Soviets have some technique to produce the field and we know nothing about it, nor does anything Morrison can tell us help us there. They might have published material that led up to it, not aware that something crucial was in the making -- that was what happened in the mid-twentieth century, when early work on nuclear fission was published before it was understood that it ought to be kept secret. The Soviets didn't make that mistake with miniaturization, however. Nor have we succeeded in retrieving information concerning the matter through espionage or by the luck of having some key personnel on the other side defect and come to us."

"I will consult with my colleagues on the Board, but on the whole, Dr. Morrison, I'm afraid that your adventure in the Soviet Union, however daring and praiseworthy has -- except for your confirmation that miniaturization does exist -- been useless. I'm sorry, Mr. Rodano, but it might as well not have happened."

90.

Morrison's expression did not change as Friar advanced his conclusion. He poured himself a little more coffee, added cream judiciously, and drank it without haste.

Then he said, "You're quite wrong, you know, Friar."

Friar looked up and said, "Are you trying to say that you know something about the production of the miniaturization field? You had said that --"

"What I'm going to say, Friar, has nothing at all to do with miniaturization. It has everything to do with my own work. The Soviets took me to Malenkigrad and the Grotto in order that I might use my computer program to read Shapiro's mind. It failed at that, which is perhaps not surprising, considering that Shapiro was in a coma and near death. On the other hand, Shapiro, who had a remarkably penetrating mind, referred to my

program as a 'relay station' after he had read some of my papers. That's what it turned out to be."

"A relay station?" Friar's face took on a look of puzzled distaste. "What does that mean?"

"Instead of tapping Shapiro's thought, my programmed computer, once inside one of Shapiro's neurons, was acting as a relay, passing thought from one of us to another."

Friar's expression became one of indignation. "You mean it was a telepathic device."

"Exactly. I first experienced that when I was aware of an intense emotion of love and sexual desire for a young woman who was on the miniaturized ship with me. Naturally, I assumed it was my own feeling, for she was a very attractive woman. Nevertheless, I was not aware of any conscious feeling of that sort. It was not until several other instances of the sort that I realized I was receiving the thoughts of a young man on board ship. He and the young lady were estranged, but the passion between them existed, nevertheless."

Friar smiled tolerantly. "Are you sure you were in condition, on board the ship, to interpret these thoughts properly? After all, you were under tension. Did you also receive similar thoughts from the young lady?"

"No. The young man and I exchanged thoughts, involuntarily, on several occasions. When I thought of my wife and children, he thought of a woman and two youngsters. When I was lost in the bloodstream, it was he who picked up my sensations of panic. He assumed he had detected Shapiro's miseries by way of my machine -- which remained in my possession when I was adrift -- but those were my feelings, not Shapiro's. I did not exchange thoughts with either woman on board, but they exchanged thoughts with each other. When they tried to catch Shapiro's thoughts, they detected similar words and feelings -- from each other, of course -- which the young man and myself did not."

"A sexual difference?" said Friar skeptically.

"Not really. The pilot of the ship, a male, received nothing at all, either from the women or from the other men, though on one occasion, he did seem to get a thought. I couldn't say from whom. My own feeling is that there are brain types, as there are blood types -- probably only a few -- and that telepathic communication can be most easily established among those of the same brain type."

Rodano interposed softly, "Even if all this is so, Dr. Morrison. What of it?"

Morrison said, "Let me explain that. For years I've worked to identify the regions and patterns of abstract thought within the human brain with some unremarkable success. Occasionally, I would catch an image, but I never interpreted that properly. I thought it was coming from the animal on whose brain I was working, but I now suspect that they came when I was fairly close to some human being who was in the grip of strong emotion or deep thought. I never noticed that. My fault."

"Nevertheless, having been stung by the general indifference and downright disbelief and ridicule of my colleagues, I never published the matter of catching images, but modified my program in an attempt to intensify it. Some of those modifications were never published, either. Thus, I entered Shapiro's bloodstream with a device that could more nearly serve as a telepathic relay than anything I had ever had before. And now that, at last, my thick head has absorbed exactly what it is that I have, I know what to do to improve the program. I am sure of that."

Friar said, "Let me get this straight, Morrison. You are telling me that, as a result of your fantastic voyage into Shapiro's body, you are now certain you can so modify your device as to make telepathy practical?"

"Practical to an extent. Yes."

"That would be an enormous thing -- if you could demonstrate it." The skepticism in Friar's voice did not disappear.

"More enormous than you perhaps think," said Morrison with some asperity. "You know, of course, that telescopes, whether optical or radio, can be built in parts over a wide area and, if they are coordinated by computer, can achieve the function of a single large telescope, one much larger than can practically be built in a single piece."

"Yes. But what of that?"

"I mention it as an analogy. I am convinced that I can demonstrate something of the same sort in connection with the brain. If we were to have six men united telepathically, the six brains would, for the time, act as one large brain and, in fact, be beyond human in intelligence and in the capacity for insight. Think of the advances in science and technology that could be made, advances in other fields of human endeavor as well. We would, without going through the tedium of physical evolution or the danger of genetic engineering, create a mental superman."

"Interesting, if true," said Friar, obviously intrigued and as obviously unconvinced.

"There is a catch, though," said Morrison. "I performed all my experiments on animals, placing leads from my computer into the brain. That was -- and as I see now, must be -- not at all precise. No matter how we refine it, we will have only a crude telepathic system at best. What we need is to invade a brain and place a miniaturized and property programmed computer in a neuron, where it can act as a relay. The telepathic process will then be sharpened enormously."

"And the poor person on whom you inflict this damage," said Friar, "will eventually explode when the device deminiaturizes."

"An animal brain is much inferior to the human brain," said Morrison earnestly, "because of the fact that the animal brain has fewer neurons, less intricately ordered. The individual neuron in a rabbit's brain may, however, not be significantly inferior to a human neuron. A robot could be used as a relay."

Rodano said, "American brains working in tandem could, then, work out the secret of miniaturization and perhaps even beat the Soviets at the task of coupling Planck's constant to the speed of light."

"Yes," said Morrison enthusiastically, "and one Soviet scientist, Yuri Konev, who was the shipmate who shared thoughts with me, caught on to this, as I did. It was for that reason that he tried to hold on to me and to my program in defiance of his own government. Without me and my program, I doubt that he can duplicate my work for a long time, perhaps not for many years. This is not really his field."

"Continue," said Rodano. "I'm beginning to get a feeling for this."

Morrison said, "This is the situation, then. Right now, we've got a kind of crude telepathy. Even without miniaturization, it may help us forge ahead of the Soviets, but it may not. Without miniaturization -- and without the establishment of a properly programmed computer in an animal neuron as a relay -- we can't be sure of accomplishing anything.

"The Soviets, on the other hand, have a crude form of miniaturization. They may, in the ordinary course of investigation, find a way of linking quantum theory and relativity theory to make a truly efficient miniaturization device, but that might take a very long time.

"So if we have telepathy but not miniaturization, and if they have miniaturization but not telepathy, it may be that we may win after a long period of time -- or they may win. The nation that wins has, in a sense, an unlimited speed of travel and the Universe will belong to it. That nation that loses will wither -- or at least its institutions will wither. It would be good for us if we win the race, but it is they who may win and the process of racing may force the breakdown of two generations of an uneasy peace and lead to an all-destructive war.

"On the other hand, if we and the Soviets are willing to work together and, both of us, to use telepathy as refined and strengthened by a miniaturized relay station in a living neuron, we may achieve, in combination and in a very short time, what amounts to antigravity and infinite speed. The Universe will belong to both the United States and the Soviet Union; indeed, to the whole globe, to Earth, to humanity.

"Why not, gentlemen? No one would lose. Everyone would gain."

Friar and Rodano stared at him in wonder. Friar finally said, swallowing hard, "You make it sound good, if indeed you have telepathy."

"Do you have the time to listen to my explanation?"

"I have all the time you want," said Friar.

It took some hours for Morrison to explain his theory in detail. Then he leaned back and said, "It's almost dinnertime. Now I know that you -- and others as well -- will be wanting to interview me and that you will all want me to set up a system which will demonstrate the practicality of telepathy and that that will keep me busy for -- well, for the rest of my life, for all I know, but I must have one thing now."

"What's that?" asked Rodano.

"Some time off to begin with. Please. I've gone through enough. Give me twenty-four hours -- from now until dinnertime tomorrow. Let me read, eat, think, rest, and sleep. Just one day, if you don't mind, and thereafter I will be at your service."

"Fair enough," said Rodano, rising. "I will arrange that if I can and I suspect I can. The twenty-four hours is yours. Make the most of it. I agree that you'll have precious little time to yourself thereafter. And from now on, for quite a while, resign yourself to being the most strictly guarded person in America, not excluding the President."

"Good," said Morrison. "I'll call for a dinner for one."

91.

Rodano and Friar had finished their own dinner. It had been an unusually silent meal in an isolated and guarded room.

Once it was over, Rodano said, "Tell me, Dr. Friar, do you think Morrison is right in this matter of telepathy?"

Friar sighed and said cautiously, "I will have to consult with some of my colleagues who are more knowledgeable concerning the brain than I am, but I feel he is right. He is very convincing. -- And now I have a question for you?"

"Yes?"

"Do you think Morrison was correct as to the necessity of cooperation between the United States and the Soviet Union in this matter?"

There was a lengthy pause and finally Rodano said, "Yes, I think he's right there, too. Of course, there'll be howls from every direction, but we can't risk the Soviets getting there first. Everyone will see that. They'll have to."

"And the Soviets? Will they see it, too?"

"They'll have to, also. They can't risk us getting there first. Besides, the rest of the world will undoubtedly get wind of what is going on and they will clamor for a piece of the action and demand that no new cold war be started. It may take some years, but in the end we will cooperate."

Rodano then shook his head and said, "But do you know what really strikes me as peculiar, Professor Friar?"

Friar said, "What in this whole course of events can possibly strike you as not peculiar?"

"Nothing, I suppose, but what strikes me as most peculiar is this. I met Morrison last Sunday afternoon to urge him to go to the Soviet Union. At the time, my heart sank. He struck me as a man without guts, as a zero, as a wimp, as someone who wasn't even bright except in an academic sense. I didn't think he could be relied on to accomplish anything. I was simply sending him to his death. So I thought -- and so I said to a colleague the next day -- and, so help me, so I still think. He's nothing and it's simply a miracle that he survived and that's only thanks to others. And yet --"

"And yet?"

"And yet he returned, having made an incredible scientific discovery and having set in motion a process whereby the United States and the Soviet Union will both be forced, against their separate wills, to cooperate. And, to top it off, he has made himself

the most important and, once we publicize these events, the most famous scientist in the world -- possibly of all time.

"He has, in a sense, destroyed the political system of the world and built a new one -- or at least initiated the process of building a new one -- and he has done it all between the afternoon of last Sunday and the afternoon of today, Saturday. He has done it in six days. Somehow that's a frightening thought."

Friar leaned back and laughed aloud. "It's more frightening than you think. He plans to rest on the seventh day."
